For Permanent Insulation that Saves TWO Ways

-- Specify New REFLECTIVE Kimsul

The only insulation which gives both heat-barrier and vapor-barrier savings is the new reflective type Kimsul. Kimsul's aluminum foil backing stops heat loss. Kimsul is a permanent, fire-resistant installation, applied easily and at low cost to walls, floors, attics. Prefabricated in standard sizes, will not sift or settle.

WHITE ALICE FACILITIES— Alaska

Bids will be called soon by Corps of Engineers, Alaska District, district engineers, D-E Bldg., Anchorage, for construction of White Alice Facilities, communications projects at Middleton Island; ENG-95-507-56-53; Sparrevohn, Indian Mountain, Unalakeett, Kodiak, Bethel and Sitkinak, ENG-95-507-56-54. Projects will be advertised for three weeks, but bidders should arrange to view sites, etc., before the time of advertising. Other information may be obtained at the district engineer's office, Anchorage. Plans and specifications of similar (not identical) projects may be examined at the Anchorage or Seattle branch office. Completion about 4 months from date of contract award.

The work at all sites consists of construction of an equipment building of approximately 5,000 sq. ft.; installation of diesel engines and generators; erection of towers and antennae composed of structural steel shapes bolted together, and the erection of a communications cable on a pole line from an existing Air Force Station which is located nearby to the site. The foundations at the site vary. A bench mark will be set for control of all elevation and a base line will be established to control the azimuth sitting of the towers and equipment building. Sparrevohn; in addition to the equipment building will have a dormitory of 5,200 sq. ft. Unalakleet will have a dormitory 4,500 sq. ft., and 10 mi. of road will have to be constructed from the Air Force station to the site before work can be started on the site. This will be done generally by dumping sand and gravel on the tundra and will also have erection of a tower at an Air Force station nearby included in its invitation. Bethel, steel H-piles will be used and steel shapes for the floors, these to be government furnished. GW 5-16

▲SHOP PAINTING— Anchorage, Alaska

★STEAM POWER PLANT—Glenrock, Wyo.
(Estimated cost $22,000,000)

Several contracts have been awarded by Portland General Electric Co., Paul B. McKee, president, Public Service Bldg., Portland, for equipment and other work in connection with a 100,000 kw. steam-electric generating plant to be located 5 miles east of Glenrock on North Platte River. Actual construction is expected to start in fall of 1956. Ebasco Services, Inc., is in charge of design and managing construction. The plant will use an estimated 400,000 tons of coal per year from deposit to be developed by the company immediately north of the plant location. Plant will be modern "outdoor type" installation, with a single large generator. Water from North Platte River will provide water for boilers and for cooling. Estimated cost includes fuel development and transmission line connections. Plant to start operation in fall of 1958. CONTRACTS: Exploration drilling in coal—Morrison-Knudsen Co., Boise; Evitt Drilling Co., Casper, Wyo.; aerial mapping of coal area and plant site—Ryall Engineering Co., Denver; ground topographic mapping of plant site in connection with coal area—Worthington & Lenhart, Casper; consulting geologist—Florent Bailey, Petroleum Engineers Associates, Pasadena, and Wyoming Natural Resources Research Institute, Laramie; 100,000 kw. turbine-generator and related transformers—General Electric Co.; boiler, 1450 psi/1000°/1000°—Babcock & Wilcox; condensor—Ingersoll-Rand; structural steel—Gate City Steel Co., Omaha.

THE RATE for Advertisements for Bids is 35 cents per line for the first insertion; 25 cents per line for each insertion thereafter.

ELEMENTARY SCHOOL
BIDS CLOSE 8 P.M., MAY 23
Bay Center, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the undersigned at the Bay Center Elementary School Building, Bay Center, Washington, until 8:00 p.m. on May 23, 1956 for the construction of an elementary school building for Bay Center School District No. 22, Bay Center, Washington. The building consists of four classrooms, a book room, office, boys' and girls' toilet rooms, storage rooms, janitor and boiler room, kitchen, and multipurpose unit including stage and storage room; employing tilt-up reinforced concrete construction. Combined bids will be received for general construction, plumbing and heating, and electrical. Plans and specifications may be obtained from the office of Charles A. Baylon, Architect, 912 Elliott Avenue West, Seattle 99, Washington, upon deposit of $25.00 which sum will be returned to the bidder provided plans are returned in good condition with submitted bid, or provided plans are returned within five (5) days after issue if no bid is submitted. Plans and specifications may be examined at the office of Charles A. Baylon and Associates at the above address.

Each bid shall be accompanied by a certified check, cashier's check, or bid-bond (with authorized surety company as surety) made payable to the Bay Center School District No. 22 in an amount not less than 5% of the basic bid plus alternates. Board of Directors of Bay Center School District No. 22 reserves the right to waive any informalities or irregularities in any bid or in the bidding, or to accept or reject any or all bids. Bid opening shall be public.

No bidder may withdraw his bid after the hour set for the opening thereof or before award of the contract unless said award is delayed for a period exceeding thirty (30) days.

Edwin R. Stearns
Clerk of the Board
Bay Center School District No. 22
Bay Center, Washington

5451—5-3, 10, 17

ELEMENTARY SCHOOL
BIDS CLOSE 3 P.M., MAY 29
Enumclaw, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by Mr. Albert Bogdan, Clerk of Board of School, Enumclaw School District No. 216 at the Superintendent's office at the Enumclaw High School, 2222 Porter Street, Enumclaw, Washington, until 3 p.m., Tuesday, May 29th, 1956, for the construction of J. J. Smith Elementary School Building, Enumclaw, Washington, for School District No. 216, Enumclaw, King County, Washington, and will then and there be opened and will be publicly read aloud. Bids received after the time fixed for opening will not be considered.

Specifications, including contract documents, and drawings may be examined at the office of the Architect, William Aitken, 408 Marion Street, Seattle 4, Washington, and at the office of the Superintendent of the Enumclaw School District No. 216, at Enumclaw, Washington, and may be obtained by bona fide bidders at the Architect's office upon deposit of $25.00 for each General Work set and $10.00 for each set of Mechanical and/or Electrical Work. Contractors who hold bidding documents over forty-eight hours shall forfeit deposit if bid is not tendered.

The full amount of the deposit for one set of documents will be refunded to actual bidders upon return of the documents, unmutilated and without marks or annotations, within 3 days after the time set for opening of bids. Other deposits will be refunded with deductions for the actual cost of reproducing the documents.

Bidders shall submit proposals for the General, Plumbing and Heating, and Electrical Work separately. Each bid must be accompanied by a certified check, cashier's check, or bid bond, in an amount not less than 5% of the Base Bid, made payable to the Enumclaw School District No. 216.

The right is reserved to reject any or all bids and to waive informalities.

No bidder may withdraw his bid after the time set for the opening of bids unless the award of contract is delayed for a period exceeding 30 days.

By order of Board of Directors, Enumclaw School District No. 216, King County, Washington.

MR. ALBERT BOGDAN,
Clerk of Board.

ELEMENTARY SCHOOL
BIDS CLOSE 2 P. M., JUNE 5
Bellevue, Washington
NOTICE TO CONTRACTORS

Separate sealed proposals will be received by Bellevue School District No. 405, King County, Washington, at the Bellevue School District Office, P. O. Box 67, Bellevue, Washington, until 2:00 P. M., June 5, 1956, for the General, Mechanical and Electrical contracts (separate contracts), for the construction of a new Highland Elementary School, and the said proposals will then and there be publicly opened and read aloud. Bids received after the time set for opening cannot be considered.

Specifications and drawings may be examined at the office of the Architects, Jones and Bindon, 715 Hoge Building, Seattle 4, Washington, and at the Seattle Chapter, Associated General Contractors of America, 215 West Harrison Street, Seattle, and may be obtained at the Architects' office upon deposit of $25.00 for each set of general drawings and specifications and $15.00 for each set of mechanical or electrical drawings and specifications.

The full amount of deposit for one set of documents will be refunded to actual prime contract bidders upon return of the documents, unmutilated and without marks or annotations, within one week after the date of the bid opening. Other deposits will be refunded with deductions for the actual cost of reproducing the drawings, under the same conditions.

Each bid must be accompanied by a certified or bank cashier's check, or by a bid bond, each in an amount not less than 5% of the Base Bid, made payable to Bellevue School District No. 405, King County, Washington. Bid bond must be furnished in the form set forth in the specifications with a State-licensed surety company as surety.

Attention of bidders is directed to State laws concerning wages, working hours, and other conditions of employment.

The Board of Directors reserves the right to reject any or all bids and to waive informalities. No bidder may withdraw his bid after the hour set for the opeing thereof unless and until the award of contract has been delayed for a period exceeding forty-five (45) days.

By GEORGE B. BRAIN,
Superintendent.
Bellevue School District No. 405,
Bellevue, Washington.

NOTICE TO CONTRACTORS

SEALED BIDS, in single copy for furnishing all labor, equipment, and materials and performing all work for the project described herein will be received until 11:00 a.m., June 5, 1956, in Room 319, Alaska Road Commission Offices, Federal Building, Juneau, Alaska, and then publicly opened.

Plans and specifications for the project may be obtained from the Alaska Road Commission, P. O. Box 1961, Juneau, Alaska. Plans should be returned to the Alaska Road Commission District Office, Anchorage, Alaska. No deposit will be required, but if plans are not returned in good condition within thirty days after date of bid opening, the planholder will be billed for the actual cost of the plans.

A guarantee of not less than five percent (5%) of the total amount bid will be required with each bid.

Grading, drainage and bituminous surfacing of 29.28 miles of the Sterling Highway. Principal items of work include 1,143,000 cu. yds. Unclassfied Excavation, 466,000 cu. yds. Unclassified Excavation for Borrow, 117,000 ton crushed gravel base course, 37,200 ton Class F Pavement Plant Mixture.

Work shall be started within 30 calendar days after date of receipt of Notice to Proceed and shall be completed within 476 calendar days after date of Notice to Proceed.

The attention of bidders is directed to the invitation for bids by the Department of Commerce, Bureau of Public Roads, Juneau, Alaska, for the construction of Alaska Forest Highways Project 5-A6, B4, Kenai River Highway, to be opened at the same time and place as bids for Sterling Highway, Section B2. Bid invitation for both projects provide for offering a percentage or lump sum reduction in the total amounts to be paid under each contract if both contracts are awarded to the same bidder. Bidders are invited to execute the certificates on the bid schedules providing for such reduction, but no bid will be rejected solely for failure to do so. Information concerning Bureau of Public Roads Alaska Forest Highways Project 5-A6, B4, may be secured from Mr. Chr. F. Wyler, District Engineer, Bureau of Public Roads, P. O. Box 1511, Juneau, Alaska.

A. F. Ghiglione
Director

C.; at the Area Engineer's office, Alaska Public Works, Room 309 Federal Bldg., Ketchikan, Alaska; and Associated General Contractors of America offices as follows: Seattle Chapter, Construction Center, 215 West Harrison St., Seattle, Wash.; Mountain Chapter, 220 W. Harrison St., Seattle, Wash.; Tacoma Chapter, 452 St. Helens Ave., Tacoma, Wash.; Portland Chapter, Suite 112, Multnomah Hotel, Portland, Oregon; Alaska Chapter, 306 Central Building, Anchorage, Alaska also the Plan Bureau, 2413 Western Ave., Seattle, Wash.; and the Builders Exchange Cooperative, 317 Builders Exchange Bldg., Portland, Oregon. A set of such documents may be procured from the office of the Acting Director at Juneau, Alaska, upon deposit of $25.00, all of which will be refunded upon the return of the plans and specifications in good condition **within** twenty (20) days from date of bid opening. Each bid must be accompanied by a satisfactory bid security (certified check or bid bond) in an amount not less than 5 percent of the total bid in dollars and cents. No bid will be withdrawn until thirty days after the scheduled closing date for the receipt of bid. The successful bidder will be required to furnish a performance bond and payment bond, each in the amount of 100 per cent of the contract price. The Government reserves the right to award a contract for the project on the basis of the acceptance of any or all of the alternates, whichever course is in the best interest of the Government.

DESCRIPTION: Project Aaa. 50-A-210, Unit 2, Water Supply, Ketchikan, Alaska. Water main installations in the City of Ketchikan, Alaska, including 372 L.F. 4" pipe, 1917 L.F. of 6" pipe, 460 L.F. of 10" pipe, 1826 L.F. of 16" pipe, four fire hydrants, valves, fittings and other necessary appurtenances. Alternates are provided for steel, cast iron, and asbestos cement pipe. Information regarding liquidated damages (if any), payments, etc., is attached or made a part of the specifications. Bids shall be submitted on the forms furnished or copies thereof.

5452—5-5, 12, 19

HOUSING, MAINTENANCE FACILITIES

BIDS CLOSE 10 A.M., MAY 29

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, May 29, 1956, until 10:00 A.M., for the construction of the following improvement and will then and there be opened and publicly read:

1. Constructing Duplex Housing Units and Maintenance Facilities for District No. 3, a State Project, consisting of five base bids as follows:

BASE BID No. 1

Constructing Duplex Housing Units and/or Maintenance Facilities in AMANDA PARK, KALALOCH, FORKS and POTLATCH in Grays Harbor, Jefferson, Clallam and Mason Counties, respectively.

BASE BID No. 2

Constructing a Duplex Housing Unit and Maintenance Shed at AMANDA PARK in Grays Harbor County, and/or

BASE BID No. 3

Constructing a Duplex Housing Unit and Maintenance Shed at KALALOCH in Jefferson County, and/or

BASE BID No. 4

Constructing a Maintenance Shed at FORKS in Clallam County, and/or

BASE BID No. 5

Constructing a Maintenance Shed at POTLATCH in Mason County.

All work for this improvement is combined into one set of plans and specifications which contains a common proposal.

Bidders who are satisfactorily prequalified shall have the option of submittting proposals on any one or all of the base bids, except that when submitting a proposal on Base Bid No. 1 a bidder may also submit proposals on Base Bids Nos. 2 to 5, inclusive. The Director of Highways reserves the right to accept or reject the lowest bid on each base bid which gives the lowest total cost to the State.

Prequalification of bidders is required. Plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each such set of plans and specifications as a rental for the use of them. Plans will be forwarded by first class mail.

Bidders who may not be prequalified in sufficient amount to bid on the entire improvement, namely Base Bid No. 1, shall indicate in their application for plans and specifications the particular section or sections upon which they desire to bid.

Each bid proposal shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five percent (5%) of the total of Base Bid No. 1 or of any combination of Base Bids Nos. 2 to 5, whichever is the greater. Should a successful bidder fail to enter into such a contract and furnish a satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Informational copies of plans and specifications are on file in the Chapter Offices of the Associated General Contractors of America in Seattle, Tacoma and Portland, Oregon and the office of the District Engineer of the Department of Highways in Olympia where they may be inspected.

E. C. HUNTLEY, Chairman
W. A. BUGGE, Director

Location near Tulare, California. Principal items are 100 cu. yds. excavation; 1,970 lin. ft. furnishing and driving timber piles; 3.9 Mbm furnishing and erecting treated timbers in structures; 109.0 Mbm furnishing and erecting untreated timbers in structures; and other work. Completion time 150 days. For particulars, address Bureau of Reclamation, P. O. Box 2511, Sacramento 11, California; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5448—5-5

SCHOOL BUILDING

BIDS CLOSE 8 P.M., MAY 29

Seattle, Washington

NOTICE TO CONTRACTORS

Separate sealed proposals will be received by Shoreline School District No. 412, King County, Washington, at the Shoreline School District Office East 158th Street and 20th Avenue N.E., Seattle 55, Washington, until 8:00 P.M., May 29, 1956, for the General, Mechanical, and Electrical contracts (separate contracts), for the construction of a new Meridian Elementary School, and the said proposals will then and there be publicly opened and read aloud. Bids received after the time set for opening cannot be considered.

Specifications and drawings may be examined at the office of the Architects, Jones and Bindon, 715 Hoge Building, Seattle 4, Washington, and at the Seattle Chapter, Associated General Contractors of America, 215 West Harrison Street, Seattle, and may be obtained at the Architects' office upon deposit of $25.00 for each set of general drawings and specifications and $15.00 for each set of mechanical or elctrical drawings and specifications.

The full amount of deposit for **one set** of documents will be refunded to **actual** prime contract bidders upon return of the documents, unmutilated and without marks or annotations, within one week after the date of the bid opening. Other deposits will be refunded with deductions for the actual cost of reproducing the drawings, under the same conditions.

Each bid must be accompanied by a certified or bank cashier's check, or by a bid bond, each in an amount not less than 5% of the Base Bid, made payable to Shoreline School District No. 412, King County, Washington, bid bond must be furnished in the form set forth in the specifications with a State-licensed surety company as surety.

Attention of bidders is directed to State laws concerning wages, working hours, and other conditions of employment.

The Board of Directors reserves the right to reject any or all bids, and to waive informalities. No bidder may withdraw his bid after the hour set for the opening thereof, unless and until the award of contract has been delayed for a period exceeding thirty (30) days.

By Myron Ernst, Secretary
Shoreline School District No. 412
East 158th Street and 20th Ave. N.E.
Seattle 55, Washington

STATE HIGHWAY PROJECTS

BIDS CLOSE 9:30 A.M., JUNE 4

Helena, Montana

NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:30 A.M., on June 4, 1956. The proposals will be publicly opened and read immediately thereafter.

1. **F 64(9)U2, F 148(6)U2 & F 155(7)U2, F 211 (11)U2 & F 220 (6)U2, F 69(10)U2 & F 248 (11)U2, F 264(5)U2** Seal coat oiling of 50.701 miles on various roads.

F 64(9)U2—Great Falls-Armington Road in Cascade County. This portion of the project is under the supervision of Ben B. Briscoe, Division Construction Engineer at Great Falls.

F 148(6)U2 & F 155(7)U2—The Saco East and Glasgow West Road in Valley County. This portion of the project is under the supervision of Gerald Flemming, Division Construction Engineer at Wolf Point.

F 211(11)U2—The Dutton Southeast section of the Vaughn-Conrad Road in Cascade and Teton Counties. This portion of the project is under the supervision of Ben B. Briscoe, Division Construction Engineer at Great Falls.

F 220(6)U2—The Cut Bank East and West Road in Glacier County. This portion of the project is under the supervision of A. G. Middleton at Havre.

F 69(10)U2 & F 248(11)U2—The Whitehall Section of the Pipestone Pass-Whitehall and the Three Forks-Whitehall Roads in Jefferson County. This portion of the project is under the supervision of Lewis M. Chittim, Division Construction Engineer at Butte, Montana.

F 264(5)U2—The Townsend-White Sulphur Springs Road in Broadwater and Meagher Counties. This portion of the project is under the supervision of Glenn Learn, Division Construction Engineer at Lewistown.

This work involves about 9,908 tons hauling and placing cover material; 224,959 gals. MC-5 Liquid Asphalt; 308 hours watering; 386 units rolling, and other items. Project to be completed by September 15, 1956.

2. **I-FI 188(7)U2, & I-IN 212(12) U2**—Construction of two 156.0' steel and concrete bridges over the Little Big Horn River on the Crow Agency Hardin & Wyoming Line-Crow Agency Road in Big Horn County, involving about 156,834 lbs. reinforcing steel; 838.4 cu. yds. concrete; 619.0 lin. ft. steel bridge rail; 720 cu. yds. structure excavation; 2,040 cu. yds. unclassified excavation;

60,480 lbs. furnishing steel bearing piles; 783 lin. ft. driving steel bearing piles, and other items. Project to be completed by July 31, 1957.

3. **F 191(16)U2**—Construction of a 82.0' steel and concrete bridge over Pablo Feeder Canal on the Polson-South section of the Pablo-Kalispell road in Lake County, involving about 40,042 lbs. reinforcing steel; 153.9 cu. yds. concrete; 160.46 lin. ft. steel bridge rail, and 16 each 25' concrete piles. Project to be completed by October 31, 1956.

4. **U 230(6) & U 386(4)**—Grading, gravel surfacing, plant mix oiling and drain about 0.598 mile on the Billings East Road and 0.705 mile on the First Avenue South North 13th Street and Fourth Ave. North-Billings Road both in Yellowstone County, involving about 38,559 cu. yds. unclassified excavation; 7,655 tons plant mix bituminous surfacing; 53,256 tons crushed gravel; 1,217 M gals. watering; 292 units rolling; 111,705 gals. 100-120 Penetration Asphalt Cement; 15,395 gals. MC-1 liquid asphalt; 12,391.2 lin. ft. concrete integral curb and gutter; 1418.6 lin. ft. special concrete curb; 4,820.0 lin ft. new concrete sewer pipe, and other items. Project to be completed by September 15, 1957.

5. **F 333(17)**—Grading, gravel surfacing and drain 11.279 miles on the Grass Range-Malta Road in Phillips County, involving about 912.837 cu. yds. unclassified excavation; 1,755 cu. yds. gravel backfill; 37,318 mi. yds. overhaul; 1,906 cu. yds. binder; 3,812 mi. yds. overhaul on binder; 81,292 tons crushed gravel; 15,270 M. gals. watering; 2,225 units rolling; 2,502 lin. ft. corrugated metal pipe culverts; 1,718 lin. ft. structural plate pipe arch culverts, and other items. Project to be completed in 290 calendar days.

6. **F 391(3)**—Grading, gravel surfacing, bituminous surface treatment and drain 10.781 miles on the Lane-Lambert section of the Circle-Sidney road in Richland County, involving about 496,730 cu. yds. unclassified excavation; 30,817 mi. yds. overhaul; 35,283 tons crushed gravel; 154,676 tons selected borrow base course (uncrushed); 64,201 gals. MC-2 liquid asphalt; 64,201 gals. RS-2 emulsified asphalt; 11,190 M gals. watering; 1,900 units rolling; 2,895 lin. ft. corrugated metal pipe culverts; 974 lin. ft. structural plate pipe culverts, and other items. Project to be completed by September 15, 1957.

7. **S 94(3)**—Grading, gravel surfacing, and drain 7.628 miles on the Chester Northwest Road in Liberty County, involving about 85,328 cu. yds. unclassified excavation; 1,865 mi. yds. overhaul; 196 cu. yds. gravel backfill; 18,981 cu. yds. selected borrow base course (uncrushed); 27,367 tons crushed gravel; 910 cu. yds. binder; 1,825 mi. yds. overhaul on binder; 2,190 M gals. watering; 1,250 lin. ft. corrugated metal pipe culverts, and other items. Projects to be completed by October 31, 1956.

8. **S-174(2)**—Grading, gravel surfacing and drain 4.878 miles on the Judith Gap-East Road in Wheatland County, involving about 215,484 cu. yds. unclassified excavation; 327 cu. yds. gravel backfill; 22,498 mi. yds. overhaul; 31,138 tons crushed gravel; 664 cu. yds. binder; 1,328 mi. yds. overhaul on binder; 3,835 M. Gals. watering; 1,306 lin. ft. reinforced concrete pipe culverts; 351 lin. ft. structural plate pipe culverts, and other items. Project to be completed by October 31, 1956.

9. **S 188(1)**—Grading, gravel surfacing, and drain 10.395 miles on the Galata North Road in Toole County, involving about 115,407 cu. yds. unclassified excavation; 54 cu. yds. gravel backfill; 4,191 mi. yds. overhaul; 45,-932 tons crushed gravel; 2,620 M gals. watering; 1,415 cu. yds. binder; 2,830 mi. yds. overhaul on binder; 2,056 lin. ft. corrugated metal pipe culverts; 60 lin. ft. structural plate pipe culverts, and other items. Project to be completed in 150 calendar days.

10. **S 190(2) U1**—Grading, gravel surfacing, and drain 5.000 miles on the Presserville-Girard-Fairview Road in McCone County, involving about 128,822 cu. yds. unclassified excavation; 54 cu. yds. gravel backfill; 5,488 mi. yds. overhaul; 29,093 tons crushed gravel; 2,500 M. Gals. watering; 145 units rolling; 672 cu. yds. binder; 1,344 mi. yds. overhaul on binder; 832 lin. ft. corrugated metal pipe culverts; 60 lin. ft. structural plate pipe culverts, and other items. Project to be completed by October 31, 1956.

11. **S 289(4) U2**—Construction of one 110.0' steel and concrete bridge over Rosebud Creek near Roscoe on the Red Lodge-Columbus road, in Carbon County, involving about 48,108 lbs. reinforcing steel, 247.3 cu. yds. concrete; 217.34 lin. ft. steel bridge rail; 195 cu. yds. structure excavation; 430 cu. yds. unclassified excavation. Project to be completed by October 31, 1956.

The above listed quantities are approximate only.

All bid proposals shall be accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in his proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of bids is required.

Plans, specifications, forms of contract and bond, proposal blanks, and full instructions are on file for examination and may be obtained at the offices of the State Highway Commission in Helena, Montana. Plans and specifications for all Federal Aid Projects are also on file and may be examined in the office of the Bureau of Public Roads at Missoula.

MULTIPURPOSE BUILDING, ALTERATIONS

BIDS CLOSE 8 P. M., P.S.T., MAY 29

Sultan, Washington

NOTICE TO CONTRACTORS

Notice is hereby given that the Sultan School District No. 314 will receive sealed bids up to 8 P. M., P.S.T., May 29, at Sultan Elementary School on Date Street, Sultan, Washington, at which time all bids will then and there be opened and publicly read aloud for the Sultan Elementary School multipurpose building and alterations.

Each bid shall be in accordance with the plans, specifications, and other contract documents now on file with Ralph Burkhard, architect, 2120 S.W. 152nd Street, Seattle 66, Washington, where copies may be obtained upon furnishing a deposit of $50.00 for each set. Deposit will be refunded upon the return of plans and specifications in good condition on the above date.

Each bid shall be made out on a bid form to be obtained from the architect.

Each bid must be accompanied by a certified check, Cashier's Check, or a satisfactory bid bond in favor of Sultan School District No. 314 executed by the bidder and a surety company in an amount equal to 5 per cent of the bid.

Each proposal shall be sealed and addressed to the clerk of the board of Sultan School District No. 314, and the name of the project plainly written on the outside of the package.

Sultan School District No. 314 reserves the right to reject any or all bids and to waive minor informalities.

No bidder may withdraw his bid after the hour set for the opening thereof, unless the award of contract is delayed for a period exceeding thirty days.

Signed: MELVIN CLAUSEN,
Superintentdent.

5458—5-5, 12, 19

BITUMINOUS SURFACING

BIDS CLOSE 11 A.M., JUNE 12

Juneau, Alaska

NOTICE TO CONTRACTORS

SEALED BIDS, in single copy for furnishing all labor, equipment, and materials and performing all work for the project described herein will be received until 11:00 a.m., June 12, 1956, in Room 319, Alaska Road Commission offices, Federal Building, Juneau, Alaska, and then publicly opened.

Plans and specifications for the project may be obtained from the Alaska Road Commission, P. O. Box 1961, Juneau, Alaska. Plans should be returned to the Alaska Road Commission District Office, Fairbanks, Alaska. No deposit will be required, but if plans are not returned in good condition within thirty days after date of bid opening, the planholder will be billed for the actual cost of the plans.

A guarantee of not less than five percent (5%) of the total amount bid will be required with each bid.

Bid schedule No. 1 consists of reconstruction, bituminous surface repair and new bituminous surfacing between about Mile 1385 and Mile 1314. Principal items of work are: Unclassified Excavation, 44,000 cubic yards; Borrow, 63,000 cubic yards; Crushed Gravel Base Course, 45,000 tons; Plant Mixture, 11,000 tons.

Bid Schedule No. 2 consists of sealing all new paving proposed above, and all remaining penetration-type bituminous surfacing on the B2 portion of the contract, a total length of 54.95 miles of seal coat. Principal items of work are: Cover aggregate, 7,100 tons; Asphalt, 860 tons.

Prospective bidders are advised that the Government has limited funds available for the contract as a whole, and that if the total successful low contract bid price exceeds the funds available, the right is reserved to either reject Bid Schedule No. 2 in its entirety, consisting of 59.15 miles of bituminous seal, or to reduce the length; provided that if the length is reduced an increment of not less than 20 miles of seal, located at the easterly end of Alaska B2, will be included in the contract. Additional increments will be added to the easterly 20 miles as funds permit.

Bid Schedule No. 3 consists of placing gravel base and bituminous surfacing on streets belonging to the Alaska Communication System at Tok Junction. Principal items of work are: Crushed Gravel Base Course, 1,700 tons; Plant Mixture, 620 tons.

All work shall be completed within 270 calendar days after date of receipt of Notice to Proceed.

A. F. Ghiglione
Director

GARAGE, POWER HOUSE

BIDS CLOSE 11 A.M., JUNE 12

Juneau, Alaska

NOTICE TO CONTRACTORS

SEALED BIDS, in single copy for furnishing all labor, equipment, and materials and performing all work for the project described herein will be received until 11:00 a.m., June 12, 1956, in Room 319, Alaska Road Commission, Federal Building, Juneau, Alaska, and then publicly opened.

Plans and specifications for the project may be obtained from the Alaska Road Commission, P. O. Box 1961, Juneau, Alaska. Plans should be returned to the Alaska Road Commission District Office, Anchorage, Alaska. No deposit will be required, but if plans are not returned in good condition within thirty days after date of bid opening, the planholder will be billed for the actual cost of the plans.

A guarantee of not less than five percent (5%) of the total amount bid will be required with each bid.

Constructing at Naknek, Alaska, a garage and power house, consisting of two (28'x80' and 12'x20') wood frame buildings with steel roof girders, finished inside and out with plywood, concrete floors, and insulated with glass wool. The work includes installation of equipment and drilling a water well. The Government will furnish at the site all building materials required except concrete aggregate.

Work shall be started within 30 calendar days after date of receipt of Notice to Proceed and shall be completed within 246 calendar days after date of Notice to Proceed.

A. F. Ghiglione
Director

STATE HIGHWAY PROJECTS

BIDS CLOSE 10 A. M., JUNE 5

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia Washington, on Tuesday, June 5, 1956, until 10:00 A. M., for the construction of the following improvements and will then and there be opened and publicly read:

1. Clearing, Draining, Grading, Surfacing with Light Bituminous Surface Treatment, Paving with Type I-1 Asphaltic Concrete and Constructing a Steel Girder Railway Bridge Undercrossing on Primary State Highway No. 2 in Spokane County, G.N. RAILWAY UNDERCROSSING AND BARKER ROAD UNDERCROSSING APPROACHES, FAP No. UGI-002-6(23) and State Project, involving about 44,300 cubic yards of Common Excavation, 760 cubic yards of Solid Rock Excavation, 2,430 tons of Crushed Stone Surfacing, 13 tons of Asphalt Cement, 95 cubic yards of Crushed Cover Stone and Mineral Aggregate, 510 tons of Asphaltic Concrete, 693 linear feet of Beam Guard Rail, 236 linear feet of Concrete Pipe, 242 linear feet of Steel and Iron Pipe, 1,041 linear feet of Asbestos-Cement Pipe, 944 cubic yards of Concrete, 53,000 pounds of Steel Reinforcing Bars, 611,000 pounds of Structural and Cast Steel, 31 MBM of Timber and Lumber and other items.
2. Draining, Grading and Surfacing with Crushed Stone on 2.321 miles of a Whitman County Road, PULLMAN-BUSBY ROAD, FAS No. S-0669(1), involving about 17,540 cubic yards of Common Excavation, 26,770 cubic yards of Solid Rock Excavation, 41,760 tons of Crushed Stone Surfacing, 906 linear feet of Corrugated Metal Pipe and other items.
3. Clearing, Draining, Grading and Surfacing with Crushed Stone on 2.100 miles of a Clark County Road, HAAPA EAST, FAS No. S-0590(5), involving about 11 acres of Clearing, 59,560 cubic yards of Common Excavation, 21,160 tons of Selected Roadway Borrow, 9,160 tons of Crushed Stone Surfacing, 858 linear feet of Concrete Pipe, 542 linear feet of Corrugated Metal Pipe and other items.
4. Paving with Type I-1 Asphaltic Concrete on 11.33 miles of Primary State Highway No. 3 in Benton County, PROSSER TO KIONA, a State Project, involving about 20,975 tons of Asphaltic Concrete, 48 tons of Asphalt Cement, 4,250 cubic yards of Maintenance Rock and other items.
5. Surfacing and Constructing a Bituminous Surface Treatment Road Mix, Non-Skid Single Seal Treatment and Light Bituminous Surface Treatment on Shoulders on 31.29 miles of State Highways Nos. 15, 15-C and 15-D in Chelan and King Counties, DECEPTION CREEK TO GAYNOR, ET AL, a State Project, involving about 16,960 tons of Selected Roadway Borrow, 57,710 tons of Crushed Stone Surfacing, Crushed Cover Stone, Maintenance Rock and Mineral Aggregate, 693 tons of Asphalt Cement, 2,565 cubic yards of Mineral Aggregate and other items.
6. Constructing a Light Bituminous Surface Treatment and Non-Skid Single Seal Treatment on 19.10 miles of State Highways Nos. 3 and 3-L in Yakima, Garfield and Columbia Counties, PARKER BRIDGE TO DONALD, ET AL, a State Project, involving about 300 tons of Asphalt Cement, 2,350 cubic yards of Crushed Cover Stone and Mineral Aggregates and other items.

Federal funds have been allocated for items Nos. 1 to 3, inclusive.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

STATE HIGHWAY PROJECT

BIDS CLOSE 10 A.M., MAY 22

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, May 22, 1956, until 10:00 A.M. for the construction of the following improvement and will then and there be opened and publicly read:

1. Removing Portions of Existing Steel Girder Bridge on Primary State Highway No. 13 in Gray Harbor County, CHEHALIS RIVER BRIDGE REMOVAL, FAP No. U-006-1(8), involving the Removal of about 300 Existing Piles and 2 lump sum bids for the Removal of the Existing Steel Spans and Existing Piers and Fenders.

Bids for this project will be opened in the office of the Director of Highways, room 203, Transportation Building, instead of in the board room of the Public Service Commission where bid openings are usually held.

Federal funds have been allocated for item no. 1.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Legal advertisements appearing in our columns come to the attention of construction firms, and equipment and supply houses throughout the entire Pacific Northwest and Alaska.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

PACIFIC TELEPHONE AND TELEGRAPH DIALS RAinier 5355 FOR STRUCTURAL STEEL

The Pacific Telephone and Telegraph Company spends large sums of money annually in buildings and equipment in order to keep abreast of the continuing growth of the territory it serves so adequately.

One of the Pacific Telephone and Telegraph jobs currently under way is an enlargement of the Exchange Building at 1208 E. 64th Street, Seattle.

Early this spring, a 21'x89' addition to this building was completed. Now in process of construction is a further enlargement consisting of adding third and fourth stories to both the original building and the recently finished addition.

The area of the building presently being enlarged is 104'x89'. Construction is of steel and concrete with brick facing, which matches the structure to which the floors are being added.

Serving Kenwood, Fillmore, Plaza and Vermont numbers, the cost of this project will come to approximately one million dollars for building and equipment.

The equipment to be installed is primarily dial switching equipment made by Western Electric, one of the companies in the Bell System.

Pacific Car both fabricated and erected 98 tons of structural steel for the two new stories of the 64th Street Exchange Building. Erection was with high tensile bolts.

Carco offers buyers of structural steel not only the largest fabricating facilities in the Northwest but also a "one-stop" steel service. This means money-saving ideas and suggestions, prompt engineering detail and estimates, fabrication and erection. Let Pacific Car quote on your structural steel needs. No job is too small to receive our interested attention nor too large for our equipment and experienced personnel.

KAWNEER METAL WALL *one responsibility from inception through installation*

The new Mutual Benefit Life building in Newark, N. J., is another outstanding example of Kawneer Metal Wall. Years of creative engineering and production in the field of architectural metals has culminated in a new service for architects . . . a new concept in metal wall construction. This building is an expression of Kawneer's ability to engineer a curtain wall to fit this architect's individual design. Kawneer accepts the complete responsibility for engineering, manufacturing and installation. Special weather-tightness features, adequate provision for expansion and contraction, and tested prefabrication methods assure the architect and contractor of complete client satisfaction. WESTERN STRUCTURAL TILE INSTITUTE . . . . . .

A MESSAGE FOR STUDENTS

by LEON CHATELAIN JR., FAIA

A letter written by the new national AIA president to the Unit Masonry Association of Seattle on the occasion of its scholarship dinner in May

I AM SORRY that I am not able to be with you to make the presentation to the winner of the Unit Masonry Association scholarship. My regret is particularly keen because of my long-standing interest in architectural education and a knowledge that the future strength and prestige of the architectural profession rests with the students now in our architectural schools.

The American Institute of Architects recognizes its need and obligation for gathering the young architects into the fold, for giving them an understanding of the task ahead and for developing those dedicated individuals who will lead the profession toward continued public and professional service.

The existence of the fine architectural education system which we enjoy today can be traced largely to the institute's insistence on sufficient and adequate architectural schools and its efforts toward that end. The entire profession today is proud of the output of these schools as exemplified by the scholarship winner who is being honored by your association.

As a further step in bringing architects into closer contact with their eventual profession, the AIA has sponsored the formation of student chapters at the schools. There are now 34 of these, many of which have proved to be extremely successful. The value which students have derived from their chapters seems, as in the case with AIA membership nationally, to be directed in proportion to the amount of interest and effort put into the chapter activities.

A student forum held at the Octagon last November was attended by representatives from every architectural school. A new stimulus to student activity and participation in institute affairs resulted from this meeting in the formation of a national student organization as a recognized part of the institute, a periodically issued student report written and edited by students, and a renewed interest and enthusiasm on the part of both students and AIA chapters.

You students are graduating into the architectural profession at a time when it is enjoying its greatest prestige and prosperity. Members of our profession must, therefore, have the highest ethical standards, an awareness of public responsibility and should always be prepared to furnish the finest quality of professional services.

Your schools present you with excellent educational opportunities. Stimuli, such as the Unit Masonry Association scholarship, offer inducements to take further advantage of these opportunities. But upon graduation it is your individual obligation to enhance the profession you have entered. As president of the AIA I urge each of you to practice ethically, respond to civic responsibility, continue your professional education both in training and in practice and dedicate yourselves to providing the complete and competent professional service we architects owe our clients.

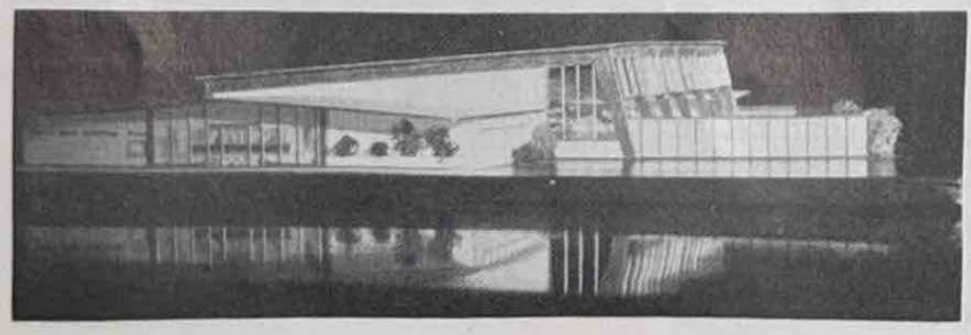
PACIFIC BUILDER AND ENGINEER—1st Saturday each month. $4 one year; $6 two years; $7 three years. Canadian $5, $8, $10. Foreign $6, $10, $13. Single copies 50c.

FOR NORTHWEST BUILDING AND ENGINEERING NEWS EVERY WEEK subscribe to all three (PA&B, PB&E, CNB) $20 one year; $30 two years; $38 three years. FOR FLASH ADVANCE DAILY SERVICE, read Pacific Construction Daily, $75 per year. Rates for U.S. and Alaska.

PACIFIC ARCHITECT AND BUILDER is published monthly by Pacific Builder and Engineer, Inc., 2418 Third Ave., Seattle 1, Wash., and is mailed on the third Saturday of each month. Price: $4. per year. Acceptance under P.L.&R. 34.64 authorized.

EDUCATIONAL PLANT to be built at Holmes Corner, Wash., will replace Edmonds High School which will be converted into junior high school. The $2 million project, designed by Waldron & Dietz of Seattle, will include 60 teaching stations, athletic facilities and administrative offices.

PERSPECTIVES



by Pacific architects

SEMI-TROPICAL IN DESIGN to fit surroundings, administration building and gatehouse of Los Angeles State and County Arboretum in Arcadia will feature partially enclosed porches. To cost an estimated $200,000, two buildings planned by Allison & Rible will have concrete block walls with wood framing.

FIRST UNIT of Gethsemane Lutheran Church will contain sanctuary seating 164, classrooms and fellowship room. Red brick structure will have glued laminated arches supporting roof and colored glass grillwork at front. Eddy, Carlson & James are architects on the project, to which Christian day school and gymnasium-auditorium will be added later.

MODEL OF INDOOR-OUTDOOR swimming pool for which $325,000 bond election was passed by North Bend, Ore., residents. Of reinforced concrete, it will have U-shaped pool, plastic fence on west side of sun deck for windbreak, sun-tinted plastic windows on south and permanent spectator space for 260 seats. Plans have been drawn by Stevens & Thompson, consulting engineers, and Gorden E. Trapp, architect, of Portland.

Building News - Trends - Views

TWO WEST COAST MEN—landscape architect Garrett Eckbo of Los Angeles and philospher Mortimer Adler of San Francisco—were among 15 main speakers at the sixth International Design Conference in Aspen, Colo., June 23-July 1. Excerpts from their papers, "Design and the Landscape in Which We Live" and "Some Philosophical Questions About Design," will appear in PA&B next month, along with other conference highlights.

BIDS ARE BEING CONSIDERED by Commerce Investment Co. in Portland for an 11-story apartment building which at the contractor's option will be lift-slab construction. Edmundson, Kochendoerfer & Kennedy, architects-engineers, believe it will, if constructed by this method, be the tallest lift-slab job in the country, the previous record being 10 stories.

THE ANNUAL SEMINAR-TOUR of Mexican architecture, "Gira Arquitectura," will get underway in Laredo, Texas, October 14, returning to that city 13 days later. Designer T. H. Hewitt has planned and will escort the tour in cooperation with the Sociedad de Arquitectos Mexicanos. For further details write Gira Arquitectura, 2413 Driscoll, Houston 19, Texas.

THE HOME ECONOMY is in a transition period, says John M. Dickerman, NAHB executive director. A combination of circumstances—higher costs, tight mortgage money, market readjustments and possible changes in government programs—have the industry in a state of flux.

ARCHITECTURE RECEIVES its due share of attention in the first annual report of Seattle's Municipal Art Commission, which is not at all surprising since its chairman, John S. Detlie, and another member, Robert L. Durham, are both architects. The 40-page document recommends that a policy be established basing selection of architects, designers and artists for major civic projects upon a formal programmed competition; that in all other cases a thorough direct selection method be used; and that a minimum of 2% of estimated gross cost be allocated for murals, sculpture and other arts in appropriations for public buildings.

A $51½ MILLION CULTURAL CENTER for construction in downtown Los Angeles has been approved by the board of supervisors. Proposed plans call for a 20,000-seat civic auditorium, a 4,000-seat music center and parking facilities for 5,500 cars within five years.

THE RUSSIANS have at long last closed that deal they made during their home builders' inspection trip of the U. S.: to buy a seven-room house built at San Bruno by Andy F. Oddstad Jr. The house, complete with furniture, will be shipped in prefabricated sections. The Russians are paying $8,000 for the house, $4,000 for the furniture.

THE NATIONAL SWIMMING POOL INSTITUTE at its first luncheon meeting in Chicago last month discussed such topics as establishing codes of ethics, starting a public relations program, assisting on legislation and standardizing trade practices and techniques.

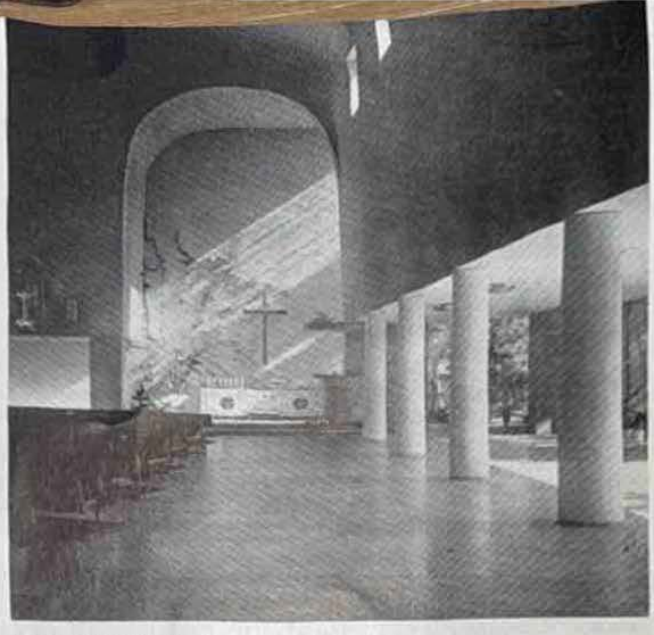
THE PLYWOOD INDUSTRY'S new program of architect-emphasis was underscored last month by the presence of John Lyon Reid, FAIA, as keynote speaker at the 20th annual meeting of the Douglas Fir Plywood Association at Gearhart, Ore. Among other things, the 250 manufacturers on hand were told that DFPA has comissioned six architects for creative research in the field of school design; has named six faculty members from top design schools to develop ideas and structures keyed to leisure time; has commissioned three architects to develop designs for expandable small churches in suburban areas; and has turned to still another architect to develop a simplified system of building applicable to any style of home.

TWELVE BAY AREA ARCHITECTS have banded together to design custom built homes in the $18,000-$25,000 price range, as well as to provide alterations and modernization of older homes. They will operate as a group on certain problems but the application to each job of solutions achieved as a group will be left to the individual members.

OPERATORLESS AUTOMATIC ELEVATORS have been so completely accepted that 98.2% of all new intensive service cars sold by Otis in the U. S. in the past year are of the without-attendant type.

THE ARCHITECTURAL DESIGNER for Seattle's first Lake Washington bridge has spoken out against construction of a parallel second bridge. Lloyd J. Lovegren, retiring president of the Washington State chapter, AIA, emphatically states, "I would rather have no second bridge, if we cannot have one which would serve the cause of sound, long-range planning."

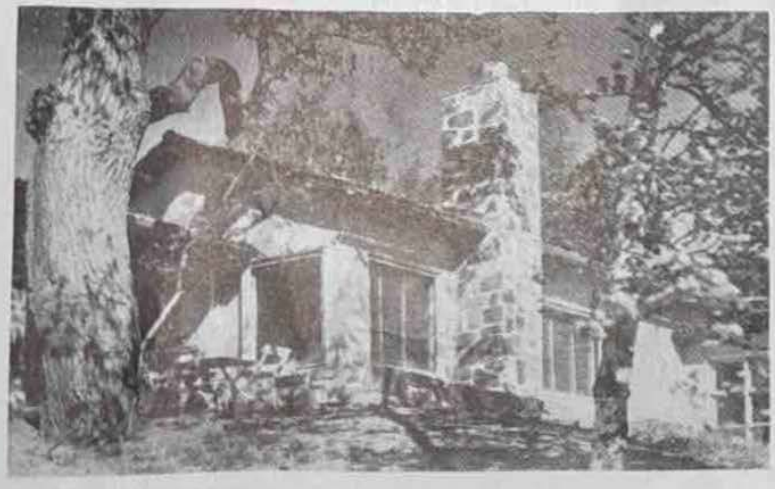
THE TYPE OF PAINT JOB is one of the most important factors in the sales of homes, says Edward H. Fickett, AIA, of Los Angeles. "The smart merchant builder of today knows that an extra $200 put into a paint job done by an expert may save him $1,000 in sales costs, overhead and idle capital in unsold real estate," the architect points out. "The extra money spent on quality materials and workmanship is the most obvious 'unseen' salesman in the whole selling operation."



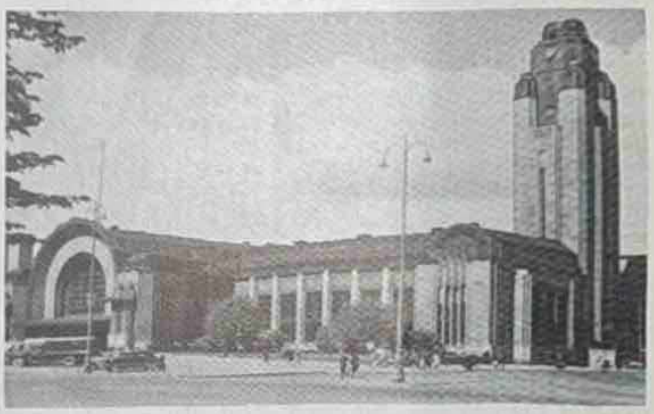
A HIGH DENSITY, maximum utilization design to solve San Francisco's problem of redeveloping its produce market has been suggested by Michael Goodman, professor of architecture at the University of California. Such a design has been created by UC graduate student Herbert Kosovitz under the direction of Goodman and Prof. Ernest Born, also of the school. The plan involves a big plaza surrounding a convention hall to handle 23,000 persons, with a smaller plaza surrounded by shops plus a mall flanked by block-long apartments and a promenade leading to the Ferry Building.

"**THE BUILDING BUSINESS** is moving into a new era caused by the force of economics of our time," according to John Dinkeloo, project director for Eero Saarinen & Associates on the General Motors Technical Center. In addressing the first annual meeting of the aluminum division of the Porcelain Enamel Institute in Cleveland June 26-27, the architect told the group, "As manufacturers you have a much greater responsibility in what buildings look like . . . the architecture of today and the architecture of tomorrow is based on the products that we can manufacture—the products that are developed. We are no longer in a brick and stone era of building."

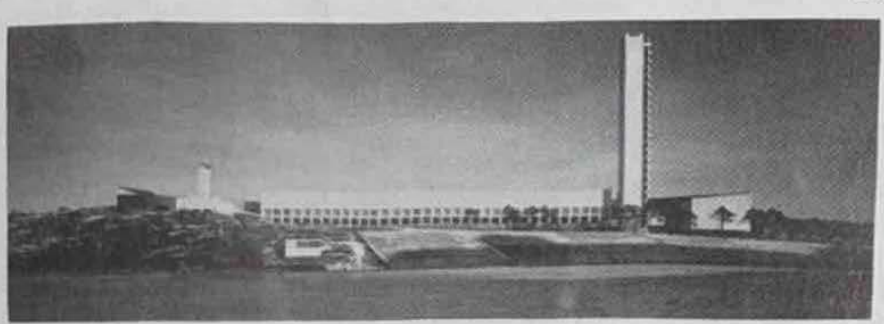
MATERIALS FORECAST: This should be a banner year for gypsum sheathing. For the first time since World War II, the supply is matching the demand in many areas of the country . . . Production of perlite is expected to reach more than 250,000 tons in 1956. Use of perlite insulating concrete for roof construction is on the upgrade . . . Home lighting fixtures sales may rise between 12 and 25%, if predictions made by the American Home Lighting Institute come true.



Finnish exhibit tours West Coast

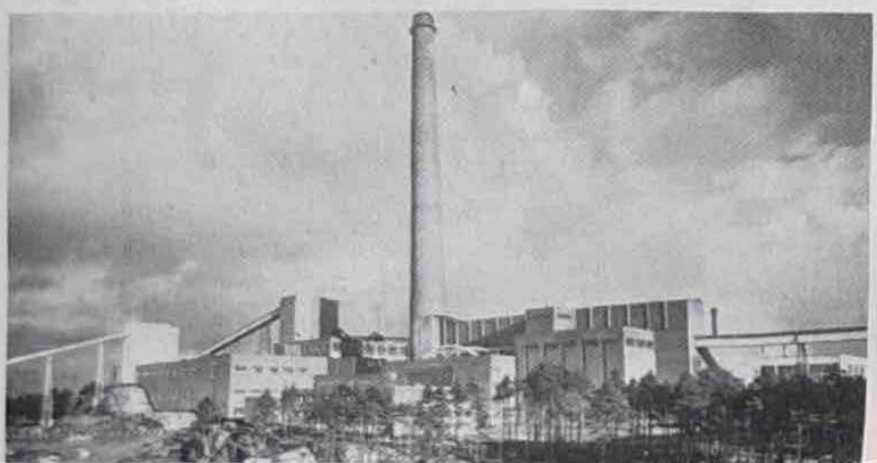


EIGHTY-FIVE PHOTOGRAPHS of significant projects constructed in Finland during the last decade or two (a small section as a memorial to Eliel Saarinen is included) are shown in the exhibition of "Contemporary Finnish Architecture" which is winding up its West Coast tour in Portland this month. The show will hang in the Oregonian Hostess House through July 31, having been seen in Seattle and earlier in Los Angeles during the national AIA convention. It is being circulated in the United States by the Smithsonian Institution Traveling Exhibition Service.

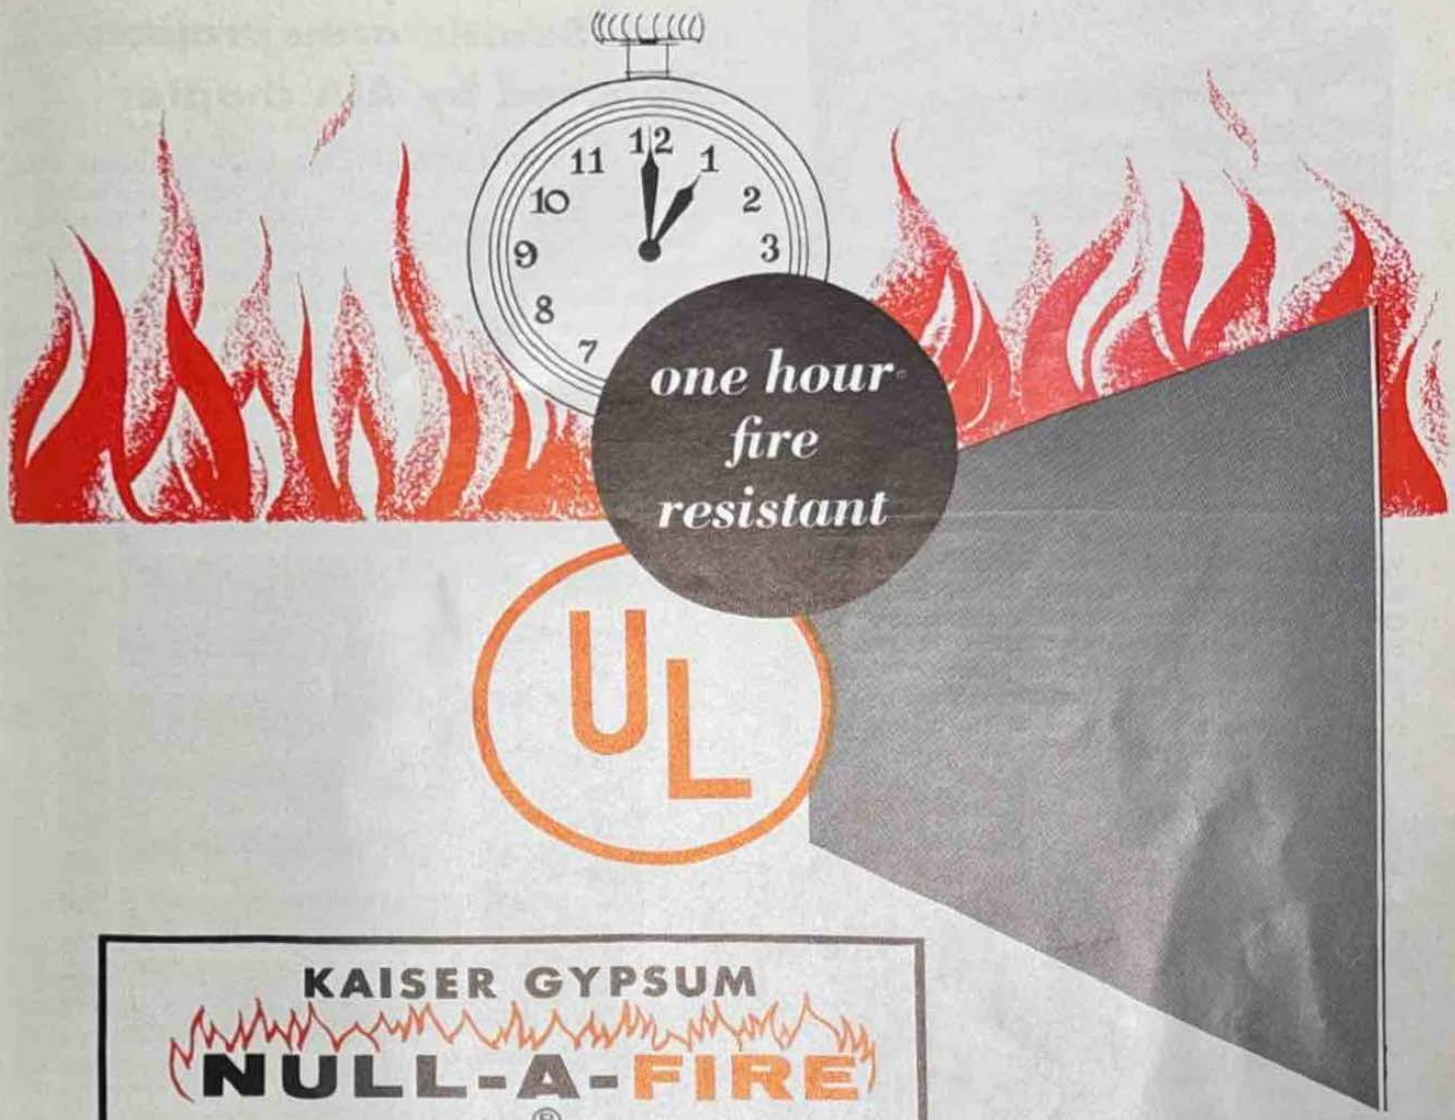


ERIK BRYGGMAN: Cemetery Chapel, Turku.

ERIK BRYGGMAN: Residence (1947).



ELIEL SAARINEN: Railway Station, Helsinki (1906-14).



YRJO LINDEGREN and TOIVO JANTTI: Olympic Stadium, Helsinki.

ALVAR AALTO: Sunila Sulphate Mills, Gorhula (1937).

Alvar Aalto in his forward to the illustrated catalogue says:

"There is an increasing tendency toward organic architecture all over the world, and we may hope to see the various technical fields and forms of commercial production become more integrated with an architecture which dares to think more broadly in terms of service to the human soul. This humanization of the technical field is, indeed, a special objective toward which architecture and all of the arts might well devote themselves."

KAISER GYPSUM
NULL-A-FIRE®
5/8" GYPSUM WALLBOARD

Kaiser Gypsum NULL-A-FIRE is officially rated as one-hour fire resistant gypsum wallboard for (1) non-load bearing partitions; (2) load bearing partitions; (3) floor-ceiling construction in wood frame construction, as determined by official testing laboratories in accordance with A.S.T.M. Designation E119, Standard for Fire Tests of Building Construction Materials.

Kaiser Gypsum NULL-A-FIRE 5/8" wallboard is manufactured under constant inspection by Underwriters' Laboratories and subject to approval in accordance with Underwriters' Label Service.

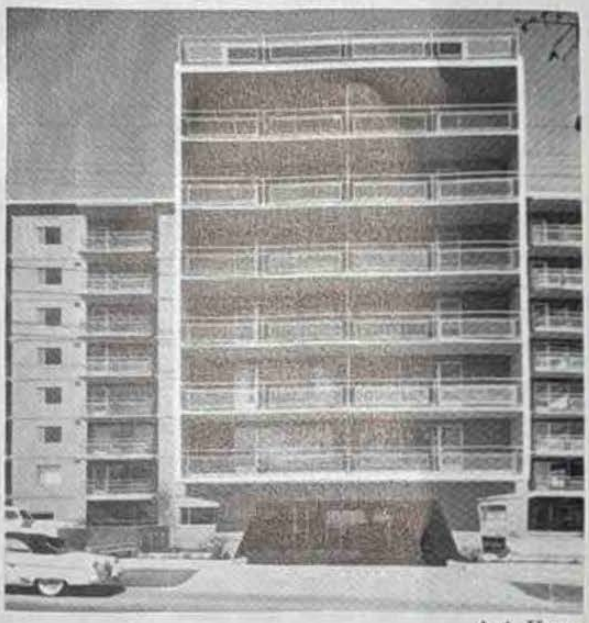
Five Seattle area projects honored by AIA chapter

IN ITS SIXTH ANNUAL Honor Awards competition, the Washington State chapter, AIA, cited five buildings as outstanding examples of Pacific Northwest architecture. The jury's comment: "These buildings were chosen for their solution of current problems of planning and design fitness. They are all well planned, sound solutions and not dependent on design tricks or gaudiness." Three Northwest architects served as jurors—Omer L. Mithun of Seattle, Alan Liddle of Tacoma and Charles E. Pratt of Vancouver, B.C., winner of Canada's Massey Award for the nation's outstanding design executed from 1953-55.

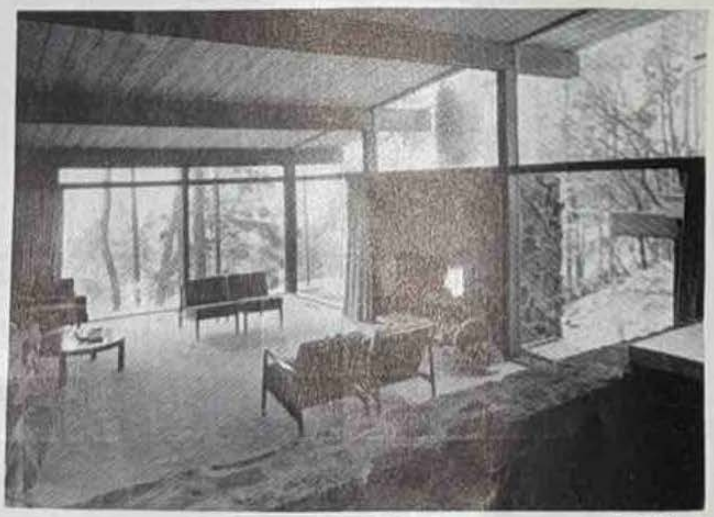
Dearborn-Massar

Woodway Elementary School, Edmonds: Waldron & Dietz and associate Dan F. Miller, architects; O. E. Turnquist Construction Co., contractor. "An outstanding and refreshing solution. The school indicates a thorough study of all phases of design from the overall scheme down through the smaller details. Excellent relation of units, orientation, lighting and use of materials."



Dr. John Smith Clinic, Seattle: Paul Kirk, architect; Raun Construction Co., contractor. "A simple, direct and pleasing solution to the problem. Consistent in design and detail."

Mrs. Paul Schlosser Residence, Union: Bassetti & Morse, architects; Palmer Steiro, contractor. "Excellent use of the site, consistency of design, pleasant use of materials."



Art Hupy

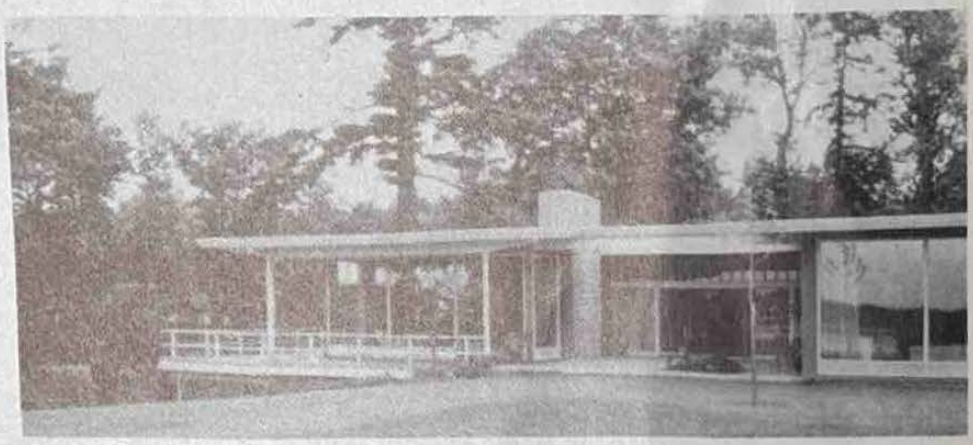
Art Hupy

Skyline House, Seattle: Durham, Anderson & Freed, architects; E. S. Lovell, contractor and owner. "A good solution providing many good living units, each utilizing the dramatic day and night views from the site."

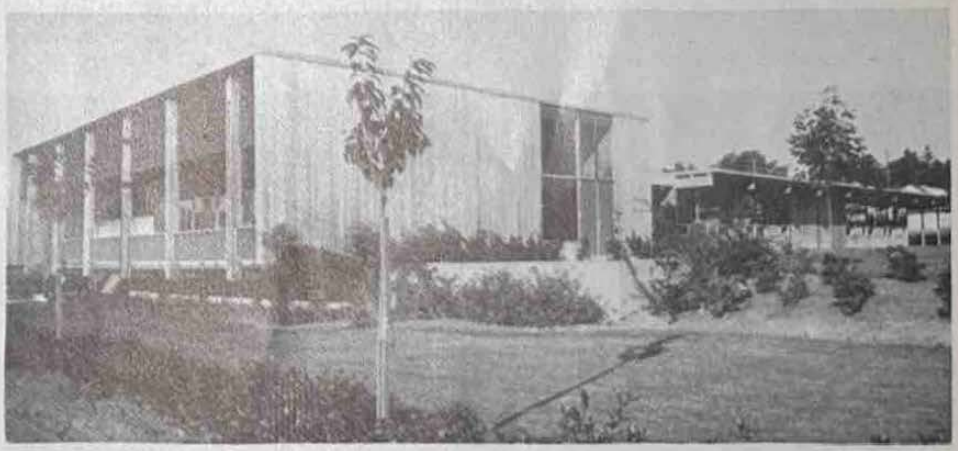
Art Hupy

Thomas J. Graham Residence, Seattle: A. O. Bumgardner, architect; built by the owner. "Pleasant use of natural materials. Excellent integration with site, view and orientation."

Portland cites four buildings in first design competition



FOUR BUILDINGS—one Honor Award and three Awards of Merit—were selected out of a total of 52 entries from 23 offices in the first design competition sponsored by the Oregon chapter, AIA. Victor Steinbrueck of Seattle, Robert Price of Tacoma and Robert Douglas of Portland made up the jury of architects.



Honor Award

Motor Bank Addition to the U.S. National Bank of Portland: Belluschi and Skidmore, Owings & Merrill, architects; Donald M. Drake Co., contractor. "An outstanding example of contemporary design with traditional forms. The jury was impressed with the handsome and refined exterior skillfully related to the existing structure. The plant obviously handles its function well."

Awards of Merit

Charles E. Miller 3rd Residence near Vancouver, Wash. (right): Walter Gordon, architect; Dan Schuh, contractor. "A residence in which the interior was thoughtfully planned and carefully detailed. The house is well related to a spectacular site. The above combination of factors provides an atmosphere for pleasant living."

Tucker-Maxon Oral School, Portland (right): Belluschi and Skidmore, Owings & Merrill, architects; Malarkey & Moore, contractor. "The architecturally cheerful solution adds much to the success of the building."

Richard H. Carlton Residence near Tigard, Ore. (cover); Richard Gilman Davis, architect; built by the owner. "An unusual house which seems most sympathetic to the needs of this particular young family. The refreshing use of vertical space is commended."

about architects • planners • engineers

HONORARY DEGREE: Los Angeles architect Paul R. Williams, AIA, was awarded an honorary degree of Doctor of Fine Arts by Tuskegee Institute in Alabama at its 75th commencement exercises.

WILLIAMS

A graduate of the University of California at Los Angeles, Williams was cited for "the unwavering excellence of his work and the sustained surge of those creative ideas which have distinctly identified his contributions to architectural design."

Among his principal works: the Beverly-Wilshire Hotel, Saks Fifth Avenue and the Music Corporation of America Building in Beverly Hills; the Sunset Plaza Apartments in Hollywood; the Imperial-Compton housing project and the Golden Gate Mutual Life Insurance home office in Los Angeles; and the Royal Nevada Hotel in Las Vegas.

ON THE MOVE: Ralph C. Bonadurer, architect, is now located in Portland's Hollywood District at 3705 N.E. Sandy Blvd. He was formerly at 1111 S.E. Sandy Blvd. Bonadurer has designed what is believed to be Oregon's first drive-in insurance office for the Homer Waltz Agency at Forest Grove.

NEW PARTNERSHIPS: Richard L. Taylor, AIA, of Kalispell, Mont., has announced formation of a four-member partnership taking in three former employees: Raymond A. Thon, John C. Schwartz and Kenneth Kirkpatrick. The firm, which will continue in the present quarters in the Ford Block, is now known as Taylor, Thon, Schwartz & Kirkpatrick.

A graduate of the University of Minnesota, Taylor began practicing architecture in Kalispell in 1951 after a period of employment with other architects in the city. Thon was graduated from the University of Michigan in 1950, Schwartz from Montana State College in 1952 and Kirkpatrick from the same school in 1953.

Harry Loners, AIA, and Francis G. Stroebe, AIA, both of whom have practiced architecture in Billings, Mont., for many years, have formed a partnership under the firm name of Loners & Stroebe, with offices at 418 N. 25th St. Loners was graduated from the University of Washington in 1928, Stroebe from Montana State College in 1940.

NEW OFFICES: Joseph H. Rudd Jr., AIA, has opened an office for the practice of architecture at 2744 S.W. Rutland Terrace, Portland. Upon graduation from the University of Oregon in 1950, he was employed as a designer with a Pennsylvania firm and later returned to Oregon where he has been associated with several Portland firms.

Harry L. Cummings Jr. of Kirkland, Wash., has opened an architectural office in the Journal Building. He has been employed by the Seattle architectural firms of John Graham & Co., Paul Thiry and Waldron & Dietz.

APPOINTED: Kendall Ellingwood has been named director of development for Victor Gruen & Associates of Los Angeles. A graduate of Stanford University, he began his career in the Los Angeles construction industry as a mechanical engineer. Most recently he has been with the Ford Foundation's Fund for Adult Education.

Lawrence J. Cuneo has been appointed chief designer of the Los Angeles architectural and engineering firm of Daniel, Mann, Johnson & Mendenhall. He attended the Armour Institute of Technology and was a member of the Taliesin Fellowship with Frank Lloyd Wright.

PR CONSULTANT: Irving Myers, author of "Mexico's Modern Architecture," has opened an office in the Architect's Building, Los Angeles, as a consultant in public relations, graphic design and research to architects and the building industry.

MYERS

Formerly public relations director for a Los Angeles architectural firm, Myers served as consultant to the Southern California chapter, AIA, in preparing its "Guide to the Architecture of Southern California."

DESIGN AWARD: A Portland designer, John Yeon, has received the $1,000 Arnold W. Brunner memorial prize for architecture, awarded annually by the American Academy and the National Institute of Arts and Letters. He was honored for his general contributions, not for any specific work.

Yeon has received recognition for his residential work in Oregon and northern California, as well as Portland's Visitors' Information Center. Two exhibitions at the Museum of Modern Art in New York, "Building USA," have included his projects.

The Moore house at Yankee Point near Carmel, designed by San Francisco architects Anshen & Allen (PA&B, Jan., '56) will be included in an exhibit of architecture destined for a fall showing in Brussels, Belgium. The show will feature works by 14 mural painters, 12 sculptors and 24 architectural firms from throughout the U.S., selected by the Architectural League of New York.

Top prize in the annual national "Interior Awards Program" of Institutions magazine has gone to Mario Gaidano, AIA, of San Francisco for his remodeling of Fior d'Italia Restaurant in San Francisco (PA&B, Feb., '56).

BEAUTY AND THE BRICK—Clifton J. Brady, AIA, of Seattle receives set of brick cuff links from Miss Brick Apprentice (model June Svedin) at recent meeting of Producers' Council and AIA. More than 50 architects earned cuff links by suggesting uses of brick and tile in construction.

AIA activities

Washington State: James J. Chiarelli was elected president at the chapter's final meeting of the season in June.

CHIARELLI

Edwin Turner was named first vice president. Reelected for second terms were Harold W. Hall, second vice president; John L. Rogers, secretary; and A. O. Bumgardner, treasurer. All are Seattle architects except Hall who practices in Everett. Arnold Gangnes, Harrison Overturf and retiring president Lloyd J. Lovegren, all of Seattle, were named directors.

Chiarelli has served the chapter as a board member and first vice president.

The June meeting also was the occasion for the award of two architectural scholarships made available by the National Board of Fire Underwriters through cooperation with the American Architectural Foundation, Inc., and the AIA. Miss Ching-Hwa Hsaio of Seattle received a check for $533 for study in her fifth year at the University of Washington and Hajime Kinoshita of Slocan City, B.C., a check for $1,600 for graduate study at MIT.

Spokane: For the first time in its history the chapter recognized one of its own members with an Honor Award when it presented a plaque to E. Norman Sylvester for "outstanding service." He has edited the chapter publication, "Inland Empire Architect," since its inception three years ago and has served on several committees, including the construction industries committee, of which he is currently chairman.

New officers are William C. James, president; Carl Johnson, vice president; Keith Boyington, secretary; and Ralph Bishop, treasurer. Kenneth W. Brooks is a new trustee.

RETIRING PRESIDENT Lawrence Evanoff (l.) of Spokane chapter congratulates E. Norman Sylvester upon receiving plaque for "outstanding service."

Northwest, California make plans for annual meetings

While the Northwest Regional Council, AIA, was selecting dates for its fifth conference, September 6-9, the California Council of Architects was naming the keynote speaker for its October meeting, Dr. Stephen C. Pepper, chairman of the department of philosophy at the University of California, Berkeley.

The Northwest architects will meet in Tacoma, with the Winthrop Hotel as headquarters for their conference, which this year will be extended by one day. Tentative events include seminars on wood products and prestressed concrete, a cruise and salmon bake, a dinner-dance and a trip to Mount Rainier.

The Californians, who earlier this year selected October 10-14 for their convention in Yosemite National Park, "will emphasize the relationship of the architect's work to his state and his community, rather than on technical professional matters," reports William Corlett of San Francisco, chairman of the advisory committee.

Dr. Pepper will speak on architecture as it relates to the world in his address on the second day of the four-day meeting. He also will take part in the principal convention panel October 12.

The California-Nevada-Hawaii Regional Council will meet during the Yosemite sessions.

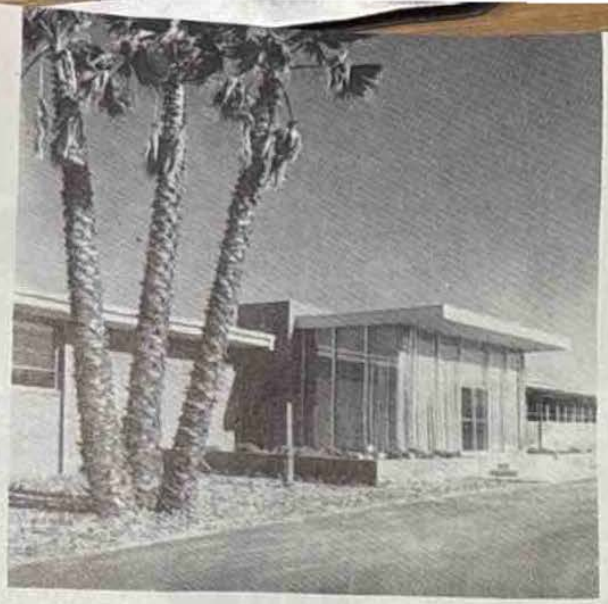
A NEW HAWS FOUNTAIN IN Fiberglas

in 5 decorator colors* . . . and white

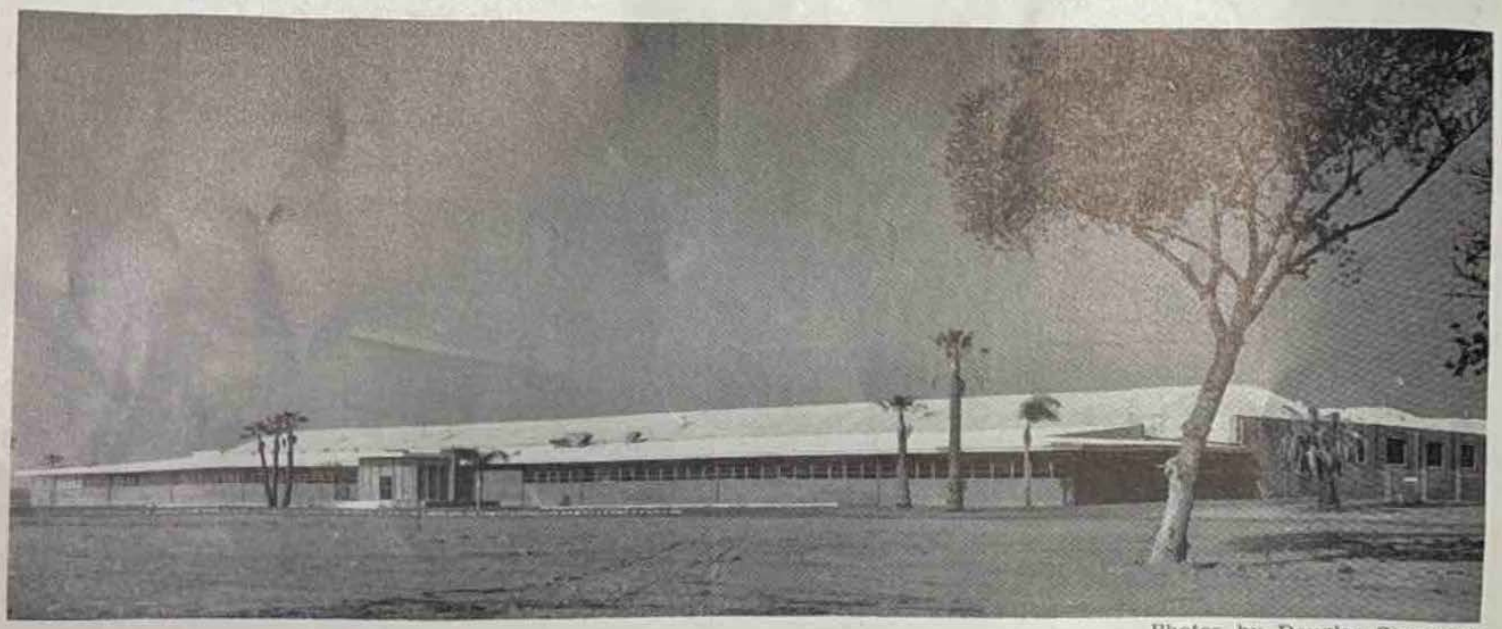
Designed by: CHANNING WALLACE GILSON

The striking lines of HAWS Model 10Y fountains, in your choice of complementary color* at no extra charge . . . add a brilliant finishing touch to your design. These three-bubbler wall mounted models are constructed of REINFORCED FIBERGLAS PLASTIC . . . *the modern strength material that is extremely light in weight!*

Model 10Y contains all of the HAWS advanced sanitation features. Angle stream fountain heads are raised and shielded, and are VANDAL PROOF mounted on receptor. Valves have automatic stream control and are self-closing. All exposed trim is chrome plated.



Take your choice of color . . .* and design this beauty into your next school job. It's easier to install and built for a lifetime of sanitary service.



Write for full information, TODAY!

*MODEL No. 10Y complementary colors: Cerulean, Pistachio, Coral Accent, Yellow Mist, Gray Satin, and Petal White.

MAIN OFFICE shows arrangement of business area to provide degree of privacy. Slimline lighting is used here.

OUTLINE SPECIFICATIONS

Type of Construction: Reinforced concrete tilt-up, with Gunite pilasters and joints.

Exterior Walls: Reinforced concrete and reinforced brick.

Roof. Built-up on wood rafters and wood sheathing, with ½-in. fiberglass insulation.

Windows: Projected steel sash.

Floors. Reinforced concrete, surfaced with asphalt tile in offices and laboratories except terrazzo in lobby and carpeting in president's office.

Interior Walls: Non-bearing, drywall finish on wood studs; wood paneling in lobby and president's office.

Ceilings: Acoustical tile suspended from tapered steel girders.

Lighting: Slimline fixtures on 277-volt system.

Heating: Gas Fired, suspended unit heaters with exhaust fans.

Total Area: 125,000 sq. ft.

Total Cost: $658,000 (including utilities).

Cost per Square Foot: $5.20.

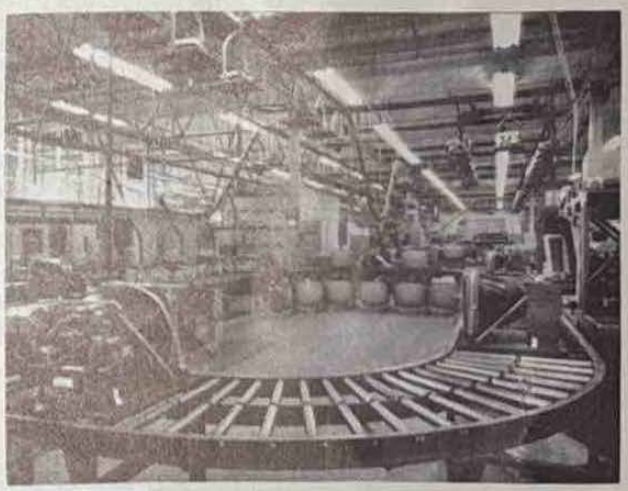
Date of Completion: June 1954.

THE DESIGN PROBLEM: how to apply those architectural principles which would permit complete utility in an attractive structure for the manufacture of television sets, radios and other electronic equipment.

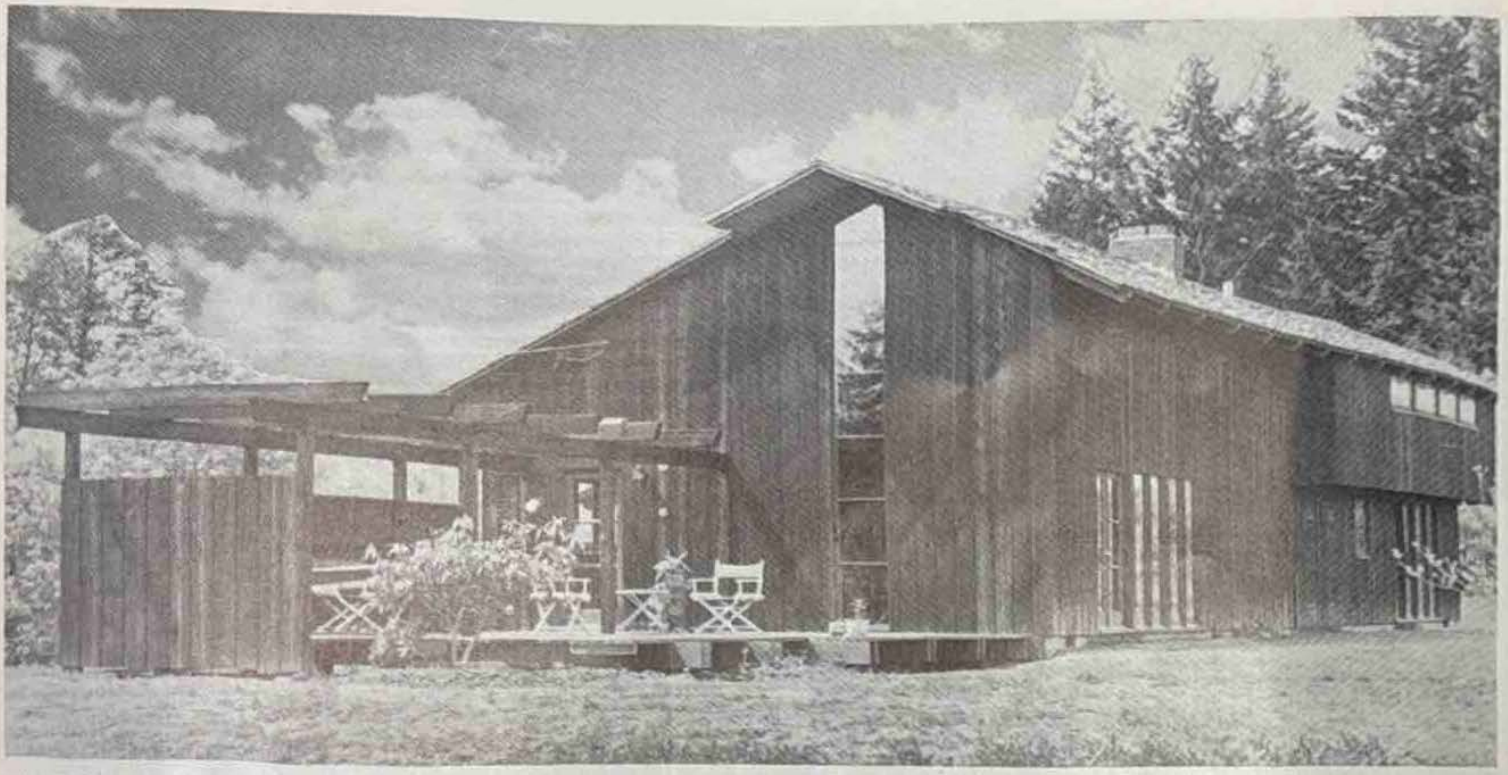
Specific requirements were complex, calling for research laboratories and offices for engineering, management, sales, purchasing and accounting, as well as an actual production line. It was also necessary to consider the maximum production capacity needs of 1,050 TV sets per eight-hour day.

The architect divided the single-story building, 290×420-ft., into two major areas—one for production and assembly, the other for engineering and office facilities, with everything under one roof for economy, flexibility and ease of supervision. He further divided the plant area into two 70-ft. spans and one 90-ft. span, the latter providing a clear space to accommodate three TV assembly lines. At present 1½ full lines are installed for producing 650 sets per day.

President Joseph Benaron insisted that the new plant be a pleasant place for his 550 workers. In designing for employee efficiency, the architect conveyorized a major portion of the materials handling and assembly lines. Picture tubes are carried by an overhead chain conveyor to the points where they are attached to the chassis, thence by the same conveyor to the assembly line and into the cabinets. Slat and belt conveyors move the products through final testing, marking, touch-up and packaging.



The site, 40 acres of gently sloping land, is bounded by two streets and a railroad main line. The city required the provisions of a buffer zone on the street fronts; it also demanded that all trucks, which deliver cabinets from the company's nearby plant and some of the raw materials, enter the factory from the south.



The main entrance and the lobby—located off center on the east side—actually divide the office section into management and engineering departments, with the present lunchrooms in-between to provide room for future expansion of either area. (A cafeteria will be built later.)

Space now is allotted for storage of finished goods. Later this area will be used for incoming inspection and subassembly work when a proposed finished goods warehouse is completed.

ASSEMBLY AREA above. Note cleanliness of plant and lighting. Detail of conveyor assembly line below.

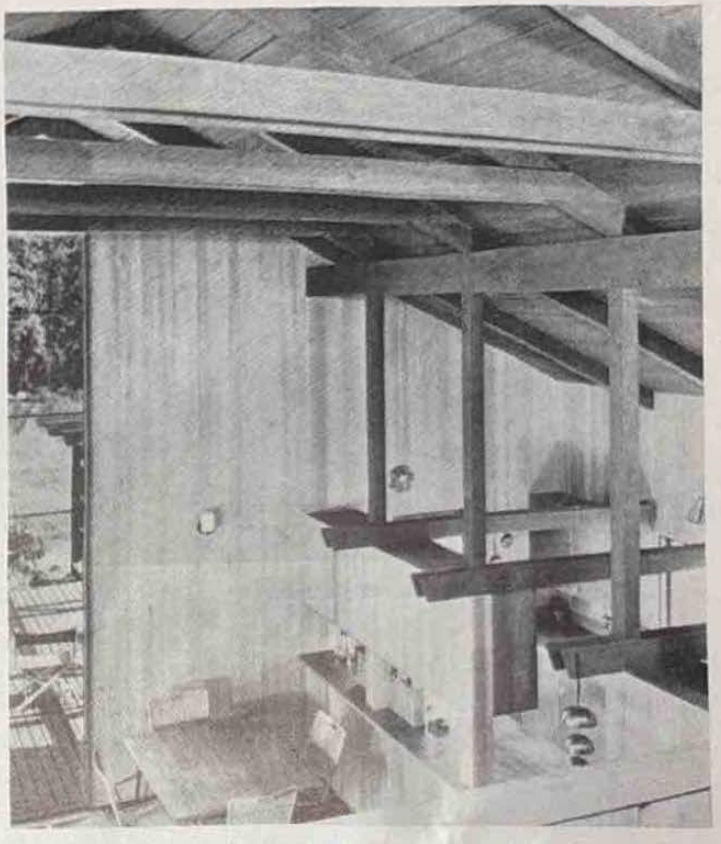
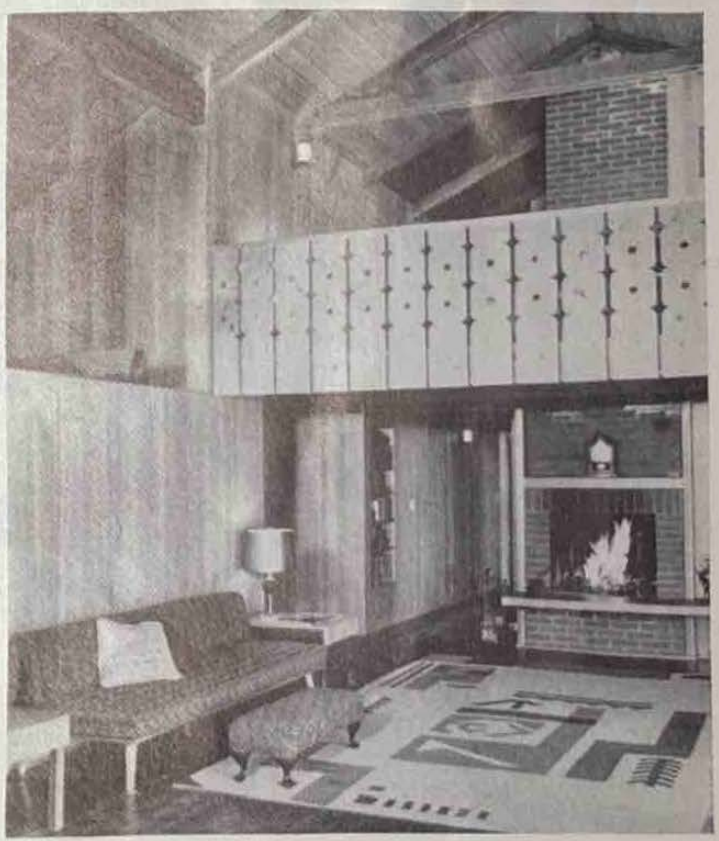
RICHARD A. CARLTON
General Contractor



THIS UNUSUAL HOUSE comes as close to being a completely spontaneous creation as possible. The client, who accepted the first design, was in full rapport with the architect. The result, in the designer's own words, is "a happy kind of structure which seems to enjoy being a house."

The chief problem was how to create a residence to sit in the middle of a two-acre field, virtually surrounded by trees, and still maintain its identity. A two-story plan seemed the best solution, particularly since it allowed the client, who was then a teacher, to get away from two grade-school-age daughters. Even now the second level offers a retreat for both adults to pursue hobbies and other activities uninterrupted. As for materials, the architect specified woods sympathetic to the setting: rough sawn cedar for exterior siding; t&g hemlock for interior walls; t&g fir for exposed beams, floor decking, doors and cabinets.



The open plan—1,024 sq. ft. on the first floor and 560 on the second—is characterized by extreme contrasts in vertical space which produce a feeling of spaciousness in the relatively small area. The living room ceiling is 18 ft. high while the underside of the balcony beams is 6 ft. 10 in.; bedroom heights vary from 5 ft. 6 in. to 9 ft. It was this "refreshing use of vertical space" that drew special commendation from an architect-jury who selected the house for an Award of Merit in the first design competition of the Oregon chapter, AIA.

The balcony railing at the fireplace end serves as a large decorative element in the living room (14x26 ft.). Its band sawn and drilled 2x10 railing is repeated in the winding stairway which leads from the hall and up to the master bedroom (16x13 ft.), off which there is an exterior balcony.

The galley type kitchen has a pass-through to the dining area, highlighted by a window 18 ft. high and 20 in. wide which looks out on a pergola and terrace. Since the site is open with no large plantings, it was desirable to provide some feeling of protection for the outdoor living area—thus the fenced deck with pergola for green shade.

DINING AREA at end of living room and kitchen with pass-through.

BALCONY, on which master bedroom is located, highlights living room.

OUTLINE SPECIFICATIONS

Type of Construction: Frame

Exterior Walls: Rough sawn, vertical cedar channel siding with dark reddish brown Cabot's stain.

Roof: Handsplit shakes over 2x6 t&g hemlock decking over fir beams; quarter pitch.

Floors: 2x6 t&g decking over fir beams, covered with linoleum in kitchen and bath.

Windows: Stopped in wood.

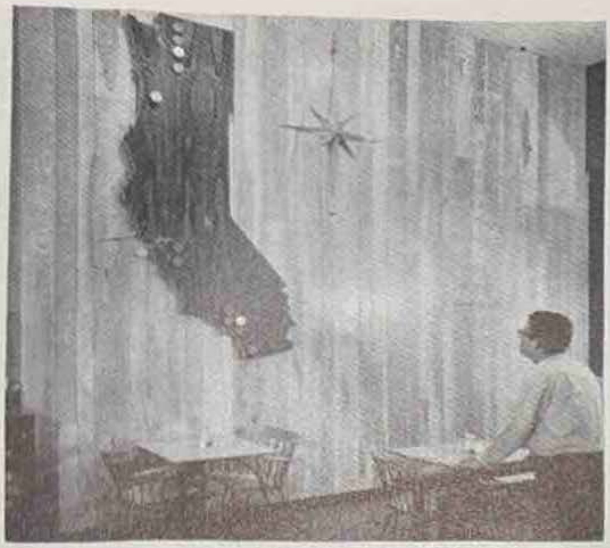
Doors. Fir.

Interior Walls: Vertical grain 1x4 t&g hemlock in natural finish; painted sheetrock in bathrooms.

Stairway: Wood.

Cabinets: Stained fir.

Insulation: Blanket in walls.



Heating: Oil fired, counterflow furnace in low temperature perimeter system with continuous flow operation.

Total Area: 1,584 sq. ft.

Total Cost: $15,000.

Cost per Square Foot: About $10.

Date of Completion: March 1955.

Large cafeteria has intimate details

BRICK to left of entrance is carried through plate glass inside. Wall is of ash panels, floor of terrazzo.

OUTLINE SPECIFICATIONS
(Complete Remodeling)

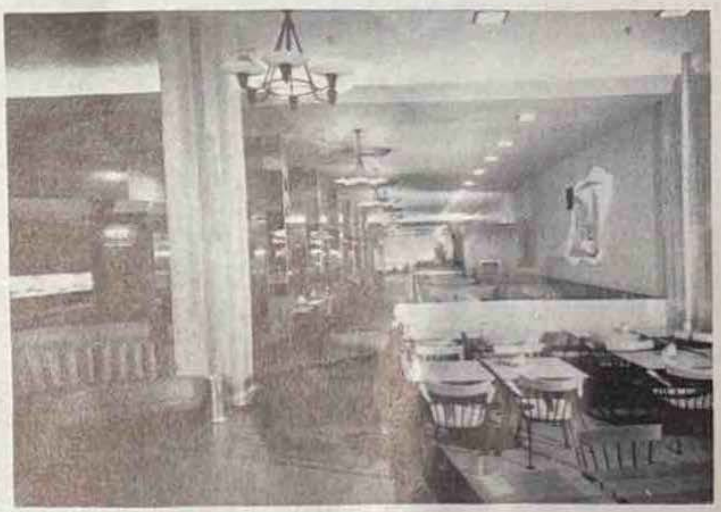
Exterior Walls: Dark brown lightweight cement bricks.
Windows: Kawneer aluminum sash.
Doors: Kawneer aluminum frame.
Floors: Original maple surfaced with Robins vinyl plastic tile; terrazzo in entrance area; random oak plank in men's clubroom.
Interior Walls: Painted plaster with wood wainscoting; Gladding, McBean tile behind all working areas; ash paneling on one wall; walnut paneling and finished cork in men's clubroom.
Ceilings: Acoustical tile with egg-crate latticework above double serving line.
Lighting: Incandescent; custom designed fixtured in one section.
Heating: Tempered air, gas fired units in ducts.
Total Cost: $500,000.
Total Area: 35,000 sq. ft.
Date of Completion: June 1954.

NEWEST IN A CHAIN of 46 food service and retail bakery units owned by Manning's in 15 major Pacific Coast communities from San Diego to Bellingham, Wash., is the largest cafeteria in San Francisco. The 510-capacity operation is located in a structure originally erected following the earthquake and previously occupied by a Woolworth store.

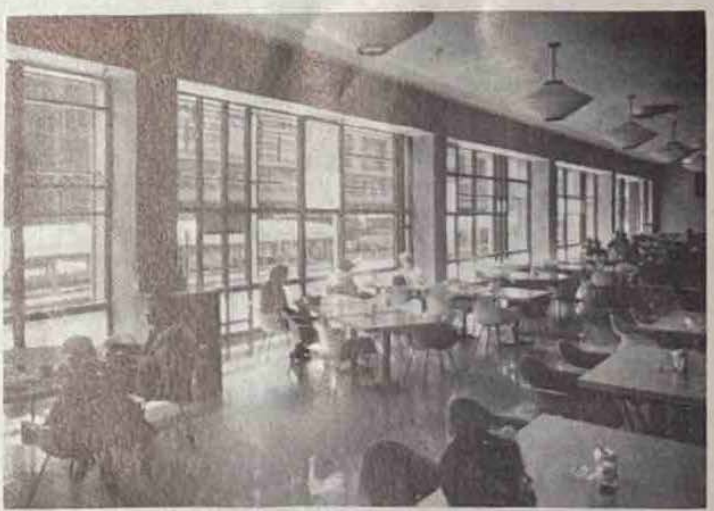
There was a small forest of columns in the old building, the ceiling was high, the maple floor had many badly worn spots and the basement was at two different levels. It was decided to hang an acoustical ceiling and use as much of the existing structure as possible.

The architects gave the columns varying treatments in different areas to break up the monotony of an unusually long room. They selected ¼-in. vinyl plastic tile with a filler in the worn spaces for the floor; they used terrazzo in the entrance area "to cut down on wear caused by grit carried in on customers' shoes." The tile was laid dry and is held fast to the rough base floor by heat and suction. Each individual square can be picked up for replacement should a tile be damaged.

The basement areas were allocated for food preparation on one level and personnel, public restrooms and mechanical equipment on the lower level. New utility lines were run in, the existing elevators rehabilitated and a new one added.



Total area of the main foor and basement is 35,000 sq. ft., with 17,000 sq. ft. devoted to dining space which is divided into five distinctive sections, each individually decorated and furnished. Since the interior from the front entrance to the extreme rear wall is 300 ft. long, the separate areas were developed to break up this vast room expanse. The stepped ceiling also helps to create more intimate areas.



One of the sections is a clubroom reserved exclusively for men. It has walnut paneling and furniture, and a random oak plank floor. One wall is of finished cork and the entrance is through an accordian door made of limed oak.

The double serving line area is covered by an overhead egg-crate latticework of 24-in. squares, painted a soft coral, which helps to lower the ceiling of the old structure. Soft lights are imbedded in the acoustical tile ceiling directly above the lattice.

The retail self-service bakery operation, convenient to the entrance, is separated from the first of the dining areas by a curved wooden partition which faces a wall of random width V-grooved ash paneling. Lightweight cement bricks are used on the exterior and the brick sidewalls extend through plate glass windows into the interior, with extra large brick planters adding a note of interest on either side.

DOUBLE SERVING LINE with egg-crate lattice ceiling and tile behind all working areas (top). Entrance to 300-ft. long dining area (middle). Serving counters are separated from dining area by structural pillars covered with mirror glass. Dining area—one of five—with 110-ft. long window arrangement (below). To provide element of privacy and create interest, architects designed Mondrianesque screen of wood and multicolored plexiglass which permits entry of daylight but shields diners from street.

Architecture for the *Good Life*: Part 2

The keynote address delivered before the 88th annual AIA convention in Los Angeles

by JOHN ELY BURCHARD
Dean, School of Humanities and Social Studies
Massachusetts Institute of Technology

IN OPENING these dialogues it has seemed to me that I might not be able to do anything more useful than to comment on conditioning forces in America which may bear on the possibility of reaching towards this lofty interpretation of Architecture and the Good life.

Before I do this, one other distinction ought perhaps to be made. We do, I suppose, have to ask ourselves whether we are talking about architecture for history or architecture for our own times. I doubt that anyone ever built great architecture or did any great deed because he was eager to gain the applause of history. You realize that some important historians have asserted that the judgment of posterity did control men's acts; in particular that men of evil intentions might be deterred from evil deeds for fear of the scolding they would get from history. This seems dubious doctrine to me and I would expect the same to be so of good deeds.

But there are societies which have left us monuments of their architecture and societies which have not; and the suspicion remains that those which have, have done so because they built durably; in turn the expectation is that they built durably not because they did not know how to build ephemerally but because they expected that things in which they believed had some probability of permanence. The first temple of Apollo at Delphi was of wood and legend follows it with one of feathers and beeswax and one of brass but it ended in stone. It did not end in stone because the Greeks who built it cared only about what their successors would think, but because they expected both to gain current enjoyment and profit from its use and to leave it to a posterity which would enjoy it and for the same reasons.

Now it is pretty evident that our current building materials will not survive for our descendants to study, much less to admire. The glass and the metals will go; if anything remains it will be those buildings of Washington like the Mellon Gallery or the Jefferson or Lincoln Memorial which are least typical of our culture. We are right of course to build buildings that serve our current needs well and not to inhibit this service by demanding an unnecessary permanence. But permanent building and building for contemporary needs are not necessarily antithetical. The basic truth is in the inference from our building and from our architecture that we do not believe in permanence.

This is the first of my points about the American scene. It is a scene in which, ever since the 1820s anyway, almost everyone has believed things would be quite different in a decade, at least west of the Appalachians. Economic circumstances would improve for some families, decline for others, but in general they would all improve. As they improved or even as a consequence of that improvement a given American would not expect to live his whole life in the same region or at least not in the same neighborhood or house. Much less would he expect his descendants to do so. The general theme of literature, of the agrarian myth as Hofstadter describes it, of technology, indeed even of architecture, has been that things would change so rapidly that it was extravagant to invest in permanence. Thus hyperconsciousness of the ephemeral which is peculiarly American has accelerated rather than diminished with time. It undoubtedly has some meritorious consequences. But it has unfortunate consequences too. You can see these in caricature if you contrast the appearance of a little town on the eastern slope of the Sierra or the Rockies with its opposite number at 5,000 ft. in a Swiss valley. The Swiss who live in such a valley are much poorer than their American counterparts. But when they came there they expected that the family would remain and they began to build accordingly. They acquired a corporate and communal pride; they cared for the total appearance of their community and for their own individual contribution to that appearance. The results are of course fabulously more satisfactory. No one in his senses would exchange the life in a Zinal or a Saas Grund for the life of a Leevining or a Reno even if television and filling stations never come to the coves of the Valais.

There are probably other differences in the Swiss character which have something to do with the differences in the solution but the general disorder and squalor of most of our towns west of the Alleghenies and many east of the same range is so discouraging that one likes to find defenses. One of these I am sure, and an important one, is our sense of the transiency, not so much of our life spans as of the ways we live within that span. Now that the physical frontier may be gone for Americans some of this urgency of change may disappear but I doubt it; for there is a new frontier whose boundaries can not so easily be stated—and this is the frontier of technological change. The opportunities this offers for real architecture will be boundless; that they can be much realized in the absence of some convictions of ours that some things anyway are here to stay, I very much doubt. Meanwhile this sense of transiency will continue to manifest itself in the strips which degrade the highway entrances to every community in our land and which are gradually inserting themselves into the centers of our towns as well.

There is reason to believe that this expectancy of early obsolescence is truly an American characteristic because it is not a new phenomenon which can be associated only with the vertiginous acceleration of the fruits of technology. You can find traces of it even as early as Emerson. German and Swiss and French peasants fought it for a time when they built their colonies in Pennsylvania, Ohio, Illinois or Iowa but their children have ceased to resist and even the constructions of the Amana colonies are changing from architecture to building.

Closely related to this consciousness of the ephemeral is the fact that Americans are enormous consumers, one might even say scandalous consumers. It is well known that we use such a large quantity of almost any natural resource per capita as compared with that available to peoples in other parts of the world that we are subjects not of admiration but of suspicion and resentment. This suspicion, resentment, envy would exist anyway but it is augmented by our patent waste of these resources. Our entire history has been one of a people finding lavish means and destroying them quite as lavishly, whether they were forests, mines, topsoil or water. The kitchen middens we might leave to posterity should be a cause for acute embarrassment if we cared about the judgment of posterity. You well know that at this very moment there is something resembling a gray market in steel for buildings, but this is not really because of the enormous consumption of the military program though that is bad enough. No, the plain fact is that it is still the automobile industry which is the avid consumer; that this industry is built upon a process of artificial, unnecessary and, in the light of other world standards, even immortal obsolescence. It is a little risky to go further because the relation of the automobile industry to the entire prosperity of the country is probably very sensitive but one can hazard the guess that what is good for the automobile industry may not be good for the architecture of America.

But it is not of course the automobile industry which is the only demon in the piece. The makers of refrigerators or indeed of any other article of consumer goods would create the same artificial obsolescence if they knew how, and don't think for a moment they are not trying to find out how.

Nor is it only obsolescence. After all much of the steel can finally and ultimately be reused as scrap. This is not true for glass bottles. It is cheaper there to start again with original raw materials. So these hypothetical kitchen middens of ours will consist mostly of glass, some from the shattered plate of our new buildings but mostly in the form of Coca Cola bottles which march en masse through the land while building glass is also in short supply. The public holds the Coca Cola bottle in higher esteem one would conclude than it does a window of the Sainte-Chapelle.

I have exaggerated this a little simply to point out that this elaborate and general belief in the inexhaustible resource with its accompanying egregious waste of everything plays hand in hand with the sense of the ephemeral to produce a social climate in which building for permanence seems to have little meaning.

There are two or three other things about the American environment that bear investigating. We rest comfortably with the impression that we are about the most ingenious people in the world and speak of Yankee inventors as though they had existed in every hamlet of early America. This is a kindly myth. Some myths are true. This one may not be. It would be very hard to make a case that even on the scale of pure invention this country had consistently produced more important inventions per capita than others. Indeed we would be likely to find to our shame that this was not so. Clearly we have not, per capita, produced as many creative ideas in science, philosophy, literature or the arts as several other parts of the world. Indeed in many of these areas of the higher artistry we have produced scandalously few. In architecture perhaps our only significant native innovators up to now have been William Le Baron Jenney, Frank Lloyd Wright, Buckminster Fuller and one other whom I will not name so that each of you can tuck in a name that suits him and be less resentful of this assertion. Of these the most imaginative has hardly built a building at all; the greatest was never really accepted in this country until long after it mattered; and such effects as we have felt from his innovations have largely come to us through the hands of German and Swiss translators and translations.

But we do have a different quality which has stood us in good stead. Once we recognize the general merit of an innovation we are not afraid to go for it hard. So once the meaning of the cavity magnetron got into the American consciousness we produced not only a larger but also a more varied set of radars than the British conceivers might have been expected to do; the atomic bomb emerged in America from European-born concepts; once we really grasped the principles of Le Corbusier and Mies van der Rohe we began to exploit them in profusion and with some, though perhaps not enough, variety.

Here we are talking of course of a past. There is some evidence in science that more ingenuity has come into American physics and mathematics, and I suppose in time we may expect to see it in architecture too; but this does not necessarily follow, for Americans have generally been more innovative in their science and its technological applications than they have been in their aesthetic creations and quicker too to understand, adopt and modify the ideas of others. We have yet for example to try to make anything very serious of the many partly formed suggestions for glass shielding which appear in such profusion and often with such dramatic aesthetic effect in the countries to the south of us. The unbridled imaginations of Italy and Mexico may create many horrors such as our more restrained efforts may avoid; but they may also cast up some mountain peaks which we have as yet, with the possible exception of Rockefeller Center, the United Nations and 860 Lake Shore Drive, refrained even from trying to build.

It is common of course for Europeans to speak of us as a violent people; and we probably like to think of ourselves so. But the fact probably is, as Ruth Benedict has I think suggested, that we are more like Zunis who avoid excess than like the Kwakiutls who shoot the works at a potlatch dinner. This shows itself in the reluctance with which we have adopted the brilliant engineering schemes suggested by the works of Freyssinet or Maillart or Nervi or even of our own Buckminster Fuller and in the enormous restraint we have shown both in the use of sculpture and in the use of texture in buildings; even most of all I suppose in the extent to which we exclude sculpture and painting from our buildings. Restraint is even too kind a word; reluctance and disdain may not be too harsh. For this there are several reasons. For the moment I wish to speak only of the Zuni aspect. With respect to any of these excesses we ordinarily proclaim in virtuous terms that they are too expensive. It may well be that a Nervi system is better economics in Italy than it is in America but to apply economic determinism to art is the last refuge of the unaesthetic mind. We are incomparably the richest nation in the world. That is what the Athenians were after they moved the Treasury of Delos to Athens in the name of safety, but they were not afraid to spend this wealth on the architectural and sculptural embellishment of Athens; and so it was with the Romans; and so it was even in the poor villages of the Ile de France in the 13th century; and even with the prudent English Victorians.

But now in the richest land the world has perhaps ever known we say over and over again that we cannot afford these aesthetic extras; the national government cannot afford them; the richest industrial firms cannot afford them; the universities cannot afford them. So

our campuses have no sculpture save a few aging and desultory portrait statues of long-gone presidents sitting in armed chairs; and college presidents say that their constituents, that is the donors, big and little, who are already pressed to the breaking point, would resent such extravagances. No doubt they would, but what more pressing job could there be than to educate the donors that this was not extravagance? You learn about art and architecture by being with it and seeing it and not by talking about it: one good contemporary statue on a college campus would have more educative value than many kodachrome slides of Mona Lisa and Moses. Architects have no right to feel virtuous in this matter. Most of you refrain from suggesting such embellishments; when you do you almost never put them in as indispensable; they are rather budgeted separately. Under these circumstances surely no architect is so naive as to believe they will not be the first thing to be cut when the budget runs over as it almost always does. Indeed it is all too often the architect himself who acts as the executioner at this point of crisis.

We can not really plead this economic excuse for our omission of art because of course we can afford it. The plain fact is that we do not want it very much. We do not mind the used car dumps very much. We even learn not to see them. But on the positive side which is more important we do not labor very hard to produce this larger and common, non-museum, art environment which has characterized every previous high culture. That is bad enough. It becomes sickening when we talk in hypocritical terms of economic barriers almost as though it were a matter of morality to build a building cheaper. If there is any morality at all in great architecture on the economic side it probably rests in wasting money for elegance, not in saving it by leaving the sculpture out of the final budget. But I am not one who wants to say much about morality and architecture.

However if I may wander for a moment let me say that morality has not much to do with architecture. Ruskin of course was full of morality—architecture was immoral if it served an immoral purpose and so the Colosseum and the Renaissance Palace had to go; it was immoral if it employed cast iron for this was a material which **seemed** to have required more hand labor than it really did. Viollet le Duc put in his oar when he talked about the morality of structure in the Gothic cathedrals, a morality which was by no means always there and would always be scuttled in favor of the more important thing that the cathedral must be a reflection in stone of the major principles of the Summa of Aquinas stated in words.

Now the very modern people who reject most fully the canons of Ruskin can be found also to be talking of morality. It has somehow become honest and natural and organic to display the structure as blatantly as possible and anything else is dishonest and even unnatural. These are harsh words and used inconsistently. There are no animals in nature, for example, except a few exoskeletal ones like turtles and lobsters who betray their skeletons clearly. Often even the musculature is not clear. The structural system of a tree is not apparent to the eye of common sense. The animal which is thin enough to show its bones, we look upon as an undesirable and ugly animal whether it is an old horse or man-eating tiger. It may well be that from expressions of structure behind hung walls, transparent or not, we have achieved a certain desirable and appealing aesthetic. But let us be content with that for it is a great achievement. Let us not go around calling our predecessors or their work dishonest any more. That we do not want to emulate the activities of another man or another age is no excuse for accusing the other man or the other age of immorality or dishonesty. Indeed any one with sense of history, and of how the tides of the affairs of men ebb and flow, and how the winds of taste and desire veer to all points of the compass, will be a little slow even about calling another age a stupid age. But of course there is not much sense of history left in us.

I feel a little less sure about one other possible American quality. I think we lack a certain sense of innate fitness and order in matters of aesthetics. But what I am not sure of is whether this is a corollary of our adoration of the ephemeral, our enormous consumption and our reluctance really to go all out for any kind of pageant, social or architectural, or whether it is an independent trait. What I do sense is that the people of Portugal can for example assemble paints on tiles of a wide variety of apparently incompatible colors on adjacent houses piled on the hills of Lisbon and achieve a kind of overall pleasant effect which seems to me missing from any of our spontaneous and even most of our calculated efforts in this direction. This is a quality which is achieved in many areas of the world; elsewhere on the Mediterranean for example; and it seems to be in a different way possible in the mountains of Tibet or Switzerland, in Bali, in Japan. I am not ready to yield easily to the notion that this rests on technical grounds such as the quality of the sky or the impermanence of foreign paint; because California also has such a sky and has not produced such results; and I know of no greater total chaos than the jumble of some new streets on some California hills where almost every individual house is one of substantial distinction but where the collective result is almost more horrible than the pedestrian villas of a suburb.

I have painted this picture of American traits in strong colors deliberately to overemphasize the soil on which American architecture has had to grow. That it has grown so well almost in opposition to the soil seems to me a tribute to the persistence of American architects. It is a persistence which was manifested long ago, which began indeed with the efforts of such men as Jefferson and Mills and Thornton, not always sophisticated or even refined in proportion but always with a certain simple effort towards elegance. The more sophisticated talents of Manigault and Latrobe blossomed once in the Greek revival which has left buildings of dignity throughout our landscape, buildings which we need not repeat but which have been little tarnished by time. It appeared in renewed form in the work of men to whom we are ungenerous today, men like Hunt and McKim and Stanford White; in the towering and robust and not quite so derivative Richardson; in the brave poetry of Sullivan fortified by the earthy realism of Adler; in the wide dreams of Burnham made true so long as he was allied with the sensitive Root; in the undoubted and unfettered but not always appreciated talent of our one sure native genius, Frank Lloyd Wright; in the sentimental medieval aspirations of Cram and the more imaginative adaptations of Goodhue; in the original work of men like Maybeck and Gill and the brothers Greene on the West Coast. And all this was not in vain though not all the men were original and though not all the works were suited for the tasks of today or even always for their own day. But Boston would be the meaner without its public library and its Trinity Church. In all this there was a surge towards a future, a future which is now with us; a future which was anticipated by the

evolution in the work of Raymond Hood; a future which built on the welcome this country finally gave to great visitors, men like Neutra and Mendelsohn and the elder Saarinen and Gropius and Mies van der Rohe.

All this was a long time coming. Innovations perhaps continue to pour in more from abroad than from our native soil. Yet in the last analysis if one were required to name the nation in which the highest average of architecture was now being maintained he must and without chauvinism name our own land. In this country architecture, so far as what architects do, has finally come of age. We have a past of which we need not be ashamed and a future which we need not fear; and this has come about despite our will to the transient, our enormous and wasteful consumption, our puritanical rejection of the opulent, the colorful, even the elegant, our native tendency toward the disorder of the newspaper litter and momentarily silenced horns of New York and the ubiquitous used car dump. On all of this we can look with some pride, but also humbly for we have not reached the stars.

We can look with most pride perhaps to the most recent phenomenon: that foreigners now come to America in numbers to study architecture, architectural design I mean as well as building methods; and that the architecture we now export abroad is often something of which we may be proud.

But this does not mean that all the problems are solved. While our buildings have, as individual buildings, taken on a distinction which American architecture itself has never before possessed, save perhaps in the dignity of the New England village green or the plantations and courthouse squares and little parish churches of Tidewater Virginia, our cityscapes have become increasingly ugly. No building can like St. Sophia be clearly seen. Scale competes with scale and never in moderation. Large throughways move us rapidly through the urban terrain and sometimes obtain their own beauty. But this is a beauty like that of the Roman aqueduct and not the beauty of the urbs. We have not learned to cede space to squares and axes so that noble buildings can be seen and comprehended instead of fragmented by fragments of other buildings; again we argue that we cannot afford it. We have not learned how to restrain the excesses of competitive advertising while losing none of the gains of convincing exhortations to buy; we have found no way to control disorder either by law which is least desirable or by a commonly found self-discipline which is most desirable.

Yet all of this is easily possible as the Athenians could teach us; and some men understand the problem. Not enough men understand the problem for we have failed almost completely in our effort to interest the common man in the problems and the eloquences of a great national architecture. We have failed for the most part even with the elite; and if the educated be the elite we have to face the fact that every year great universities containing great architectural schools are turning out graduates the majority of whom are visual illiterates and have hardly heard of architecture, much less made any effort to comprehend it. Yet these are presumably the men who will later sit in the seats of decision about our architecture. It takes men of great talent to create the architectural potential and I think we are devoloping that talent, but it takes a public of some general sensitivity to create a world in which great architecture will be the order of the day; at least that is the way it will have to be in a democracy. In this preparation we have, I should guess, almost completely failed.

But this is an external failure and one shared by the makers of other arts and even in a fundamental way by the makers of science too and other intellectuals. There is also an internal failure which is less defensible.

I refer of course to the paucity of adornment of our buildings. By this I do not mean architectural forms so much as sculpture and painting. The divorce of the architecture of America from the sculpture and painting of America is almost as complete as the divorce of painters and sculptors from the ideas of the general public. But this is with less justification. Though history does not exactly ever repeat itself, it is hard, if not impossible, to think of any great past architecture in which sculpture and painting were not used to the hilt. It is not a little arrogant to say, as some do, that the building is its own sculpture and its own painting and that no help is needed. Is it not only a little less arrogant to arrange things so that the painter or sculptor is drawn in only at the last moment as a kind of superior interior or exterior decorator. Here and there, there have been more serious tries of course and not often, alas, very successful tries either. But failures do not justify giving up.

Nor will it do to insist that painters and sculptors of today are so undisciplined and so personal that they will not tackle the difficult problems of adjusting themselves to the discipline of a building. Artists have always in one sense been undisciplined. But this discipline has always been imposed on the artists who would apply their art to architecture. It was prominent in the technical problem of the Doric pediment with its terrific limitations of geometry; it was present in the easier form of the Gothic tympanum but controlled still more there by the dicta of the iconology and the rules of the Council of Nicaea; it was awkward for the fresco painters who had to adorn the broken walls of the Renaissance. The technical problems of today's architecture are easier really than these and it seems to an outsider that only the will to use art is lacking and in particular the will to use painters and sculptors as collaborators and partners and not as paid employees. This lack of will inhibits our achievement of architectural ecstasy.

But despite all this one can sense well-being and future fruition, not despair. American architecture has matured enormously in the last decades; even the federal government, even the universities, show some signs of maturing. There will remain for a long time the slow process of modifying old established and well-ingrained habits of thought, modifying them some and to finding as well ways to exploit them so that all the concessions do not have to be one way. There will remain the problem of dissolving the long estrangement of American art and American architecture. I cannot believe these problems to be impossible of solution. I cannot believe that in the long run the wealthiest nation in the world, and in some ways the most daring, will not cease to be timid and tepid in its acceptance of its total aesthetic opportunity and responsibility. It is not impossible that we may achieve in America a sort of Periclean age in architecture. American architecture is now mature; it needs only to become great. Then a future American president might truthfully say on a great occasion: "Yet ours is no work-a-day nation only. No other provides so many recreations for the spirit. We are lovers of beauty without extravagance and lovers of wisdom without unmanliness. Wealth is to us an opportunity for achievement, our buildings cheer the heart and delight the eye day by day." It is in this sense and this sense only that I believe we can legitimately couple the words Architecture and the Good Life.

Materials – Products – Tools

and the latest literature

METAL MESHES: Expanded metal meshes which are versatile enough to serve as the main design element or to lend an added expression to a general ornamental theme are being offered by United States Gypsum. The four new meshes — Rondo, Festoon, Wavelength and Armoweave — are available both in three-dimensional and flattened patterns where a smooth surface is desired.

Architects and decorators will find the meshes helpful in developing advanced designs for portable and fixed screens, room dividers, book shelves, ornamental trims, grilles, ceilings and partitions.

(Item No. 1)

SLIDING WINDOW: Builders will be interested to learn that Durell's Duraglide aluminum sliding window provides a fully integrated frame to accommodate the sliding unit as opposed to former types in which it was merely fitted into a regular frame. This avoids unnecessary fitting time in installation.

The window is completely weatherstripped against dust, rain, wind, etc. Screens can easily be snapped in from the inside. Duraglide incorporates a safety factor because the window cannot be lifted or removed when locked on the inside. Provision also has been made for locking it in a partially opened position for safe ventilation.

(Item No. 2)

CHIMNEY: The brick panel housing of the Van-Packer masonry chimney is now offered in a choice of three brick colors—red, buff and white—enabling project builders to vary the roof appearance of their homes and custom builders and architects to harmonize the chimney with the exterior color scheme.

The housing is constructed of fireproof, weatherproof cement asbestos. Completely packaged including the flashing, the Van-Packer is a safe, permanent chimney which can be put up in three hours.

(Item No. 3)

DRINKING FOUNTAIN: A three-bubbler, wall mounted drinking fountain designed with flowing contour lines should feel right at home with modern school design and can be adapted for use in other locations where multiple drinking facilities are required. The Hawes lightweight fiberglass model is available in five decorator colors, besides white: Cerulean, Pistachio, Coral Accent, Yellow Mist and Gray Satin.

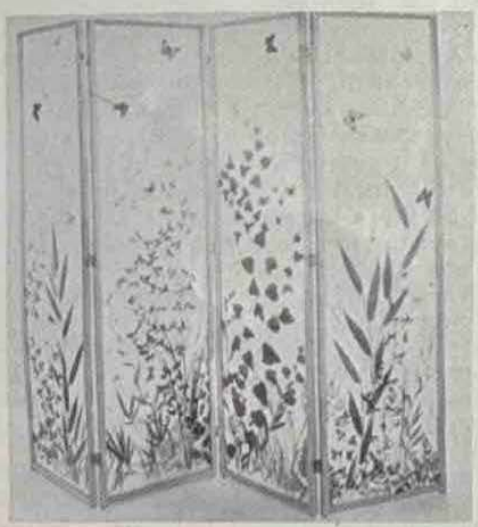
The three-angle stream fountain

FIBERGLASS FOUNTAIN

heads are raised and shielded to prevent direct mouth contact, self-closing valves have automatic stream control and all exposed fixtures are polished chrome plated brass.

(Item No. 4)

CHALKBOARDS: The squeal of chalk on blackboards may soon join the little red schoolhouse in educational limbo. A new chalkboard, green not black, is a sheet of plastic and glass fiber with a silent surface. The softness, which eliminates the squeal, also reduces glare and makes for easier reading. Called K-lite, it will be sold in sizes up to 12x3½ ft.



(Item No. 5)

DECORATIVE PANELS: For screens, room dividers, entrance ways and many other areas, Luis Cardenas of Glass Laminators has designed a series of decorative fiberglass panels using such materials as natural foliage, photographs, maps or coins.

The three lines now available include Pagoda, oriental silhouettes in color including natural leaves and butterflies; Nature, a composition of natural leaves and plant life; and Custom, created to customer's specifications using whatever motif he wishes for home, office or club.

Cardenas panels are made with a glasslike surface on one side and textured fiberglass on the other.

(Item No. 6)

UNUSUAL PANEL DESIGNS

AIR CONDITIONERS: Utility's new line of air cooled air conditioning units are simple for field installation with existing forced air furnaces. Consisting of a condensing unit, evaporator and tubing, the units are designed for every type of forced air installation, including horizontal and counterflow furnaces.

The condensing units, which feature extra large blowers for a quieter and larger volume of air movement, come in four sizes: economy two-ton, full two-ton, three-ton and five-ton.

(Item No. 7)

POLYSTYRENE BLOCKS: United Cork has obtained the license to manufacture and market Uni-Crest, an expanded polystyrene originally developed in Germany. The process permits molding polystyrene beads into any shape or form desired which, when laminated with wood, steel, aluminum, plastic or fibrous facings, produces a strong, lightweight, durable, decorative building material.

Uni-Crest has a low rate of heat transfer and water absorption, is impervious to parasitic insects, vermin and fungi and easy to handle. It is recommended for perimeter insulation of homes and industrial buildings.

(Item No. 8)

PLASTIC SURFACED PLYWOOD: GPX Yellow is a medium density plastic surfaced plywood designed to speed construction finishing and cut building costs. It is specifically intended for use where painting is required and edges should be sealed and filled.

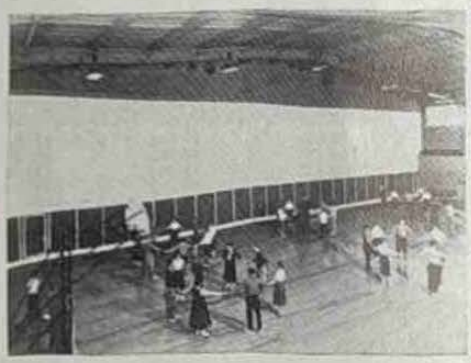
Georgia-Pacific makes the plywood in standard 4x8-ft. panels in thicknesses ranging from 5/16 in. to 1¼ in. It can be used as exterior siding, either panel or lapped, and for gable ends and soffits in home and industrial construction; its smooth surface makes it suitable for built-ins, compartmented walls and partitions in residential work.

(Item No. 9)

BASEBOARD HEATERS: Crystalheat's latest innovation in perimeter heating systems is an electric baseboard radiant-convector type. The wafer thin panels permit full use of every room and do not impair furniture arrangement.

The Crystalvector is available in modular lengths of 4 ft. rated at 1,000 watts and 2 ft. at 550 watts. A built-in 115-volt wall receptacle which is styled to become a part of the regular baseboard heater is offered as an accessory. Floor lamps and other appliances can be plugged in.

(Item No. 10)



Latest Handbooks, Manuals and Literature

Yours for the Asking

ALUMINUM WINDOW CARE: The title of a 16-page booklet, "The Care and Cleaning of Aluminum Windows During and After Construction," speaks for itself. Published by the Aluminum Window Manufacturers Association, it details simple procedures to guard window finishes during handling, storage and installation and provides basic data on how to restore the finish of those which have been neglected over a period of years.

(Item No. 11)

ALUMINUM PARTITIONS: The first installation of an aluminum folding partition for gymnasiums—West Sen-

ALUMINUM PARTITION

ior High School of Aurora, Ill.—is covered in an eight-page brochure. The Richards-Wilcox partition consists of 27 sections that are 3 in. thick, 4 ft. wide and 27 ft. high. Each panel is composed of an extruded aluminum frame and a resin impregnated honeycomb core to which is bonded the embossed aluminum facings. The core extends to the full dimensions of the frame to which the facings are roll-interlocked.

(Item No. 12)

CORK TILE FLOORS: Dodge has issued a booklet which presents clear and concise instructions on how most easily to maintain its flooring products. Separate pages are devoted to standard cork tile, SG finish cork tile and vinyl cork tile, each of which requires a slightly different maintenance procedure.

(Item No. 13)

VERMICULITE SPECS: Vermiculite Institute has revised its 12-page booklet, "Standards for Vermiculite Plaster and for Vermiculite Acoustical Plastic," to include new provisions of the American Standards Association specification for gypsum plastering.

A new section on machine applied vermiculite plaster has been added and the specification for vermiculite acoustical plastic has been completely revised to include machine application.

(Item No. 14)

WALL PANELS: A picture folder shows various combinations possible with Shadowall panels which accentuate the natural grain of the wood. Both sides are processed for greater selection of grain and paneling variations. The panels are tongue and grooved on both edges and ends.

(Item No. 15)

SWIMMING POOLS: Modern's 52-page catalog contains data, photographs and prices on just about every item needed to build a new residential or private swimming pool or to equip and maintain an existing one. But there's other information too which will be helpful to pool owners and builders, architects, engineers and institutional and school administrators.

The section on proper care and maintenance of pools, both filtered and unfiltered, covers such aspects as filtration, flocculation, cleaning, chemical treatment, chlorination, algae control and water testing.

(Item No. 16)

BATH, KITCHEN PLANS: While this booklet is intended primarily for builders and home owners, architects too will find some useful tips on how to plan better bathrooms and kitchens. Gladding, McBean in its brochure has emphasized the desirable but often forgotten features such as plenty of cabinet storage space, ample countertops and good lighting. Suggested floor plans for maximum efficiency of limited space are featured, along with diagrams of helpful hints for better uses of these areas.

(Item No. 17)

STEEL BUILDINGS: How to solve big building problems—from 1,600 sq. ft. up—with rigid frame type steel structures is explained in Armco's six-page folder. The well illustrated piece includes specifications and descriptions.

(Item No. 18)

WOODWORK FINISHES: A stimulus to new approaches for use of knotty wood paneling through special color finishes is found in the Western Pine Association's latest folder. "Fine Finishes for Kitchen Paneling and Woodwork" is the second in a series depicting finishes especially created for different rooms in the home but applicable to any or all rooms.

The folder's six finishes are entitled Shadowy Shoshone, Apache Gold, Mojave Maroon, Palouse Skies, Green River and Ochoco Ochre. Recipes for attaining the finishes, displayed in full color, are provided.

(Item No. 19)

CONCRETE FORMING: The versatility of Uni-Form panels on a variety of concrete forming jobs is shown in a 24-page, pocket-size booklet prepared with a minimum amount of words. On-the-job photographs illustrate such projects as residences, light and heavy industrial, sewage treatment plants, bridges, culverts, schools, slabs, architectural concrete columns, Y-walls and prison cells.

Item No. 20)

STEEL FLOOR TILE: A four-page brochure describes the various applications and methods of installation of Bethlehem Pacific's steel floor tiles, which are 12x12-in. squares of ⅛-in. thick steel. The literature explains that 57 anchors, punched from the steel itself, hold the tile firmly in the base material. When laid in concrete, it provides a long-lasting surface for floors subjected to heavy wear.

(Item No. 21)

BUILT-IN REFRIGERATORS: To answer the trend to built-in kitchen appliances, Servel has made available a refrigerator bevel or frame, whose installation is described in a four-page folder giving step-by-step instructions. Made of anodized and polished aluminum, the bevel fits the contour of the large 34-in. wide refrigerator on the sides and top and it may be easily cut with an ordinary hacksaw to fit narrower models.

Building permits for June keep steady pace

BUILDING STARTS for June in the five western states continued at an even keel, the $240,593,209 total exceeding May by $1½ million. California and Montana barely surpassed the previous month's totals; Washington chalked up a sizeable increase; Oregon and Idaho showed sizeable drops.

The first half of the year is running slightly behind the corresponding period in 1955. The six-month totals by state are:

	1956	1955
California	$1,063,898,673	$1,068,746,333
Oregon	75,560,905	68,253,539
Washington	161,293,241	169,743,022
Montana	15,280,497	12,861,562
Idaho	13,045,845	11,816,269
	$1,329,084,161	$1,331,420,725

The building picture undoubtedly is being influenced by a curtailment of housing starts. NAHB reports that since the middle of last year there has been a consistent downward trend nationally in the home building economy. Association officials believe that volume will be stabilized at somewhere around the current level with some sidewise shifts from time to time and that the second half of the year may be slightly better.

Compared with June of last year, the five-state total is $2½ million short, attributed mainly to a leveling off in California which had a 5% decrease. Idaho also was down but the other three states recorded gains: Oregon, 7%; Washington, 20%; Montana, 61%.

Following is a breakdown of building permits issued by several of the major agencies during June.

	DWELLING UNITS		COMMERCIAL & INDUSTRIAL		PUBLIC	
Portland	74	($ 1,117,800)	82	($ 811,280)	3	($ 215,000)
King County	448	(3,647,755)	56	(10,511,342)	5	(408,300)
Seattle	171	(1,662,305)	96	(659,335)	3	(2,259,000)
Tacoma	191	(1,183,805)	6	(785,500)		
Los Angls Co.	1,644	(20,267,024)	180	(4,716,108)	14	(282,000)
Orange County	452	(4,123,792)	35	(1,153,475)	78	(2,923,594)
Sacramento Co.	875	(7,691,992)	50	(838,248)	34	(684,405)

Building Permit Totals for 116 Western Agencies for June 1956

MACOMBER V-BEAMS

When this product was introduced in 1955 the ruggedness and structural economy it provided were demonstrated so convincingly that today —less than a year later—Macomber V-BEAMS are in nation-wide demand.

THINK what it means to you to have a steel framing member that is not only lighter and therefore less expensive but STRONGER than other steel framing members for floors and roofs.

If you do not have a V-BEAM catalog, send for yours today and see why the V-BEAM is fast becoming the architect's choice for any building within the 48' span range.

LANDSCAPE AND GARDEN MANUAL from which sketch is taken gives pointers on design, overhead structures, plant cautions, color, night lighting, etc.

'Climate control' for builder's subdivision

WHEN BUYERS moved into their single-story and two-level residences in Rollingwood, they got "climate control" for good measure. The hillside sites in the suburban San Francisco subdivision provided weather problems along with the dramatic views.

Builder Andres F. Oddstad Jr. realized that if his clients were to enjoy the 1,000 sq. ft. of patio space benched out for each home, they would need a plan for plantings, fences and other windbreaks. He engaged the California Foundation for Horticultural Research to recommend a program. The result: a 48-page landscape and garden manual tailored to Rollingwood conditions.

But Oddstad's plan didn't end there. He gave each owner a chance to attend three free lectures on landscaping and to consult with a licensed landscape architect to iron out individual problems.

Oddstad in his preface of the garden book commented: "In preparing the material, working with soil scientists, gardening experts, nurserymen and horticulturists, I was impressed with the feeling they had that when shrubs and trees take hold, the whole garden climate of Rollingwood would gradually change. Winds will be lifted over the gardens; growth of all plants will be more rapid. No plant likes to grow alone. Plants thrive in communities where one protects the other."

Recreational unit can serve variety of purposes

- **Built at $7 per sq. ft.**

Remodeling activities of Prather & Lozica, Oakland home builders, have resulted in the development of a family recreation structure which can be attached to the home or built separately at a total cost of $2,100 or $7 per square foot.

"We call it the Rumpus Room," explains Gordon Prather, "but actually it can be used for any purpose the home owner desires, or even as a mountain lodge, office, motel unit or even a 'mother-in-law' house."

The $2,100 price tag includes all construction, 15 by 20 ft of space, fireplace, sliding aluminum patio doors, jalousie windows, beam ceiling, rock roof, wiring, painting inside and out, asphalt tile, brick planter and steps.

More than 200 northern California families either have added the room to their homes or used it as a lodge.

RUMPUS ROOM devised by Oakland home builder at total cost of $2,100.

One of world's largest dredges pumps fill for Bay area shopping center

A GIANT DREDGE, the Franciscan, the size of a modern U.S. Navy destroyer, is now pumping sand from the depths of San Francisco Bay to lift up land alongside Alameda on which will rise a vast new community of homes, beaches, shopping centers, schools and parks to be built by Utah Construction Co.

The dredge, which cost more than $2½ million, was constructed specially for the Utah firm and is one of the largest in the world. Every month for the rest of 1956 it will pump nearly one million cubic yards of fill.

"By the first of next year," explains Allen D. Christensen, president of Utah Construction Co., "the South Shore area of 11 million cubic yards will be filled and we can begin actual construction on brand new land of a modern shopping center to serve the community of new homes we will build."

When the South Shore fill is completed, the giant dredge will then move to a companion project at Bay Farm Island, where Utah will construct another large planned community of homes. The dredge will pump 25 million cubic yards of fill at Bay Farm Islands in 2½ years' time.

Together the two new projects will provide homes for 5,000 San Francisco Bay area families in a construction project which involves a $23 million payroll and some $43 million in materials. The cost of furnishing electricity to the dredge alone amounts to $40,000 a month.

The land to be filled in on the South Shore includes 350 acres in area and the development will have 1,300 new homes, a 40-acre shopping center, with 32 acres for off street parking, 28 acres for schools and parks and a sandy beach for public use which will be 250 ft. across, built on a slope of 20 to 1.

Completion of the South Shore project will add 8% to the total land area of the city of Alameda. Completion of the Bay Farm Island project will add another 17% to the land area of the city.

The entire project will require more than enough lumber to circle the earth with a 1x6 plank, more than enough asphalt to pave a four-lane highway from Alameda to Sacramento, more steel than needed for 3,000 automobiles, a small mountain of concrete and half a million tons of rock.

LIFTING UP LAND alongside Alameda, Calif., this dredge will pump nearly one million cubic yards of fill every month for rest of year.

The huge dredge accomplishing the task of providing the land for this project displaces 2,400 tons. It is 207 ft. in length (285 with ladder), 42 ft. wide and has a 12-ft. hull. A crew of 75 men operate the dredge on an around-the-clock shift.

Built-in telephone outlets are a must in today's homes

says ARTHUR K. EHRLICH, Arthur K. Ehrlich & Associates, Burbank, Calif. Builders, *Better Homes & Gardens* Idea Home for 1955 in Glendale, Calif. (pictured below)

"We wouldn't dream of building a home without concealed wiring and telephone outlets in the original plans. It's the kind of detail that sets the well-built home above the average. It just has to be there." Telephone outlets in rooms that are used most add much to the value of Ehrlich homes.

To successful builders like Mr. Ehrlich, who are setting living standards in the Pacific West, complete telephone planning is as basic as adequate electrical wiring. We are always ready to help you plan built-in telephone facilities. Just call us and ask for our *free* Architects and Builders Service.

Specify built-in telephone facilities —a sign of good planning

NAHB reports on its 'air conditioned village'

$115 is average cost for year-round comfort in 22-house project in Texas

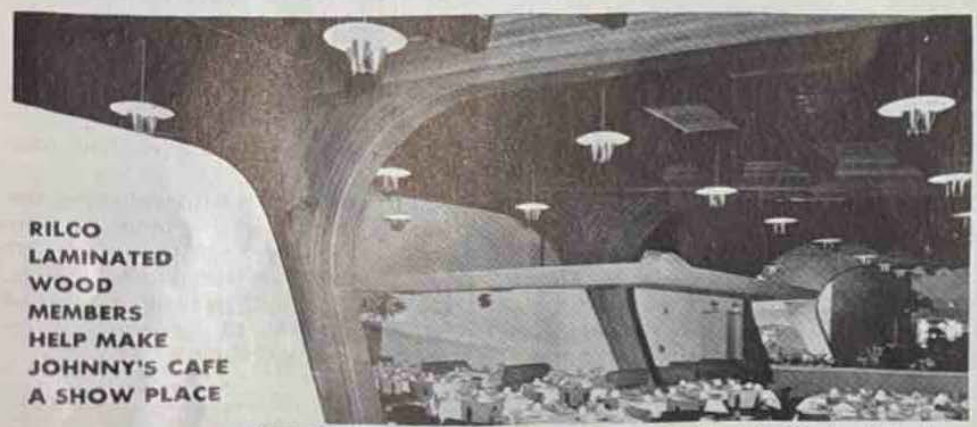
YEAR-round comfort in the home, with modern heating and cooling systems, is relatively inexpensive.

This is one of the principal conclusions set out in the final report on the National Association of Home Builders' air conditioned village research project in Austin, Texas. The highly technical summary report was prepared by the NAHB Research Institute primarily for the guidance of home builders.

"A major effort of this report has been to achieve an overall reduction of the in-place cost of air conditioning in order to make its benefits available to more people," the institute observes.

The 22 homes in the NAHB air conditioned village were started in 1953 and completed the following June with the cooperation and assistance of interested industry organizations. The houses and equipment, as well as the families living in the village, were subjected to extensive research designed to test the performance of various design and construction types of air conditioning systems. The objectives were to obtain initial construction and operating cost information on air conditioning and provide technical data for a) sizing equipment; b) layout installation and operation; and c) construction details on economical air conditioning.

Research at the project in 1955 disclosed that year-around heating and cooling operational costs averaged approximately $115.65 a year for the village houses on the basis of Austin utility rates. The utilities included electricity, gas and water. This figure would, of course, vary with the climatic conditions and utility rates in other parts of the country.



Although not related specifically to the Austin project, the report also included the finding that the cost of air conditioning only would increase the monthly amortization payments of a 20-year mortgage by approximately $6. A compensatory factor in the family budget, however, is the reduction in the cost of away-from-home summertime dining and entertainment "just to be comfortable." There was an average difference of $5.80 a week between the outside entertainment expenses of the village families and families living in non-air conditioned houses during the summer months.

The institute suggested that home builders evaluate the sales advantages of air conditioning, as well as their local markets, before a) offering an air conditioned home or b) making provisions for "add-on" type of air conditioning to be added or omitted at time of sale. The latter was specifically recommended for low and medium priced houses.

The report outlined six items in the in-place cost of year-around air conditioning which should be taken into consideration by home builders. Some are obviously applicable to persons contemplating air conditioning in existing houses. The cost items:

Equipment; installation; cost due to interruption of normal construction program; cost of floor space, including that required for access as well as for the actual unit; maintenance cost during the warranty period; and cost

NEVER ENDING STREAM OF COMPLIMENTS

RILCO LAMINATED WOOD MEMBERS HELP MAKE JOHNNY'S CAFE A SHOW PLACE

Architect, Willis Regier AIA; Contractor, Cooper Construction Company; Omaha, Nebraska.

Pleased customers of Johnny's Cafe, Omaha, Nebraska, often praise the unusual design of the building as much as they do the food. There is a "never ending stream of compliments" and Johnny doesn't mind, just so long as they come back for more.

Omaha Architect Willis Regier has used Rilco Laminated Wood Frames to achieve a striking interior design with the structural members. Curved elements act as interior supports sweeping into the ceiling beams in a graceful arc. The frames are 20 ft. o.c. with a span of 43 ft.

Rilco Structural Wood Members fit into many types of construction — churches, schools, industrial and commercial buildings. Fire safe Rilco Laminated Wood Members span large areas gracefully and economically.

Rilco engineers will gladly work with you on your requirements and give on the job cooperation. Just write —

Sketch shows unusual design of complete laminated wood frame.

RILCO works wonders with wood

HOUSING SURVEY

The most comprehensive study ever undertaken of the physical characteristics of new housing is now being conducted by the Bureau of Labor Statistics of the U.S. Department of Labor and sponsored by Producers' Council. The sample survey will cover from 40,000 to 45,000 homes which were started the first quarter of 1956.

of increase, if any, in construction specification requirements.

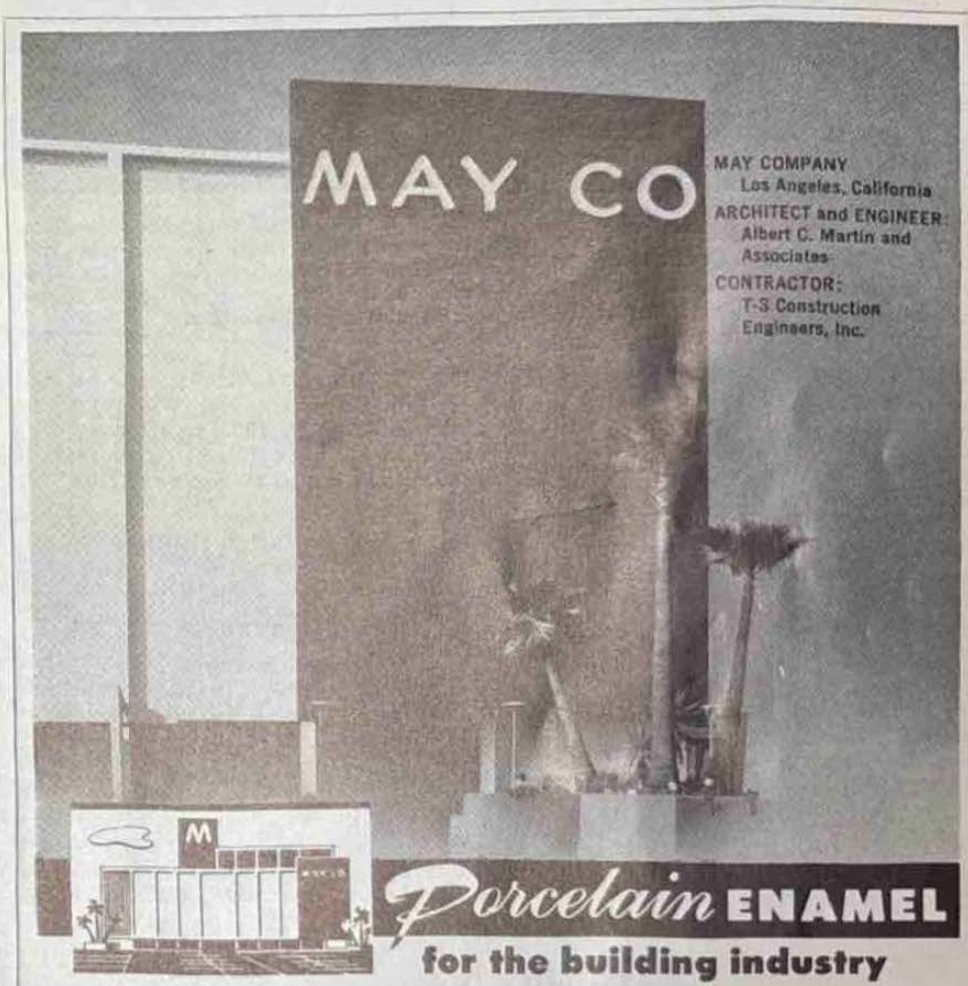
With regard to equipment costs, the report says:

"As with any product, mass production will produce a downward trend in factory costs. However, for the near future, the addition of refinements and improvements now being studied may offset such a trend. The Austin village project has contributed to and stimulated the continuing industry efforts to provide improved quality, such as integral noise control and continuous fan operation."

The report also notes that the trend in heating and cooling equipment is toward "increased packaging and simplified installation methods, all aimed at reduction in field installation costs."

The central air conditioning systems installed in the 22 Austin houses were of different manufacture and types. The houses are not indentical and some, for reasons of research, were designed with temporary features considered undesirable for efficient air conditioning. The village offered an excellent vehicle for research and turned up significant information. However, the units in the individual houses were not comparable with each other in terms of operational costs and performance because of the varying heat loads and the conditions under which the tests were carried out. Data on individual units will not be made public.

The tests were under the direction of NAHB project manager Ned A. Cole of Austin. They were conducted to determine the relative importance of the four principal elements producing comfort—air motion, relative humidity, air temperature and mean radiant temperature—and the values which are desirable to maintain in each.



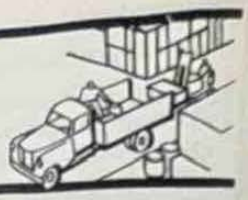
"Comfort is more important than efficiency," the Research Institute comments, "but both are necessary for economical residential air conditioning."

In determining the size of both heating and cooling systems it is necessary, in the former, to determine heat loss and, in the latter, the heat gain. The amount of heat or coolness required to offset the loss or gain determines the size of the unit required. A large number of factors enter into the calculations, including orientation of the house, design, type of construction, equipment, occupancy, location of windows and trees, and both the size and location of the ducts.

"Numerous methods of calculating heat loss/gain are available; almost all have merit and certain advantages," the report says. "The air conditioning industry is working diligently in an attempt to obtain agreement on a single simpilfied method of calculation."

The report shows that data obtained from the 22 Austin houses under research conditions were at variance in some respects with yardsticks generally accepted by the industry both with regard to average heat gain and the output of equipment.

Copies of the report are available at $2 apiece from the NAHB Research Institute, National Housing Center, 1625 L St., N.W., Washington 6, D. C.



Porcelain Enamel assures outstanding beauty for this modern department store. Even through years of exposure to severe weather and corrosive elements... this glass-hard surface will not fade or deteriorate! Builders and Suppliers

headlining the news

• **Washington Brick and Lime Co.** of Spokane has purchased Evertru Products Co. of Moses Lake, one of the largest concrete operations in the Columbia Basin. Neal R. Fosseen, Washington Brick president, reports that Evertru will be an independently operating subsidiary, with Lester O. Kalbrenner as general manager.

The Spokane firm now is in the completion stages of its new $400,000 tunnel kiln for the production of glazed structural tile units.

• **Ralph E. Bennett & Associates** of Beverly Hills, Calif., have been named West Coast representatives of the Tectum Division, Peoples Research and Manufacturing Co. The Bennett firm, whose offices are at 221 N. Robertson Blvd., specializes in structural materials, insulation and fireproofing materials.

• **United States Plywood Corp.** has appointed two district managers in its California operations, according to Fred B. Smales, vice president and West Coast regional manager.

Donald L. Braley, manager of the Los Angeles branch, becomes manager of the southern California district; Donald L. Kesselring, manager of the Oakland branch, takes charge of the northern California district.

• **Modernfold Doors, Inc.,** has been named exclusive distributor in the Seattle-Tacoma area for Ador Sales, Inc.

• **Trane Co.** has appointed Roger Burtness manager of its Billings, Mont., sales office at a new address:

REELECTED PRESIDENT of Gypsum Association for second year, Claude E. Harper (r.), vice president and general manager of Kaiser Gypsum Co., is congratulated by Lloyd H. Yeager, association general manager.

403 N. 24th St. (9-0269). A graduate of the University of Wyoming, he joined Trane in 1950 as a sales engineer in Billings, following a tour of duty with the U. S. Navy.

• **Robertshaw-Fulton Controls** has appointed K. Kelly Kennan as San Francisco district sales manager for the heating appliance controls division. Kennan's territory covers northern California, Oregon, Washington, Montana, Wyoming and Nevada. He has been with the company since 1954.

• **L. O. F. Glass Fibers Co.** has named these distributors in the West: The E. J. Bartells Co. of Portland, Seattle and Spokane and Pacific Insulation Supply Co. of Puente, Calif.

• **W. P. Fuller & Co.** has been appointed a sales distributor in eight western states for asphalt coatings and floor covering adhesives produced by The Henry Co. of Huntington Park, Calif.

• **Architectural Plastics Corp.** of Eugene, Ore., which will expand its two divisions — Plasti-Products Co. and Design Industries — has announced the public sale of 4,568 shares of its common stock. President George R. Hermach states that the current expansion program involves additional geographical coverage and an accelerated research and engineering program.

• **Western Pine Association** has increased the floor space of its research laboratory in Portland by 60% with a two-story addition. The research staff of 11 is headed by Carl A. Rasmussen.

• **Pioneer Manufacturing Co.** will construct a $1 million plant in Puente, Calif., for the manufacture of home appliances. Pending completion of a second factory unit and office building, the company's executive offices and existing plant facilities in Los Angeles will be maintained, says president Ray A. Polverini.

• **Prescon, Inc.,** of Paramount, Calif., and Prescon of Texas have been merged to form Prescon Corp., which will manufacture headed, cold formed, steel wire units for stressing concrete. The Corpus Christi firm has working arrangements for the distribution of the units in Washington and

Flush type wall hydrant with locking type hinge (will rough into 6" wall).

Nipple and adapter allow placing inlet at either side or back.

California, says Guy Braselton of Corpus Christi, who headed Prescon of Texas and now is serving as president of the new company.

• **Given Manufacturing Co.** of Los Angeles has changed its name to Waste King Corp. to provide closer identification with the products it manufactures: disposers, dishwashers, built-in ranges, commercial disposers and incinerators.

• **Calaveras Cement Co.** has established an office in the Builders Exchange in San Jose to service dealers and contractors in the south coast area of northern and central California. In charge will be Philip J. Eldredge, who for the past 3½ years has covered the same territory for Colorado Fuel and Iron Corp.

• **Ajax Hardware Sales Co.** has appointed Toby N. Tobias as general sales manager. Since joining the firm in 1955, he has held the position of territory sales manager and assisted the president in all sales activities.

• **E. K. Wood Lumber Co.** has appointed J. D. Hanauer as assistant general manager and Jerry Huntley as sales manager of its southern California division, which is now located in new quarters in Whittier. Hanauer continues to act as general manager of Fabricraft of California, a Wood subsidiary which manufactures and markets the Feather Glide wardrobe door.

• **Noise Control of Seattle, Inc.**, has moved from 1109 N. 35th St. to larger quarters at 600 W. Nickerson (ALder 8390).

• **Trimview Metal Products** of Covina, Calif., has opened a new administration building at 600 N. Third St.

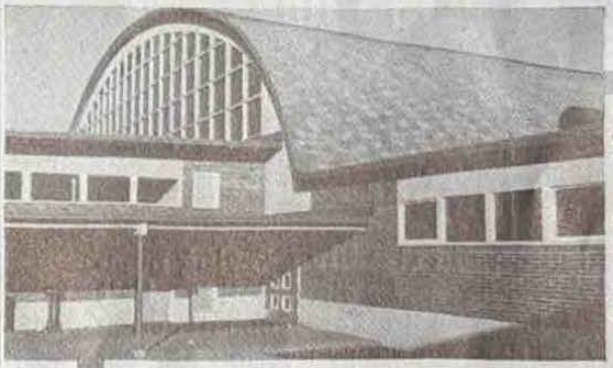
BUILDING PRODUCTS EXHIBIT

Reservations are now open for building products exhibit space at the 1956 California Council of Architects convention, according to exhibits manager Donald Canty.

Convention headquarters for the October 10-14 sessions will be the new Yosemite Lodge, with building products exhibits in the old lodge directly across from the new structures. Because of limited accommodations, the number of exhibit booths will be held to 55 this year, some 20 less than in 1955.

Full information may be obtained by contacting Canty at the council office, 26 O'Farrell St., San Francisco 8.

OUTGOING PRESIDENT of Producers' Council in Seattle, Tom Franklin (l.), Minneapolis-Honeywell Regulator Co., poses with four incoming officers: Robert Grimm, Ehrlich-Harrison Co., vice president; John McDaniel, Libbey-Owens-Ford Glass Co., secretary; E. E. Henry, Gladding, McBean & Co., treasurer; and Ralph Yoder, SCPI Pacific Northwest Brick and Tile Association, president.



• **Schemenauer Manufacturing Corp.** has named two new sales representatives in the West: Tower Boiler Sales of San Francisco for the state of California and Leffler Engineering Sales of Billings for Montana and Wyoming.

• **Aeroil Products Co., Inc.**, has appointed Charles E. Klevies as regional manager of its western division with headquarters in Los Angeles. He will head sales and service in the 11 western states.

• **Seattle Master Builders Association** has seen two of its members—Samuel Anderson and Stanley Long—honored for their more than 40 years of service to the industry. Each received gold cuff links from the NAHB in recognition of their work.

• **Matson Ston-O-Fect Co.** of Olean, N. Y., has opened a plant in Van Nuys, Calif., to serve the San Fernando Valley. It will be operated by John L. Sweeney and Roy Adkins.

• **Arcadia Metal Products** has expanded its northern California branch office to include northern Nevada. An optional service which includes installation, flashing and final adjustment of both steel and aluminum

NEW WAREHOUSE of Wm. B. Proby & Associates, Inc., manufacturers' agent for electrical equipment, at 2915 13th Ave. S.W., Seattle. Tilt-up wall structure was designed by architects Wortman & Wilkin, built by Strand, Inc., for Donald W. Close, building owner. Warehouse takes up entire main floor with exception of shipping office, while main business offices are on mezzanine floor extending across front part of building.

I've no worries about TERMITES or ROT...

I built with BOLIDEN SALT pressure-treated lumber

Architects and builders in steadily growing numbers are recommending and using Boliden Salt Pressure-Treated Lumber in home construction because it provides dependable protection against termites and rot. The small extra cost now is a long-range saving.

Time-tested Boliden Salt is approved as a standard preservative by the American Wood Preservers' Assn., American Assn. of State Highway officials, Federal, State and Local agencies and the P.C.B.O.B.

framed sliding glass doors now is available throughout San Francisco, San Mateo, Alameda and Contra Costa counties.

• **Bethlehem Pacific Coast Steel Corp.** has announced the retirement of its chief executive in the Northwest, Leslie G. Knight of Seattle, after 46 years' service to the steel industry. For the past three years he has been assistant to president H. H. Fuller and prior to 1953 held several positions, all at the same time.

KNIGHT

Among the important assignments Knight carried out for Bethlehem Pacific and its predecessor, Pacific Coast Steel Co., were these two: in 1919 he directed the initial construction of a new steel plant in Portland; in 1947 he was selected to serve on a nationwide industry committee sponsored by the Navy to study the feasibility of returning battlefront scrap from the South Pacific.

Accompanied by Mrs. Knight, the retired executive wants to spend the summer covering by automobile some of the same route he traveled by covered wagon when he came to Seattle with his family as a boy.

NATIONAL NOTES

• **The National Association of Architectural Metal Manufacturers** has elected Louis F. Fontana, sales manager of Irving Subway Grating Co., Inc., Long Island City, N. Y., as its president for 1956-57.

• **American Institute of Timber Construction** has chosen George E. Schweitzer, vice president in charge of sales for Rilco Laminated Products, Inc., St. Paul, to head the organization.

• **Crane Co.** suffered a major loss May 15 with the death of six sales executives and two company pilots in a plane accident at Jeffersonville, Ind. The aircraft was en route from Chicago, the firm's home base, to Louisville, Ky., where the Crane men were to attend a convention of the Heating, Piping and Air Conditioning Contractors Association.

The men were: James A. Dwyer, 59, vice president of industrial sales; George L. Erwin Jr., 60, vice president of heating sales; George L. Lindholm, 54, manager of valve and fitting sales; Jess A. McMurry, 59, director of branches; Charles A. Towner, 42, assistant to Erwin; Fred J. Wilkey, 47, special representative in industrial sales; Randy Mulherin, 54, pilot; and Robert Robinette, 27, co-pilot and Mulherin's son-in-law.

STATE HIGHWAY CONSTRUCTION
BIDS CLOSE 9:30 A.M., JULY 26
Helena, Montana
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:30 A.M., on July 26, 1956. The proposals will be publicly opened and read immediately thereafter.

1. **F 2(13)**—Grade, gravel surfacing, bituminous surface treatment and drain 11.266 miles on the Baker-Wibaux Road in Wibaux County involving about 341,105 cu. yds. excavation; 280 cu. yds. gravel backfill; 40,962 mi. yds. overhaul; 38,501 tons crushed gravel; 223,359 tons selected borrow base course; 66,907 gals. liquid asphalt; 66,907 gals. emulsified asphalt; 9,872 M gals. watering; 1,625 units rolling; 500 lin. ft. steel guard rail; 1,066 lin. ft. reinforced concrete pipe culvert; 70 lin. ft. corrugated metal pipe culvert; 286 lin. ft. structural plate pipe; and other items. Project to be completed in 240 calendar days.

2. **F 43(12)**—Grade, gravel surfacing, bituminous surface treatment, construction of one 38.0' treated timber bridge and drain. 5.256 miles on the Wisdom-Divide road in Beaverhead Countiy involving about 251,465 cu. yds. excavation; 100 cu. yds. gravel backfill; 35,784 mi. yds. overhaul; 88,833 tons crushed gravel; 30,409 gals. liquid asphalt; 30,409 gals emulsified asphalt; 5,534 M gals. watering; 1,066 units rolling; 1,642 lin. ft. reinforced concrete pipe culvert; 96 lin. ft. corrugated metal syphon pipe; 24.445 MBM treated timber; 0.607 MBM untreated timber; 576 lbs. structural steel; 100' 25' treated timber piles; 690' 30' treated timber piles; and other items. Project to be completed in 150 calendar days.

3. **F 43(13)**—Grade, gravel surface, bituminous surface treatment, the construction of one 38.0' treated timber pile bridge and drain 0.566 mile on the Wisdom-Divide Road in Silver Bow County involving about 41,506 cu. yds. excavation; 5,486 mi. yds. overhaul; 20 cu. yds. random riprap; 2,500 tons crushed gravel; 7,739 tons selected borrow base course; 4,117 gals. liquid asphalt; 4,117 gals. emulsified asphalt; 820 M Gals. watering; 122 units rolling; 464 lin. ft. reinforced concrete pipe culverts; 281 lin. ft. corrugated metal pipe culverts; 21.284 MBM treated timber; 0.607 MBM untreated timber; 675' 25.0' treated timber piles; and other items. Project to be completed not later than sixty (60) days after the issuance of a proceed order in 1957.

4. **F 62(9)**—Grade, gravel surfacing, bituminous surface treatment and drain 8.249 miles on the Shelby-Chester Road in Toole and Liberty Counties involving about 216,-276 cu. yds. excavation; 389 cu. yds. gravel backfill; 11,266 mi. yds. overhaul; 31,981 tons crushed gravel; 115,019 tons selected borrow base course; 108,858 gals. liquid asphalt; 6,160 M gal. watering; 1,170 units rolling; 1,284 lin. ft. reinforced concrete pipe culverts; 360 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 200 calendar days.

5. **FI-FGI 70(11)U3, I 70(13)U2, U 70(14)U3 and U-UG 279(3)U4** Surfacing and bituminous surface treatment on 4.383 miles on the Brewery Bypass-Butte Road and the Butte West Road in Silver Bow County, involving about 204,474 tons crushed gravel; 68,892 gals. liquid asphalt; 273,017 gals. emulsified asphalt; 688 gals. bituminous material additive; 4,090 M gals. watering; 1,780 units rolling; 7,379 lin. ft. concrete median curb; 3,-447 lin. ft. concrete integral curb and gutter; 2,463 sq. yds. concrete sidewalk; and other items. Project to be completed by July 31, 1957.

6. **F 267(9)U1**—Grade, gravel surface, and drain 7.08 miles on the Ovando-Rogers Pass Road in Powell countiy involving about 410,874 cu. yds. excavation; 805 cu. yds gravel backfill; 312 cu. yds. sand backfill; 50,546 mi. yds. overhaul; 46,714 tons top course; 1,049 units rolling; 3,596 lin. ft. reinforced concrete pipe culverts; 376 lin. ft. structural plate pipe culverts; 490 lin. ft. helically corrugated metal perforated pipe culvert; and other items. Project to be completed in 250 calendar days.

7. **S 36(6)**—Grade, gravel surfacing and drain 4.032 miles on the Drummond-Helmuilk-Blackfoot Canyon Road in Powell County involving about 310,923 cu. yds. excavation; 282 cu. yds. gravel backfill; 25,-109 mi. yds. overhaul; 25,880 crushed gravel; 5,160 M gals. watering; 737 units rolling; 258 lin. ft. corrugated metal pipe culverts; 1,122 lin. ft. reinforced concrete pipe culverts; 180 lin. ft. standard sectional reinforced concrete pipe culverts; and other items. Project to be completed in 150 calendar days.

8. **S 40(2)U2**—Grade, gravel surfacing, bituminous surface treatment, and drain 7.833 miles on the Belgrade-Menard Road in Gallatin County involving about 161,467 cu. yds. excavation; 91,740 cu. yds. designated borrow; 225 cu. yds. gravel backfill; 138,026 mi. yds. overhaul; 192,234 mi. yds. overhaul on designated borrow; 97,625 tons crushed gravel; 46,225 gals. liquid asphalt; 46,073 gals. emulsified asphalt; 5,725 M gal. watering; 1,139 units rolling; 1,318 lin. ft. reinforced concrete pipe culverts; 1,020 lin. ft. corrugated metal pipe culverts; 128 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 180 calendar days.

9. **S 120(1)U2, S SG 169(1)U4 and S 170(1) U3**—seal coat oiling on the Stevensville-Three Mile Creek Road in Ravalli County, Superior South and East Road in Mineral County and the Three Mile Creek-Florence Road in Ravalli County a total distance of 11.640 miles involving about 1,907 tons hauling and placing cover material; 43,412 gals. emulsified asphalt; 100 gals. liquid asphalt; 59 hours watering; 75 units rolling; and other items. Project to be completed by September 15, 1956.

10. **S 282(3) and S 337(7)**—Grade, gravel surfacing, plant mix oiling, and drain 10.708 miles on the Malta-North and Malta-Loring Roads in Phillips County involving about 47,123 cu. yds. excavation; 100 cu. yds. gravel backfill; 40,501 mi. yds. overhaul; 80,770 tons selected borrow base course; 43,976 tons crushed gravel; 235,078 gals. liquid asphalt; 40,828 gals. emulsified asphalt; 383 hours blading; 144 hours scraping; 3,120 M gal. watering; 784 units rolling; 318 lin. ft. corrugated metal pipe; 1,489 lbs. structural steel; 4.475 MBM treated timber; 0.092 MBM untreated timber; 1 50.0' treated timber pile; 175 sq. yds. grouted riprap; and other items. Project to be completed by September 15, 1957.

11. **S 348(7) and S 348(8)**—Seal coat oiling on 6.705 miles on Great Falls-Highwood road in Cascade County and grade, gravel surfacing, plant mix oiling and drain 7.039 miles on the Great Falls-Highwood Road in Cascade County involving about 162,178 cu. yds. excavation; 13,710 mi. yds. overhaul; 99,756 tons crushed gravel; 132,548 gals. asphalt cement; 84,483 gals. liquid asphalt; 4,222 M gal. watering; 801 units rolling; 306 lin. ft. reinforced concrete pipe culverts; 370 lin. ft. corrugated metal pipe culverts; and other items. Project to be completed by September 15, 1957.

The above listed quantities are approximate only.

All bid proposals shal lbe accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in his proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of bids is required.

Plans, specifications, forms of contract and bond, proposals blanks, and full instructions are on file for examination and may be obtained at the office of the State Highway Commission in Helena, Montana. Plans and specifications for all Federal Aid Projects are also on file and may be examined in the office of the Bureau of Public Roads at Missoula.

STATE HIGHWAY CONSTRUCTION
BIDS CLOSE 10 A.M., JULY 31
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, July 31, 1956, until 10:00 A.M. for the construction of the following improvements and will then and there be opened and publicly read:

1. Clearing, Draining, Grading and Surfacing on 5.528 miles of Secondary State Highway No. 13-A in Pacific County, AIRPORT ROAD TO NORTH RIVER, FAS No. S-0453(4), involving about 46 acres of Clearing, 394,590 cubic yards of Common Excavation, 33,670 units of Overhaul, 23,730 cubic yards of Excavation of Unsuitable Material, 28,450 tons of Ballast, 1,125 linear feet of Concrete Pipe, 1,578 linear feet of Corrugated Metal Pipe, 50 cubic yards of Hand Placed Riprap 12,520 tons of Loose Riprap and other items.
2. Clearing, Draining, Grading, Surfacing with Light Bituminous Surface Treatment, Paving with Type I-1 Asphaltic Concrete and Constructing a Reinforced Concrete Flat Slab Bridge on 3.069 miles of Primary State Highway No. 2 in King County, FACTORIA INTERCHANGE EAST, FAP No. IN-002-1(14), involving about 38 acres of Clearing, 120,290 cubic yards of Common Excavation and Borrow, 21,280 tons of Selected Roadway Borrow, 8,960 tons of Crushed Stone Surfacing, 76 tons of Asphalt Cement, 660 cubic yards of Crushed Cover Stone and Mineral Aggregate, 6,835 tons of Asphaltic Concrete, 750 linear feet of Asphaltic Concrete Gutter, 4,547 linear feet of Cement Concrete Gutter, 170 linear feet of Asphalt Lined Spillway, 890 linear feet of Asphaltic Shoulder Curb, 4,895 linear feet of Mountable Cement Concrete Curb and Extruded Traffic Curb, 2,290 linear feet of Corrugated Metal Pipe, 3,869 linear feet of Concrete Pipe, 78 linear feet of Beam Guard Rail (State Furnished), 100 Spot Posts (State Furnished), 106 cubic yards of Riprap, 560 linear feet of Conduit Pipe, 240 square yards of Paved Slope Wall, 156 cubic yards of Concrete, 20,320 pounds of Steel Reinforcing Bars, 1,700 linear feet of Timber Piling and other items.
3. Clearing, Draining, Grading and Surfacing with Selected Roadway Borrow on 2.236 miles of Primary State Highway No. 9 in Thurston County, KAISER ROAD TO TUMWATER, FAP No. F-007-5(6), involving about 61 acres of Clearing, 247,240 cubic yards of Common Excavation, 15,670 units of Overhaul, 35,-510 tons of Selected Roadway Borrow, 2,922 linear feet of Concrete Pipe, 245 linear feet of Corrugated Metal Pipe and other items.
4. Draining, Grading, Surfacing, Paving with Type I-1 Asphaltic Concrete and Stockpiling Crushed Stone Surfacing, Ballast and Mineral Aggregates on 0.522 mile of Primary State Highway No. 3 in Asotin County, HIGHLAND STREET TO CHESTNUT STREET IN CLARKSTON, FAP No. F-042-1(2), involving about 5,870 cubic yards of Common Excavation, 39,-610 tons of Crushed Stone Surfacing, Ballast, Maintenance Rock and Mineral Aggregates, 2,810 tons of Asphaltic Concrete, 23 tons of Asphalt Cement, 125 cubic yards of Mineral Aggreate, 3,211 linear feet of Cement Concrete Curb and Gutter, 308 linear feet of Precast Traffic Curb, 4,918 linear feet of Concrete Pipe, 95 square yards of Cement Concrete Sidewalk and other items.
5. Constructing a Reinforced Concrete Slab Pedestrian Bridge on Primary State Highway No. 2 in Spokane County, CUSTER STREET PEDESTRIAN UNDERCROSSING, FAP No. U1-002-6(23), involving about 267 cubic yards of Concrete, 60,000 pounds of Steel Reinforcing Bars, 768 linear feet of Steel Handrail, 600 pounds of Structural Steel, a lump sum bid for Installation of Electrical Heating System and other items.
6. Grading, Surfacing, Paving with Type I-1 Asphaltic Concrete and Constructing a Reinforced Concrete Box Girder Bridge on 0.256 mile of a Yakima County Road, WAPATO-DONALD BRIDGE AND APPROACHES, FAS No. S-0404(2), involving about 6,250 cubic yards of Unclassified Excavation and Borrow, 1,110 cubic yards of Selected Material, 545 cubic yards of Crushed Stone Surfacing and Mineral Aggregates, 380 tons of Asphaltic Concrete, 750 linear feet of Beam Guard Rail, 360 cubic yards of Riprap, 1,003 cubic yards of Concrete, 258,000 pounds of Steel Reinforcing Bars, 14,800 pounds of Structural Steel, 894 linear feet of Steel Handrail, 360 linear feet of Concrete Piling and other items.
7. Clearing, Draining, Grading, Surfacing and Paving with Cement Concrete on 2.0 miles of a King County Road, SOUTH 312TH STREET, FAS No. S-1193(1), involving about 23,660 cubic yards of Common Excavation, 19,340 tons of Selected Roadway Borrow, 3,860 tons of Crushed Stone Surfacing, 25,831 square yards of Cement Concrete Pavement, 3,300 pounds of Pavement Reinforcement, 145 tons of Bituminous Mix, 1,202 linear feet of Concrete Pipe, 80 Guide Posts and other items.
8. Clearing, Draining, Grading and Surfacing with Selected Roadway Borrow on 0.919 mile of a Kitsap County Road, PORT ORCHARD-WATERMAN ROAD, FAS No. S-0329(1), involving about 33,300 cubic yards of Unclassified Excavation and Borrow, 3,130 cubic yards of Selected Roadway Borrow, 43 cubic yards of Concrete, 5,750 pounds of Steel Reinforcing Bars, 60 linear feet of Conduit Pipe, 1,764 linear feet of Concrete Pipe, 9,950 cubic yards of Riprap and other items.
9. Constructing Two Reinforced Concrete Flat Slab Bridges on 0.036 mile of a Whatcom County Road, CALIFORNIA CREEK AND WISER LAKE ROAD BRIDGES, FAS Nos. S-0752(2) and S-0746(1), involving about 224 cubic yards of Concrete, 48,900 pounds of Steel Reinforcing Bars, 372 linear feet of Beam Guard Rail, 2,540 linear feet of Concrete Piling and other items.
10. Surfacing with Light Bituminous Surface Treatment and Paving with Type I-1 Asphaltic Concrete on 4.145 miles of Primary State Highway No. 1 in Snohomish County, JCT. BROADWAY CUTOFF TO 42ND STREET IN EVERETT, a State Project, involving about 6,000 tons of Crushed Stone Surfacing, 138 tons of Asphalt Cement, 810 cubic yards of Crushed Cover Stone, 22,460 tons of Asphaltic Concrete and other items.
11. Draining, Grading, Surfacing with Light Bituminous Surface Treatment, Paving with Unfinished Cement Concrete and Type I-1 Asphaltic Concrete and Installing an Illumination System on 0.246 mile of Primary State Highway No. 2 in King County, JCT. SSH No. 2-B, a State Project, involving about 1,170 cubic yards of Unclassified Excavation, 150 cubic yards of Selected Roadway Borrow, 480 tons of Crushed Stone Surfacing, 5 tons of Asphalt Cement, 40 cubic yards of Crushed Cover Stone, 470 tons of Asphaltic Concrete, 2,400 square yards of Unfinished Cement Concrete Pavement, 60 linear feet of Asphaltic Concrete Gutter, 320 linear feet of Integral Cement Concrete Curb, 1,745 linear feet of Precast Traffic Curb, 42 linear feet of Concrete Pipe, a lump sum bid for Installation of an Illumination System and other items.
12. Draining, Grading, Surfacing and Constructing a Non-Skid Single Seal Treatment on 3.107 miles of Secondary State Highway No. 2-F in Grant County, COULEE CITY NORTH, a State Project, involving about 43,400 cubic yards of Solid Rock Borrow, 400 cubic yards of Non-Skid Single Seal Treatment, 100 cubic yards of Crushed Cover Stone, 72 linear feet of Corrugated Metal Pipe, 388 linear feet of Beam Guard Rail and other items.
13. Installing Drainage on 0.651 mile of Primary State Highway No. 1 in Lewis County, NATIONAL AVENUE TO SALZER CREEK, a State Project, involving about 7,886 linear feet of Concrete Pipe and other items.
14. Installing an Illumination System on Primary State Highway No. 2 in King County, EASTGATE INTERCHANGE, a State Project, involving a lump sum bid for the Installation of an Illumination System.
15. Installing Illumination Systems on Primary State Highway No. 1 in Whatcom County, BELLINGHAM TO FERNDALE, a State Project, involving a lump sum bid for Installation of Illumination Systems.
16. Cleaning and Painting Three Bridges on Secondary State Highways Nos. 1-A, 1-B, and 1-E in Snohomish and Whatcom Counties, SNOHOMISH RIVER BRIDGE, ET AL, a State Project, involving about 250 hours of Sandblast Cleaning and 3 lump sum bids for Cleaning and Painting.
17. Cleaning, Painting, Bundling and Storing Bailey Bridge Components in Pierce County, BAILEY BRIDGE COMPONENTS, a State Project, involving a lump sum bid for the Entire Improvement.

Federal funds have been allocated for items Nos. 1 to 9, inclusive.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalifications of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

PUMPING UNITS
BIDS CLOSE AUGUST 14
Denver, Colorado
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4723) will be received at Denver, Colorado, until August 14, 1956, for furnishing the following motor-driven pumping units: vertical-shaft, turbine-type, four units, each with capacity of 11.7 cfs under 190 foot head; horizontal, centrifugal-type, four-units, each with capacity of 11.7 cfs under 350 foot head, and three units, each with capacity of 13.0 cfs under 150 foot head, for Brewster Flat Pumping Plants, Foster Creek Division, Chief Joseph Dam Project, Washington. Delivery is desired within 300 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5535—7-14

BRIDGE

BIDS CLOSE 10 A.M., JULY 27

Portland, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, BUREAU OF PUBLIC ROADS, July 13, 1956. SEALED BIDS will be received at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon, mail address P. O. Box 3900, Portland, Oregon, until 10:00 o'clock A.M. on July 27, 1956, for furnishing the material and performing the work for constructing 0.019 mile bridge, Oregon Forest Devepolment Road Project Umpqua 2719-B, Black Creek Road, Black Creek Bridge, Umpqua National Forest, Douglas County, Oregon, involving 130 Cu. Yds. Structure Excavation; 154 Cu. Yds. Concrete; 39,000 Lbs. Reinforcing Steel; 214 Lin. Ft. Metal Hand Rail, and other small items of work. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon. F. E. ANDREWS, Division Engineer.

5546—7-14

EARTHWORK, STRUCTURES

BIDS CLOSE AUGUST 2

Rupert, Idaho

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specification No. DC-4721) will be received at Rupert, Idaho, until August 2, 1956, for furnishing labor and materials for Earthwork and Structures, Main Canal West-Michaud Flats Project, Idaho. Location near American Falls, Power County, Idaho. Principal items are 115,000 cu. yds. excavation; 325 cu. yds. concrete; 6,000 lin. ft. standard strength culvert and pressure pipe; and other work. Completion time 400 days. For particulars, address Bureau of Reclamation, Rupert, Idaho; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5534—7-14

PUMPING PLANT EXTENSIONS

BIDS CLOSE AUGUST 21

Boise, Idaho

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4729) will be received at Boise, Idaho, until August 21, 1956, for furnishing labor and materials for Extension of "C" Line Canal Pumping Plant, Payette Division, Boise Project, Idaho. Location near Emmett, Idaho. Principal items are 4,170 cu. yds. excavation; 380 cu. yds. concrete; 388 lin. ft. furnishing and laying 48-inch diameter HC50, HC75 and HC100 concrete pressure pipe; 1,525 sq. ft. construction 8-inch concrete masonry unit walls; 21,000 pounds furnishing and erecting steel for pumping-plant superstructure; installing and testing one 75-cfs vertical centrifugal pump; and other work. Completion time 310 days. For particulars, address Bureau of Reclamation, P. O. Box 937, Boise, Idaho; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5541—7-14

CANAL STRUCTURES

BIDS CLOSE AUGUST 22

Medford, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4728) will be received at Medford, Oregon, until August 22, 1956, for furnishing labor and materials for Main Canal Structures, Station 123/00 to Station 829/00, Medford and Rogue River Valley Irrigation District, Rogue River Basin Project, Oregon. Location northeast of Medford, Oregon. Principal items are 350 cu. yds. excavation for flumes and wall; 200 cu. yds. concrete for flumes and wall; constructing 60-inch concrete siphon, about 350 feet long; constructing 54-inch concrete siphon, about 1,100 feet long; and other work. Completion time 180 days. For particulars, address Bureau of Reclamation, P. O. Box 629, Medford, Oregon; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5542—7-14

PUMPING PLANTS, DISCHARGE LINES

BIDS CLOSE AUGUST 2

Ephrata, Washington

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4719) will be received at Ephrata, Washington, until August 2, 1956, for furnishing labor and materials for Burbank Pumping Plants No. 2 and 3, Approach Channels BP-2 and BP-3 and Discharge Lines, Block 3, Columbia Basin Project, Washington. Location near Pasco, Washington. Principal items are 103,600 cu. yds. excavation; 1,839 lin. ft. furnishing and laying 30 and 42-inch diameter HC50 and HC75, concrete pressure pipe with type R joints; 535 cu. yds. concrete in structures; furnishing and installing steel discharge lines; furnishing and installing 6 motor-driven vertical-shaft, turbine-type pumping units; and other work. Completion time 360 days. For particulars, address Bureau of Reclamation, P. O. Box 937, Boise, Idaho; P. O. Box 368, Ephrata, Washington; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5529—6-30

DIVERSION DAM, CANAL

BIDS CLOSE JULY 31

Winter, California

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4716) will be received at Winters, California, until July 31, 1956, for furnishing labor and materials for Putah Diversion Dam and Putah South Canal, Station 12/46.44 to Station 14/10, Solano Project, California. Location near Winters, California. Principal items are 72,000 cu. yds. excavation; 6,000 cu. yds. concrete in structures and canal; furnish and install 14 radial gates and hoists; and other work. Completion time 360 days. For particulars, address Bureau of Reclamation, P. O. Box 546, Winters, California, or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. DEXHEIMER, Commissioner.

5511—6-23

COLLEGE CENTER BUILDING

BIDS CLOSE 2 P.M., P.S.T., AUGUST 3

Portland, Oregon

NOTICE TO CONTRACTORS

Sealed bids will be received by the Oregon State Board of Higher Education at Room 110, Portland State College, 1620 S.W. Park Avenue, Portland, Oregon, until 2:00 P.M. Pacific Standard Time on Friday, August 3, 1956, for the construction of the Portland State College Center Building at southwest Montgomery Street and Park Avenue, Portland, Oregon. Separate bids will be received for General Work, Mechanical Work and Electrical Work.

One set of drawings, specifications and forms of contract documents for the General, Mechanical and Electrical Work may be obtained by the respective prime bidders only, from Lawrence, Tucker and Wallmann, Architects, at 920 Failing Building, Portland 4, Oregon, upon the deposit of fifty dollars for General Work, twenty-five dollars for Mechanical and Electrical Work. Additional sets may be obtained from the Architects for the cost of reproduction.

The deposit made upon the procurement of drawings, specifications and forms of contract documents will be refunded upon the return thereof in good condition by the actual bidders within two weeks after the opening of bids, but to non-bidders only if returned no later than two weeks prior to the bid opening.

The drawings, specifications and forms of contract documents may be examined at the Builders Exchange in Portland or at the office of the Architects.

All bidders must be prequalified in accordance with Chapter 279, Oregon Revised Statutes.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid form provided by the Architects and accompanied by a certified check or bid bond, executed in favor of the State of Oregon and the Oregon State Board of Higher Education in an amount not less than ten percent of the total amount of the bid, to be forfeited as fixed and liquidated damages should the bidder neglect or refuse to enter into a contract and provide suitable bond for the faithful performance of the work in the event the contract is awarded to him.

The Oregon State Board of Higher Education reserves the right to reject any or all bids and to waive all informalities.

No bidder may withdraw his bid after the hour set for the opening thereof until after the elapse of 30 days from the bid opening.

OREGON STATE BOARD OF HIGHER EDUCATION,
By: Earl M. Pallett,
Secretary, Eugene, Oregon.

5543—7-6, 12

DOUGLAS GRADE SCHOOL

BIDS CLOSE 10 A.M., P.S.T., JULY 25

Juneau, Alaska

NOTICE TO CONTRACTORS

Project Aaa. 50-A-196, Grade School, Douglas, Alaska, June 11, 1956. Alaska Public Works, Office of Territories, Department of the Interior, by (Issuing office) John D. Argetsinger, Acting Director, Alaska Public Works, Office of Territories, Department of the Interior, Post Office Box 1181, Juneau, Alaska. **Sealed bids** in single copy for furnishing all labor, equipment, and materials and performing all work for the project described herein will be received until 10:00 A.M. Pacific Standard Time, July 25, 1956 in the mailroom of the Office of the Acting Director, Alaska Public Works, Office of Territories, Department of the Interior, 123 West Third Street, P. O. Box 1181, Juneau, Alaska, and then **publicly** opened and read aloud. **Information regarding bidding material, bid guarantee, and bonds** follows: Plans and specificatioin and other proposed contract documents are open for public inspection at the Acting Director's office, Juneau, Alaska; at Room 2723, Interior Bldg., Washington 25, D.C. and Associated General Contractors of America offices as follows: Seattle Chapter, Construction Center, 215 West Harrison Street, Seattle, Wash., Tacoma Chapter, 452 St. Helens Ave., Tacoma 3, Wash., Mountain Chapter, 220 W. Harrison St., Seattle, Wash.; Portland Chapter, Suite 112, Multnomah Hotel, Portland, Ore.; and the Alaska Chapter, P. O. Box 992, 306 Central Bldg., Anchorage, Alaska; at the Plan Bureau, 2413 Western Ave., Seattle, Wash., Builders Exchange Cooperative, 317 Builders Exchange Bldg., Portland, Ore.; and Payroll Service of Anchorage, 414 6th Ave., Anchorage, Alaska. Sets of such documents may be procured from the office of the Acting Director at Juneau, Alaska, upon deposit of $25.00, all of which will be refunded upon the return of the plans and specifications in good condition within **twenty (20) days** from date of bid opening. Each bid must be accompanied by a satisfactory bid security (certified check or bid bond) in an amount not less than 5 per cent of the total bid in dollars and cents. No bid will be withdrawn until thirty days after the scheduled closing date for the receipt of bids. The successful bidder will be required to furnish a performance bond and payment bond, each in the amount of 100 per cent of the contract price. The Government reserves the right to award a contract for the project on the basis of the acceptance of any or all of the alternates, whichever course is in the best interest of the Government. DESCRIPTION: Grade School, Project Aaa. 50-A-196, Douglas Alaska. A grade school building of reinforced concrete open web joints and glued laminated beam construction. Building contains approximately 23,000 sq. ft. of floor area. Information regarding liquidated damages (if any), payments, etc., is attached or made a part of the specifications. Bids shall be submitted on the forms furnished or copies thereof.

creative color...

Ceramic Veneer

Pacific Mutual Building, San Francisco, shows how Ceramic Veneer — in a special custom-made grey green mottled color — compliments design appearance. Architects: Loubet & Glynn, A.I.A. General Contractor-MacDonald, Young & Nelson, Inc.

In Honolulu, the F. W Woolworth Store reveals a unique combination of a bevel shape, tooled and smooth Ceramic Veneer Striking "Polynesian print" design exemplifies wide range of patterns now possible through the "silk screen" glazing technique. Designers: F. W. Woolworth Co., San Francisco. General Contractor: Walker Moody Co., Ltd., Honolulu.

UNLIMITED freedom of expression, within the bounds of good design, is an architectural advantage in planning and building. So great is the range of colors and styles in *custom-made* Ceramic Veneer, architects are more and more specifying this modern facing material. Indoors or outdoors, Ceramic Veneer enables you to achieve the kind of dramatic effects that are so desirable.

VERSATILITY is the major reason Ceramic Veneer earns the recommendation of leading architects. Its unique permanence, lower cost of maintenance, and the wide variety of colors, textures and sizes offer a combination of major advantages to consider in planning.

A 32-PAGE CATALOG, illustrating the many advantages of Ceramic Veneer is now available and can be mailed to you quickly. Write today . . . or ask the CV representative near you to demonstrate how Ceramic Veneer can enhance the beauty and practicability of your projects

Macomber Did Something About The Time and Cost of Erecting SCHOOLS

NEGLEY (OHIO) ELEMENTARY SCHOOL
ROBERT BEATTY, A.I.A., ARCHITECT
EAST LIVERPOOL, OHIO

WHEREVER A V-LOK STEEL FRAME IS USED, A SCHOOL BOARD AND LOCAL TAX PAYERS SAVE MONEY AND THE SCHOOL IS IN USE MONTHS EARLIER

Schools all across the country are being erected at tremendous savings — per square foot — due to the speed of interlocking structural members. Large rambling elementary and secondary schools are erected and under roof in a few days when Architects design with V-LOK. This is just the reverse of the ancient practice of eventually putting a roof over a school when the walls are completed.

This fundamental difference speeds up every other operation and non-bearing walls and partitions provide greater flexibility for future needs. Send for this booklet. It sells the whole idea of V-LOK savings to your Board and Building Committee.

"Been settin' here, wettin' this fool stick for twenty years—and she ain't rotted yet." Paul Bunyan threw down the 12x12 Chemonited* timber in defeat. His disgusted sigh flattened 30 acres of prime Douglas fir. "Yessir, Babe, I been suckered again by a city slicker. That Baxter man bet me a year's free loggin' to a month in Frisco that that there stick would never rot—even in moist ground. On account of this new fangled presarvative, Chemonite* . . . Well come on, you lazy Blue Ox, let's get haulin' . . ."

Baxco

CHEMONITED

pressure treated lumber

*You WERE slickered, Paul. Because hundreds of installations prove that when you pressure treat wood with Chemonite, as the Baxter people do it, you've got a PERMANENT construction material protected from decay and termite attack. Just like the man said, Paul, even water and exposure won't take away that locked-in Chemonite protection. Baxco Chemonited wood is clean, odorless, paintable . . . Write for "Chemonited Forest Products," 28 page brochure on the development, testing, uses and service records of this wood preservative.

RECOMMENDED USES: *Building Foundations . . . Bridge Timbers . . . Wharf Timbers . . . Fence Posts . . . Septic Tanks . . . wherever wood is exposed to decay or insect attack.*

PERSPECTIVES

by Pacific architects

SAFEWAY DISTRIBUTION CENTER to be erected in Butte, Mont., will be refrigerated building, costing more than $2 million. Designed by Norman J. Hamill & Associates, it will have 216,000 sq. ft. of floor space, concrete foundations and floor slabs, concrete block exterior walls, wood trusses, refrigeration rooms, truck repairs, grocery warehouse, perishable goods warehouse and offices.

DESIGN OF ARIZONA WILSHIRE, luxury apartment building set for construction in Santa Monica, is oriented around 6,000-sq. ft. patio where heated swimming pool provides focal center of landscaped area. Two-story structure combines beige spandrels and charcoal mullions in "meander" pattern with ceramic tile panels in accent colors. Architects for 68-apartment project are Palmer & Krisel.

PRESBYTERIAN CHURCH of Wapato, Wash., will construct sanctuary and fellowship hall on site where church was burned earlier this year. To cost about $175,000, project will have solid masonry walls in sanctuary, brick veneer in hall, with wood exterior trim on both. Plans were drawn by architects Don Gochnour and Edward H. Marble.

HEADQUARTERS AND MAIN FACTORY of Marchant Calculators, Inc., in Oakland will be one of nation's largest light manufacturing plants. Representing $4 million investment, structure will consolidate activities now housed in 12 buildings, with 12 acres under roof. Plans prepared by Albert F. Roller, AIA, call for reinforced concrete walls and floors, with large exterior areas faced with brick.

"ARCHITECTURE UNLIMITED" will be the theme of the fifth annual conference of the Northwest Regional Council, AIA, which will meet in Tacoma, September 6-9, with the Winthrop Hotel as headquarters. Keynote speaker will be William L. Pereira, AIA, Los Angeles. Two other Angelinos will give major talks: landscape architect Garrett Eckbo and engineer Edgardo Contini, associate in charge of Victor Gruen's proposal for downtown Fort Worth.

All three Californians will appear on a panel devoted to the conference theme and moderated by John S. Detlie, AIA, Seattle. The program calls for two other seminars, one on forest products with Paul Thiry, FAIA, Seattle, presiding and another on prestressed concrete with Dr. Arthur Anderson, structural engineer, Tacoma.

National AIA president Leon Chatelain Jr., FAIA, will be the main speaker at the Saturday night banquet at the Tacoma Country Club. Other events: dinner with an address by Walter Taylor, AIA, of the Octagon staff on Thursday and a Puget Sound cruise and salmon bake on Friday.

CALIFORNIA ARCHITECTS AND ENGINEERS are being asked to contact contractors and construction suppliers for contributions to support SCA 6 which will appear on the November ballot as Proposition 10. Campaign manager William Latta says that the program must be stepped up if the $150,000 goal is to be reached. Proposition 10 is intended to speed the state construction program through use of private architects and engineers.

NAHB HOUSING DELEGATION, back from a tour of Russia as guests of the Soviet government, reports that Russians suffer from a lack of production facilities and skilled workmen but that the construction industry there has "done a very big job." Of particular interest were the Soviet techniques in the manufacturing and handling of prefabricated concrete beams, floor and wall panels for apartment house construction and "quickie" building methods—the latter frequently at the expense of quality with regard to finishing and conveniences.

SOUTHERN CALIFORNIA HOMES top the nation in design because "only about 2,000 U. S. builders regularly use the services of an architect—and more than half of these are in the southern California area," according to Arthur B. Gallion, dean of the School of Architecture at the University of Southern California. Fred Emmons, AIA, and William Krisel, AIA, who served on a recent panel with Dean Gallion, agreed that home styling in the area is in transition, with the public "still divided between traditional and contemporary design." All pointed out that the scale is slowly tipping in favor of the latter.

SWAN SONG OF 84TH CONGRESS included passage of the Housing Act of 1956 and an omnibus GI bill which extends the World War II loan program ending date for one more year to July 25, 1958.

NEW LIST OF AMERICAN STANDARDS indexes about 275 in the field of construction and civil engineering. They include codes for building and plumbing, test methods and specifications for building materials of all types, fire tests and safety precautions in construction, modular coordination and many other related items. The 56-page booklet is available by writing the American Standards Association, 70 E. 45th St. New York 17, N.Y.

THE FEDERAL-STATE CONFERENCE ON AGING has recognized that private housing, both single-family and group units, plays an extremely important role in any well rounded program. One of the comments: "We ought not to be building homes for older people as such but well designed, more flexible homes which would include special features, such as handrails and a minimum of stairs. Such homes would have features that would be both essential for the aging and also useful and practical for younger people just starting their families. They would be, in effect, small homes that would be attractive and saleable to any small family seeking a modest-sized home."

AN ARCHITECTURAL LANDMARK in the nation's capital, the Old Patent Office designed by Robert Mills, may be preserved by the government, first as an office building and later for use as a national portrait gallery.

CENTRAL AIR CONDITIONING MANUFACTURERS at a housing meeting in Washington, D. C., claimed that $100 a year is a fair allowance for operation and maintenance of such systems. Meanwhile, a nationwide survey of factories by another manufacturer, The Trane Co., reports on two West Coast cities.

San Francisco—Trend is developing slowly because of low summer and mild winter temperatures in Bay area industrial sections. Increase in tendency to arrange installations to provide for cooling later is very pronounced.

Los Angeles—Many air conditioned factories listed. Trend is snowballing as companies compete for personnel in critical labor market. Harold Cross, vice president of Union Bank, recommends to customers that they consider air conditioning to cut down turnover in personnel.

COLOR SEEMS TO BE AN UNKNOWN QUANTITY in most urban planning, H. Creston Doner, director of design and color for Libbey-Owens-Ford Glass Co., told a citizens' forum in Toledo. "Today the architects, landscape architects and city planners are beginning to coordinate their thinking, but color still is a subject avoided by most experts. Some of the new skyscrapers in the country are beginning to blossom out in gay colors, but it has taken such architects as Eero Saarinen of Detroit and Carlos Lazo of Mexico to use bold, dramatic strokes of color in the great new building projects."

THREE SAN FRANCISCANS will be on the program of the Modern Masonry Conference in Washington, D. C., September 19-20. They are S. Robert Anshen, AIA; A. E. Barnes, manager, architectural products promotion, Gladding, McBean & Co.; and Walter L. Dickey, The Bechtel Corp.

A LEADING BUSINESSMAN and founder of the Building Research Institute has called on his industry to expand its psychological and sociological research activities. "We can no longer afford to give the consumer what he ought to want rather than what he really wants," declares chairman Melvin H. Baker of National Gypsum Co. He asserts that "we have proceeded blithely to develop new architectural styles, combining living and dining rooms, cutting kitchens to a minimum and eliminating extra rooms."

HOME BUILDING AND COMERCIAL CONSTRUCTION throughout northern California ground to an almost complete stop during July when a double-header strike of 16,000 carpenters and 2,000 plumbers joined for a short period by plasterers, dragged on for two weeks. Both strikes ended with new contracts and wage boosts for all concerned, presaging a substantial rise in construction cots and inevitably in the sale price of new homes to be built in the future.

In southern California the record-breaking pace of construction, which last year set all-time records in the

NEW PARTNERSHIPS: Gifford E. Sobey and Marvin S. Knox have formed an architectural partnership under the firm name of Sobey & Knox and have moved to new offices at 200 San Mateo Ave., Los Gatos, Calif.

In Billings, Mont., Vernon Drake, AIA, and F. Wayne Gustafson, AIA, have formed a partnership for the practice of architecture in the Empire Building. Drake has been engaged in private practice in Billings since 1950. Gustafson has been a member of his new partner's staff for 1½ years. Both are Montana State College graduates.

NEW OFFICES: John R. Ross has opened an office for the practice of architecture at 544 S. Bascom Ave., San Jose, Calif. (CYpress 7-5459). A graduate of the University of Southern California in 1949, he has been associated with several architectural firms in Los Angeles and San Jose.

Rodney J. Grider has opened an architectural office at 1321 Vista Ave., Boise, Idaho. He is a graduate of the University of Idaho and has been associated with the office of Thomas M. I. Leake since 1953.

James Greco has opened an office for the practice of architecture at 771 Lakeview Blvd., Seattle (FRanklin 2405).

ON THE MOVE: The Seattle architectural firm of Waldron & Dietz is now located at 215 Eighth Ave. N.

Henry Hester, AIA, has opened an office at Pier 7, Embarcadero, San Francisco. He is maintaining a temporary San Diego office at 3030½ Macauley, with Ronald Davis in charge, pending a later move to permanent quarters.

NEW FIRM NAME: Seattle partners Ibsen A. Nelsen and Russell B. Sabin who have been practicing under the former's name at 1314 E. 43rd St., now are known as Ibsen A. Nelsen, Russell B. Sabin, architects.

OREGON BOARD MOVES: Offices of the Oregon State Board of Architect Examiners were moved on August 1 from the Concord Bldg. to 307 Portland Trust Bldg., Portland. The office will be open Mondays, Tuesdays and Thursdays, and the new phone number is CApitol 7-1073.

Mrs. Joyce Wineberg is acting secretary, replacing Mrs. Margaret Goodin Fritsch, AIA. Mrs. Fritsch had served in the post since 1926, succeeding architect George M. Post, the first secretary, who took office in 1919. Mrs. Fritsch has announced no future plans.

Other new officers of the board are Irving G. Smith of Portland, president; Cleo Jenkins of Corvallis, vice president, and George Whittier of Portland, treasurer.

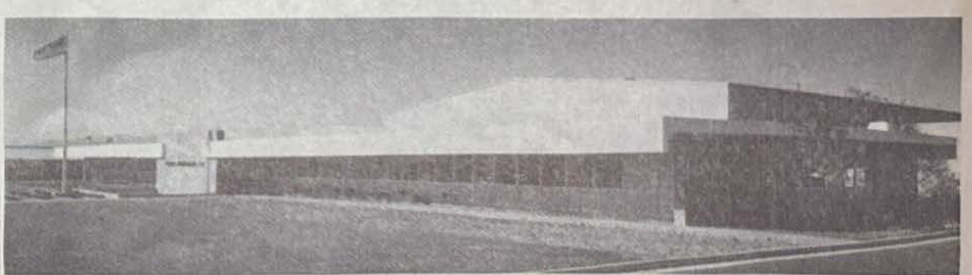
A revised version of the "California Form of Agreement Between Owner and Architect for School Building Projects" is now available and copies may be obtained from the California Council of Architects office at 26 O'Farrell St., San Francisco 8, at a cost of 10c each. Quantities larger than 100 will be made available to chapters at a special rate.

SERVICE CITED: Fred Brinkman, of the Kalispell architectural firm of Brinkman & Lenon, recently received recognition for 16 years of service on the Montana Architectural Registration Board.

EDUCATIONAL CONSULTANT: W. Harold Farquar, for the past eight years superintendent of the Southern Humboldt Unified School District, has joined the San Francisco architectural-engineering firm of Ernest Frederick Winkler as an educational consultant in the field of school plant construction.

ON WSC CAMPUS: Charles D. Peterson will leave the office of Seattle architect William Aitken to take over basic design courses at Washington State College, Pullman, this fall. He will replace Thorkel Haaland who died of a heart attack early this year. Both men had been classmates at Massachusetts Institute of Technology.

Peterson has been with Aitken since taking his master of architecture in January 1955. He received his bachelor's degree from the University of Minnesota and has taught part time in the Boston Architectural Center. He has been associated with architectural firms in New England and the Midwest.



Robert Darlington will return to the WSC campus this fall after a leave of absence during which he earned his master of architecture at the University of Minnesota. He recently received a $2,500 prize for ranking third in the national porcelain enamel design competition.

Named: Architect Robert D. McDonald has been elected president of the Citizens Association of Duarte, Calif.

New president of the La Jolla (Calif.) Town Council is Roy M. Drew, AIA.

Francis E. Huggard, AIA, has been appointed to the Seattle City Planning Commission, succeeding another architect, J. Lister Holmes, AIA.

CONSULTING ENGINEERS: J. Donald Kroeker has been elected first president of the Consulting Engineers Association of Oregon, a 41-member organization formed last month. Other officers, all of Portland: Chet A. Kershaw, vice president; R. Evan Kennedy, secretary; Grant R. Kelley, treasurer. The board of directors includes Thomas R. Miles and H. Loren Thompson, both of Portland; Holly A. Cornell, Corvallis; and Lloyd K. Clark, Salem.

LOS ANGELES ARCHITECTS AND ENGINEERS, Pereira & Luckman, have been honored for their design of the recently completed $4,500,000 Hunter Engineering Co. plant in Riverside, Calif., selected by Factory Management & Maintenance magazine as a "Significant Plant of the Year." It was one of 23 winners of special awards in the annual competition. Facade of the 134,432-sq. ft. structure is beige stucco, set off by white dividers, white stucco fascia and stone.

LONG RANGE PLANNING WITH PORCELAIN *enamel* FOR THE BUILDING INDUSTRY

BLUE CROSS BUILDING, Los Angeles
Architects: ALLISON AND RIBLE, A. I. A.
General Contractor: FORD J. TWAITS CO.

ANOTHER outstanding architectural achievement... designed to meet functional and structural needs for today and many decades to come.

Virtually the entire exterior of this building is protected by Architectural Porcelain Enamel fused to the inherent strength of steel. The locked-in beauty of this lifetime material insures that future years will find this structure as fresh and modern as today!

The versatility of Porcelain Enamel provides complete design freedom... with choice of any color of the spectrum—and finishes ranging from high gloss to semi-matte.

WRITE TODAY for latest details and Color Chart.

● *Architectural Porcelain Enamel used for veneer, louvers, soffits, sills, jambs and headers.*

CONTRACTING ENGINEERS CO.
General Contractor

WHEN CORPORATION EXECUTIVES decided to construct a medical office building on a $129,000 corner lot as in investment, they asked for the greatest possible site utilization, economical materials and functional design. Their $475,000 construction budget gave them three floors, a penthouse and a total of 27,912 sq. ft., of which 82% or 22,863 sq. ft. is net rentable floor space.

Because of the requirements of easy maintenance and inherent economy, the architects chose masonry construction to produce a pleasing exterior which need never be painted and eliminates expensive upkeep. They carried the masonry idea inside, using brick and plaster, with terrazzo and asphalt tile on the lightweight concrete slab floors to withstand rough treatment.

The structure contains the building corporation's office, a pharmacy, a clinical laboratory, a radiological suite and 28 "profitable" rental medical and dental suites.

To provide for complete flexibility of office arrangements, the architects used column spacing and a modular window layout; located heating ducts above suspended ceilings for ease of alteration; grouped plumbing risers in positions accessible from any part of the building; and installed electrical and wiring in floor ducts.

Parking, often a problem with rental buildings, has been solved in this instance. The rear of the lot and the rear of an available adjacent lot are used by a concessionaire who furnishes attendants. Slightly more than 50 autos can be accomodated normally and as many as 200 per day have been handled.

OUTLINE SPECIFICATIONS

Type of Construction: Masonry on caissons and concrete beam foundation.

Exterior Walls: Solid masonry and poured concrete faced with Norman brick, one-third bond, with motar joints same color as brick; Hollobilt store front metalwork; adjustable aluminum louvers.

Roof: Flat, composition built up with lightweight concrete thermal insulation, 4-in. fill.

Floors: Lightweight concrete over steel decking with steel joist frames, covered with terrazzo and asphalt tile.

Windows: Ceco architectural projected steel sash in reinforced concrete frames.

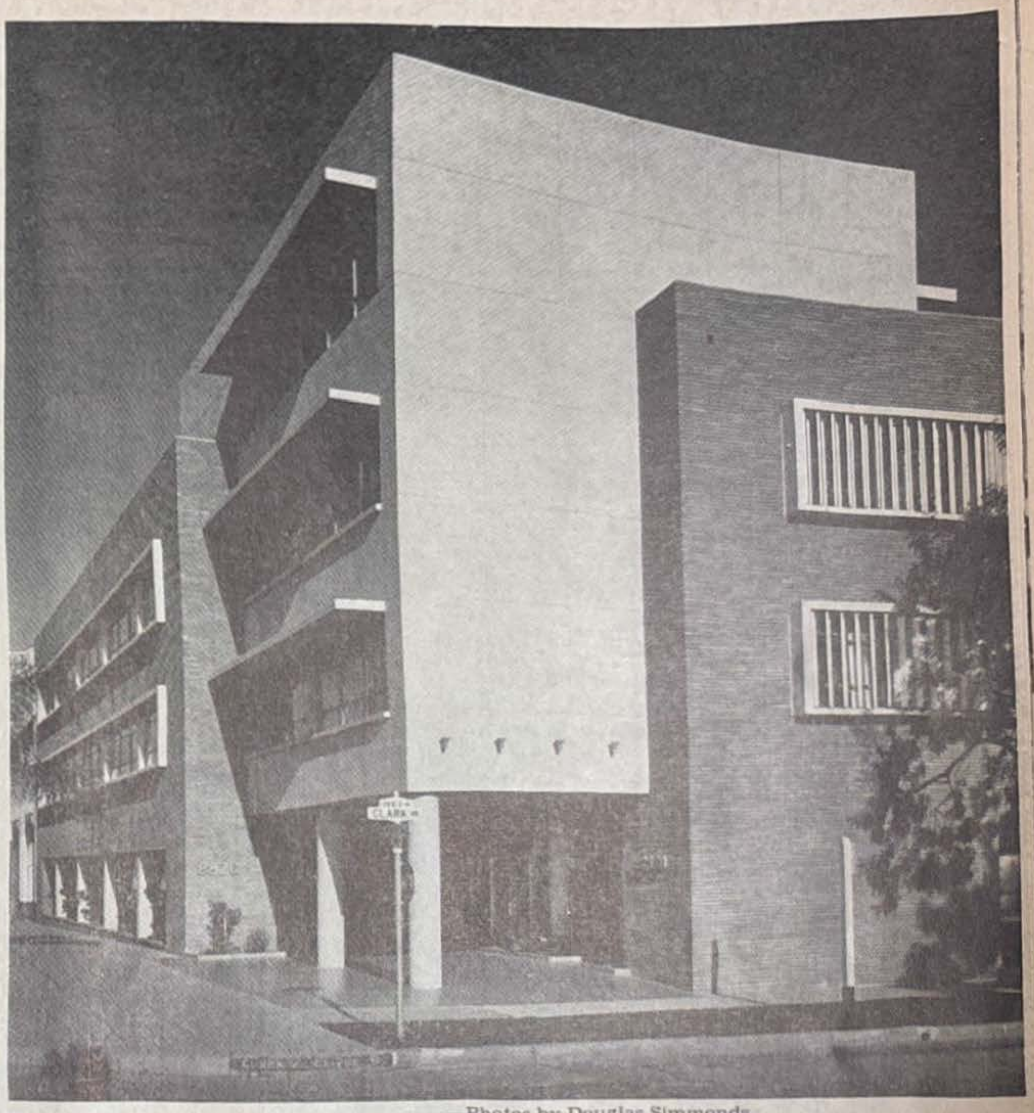
Doors: Tubular aluminum and wood slab.

Interior Finish: Brick, plaster and ceramic tile on frame and gypsum lath partitions.

Ceilings: Plaster and acoustical tile.

Heating: Gas fired Hayes furnaces.

Air Conditioning: 80-ton Chrysler Air-Temp system.



Total Cost: $475,000.

Total Area: 27,912 sq. ft.

	Gross Floor Area (Square feet)	Net Rentable Floor Area (Square feet)	Percent Rentable
1st floor	8,447	6,283	74½
2nd floor	8,905	7,554	85
3rd floor	8,905	7,554	85
Penthouse	1,655	1,472	89
	27,912	22,863	82

WEST SUN is controlled by adjustable aluminum louvers. Exterior is faced with Norman brick; entry floor, columns and planting boxes are terrazzo. Pharmacy entrance gives impression of great size.

Some philosophical questions about design

An address presented at the sixth International Design Conference at Aspen, Colo., by the co-founder of the Great Books Course and present director of the Institute of Philosophic Research in San Francisco

By MORTIMER ADLER

THE QUESTIONS about design I would like to ask are, I hope, not philosophical in the sense that they are of interest only to philosophers. I would prefer to think that they are philosophical because they are fundamental and inescapable questions which anyone who is interested in design must face.

Let me say at once that I do not know the answers to them. I do not understand the nature and meaning of design well enough to find the answers or, given competing answers, to judge where the truth lies. I look to you who have such understanding for the right answers and for the reasons why they are true.

The questions themselves, of course, rest upon some understanding of education and of art. As a philosopher who has long been concerned with both subjects, I think I have enough understanding of the purpose and kinds of education and of the purpose and kinds of art to make clear why I ask what kind of art design is, what purpose it has and what kind of education you have in mind when you propose to discuss the relation of education and design.

Let me begin with a basic distinction in the kinds of education and proceed to an equally basic and closely related distinction in the kinds of art. My questions about design will emerge from these distinctions. The clarity of the questions will depend on the clarity of the distinctions.

* * *

The most fundamental distinction in the sphere of education or learning, in school and out, turns on the purpose for which anyone learns anything.

If the learning is for the sake of leisure, it is liberal. If it is for the sake of labor, in the sense of work productive of the means of subsistence, or even of the comforts and conveniences of life, then it is **not** liberal. I say "**not** liberal" rather than "vocational" or "technical," because some of the arts for which technical training is needed belong to the pursuits of leisure and some of the professions for which men must be vocationally educated are creative of goods that enrich the mind and spirit of man rather than productive of things that serve the needs or comforts of his body. To name the kind of education which is **not** liberal because it is concerned with the production of such serviceable things, the designation which seems to me most apt, though it is likely to be misunderstood, is "servile." Anything which is a means to an end is useful. Both liberal and servile education are, therefore, useful; but they differ in the ends at which they aim and the uses to which they are put.

While it is not possible for men to live well unless they have the means of subsistence, it is quite possible for men to live, in the sense of subsisting, without living well. By living well as opposed to merely living, I do not mean having a plentiful supply of the means of subsistence as opposed to a meager amount. It is quite possible and, unfortunately, all too easy for men not to live well with superabundant wealth. King Midas with all his gold lived no better than the poorest beggar in his court. The opposite is also true. The mendicant St. Francis lived very well indeed on very meager means. So did Socrates. Living well involves all the activities of human life which are concerned with the creation and enjoyment of those goods that enrich the spirit of man and enhance human civilization or culture. They are the goods of leisure, that portion of man's time which is free from the biological necessity of servile work to provide the means of subsistence and of sleep and play to remove the fatigues of toil.

Hence when I distinguish between liberal and servile education by reference to leisure and labor, I am saying that one kind of training aims at helping men to live well and the other at helping them to earn a living. It must be remembered that we are here differentiating one kind of learning from another in terms of its purpose, not in terms of the content or subject matter of what is being learned. Though music, logic and physics are traditionally regarded as liberal arts and sciences, and have for centuries been part of the content of liberal education, it is possible to study them solely for the illiberal purpose of earning a living. Anything can be put to a servile use. A sonata by Mozart can be used to put the baby to sleep and a painting by Raphael to conceal a hiding place for bonds or jewels.

On the other hand, carpentry, masonry and the other skills involved in house building and furniture making have usually been practiced as servile arts and have traditionally been excluded from the curriculum of liberal education. Yet it is also possible to learn carpentry and related skills for the wholly liberal purpose of creating and enjoying some value that is in excess of any need for shelter or physical comfort. A Sheraton table can be placed on a platform, like a statue on a pedestal, for exhibition and with ropes around it to prevent anyone from sitting down to use it; the Parthenon no longer provides shelter for religious worship but it can still be looked at with spiritual profit.

Nevertheless, as I shall try to show in a moment, there is good reason why certain arts, traditionally classified as liberal, are normally and properly the content of liberal education, even though they can always be misused for servile purposes. The same reason explains why other arts or skills are normally and properly excluded from liberal education, even though their products sometimes escape being consumed for the needs or conveniences of living and exist to be enjoyed for the pleasure they contribute to life. But before I divide the arts into those which are essentially liberal and those which are primarily servile, let me ask my first question about design.

What kind of education do you have in mind when you come here to consider the relation of education and design? Looked at one way, that question is too easy; in fact, it is hardly a question at all if all that is meant by "education" is the study of principles and the acquirement of the skills of design. Let me, therefore, rephrase the question in the following way. **Do you think that design should be a part of truly liberal education or do you think that training is primarily servile in its purpose?**

* * *

I realize that you cannot answer this question without first answering a more basic question about the nature of design itself, as an art or skill and as a vocation or profession. I could ask that question at once if I could suppose that you regarded poetry, music and painting, or logic,

LIVING ROOM and outdoor living area (below) are bathed in morning sun, shaded in late afternoon. View at early evening from upper balcony level (right) shows panorama of San Francisco Bay area, with Richardson Bay in foreground.

Photos by Phil Palmer

Lots of livable space on tight plan

"WE WANTED a small house as an economic hedge against the possibility of inflation," explains the client, a partner in the architectural firm which designed this residence. "We also wanted a minimum of housekeeping and of non-essential space, such as hallways, and a maximum of interfamily privacy in a house of generous character."

The site that the architect-client had in mind is tabled on a hill sloping sharply to the east, overlooking a portion of San Francisco Bay, Marin County, the Bay Bridge and East Bay cities. It was subject to the wind from the west, especially during the summer months, and was well exposed to the sun. The year-round mildness of climate and the view called for an open effect toward the east and south.

The tight plan uses land sparingly but provides the family of five with a room for themselves, a guest room, two separate bedrooms for the three small children, a large living-dining area and a small kitchen. All of this is in a 24x32-ft. rectangle with two levels of sleeping quarters, one on a mezzanine reached by a ship's ladder which eliminates the need for a stair hall.

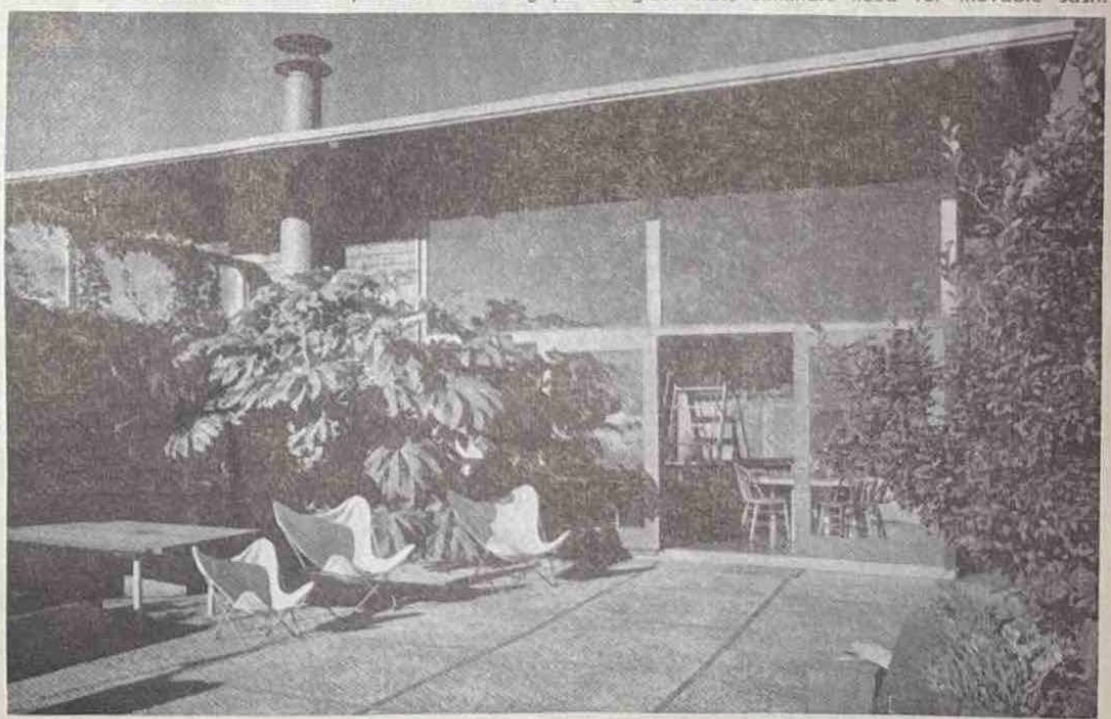
The adaptation of the mezzanine with open ladder resulted in a two-story house without the "walk up and down" or boxed room features or expensive rambling of the single-story type unit. The four-bedroom, two-bath home is amazingly spacious. One third of the total space—1,250 sq. ft.—is in the main living area.

The dormitory section stacks one level of sleeping areas above the other, with the kitchen tucked off to the side. The children's bedrooms are completely closed off and private; the master bedroom upstairs and the bedroom downstairs are open to a high glass wall, 32 ft. long and 16 ft. high, at the front of the house.

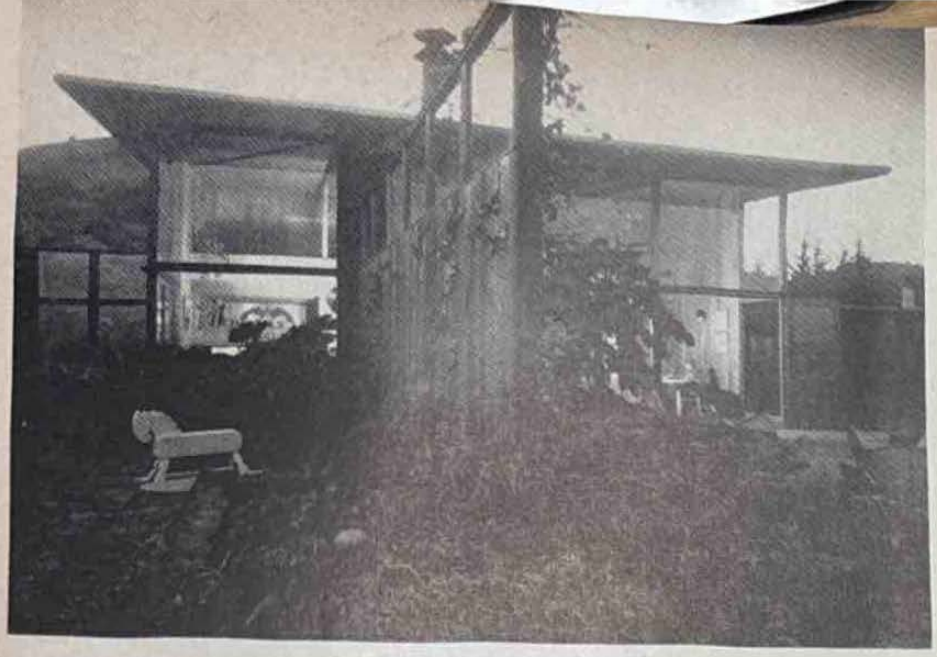
HIGH WOOD FENCE protects outdoor patio and terrace from westerly winds. Terrace is paved with pebbled concrete squares separated by wood strips.

Costing $12,500, exclusive of land or landscaping, the house was built at $10 per square foot in a custom construction operation. Included in this figure are radiant heat in colored slab, a brick fireplace with large outside flue and wide swinging doors that open to a patio. The architect is convinced that a tract builder could cut that cost even lower without sacrificing any of the numerous design advantages.

The house was designed and built as one of five which have been constructed on the same plan but with varying details and landscape treatment. The three original models cost $10,000 to build but the two more recent ones increased by $2,500.



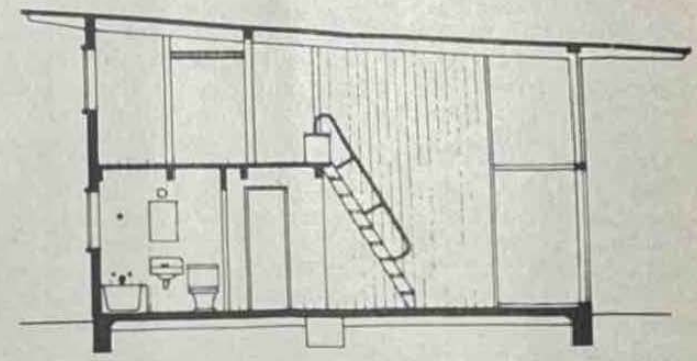
The rectangular plan and regularly spaced framing made for simple erection and low labor costs. Among construction economies were the plate glass windows which cost no more than the conventional rear wall, a solid frame and sheathing surface with five windows and a door. A saving of $300-400 was made by using 4x4 stock and 4x6 prime grades with stops rather than the usual millwork for the box fixed frames of the ¼-in. plate.



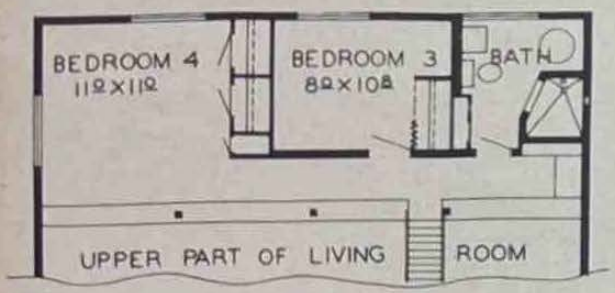
A full ventilating job for the glass side of the house is effected by the entrance doors alone, eliminating the need for expensive movable sash; and no elaborate frames are needed for the small back windows which slide in continuous wood strips nailed to the exterior wall.

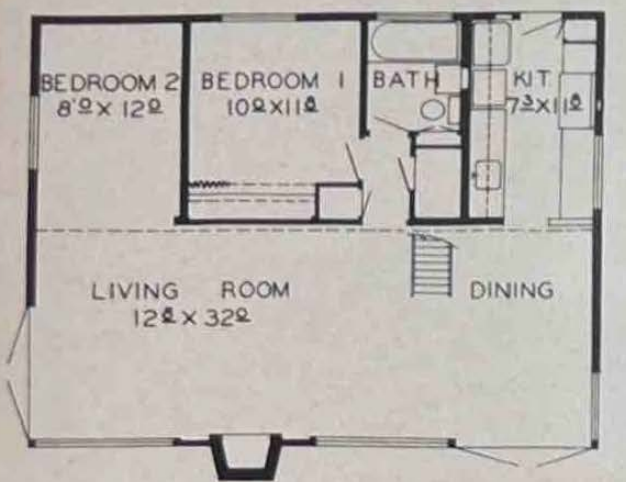
The bath and kitchen are placed back to back with the second bath on the mezzanine directly above. No heating is required for the balcony floor because copper pipe embedded in the slab floor for hot water radiant heat creates sufficient convection to keep both floors at uniform temperatures.

The exterior is covered with redwood shingles; the interior with vertical unfinished California incense cedar; the slightly pitched roof with tar and lightweight, colored gravel.



ENTRANCE DOORS perform ventilating job on glass side, eliminate need for movable sash.





WINDBREAK also divides outdoor area into separate units for children and adults. Cross section indicates how plan turns every inch of space into livable area.

Mill Valley Residence

MEZZANINE

FIRST FLOOR

OUTLINE SPECIFICATIONS

Type of Construction: Frame on monolithically poured foundation floor slab, with troweled-in Lithochrome color hardner.

Exterior Walls: Redwood shingles over diagonal sheathing; glazed east wall of ¼-in. plate glass with stock 4x4 Douglas fir members and stops set in mastic.

Roof: 4x8 beams covered with 2x8 t&g, topped by tar and colored gravel, braced by 2x6 diagonal spiked to underside; slightly pitched.

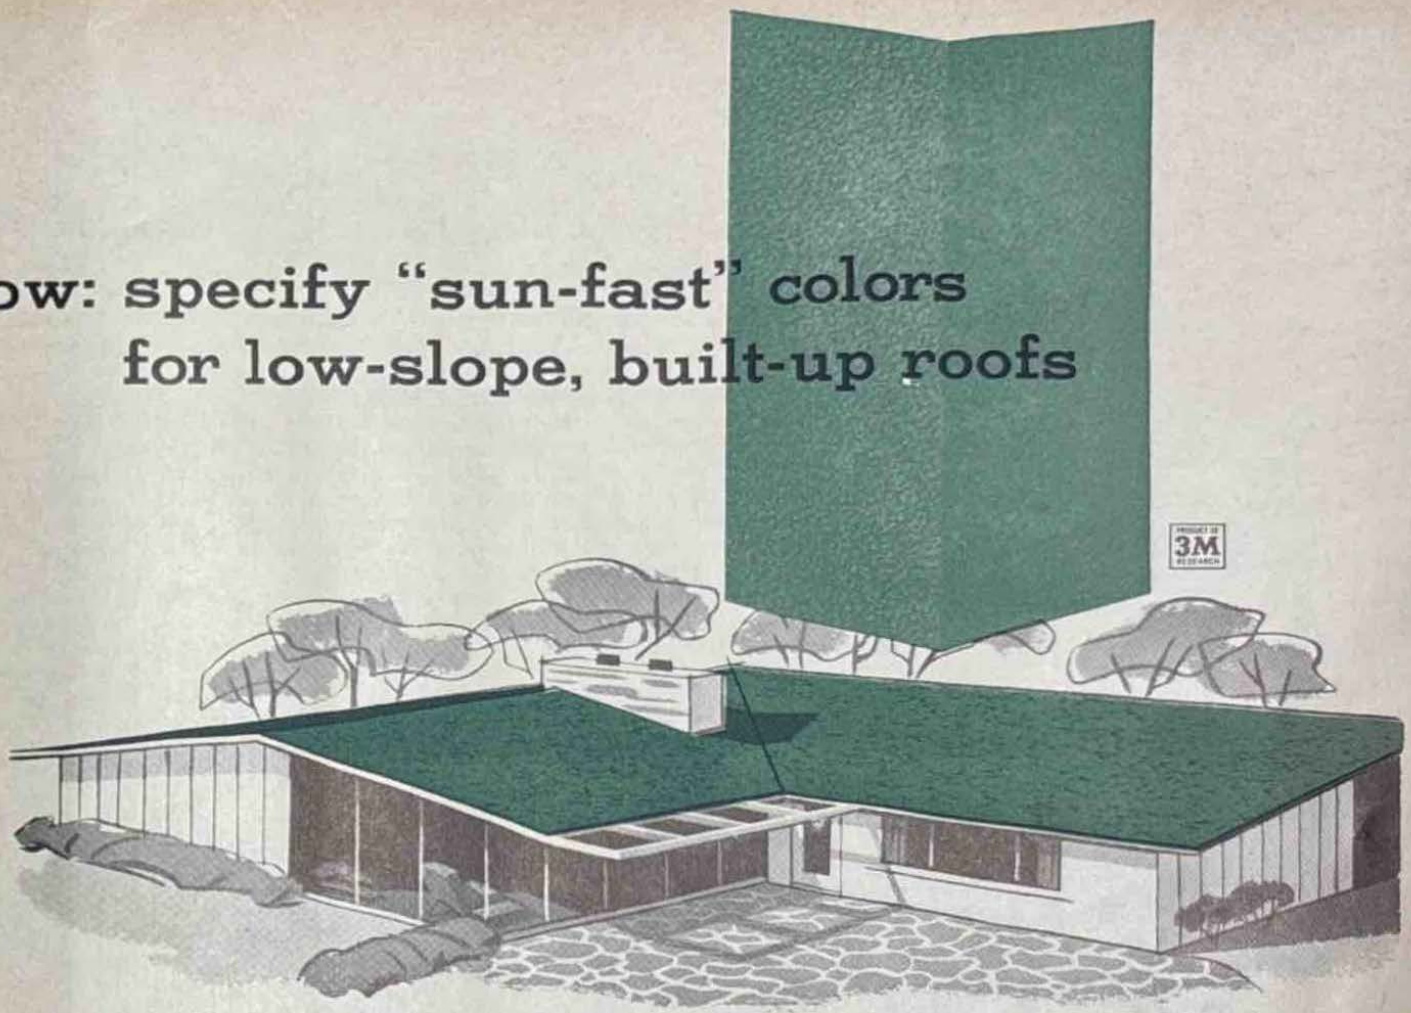
Floors: Concrete slab; 2x4 t&g covered with carpet on mezzanine.

Windows: Double strength glass sliding in continuous strips nailed to exterior wall.

Doors: Sugar pine sash (no frames needed since strips are continuous on face of exterior walls).

Fireplace: Common sand mold brick; five clay flue lining surrounded by galvanized steel sleeves.

Stairs: Ship's ladder, 1 1/16-in. oak and brass pipe handrails ¾-in. I.D.



Heating: Hot water radiant copper pipes in floor slabs.

Total Cost: $12,500 (exclusive of land and landscaping).

Total Area: 1,250 sq. ft.

Cost per Square Foot: $10.

Now: specify "sun-fast" colors for low-slope, built-up roofs

3M's new coarse aggregate roofing stones offer lasting beauty and protection in 8 beautiful colors

Here is a brand-new color-styling opportunity for you. 3M Brand Ceramic-Color Stone offers beauty *and* lasting protection – opens up an entirely new field of decorating possibilities because you may select from 8 color-fast shades! Colors are "fired on" by the same special process used in making 3M Roofing Granules . . . supplied to the building trades for over 30 years.

Special treatments developed by 3M Research make 3M Brand Ceramic-Color Stone dust-free and "sun-fast" – with maximum adhesion to asphalt. The material will not strip, roll or wash away leaving bare, unsightly patches. Stones are durable, uniformly graded, dense, fully opaque to provide complete protection against damaging ultra-violet rays.

The pebble-sized stones pack tightly on roof-tops . . . create the appearance of depth and ruggedness with a built-in shadow effect. 3M Brand Ceramic-Color Stone is shipped *dust-free* in 100 lb. bags. All colors available from a single source.

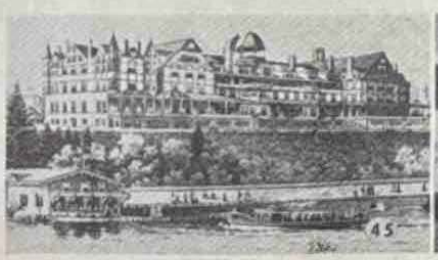
ARCHITECTURE IN THE TACOMA AREA

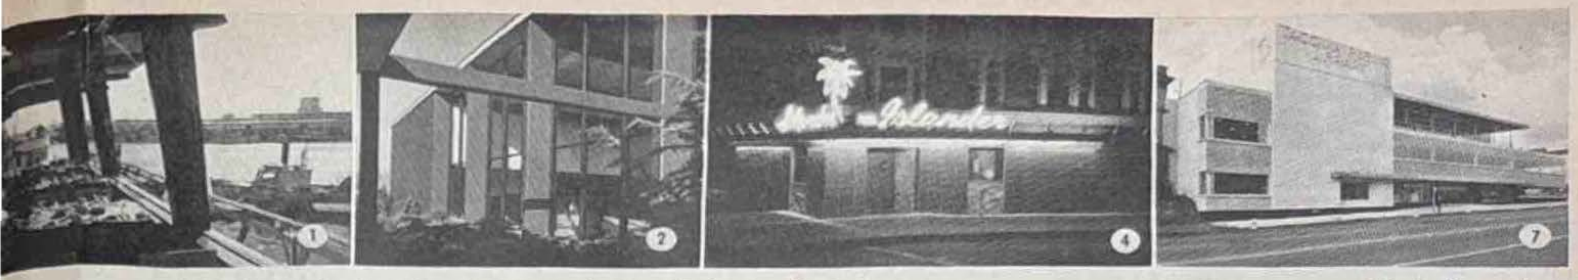
WHEN NORTHWEST ARCHITECTS convene in Tacoma next month for their fifth regional AIA conference, undoubtedly some of them will take a busman's holiday. Among the projects they may visit are the 54 important contemporary and historical buildings (of which 37 are pictured) listed on the following pages.



Just what is the architectural climate of the city? One of Tacoma's younger architects, Alan Liddle, AIA, sees it like this:

"They say that architecture is but a reflection of the spirit of the times; that the unrest of the contemporary scene is expressed by a diversity of architectural interpretations. Could it be then that the fluctuations in pace and mood of a city are translated into steel and concrete for posterity to decipher?

"At the turn of the century Tacoma was destined to be the metropolis of the Northwest. It was an era of imagination and exhuberance and the town had style. The best architects in the country were commissioned and the buildings of that period had a dignity and magnificence unequalled since. McKim, Mead & White's Tacoma Hotel, the County Courthouse, the Broadway Theater Building and Stadium High School are reminders of a proud period in Tacoma history.



"With the removal of the Northern Pacific headquarters from Tacoma and the increase in shipping from Seattle to Alaska and the Orient, the emphasis on Seattle as industrial and cultural center of the Puget Sound region became more and more apparent. Tacoma was losing the battle for supremacy and took it hard. Two generations of Tacomans were brought up believing that the rest of the world was wrong. Mediocrity prevailed. Growth continued but the spark was gone. Block after block of homes, schools, stores and office buildings went up in a potpourri of tastes. Political intrigues set in; architects were involved. During the thirties and forties, new buildings of architectural note became nonexistent.

"But things have changed. Within the last few years Tacoma has decided where it's going. It is no longer aiming at size; it is quite content to leave that dubious asset to Seattle. Its sights are set on an economy based on diversified, medium-sized industries and has space for them in a planned industrial area. Its political structure has been reorganized under a city-manager system and Tacoma's problems are no longer headline news up and down the coast. Recognition of city planning and enthusiasm for cultural organizations are expanding at a tremendous rate. The attitude of Tacomans is again fortitudinous and imaginative. The city has regained its confidence—and so has its architecture."

WALTER S. GORDON, Electrical Engineer

CONCRETE ENGINEERING CO., General Contractor

A NEW TYPE of building has risen out of the reclaimed tideflats in the heart of Tacoma's growing port industrial area. Employing the latest engineering techniques, it follows the concept of expressing the structural system as the basic architecture.

The plan adopted by the architect utilizes a large heavily reinforced concrete slab foundation, calculated to float like a raft on the filled-in ground. Conventional construction

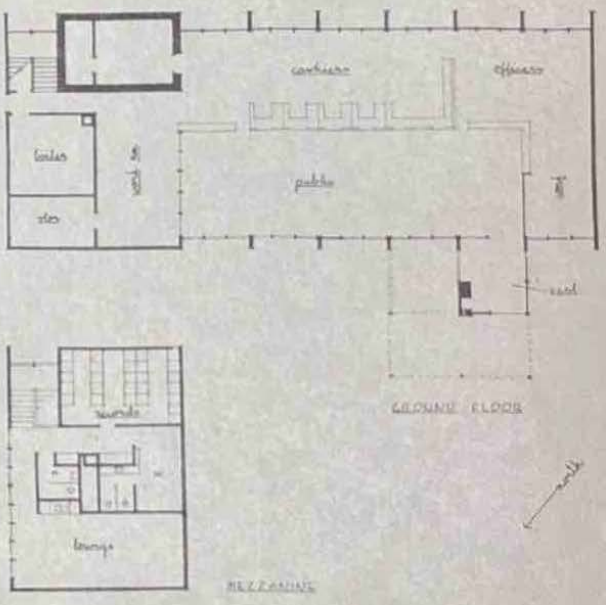
would have required expensive piling. The estimated load capacity of the sandy soil was 1,000 lb. per square foot. However, it was felt that for safety 450 lb. per square foot should be assumed as a design figure.

The foundation slab, varying from 12 to 18 in. thick, not only carries the entire weight of the 102x48-ft. building but also provides a rigid base capable of resisting earthquake forces.

The roof—itself a prefabricated concrete slab made from an aggregate which cuts the weight by about one-third—is supported by seven prestressed concrete beams 45 ft. long, 8 in. wide and 2 ft. deep, which in turn are supported by 14 prefabricated, rectangular concrete columns 28 ft. high and 2 ft. wide.

Beams, columns and roof slab were installed and secured in position in just two days' time. The employment of prestressed concrete for building purposes has been so successfully demonstrated throughout the Tacoma area that the school board has now sanctioned its use for future construction.

The columns are actually outside the building, permitting the spacious lobby and a cashiers' and work area to be completely free of any structural members. The "officers' desk" is readily accessible for the customer and has an informal, enclosed conference area. A mezzanine floor at one end of the bank provides space for record storage and an employees' lounge with a compact kitchen—easily reached but screened from the public's view.



In the glass-walled entrance area a concrete shaft encloses the night depository. Acoustical treatment is found throughout for sound control. Lighting of the main banking area is accomplished by four rows of multiple-lamp fluorescent fixtures. A network of electrical and telephone circuits are embedded in the foundation slab.

Providing adequate heat and ventilation in the concrete and glass shell posed somewhat of a problem. The solution features a system of heated ducts through the foundation slab, allowing part of the heat to be transferred to the floor. The ducts terminate at the base of the glass walls where warm air is forced upward, bathing the glass above. Exhaust fans plus a mixing and fresh air supply unit, provide circulation and ventilation of the main banking area.

Site development includes a paved customer parking lot and a drive-through at the main entry. Planted areas define property lines and complement the lobby and the bank exterior.

ENTIRE NORTHWEST FRONT SIDE is of glass, permitting daylight lobby.

OUTLINE SPECIFICATIONS

Type of Construction: Prestressed concrete on two-way reinforced concrete mat 12 in. thick (18 in. at vault).

Exterior Walls: Tilt-up concrete finished with dark red-brown Zolatone.

Roof: Precast channel slabs with rigid 1½-in. insulation.

Floors: Concrete slab covered with vinyl asbestos.

Windows: Fentron steel sash.

Doors: Metal and aluminum, exterior; slab wood, hollow metal flush, interior.

Interior Finish: End walls surfaced with pressed wood paneling over fiberglass acoustical blanket; painted concrete and drywall partitions.

Ceilings: Painted concrete; acoustical under mezzanine.

Lighting: Multiple-lamp fluorescent fixtures.

Heating: Oil fired, hot air perimeter system.

Total Area: 6,212 sq. ft. (4,782 sq. ft., main floor; 1,430 sq. ft. mezzanine).

Total Cost: $100,000.

Cost per Square Foot: $16.10.

Date of Completion: July 1955.

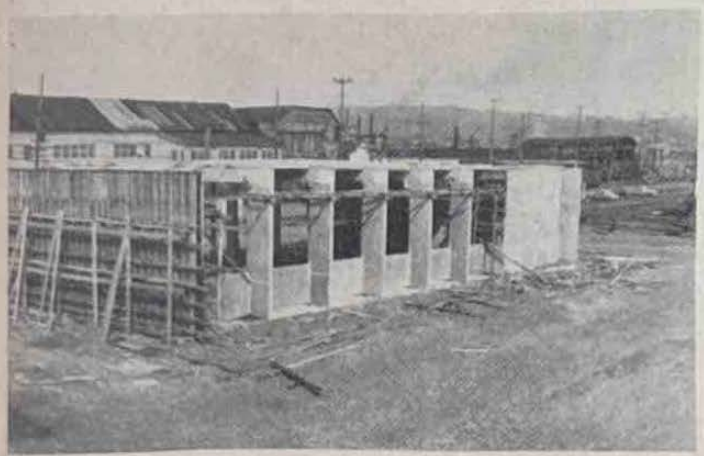
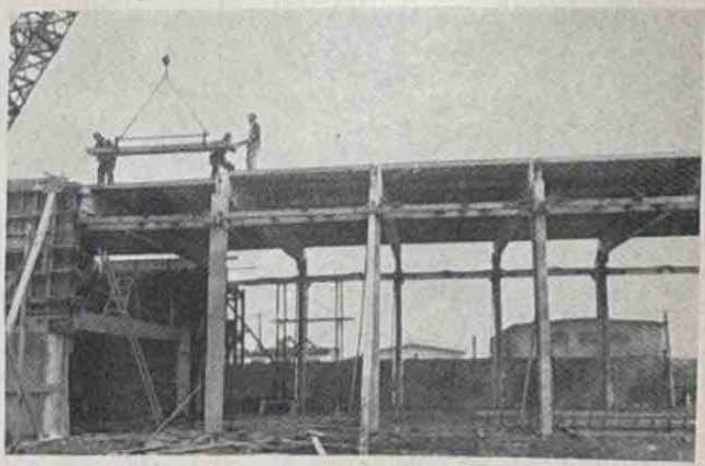
No. 1—Placement of heating and ventilation ducts which terminate at base of glass walls where warm air is forced upward.



No. 2—Foundation floor slab ready for concrete, with electrical system and reinforcement now in place.



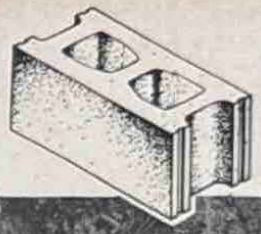
No. 3—Floor slab, formwork for vault and cast-in-place rear wall. Slab "floats" on filled-in ground.

No. 4—Prestressed concrete beams, 45 ft. long, 8 in. wide and 24 in. deep, support prefabricated concrete columns.

No. 5—Prestressed and precast structure erected, along with cast-in-place front wall formwork.

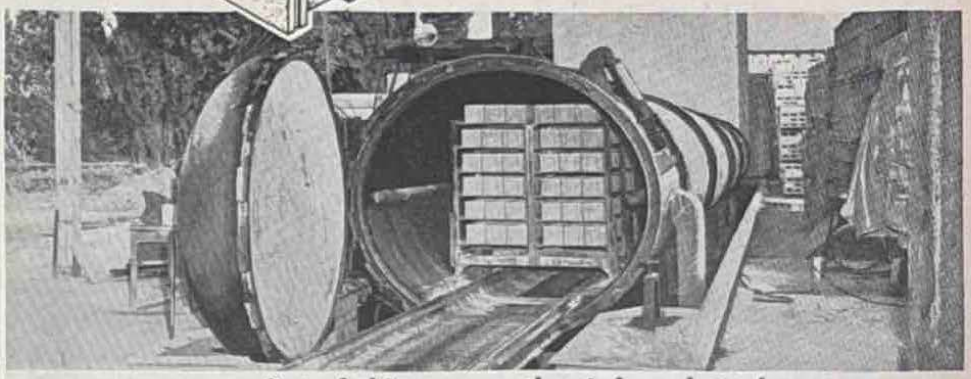
No. 6—Precast lightweight concrete roof slab made of aggregate which cuts weight by about one-third.

Philosophical questions about design



(cont'd. from p. 12)

physics and ethics as essentially liberal subjects which men should study for the uses of leisure or for the sake of living well, and that you looked upon carpentry, cooking and dressmaking, or engineering, architecture and ballistics as servile arts which men should study only for the sake of providing themselves and other men with the means of subsistence, together with the comforts and conveniences of life. But I know that I dare not suppose that the division of arts into liberal and servile is generally clear, or that there is no doubt in anyone's mind about the group to which a particular art belongs; and so the question about design cannot be so easily put.



The very mention of architecture, for example, raises all the difficulties which must be faced. Throughout the philosophy of art, the question has been debated whether architecture is a servile art like farming and shoemaking, a liberal art like sculpture and painting, or somehow a mixture of both kinds of art. Those who hold that it is a mixture of both kinds of art, and this is the predominant view, usually defend their position in the following way.

They admit that architecture is not a purely liberal art, because the intention of the building or designer of buildings is certainly to provide men with the shelter they need biologically, just as they need food and clothing and all the other implements of their physical existence. On the other hand, they insist that it need not be a purely servile art, for the architect as master builder, employing the auxiliary arts of scultpure and painting as well as all the engineering skills and building crafts, can have an intention beyond that of biological utility. He can try to make a beautiful as well as a serviceable building; he can design it and adorn or embellish it in ways that do not make it more serviceable but only more beautiful. And even if he is a modern architect who lets function wholly dictate form, he may still be engaged in producing a form or structure enjoyable to contemplate over and above something functional to be lived in or worked in.

If it is true, for the reasons just given, that architecture is a liberal as well as a servile art, then those same reasons make it **possible** for all servile arts to be both. As a matter of historic fact, this possibility begins to be realized as soon as men are able to rise above the most primitive

*Exclusive in Seattle at GRAYSTONE!

Out of this mammoth reinforced steel high-pressure steam chamber come Seattle's finest

CONCRETE MASONRY UNITS!

manufactured by the

AUTOCLAVE* PROCESS

Featuring—

★ Greater Strength

★ High Dimensional Stability

★ Lower Moisture Content

Proof of the superiority of Graystone's Autoclaved concrete masonry units is provided in the constantly increasing demand for these modern, scientifically cured, pre-shrunk and highly stabilized units. Their strength, after less than 12 hours from the block machine to the storage shed, is equal to or greater than normally cured units after 30 to 60 days.

Curing is accomplished in less than 8 hours under steam pressure that reaches 130 to 140 lbs. per square inch, and at a temperature of approximately 360 degrees F. Under this process chemical changes bring about the formation of new inert crystalline compounds that reduce volumetric change and subsequent shrinkage change to a minimum.

Our entire output of pumice and Graylite expanded shale units are now being produced by the Autoclave process. Autoclaved sand and gravel units are also available at a very slight additional cost.

NOW! FAST DELIVERIES FROM THIS NEW PEERLESS PLANT!

● Now! Doubled manufacturing and warehouse space permits Peerless to warehouse twice as many fans and blowers and increase our number of models from 250 to more than 400. When you need equipment for a complete air moving job, you can come to one source — Peerless — and get prompt delivery.

The big Peerless line is completely designed, engineered and manufactured under one roof. When you require special motors, our motor division produces them. We have complete control of all components going into every fan and blower. As a result, we can put our unqualified mechanical and performance guarantees on every unit leaving our plant.

Peerless builds to all industry standards — PFMA, NAFM and NEMA. If you require construction to meet other codes — either special industry or government — Peerless can do the job.

Engineering is the backbone of Peerless progress. Whether your installation problem is routine or complex, we'll work with you to solve it most efficiently.

Write today for Bulletins SDA-160 or SDA-200 for complete information on Peerless Forward and Backward Curve Blowers.

conditions of human life in which all their skills go to providing the bare necessities. Once they rise above this level, they start to adorn or embellish their houses, furniture, clothing, pottery, weapons, chariots, boats and all the other serviceable things they produce. To whatever extent and in whatever manner they design the things they make not only for the sake of rendering them serviceable, but also to enhance them with some biological useless value, they would appear, like the architect, to be combining the motives of servile and liberal art.

As I have just used the word "design," it has two meanings which are respectively related to the servile and the liberal aims in art. In one meaning, design aims to create biologically serviceable utilities. Accordingly, improvement in the design of anything consists in increasing its utility by making it more serviceable. If this were all that design did, design would comprise all the servile arts, involve nothing but such arts, and excellence in design would be judged entirely in terms of efficiency in function.

But in the other meaning, design aims to create biologically useless values, such as beautiful forms or patterns that provide aesthetic delight to the beholder. Accordingly, the design of something can be improved without increasing its functional efficiency and excellence in design may be judged by standards independent of the measure of a thing's serviceability. To the extent that the design of serviceable things has this second aim and is subject to this second standard of excellence, it would appear to have something of the character of liberal art. Yet if we can take architecture as the prototype of design in all its manifestations, design never has the character of a **purely** liberal art.

The question I want to ask about design, therefore, requires me to distinguish between 1) **the purely liberal arts**, such as poetry, painting and music, and 2) other arts which either do or can **add what appears to be a liberal aspect** to their predominantly servile character. Before I attempt to do this, let me say that I am proceeding on the assumption that there is no art that need be purely servile. Industrial design is now for the most part concerned with styling for delight's sake as well as with planning for the performance of a service. Modern industrial design has come to recognize that form should generally follow function and styling should be subordinate to service in all arts which by their nature are predominantly servile. Nevertheless, the modern designer would admit that

PYROFILL ROOF DECKS FEAR NO FIRE

Detail of PYROFILL roof deck used in the new Grand Central Industrial Center, Glendale, California. Engineering and construction by Coordinated Construction, Inc. Planned, developed and administered by John B. Kilroy, Realtor, and Associates. George Novikoff, structural engineer, Anning-Johnson Co., Pyrofill roof deck contractor.

Selected for this 180-acre California industrial center . . .

PYROFILL* roof decks

INCOMBUSTIBLE GYPSUM

Analysis proved no other roof deck but PYROFILL offered all these advantages:

LOW INITIAL COST—The combination of low unit erected cost and savings in sprinkler installation gave PYROFILL an outstanding advantage.

INCOMBUSTIBLE—PYROFILL fears no fire. The extra fire safety gained from PYROFILL decks was of interest to prospective occupants.

INSURANCE SAVINGS—PYROFILL received the lowest insurance rate of all decks considered.

LOW ROOFING MAINTENANCE COSTS—Experience has shown PYROFILL to be an ideal base for built-up roofing. This cuts roofing maintenance costs to a minimum.

ADAPTABLE—PYROFILL is suitable for flat, curved, or pitched roofs. No other material was adaptable enough to meet individual occupants' requirements.

FAST INSTALLATION—A pouring schedule as high as 20,000 square feet per day permitted early occupancy. No costly curing delays. Roofing applied within an hour of pouring.

SEISMIC FORCE RESISTANCE—Expensive cross bracing was eliminated by using the PYROFILL deck as a horizontal diaphragm. PYROFILL meets the requirements of Uniform Building Code, California Division of Architecture, and all codes of the city and county of Los Angeles.

For full information, see Sweet's Catalog Section 2E/UN, contact your U.S.G. Representative, or write Industrial Sales Department, 2322 West Third Street, Los Angeles 54, California.

USG UNITED STATES GYPSUM

UNITED STATES GYPSUM

the greatest name in building

functional efficiency can be increased without improvements in style and that the form or style of utilities, implements and machines can be improved without concomitant increases in their efficiency.

* * *

The purely liberal arts, in addition to their negative characteristic of **not** producing things intended for the sustenance, comfort or convenience of life (whether they happen to be misused for such purposes), create things which have three positive characteristics. The first is the aesthetic delight or enjoyment they afford the beholder by their excellence of form. The second is found in the fact that each work of liberal art is absolutely unique and as such is always set apart as superior to all copies or reproductions of itself. In other words, the liberal artist never merely lays down the specifications for producing an indefinite number of things of the same form or structure, all equally good as works of art.

The third characteristic, closely related to the first and second, is the most important of all. It is that the liberal artist has something to say to the human mind, some truth about man, the human world or human life which he expresses in the special language of his creative medium, whether that be the language of science and philosophy, the language of poetry or the quite different languages of painting and music. The work of liberal art always communicates something or, if you will, always has a message. The greatest works of liberal art are those which, like Michelangelo's "Pieta," Mozart's "Don Giovanni," or Dante's "Divine Comedy," have the most to say or the deepest truth to communicate and say or communicate it with the greatest skill, not those which say little or nothing with the technical virtuosity of supreme craftsmanship.

This third characteristic of liberal art underlies the other two. The uniqueness of a poem, a piece of music or a painting derives from the union of its form and content; what the artist has to say determines his way of saying it. Nor can the aesthetic delight afforded by the sensible form of a work of liberal art be separated from the instruction it affords the mind. If its beauty and its truth are not identical, as Keats said, they are at least inseparable.

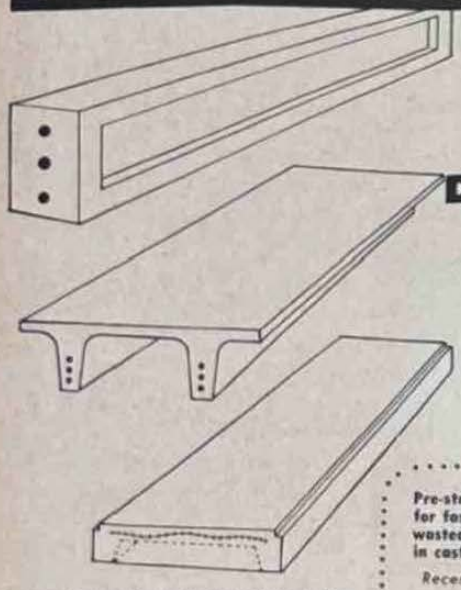
I am now ready to pose the question about design or, what is the same, about all the arts which are predominantly servile. We have seen that the works of such art may provide aesthetic delight by their styling or form, either connected with a service performed or over and above mere functional utility. We know that with industrialization most of the predominantly servile arts now seldom produce a unique work, as the handicrafts once produced a single carriage, vase or chair. Nevertheless, there are still numerous instances of industrial design in which the product is a single, unique thing, whether a building, a vessel, a bridge, a mechanical complex or an electronic comptometer. Hence in these two respects, design, even when industrial, can be like liberal art.

But, and here is the question, **do works of predominantly servile art ever have anything at all to say?** The question is not whether they have something important or profound to say. It is simply whether they have any message at all, any truth at all to communicate, any instruction for the human mind.

* * *

Before you answer the question, let me tell you what consequences I would draw from a negative answer.

If design has nothing at all to say which is instructive to the mind, then whatever beauty its productions may have as a result of styling is not the same as the beauty of works of purely liberal art, for it is not a beauty that



modern speed-up construction

Forms, shoring eliminated

no waiting for concrete to set when you specify lightweight

PRE-STRESSED CONCRETE

I BEAMS

Support double tee or channel slab in all-concrete construction. Spans to 70 ft.

DOUBLE TEE SLABS

CARCO FABRICATED STEEL HELPS ALONG SEWAGE POLLUTION ABATEMENT PROGRAM

The Southwest Suburban Sewer District, located just outside the Seattle city limits at 10023 Sixteenth Avenue, S.W., is erecting a modern sewage treatment plant at S.W. 125th Street and Shorewood Drive, which will serve suburban communities west and south of this city, including both White Center and Burien.

Scheduled for completion in October, this new sewage treatment plant will cover about an acre of ground and will have a capacity of 8,000,000 gallons per day. The estimated cost for plant and equipment is $750,000.

The equipment to be installed is of the primary sewage treatment type as opposed to secondary type. In the primary type plants, the incoming sewage is received in a series of settling tanks where the sludge sinks to the bottom and is collected in hoppers. From the hoppers, the sludge is pumped to the digester where it is reduced by bacterial action to a humus-like material which is odorless and which can be used, after it has been dried out, for fertilizer.

The effluent is water which is chlorinated to kill all disease-producing bacteria and which in this case will be discharged into Puget Sound in at least 50 feet of water, or about 1000 feet out from the high tide mark.

One of the interesting features of this up-to-date new plant is that gas generated from the sewage treatment will be used to heat the digester in order to accelerate the digestion process.

Pacific Car fabricated and erected a total of 37 tons of structural steel for the Southwest Suburban Sewer District's sewage treatment plant. This includes the structural framing as well as two 21-feet by 21-feet covers or lids weighing 19 tons. One of these is fixed while the other floats. The purpose of the floating lid is to accommodate the accumulation of gas that forms during sewage treatment.

Let Carco help you with your steel problems. Pacific Car offers buyers of structural steel not only the largest fabricating facilities in the Northwest but also a "one stop" steel service. This means money-saving ideas and suggestions, prompt engineering detail and estimates, fabrication and erection. You may count on Pacific Car's interested attention for anything from an I-beam to structural steel for dams, industrial plants, office buildings, schools or other projects. Our facilities and experienced personnel are as close to you as your telephone.

is inseparable from truth. There is all the difference in the world between that which delights by the way it instructs and that which, incidental to the service it performs, also delights.

Furthermore, if design communicates nothing and has no content of truth, then whatever uniqueness some of its productions may have is not the same as the uniqueness of works of purely liberal art, for such uniqueness is merely accidental in the particular case and not essential to the very being of the work. Anything produced by predominantly servile art or industrial design can exist perfectly in multiple reproductions turned out according to the same blueprints or specifications. It is therefore utterly different from the essential uniqueness of a work of purely liberal art, born of the inseparability of its content and form—what the artist has to say and the way he says it.

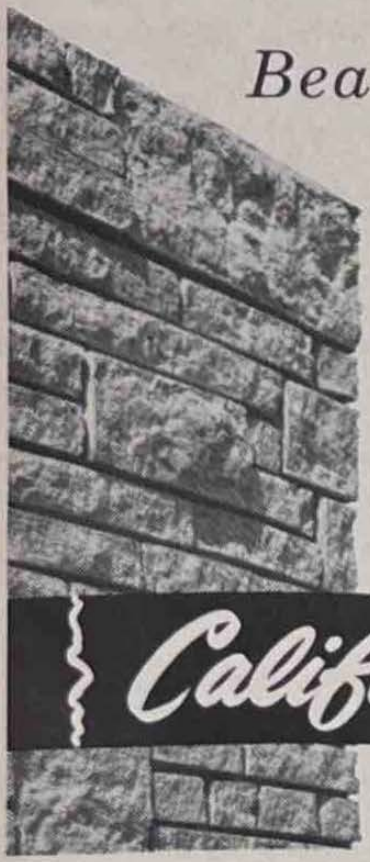
Hence if you tell me that design has nothing to say, I shall be forced to conclude that such beauty and uniqueness as works of design may have are only counterfeits of the beauty and uniqueness of works of purely liberal art; for without any intellectual content or truth to instruct the mind, their styling does not really give them the liberal aspect we at first attributed to them when we regarded them as combining both kinds of art. Further, I shall have to conclude that they have no place in the scheme of liberal education, for if they have nothing to say about man, human life or the human world, they cannot contribute to the cultivation of the mind or spirit of man, which is the whole and exclusive purpose of liberal education. Finally, I must conclude that form or styling in design, beyond the exigencies of function or service, provides at best an empty aesthetic delight or purely sensual pleasure; and, at worst, serves the purpose of planned obsolescense to increase a partially wasteful consumption, the only justification of which may be its support of our ever increasing industrial productivity.

You may, of course, maintain that design has something to say, in which case my only remaining question would be, **what?** Or you may deny the validity of the question itself by challenging my central thesis that the principal characteristic of works of purely liberal art derives from their content—the truth which, fused with beauty, instructs the mind or cultivates the spirit of man.

Against my thesis, you may point to modern painting or sculpture which, at its abstractionist extreme, seems to have nothing at all to say about man, human life and the human world. The beauty to be found in industrial design, you may say, is no different from the beauty to be found in contemporary abstractions of all sorts; and from this you may argue that if abstractionist painting or sculpture is purely liberal art, industrial design has something of the character of such art and to that extent at least has a place in liberal education and contributes not just to living but to living well.

I would then still have one further question to ask, but it would be about the abstractionist tendencies of modern art and not about design. Though I shall refrain from asking it until it becomes necessary to do so, I am sure you can guess what the question is and what my answer would be.

Why don't we have the cities we need?



Excerpts from another paper at Aspen, presented by Max Frisch of Switzerland who practiced architecture until 1952, now a full-time writer

Everyone know that architects are chock full of ideas. There is no lack of genial projects drafted by Le Corbusier, Gropius, Neutra, Wiener and Sert, Samona and many others. And when we study them we cannot help being amazed. For these projects are not only capable of satisfying the vital demands of our life today but would even be more economical than anything that is being done at present.

Then why are they not realized? That is the question that preocuppies me most. Are democracy and planning two things that mutually exclude each other? Or, to put it differently, who is really responsible for the formation or deformation of our cities?

Here is another question. Who is really responsible for the development of our cities? The architect? Or the local authorities? Or the land owners? Or the whole body of citizens? I come from a country that I love insofar as it is a democracy and hate when it falls short of democracy. And I believe in the responsibility of citizens. In other words: we have the cities we deserve.

If speculators prevent us from having the cities we need it is not their fault but ours, because we let them do it. The first step we must take to get out of the morass we are in at present is to realize that town planning is not the business of the planners but of the inhabitants. I don't want to offend the architects. What I mean is that the best ideas of our best architects go to the dogs because we fail as a social unit.

Sandstone Beauty and Texture IN COLOR

Save 40%. California Stone (manufactured sandstone) in eleven subtle decorator-selected colors and shades exceeds natural sandstone in range of colors, and ease of handling with the strength and beauty of the natural product. You save 40% in material cost. Sizes available to give a random ashlar effect. Write or phone for complete details.

A definition of the good life

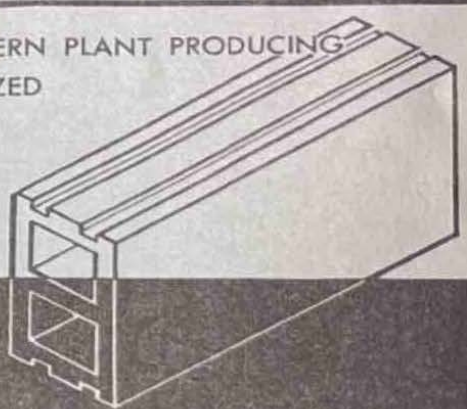
Excerpts from the message of the retiring national AIA president, George Bain Cummings, delivered at the Los Angeles convention

What is the good life?. Your own individual definition is the best. May I suggest certain ingredients of my own definition?

I think there must be, first of all, **safety** and **health** and **well-being.** We all reach out instinctively to attain them.

I think there must be **work** and **rest,** in alternation. Work that prevents our bodies, minds and spirits from atrophying through disease. There must be the zest, the exultation of driving ourselves to capacity, followed by a period of recharging.

I think there must be **love** and **worship.** Love, physical for completeness, for fulfillment; but also spiritual love, the sublimest, most nearly God-like, of our attributes: love of mate and family, of friends, of people, of visions, purposes and ideals. Love of the great, good world around us and of its Creator—love and gratefulness and submission, which is worship. As ancient as the human family is this need for love and worship, for faith in something outside ourselves. It is the lodestar of our souls.



I think there must be **beauty** and **fragrance.** Of Louis Sullivan, who was born 100 years ago, it was said: "He demanded of himself an emotional and spiritual expenditure to endow each building with its own identity of beauty." In Santa Fe there is a remarkable exhibition in the Museum of International Folk Art. Here are collected the artifacts of diverse and wholly unrelated civilization from all parts of the world. There are articles of common purpose, such as the spoon, for example, invented from necessity by each people, unknowing even the existence of other peoples or their work. The strange and striking common factor is the embellishment each people has attempted. It is a common trait of the human family instinctively to strive for beauty, for the amelioration and enhancement of environment. Recall how the narrator of the ancient story of creation reports that after each stage of His work God paused and "saw that it was good." With the great pageant of Nature ever before and around us, all our senses are ministered to and our realization of and yearning for beauty with the fragrance of goodness becomes a demand upon life. We are imbued with the desire and purpose to fulfill our capacity for living and enjoying life and with the urge to create beauty and to make our contribution to the culture of the human family.

And I think there must be **compensation:** recognition, acceptance, approval, reward, incentive and satisfaction. For all our individual striving as architects, there is the hope that there may emerge a work of art; but whether or no, there will be compensation, there will be satisfaction, in having tried our hardest and done our best, in having shared in creation.

So, in sum, my definition of the good life includes safety, health and well-being of our people and we shelter all the diverse activities—personal and of the group—that are involved in making these provisions. We design the shelter for the world's work and for the people's rest and for their loving and their worship. We contrive it with our hearts that there may be beauty and a fragrance along the way. We contrive it for the satisfaction of our own souls and conscience and find our compensation in the contribution we are permitted to make to our day, of our creative ability.

Building climbs to record July volume

DESPITE the continued slowdown in home building starts, dollar volume of building permits for the five western states in July boomed up to $260,181,530, highest monthly volume since Pacific Architect and Builder began recording the California totals in January 1955.

Industrial construction, mainly in California, is responsible for the high figure. Housing is still dragging its feet. Large tract building in California has slowed way down and some large cities, like Seattle, report as much as a 30% drop in the number of residential permits for the first seven months of this year. This downward trend also has been noted nationally.

The five-state total is 20% higher than July of 1955 and 8% over June of 1956. On a statewide basis, only California showed increases either above the previous month or the corresponding period last year. California's volume was 17% higher than June of this year and 33% higher than July of last year. Washington dropped .4% from July 1955; Idaho, 9%; Oregon, 13%; and Montana, 3%.

By the end of July the total dollar volume was $1,589,265,691, just 3% higher than the seven-month total last year. All states show fair gains for the year with the exception of Washington which is down 4%. California is up 4%; Oregon, 7%; Montana, 14%; and Idaho, 8%.

Following is a breakdown of building permits issued by several of the major agencies during July.

	DWELLING UNITS	COMMERCIAL & INDUSTRIAL	PUBLIC
Portland	117 ($1,065,370)	16 ($905,200)	
King County	494 (3,597,400)	48 (427,640)	3 ($238,000)
Seattle	172 (2,075,990)	16 (527,350)	
Tacoma	200 (820,163)	36 (439,115)	1 (2,900,000)
Los Angeles Co.	2507 (19,462,625)	543 (7,222,411)	37 (2,273,746)
Orange County	659 (6,501,927)	33 (548,061)	2 (39,500)
Sacramento Co.	589 (4,749,018)	20 (563,925)	9 (267,591)

Materials center starts expansion

Nationwide expansion of the Construction Materials Center, a $1 million California corporation launched in San Francisco a year ago, will get underway this year.

Victor M. di Suvero opened his first branch of the "one-stop shopping center" for architects and builders in Los Angeles August 1. A similar branch will be opened in Seattle by June of 1957. Others are scheduled for opening in Miami and St. Louis this year and in Dallas, Chicago, Denver, Pittsburgh, Atlanta and Boston next year.

Di Suvero, a graduate of the University of California, formerly worked in the wallpaper sales department of General Paint Corp. Later he headed a branch store wallpaper department for W. P. Fuller Co. in San Francisco.

In 1952 he opened his own Design and Color Service and has done color consultation and material specification for architects and for such tract and custom home builders as Joseph Eichler, Conway & Culligan, Myers Bros., etc.

On July 15, 1955, di Suvero opened the Construction Materials Center, or COMAC, as he calls it, at 330 Clay St., San Francisco, with Mrs. Christine Sherman as associate director. She has served as color consultant and designer for Cliff May Homes in Washington and Oregon.

"So many samples of material were acquired by our Design and Color Service and a library of data on so many products accumulated," di Suvero explains, "that a girl was kept busy nearly eight hours a day just answering questions. It seemed evident that a central display area and a library reference center was not only needed but wanted by the industry—and that's how COMAC originated."

COMAC differs from other permanent displays in that it renders specific services to exhibitors, the building industry and the general public. Competitive products are displayed side by side and presented impartially. Related products can be examined in conjunction with each other and all elements of a proposed exterior or interior can be seen together. Samples are given out, along with technical data and literature. Information is available on local stock supplies and prices, and the center has advertising aids for exhibitors.

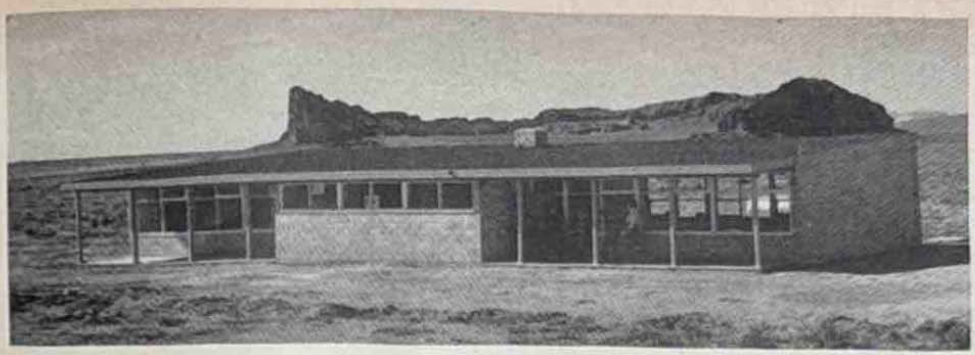
HARDWARE DISPLAY is shown by di Suvero (right) to Leslie Davis of Harvis Construction Co., South San Francisco.

Income is derived from yearly dues paid by the exhibitors who may be either the local distributor or the manufacturer.

When the center opened in San Francisco there were 47 original exhibitors. In the first six months of operation, this number jumped to 82 and it has increased steadily since.

The center attracts some 600 visitors a month, of which 20% are architects; 20%, builders; 10%, engineers; 15%, decorators, designers and retailers; and 35%, home owners.

Homemakers expect complete telephone planning



says MRS. MARIAN SILVEY,
housewife, grandmother, interior decorator, and home builder
(Silvey Builders, Portland, Oregon)

"As a builder, I find it pays to anticipate my client's needs. As a homemaker, I know that busy mothers appreciate the time and steps saved by having telephone outlets in the rooms the family uses most. Telephone planning is as indispensable to any well-built home as adequate electric wiring and correctly placed windows—and buyers expect it."

More and more builders and architects now recognize the value of complete telephone planning. We are always ready to help you plan built-in telephone facilities. Just call us and ask for our free Architects and Builders Service.

Specify built-in telephone facilities —a sign of good planning

Pacific Telephone

THE PHOTOGRAPHER, not architect and contractor, is responsible for placing The Rock on top of little schoolhouse in eastern Oregon.

Little (pumice) schoolhouse shows pioneering spirit

Every nail, stick of lumber and plate of glass for the new two-classroom elementary school at Fort Rock, Ore., was brought by truck a minimum of 70 miles.

In September the pumice block structure will be one of the least crowded of the state's grade schools with its estimated enrollment of 34 pupils.

To the amazement of chairman Robert Morehouse and other school board members, seven contractors from as far away as Portland bid on the job to construct the one-story schoolhouse in Lake County, east of the mountains. Award went to Mann Construction Co. of Redmond for $27,400. The cost covered a composition, wood joist roof, acoustical walls and ceilings, vinyl tile floors, blackboards, drinking fountains, all cabinet work and clearing the immediate area for parking and tethering horses.

Richard Mann taxied his top carpenters back and forth in his four-seater Piper cub from Redmond, counting out 1¼ hours daily for commuting to and from the job. Other workmen lived in trailerhouses at the site, which was chosen because a suitable water well could be dug there. Despite these handicaps, the school was built at $9.60 per square foot.

Architect John Howard of the firm of Morrison & Howard, made 12 round trips from Klamath Falls and estimates he drove his own car more than 4,000 miles on the job.

"One of the secrets of keeping contented workmen on the project," comments Howard, "was the good food served at Fort Rock's little grocery-post office-restaurant-filling station."

The little school sits in the shadow of The Rock, a huge volcanic bubble that rose and burst eons ago, leaving a natural ampitheater which may some day be cleared to seat an estimated crowd of 500,000. It is currently used for picnics and sunrise church services. Plans are being made to set aside The Rock as a state park for more extensive use by ranch families in the 40-mile radius who call Fort Rock their post office address.

San Francisco selects Hall of Justice site

The old Father Crowley Playground at Seventh and Bryant streets has been selected as the site for San Francisco's new $19,475,000 Hall of Justice building. Weihe, Frick & Kruse have been named as architects to develop a plan for the new structure.

Negotiations have also been started with the State Highway Commission for acquisition of the land which was purchased by the state six years ago for $898,000 for freeway construction. The portion not used for the freeway, nearly two-thirds of the total, was recently offered for sale at a minimum price of $600,000.

San Francisco voters at a June election approved a bond issue to finance construction of the Hall of Justice.

The site chosen will provide 212,000 sq. ft. of land for building area and the city expects to lease another 132,000 ft. under the freeway for parking of 318 cars. A basement garage and concrete deck will provide for 432 more cars or a total of 750.

The new structure will house not only police headquarters, but the police academy, the district attorney's office, the public defender, coroner, probation department, all criminal courts in both the superior and municipal court level, the sheriff and the city prison and county jail.

College of Puget Sound
Memorial Library features . . .

Distinctive Chehalis Brick

Architect Silas Nelson chose Chehalis Select Common Brick—in a harmonious variety of red shades—to achieve both dignity of design as well as an atmosphere of warm, lasting friendliness in this handsome Memorial Library at Tacoma's College of Puget Sound. For more than three generations the distinctive tones and textures of Chehalis Brick have played an integral part in much of the Pacific Northwest's finest regional architecture.

BUILDING SYSTEM: A load-bearing curtain wall system consisting of prefabricated aluminum panels eliminates the need for building framework and can be raised in record time. The panels are engineered to carry roof loads without additional supporting members and include integral structural framing, windows, doors and insulation to form the finished wall.

Architects can use the new system, marketed under the name W-A-E (Weather - Anchor - Expansion) by Aluminum Structures, to design one- and two-story schools, churches, manufacturing plants and small office buildings with great flexibility, since the system is fitted to the plans. The wide range of styles and possible combinations provide means for architectural variation.

(Item No. 1)

PLUMBINGWARE: Norris-Thermador has introduced a complete line of plumbingware in porcelain-on-steel and vitreous china in white and pastel shades of pink, tan, yellow, blue gray and green.

The company also produces a sink and tray combination, a favorite in large homes and apartment projects. It provides an extra large right or left hand sump and is suited for either tile or plastic top installation.

(Item No. 2)

ELECTRICAL EXTENSIONS: For electrical outlets needed in the middle of the room, Ideas, Inc., has designed a stumbleproof over-the-floor extension cord. Called Electriduct, it is made of rubber with ribs on underneath side to prevent slipping. It is 2¾-in. wide at the base, rising from a feather edge to an apex of 7/16 in. Office equipment on casters rolls over it easily.

(Item No. 3)

DUAL-PURPOSE FOUNTAIN: For schools, institutions and commercial buildings, American-Standard has designed a combination drinking fountain and receptor coated with acid-resisting enamel. The fixture can be used for such purposes as cleaning paint brushes, moistening modeling clay or cleaning laboratory equipment. It is designed for countertop installation with standard mounting frames.

(Item No. 4)

DOOR PULLS: A sliding door pull has been designed by Merendino-Greene in a choice of finishes selected to harmonize with a variety of architectural detailing in both residential and commercial building. The pulls, created exclusively for Arcadia sliding glass doors, are offered in dull chrome, dull bronze and dull black.

This is the first time that the manufacturer has completely redesigned its entire hardware appearance since the firm began making doors in 1948.

(Item No. 5)

ELECTRIC HEAT: An electrical baseboard home heater with control panel for each room has been introduced by Westinghouse. Installed snugly against the wall in place of baseboards, the units provide heat both by radiation and circulation. Models operate from standard 240-volt circuits.

(Item No. 6)

AIR CONDITIONING: Room air conditioners are getting smaller and smaller. Emerson Radio and Phonograph now announces the Slimline, a 15-in. deep unit with flush-mount design that eliminates overhang inside or outside the room. It is available in ½-, ¾- and 1-hp. units.

(Item No. 7)

CONCRETE BLOCK: To reduce cost of masonry construction, Presto Brick Machine has developed a building unit requiring no additional reinforcement and laid with no mortar between joints.

Each Presto block is a miniature twin-wall in itself, composed of two separate concrete units bound together by corrugated steel ties which are inserted into the units during manufacture. Top, bottom and end surfaces are keyed to lock upon erection, thus permitting a wall to be laid so that at no point does the inner and outer wall have a through masonry bond. The keyed joints are pointed by hand or with mortar gun.

(Item No. 8)

TWIN-WALL UNIT

SCAFFOLD HOIST: A hoist capable of raising 1,000 lb. at a speed of 200 ft. per minute has been developed by a Basin, Wyo., mason contractor, Ross D. Wardell. The hoist and system is built around standard tubular steel scaffolding and packaged masonry and can be used on any sized job. Wardell originally developed the system to solve a bottleneck in vertical movement of materials while building a church with high gable ends.

(Item No. 9)

ASBESTOS CEMENT: Belgium's inexpensive sheets of hydraulically compressed asbestos cement sheets are now available to the American market. They come in 15 colors, ranging from off-white to dark green, and in several thicknesses, depending on the use to which they are to be put.

Waterproof and heatproof, the sheets are excellent for covering surfaces in constant use and exposed to humidity. They can be used as tops for tables or counters and for door panels and shelving.

(Item No. 10)

VENTILATING SASH: To make sure that outdoor temperatures really stay on the outside of extended window wall expanses, Fabrow has produced a rubber insulated ventilating sash. It combines the natural insulating qualities of its own wood with the strength of one-piece Neoprene insulation. Insulating glass completes the combination for triple-storm protection.

(Item No. 11)

DOOR CONTROLS: An automatic operator for all swing type doors wherever there is a high frequency door use comes in eight models, six of which are carpet actuated and two handle actuated. Available in single units or pairs, Dor-O-Matic's design changes center on three areas: a larger and sturdier hinge, a new type molded mat and a simplified heavy duty power unit.

(Item No. 12)

SPANDREL GLASS: A color-enameled spandrel glass with aluminum backing, called Huetex, has been placed on the market by Blue Ridge Glass and Libbey-Owens-Ford. Developed primarily for the growing market in curtain-wall construction, the textured surface is made of 5/16th-in. tempered glass. Ceramic enamel is fused to the back to give color and aluminum welded on to protect the enamel and reflect heat. Twelve colors are available.

(Item No. 13)

TRANSIT-LEVEL: Newly designed optical system, 3-ft. short focus and brass and bronze construction are some of the features of the convertible transit-level manufactured by C. L. Berger. The instrument has a plate level in addition to the telescope vial.

The 3-ft. short focus makes it possible to take sightings in cellars and boiler rooms, for pouring concrete foundations and in other tight spots.

(Item No. 14)

Latest Handbooks, Manuals and Literature

Yours for the Asking

JALOUSIES: Interesting possible uses of jalousies are depicted in a series of photographs in a six-page brochure recently published by Lemlar Manufacturing. Both vertical and horizontal types on new and modernized buildings are shown. The company says jalousies reduce air conditioning requirements by cutting solar heat load and provide better visual conditions by diffusing light and evenly distributing it throughout the room.

(Item No. 15)

FASTENERS: Matching the fastener to the type of wall and weight to be carried is the purpose of a 20-page pocket-sized booklet "The Hang of Things" published by Star Expansion.

The booklet contains a two-page chart giving recommended and alternate fastener according to type of wall. Additional sections take up weight loads and the proper way to attach them or bore the holes. Numerous installation photographs are included.

(Item No. 16)

SCHOOLS: Use of glass block and prismatic glass skylights to daylight schools is illustrated in a recent brochure featuring excellent photographs of 17 schools, a number of them in California. The 20-page brochure, offered by Kimble Glass, shows both new structures and modernization of old schools. Before and after photographs illustrate the improved lighting effects.

(Item No. 17)

PREMOULDED MEMBRANE: Condensation, the damage it can cause to buildings and how to prevent it, is the comprehensive subject tackled in "Design Techniques for Controlling Moisture and Condensation in Building Structures."

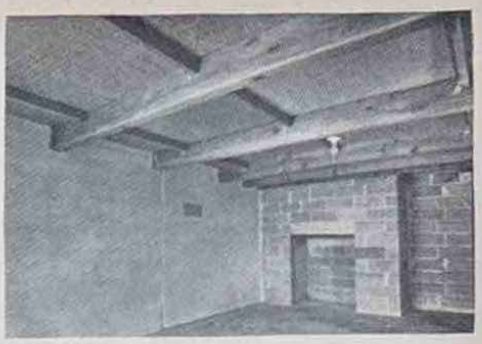
Tables provide such information as moisture production by various domestic operations and photographs depict warped floors, cracked plaster, stained walls, etc. The latter half of the booklet describes Sealtight's premoulded membrane and Corktite insulation, products designed to eliminate condensation problems and gives detailed instructions for installation.

(Item No. 18)

CEDAR SHAKES: "How to Begin a Cedar Shake Double-Coursed Sidewall" is a handy, one-sheet guide designed to help the builder in modernization or new construction. The Red Cedar Shingle Bureau has illustrated the six steps in this quick, simple method. The only extra equipment needed is a piece of shiplap, 6 to 8 ft. in length, which also may be used for leveling succeeding courses.

(Item No. 19)

DRY BASEMENTS: Causes of damp basements and construction methods that will keep them dry are discussed in a 16-page pocket-sized booklet published by Medusa. The booklet also reviews steps that can be taken in older homes and includes detailed instructions for the application of Medusa waterproofings.



(Item No. 20)

ACOUSTICAL CEILING: Embossed aluminum acoustical ceiling panels which are especially recommended for that special club or restaurant room, the board conference room, executive offices, etc., are introduced by Simplex in a four-page folder. Soft-tone panels are available in gold, copper, blue and natural anodized finishes.

The folder describes the advantage of the 85% noise reduction coefficient offered by the ceiling and contains details of suspension, installation and integration with recessed lighting. Specifications also are included.

(Item No. 21)

SUBFLOORING PANEL: A specification sheet showing recommended details and nailing schedules is available for a structural panel which serves as subfloor and underlayment. Douglas Fir Plywood Association calls its new product 2.4.1, engineered to function as a solid one-piece base over supports on 48-in. centers for

PLYWOOD SUBFLOORING

everything from thin vinyl tile to oak strip flooring.

The accompanying photograph shows how the panel provides a clean, uncluttered appearance in basement ceilings.

(Item No. 22)

PLANT DESIGN: To prevent costly errors in the planning of modern mechanized plants, F. Ward Harman has developed three-dimensional scale models of machinery, materials handling equipment, tables, walls and office furniture. A 44-page catalog describes the models and their advantages.

(Item No. 23)

LIGHTING: To present the company's Continental line, Globe Lighting Products has prepared a 38-page full-color, hard-cover catalog depicting a wide variety of modern fixtures. The Continentals feature coordination in design between large hanging fixtures and wall units.

(Item No. 24)

CORK INSULATION: New incombustible qualities of Johns-Manville Rock Cork refrigeration insulation are illustrated in a four-page folder. The increased fire protection was accomplished by adding a newly developed binder to the naturally fireproof mineral fibers from which Rock Cork is formed. Other advantages, such as high moisture resistance and low conductivity, also are described.

Have you ever wondered . . .

How red cedar shingles are made

No. 1: Manufacture of cedar shingles actually begins when forest giants, averaging 200 years in age, are brought into mill to be cut into desired lengths by tremendous circular saws.

No. 2: Splitter-saw reduces log sections into quarters so that maximum number of straight, edge-grain shingles may be sawn from each piece of cedar log.

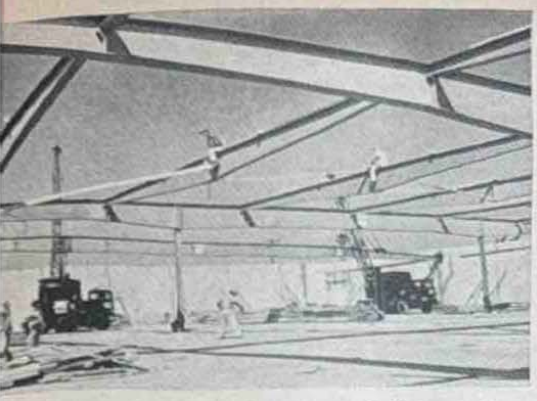
No. 3: Upright shingle machine, to sawyer's left, moves cedar block in and out of circular saw. Sawyer reaches for newly cut shingle with his left hand and "edges" another on circular saw directly in front of him with his right.

No. 4 Shingles are given anther inspection here as packer examines closely each piece before adding it to bundle in front of him. Bundles frequently are dry-kilned before shipment.

THE LONG-LIVED WOOD that is exemplified in western red cedar comes solely from the Pacific Northwest. From the forest, logs are hauled to mills by modern logging methods and equipment.

However, the process of cutting the cedar shingles has remained basically the same for more than 50 years. After the logs are chain-drawn into the shingle mills in large conveyor chutes they are cut into 16-, 18- or 24-in. lengths, according to the size of the shingle desired.

The large log sections are then split or cut into blocks of more or less triangular size for the shingle machines. Every effort is made to cut blocks having a true edge-grain face. The upright machines used to manufacture the actual shingle permit one operator to joint and edge the shingles that come from a single block.



This machine is equipped with a reciprocating, power-driven carriage which carries the block into a thin-gauge, razor-sharp circular saw, which cuts off a complete shingle smoothly at each stroke. On each return stroke of the carriage, pawls engage with the feed rolls between which the block is firmly held, the upper feed roll and the lower feed roll being alternately turned so that a tapered shingle with the butt either up or down is cut at each stroke.

The sawyer picks up each shingle as it comes from the saw, places it on a springboard with the butt held firmly against a guide which is exactly at right angles to the blade of a second circular saw, and presses the springboard down so that the overhanging edge of the shingle is clipped off smoothly. Flipping the shingle over in his hand, he repeats the process, making another smooth edge parallel to the first one.

If defects are present in the shingle as it comes from the saw, he joints the shingle in such a way that a narrower shingle, or two shingles, without defects, can be obtained.

The sawyer then drops the shingle into the proper chute, depending upon the grade, leading to the packing bins below. The packer grades the shingles again as he packs them into bundles in a packing frame, thus checking the sawyer's work.

All shingle mills belonging to the Red Cedar Shingle Bureau come under a complete inspection program which has specific grading rules which each bundle of shingles must meet to maintain the quality standards of the U.S. Department of Commerce. Each shingle bundle carries a distinctive label under the bandstick which identifies the grade and size of the shingles.

EXTRA HEADROOM is provided by built-up steel plate girders on plant under construction in Los Angeles.

Welded girders

Welded girders, built up from steel plate to 190 ft. in length, are providing maximum headroom while using a minimum of steel on the new plant of Rose-Derry Co. in Los Angeles.

The six-ton transverse girders offer the extra headroom between supporting columns by using stress patterns on each beam which eliminate much of the depth required with rolled beams, as well as much of the weight and cost. Double-tapered cross members, built up from plate along the same pattern, provide increased headroom between the transverse beams.

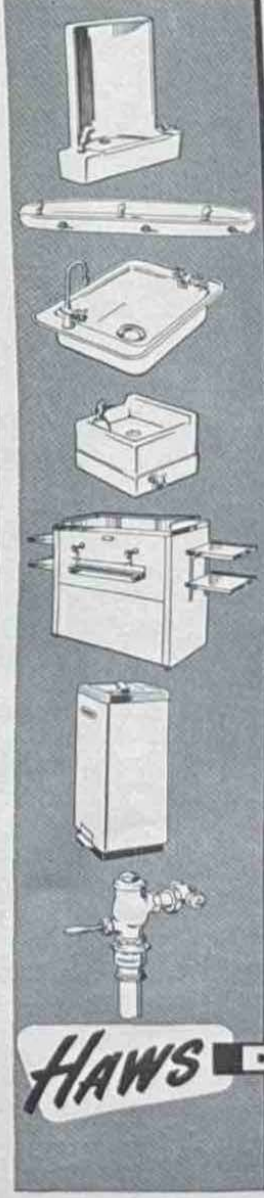
Harold Roach Construction Co. is the general contractor erecting the girders fabricated by Grano Steel Co. from Kaiser Steel plate. Architects and engineers for the plant were Stiles and Robert Clements.

Campus project

A learn-by-doing program at Pasadena City College is teaching students the techniques of construction work in a way which will more quickly qualify them for advancement in the building trades, according to Dean Reinhold, instructor of building construction.

Now in its seventh year, the program wherein students actually design and construct a 1,000-sq. ft. model home on campus has successfully taught 200 students how to select materials, prepare cost estimates, perform carpentry and electrical work. Advanced students supervise the work of beginners, Reinhold says.

The project, he adds, is also an outstanding example of cooperation between school, industry and building trades. Active supporters of the program have been building products manufacturers the Building Contractors Association of Pasadena-San Marino and trade unions.



The building construction class meets four hours daily, three hours on the job and one hour in technical study, over a two-year period during which time they participate in building two homes of approximately 1,000 sq. ft.

MODEL HOME built entirely by Pasadena City College students is inspected by Dr. William Langsdorf, president, and Rose Queen Joan Culver. Supporters of program include Norris-Thermador, whose electrical appliances—built-in oven and countertop range—are shown here.

tion in temporary quarters at 2910 First Ave. S. All orders and deliveries will continue to be made from the company's office and warehouse at 1101 Elliott Ave. W., according to Verne K. Cooperrider, district manager.

● **Moore-Evans Steel Co.** has been formed in Eugene to serve the specialized needs of construction and manufacturing industries in southern Oregon and northern California. With facilities a 2030 Cross St., the newly organized firm has bought the equipment and inventory of Moore Steel Service Co.'s reinforcing steel fabrication division.

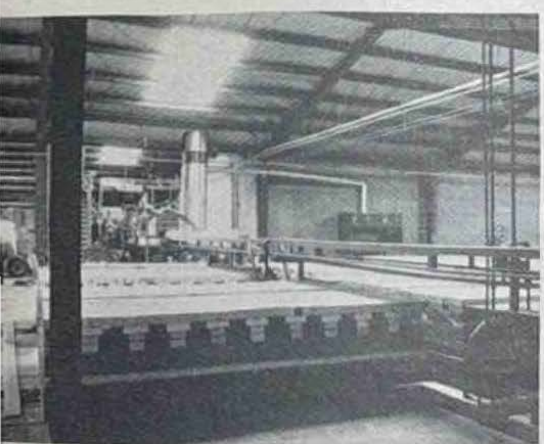
Principals Melvin C. Moore and Hugh E. Evans will be associated with Jim Rundall, engineer.

● **Northwest Structures, Inc.,** has begun production of glued laminated beams, trusses and arches for school and commercial construction at a former ice arena on the north side of Spokane. President George Kalk Jr. was in the plywood business at Mount Vernon, Wash. John H. Howard is vice president and Gordon Maxwell is plant superintendent.

● **The Mosaic Tile Co.** has announced two personnel changes in its western division. Thomas B. Jordan of Los Angeles will handle sales promotion and architectural contacts for the West Coast and Arthur McNeil, formerly assistant sales manager at the home office in Zanesville, Ohio, has been put in charge of territorial sales for the area.

"SALESMAN OF THE YEAR" for Kwikset Locks, Inc., Anaheim, Calif., Edwin J. Hoseus (l.) of Cincinatti, received congratulations from Robert T. Yerxa, general sales manager, and John St. John, sales manager of the Lockset division.

● **Kaiser Gypsum Co., Inc.,** has appointed Charles E. Watson as assistant district sales manager in the Pacific Northwest. Joining the company in 1952, he has been a special salesman in the southern California district.



Kaiser Gypsum also has named these sales representatives: Jordan (Rocky) Montano to serve the Fresno-Bakersfield area; Norman G. Foley, the San Francisco-Peninsula area; and Gordon G. Brown Jr., Orange County sales area.

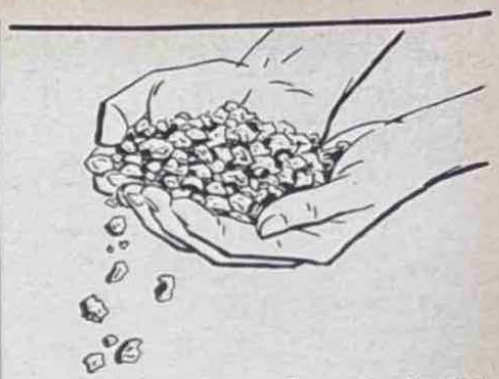
● **York Corp.** has appointed B. W. Steinkuller Pacific district manager, succeeding Clifton Sowers, who will continue his long affiliation with the company as a consultant. Now headquartered in Los Angeles, Steinkuller formerly directed York's San Francisco branch.

Northwest's first structural tile plant opens in Spokane

Washington Brick and Lime Co.'s new $400,00 glazed structural tile plant at Dishman, Wash., is now in operation.

The plant, which includes a large tunnel kiln, is the only one of its kind in the Northwest and one of three such installations west of the Mississippi.

CONVEYOR BELT delivers tile to transfer cars which take product through tunnel kiln. In background are glaze spraying and extrusion machines.



Using specially constructed transfer cars, tile is sent through the kiln automatically for the burning cycle. The gas fired kiln reaches a peak temperature of 2,100 deg. The plant is now operating on butane gas but will be switched over to natural gas in August.

It uses the latest equipment for the entire tile making operation. Clay mixture is sent through the extrusion machine where it is formed into various shapes by dies. It is then cut into desired lengths and sprayed with glaze before loading on transfer cars.

Washington Brick and Lime recently participated in the formation of the Western Structural Tile Institute for the purpose of standardizing specifications.

Officials report that there is a great demand for glazed structural tile in the Northwest. The Dishman plant was decided on after some manufacturers from other regions had quoted delivery dates up to nine months.

Robert Gaines is superintendent of the plant. President of the firm is Neal R. Fosseen.

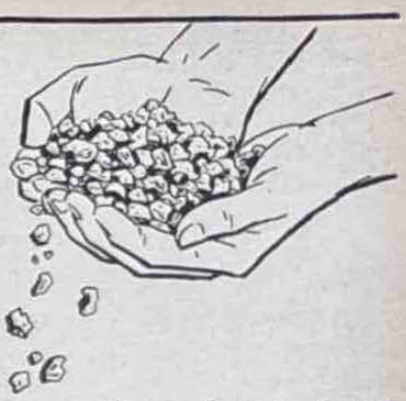
• **York Corp.** has appointed B. W. Steinkuller Pacific district manager, succeeding Clifton Sowers, who will continue his long affiliation with the company as a consultant. Now headquartered in Los Angeles, Steinkuller formerly directed York's San Francisco branch.

Northwest's first structural tile plant opens in Spokane

Washington Brick and Lime Co.'s new $400,00 glazed structural tile plant at Dishman, Wash., is now in operation.

The plant, which includes a large tunnel kiln, is the only one of its kind in the Northwest and one of three such installations west of the Mississippi.

CONVEYOR BELT delivers tile to transfer cars which take product through tunnel kiln. In background are glaze spraying and extrusion machines.



Using specially constructed transfer cars, tile is sent through the kiln automatically for the burning cycle. The gas fired kiln reaches a peak temperature of 2,100 deg. The plant is now operating on butane gas but will be switched over to natural gas in August.

It uses the latest equipment for the entire tile making operation. Clay mixture is sent through the extrusion machine where it is formed into various shapes by dies. It is then cut into desired lengths and sprayed with glaze before loading on transfer cars.

Washington Brick and Lime recently participated in the formation of the Western Structural Tile Institute for the purpose of standardizing specifications.

Officials report that there is a great demand for glazed structural tile in the Northwest. The Dishman plant was decided on after some manufacturers from other regions had quoted delivery dates up to nine months.

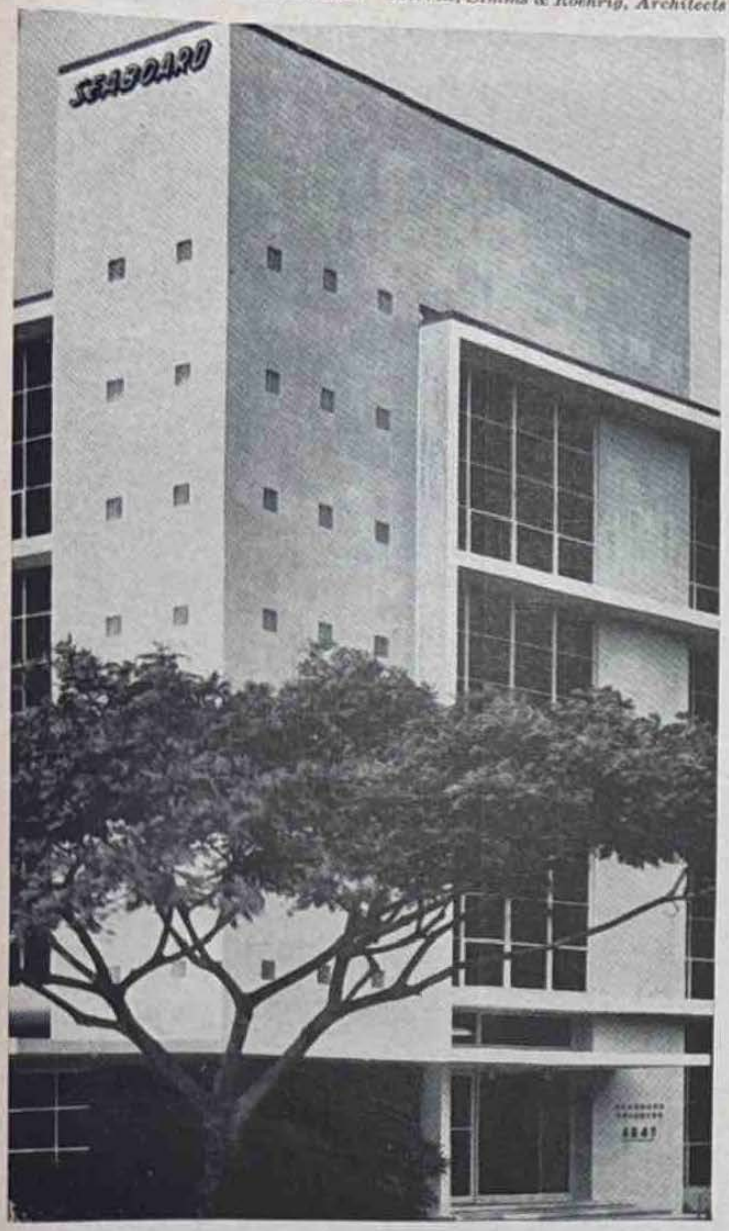
Robert Gaines is superintendent of the plant. President of the firm is Neal R. Fosseen.

These hands hold the answer to your concrete masonry needs...

CASCADE PUMICE

You'll find the most satisfactory concrete masonry material is Cascade Pumice Concrete. Its beautiful coloring when used as broken-faced block, plus strength and high insulation value, gives you a better job with lower handling and labor costs. Write for the technical story of Cascade Pumice today.

Count on Cascade Pumice Concrete for:



HIGH INSULATION VALUE
FIRE RESISTANCE
LIGHT WEIGHT
STRENGTH

Commanding Architectural Expression executed in

KRAFTILE VENEER

with 60% Savings in Space and Weight

Glazed ceramic veneer panels of ⅜" thickness, weighing only 4 lbs. per sq. ft. offer construction economies, permanent beauty and ease of maintenance. For modernization or new construction, Kraftile Veneer permits much faster handling, on-the-job cutting, and reduced structural support. Install over wood, steel or concrete by common adhesion method. Select color range. Write for Fact File of shapes, specifications and installation examples.

Building news-trends-views

(Cont'd. from p. 7)

Los Angeles-Long Beach area, is now being reflected in increased commercial building and higher retail sales. R. Reese Myers, president of the Los Angeles Home Builders Institute, reports that commercial construction is at least 13% ahead of last year and that the 1956 volume probably will exceed $220 million.

A SACRAMENTO PSYCHIATRIST has urged the board of supervisors to hire special architectural consultants for the remodeling of Sacramento Hospital's psychopathic ward. "It takes specialized architectural skill and experience," Dr. Daniel J. Sullivan declares, "to set up a psychiatric ward so as to include the necessary security precautions and yet avoid the jail kind of appearance which obviously should be avoided in a hospital setting." His "snake pit" charges led to an investigation earlier this year.

CHICAGO'S SKYLINE WILL BE TOPPED by a 50-story luxury tower, to be the city's tallest building, planned by Frank Lloyd Wright. An outer shell of aluminum and glass will be hung on cantilever floors extending from a central mast of reinforced concrete like branches extending from a tree. The site will overlook the lake front and Lincoln Park.

AMERICAN DESIGNERS certainly would have felt at home at a national conference of architects in Warsaw, for Premier Cyrankiewicz said that Polish architecture in too many cases suffered from "facade illness"— a false manumentalism. "We need simplicity and modesty, harmony between facade and interior, between style and building material, between elevation and environment, and between planning and common sense," he added.

A MINIMUM DROP of 250,000 housing starts during 1956 at a cost of more than $3 billion to the national economy is foreseen by John M. Dickerman, NAHB executive director, largely as a result of credit restrictions and tight mortgage money.

TV HAS ENTERED THE BANKING BUSINESS in Bridgeport, Conn. A system created by the president of Mosler Safe Co. enables a teller at his station to serve a customer seated in a car 100 ft. away. It includes a two-way closed circuit TV by which customer and teller see and speak to each other and underground pneumatic tubes through which they transfer money and papers. Development of the "TV Snorkel," says Edwin H. Mosler Jr., brings banking one step closer to the bank of tomorrow.

NEW HEADQUARTERS for the American Concrete Institute in Detroit, designed by Minoru Yamasaki, will feature a folded-plate reinforced concrete roof system, cantilevered front and rear from concrete interior corridor walls. It will project over the exterior walls of pecast concrete panels and glass, shielding them from summer sun and reducing the air conditioning load.

TREE FARMS IN THE 12-STATE western pine region have topped the 1,000-mark in number and 6,000,000-acre mark in total area. The movement, which started 14 years ago in western Washington, has spread to 42 states. Idaho is far ahead in tree farm numbers, with a total of 588 already certified. Other states: California, 170; Washington, 166; Oregon, 74; Montana, 52.

THE $113 MILLION EXPANSION PROGRAM now underway at Kaiser Steel Corp.'s Fontana, Calif., plant will up its production of steel ingots and finished steel by 40%. It is estimated that construction will be completed in about two years, although individual facilities will go into operation as they are ready. The project is believed to be the largest single expansion of an industrial plant in West Coast history.

URANIUM TREATMENT PLANT— **Ford, Wash.**

(Estimated cost $3,000,000)

A contract for a uranium processing plant at Ford, 40 miles northwest of Spokane, has been signed by Dawn Mining Co. and the

Increase Concrete Durability 50% with POZZOLITH

POZZOLITH, Master Builder cement dispersing agent, increases concrete durability yet cuts final costs. Pozzolith added to concrete mix makes possible reduced water-cement ratio, produces a more cohesive mix with 20 - 25% greater strength at all ages. Concrete containing Pozzolith cures better, shrinks less, increases 50% in durability. Ask Pioneer for details on laboratory tests and on-the-job results. For better quality concrete and reduced labor cost, specify Pozzolith!

PIONEER SAND & GRAVEL CO.

901 FAIRVIEW AVE. N. ● 910 W. SPOKANE ST. ● SEATTLE ● MAin 2900

Atomic Energy Commission. Ground will be broken during August and plant will be completed by July, 1957. The plant will process ores from the northwest region controlled by the contractor and independent producers. Dawn is a subsidiary of the Newmont Mining Corp. of New York and operates the Midnite uranium mine on the Spokane Indian Reservation.

Mr. Architect . . .

you can counteract the high costs of construction

. . . by placing your official advertisements for bids in the construction trade journals of the Northwest—PACIFIC BUILDER & ENGINEER (1st Saturday of each month), PACIFIC ARCHITECT AND BUILDER (3rd Saturday of each month), and CONSTRUCTION NEWS BULLETIN (2d, 4th and 5th Saturdays).

They reach more contractors, subcontractors and suppliers than any twenty newspaper-type publications.

That's why more consulting engineers — and more school districts, cities, counties, state departments, PUDs and federal bureaus — place their advertisements for bids in our columns than in any other publication in the entire Northwest.

IF YOU WISH THE *LOWEST COMPETITIVE BIDS CONSISTENT WITH RESPONSIBLE WORKMANSHIP* we can get them for you, whether your job is located in the Willamette Valley or in the Blue Mountains . . . in Western Washington or the Inland Empire . . . in the Coeur d'Alene or the Snake River Valley . . . in the Flathead or on the Yellowstone . . . in the Wasatch country or in Wyoming.

PACIFIC BUILDER & ENGINEER, Inc.

2418-Third Ave., Seattle 1, Wash.

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., AUGUST 28
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, August 28, 1956, until 10 A. M. for the construction of the following improvements and will then and there be opened and publicly read:

Bids for the following projects will be opened in the Conference room on the first floor of the General Administraton Building located at Eleventh and Columbia Streets on the North edge of the capitol group, instead of in the board room of the Public Service Commission where bid openings are usually held.

1. Clearing, Draining, Grading, Surfacing with Light Bituminous Surface Treatment, Constructing a Cement Treated Base, Paving with Type I-1 Asphaltic Concrete and Constructing Three Reinforced Concrete T Beam Bridges on 3.261 miles of Secondary State Highway No. 2-A in King County, RENTON TO MAY CREEK, FAP No. UI-025-1(11), involving about 80 acres of Clearing, 964,470 cubic yards of Common Excavation, 133,600 units of Overhaul, 21,830 tons of Selected Roadway Borrow, 7,640 tons of Crushed Stone Surfacing, 74,640 tons of CTB Aggregate, 2,880 barrels of Portland Cement, 190 tons of Asphalt Cement, 1,150 cubic yards of Crushed Cover Stone and Mineral Aggregate, 9,390 tons of Asphaltic Concrete, 5,855 linear feet of Asphaltic Shoulder Curb, 12,835 linear feet of Asphalt Lined Spillway and Ditch, 700 linear feet of Cement Concrete Gutter, 540 linear feet of Iron Pipe, 3,968 linear feet of Concrete Pipe, 5,113 linear feet of Corrugated Metal Pipe, 318 linear feet of Beam Guard Rail, 220 Guide Posts, 1,618 cubic yards of Riprap, 1,701 cubic yards of Concrete, 374,880 pounds of Steel Reinforcing Bars, 356 linear feet of Aluminum Bridge Railings, 2,600 pounds of Structural Steel, 320 pounds of Cast Steel and other items.
2. Clearing, Draining and Grading on 5.931 miles of Primary State Highway No. 2 in Lincoln County, GRAVELLE ROAD TO REARDON, FAP No. F-028-4(1), involving about 547,360 cubic yards of Common Excavation, 38,210 cubic yards of Solid Rock Excavation, 37,550 units of Overhaul, 11,250 cubic yards of Special Borrow, 2,632 linear feet of Corrugated Metal Pipe and other items.
3. Clearing, Draining, Grading and Surfacing with Selected Roadway Borrow on 0.919 mile of a Kitsap County Road, PORT ORCHARD-WATERMAN ROAD, FAS No. S-0329(1), involving about 33,300 cubic yards of Unclassified Excavation and Borrow, 3,130 cubic yards of Selected Roadway Borrow, 43 cubic yards of Concrete, 5,750 pounds of Steel Reinforcing Bars, 60 linear feet of Conduit Pipe, 1,764 linear feet of Concrete Pipe, 9,950 cubic yards of Riprap and other items.
4. Installing Eight Illumination Systems, Two Traffic Signal Systems and Channelization on State Highways Nos. 2, 7, 18 and 11-G in Douglas and Grant Counties, SOAP LAKE VICINITY, ET AL, a State Project, involving about 405 cubic yards of Crushed Stone Surfacing, 134 tons of Asphaltic Concrete, 11,042 linear feet of Precast Traffic Curb, 8 lump sum bids for Installation of Illumination Systems, 2 lump sum bids for Installation of Traffic Signal Systems and other items.
5. Constructing Drainage on 0.305 mile of State Highways Nos. 11 and 11-A in Franklin County, TOWN OF CONNELL, a State Project, involving about 1,050 cubic yards of Structure Excavation, 100 linear feet of Corrugated Metal Pipe, 2,238 linear feet of Concrete Pipe and other items.
6. Constructing a Dwelling and Remodeling a Dwelling in Lincoln County, KELLER FERRY DWELLINGS, a State Project, involving a lump sum bid for the Entire Improvement.

Federal funds have been allocated for items Nos. 1 to 3, inclusive.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

E. C. HUNTLEY, Chairman
W. A. BUGGE, Director of Highways

STATE HIGHWAY PROJECTS
BIDS CLOSE 9:30 A.M., AUGUST 29
Helena, Montana
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:30 A.M. on August 29, 1956. The proposals will be publicly opened and read immediately thereafter.

1. F 23(4), F 81(5)US, F 101(6)U2, F 154(5)U2 and F 225(2)U2. Seal coat oiling on 9.927 miles on the Chinook-East, Zurich East and the Chinook-Harlem Road in Blaine County and 1.237 miles on the Ethridge-Shelby and the Main Streets Shelby Road in Toole County. A total distance off 11.164 miles. Project involves about 1,931 tons haul and spread State-Furnished cover material; 518 tons cover material; 56,141 gals. emulsified asphalt; 76 hours watering; lump sum furnish and maintain facilities for watering; 95 hours rolling. Project to be completed by July 31, 1957.
2. F 164(9). Grade, gravel surfacing, bituminous surface treatment and widening one 39.6' steel & concrete bridge and the construction of small drainage structures on 5.178 miles of the Philipsburg-Anaconda Road in Deer Lodge County involving about 447,031 cu. yds. excavation; 660 cu. yds. gravel backfill; 55,111 mi. yd. overhaul; 88,365 tons crushed gravel; 113,049 gals. emulsified asphalt; 8,430 M gal. watering; 1,228 units rolling; 2,417 lin. ft. reinforced concrete pipe culverts; 344 lin. ft. structural plate pipe culverts; 64.92 acres clearing; 25.25 acres grubbing; 15,499 lbs. reinforcing steel; 128.4 cu. yds. concrete; 44.48 lin. ft. concrete curb and rail; 265 cu. yds. structure excavation; and other items. Project to be completed in 250 calendar days.
3. F 210(2). Grade, gravel surfacing, bituminous surface treatment, and the construction of small drainage structures on 6.012 miles of the Babb-South Road in Glacier County involving about 611,416 cu. yds. excavation; 404 cu. yds. gravel backfill; 100 cu. yds random riprap; 55,131 mi. yds.

overhaul; 124,428 tons crushed gravel; 107,382 gals. liquid asphalt; 10,939 M gals. watering; 1,921 units rolling; 3,780 lin. ft. corrugated metal pipe culverts; 108.65 acres clearing; 45.42 acres grubbing; and other items. Project to be completed by 220 calendar days.

4. F 249(9). Grade, gravel surfacing, bituminous surface treatment and the construction of small drainage structures on 3.513 miles of the Garrison-Helena Road in Powell County involving about 330,925 Cu. Yds. excavation; 350 cu. yds. hand laid riprap; 37,986 mi. yds. overhaul; 35,112 tons crushed gravel; 22,822 tons selected borrow base course; 49,782 gals. liquid asphalt; 6,115 M gal. watering; 471 units rolling; 960 lin. ft. reinforced concrete pipe culvert; 86 lin. ft. corrugated metal pipe culverts; and other items. Project to be completed in 200 calendar days.

5. 268(6)U2. Seal coat oiling on 5.333 miles of the Ryegate-Roundup Road in Mussellshell County involving about 1,103 tons hauling & placing State-furnished cover material; 26,471 gals. emulsified asphalt; 30 hours watering; 75 units rolling; lump sum furnishing & maintaining facilities for watering cover material. Project to be completed by July 31, 1957.

6. F-FG 273(9). Grade, gravel surfacing, bituminous surface treatment, construction of a 264.0' steel girder bridge and overpass and the construction of small drainage structures on 0.820 miles of the Sidney-Culbertson Road in Roosevelt County involving about 324,975 cu. yds. excavation; 128,327 mi. yds. overhaul; 3,333 tons crushed gravel; 11,321 tons selected borrow base course; 6,762 gals liquid asphalt; 6,969 gals. emulsified asphalt; 5,163 M gal watering; 661 unit rolling; 358 lin. ft. corrugated metal pipe culverts; 6,550.0 lin. ft. steel guard rail; 4,771.4 lin. ft. pre-mix bituminous curb; 49,548 lbs. reinforcing steel; 357.3 cu. yds. concrete; 531.00 lin. ft. steel bridge rail; 255 cu. yds. structural excavation; 3,000 lin. ft. furnishing treated timber piles; 2,866 lin. ft. driving treated timber piles; and other items. Project to be completed by August 31, 1958.

7. S 157(1)U2. Gravel surfacing and bituminous surface treatment on 10.392 miles of the Kalispell-Lupfer Road in Flathead County involving about 100,483 tons crushed gravel; 26,616 cu. yds. sand base; 113,710 gals. liquid asphalt; 2,010 M gals. watering; 775 units rolling; Project to be completed by September 15, 1957.

8. S 176(3). Grade, gravel surfacing, bituminous surface treatment and the construction of small drainage structures on 7.426 miles of the Molt-Billings Road in Stillwater and Yellowstone Counties involving about 151,083 cu. yds. excavation; 356 cu. yds. gravel backfill; 3,814 mi. yds. overhaul; 120,714 tons crushed gravel; 43,729 gals. liquid asphalt; 43,729 gals. emulsified asphalt; 4,660 M gal. watering; 1,039 units rolling; 2,008 lin. ft. reinforced concrete pipe culverts; 152 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 200 calendar days.

9. S 186(4). Grade, gravel surfacing, construction of small drainage structures and one 25.0' treated timber pile bridge on 4.830 miles of the wilsall-Northeast Road in Park County involving about 181,503 cu. yds. excavation; 71,618 mi. yds. overhaul; 29,748 tons crushed gravel; 5,275 M gals. watering; 634 cu. yds. binder; 1,269 mi. yds. overhaul on binder; 135 units rolling; 1,298 lin. ft. reinforced concrete pipe culverts; 812 lin. ft. corrugated metal pipe culverts; 134 cu. yds. gravel backfill; 62 lin. ft. standard sectional reinforced concrete; 13,202 MBM treated timber; 0.424 MBM untreated timber; 380' treated timber piles; and other items. Project to be completed in 180 calendar days.

10. S 208(1)U1. Grade, gravel, and drain on 8.591 miles on the Melville East & West Road in Sweet Grass County involving about 295,182 cu. yds. excavation; 403 cu. yds. gravel backfill; 121,517 mi. yds. overhaul; 16,007 tons selected borrow base course; 36,043 tons crushed gravel; 5,433 M gal. watering; 293 units rolling; 1,127 cu. yds. binder; 2,754 mi. wds. overhaul on binder; 2,899 lin. ft. reinforced concrete pipe culverts; 796 lin. ft. corrugated metal pipe culverts; 324 lin. ft. structural plate pipe arch culverts; and other items. Project to be completed in 200 calendar days.

11. S 289(4). Grade, gravel surfacing, plant mix oiling and construction of small drainage structures on 6.370 miles of the Red Lodge-Columbus Road in Carbon County involving about 441,784 cu. yds. excavation; 239 cu. yds. gravel backfill; 26,296 mi. yds. overhaul; 8,678 tons plant mix; 69,548 tons crushed gravel; 28,960 gals. liquid asphalt; 22,978 gals. emulsified asphalt; 107,117 gal. 250-300 penetration asphalt cement; 7,711 M gal. watering; 1,243 units rolling; 4,062.4 lin. ft. reinforced concrete pipe culverts; 448 lin. ft. corrugated metal pipe culverts; 56 lin. ft. structural plate pipe culverts 1,780 lbs. reinforcing steel; and other items. Project to be completed by September 15, 1957.

12. S 361(8). Grade, gravel surfacing and construction of small drainage structures on about 6.042 miles of the Fairview-Girard-West Road in Richland County involving about 467,001 cu. yds. excavation; 750 cu. yds. gravel backfill; 8,686 mi. yds. overhaul; 37,948 tons crushed gravel; 500 cu. yds. random riprap; 7,700 M gal. watering; 175 units rolling; 3,181 lin. ft. corrugated metal pipe culverts; 606 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 180 calendar days.

The above listed quantities are approximate only.

All bid proposals shall be accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in his proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of bids is required.

Plans, specifications, forms of contract and bond, proposal blanks, and full instructions are on file for examination and may be obtained at the offices of the State Highway Commission in Helena, Montana. Plans and specifications for all Federal Aid Projects are also on file and may be examined in the office of the Bureau of Public Roads at Missoula.

Frank G. Connelly, Chairman
Scott P. Hart, State Highway Engineer

Sealed bids (Invitation No. DS-4748) will be received at Denver, Colorado, until September 25, 1956, for furnishing four motor-driven, horizontal, centrifugal-type pumping units, each having a capacity of 44.4 cfs under a total head of 85-feet for White Bluffs Pumping Plant No. 1, Columbia Basin Project, Washington. Delivery is desired within 330 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

5587—8-18

SCHOOL ADDITION

BIDS CLOSE 8 P.M., P.S.T., AUGUST 30

Othello, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Secretary of the Othello School District 147-163-55, Othello, Washington, at the offices of the School District at Lutacaga Elementary School on or before 8:00 P.M., P.S.T., Thursday, August 30, 1956, for the construction of additions to present school consisting of Gymnasium, Homemaking & Music Sections of frame, steel, and masonry construction. The bids will then and there be publicly opened and read aloud.

Bids received after the time fixed for opening cannot be considered.

Separate bids will be received for the following contracts:

a. General
b. Mechanical work
c. Electrical work

Drawings and specifications including contract documents may be examined at the office of the Architect, Victor Louis Wulff, 1526 West Riverside Avenue, Spokane, Washington, and may be obtained there, upon the deposit of $50.00 per set for general and $25.00 for electrical and mechanical.

The sets of plans and specifications will be on file at the following places for convenience of sub-contractors, etc.:

Construction Council, W. 933 3rd Ave., Spokane, Washington.
AGC Builders' Chapter, N. 1207 Washington St., Spokane.
Associated General Contractors, 215 W. Harrison St., Seattle 99.
Builders' Exchange Cooperative, 317 Builders' Exchange Bldg., Portland 4, Oregon.
Plan Bureau, 2413 Western Ave., Seattle 1, Washington.
Construction Council, Moses Lake, Wash.

The full amount of the deposit for one set of documents, will be refunded to actual bidders upon return of the documents, unmutilated and without marks and annotations, within 10 days after the time set for opening of bids, but to non-bidders only if returned no later than 10 days before the bid opening.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" and on the bid form provided by the Architect and each bid must be accompanied by a certified check, cashier's check or bid bond with State-licensed surety or sureties in an amount of not less than five per cent (5%) of the bid for which security is given, made payable to Othello School District 147-163-55.

The right is reserved to accept or reject any or all bids and waive all claims or any informalities or irregularities in the bids or in the bidding. The School District reserves the right to award a contract for this project on the basis of the acceptance of any or all of the alternates, whichever course is in the best interests of the School District.

No bidder may withdraw his bid after the time set for the opening thereof, unless the award of contract is delayed for a period exceeding 30 days.

By order of Othello School District #147-163-55.
Lutacaga Elementary School, Othello, Wash.
Thomas R. Booker Jr., Chairman.

5586-A—8-11, 14, 15

REMODEL NATATORIUM

BIDS CLOSE 4:30 P.M., AUGUST 20

Klamath Falls, Oregon

NOTICE TO CONTRACTORS

Sealed bids will be received on or before 3 p.m., Monday, August 20, 1956, at the office of the Superintendent of Schools, Room 200, Klamath Union High School, Klamath Falls, Oregon, for remodeling of the existing Klamath Union High School natatorium.

A general bid will include all items of work. Bids will be publicly opened and read at 5 p.m., Monday, August 20, 1956.

As a condition precedent to receipt of his proposal, the bidder must have qualified 10 days prior to the opening of bids as prescribed by Page 225, Laws of Oregon, 1951.

Plans and specifications may be obtained at the offices of Morrison and Howard, architects, 203 Williams Building, Klamath Falls, Oregon. A deposit of $30 will be required and the deposit will be refunded to the bidder upon return of the plans and specifications in good condition.

Plans and specifications on file at the builders exchange cooperatives in Portland, Eugene.

The successful bidder will be required to furnish a surety bond in the full amount of the contract price. He shall be required to carry public liability insurance as specified. A bidders bond or certified check in the amount equal to five per cent of the lump sum bid must accompany the bid as a guarantee for the execution of the contract and bonds in case the contract is awarded to the bidder. The school board reserves the right to refuse to accept any or all bids.

HAROLD ASHLEY
Clerk,
School District No. 2
Klamath Falls, Ore.

5579—8-8, 15

VOCATIONAL BUILDINGS

BIDS CLOSE 8 P.M., AUGUST 28

Pasco, Washington

NOTICE TO CONTRACTORS

MECHANICAL EQUIPMENT FOR SEWAGE TREATMENT PLANT

BIDS CLOSE 8 P. M., AUGUST 28

Edmonds, Washington

NOTICE TO CONTRACTORS

Written proposals will be received by the City of Edmonds at the City Hall, Edmonds, Washington, until 8:00 p. m., August 28, 1956, and then and there opened and publicly read aloud for furnishing mechanical equipment required for a primary type Sewage Treatment Plant to include circular clarifiers, bar screen and grinder, lift pump, sludge pump, digester mixer and heat exchanger, grit separator and pump, chlorinator and appurtenances. Each bidder may bid upon one or more items and award will be made to one or more bidders on the basis of individual items, as deemed to the best interest of the City.

Specifications and contract documents may be obtained from the office of James H. Reid & Associates, Consulting Engineers, 420 Bell Street, Edmonds, Washington.

Each proposal shall be accompanied by a certified check or cashier's check made payable to the City Treasurer in amount not less than 5% of the amount of the bid. The check shall be given as a guarantee that the bidder shall execute the contract in conformity with the contract documents if it be awarded to him.

The City of Edmonds reserves the right to reject any or all bids and to waive irregularities or informalities in the bid or in the bidding.

No bidder may withdraw his bid after the hour set for the opening thereof or before award of contract unless said award is delayed for a period exceeding thirty days.

Signed: ANITA BUSCH,
City Clerk, Edmonds.

COURTHOUSE

BIDS CLOSE 10:30 A. M., AUGUST 27

Billings, Montana

NOTICE TO CONTRACTORS

Notice is hereby given that sealed proposals will be received up to 10:30 A.M. Monday, August 27, 1956 by the Board of County Commissioners, Yellowstone County, Billings, at the office of the commissioners in the County Court House, Billings, Montana for the furnishing of materials and labor for the construction of a Court House at the corner of Third Avenue North and 27th Street North, Billings, Montana for the following:-

1. General Construction
2. Mechanical Construction
3. Electrical Construction
4. Elevator

All to be in accordance with plans and specifications prepared by Chandler C. Cohagen, Architect, 211 Hedden Building, Billings, Montana. Bids will be opened on the 2nd floor of City Hall, August 27, 1956, at 11:00 A.M. Bids shall be made on the printed forms furnished with the specifications. Plans and specifications may be obtained at the office of the architect. Each bid shall be marked on the outside of the opaque envelope with the nature of the proposal and the name of the bidder. Each bidder shall submit, with his proposal, bid bond, certified check or cash in the amount of ten percent, (10%) of the total amount of his proposal. This security shall be made in favor of the County of Yellowstone as a guarantee that bidder will enter into a contract and furnish a performance bond in the value of one hundred percent (100%) if contract is awarded to him. No bidder may withdraw his bid within fifteen days after the closing time for the receipt of bonds. The board reserves the right to waive informalities, to reject any and all bids or to accept the one bid that, in its judgment, will be to the best interest of the county.

Signed
BOARD OF COUNTY COMMISSIONERS, YELLOWSTONE COUNTY, MONTANA.
BEN B. HAGERMAN,
Chairman

REMODEL BUILDING

BIDS CLOSE 2 P.M., AUGUST 28

Seattle, Washington

NOTICE TO CONTRACTORS

Separate sealed proposals will be received by the Board of Regents of the University of Washington at the office of the Comptroller, Room 203 Administration Building, on the University Campus, until Tuesday, August 28, 1956, at 2:00 P.M. for the Denny Hall remodeling for the University of Washington, and said proposals will then and there be publicly opened and read aloud. Bids received after the time set for opening cannot be considered.

Specifications and drawings may be examined after August 7, 1956, at the office of the Architects, Grainger, Thomas & Baar, 6153 Arcade Building, Seattle 1, Washington, or at the Seattle Chapter, Associated General Contractors of America, 215 West Harrison, Seattle, and may be obtained at the Architect's office upon deposit of $25.00 for each set of drawings and specifications. A maximum of two sets per bidder.

The full amount of deposit for each set of documents will be refunded to actual bidders upon return of the documents, unmutilated and without marks or annotations, within one week after the date of the bid opening.

Each bid must be accompanied by money, or a certified or bank cashier's check, or by a bid bond, each in an amount not less than 5% of the Base Bid, made payable to the University of Washington. Bid bond must be furnished in the form set forth in the specifications, with a State-licensed surety company as surety.

Attention of bidders is directed to State laws concerning wages, working hours, and other conditions of employment.

The Board of Regents reserves the right to reject any or all bids, and to waive informalities with respect thereto. No bidder may withdraw his bid after the hour set for opening thereof, unless and until the award of Contract has been delayed for a period exceeding forty-five (45) days.

By order of the BOARD OF REGENTS

ANOTHER EXAMPLE OF CARCO "one stop" STEEL SERVICE

FISH PASSAGE FACILITIES TO COST $5,000,000 AT PORTLAND GENERAL ELECTRIC'S PELTON PROJECT

In designing and developing the Pelton hydroelectric project on the Deschutes river near Madras, Oregon, the Portland General Electric Company has gone to unusual lengths to preserve commercial and sports fishing for present and future generations.

While the project is being built and until the permanent fish passage facilities are erected, a temporary fish elevator has just been completed. Upstream migrants enter a brail which is hoisted or elevated for dumping into a hopper which, in turn, is lifted and moved by a traveling crane for emptying into a transportation truck.

Eventually, about $5,000,000 of the $25,000,000 project cost will be spent on the fish elevator, the re-regulating dam, the fish ladder and other facilities to guide upstream and downstream salmon and steelhead migrants past the dam.

Pacific Car fabricated 30 tons of structural steel for the Pelton project's temporary fish elevator.

Let Carco help you with your structural steel problems. Pacific Car offers not only the largest fabricating facilities in the Northwest but also a "one-stop" steel service. This means money-saving ideas and suggestions, prompt engineering detail and estimates, fabrication and erection. Remember, no job is too large for Pacific Car's equipment and technical competence, nor too small to receive our interested attention.

ONLY
PUMICE
(expanded by nature)
IS SO
FIRE
RESISTANT

Pumice is the *only* structural lightweight aggregate from which building blocks of standard wall thickness can be manufactured to meet all these rigid requirements: (1) Satisfy **ASTM** specifications for class "B" block, (2) Satisfy **FHA** requirements for "U" Factor of 0.25, (3) Satisfy **Underwriters Laboratories, Inc.** specifications for a *4-hour* fire wall block — and, at the same time, possesses the other desirable qualities of lightweight aggregates.

Natural expanded Pumice cuts construction costs, too. Free, complete technical data gladly sent upon request.

A plea for design: *our very best*

A digest of an address presented by Robert Billsbrough Price at the Honor Awards banquet of the Oregon chapter, AIA, in Portland

DURING the past few years I have been very fortunate to be a guest and also to play host to a number of my colleagues, both in cities around the country and in my own city of Tacoma.

The most fascinating part of these meetings has been the exchange of ideas and to hear the various practitioners express their philosophy of architecture. However, more times than I care to count the discussion very quickly regresses to a discussion of details, client problems or how much of a financial loss the last project entailed. It is stimulating when the big approach is given: the problem (what the architect was attempting to accomplish) and finally his solution.

This facet of our complex work, I believe, is the very foundation of our professional existence. From the start of our scholastic training, all subjects are subordinate to the concept that the ability to create order, function and beauty in the fields of products, industry, building and planning is our biggest contribution to those we serve.

To realize a peak of design perfection is not a simple job, but rather one of a united and determined effort on the part of all connected with the project to give their very best.

It is my contention that one can not precisely and carefully isolate any one phase of the problem, such as design, mechanical, electrical, acoustical, landscape, sculpture and painting, from the others. Each draws strength and meaning from its relationship to the others. Each must be examined in its relationship to the others and to the whole.

To realize the very best from those participating within and without of the office, there must be a feeling of teamwork. Each participant must be made to feel that he is a real and vital part of those responsible. Any man entrusted with a phase of the work is worth listening to and given a chance to express himself. There should be in every office an atmosphere that is conducive to a free exchange of ideas.

When I hear the expression, "We are out of the design stage and are now on work drawings," it makes me boil. There is design in all phases of the job, down to the very problem of sheet composition and the cover layout for the specs. This feeling for perfection, this awareness for order and beauty, must be paramount in the minds of all participating.

There must be a leader but he should be so instilled with a desire to do his very best that it becomes contagious to all working with him.

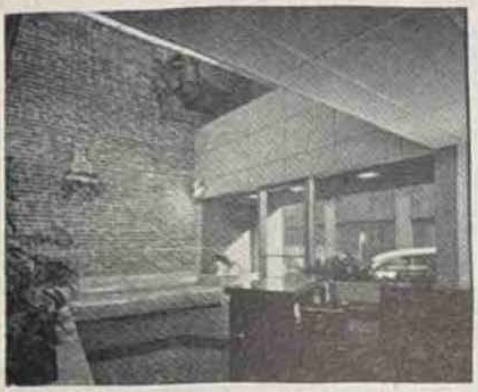
At a recent lecture dealing with the subject of better acquainting the public with an architect's services, care was taken to call attention to complete plans, specifications, competitive bidding, supervision, etc.—but not one word of design, no mention of that attribute that takes the ordinary and makes something fine.

Every job should have your very best. And each job as it is approached should be with the mind that this will be our very best. I know what you are thinking: we can't because of program, budget or the client. These are not unsurmountable problems. If the program is unrealistic make it real; it's part of your work! From the program the breath of life is given to a piece of archtecture.

The budget—a very real problem but it can be solved if the architect approaches it in an understanding way with the client. A limited budget never forced an architect to use bad proportions or to be out of scale or do a poor parti, etc. Often a limited budget has stimulated the imagination and ingenuity of the designer to the point where a wonderful solution has been the result.

The client—I will grant you the client and his desires and attitudes has much to do with the success of any project. However, too often do we hear, "Oh, the client wouldn't let us do a good job." No client ever forced us to do a bad job. Far too often the architect will hide behind this type of talk as an excuse for prostituting the greatest contribution he can make.

If all these problems become too great, don't do the job. I know again you will say we have an obligation and a service to perform. However, your first obligation should be to those truths and ideals to which at one stage of our training we all dedicated ourselves.



Every job that is executed in a poor or mediocre manner lowers the standard of the entire profession. If every job is treated as the most important commission in the office and given our very best, the results are bound to be good. And every job that is brilliantly conceived and executed adds stature to the architect as a group and to each and every member of the architectural profession.

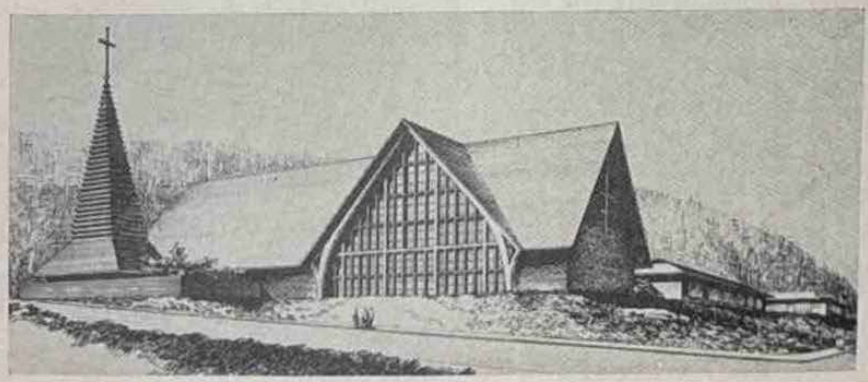
UNIVERSITY OF WASHINGTON TEACHING HOSPITAL in Seattle is shown at extreme left as it will ultimately look (except left-hand wing will have one less story) when added to Health Sciences Building. Contract awarded in May for 300-bed project provides contractor right to revert to 140-bed unit within 12-month period if sufficient funds are not available. Plans have been prepared by Naramore, Bain, Brady & Johanson, McClelland & Jones, associated architects.

PERSPECTIVES

by Pacific architects



PERFORATED ALUMINUM SCREEN will envelope headquarters and research center for Adolph's, Ltd., in Burbank, Calif., enclosing landscaped areas and assuring privacy of all offices, yet allowing full use of natural light. Slated for completion early in 1957, block-long building will be constructed entirely of glass and steel. Design by Raphael S. Soriano, AIA, calls for flexibility of office arrangements since inside walls are non-supporting. Floors will be radiant heated.

HONOLULU'S FIRST full-scale suburban shopping center will become a reality when $3 million project is completed in fall of 1957. Liberty House Department Store and 35 other diversified tenancies covering 150,000 sq. ft. will be located in one-story, light steel building cluster with generous courtyards. Victor Gruen & Associates, who designed the original Liberty House store, are architects for new center.

FIRST METHODIST CHURCH in Portland is constructing sanctuary seating 800, two Sunday school buildings and administrative unit as first step in overall project consisting of series of structures grouped around private courtyards. Church will have brick walls, wood laminated arches, stained glass window facing east and clear glass window facing court. Other buildings will be of Douglas fir. Plans have been prepared by Stewart & Richardson.

ARCHITECTS WILL TAKE A LONG LOOK at the role they play in California's growth and progress during their annual state convention October 10-14 at Yosemite National Park.

In his keynote address on Thursday, October 11, Dr. Stephen C. Pepper, chairman of the department of philosophy at the University of California, will speak on architecture as it relates to the world. He also will participate in the principal convention panel on the following day, which will include both architect and lay speakers.

Committees of the California Council of Architects, sponsoring organization, will hold open seminars on current developments in three types of buildings—homes, schools and hospitals. Two other committee seminars will deal with the architect's relations with the public and conduct of his office practice.

Other program highlights outlined by chairman William Corlett of San Francisco: the California-Nevada-Hawaii regional conference, AIA, led by director Donald Beach Kirby of San Francisco; business meeting of the State Board of Architectural Examiners; and a full schedule of social events starting with a reception Wednesday evening (registration day).

The Old Yosemite Lodge, directly across from convention headquarters in the new lodge buildings, will be occupied by the building products exhibition, limited this year to 55 because of space accomodations.

THE PARADE OF BIG BUSINESS MERGERS is led this month by Owens-Illinois Glass Co. and National Container Corp., whose directors have given the green light to the proposed consolidation.

SHORTAGE OF MORTGAGE MONEY is critical, says NAHB president Joseph B. Haverstick, who offers this advice to the 39,000 members: 1) Do not start construction or advance very far in project planning without written financing commitments for your long-term mortgage needs. 2) Keep production closely related to your sales volume. This is no time to risk either unsold or unfinished inventories. 3) If using warehousing, don't depend on extensions of warehousing agreements—they not be forthcoming. 4) Don't assume that the tight money market is temporary—because it may well get tighter. 5) If your profit margin has been squeezed down to the vanishing point (as many have), cut back your production instead of risking a loss from which you may never recover.

"Builder after builder is going out of business, converting to land development work, going into custom work or building a smaller number of conventionally financed expensive homes," Haverstick declares. "This is certainly not the way to house the great masses of our American people."

HOUSING HAS BEEN MAKING NEWS in other quarters too. Apartment house owners from across the nation who met for their 15th annual convention in Portland late last month were encouraged to cooperate in local programs to modernize and rehabilitate the "central cities" but to oppose "any form of public housing" . . . The counsel for the House subcommittee on housing goes to Hawaii this month to survey military and civilian housing needs on the islands. . . . Seattle and Los Angeles are among nine metropolitan areas for which data will be provided in the 1956 National Housing Inventory to be conducted by the Bureau of the Census beginning in December.

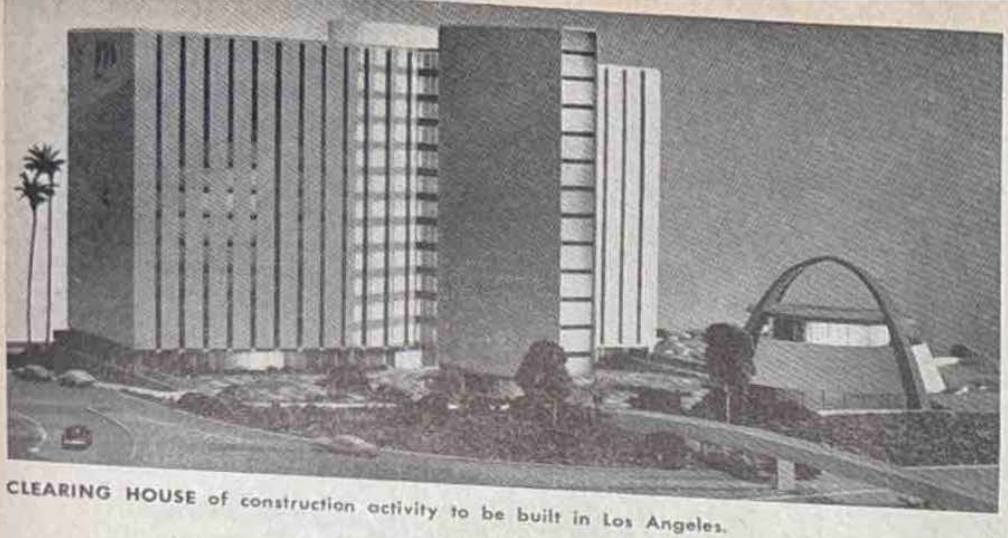
THE LOS ANGELES METROPOLITAN AREA is the third-ranking industrial center in the U.S. The Census of Manufacturers reports a 149.3% industrial increase from 1947 to 1954 in the area, forging ahead of Detroit and Philadelphia.

THE FRANK LLOYD WRIGHT ENDOWMENT FUND, a non-profit organization with offices in Chicago, will honor the architect of the proposed "cloudscraper," mile-high building to be erected on the shores of Lake Michigan near the Adler Planetarium, at a sponsored dinner in the Hotel Sherman October 17. Along with the food and an address by Wright, the guests will view an exhibit of writings, drawings and models covering his most important work during the past 65 years.

U. S. LUMBER PRODUCTION is holding steady at around 37 billion board feet annually, more than a third of the world's output.

THE TERRITORY OF ALASKA for the first time in its history is now empowered to bond itself up to the $20 million mark for public improvements. The bonding authority includes construction, alteration, equipping or acquiring all types of public buildings—schools, hospitals, colleges, offices, prisons—and other types of structures. It also provides for roads, water and sewer systems and similar public facilities.

NORTHWEST: ACCENTUATE THE REGIONAL



Winding up a most successful four-day conference in Tacoma September 9, the Northwest Regional Council, AIA, got a Sunday morning eye opener when delegates slapped the national institute on the wrist with a resolution which had almost unanimous approval. (PA&B for October will carry a complete report of the conference.) The original resolution, which would have proposed elimination of national conventions, was amended to put greater emphasis on regional conferences, including financial assistance, and to de-emphasize national meetings.

The delegates also gave full support to the architect-in-training program; and although no formal action was taken, they gave considerable discussion to the role of the AIA's public relations program. Nelson J. Morrison of the Southwest Washington host chapter was named as third member to the regional judiciary committee, with LaMonte J. Shorett of Washington State chapter as alternate.

DEAN OF TACOMA ARCHITECTS DIES

George Gove, FAIA, a leader in Tacoma architectural circles for the past half century, died August 31 at the age of 87. He was the last surviving member of the firm of Heath, Gove & Bell, which designed such projects as the Central School, Lincoln High School, First Baptist Church, Sixth Avenue Baptist Church, Central Lutheran Church and the Puget Sound Bank Building, all in Tacoma, as well as the Masonic Home in Zenith and the Northern Hospital in Sedro Woolley.

A native of Rochester, Minn., Mr. Gove came to Tacoma in 1908 following completion of architectural studies in Paris. He was a founder of the Tacoma Society of Architects nearly 40 years ago, a member of the Washington State chapter, AIA, since 1914 and elected to fellowship in the national institute in 1949. He served on the Washintgon Board of Examiners for Architecture for many years and helped to establish the Boys Ranch Home near Winlock.

CLEARING HOUSE of construction activity to be built in Los Angeles.

Los Angeles to get construction center

Ground was to have been broken this month for the $5 million, height-limit Construction Industry Center at the edge of Los Angeles' freeway network.

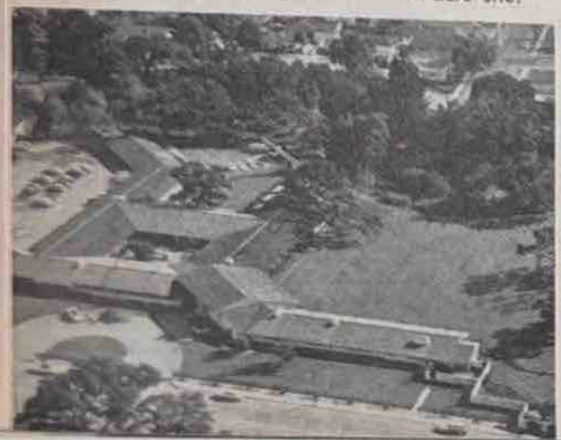
Sponsored by the 2,000 members of the Building Contractors Association of California, the center will draw together all segments of the industry into one giant headquarters when it is completed in the fall of 1957. It will include a 150,000-sq. ft., 13-floor office building, 13-floor elliptical exhibits tower, graphic arts center and tri-level parking facilities.

The center will house sales and administrative offices of product manufacturers, financial organizations, subdividers, architects, trade and professional associations. BCA president Ernani Bernardi says its completion will bring "realization of a dream we've always had for improving everybody's business with one clearing house of data and activity."

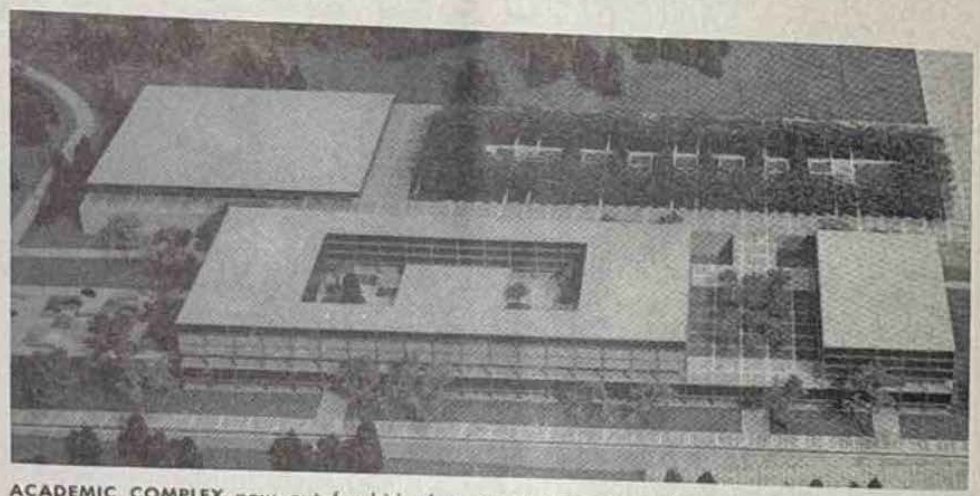
As designed by John C. Lindsay, AIA, the center plans call for dozens of features tailored to meet the needs of the construction industry, among them an expandable auditorium for sales and special events meetings. There will be facilities for closed circuit TV and the showing of sound motion pictures. Water, gas, electric and sewer outlets built in on the stage will facilitate live demonstrations for shows open to the public.

Included in the center will be a bank and a restaurant which will cater the monthly trade association meetings held elsewhere in the building. The roof garden will house the Greater Los Angeles Construction Club.

Office building construction will feature 10-ft. wall sections alternating with 36-in. glass panels, both running the full height of the structure and providing plenty of wall space for desk placement as well as natural lighting for each worker. Ceilings throughout are actually to be huge light panels with individual rheostats for increasing or diminishing light in any area.



The permanent Tower of Exhibits—the core of which is to be the first all-glass elevator in America — will connect with the office building at each of the 13 floors by glass enclosed walkways and will provide a single dramatic showcase for the entire range of building products.



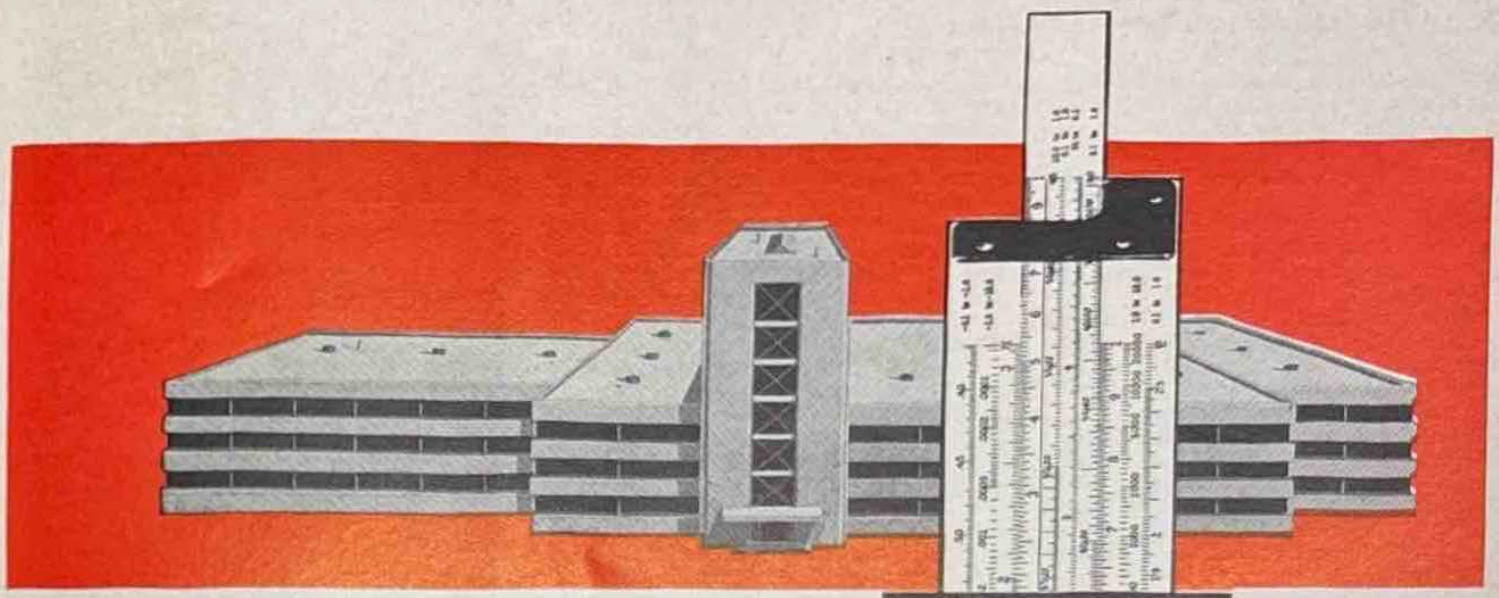
Landscaping award presented to Sunset headquarters

Built like a home but 25 times larger, the office headquarters building of Sunset magazine at Menlo Park, Calif., has been named only western winner in the third annual national "Plant America" competition for industrial landscaping, conducted by the American Association of Nurserymen. Thomas Church was landscape architect for the project, designed by Cliff May.

The ranch style structure is on a seven-acre site dotted with gardens and lawns. A 100-year-old olive tree grows beside a pond in the patio.

SUNSET HEADQUARTERS on seven-acre site.

ACADEMIC COMPLEX now out for bids does not include dining hall at upper left.



Air Force Academy to let first construction contract

With plans of all buildings, except the controversial chapel, now approved by Air Force Secretary Donald A. Quarles and his consultants, the Air Force Academy was scheduled to open bids this month on the first structure—the academic building.

Many details are yet to be worked out but the overall design of the academy near Colorado Springs, Colo., whose cost may hit $155 million, has been accepted.

Exterior wall enclosures of the academic building include these quantities: glass and aluminum, 118,000 sq. ft.; marble and aluminum, 38,000 sq. ft.; masonry and stucco, 25,000 sq. ft. Revised plans by Skidmore, Owings & Merrill, architects-engineers, have reduced the use of glass in exterior walls of all buildings.

The first contract calls for furnishing all materials except foundation caissons and structural steel.

THE PROOF OF THE ROOF

KAISER
STRUCTURAL GYPSUM
ROOF DECK

The Kaiser structural gypsum roof system is adaptable to curved or sloped, as well as to flat roofs. This offers maximum flexibility of design to the architect and engineer. The "plastic" nature of the system minimizes structural problems occurring at skylights, curbs, and other breaks in the roof plan.

Free flowing poured gypsum concrete sets rapidly into a light, strong, fire resistant roof. The undersurface of Kaiser Gypsum form board makes a clean, beautifully finished ceiling which requires no further treatment.

Kaiser Structural Gypsum Roof Deck system is particularly adaptable for use on commercial, industrial and institutional jobs. *For additional information and A.I.A. folder, write Kaiser Gypsum Company, Inc., 1924 Broadway, Oakland 12, California.*

Two experimental houses for California

Eichler Homes X-100 is steel showcase

The Eichler Homes X-100 experimental house using light structural steel, designed by architects A. Quincy Jones and Frederick E. Emmons, is scheduled for public viewing this month.

Built in northern California at San Mateo Highlands, the all-steel Eichler home will not be offered as a production model. Instead it is being exhibited as a showcase of new ideas and new building materials as well as a preview of planning concepts that may be expected in merchant-built homes of a few years hence.

President Joseph L. Eichler, whose firm has built nearly 4,000 houses since 1946, has been a pioneer in contemporary design as applied to tract housing. His new X-100 is planned around an all exposed all-steel frame. No wall carries lateral or vertical loads and the 2,226 sq. ft. of enclosed living space are planned for maximum living.

All plumbing for the kitchen, laundry and bathrooms are contained in one central core and areas have been designed to flow into each other with complete integration of indoor and outdoor.

The house has only one hallway, between the bedrooms and the baths, and the entire space is devoted to living area, with three bedrooms, two baths, an all-purpose family room, living area, dining and kitchen related space and two special informal rooms.

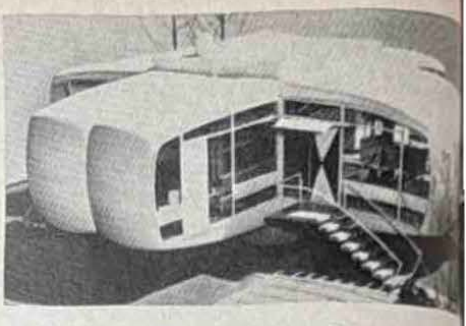
In addition, there is an enclosed workshop of 84 sq. ft. adjacent to the carport and a large playyard for children just outside the bedroom wing. The covered carport serves as a second play area for children.

The exterior walls consist of three materials: special panels of high density overlaid plywood; panels of plastic with a honeycomb core; and steel framed sliding glass doors which form the skin of the house.

The plastic panels are used in areas where it is desirable for light to filter into the house but where privacy and insulation are also required.

The high density overlaid plywood panels, developed originally for use as pouring forms for concrete jobs, are 1-in. thick, as are the plastic panels. Sliding glass doors are used throughout with no other sash.

Exposed steel decking is used for interior ceilings; walls which serve only as boundaries for the spaces, rather than as structural units, may be altered according to changing family requirements.



The latest built-in appliances for kitchen and laundry include new models in refrigeration, home freezers, wall ovens and cooking units which are an integral part of the dining table design.

Other members of the team constructing the new Eichler home include Douglas Baylis, landscape architect; Matt Kahn, artist; Knorr Interior Planners, interior designers; and Gump's, accessories.

ALL-STEEL HOUSE opens for public showing this month at San Mateo Highlands.

MONSANTO HOUSE set for Disneyland.

'House of Tomorrow'

Monsanto's "House of Tomorrow" will be built in Disneyland at Anaheim, Calif., with construction slated to start late this year.

Scheduled for completion early in 1957, the experimental house will demonstrate and test the use of plastics in home construction, the first test type model of its kind.

The novel design was created by architect Marvin Goody of Boston under the direction of Richard W. Hamilton, who heads a plastic research project sponsored by Monsanto at Massachusetts Institute of Technology.

It is based on a U-shaped molded unit, 8x16 ft., which forms part of a room's ceiling, wall and floor. In the simplest plan, eight molded units or modules are hung in pairs from a 16-ft.-square utility core to form four rooms, each 16x16 ft. The core contains kitchen, laundry and heating facilities and baths.

Several combinations of the components, including twin cores, make possible a variety of floor plans and great flexibility, comments R. C. Evans, director of marketing for Monsanto's plastics division. Rooms may be added or removed easily and economically to conform with the family's changing space needs.

The design, Evans says, is intended primarily to prove-out new architectural and engineering concepts utilizing the inherent properties of plastics and thus stimulate the use of plastics in achieving more satisfying ways of living five or ten years from now.

The design also will incorporate advanced methods of heating, ventilating, lighting, food preparations and preservation and plumbing. The use of movable and transparent walls and partitions will make the house suitable for the more leisurely indoor-outdoor living foreseen by economists and sociologists.

Evans emphasizes that while the "House of Tomorrow" lends itself to factory production, duplicates of it may not be available commercially, although many of its components or modifications may be. He adds that it was impossible now to estimate the cost of such a house or to say definitely how many or which plastics will be used in its construction.

Letters...

Civic Auditorium Competition

LOS ANGELES

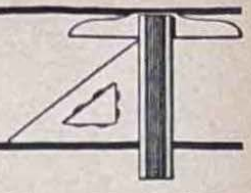
Los Angeles, which has established itself as a leader in so many industries, has never been known as a center of architectural beauty. In fact, our city is often criticized for the heterogeneous collection of buildings known as our Civic Center.

As we approach the realization of the long-awaited Civic Auditorium, it seems inconceivable that we do not take advantage of a rare opportunity to establish ourselves also as leaders in architecture and city planning.

When the UN Building was under consideration, it was opened to an international competition, with Le Corbusier — one of the founders of modern architecture — participating and ultimately acting as consultant to the New York firm that received the assignment. This focused world-wide attention on both the building and the city of New York and the civic fathers are still receiving acclaim for having executed the UN headquarters in that fashion.

There is approximately $50 million at stake and the only proof that the money will be spent wisely and to the satisfaction of Los Angeles citizens lies in selecting the proper architect for the job. It is too great a risk to just be decided by a person or by a committee, which stands to be criticized from all angles if the completed auditorium is not architecturally acceptable. If, however, we poll, through a competition, leading architects of the country and the world, then the chances that the auditorium will be successful are greatly increased. The expenses of an architectural contest for preliminary sketches are negligible compared with the project.

We should not jeopardize this opportunity to make an important step forward in the progress of our city.



The convention of the American Institute of Architects held in Los Angeles this year adopted the resolution to suggest to federal, state or municipal public agencies that they consider the possibility of using competitions in selecting architects whenever feasible.

The best architectural talents in the country and the world should be invited. The auditorium project must be treated carefully because if badly done, it will draw more fire than our city needs at this point.

GEORGE DE MASIREVICH, AIA

T-square talk

about architects • planners • engineers

PLANE TRAGEDY: A body found at the mouth of the Eel River near Eureka, Calif., late last month was identified as that of Harold Farquar, 48, of Pleasant Hill, who only recently had joined a San Francisco architectural-engineering firm as educational consultant.

Farquar and his employer, Ernest Frederick Winkler, and a fellow employee, Clarence Fong of Berkeley, have been the objects of an intensive search since their light plane vanished on a flight from Eureka to San Rafael. Winkler's briefcase and a landing light and bucket seat apparently from their plane were washed up on beaches and found by Coast Guardsmen, who report that Winkler and Fong are assumed to have perished at sea.

DIED: Ralph Wycoff, president of the Central Coast Counties chapter, AIA, died in his sleep at the age of 73 at his San Jose home August 17. Wycoff, a native of Watsonville, practiced architecture throughout northern California before he moved to San Jose 34 years ago. He designed the San Jose post office building and several structures on the San Jose State College campus.

Fred F. Willson, AIA, of Bozeman, Mont., died August 13 at the age of 79. He was credited with designing almost all of the buildings in Yellowstone National Park except for this year's construction. He was one of the first students at Montana State College, which he attended for three years before being graduated from Columbia University in 1902.

J. Leigh McKenzie, 41, Portland architect who had started his own practice last year, died July 15, following a brief illness. During his 15 years' residence in Portland, he was employed in the offices of Lee Thomas, the Vancouver Housing Authority, and Edmundson & Kochendoerfer, with time out for service in World War II. He was graduated from the University of Oregon in 1938. Among the buildings which he designed were Sandy Junior High School in association with Donald W. Edmundson, a medical clinic at Gresham and Our Savior's Lutheran Church Sunday School addition at Oswego.

NEW PARTNERSHIP Walter W. Beeson, AIA, has become a partner in the firm of Henry Charles Burge and George W. Roach of La Canada, Calif., now known as Burge, Roach & Beeson. Formerly an associate in the firm of Daniel, Mann, Johnson & Mendenhall, Beeson was 1955 president of the Pasadena chapter, AIA.

SHARE OFFICES: New offices at 1328 S.W. 14th Ave., Portland, have been opened by William L. Fletcher, Donald Blair and John W. Reese, architects; Saul Zaik, designer; and Thomas A. Welch, contractor. The five young men, ranging in age from 29 to 36, are jointly occupying a pioneer house which has been remodeled. They will work independently but collaborate on larger projects.

Graduates of the University of Oregon, Fletcher, Blair, Reese and Zaik each has been associated with several Portland architectural firms. Reese also has been self-employed for the past three years. Welch, a University of Portland graduate, has been a general contractor for the past three years, specializing in the construction of four-plexes.

ON THE MOVE: The Seattle architectural firm of Steinhart, Theriault & Anderson now is located in its own new office building, designed by the partners, at Eastlake and Galer (EAst 3222).

Mary Alice Hutchins, AIA, who maintained her own office in Portland where she prepared specifications for various architectural firms, now is associated with Law & Wilson, Honolulu architects-engineers.

Warren Cummings Heylman, AIA, has moved to Suite 207, W. 1023 Riverside Ave., Spokane (RIverside 7-2550).

NAMED: Marshall Perrow, AIA, has been elected chairman of the Tacoma Planning Commission by his fellow members.

WINS COMPETITION: Ernest J. Kump, FAIA, architect and planning consultant with offices in Palo Alto, Calif., has been announced winner of an international competition for the design of two new planned communities to be constructed in Spain for the families of off-base personnel of the Joint United States Military Mission. The projects consist of complete communities to be developed in the suburban areas of Madrid and Zaragoza.

A fellow of the Royal Society of Arts, Kump recently was one of eight architects invited by the U.S. Department of State to participate in a closed competition for the new United States embassy to be built in London. He presently is designing the new embassy residence and staff housing in Seoul for the State Department.

Design and the landscape in which we live

Excerpts from a paper presented by the Los Angeles landscape architect at the sixth annual International Design Conference in Aspen, Colo. Garrett Eckbo also addressed the Northwest Regional Council, AIA, in Tacoma earlier this month and the national AIA convention in Los Angeles.

by GARRETT ECKBO

LANDSCAPE DESIGN is most successful when it produces recognizable units or continuities of outdoor space or volume, with special characters and proportions.

The definition of this space is accomplished by the placement of buildings, trees, ground forms, shrubs, rocks, water bodies, ground surface patterns, fences, walls and shelters in such a manner as not only to solve the technical and functional problems but also to impress the user or observer with the special quality of the space between and among these elements. This is the 3-D of landscape design, more important than patterns with flowers and paving, foundation planting, or pretty pictures out the windows, and inclusive of them. It is subject to endless variation in conception and execution, even as painting and sculpture, to which it is closely allied.

In the search for background and inspiration, the landscape architect must explore the world which is behind him in time and around him in space, the world of nature, the world of man and the new forms which the interaction of these two worlds can produce. Any rich rural countryside is an encyclopedia of forms and arrangements produced by the joint action of man and nature. History is important, but not in the old formal and informal copybook sense. The allied arts are important because each produces refinements and concepts which can inspire the landscape architect.

Architecture is important to landscape design because it is the primary expression in the landscape of human creativity and control of nature. It has a great tradition of bringing magnificent order out of manifold complexities, of putting great quantities of highly variable members and elements together in such a way that the result has a new and special identity, greater than the mere accumulation of parts. At best it represents the highest levels of human imagination, the broadest connection between abstract conception and concrete reality, the greatest steps toward production of a completely humanized environment. The fact that our communities generally fail to make use of this potential should not obscure its importance.

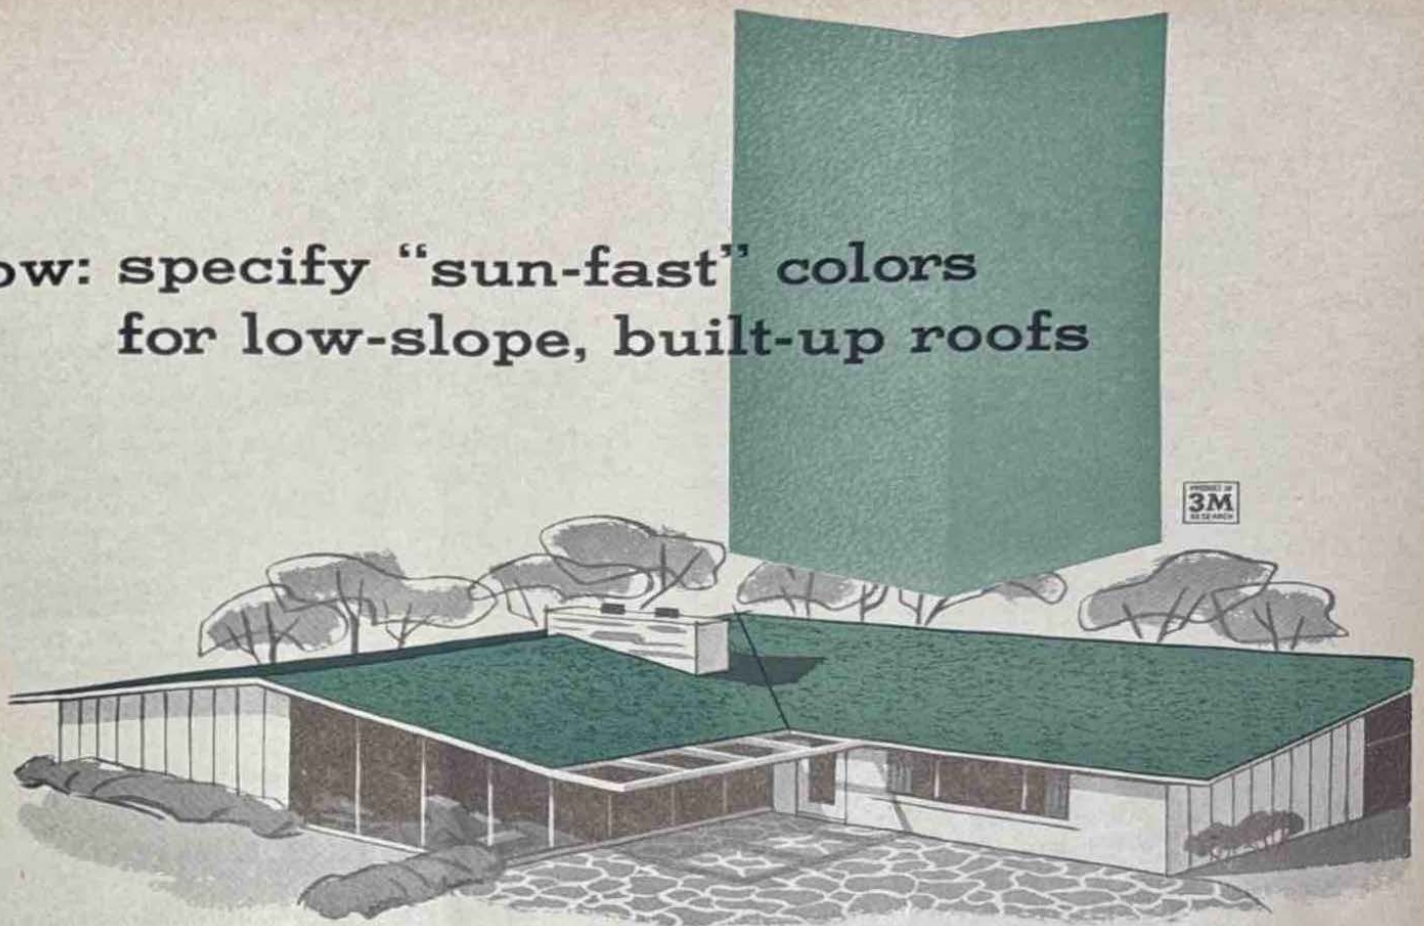
Nature is important to landscape design because it is the world of forces and processes within which we live and work, the world of which man and all his works are an inextricable part, no matter how broad the contradiction may become between his efforts to control nature and to preserve her. Although very often landscape design has to defend nature against the destructive attacks of man, its true constructive role is the establishment of connections, relations and adjustments, both physical and visual, between building sites and their surrounding landscapes, that is, between people and the total landscape around them. This means that in general landscape design must work with forms and materials derived from **both** the specific structures with which it works, and the specific sites and landscapes around them; or from **both** architecture and nature.

It is in the combination and interrelation of these diverse forces, in many complex patterns ranging from complete integration to complete contrast, that the vitality of the art lies. It is thus an art of continuity, of connections, of relations to existing forces, more than an art of pure and original conception, as architecture. Neither the Renaissance idea of forcing architecture on nature nor the romantic idea of forcing nature on architecture can solve our problems today.

Society is important to landscape design because it presents problems for solution and opportunities for production. The humanized landscape is the expression of social forces on the world of nature. For thousands of years landscape design officially solved problems for a small minority of the population — private parks, estates, villas, palaces. Central Park in New York initiated a new and unprecedented phase of landscape design in which the general public became the client.

The fact that these new park problems were solved largely with forms developed by the romantic movement in the 18th century should not obscure the importance of their impact upon the general landscape. There has been an increasing, and gradually accelerating, democratization of design processes since then. The private estate is no longer the only problem which the landscape architect will deign to touch. A whole new school of design has grown up in California around the problem of the small middle class garden. A large proportion of landscape graduates go into public service. Irrespective of the quality of work produced, the potential of these facts is for a broad improvement in the quality of the general landscape in which we all live. An unprecedented world situation in which general war has become impossible, in which we must choose between coexistence or no existence, impels us toward an unprecedented concentration upon the arts of peace.

With all this background, the primary sources of landscape inspiration lie in specifics: the specific character of the individual site, the specific nature of the people involved, the specific nature of the materials available and the specific possibilities for creation of outdoor space.



Typical landscape problems today are: small, medium and large gardens; estates; schools, hospitals, churches, clubs, community centers; shopping centers, colleges and universities, public building complexes; parks—small, medium, large. These can be boiled down to typical groups: private gardens, public grounds, parks and public recreation spaces.

Private gardens make up a large part of the total area of humanized landscape, are greatly variable in the detailed relations between house and site, the broad and intricate play of individualized creativity, personal expression by choice and whimsy, family life, and the range from visual pleasure through outdoor living to active gardening, from utility gardens through living gardens to show gardens. They also involve the greatest concentration on detailed humanized scale and intimate livability. It might also be said that the majority of private yards never become gardens in the sense of these words.

Public grounds are front yards whether for houses or city halls. They are spaces to look into rather than

Now: specify "sun-fast" colors for low-slope, built-up roofs

3M's new coarse aggregate roofing stones offer lasting beauty and protection in 8 beautiful colors

Here is a brand-new color-styling opportunity for you. 3M Brand Ceramic-Color Stone offers beauty *and* lasting protection — opens up an entirely new field of decorating possibilities because you may select from 8 color-fast shades! Colors are "fired on" by the same special process used in making 3M Roofing Granules . . . supplied to the building trades for over 30 years.

Special treatments developed by 3M Research make 3M Brand Ceramic-Color Stone dust-free and "sun-fast" — with maximum adhesion to asphalt. The material will not strip, roll or wash away leaving bare, unsightly patches. Stones are durable, uniformly graded, dense, fully opaque to provide complete protection against damaging ultra-violet rays.

The pebble-sized stones pack tightly on roof-tops . . . create the appearance of depth and ruggedness with a built-in shadow effect. 3M Brand Ceramic-Color Stone is shipped *dust-free* in 100 lb. bags. All colors available from a single source.

Addition to David M. Johnson Residence
Gravelly Lake, Washington

ALAN LIDDLE, AIA, Architect

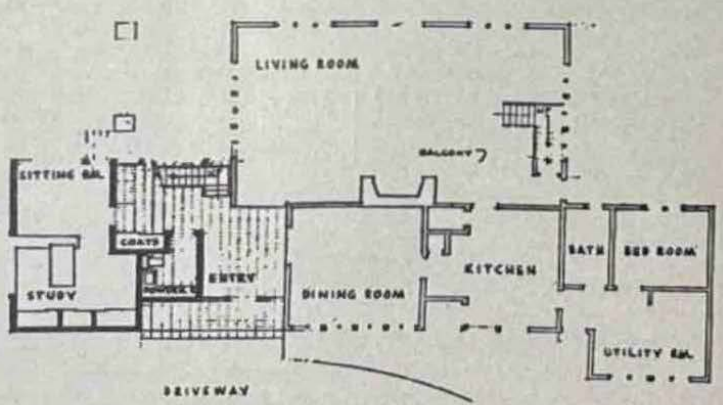
ALLEN HAMPTON, Contractor

CONTINUATION of existing roof lines and use of same type rough boards help to blend addition at left end of house with original structure. Inside, generous entry hall ties old and new portions together.

Entry hall serves as fitting transition

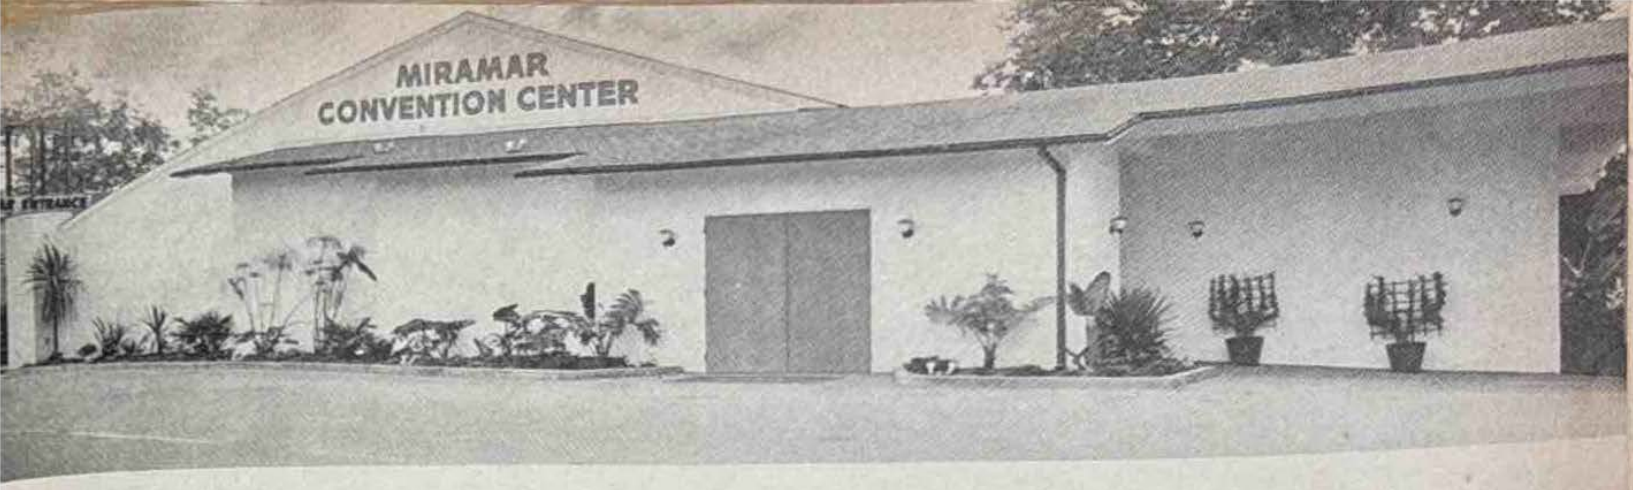
A GENEROUS ENTRY HALL served as the matchmaker in the marriage of an existing World War I house with a contemporary addition.

The clients wished to retain certain desirable features of the original house, among them large rooms and a two-story living room with a massive stone fireplace under the balcony leading to the bedrooms; they did not want to continue the dark wood paneling and small windows into the new addition.



To maintain unity, the architect continued the lines of the existing roof and used the same type rough boards for the exterior siding, painted to match.

One of the main requirements was an ample entry hall, since access to the old house was directly into the living room from the front porch. Its focal point is an open stairway, built with steel stringers and mahogany risers. It seems to float in front of a two-story window which provides a view of woods and Gravelly Lake. The hall is covered with quarry tile to accommodate the heavy traffic; the walls and ceiling are paneled with golden stained oak flooring.



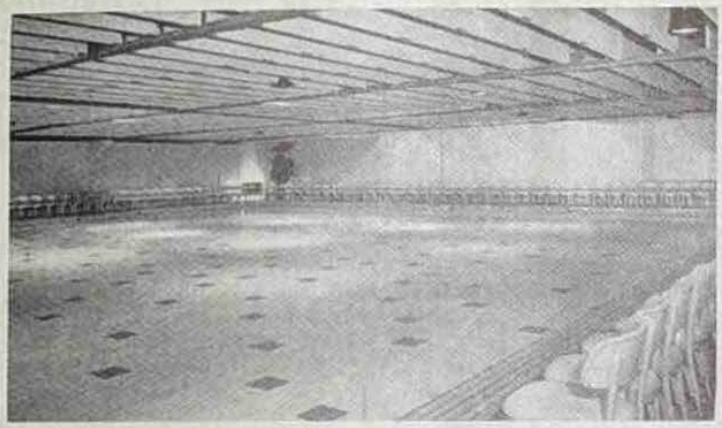
A powder room for guests and a combination study-sitting room, which doubles as an office, is off the entry. Upstairs is a master bedroom with floor-to-ceiling windows overlooking the trees and the lake. The hall connects with the existing balcony, from which the children's bedrooms are reached.

OUTLINE SPECIFICATIONS
(Addition)

Type of Construction: Frame.
Exterior Walls: Painted cedar.
Roof: Shingled.
Windows: Stopped in wood.
Doors. Wood slab, both inside and out; Pella wood folding doors.
Floors: Frame covered with quarry tile.
Interior Walls: Sheetrock and painted wood trim on drywall partitions. Oak flooring in entry.
Ceilings: Oak flooring in entry.
Stairway: Mahogany risers mounted on steel stringers.
Date of Completion: June 1954.

ADDITIONS TO FIRST FLOOR PLAN are indicated by heavier lines.

Old garage becomes a convention hall



Miramar Convention Center
Santa Barbara, California

LUTAH MARIA RIGGS, AIA, Architect

PETER DAVISON & SONS, General Contractors

GOLD ROOM (right) is ideal for meetings or banquet groups up to 130. All furniture is movable. With two stand-up bars, it also is used as registration lobby and for private parties. Fiberglass baffle arrangement in ceiling provides good acoustics for Miramar Room (below). It has capacity of 575 diners, can be used as exhibition hall.

THE MIRAMAR HOTEL, with its own private ocean beach, swimming pool, tennis courts and 200 rooms, had everything any organization could want for a successful convention — except an adequate meeting hall. The owners felt that such a hall could be obtained by using the former garage.

When the architect completed her assignment, the raw steel girders, corrugated sheet iron roof and blackened concrete floor had been converted to an ultra-modern structure with two huge rooms seating more than 700 diners under one roof and with table-free room for more than 1,000 attending meetings. The Miramar Room (5,500 sq. ft.) and the Gold Room (1,500 sq. ft.) are separated by doors and extensive use of soundproofing.

The convention center is in a steel frame building with outside walls of masonry. The concrete slab floor is covered with asphalt tile and carpeting.

The 6-in. steel basement girders supporting the floor joists and those from the ceiling struts to the roof were covered with fireproof plaster. The roof itself is the sheet iron that covered the garage, but building and fire regulations called for extra measures when the conversion took place. The roof's inner surface was coated with insulation and its top covered with plywood sheets, then a generous sheathing of insulation and a covering of asphalt shingles, painted blue in keeping with the resort's overall color scheme.

The ceiling joists of the first floor are independent of the second floor and the area between has been soundproofed. The second floor ceilings are of exposed beams, with 2-in. solid sheathing.

Fireproofed steel trusses span the 75 ft. of the building and in between each truss are suspended acoustic

OUTLINE SPECIFICATIONS

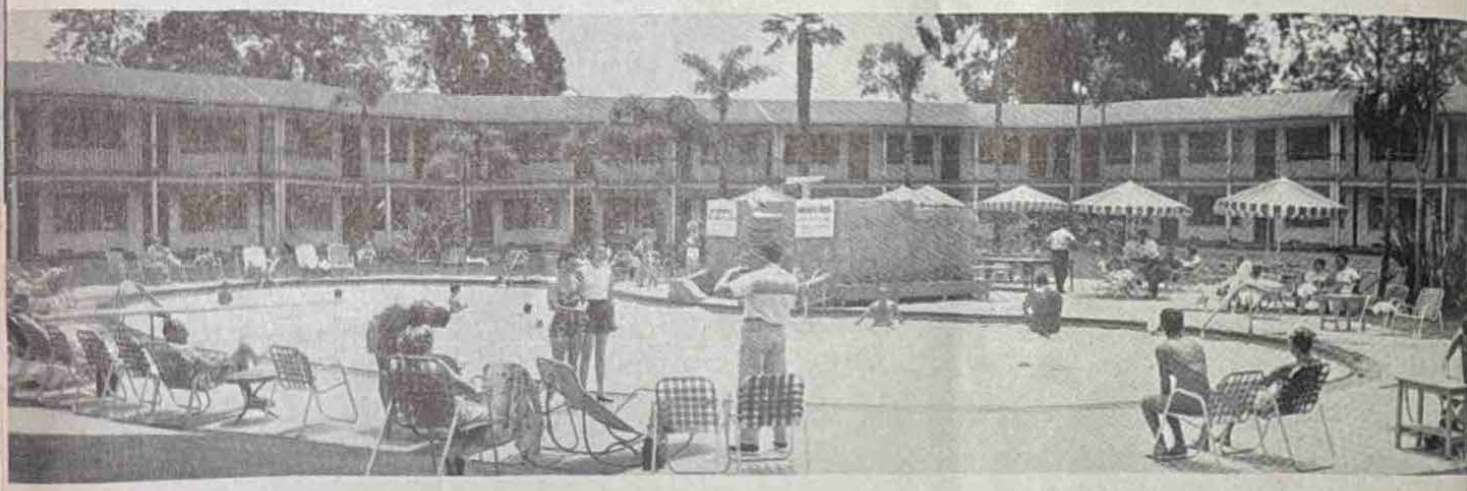
Type of Construction (original building): Steel frame, 105x78 ft.
Exterior Walls: Masonry.
Roof: Original corrugated sheet iron covered with plywood sheets, 1-in. insulation and painted asphalt shingles.
Floors: Concrete slab covered with asphalt tile and carpeting.
Ceilings: Painted acoustical plaster, Gold Room; acoustical baffles, 24 in. high and 14 in. long, spaced at 24 in. on centers, suspended between fireproof steel trusses in Miramar Room.
Lighting: Each light on separate rheostat, providing combinations of illumination on center and sides of each room.
Special Equipment: Flexible loud speaker system installed by B. E. Harberts Co. to connect eight microphones, FM and standard broadcast receivers and three-speed phonograph; fully equipped banquet kitchen with three specially designed refrigerators; two stand-up cocktail bars.
Total Cost: $200,000.

Convention Center

baffles, 24 in. high and 14 ft. long, spaced at 24 in. on centers.

A giant air conditioning and heating system installed in the basement adjusts the temperature inside the hall to changes caused by body heat of large crowds.

The center has a completely flexible loud speaker system, using 1,150 ft. of wiring to connect eight microphones, FM and standard broadcast receivers and a three-speed phonograph. Each of the two rooms has eight microphone jacks.



The lighting system provides combinations of illumination on the center and at the sides of each room. Each light is on a separate rheostat and the interior may be dimmed or brightened by twisting a knob on the switch panel.

Picture molds were installed on all walls for convention displays and all doors are wide enough for a 1½-ton truck to drive directly onto the hall floor for display purposes.

The Miramar Room, on three sides, has raised platforms covered with carpeting and designed for seating sideline audiences at auto shows, dances, etc. The Gold Room has wall-to-wall carpeting in a deep piled woolen fabric and green luxury lounge type furniture. The high-sound absorption plastered walls are used as background for original paintings by Santa Barbara artists.

Both rooms are served by a $35,000 high-speed banquet kitchen equipped to accommodate 575 diners in the Miramar Room and 130 in the Gold Room. It has three king-size specially designed refrigerators with racks to hold foods which are prepared in advance of banquets. The kitchen also is equipped with a battery of service carts, each with a 100-plate capacity and with an electric cord which is plugged to an outlet on reaching the dining room to keep food hot for an hour. Using these carts the Miramar can serve 475 steak dinners in 18 minutes flat.

The convention center can be operated by a crew of 90 which is capable of handling 700 diners and clearing the hall within 30 minutes after dinner has been completed.

Miramar Hotel Addition

Besides the convention center, the expansion and modernization program at the Miramar has added 47 new bedroom units, a $300,000 project designed and built by the same architect and general contractor. The motel type units form a semicircle around the swimming pool and look out on the Pacific Ocean at the rear. The front windows also frame the Santa Ynez Mountains.

The rooms are insulated against sound in all four walls, ceiling and floor. Windows, for example, are double panes of glass, set in felt. Built-in dressing tables and mahogany wardrobes are featured in each room; baths have built-in pullmans with tile tops.

MAJORITY OF POOLSIDE BEDROOMS are triples in that they have set of twin beds plus one full-size duo-studio bed. Each room, 16x23 ft., has ceiling-to-floor double-thickness drapes and three original water colors of Santa Barbara scenes.

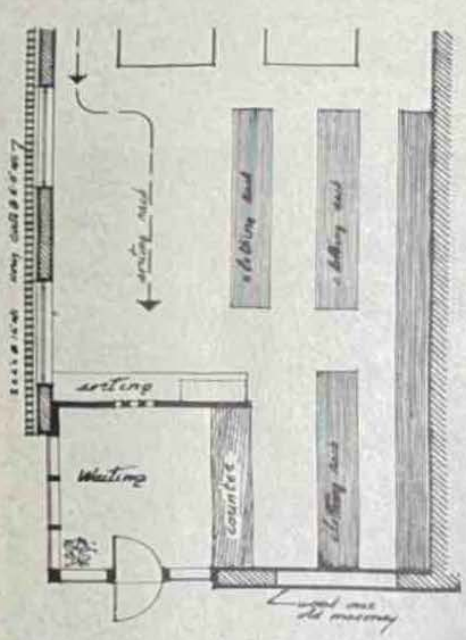
Tom Burns Jr.

Springfield Cleaners
Springfield, Oregon

DONALD H. LUTES
Architect

F. D. HOLLISTER
General Contractor

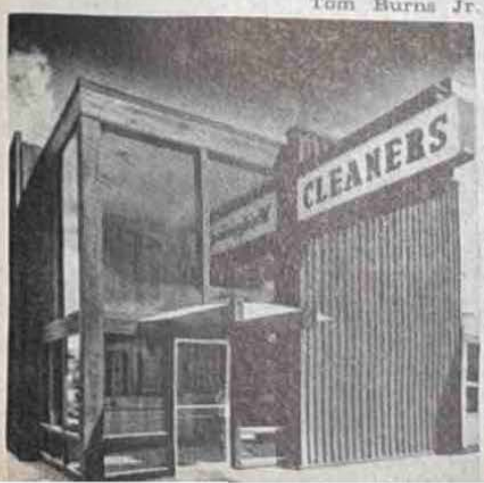
Real face lifting for $5,750



THE CLIENT DESIRED that 1) his cleaning establishment be opened up for better light on his wares and 2) additional clean clothes storage be provided. In accomplishing these two objectives, the architect hoped to make the building—originally Springfield's first bank with 12-in. masonry walls—specifically more indigenous to the lumbering town environment and generally more attractive. That he was successful is reflected in part by the fact that business increased 6% last year while other cleaners in the city were down in sales.

The first requirement was met by knocking out the corner of the structure and replacing it with glass. The designer did this with full recognition of the southwest sun problem, feeling that the added openness as a form of advertising justified some draping or screening a few months of the year. The glass is carried all the way up to the roof joists, then drops down at the sign to the existing ceiling joist level.

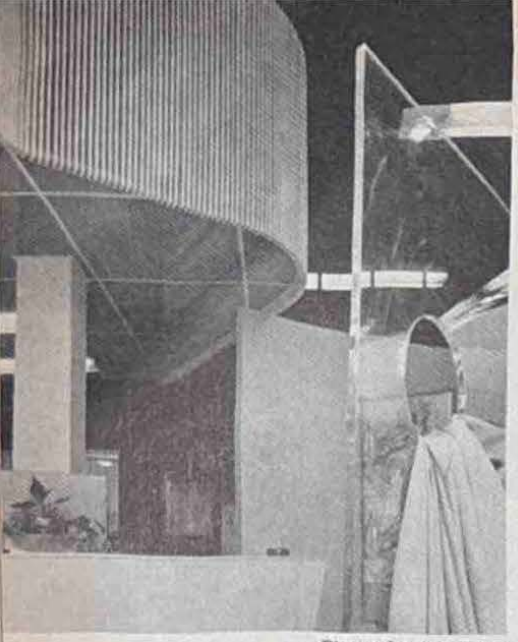
Relocation of the entry not only met the second requirement but afforded a more visible reception area. A full-length partition screens the sorting area, and three small windows (blue glass for one-way vision) allow the sorters to see customer as they enter.



The entire building is skinned with cedar. On the west side 2x4s 6 in. on center, held out from the face to permit drainage behind, cut off the view of the old wall with its many and varied openings. The front wall is faced with 1-in. rough sawn cedar; 1x2 battens cover up the old entrance. Two side doors are reached through gates in the 2x4 facing as are the windows for cleaning.

The interior is a repeat of the exterior, the finish being smooth cedar and battens with a new paint job on the plaster side walls. The ceiling tile is glued to stripping which was applied over the old plaster.

SIGN is integral part of building. Corrugated plastic between projected structural beams carries lettering and is repeated in canopy.



Tom Burns Jr.

OUTLINE SPECIFICATIONS

Exterior Walls: Stained cedar siding.
Windows: Stopped in wood.
Doors. Aluminum frame, exterior.
Floors: Concrete slab covered with linoleum in entry, asphalt tile in service areas.
Interior Walls. Smooth cedar and painted plaster; drywall partitions.
Ceilings: Acoustical tile.
Cabinets: Wood.
Lighting: Incandescent spots and floods.
Heating: Warm air from cleaning plant boiler.
Total Cost: $5,750.
Date of Completion: June 1955.

Drive-in showroom for fabrics

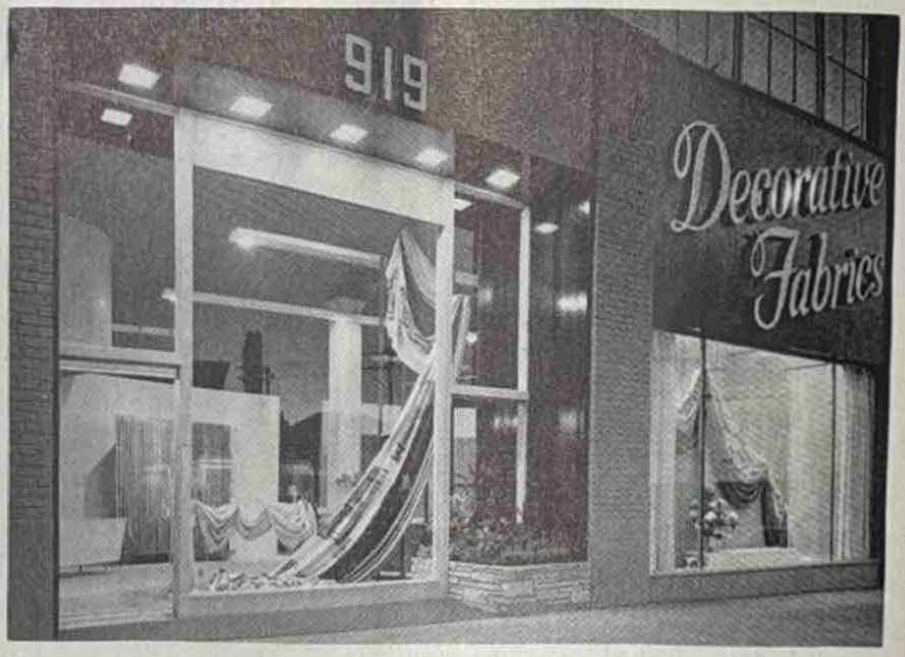
Photos by Art Hupy

PLASTIC SHEETS with circular cut-outs "float" fabrics in air at entrance window display. White birch vertical louvers serve as background.

FABRIC BUYERS throughout the Northwest and Alaska who consider this showroom to be one of the finest on the Pacific Coast probably don't realize that the building originally housed a car-dealer-garage. Its location on the very fringe of Seattle's shopping center and close proximity to department and furniture stores, specialty shops and hotels made it an ideal site with one exception: the traffic problem made parking difficult and the shipping of the wholesaler's large daily orders a slow and costly process.

The architect solved the problem by retaining the car-service entrance of the old garage and enough floor space to park 30 to 35 vehicles. Now clients need only to drive into the entrance where a uniformed attendant takes over. The loading and shipping problem was solved just as nicely. The truck ramp to the third floor from an incline side of the street was kept intact to facilitate receiving and shipping merchandise.

The front of the three-story structure was done over in stained redwood and painted brick. An Arizona sandstone planter at the entrance extends into the showroom.



Lines of seasonal importance are highlighted in the main showroom where some 500 different styles are shown from large and tall multiplex racks. Displayed from three-hinged clear plexiglass sheets with circular hole cut at varying heights, the fabrics seem to float gracefully in the air. Vertical louvered frames of white birch are used as backgrounds.

Neutral colors which do not conflict with the displayed samples are used throughout the showroom and soft colored panels hide a series of offices. An adjoining salesroom displays the firm's more prosaic lines. The remainder of the building contains ample warehouse space, cutting and processing rooms and employee lunchrooms.

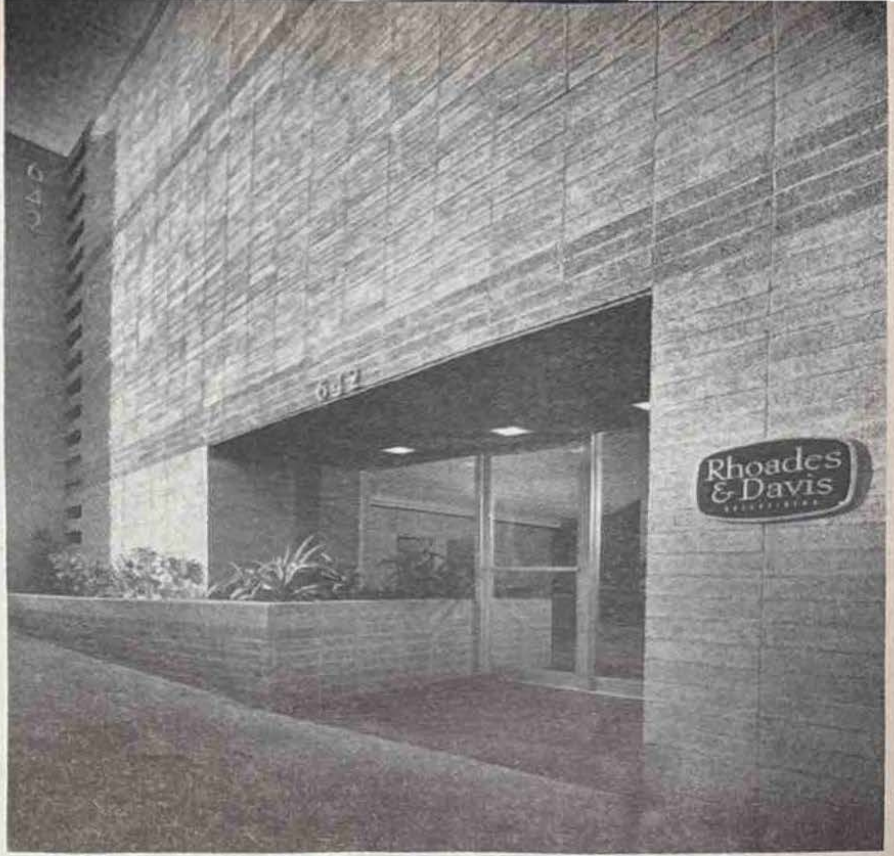
DRIVE-IN ENTRANCE is to right of display windows which permit full view of interior. Multiple racks are supported by expanded metal lath and black iron pipe display wing. Lucite chain from ceiling holds samples. Fabric covered plywood surrounds PBX at reception desk.



OUTLINE SPECIFICATIONS

Exterior Walls: Stained redwood and painted brick.
Doors: Tempered glass and birch slab.
Floors: Carpeting over concrete slab.
Interior Walls: Frame with plasterboard and birch slats.
Lighting: Fluorescent and recessed floodlights.
Heating: Existing hot water system.
Total Area: 40,000 sq. ft.
Total Cost: $42,000.
Date of Completion: November 1954.

ORIGINALLY PLANNED for Rhoades & Davis advertising agency, since merged with Honig-Cooper Co., windowless building now is occupied by central advertising department of Safeway Stores, Inc. Office seen above uses existing brick wall of old structure.

Advertising Headquarters
San Francisco, California

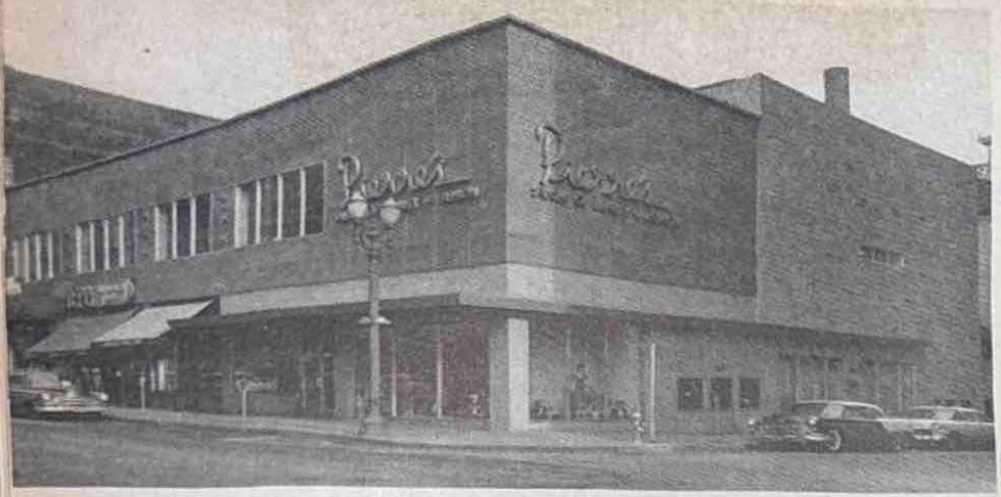
Brick walls offer point of departure

BRUCE E. HEISER, AIA
Architect

MILLS CONSTRUCTION CO.
General Contractor

OUTLINE SPECIFICATIONS

Exterior Walls: Brick and biege Basalite concrete blocks.
Roof: Pabco 20-year specification.
Floor Finish: Marble, vinyl plastic, terrazzo, Armstrong asphalt tile.
Doors: Stock mahogany.
Interior Walls: Exposed brick and Basalite concrete blocks, walnut and mahogany paneling. U. S. Gypsum Rocklath.
Ceilings: Fiberglas suspended.
Heating: Atlas plant.
Air Conditioning: Atlas plant.
Total Cost (alterations): $32,000.
Total Area: 6,290 sq. ft. (2,330 sq. ft., first floor; 1,980 sq. ft., second and third floors).
Date of completion: August 1954.



THE ORIGINAL STRUCTURE had three "beautiful" walls of rough red brick which were retained as part of the new building's interior. In view of the location, just on the fringe of San Francisco's produce market and within walking distance of Chinatown, the architect and client agreed to keep the building windowless and use the exterior as a means of beautifying the neighborhood.

The entire facade is of beige lightweight masonry blocks, and the recessed entrance and reception lobby were planned as a single unit, separated only by the plate glass walls and door. The exterior was livened up by providing a large outdoor planting area which extends through the plate glass into the lobby itself. Inside, the shrubs reach from long low planters on a black marble floor toward the glass ceiling a full three floors above.

The noise and confusion often common to advertising agency offices were eliminated by the adoption of an overall traffic plan which locates the copy, art, production and supply departments, as well as the main reception lobby and a spacious corridor, on the street level floor. The second floor houses the media department, conference room, coffee lounge and model kitchen used in testing products; the third floor, executive offices and the secretarial staff.

The architect utilized striking contrasts in textures throughout the building: smooth glass next to sandblasted brick; heavy carpeting next to polished marble; white mahogany next to pressed cork; silk screen-printed wallpaper next to rippled glass. He also used generous amounts of walnut paneling, aluminum and fiberglass and provided large planting boxes on all three floors.

The fully air conditioned building is illuminated with cold white fluorescent lighting with occasional clusters of spotlights. Specially designed cabinets were custom built into the conference room to hold television and sound film equipment.

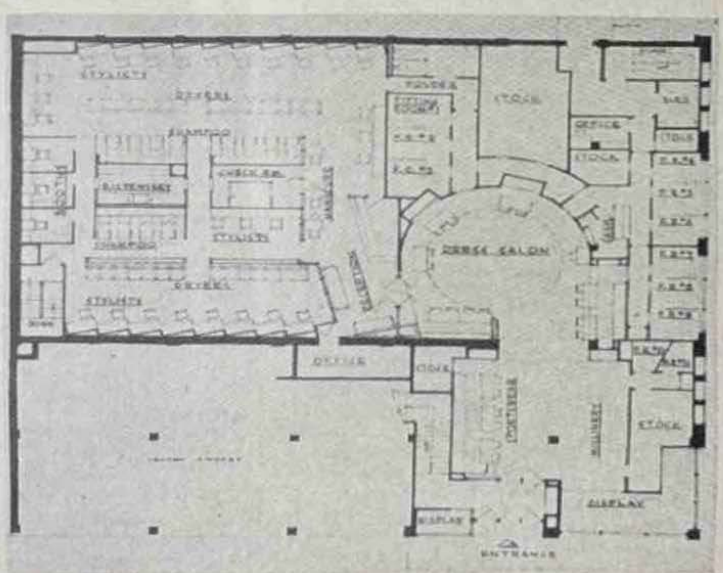
Pierre's
Portland, Oregon

High-style patrons shop in remodeled theater

REMODELING of Portland's Music Box Theater into a women's specialty shop presented a number of interesting problems. The concrete balcony was torn out and used for fill material to make a level surface for the new concrete ground floor slab; a steel frame erected to carry the second floor; stairways altered or removed and vertical traffic facilities, including a service elevator, constructed to accommodate the two floors and basement.

The concrete frame and solid brick exterior filler walls of the original structure (built in 1911 as the Peoples Theater) were left intact, while brick parapets and elaborate cornices that were added in later alterations (in 1929 when it became the Music Box) were removed. The stripping of the existing stuccoed brick veneer facing made possible the addition of new textured brick veneer and porcelain enamel panels.

Sheet metal cantilevered on steel framing is used for the marquee and eyebrow; polished cast aluminum for the design of the window mullions. The identification signs, designed by the architect, are executed in stainless steel, backlighted by cold cathode tubes.



The aluminum store front and entrance with its ceramic tile floor make a sedately attractive point of entry for the fashion-minded shopper. The bold rubber tile floor which highlights the sports and millinery departments is in sharp contrast to the rich, thick carpeting of the dress salon, which repeats the color in various tones throughout its decor. The circular salon means that customers and sales people alike have a short walk to fitting rooms, separated by three partitions and further divided by folding doors. Access to stockrooms also is speedy.

Exterior show windows are draped to enable a second use of these areas as fitting rooms during store hours. This same functionalism is found throughout the building, with work areas necessary for the operation of each salon made easily accessible. The basement and second floor are devoted almost exclusively to service operations, allowing the maximum area for sales and display on the first floor.

HOLMAN J. BARNES, AIA, Architect
LOUIS ELLINGWOOD, Structural Engineer
TELLER CONSTRUCTION CO., General Contractor

OUTLINE SPECIFICATIONS

Exterior Finish: Porcelain enamel and Willamina split tile.
Floors: Concrete slab covered with ceramic tile, vinyl tile and carpeting, first floor; Q-deck with concrete-wearing slab, second floor.
Windows: Kawneer aluminum.
Doors: Kawneer aluminum, entrance; flush birch, interior.
Interior Walls: Painted plaster.
Ceilings: Painted plaster.
Total Area (remodeled): 14,000 sq. ft.
Total Cost: $184,500.
Cost per Square Foot: $13.10 (including fixtures).
Date of Completion: November 1954.

ON THE NEWS FRONT WITH STRUCTURAL STEEL

First floor of Oregon store is twice size of city block

The first floor of Meier & Frank's new department store in Salem, Oregon, is the largest expanse of merchandise on one level in the Pacific Northwest. It is the first branch store built by Meier & Frank, well-known as Portland's largest emporium. Containing four levels—a lower level, first floor, mezzanine, and second floor—this handsome store is framed with structural steel supplied by Bethlehem to Stevens Equipment Co., Salem, who fabricated the steelwork.

For low structures, such as this store, the economies and other advantages of structural steel are just as valid as they are for multi-story buildings. Steel framing is adaptable to any architectural design; and it provides maximum flexibility of floor layout.

Architect: Welton Becket and Associates, Los Angeles; *Associate Architect:* James L. Payne, Salem; *Steel Fabricator:* Stevens Equipment Co., Salem; *Contractors:* Hoffman Construction Co., Portland and Viesko & Post, Salem.

Shoppers can step right out of their cars and walk directly into the store. Double-spiral ramps give access to space for parking 1000 cars.

Building volume eases off in August by 6%

AFTER A RECORD MONTH in July, building permit volume in the five western states nosed down to a $245 million total in August, a 6% drop from last month. The total is also 3% below August of last year.

Although three states showed increases over July, the overall total was pulled down by a 9% drop in California dollar volume and a 29% decrease in the Montana figure. Oregon was up 5% over the previous month; Washington, 25%; and Idaho, 24%.

Compared to last August, only Washington recorded an increase, 18%. California dropped 5%; Oregon, 11%; Idaho, 2%; and Montana 37%. However, August of last year was a boom month.

For the most part, major cities and counties reported decreases compared to a year ago. Los Angeles was down $5½ million; Los Angeles County, $½ million; San Francisco, $4½ million; Multnomah County, $1¼ million; Portland, $3 million; and King County, $2 million. The Seattle total, swelled by the permit for an addition to the University of Washington Teaching Hospital, was $7 million higher than last year. Orange County was up $3 million; Sacramento County, $1 million; and San Bernardino County, $1¾ million.

By the end of August the total for 116 agencies in the five states was $1,834,702,985, a bare 2% higher than the January through August figure for 1955. California is running 3% higher; Oregon, 4%; Montana, 4%; and Idaho, 7%. Washington is a bare 1% behind.

Following is a breakdown of building permits issued by several of the major agencies during August.

	DWELLING UNITS		COMMERCIAL & INDUSTRIAL		PUBLIC	
King County	547	($4,842,941)	59	($ 876,636)	8	($1,382,287)
Seattle	199	(2,769,690)	17	(264,600)	4	(9,045,700)
Tacoma	183	(610,440)	57	(647,720)	7	(366,500)
Orange County	735	(5,963,171)	63	(2,555,635)	28	(2,587,261)
Sacramento Co.	616	(5,044,086)	57	(525,454)	15	(2,002,737)

and the latest literature

TEMPERED HARDBOARD: Forest Fiber's Sandalwood, the first prefinished, light colored, tempered hardboard, is especially tough and rugged and can even be used for floors. Its baked-in surface resists weather, abrasion and staining.

Sandalwood, which can be used "as is," or painted if desired, is available with a regular or punched surface. Panel sizes go from 4x4 ft. to 4x16 ft.

(Item No. 1)

DRAFTING AID: As a reference aid for engineers and draftsmen, Johnson Research has produced a handy decimal equivalent table in the form of a ready-to-apply Transeal. Transparent with easy-to-remove waxed paper backing, it is self-adhering and can be printed to any specifications. Transeal eliminates repetitive drawing time on paper, vellum and cloth and ite matte surface readily accepts inking without the use of "non-crawl" preparations.

(Item No. 2)

ACOUSTICAL TILE: A non-combustible acoustical tile with the appearance of stippled plaster is now available for use in residential, commercial and institutional building. Latest addition to the Owens-Corning Fiberglas line is Fresco which has a rough finish.

Fresco is offered in 12x12-in. and 12x24-in. sizes with butt joints. It can be installed either on a concealed mechanical suspension system or adhered directly to the underside of any surface.

(Item No. 3)

POOL FILTER: A swimming pool filter which can be assembled in less than an hour has been designed so that owners of the smallest home installations can enjoy its advantages, although it is available in six sizes for pools ranging up to 150,000-gal. capacity.

The Fabro filter underdrain eliminates the need for layers of gravel, making it possible to use only sand in the filter. Other features: oversized leaf strainer, rustproof filter vessels, preassembled valves and fittings and chlorinator.

(Item No. 4)

SOUND-CATCHER: To minimize deafening noises that bounce around in factories and other enclosed premises where sound is "out of bounds," United States Gypsum has developed a new portable "sound-catcher" which can reduce apparent loudness level by as much as 50%.

Sold under the trade name Acousto-

INDUSTRIAL "SOUND-CATCHER"

sorber, the unit is composed of an outer sheet of perforated aluminum foil backed with a mineral fiber blanket, 2 in. thick. It is shipped in flat sheet form to the jobsite where it is easily shaped along pre-embossed lines into a boxlike pyramid. The acoustical unit is 28 in. long on a side, has an altitude of 24 in. and weighs about 1¾ lb. It is suspended from the ceiling on wires which are attached to a stapling flange on the unit.

(Item No. 5)

DRAFTING BOARD: Designed to reduce draftsman fatigue, the Easy Shift vertical drafting board has an up and down adjustment of 20 in., permitting the draftsman to work, seated or standing, at optimum visual angle in a comfortable position on any area without bending or stretching.

The board comes in two models, one with fixed angle of 15 deg. from vertical and the other adjustable through an arc of 85 deg. from vertical. A drafting machine rests on the drawing with feather touch.

The frame is of tubular steel construction; the board itself of lightweight, aluminum lined honeycomb sandwich construction, warp-proof and sufficiently rigid to withstand heavy loads without deflection.

Item No. 6)

BUILDING PAPER: A polyethylene sheet added to Richkraft's line of building papers is used as a water barrier and for moisture- and dustproofing over subflooring, under roofing, on the warm side of walls, around foundations and in crawl spaces and under slab.

Impervious to bacteria, rot or mildew, Richlite makes a low cost tarpaulin on painting jobs, serves as a waterproofing cover for equipment and material and meets all requirements for curing concrete. It is offered in 2-, 4- and 6-mil weights in widths up to 20 ft.—100 ft. to the roll.

(Item No. 7)

DIVIDER WALL: Semi-private office units can be created from open floor space in a matter of minutes with Hauserman divider wall partition. The unit is offered in two types: unglazed, at a height of 43 in. from the floor, including legs; and glazed, at a height of 66 in. from the floor. There is a 4-in. space between the bottom of all panels and the floor.

The divider wall features instant, snap-in panels, leveling devices on legs, concealed wiring channel, baked enamel finish and plastic glazing strips for inserting and removing glass panels without danger of chipping.

(Item No. 8)

RADIANT HEATING: Berko Electric has introduced its first 2,000-watt glass radiant heating unit, providing a greater concentration of wattage per square inch than previously obtained. With the increased heat output, one unit can take the place of two or three formerly required to heat large areas.

Models HW-20 and HWT-20 (with thermostat) have a tempered Pyrex brand glass heating element, capable of withstanding over seven watts per square inch output.

(Item No. 9)

Latest Handbooks, Manuals and Literature

Yours for the Asking

COMBINATION FIXTURE: The Mult-Vent Trofferlite, a dual-purpose fixture which diffuses conditioned air and provides illumination, is described in an eight-page booklet containing cutaways, exploded views, sound level charts and data pertinent to selection of correct fixture parts. Suggested installation procedures and applications are included.

(Item No. 10)

OUTDOOR LIGHTING: Architectural floodlighting and outdoor lighting for shopping centers, suburban businesses and commercial parking lots are the topics of two bulletins released by General Electric.

The eight-page publication illustrates various methods of floodlighting public and commercial buildings, fountains, industrial plants, motels, shopping centers, banks, etc. It discusses the four "musts" found in an efficient, economical floodlighting installation and includes a table of

recommended footcandle levels for buildings exteriors.

The 12-page bulletin defines basic lighting terms, describes several applications of effective outdoor lighting and provides a table designed to help in making preliminary plans for an outdoor lighting installation.

(Item No. 11)

STEEL DOORS: Recommended specifications have been prepared by the Steel Door Institute to aid the architect and builder in specifying and using standard stock items — flush type interior steel doors, frames and sliding closet door and frame units — in all types of construction. The products covered by this recommendation are generally used in residential housing, apartments, hotels, motels, schools and light commercial and industrial structures.

(Item No. 12)

WINDSTORM DAMAGE: A 40-page technical publication on how to prevent windstorm damage and help save lives and property is intended for use by architects, engineers and others concerned with building standards. Entitled "Windstorm Damage Prevention," the National Board of Fire Underwriters booklet deals with the frequency of these storms, their occurrence and characteristics and their effects on buildings.

The publication points out that windstorm losses occur in a variety of ways, ranging in extent from damaging paint by windblown debris to complete collapse of a structure. But by attention to details of design and construction, much can be done to reduce losses from hurricanes and even tornadoes.

(Item No. 13)

HOSPITAL COMMUNICATIONS: Executone's "Better Patient Care" tells how hospitals make maximum use of nursing time and skills and includes a summary of time and motion studies made by the Surgeon Generals' Offices of the Army and Air Force.

Illustrated and described in detail are multi-audio-visual nurse call systems which permit patient calls to be answered from many points on the floor; doctors' paging systems; bedside radio-sound systems providing patient entertainment through pillow speakers; and administrative intercom systems for two-way communication within and between departments.

(Item No. 14)

BATHROOMS: Gerber tells you "How to Build More Bathroom Appeal into Your Homes" in a 16-page booklet which illustrates eight ways to do it economically through proper use of new fixtures. For example, instead of chain and plug fixtures, you can have pop-up drains; instead of a washdown closet, you can have a reverse trap closet.

(Item No. 15)

STRUCTURAL STEEL IN USE

STRUCTURAL STEEL: "Steel for the Structures of America," a 24-page picture booklet issued by Allied Structural Steel, shows a number of recently completed buildings, schools, hospitals and bridges in color as well as black and white. Among the projects shown in the structural steel erection stage: the University of Kansas Fieldhouse, the Diagnostic Building of the Mayo Clinic and the Sylvania Electric Products Co. plant.

(Item No. 16)

ACOUSTICS: In its 16-page booklet Armstrong discusses technical aspects of acoustical treatment in non-technical terms. Well illustrated, "Quiet at Work" provides data needed in choosing materials for specific uses and summarizes advantages of each product type in chart form.

(Item No. 17)

SOUND SYSTEMS: Brief and non-technical text highlights three brochures, each an eight-pager devoted to RCA sound systems. One is concerned with hotels, another with churches and a third with public address sytems. Intallations in two California projects are described and illustrated: the Beverly Hilton Hotel, Beverly Hills, and Bay Meadows Race Tract, San Mateo.

(Item No. 18)

METAL LATH: Methods of attaching metal lath directly to horizontal wood supports are discussed in the latest technical bulletin published by the Metal Lath Manufacturers Association. The specifications section recommends methods for nailing metal lath to wood studs and nailing or nailing-and-tying metal lath to wood joists. Various tables and a page on wood construction details round out the bulletin.

(Item No. 19)

WINDOW PROCESS: A steel window finishing process that eliminates the need for painting is introduced in Fenestra's four-page brochure. Called Fenlite, it consists of eight steps: vapor degreasing, pickling, rinsing, liquid fluxing, oven drying, zinc alloying, passivating and chemical polishing, final product assembly. The process reportedly protects the steel with an alloy bonded, high luster, zinc surface.

(Item No. 20)

PLYWOOD TIPS: The home builder primarily will be interested in the latest United States Plywood booklet which deals with a variety of phases of hardwood plywood. Such headings as "Where to Use It," "How to Use It" and "How to Select It" indicate the scope of the material.

A section presenting ideas for treatment of individual rooms is supplemented by color plates showing the grain pattern and color of the 10 most popular hardwoods. Information about thicknesses, construction and face matching effects is another feature. A reference guide to Weldwood includes a brief description of all types of panels and suggestions for their use.

(Item No. 21)

SLIDING GLASS DOORS: To furnish architects, contractors and the public with complete information on its product, the Sliding Glass Door and Window Institute has developed a brochure for general distribution. The 12 pages include photos applicable to new residential construction and the commercial field; a nomenclature of stock door sizes; and a listing of institute activities.

(Item No. 22)

CEILING DIFFUSER made by Connor Engineering Corp. is simple dome shaped fixture extending but few inches below ceiling and usually painted same color as latter.

Ceiling diffusers

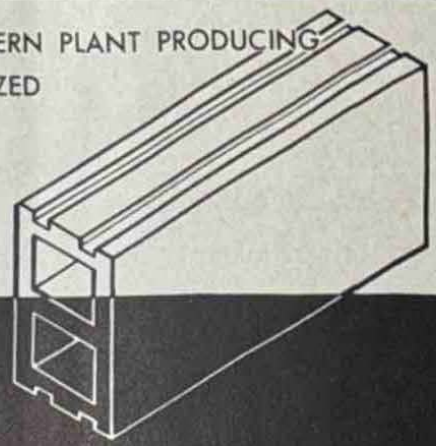
Ceiling diffusers, outlets originally developed for commercial and industrial use, are now being applied in homes, particularly where there is year-round temperature control.

These devices stem from air conditioning. Since people are more sensitive to cold than to warm air motion, warm air grilles and registers as cooled air outlets were frequently found inadequate. What was needed was a means of introducing air in such a way as to be draftless, yet provide roomwide circulation and even temperatures. Though space, occupancy and other conditions are not as critical in the average home as in many commercial buildings, requirements are still basically the same and ceiling air diffusion in homes offers several advantages.

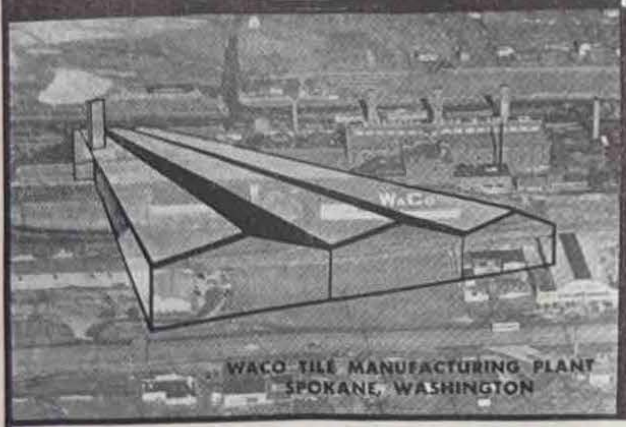
The ceiling air diffuser is really an air mixer. It mixes supply or incoming air with the room air so rapidly that by the time the mixture reaches the living area, its velocity is virtually imperceptible and temperature is at the desired level. And radial discharge distributes the cooled or heated air evenly and thoroughly in all directions. Hence with a properly designed overhead system there are no drafts nor over or under-conditioned spots.

A ceiling diffuser has roughly twice the air mixing ability of a grille because air discharge is in the form of a thin disc-shaped stream. The greater surface area of the air stream, what engineers call aspect ratio, the more room air it entrains and mixes.

An important element in the diffuser system is the return air grilles which are located in the baseboards under the windows. Warm air, being lighter, has a tendency to stratify in the upper part of the room but the grilles, continually drawing off the cooler floor level air, help to pull it down into the room.



Installation of the overhead system is the same as for forced warm air methods with the exception, of course, that the supply ducts are in the attic rather than the basement. In ranch houses ducts are laid across the joists in any way convenient and in the expansion attic house they are run between the joists and floored over.



Basement headroom is saved by making the joists serve as return ducts. This is done by joining two joists at the bottom with a strip of sheet metal.

While cooling may not be installed when the house is built, by providing for its eventual addition the owner can protect the resale value of his property. This seems all the more logical when a heating plant that can

WACO TILE

be easily converted to cooling is well in line, costwise, with other types. The ceiling diffuser method, because it embodies accepted air conditioning features, is preferred by heating and air conditioning authorities for the all-year system.

At the Beverly Hilton

The basic design of the $17 million Beverly Hilton Hotel in Beverly Hills, Calif., consists of three slender wings, radiating out from a central service core to provide most of the 450 rooms with excellent outside exposures.

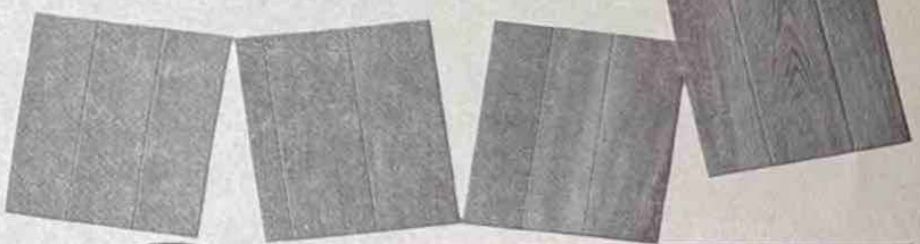
To gain full advantage of this feature, these rooms include an outdoor balcony which is given privacy by a partition of porcelain enameled, double-faced panels, laminated to honeycomb material. Colors of these separation panels vary from light pastel shades to dark blues and browns, in tones to match their surrounding decorations.

Movable shutter doors, 33 in all, were designed by Paul Heinley to form the entrances for the cabanas surrounding the swimming pool. This treatment allows swimmers and sun bathers complete privacy. Light and heat can be controlled by merely adjusting the tilt rods.

OUTER BALCONIES of Beverly Hilton are partitioned by porcelain enameled panels. Below, installation of four-panel shutter doors on cabanas lining swimming pool of hotel, designed by Welton Becket & Associates and built by Del E. Webb Construction Co.

IN WALL PANELS
its the
SURFACE
that SELLS!

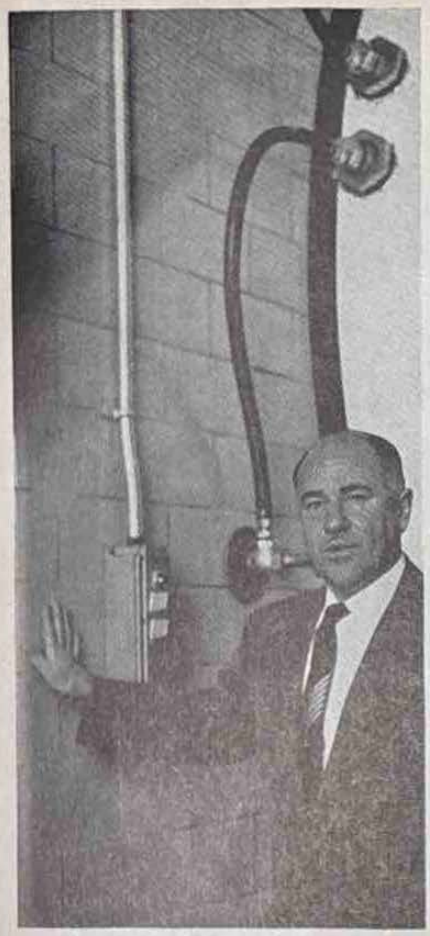
FINEWOOD®
means
FINER SURFACES!



Quality construction is important—*sure!* But in wall panels, its the *Surface that Sells!* And FineWood means not only quality construction, but also *the finest, most beautiful surfaces of any Pre-Finished Hardwood Panels!* One wall or a room paneled with FineWood precedes all else in a perfect setting for future decor and furniture.

FINER CONSTRUCTION Even back and center veneers are specially selected to guarantee a permanent glue bond assuring a perfect face surface always.

SPECIAL PROCESS FINISH FineWood's exclusive finish contains basic ingredients that enhance the lustre and stability of the panels, making them resistant to moisture. In addition the natural color finish gives added beauty and prevents any change in color and texture.



GREATER VARIETY ***Nine*** select hardwoods—Birch, Maple, Mahogany, Red Oak, White Oak, Sycamore, Walnut, Cherry, and Limba. Other special woods available on request.

"GLAZED STRUCTURAL WALLS MAKE BREWERY SANITATION EASY"

Burgermeister's vital problem of controlled sanitation has been greatly simplified and reduced in cost with walls of Western Glazed Structural Units.

In three remodeling and expansion programs since 1952, the brewery has installed 37,620 sq. ft. of this gleaming ceramic finished tile.

Wall and finish are one — no framing, lathing, plastering or finishing required. Hard, smooth surface resists wear, stains, odors; never needs painting. Clear glaze, plus 12 attractive colors. Standardized sizes and shapes for every requirement. For shape chart and specification details write to KRAFTILE CO., Niles, Calif.; or WASHINGTON BRICK & LIME CO., Spokane, Washington; members of

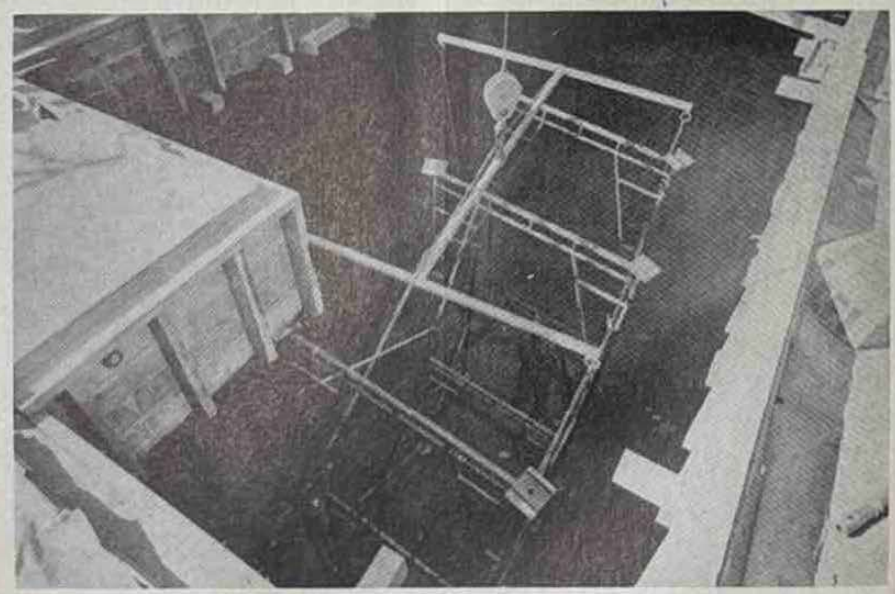
WESTERN STRUCTURAL TILE INSTITUTE

Here's what they're doing with sectional shoring

ALERT CONTRACTORS successfully applied several new techniques recently which further increased the versatility and efficiency of sectional steel shoring, the workhorse of modern concrete construction.

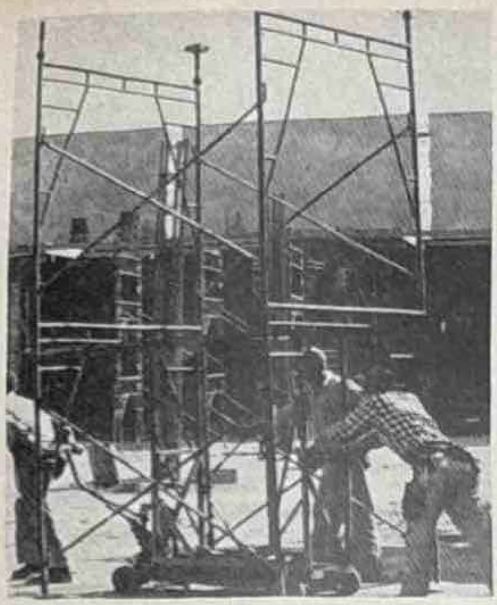
In one case the contractor rolled prefabricated shoring units from pour to pour on a wheeled dolly and lifted them to the next floor by an electric crane. In another instance shoring units were slid on greased wood sills. And in other cases, contractors used 5-ft.-wide units to support precast roof planks, to support isolated, exterior spandrel beams and to support a unique, poured concrete pitched roof.

The techniques, impractical or impossible with built-on-the-job wood shoring, all utilized Patent Scaffolding's steel, frame type shoring called Trouble Saver. In each case the shoring was quickly assembled on the job from base plates, 20-in. adjustable extension legs, welded 5-ft.-wide frames and diagonal braces. Fast-acting SlideLoks or wing nuts are used to secure the braces to the frame.



In Anaheim, Calif., a mechanized handling system was devised for moving sectional steel shoring both horizontally and vertically on the multi-storied Broadway-Hale Department Store. Contractor Ford J. Twaits Co. used rubber-tired hydraulic lift trucks to transport the sections horizontally to either a stair well or escalator block-out. There the sections were raised to the next floor by means of a monorail mounted hoist which in turn releases each section to a lift truck working that level (photo right).

The assembled sections were moved quickly into position and joined to existing shoring by cross braces. Construction manager L. E. Douglas reported that the mechanized movement of the shoring permitted unusually big pours. Single pours from 550 to 660 cu. yd. were not uncommon. These pours covered from 16,000 to 18,000 sq. ft. and were made at rates up to 93 cu. yd. per hour.



Another project involving horizontal movement of shoring sections was the Emporium-Capwell Co. warehouse, Oakland, Calif., with William J. Moran Co. as contractor (photo below).

A system of sliding entire sections of sectional steel shoring to new pour areas was used on the Monsanto Chemical Co. warehouse, Kearney, N. J. Eleven shoring sections, each covering 720 sq. ft. were pulled on greased wood sills by a hand winch. Each section was slid three times for succeeding pours on the 189-ft. by 231-ft. structure.

Sectional steel shoring is as adaptable to precast roof planks as it is to poured construction as proved by two one-story jobs. On a 46,000-sq. ft. warehouse in Dallas, 710 6-ft. 6-in.-high steel end frames spaced 6 ft. apart shored a 15-ft.-high ceiling

WHEELED HYDRAULIC DOLLY is used to move four-frame unit shoring horizontally to next pour on Emporium-Capwell Co. warehouse, Oakland.

SIX-FRAME shoring section is lifted from floor to floor of three-story department store in Anaheim, Calif., through escalator black-out. Unit is picked up by four chains hung from corners of H-shaped bridle.

made of 12-in.-thick precast planks. On a Kansas City building, 160 frames shored 2-ft.-and 5-ft.-wide poured beams as well as 24-ft.-long by 12-in.-thick precast roof planks.

While constructing a 100-ft. dia. digestion tank in Jersey City, N. J., the contractor was faced with the problem of supporting a concrete roof slab 32 ft. high and 12 in. thick from a difficult cone shaped base. The lowest point of the floor dipped to 12 ft. 6 in. below the bottom of the wall. The unusual floor condition was overcome with sectional steel shoring frames of various heights and by making leveling adjustments with the 20-in. adjustable legs. A datum line was projected on a level with the bottom of the 32-ft.-high tank wall and the shoring base frames brought to that level.

A concrete contractor put sectional steel shoring to good use while building a high school in North Arlington, N. J. The shoring supported formwork for the pouring of heavy, isolated exterior spandrel beams which were 120 ft. long, 1 ft. 4 in. wide and 3 ft. 5 in. deep. The shoring frames also provided a ready-made "built-in" scaffold for stripping of the forms.

In Miami, sectional shoring frames easily handled the job of supporting forms for a unique, poured concrete pitched roof on a new school, as well as shoring the flat slab.

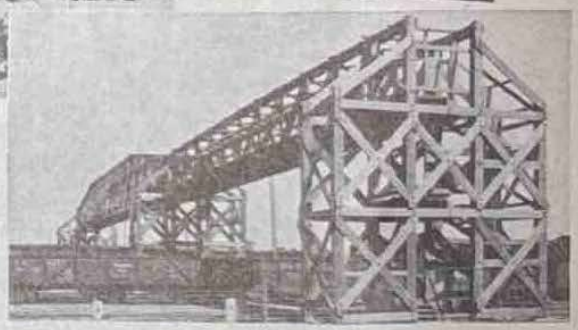
Naturally these shoring "tricks" are not always required in everyday use. But they do reflect one of the major advantages of sectional steel shoring —its versatility that makes it the workhouse on routine jobs.

Three honored for role in modular measure

Three men have been recognized by the American Standards Association for their part in the past year to encourage the use of modular measure in building. They are Leonard G. Haeger, technical director, Levitt & Sons, Inc., Levittown, Pa.; Fred M. Hauserman, president, The E. F. Hauserman Co., Cleveland manufacturer of metal partitions; and H. B. Zackrison, chief, engineering department, U. S. Army Corps of Engineers.

Presentation of awards was made in Los Angeles by C. W. Kraft, president of Kraftile Co. of Niles, Calif., who received an ASA award in 1954.

"Modular measure is a self-sustaining movement, with no high-pressure promotion behind it," Kraft explained. "The individual efforts of enthusiastic builders, producers, contractors and architects are of immense importance in speeding the present trend to modular dimensioning in building. Their work will accrue to the benefit of the American people in terms of lower building costs. The ASA modular measure award symbolizes the sponsors' appreciation of the essential contribution being made by individuals throughout the industry."



Sponsors of the movement, which uses the 4-in. module as a "least common denominator" are AIA, Producers' Council, NAHB and AGC.

HOW TO BUILD *Better for Less*

BE SURE YOU'RE UP-TO-THE-MINUTE ON FABRICATED SOLID TIMBER CONSTRUCTION— CHECK WITH RILCO

Erecting 100' Rilco monocord trusses — Big Bear Store, Lincoln Park, Michigan

Fabricated timber overpass D & R G Railroad, Denver. Spans are 70' and 170'.

Contractors are reporting amazing savings on solid timber structural designs. Daily we are getting new information that we would like to pass on to you.

Whether it is a roof construction or a structural assembly, we are constantly developing short cuts in design, speeding erection and increasing profits for contractors. Even on the first job, contractors report successful results.

Rilco Glued Laminated and Fabricated solid timber members speed construction on a wide range of structures. Let us help you with your design and fabrication specifications.

Builders and Suppliers

headlining the news

• **Evertru Products Co.** of Moses Lake, Wash., has appointed Charles Smith as manager, replacing L. O. Kalbrenner who recently resigned. The concrete block plant is a newly acquired subsidiary of Washington Brick and Lime Co. of Spokane.

• **Monsanto Chemical Co.** has occupied a new office and warehouse structure at 6670 E. Flotilla St. in the Vail Field area of Los Angeles to serve as a distribution center for all of the company's marketing activities in southern California.

• **Kaiser Steel Corp.** has named Harry L. Warner as sales manager of its Fontana fabricating division. He previously was manager of contract sales at Kaiser's Napa fabricating division.

• **Ruby Lighting Co.** of Los Angeles and Dallas, maker of industrial fluorescent lighting fixtures, has been purchased by Ekco Products Co., marking the initial phase of an expansion program in which the latter plans to acquire a number of factories in the builders hardware and architectural field.

The Los Angeles Ruby Lighting operations will be moved into Ekco's new enlarged Whittier factory. Ekco chairman Arthur Keating says his firm's interest in the lighting field will be confined to industrial applications such as factories, offices, hospitals, etc.

Robert L. Lang, recently appointed vice president of the parent company, and Ralph Simon have been elected chairman and president, respectively, of the Ruby firm. Albert Jassin has been named executive vice president in Los Angeles.

• **Pomona Tile Manufacturing Co.** has been appointed distributor of Summitville quarry tile in several Pacific Coast and mountain states, including California.

• **Superior Scaffold Co.** of Culver City has a new sales manager, Robert Gray, formerly western regional sales manager of roofing products for U. S. Gypsum Co.

VOGEL

BOGET

• **Gladding, McBean & Co.** has formed an architectural division, a consolidation of Hermosa tile and masonry products. Named to head the new product division as vice president and general manager is Verne W. Boget, who previously has held the same posts in the Hermosa tile division.

Pete Vogel, for five years vice president in charge of sales in the 11 western states for Miracle Adhesives, has been appointed general sales manager for Hermosa tile and other tile products. He will have his office at the company's headquarters in Los Angeles.

• **Airtemp Division,** Chrysler Corp., has named George Sharkey West Coast assistant regional manager, succeeding L. D. Brosell who resigned.

• **NAHB** and Household magazine in a jointly sponsored design competition for small-volume builders have awarded honorable mentions to two California firms: Calvin R. Campbell of Pasadena and Security Development Corp. of Monterey.

• **National Electric Products Corp.** will construct a warehouse for electrical distribution systems, fittings and accessories at 6400 Corvette St., Los Angeles, and will discontinue production operations at its Torrance, Calif., plant.

• **Building Components, Inc.,** of Los Angeles has been appointed factory representative for southern California by Iron Fireman Manufacturing Co.

• **Portland Cement Association** in an expansion of its field services to cement users has opened a regional office in Los Angeles to supervise activities of the district office there and in Seattle.

Hugh Barnes has been named western regional manager with headquarters at 816 W. Fifth St. He joined the association in 1937 and has been

Attractive Olympia Memorial Clinic *features*

Chehalis Red Roman Brick

The warm, pleasing texture of Chehalis Red Romans—the Pacific Northwest's most distinctive brick—was selected by the architect to distinguish this modern clinic building in Olympia.

Here is functional design at its eye-appealing best—permanent, practical, fire-safe . . . and economical to build and maintain! Only brick—and preferably CHEHALIS BRICK—combines all these advantages so well.

SCPI

CHEHALIS BRICK and TILE Co.

BOX 868, CHEHALIS, WASHINGTON

Los Angeles district engineer since 1942. Barnes has been succeeded by John M. McNerney, with the association since 1941 and most recently statewide paving engineer for the Los Angeles office.

The expansion program raises the number of the association's regional offices to five and of its district offices to 32, covering almost the entire United States as well as British Columbia.

• **Gunite Contractors Association** has elected these officers: J. C. Fredericks, F. W. Case Corp., president; James Enbody, H. W. Enbody & Sons, secretary; N. R. Sanders, Johnson Western Gunite, treasurer. Stanley Zynda will continue as manager.

Members have agreed on four meetings a year, two in San Francisco and two in Los Angeles.

• **Associated Home Builders of the Greater East Bay** have elected Don T. Groom, partner in the Oakland firm of Groom-Moyer, to succeed McKie W. Roth of Walnut Creek as president.

William G. McFarland has been named field secretary of the group, succeeding Ronald L. Pardini who resigned to join Perma Bilt Homes at Sacremento.

The association has established a Livermore chapter, electing Roy N. Jensen its first president and Masud Mehran secretary.

• **Roddis Plywood Corp.** has established a fir plywood industrial sales division in the Ardel Building, 33 E. 10th Ave., Eugene, Ore., with Richard L. Rinde as newly appointed manager. A graduate of the University of Oregon, he formerly was assistant sales manager of Clear Fir Sales Co., Springfield, Ore.

• **Ralph Yoder** of Seattle, who heads the Washington State chapter, Producers' Council, will address the annual chapter presidents' conference at the Wade Park Manor Hotel in Cleveland September 25.

In announcing Yoder's selection, managing director John Haynes of Washington, D.C., commented: "We pick our speakers from the most successful chapters during the preceding year. In 1955 the Washington State chapter ranked 11th in guest-per-member ratio at its monthly informational meetings for architects. This is a sharp rise from the 21st ranking of the previous year."

• **Orr & Sembower, Inc.**, has added a sales representative to handle its automatic boilers in Boise: Richardson Equipment Co., 612 Front St.

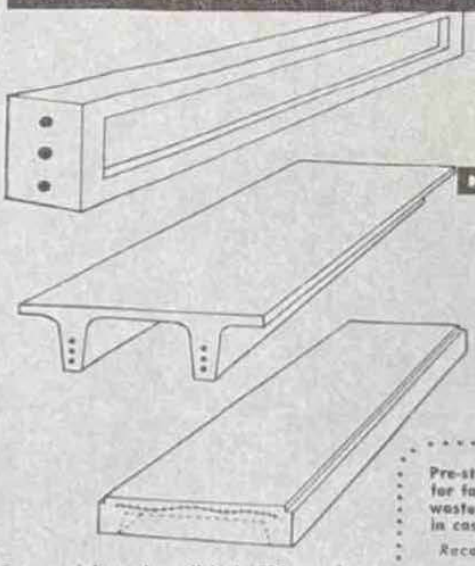
• **Southwestern Idaho Association of Homebuilders** has elected Charles R. Kreiensieck of Boise as its first president. Other officers are DeWayne Bills, vice president, and Earl Hardy, secretary-treasurer, both of Boise.

• **W. P. Fuller & Co.** has announced changes in its administrative structure, highlighted by the creation of a new marketing division under the direction of W. P. Fuller 3rd, vice president and great-grandson of the company's founder. The new division brings together for the first time both paint and glass sales management.

C. E. Ide, at present manager of Fuller's intermountain district, will take over the newly created position of director of sales, paint and allied products about the first of the year. J. P. Walsh will continue in his present position as director of sales, glass and building products. Vice president H. S. Margetts will be in charge of division operations, which includes responsibility for the Fuller branch system throughout the West, Hawaii and Alaska.

• **Home Builders Institute of Los Angeles** has a new director of public relations, Richard D. McNish, who has been field representative since 1954. He is a graduate of California State Polytechnic College.

• **Calaveras Cement Co.** has opened a bulk cement transfer plant in San



modern speed-up construction

Forms, shoring eliminated

no waiting for concrete to set when you specify lightweight

PRE-STRESSED CONCRETE

I BEAMS

Support double tee or channel slab in all-concrete construction. Spans to 70 ft.

DOUBLE TEE SLABS

for economical pre-cast floors, roofs. 20-40 ft. spans, maximum unit coverage.

CHANNEL SLABS

for 20 foot or shorter spans. Light, easy-to-handle. Use with steel beams, poured or pre-cast concrete beams.

Pre-stressed concrete is the answer to your clients' demands for faster construction, lower costs. No time, labor, material wasted on building forms or waiting for concrete to set (as in cast-in-place method).

Leandro to serve the San Francisco and East Bay construction industry. The $100,000 installation has a storage capacity of 5,000 bbl. of cement.

• **Robertshaw-Fulton Controls Co.** has named Harold W. Rice director of its West Coast research and development laboratory in Los Angeles. Rice, a member of the firm for more than 20 years, succeeds H. W. Geyer, who resigned.

• **Kaiser Aluminum and Chemical Sales, Inc.,** is expanding its service to architects in the Los Angeles area with the appointment of Walter F. Pruter Jr. to the newly created post of district architectural representative. A former senior service engineer, he joined Kaiser Aluminum in 1955 and was associated with the sales staff of United States Gypsum Co. for six years.

• **Permanente Cement Co.** has established a new contractor sales division in the Russ Building, 235 Montgomery St., San Francisco, with C. C. (Cless) Moore as division sales manager.

"As the name implies, the new unit will concentrate on serving major contractors," says James K. Beatty, vice president in charge of sales, "thus allowing the regular line salesmen to give their full attention to the requirements of batch plant operators and building material dealers."

Permanente's sixth kiln, latest unit in its $35 million expansion program, went into production near Los Altos, Calif., last month.

• **Empire Building Material Co.** of Portland has appointed Richard (Dick) Mason as district sales manager in Oregon and southern Washington. For the past two years he has been plant foreman.

• **Evans Products Co.** has doubled its timber supply on the West Coast by acquisition of cutting rights on a half-billion feet in Oregon to help supply veneer for production of the Michigan company's Evaneer plywood operations.

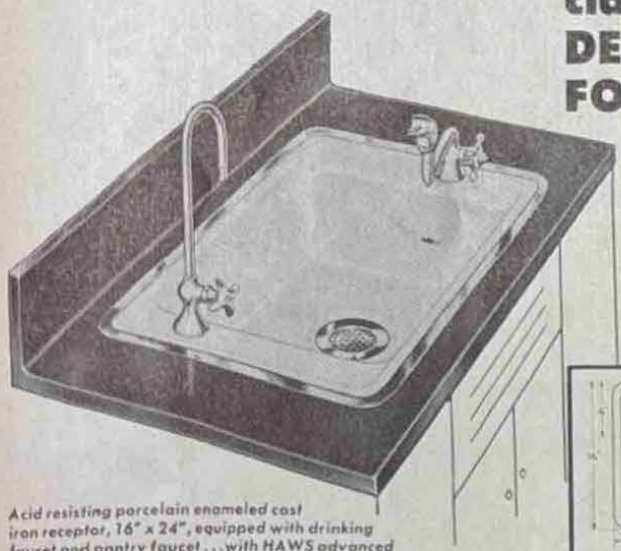
• **Symons Clamp and Manufacturing Co.** has opened a new concrete forming equipment plant in San Leandro, Calif., representing a major expansion of its West Coast operations.

Joseph Von Drasek has been named vice president in charge of the California factory, first to be built outside of Chicago. Assisting him in sales is Richard G. Allen. Robert P. Tross has been transferred from Chicago headquarters to act as chief engineer.

• **Harvey Aluminum** of Torrance, Calif., has resumed work at its 54,000-ton aluminum reduction plant at The Dalles, Ore., with an announcement that all financial and contractual arrangements have been finalized for construction, which was interrupted four years ago. On a 500-acre site, the plant is scheduled for completion late in 1957.

• **Gordon Tongue,** president of Northwestern Portland Cement Co. of Seattle, has been elected to the board of directors of the Portland Cement Association.

• **General Electric Co.** will construct a $2 million lamp division warehouse, distribution and office center in the Vail Field area of Los Angeles. Albert C. Martin & Associates are architects-engineers for the single-story, reinforced concrete structure, and Noyes Roach and C. L. Peck are joint contractors.



GE has opened its first Alaskan facility, a branch supply and apparatus house of General Electric Supply Co., in Anchorage, with George H. Smith, formerly of Portland and Medford, Ore., as manager.

• **Fibreboard Paper Products Corp.** has named Patrick H. Ryan to serve as merchandise manager of the Pabco building materials division in the firm's San Francisco headquarters. He was with the Pabco floor cover-

ing division as assistant to the vice president in 1954-55 and then became vice president and general manager of Building Products Corp. in Milwaukee.

• **Allmetal Screw Products Co.** has moved its West Coast division to larger quarters at 2978 Wilshire Blvd., Los Angeles (DUnkirk 5-6357).

• **A. C. Horn Co., Inc.**, has a new branch manager in its Los Angeles office, Harry D. Kennedy, who served as district sales representative in the Tacoma, Wash., area.

• **Pioneer Manufacturing Co.** has named W. Q. (Chris) Kringle sales manager for its Bay area office, succeeding William Bucknum who was recently appointed sales manager of Pioneer Range Co., a subsidiary.

Carl F. Hurley is Pioneer's new representative in San Diego.

• **Smith-Davis Co.** of Los Angeles, in conjunction with its parent company, Maas & Waldstein Co., is sponsoring a year-long series of technical clinics for painting contractors throughout the 11 western states. Sessions are being conducted by Hal Palmer, sales manager of the firm's architectural division.

• **Westinghouse Electric Corp.** has appointed William L. Trudgian as Pacific Coast regional agency and construction manager, with headquarters in San Francisco. Ray T. Killen succeeds Trudgian as district agency and construction manager in Seattle.

Robert E. Ralstin has been named to the newly established position of area sales manager for apparatus in the Portland office.

• **Georgia-Pacific Corp.** has appointed Robert O. Lee, formerly with Pacific Telephone in Seattle and San Francisco, as advertising manager and public relations director.

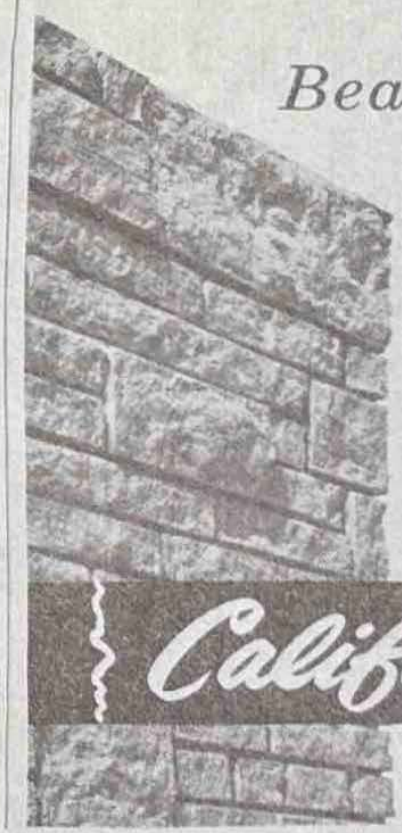
• **Textron, Inc.**, will construct a second plywood plant at Coquille, Ore., a $2 million operation adjacent to the present facility.

• **Drywall Contractors Association** (Southern California) has reelected its president, Wayne Vaughan of West Los Angeles. Frank Donaldson, Santa Ana, is vice president; Fletch Reynolds, La Habra, secretary; Reuben Casey, Garden Grove, treasurer. New directors are S. Douglas Hartley, Canoga Park, and M. R. McColley, San Diego.

• **Arcadia Metal Products** has moved its southern California sales office, headed by Bob Reed, to the new half-million-dollar plant at 801 S. Acacia Ave., Fullerton (MIchigan 3908, LAmbert 5-0291).

Design and the landscape in which we live (cont'd. from p. 12)

to use, and their primary functions are to provide settings for buildings and to impress the passerby. In doing this they have a potentially great contribution to make to the community landscape. This is rarely realized through failure to make use of the full possibilities inherent in free arrangements of trees, shrubs, flowers, ground cover and grass. Maintenance problems are also an inhibiting factor, basically through inadequate budgets. When these public grounds are adequate in size a good sense of outdoor space can be created.



Parks are sections of green outdoor space large enough to be used for circulation and relaxation by the general public. A "keep off the grass" sign will convert a park space to a public grounds space, to see only. Parks are pure humanized landscapes with a primary potential for saving our commmunities from speculative constructivism and the auto. We should all live in parks rather than having to go to parks. Parks embody the greatest opportunities for free landscape design with elements derived largely from nature and a minimum of construction.

Active public recreation spaces and facilities are quite specific and positive in their requirements. Playfields, game courts, playground areas and community buildings tend to be treated in a mechanized functional manner without grace of conscious design. The result is that many of them are about as attractive as a parking lot or a warehouse. When these active programs are merged with passive park spaces the latter may lose more than the former gains. However sensitive design control can take advantage of the more dynamic patterns which result, with multiple variations in combination and contrast.

Most of these landscape problems, except parks, are intimately involved with buildings, that is, with architecture. The relations between these two arts are constant and unavoidable. Architecture, as the art of shelter, enclosing and creating indoor space, has a maximum impact on the landscape around it. As practiced, landscape design and architecture differ in certain important aspects:

1. **Material.** Architecture uses the complex variety of construction materials. Landscape design uses some of these, but primarily the materials of the natural landscape—rock, earth, water, plants. These are also complex in their variations.

2. **Discipline.** Technique and function are usually less dictatorical in

landscape design than in architecture. The parts of a garden don't hold each other up, and a garden space may have no function at all except to provide a pleasant experience for those looking into or passing through it.

3. Scale. The scale of architecture is a compound of human scale and structural economy, often reflecting the site scale. The scale of landscape design is a compound of human scale and site scale, often reflecting the scale of the surrounding landscape.

4. Continuity. Architecture tends to produce buildings which are complete and self-sufficient works of art, however carefully they may be related to the site. Landscape design must almost always establish a relation or connection between building, site and surrounding landscape. Therefore it tends to establish continuity between them, must relate itself to their forms and hence cannot be self-sufficient. Of course, when architecture is expressed in groups of buildings it also becomes concerned with continuity.

In the final analysis architecture and landscape design are both parts of a larger art of site-space design. In an urban skyscraper there may be no landscape design; in a rural park there may be no architecture. Most problems fall between these extremes, and the proportions of responsibility and control falling to the two fields will likewise vary. Each parcel of land has a block of air-space above it, and the three-dimensional development of this space for use and pleasure is the joint responsibility of architecture and landscape design.

In the most final analysis the landscape is indivisible. It stretches from ocean to ocean, and its limits are those of human vision and motion and such physical obstacles as may exist or be established. The landscape is everything an individual can see from a given station point or circulation route, colored by everything he has seen before and everything he has heard or read about it. This landscape, especially in the more developed urban and suburban areas, is compounded of many separate parcels of real estate and of all the multiple disconnected decisions made by different people at different times on those different parcels.

This is the basic process of landscape design in the large sense. The problem of how to unify and coordinate these multiple decisions so as to produce a harmonious community landscape is being tackled today by planners and redevelopers, but tomorrow it will be ours. Once the proper relations between overall control and democratic processes is worked out, the community landscape will become a physical design problem.

Landscape design today begins with backyards and front yards and all the miscellaneous open spaces left over by buildings, street and utility construction, within the preconceived patterns of standard subdivision and land planning practices. It expands from these problems into larger planned open spaces—parks, school and college grounds, other institutions, parkways and freeways, country clubs, golf courses, etc.

In the future landscape design will become synonymous with the unified design of the humanized landscape. The basic vocabulary for this includes ground forms, buildings, trees, vehicular circulation, pedestrian circulation, green open space, paved open space, water forms. The secondary vocabulary includes all the multiple furnishing, equipping and enriching detailed elements of the man-made world and the world of nature.

Thus landscape design begins with the common or garden variety of local landscaper and ends with the merging of all the space-planning professions and all the other fields of design concerned with improving our world.

I've no worries about TERMITES or ROT...

I built with BOLIDEN SALT pressure-treated lumber

Architects and builders in steadily growing numbers are recommending and using Boliden Salt Pressure-Treated Lumber in home construction because it provides dependable protection against termites and rot. The small extra cost now is a long-range saving.

Time-tested Boliden Salt is approved as a standard preservative by the American Wood Preservers' Assn., American Assn. of State Highway officials, Federal, State and Local agencies and the P.C.B.O.B.

BOLIDEN SALT

Boliden Salt is Clean, Odorless, Fire-Resistant, Nearly Colorless, Paints Readily

Buyers look for telephone planning in today's homes

say WELDON B. MANSFIELD *and* SHELDON W. PARKER,
partners, Western Enterprises, Inc.
Sacramento, California

Buyers of new homes "just naturally expect" built-in telephone outlets in convenient locations, report builders Mansfield and Parker. The same goes for concealed telephone wiring. Western Enterprises' newest development offers these features—plus two color telephones and six-months' service *free of charge* for each home.

To successful builders like Messrs. Mansfield and Parker, who are setting living standards in the Pacific West, complete telephone planning is as basic as adequate electrical wiring. Pacific Telephone is always ready to help you plan built-in telephone facilities. Just call us and ask for our free Architects and Builders Service.

Quantities: 72,670 c.y. excavation; 28,539 mi. yd. overhaul; 17,445 ton crushed gravel; 30,172 gal. liquid asphalt; 1,430 M gal. watering; 1.050 mi. processing; 258' corrugated metal pipe culverts.

YELLOWSTONE RIVER BRIDGE — Construct one 1317.5' steel and concrete bridge over Yellowstone River on Yellowstone River Bridge-Glendive Road at Glendive in Dawson County; F 213(3).

Quantities: 225,395 lb. reinforcing steel; 4,416.7 c.y. concrete; 2,638' steel bridge rail; 47,700 lb. furnish steel bearing piles; 864' drive steel bearing piles; 56 floor drains; 5,675 c.y. structure excavation; lump sum shoring and cribs.

GLENDIVE - SIDNEY ROAD — Construct structural plate pipe arch culvert and grading, gravel surfacing, bituminous surface treatment, drainage structures on 0.706 mile in Richland County; F 245(10), F 245(11).

Quantities: 64,729 c.y. excavation; 451 c.y. gravel backfill; 9,438 c.y. designated borrow; 2,140 mi. yd. overhaul; 101 mi. yd. overhaul; 3,632 ton crushed gravel; 5,933 gal. liquid asphalt; 5,933 gal. emulsified asphalt; 1,300 M gal. watering; 1,070' corrugated metal pipe culverts; 328' haul, erect state furnished structural plate pipe culvert.

BOZEMAN - WILSALL ROAD — Grading, gravel surfacing, seal coat oiling, plantmix oiling, drainage structures on 0.782 mile of North Rouse Avenue-Bozeman section of Bozeman-Wilsall road and graveling surfacing, seal coat oiling and plantmix oiling on 2.890 mile of another section of same road, Gallatin County; U. S. 370(8), S 370(10).

Quantities: 7,331 c.y. excavation; 8,539 ton plantmix; 44,788 ton crushed gravel; 126,903 gal. asphalt cement; 30,551 gal. liquid asphalt; 1,365 M gal. watering; 546' corrugated metal pipe culverts; 337.5' steel guard rail; 2,201 sq. ft. galvanized metal bin type retaining wall; 400 c.y. gravel backfill.

IN THE CITY OF HARLEM—Construction of one 88' treated timber pile bridge, approaches over Thirty Mile Creek on Smith Avenue between Water and Park Streets on Harlem-Turner-Canadian Line Road, Blaine County; S 12(8).

Quantities: 530 c.y. excavation; 3,227 c.y. designated borrow; 8,867 mi. yd. overhaul; 48 M gal. watering; 192' corrugated metal pipe culverts.

RAYNESFORD-SOUTH ROAD — Grading, gravel surfacing, one 38' treated timber bridge over Big Otter Creek and one small drainage structure on 7.073 mile in Judith Basin County; S 183(1).

Quantities: 379,059 c.y. excavation; 489 c.y. backfill; 5,358 mi. yd. overhaul; 963 c.y. binder; 1,926 mi. yd. overhaul; 42,352 ton crushed gravel; 6,449 M gal. watering; 3,744' reinforced concrete pipe culverts; 372' structural plate pipe stockpass.

GLASGOW - OPHEIM - CANADIAN LINE ROAD—Grading, gravel surfacing, drainage structures on 10.437 mile in Valley County; S 286(4).

Quantities: 521,237 c.y. excavation; 487 c.y. gravel backfill; 52,960 mi. yd. overhaul; 12,543 ton selected borrow base course uncrushed; 66,191 ton crushed gravel; 1,566 c.y. binder; 3,132 mi. yd. overhaul; 8,593 M gal. watering; 3,618' corrugated metal pipe culverts; 359' structural plate pipe culverts.

SMP 0299—Crushing, stockpiling 132,500 ton of ⅝" crushed gravel surfacing and 55,000 ton ½" crushed gravel surfacing from 12 crusher set-ups in Big Horn, Carbon, Stillwater, Sweetgrass, Yellowstone counties.

SMP 2110-03—Construct one 38' untreated timber bridge over Beaver Creek about four miles west of Havre on Gilford-Havre-East Road, Hill County.

Quantities: 18,639 mbm untreated timber; 690' untreated timber piles; 305 c.y. unclassified excavation.

★**CURBS, GUTTERS—Salt Lake City, Utah**

Award to Richard C. Bradshaw, 4610 Atwood Blvd., Murray, $29,436, by Salt Lake City Corporation, Roy W. McLeese, city engineer, 401 City-County Bldg., Salt Lake City, for construction of curbs and gutters on 11th East from 7th to 9th South in Salt Lake City. GH 9-8. Previous report 9-5

●**STATE HIGHWAY PROJECTS— Salt Lake City, Utah**

Bids will be opened 2 p. m., September 25, by Utah State Road Commission, State Capitol, Salt Lake City, for highway construction. Specifications with above office. $2 deposit. Certified check, cashier's check or bid bond 5%.

STATE ROAD No. 48—Construction of 2½" plantmix bituminous surfacing on 0.671 mi. Midvale Center Street between the Union Pacific railroad tracks and the Denver and Rio Grande Western railroad tracks, Salt Lake County; State Proj. No. 1580.

Quantities: 4,000 ton plantmix bituminous surface; 273 ton bituminous material; 4,200 ton gravel.

U. S. 160, STATE ROAD No. 47—Construction of 3" roadmix bituminous surfacing on 5.467 mi. Monticello Main St. and State Road No. 47, from Blanding Southerly to the Jct. of State Road 47, San Juan County; State Proj. Nos. 1577 and 1578.

Quantities: 963 ton bituminous material; 56,900 ton gravel; 53,300 c.y. roadway excavation.

FAS ROUTE No. 250—Construction of one concrete bridge over the Provo River between Midway and the Jct. of U. S. 40 north of Heber, Wasatch County; FAS No. S-0250(1).

Quantities: 353 c.y. concrete; 46,050 lb. reinforcing steel. SP 9-11

ALASKA

SEWER LINE— Anchorage, Alaska

Contract approved by City Council, City Hall, Anchorage, for city use of the outfall line from the Air Force Hospital to Knik Arm, saving the city about $200,000. Cost to the city will be $95,588 for thirty years; city will also pay one-third of maintenance costs, not to exceed $60,000. The sanitary sewer serves residents of west Government Hill and all Mountain View north of the Glenn Highway, for which the city would pay $360,000 over a period of 30 years under the previous arrangement. SC 9-8

Bureau of Reclamation Lists 31 Major Projects . . .

. . . Scheduled for Bid Call Within Next Three Months

Thirty-one major construction projects will be among bid invitations issued by the Bureau of Reclamation during September, October and November. Bids will be called in September on alternate proposals for an earthfill dam or a concrete arch dam on the South Fork of Owl Creek about 35 miles west of Thermopolis, Wyo. Also planned for September bid calls are the earth and rockfill dam on Beaver Creek about 27 miles east of Ashland, Ore.; the horseshoe tunnel east of Helena, Mont. adjacent to Canyon Ferry Dam; and the Wanship and Gateway power plants in Utah. For further information, write to L. N. McClellan, chief engineer, Denver Federal Center, Denver, Colo., referring to the project by title and number.

BID CALLS EXPECTED IN SEPTEMBER

DAM, Anchor (9-1), Missouri River Basin Project, Wyo. On South Fork of Owl Creek about 35 miles west of Thermopolis, Wyo. Bids will be received on the two following alternate proposals: 1 — Constructing an earthfill dam with crest of 175' above streambed and 460' in length, a spillway with approach channel, concrete inlet structure, concrete lined tunnel, concrete conduit and stilling basin, riprap lined outlet channel, outlet works with concrete intake structure, lined tunnel, gate chamber, adit and access shaft, shaft house, ventilating system and one mile of access road with drainage structures. 2—Constructing a 66,000 cu. yd. concrete arch dam 200' high and 550' long and constructing one mile of access road with drainage structures.

Quantities: Earthfill Dam—59,000 c.y. excavation, overburden in open cut, 12,000 c.y. bedrock excavation in open cut; 7,000 c.y. excavation in tunnels and shafts; 641,000 c.y. excavation from borrow; 22,000 c.y. pervious backfill; 544,000 c.y. earthfill in dam embankment; 8,600 sacks pressure grouting; 800,000 lb. reinforcing steel; 2,750 lb. piping; 58,000 lb. metalwork, equipment. Concrete Arch Dam—diversion and care of river; 44,000 c.y. overburden excavation; 20,000 c.y. bedrock excavation; 26,000 c.y. roadway excavation; 5,000' grout holes; 5,000 sacks grouting; 66,000 c.y. concrete; 31,000 lb. mechanical equipment; 83,000 lb. metal work.

Completion time 900 days.

Bids will be called by the chief engineer, Denver, Colo. late in September.

DAM, Howard Prairie (9-2)—Rogue River Basin Project, Ore. On Beaver Creek about 27 miles east of Ashland, Ore. Constructing an 86' high, 990' long earth and rockfill dam; a spillway with approach channel, concrete crest structure, chute and stilling basin; an outlet works with concrete intake structure, fish screen structure, conduit, gate chamber, control house and stilling basin.

Quantities: 34,000 c.y. common excavation for dam; 825 c.y. rock excavation for dam; 367,000 c.y. excavation from borrow; 400,000 c.y. fill in dam embankment; 26,000 c.y. excavation for structures; 2,000 c.y. concrete in structures; 13,000 c.y. pressure grouting; 250,000 lb. reinforcing steel; 5,000 lb. metalwork; 41,000 lb. government furnished metalwork, equipment; 16,000 lb. outlet pipe.

Completion time 750 days.

Bids will be called by the chief engineer, Denver, late in September.

TUNNEL—Helena Valley (9-3) — Missouri River Basin Project, Mont. Fifteen miles east of Helena adjacent to Canyon Ferry Dam, Mont. Constructing a seven foot diameter horseshoe tunnel about 2.6 miles long.

Quantities: 31,000 c.y. excavation in tunnel; 10,000 c.y. concrete in tunnel lining; 100 c.y. concrete in structures; 600,000 lb. steel supports; 14,000' roof bolt supports; 50,000 lb. tunnel liner plate; 200 mbm permanent timbering.

Completion time 800 days.

Bids to be called late in September by the chief engineer, Denver.

POWER PLANTS—Wanship and Gateway (9-4)—Weber Basin Project, Utah.

Wanship Power Plant, south of Wanship, Utah—Constructing a reinforced concrete, outdoor type power plant including steel penstock, concrete tailrace structure and channel, installing one 2,000 hp. turbine, one 1,400 kw generator, one 54" butterfly valve, one gate shaft type governor, furnishing and installing one bulkhead gate and a package type substation, construction a wood pole transmission line 1,700' long. Quantities: 3,800 c.y. common excavation; 20 c.y. rock excavation; 390 c.y. concrete; 50,000 lb. reinforcing steel; 50,000 lb. of 54" steel penstock; 3,560 lb bulkhead gate.

Gateway Power Plant, ten miles southwest of Ogden, Utah on the south bank of the Weber River—Constructing a reinforced concrete, outdoor type power plant including steel penstock and concrete penstock anchor, concrete tailrace structure and channel, installing two 2,900 hp turbines, two 2,000 kw generators, two 54" butterfly valves, two gate shaft type governors and furnishing and installing bulkhead gate, one radial gate and a package type substation. Project also includes construction of timber bridge across existing wasteway structure and an access road 1,000' long. Quantities: 29,000 c.y. common excavation; 1,000 c.y. rock excavation; 1,600 c.y. concrete; 170,000 lb. reinforcing steel; 400,000 lb. 54" steel penstock; 4,165 lb. bulkhead gate.

Completion time 520 days.

Bids to be called soon by chief engineer, Denver.

PUMPING PLANT, Helena Valley (9-5)—Missouri River Basin Project, Mont. Near Helena, Mont. Constructing an outdoor type pumping plant of reinforced concrete with a structural steel crane runway and overhead traveling crane and an approach bridge. Work includes installing two 150 cfs, hydraulic turbine driven pumps and other government furnished equipment. Water for both pumps and turbines will come from Canyon Ferry Reservoir about 500' upstream.

QUANTITIES: 10,000 c.y. excavation; 6,300 c.y. concrete; 136,000 lb. structural steel; 80,000 lb. reinforcing steel; 670,000 lb. government furnished reinforcing steel; 500,000 lb. government furnished penstock, discharge pipe and manifolds; 225,000 lb. government furnished gates and valves; 171,000 lb. miscellaneous metalwork including trashracks.

Completion time 750 days.

Bids to be called by the chief engineer, Denver, late in September.

PUMPING PLANT, White Bluffs (9-6)—Columbia Basin Project, Wash. Near Othello, Wash. Constructing an indoor type pumping plant with four electrically driven, horizontal pumping units of 178 cfs total capacity. The substructure is to be reinforced concrete, the superstructure a structural steel frame with uninsulated metal panel siding, and the framing to carry a crane runway for a six ton, hand operated traveling crane. Also included is construction of the inlet transition, pump discharge line, outlet structure and switchyard and installation of pumping units and electrical equipment.

Quantities: 56,000 c.y. lateral excavation; 22,000 c.y. excavation for structures and discharge line; 10,000 c.y. backfill; 700 c.y. concrete; 60,000 lb. structural steel;48,000 lb. steel pipes and manifold; 1,650' of 21" and 66" concrete pipe.

Completion time 650 days.

Bids to be called late in September by the chief engineer, Denver.

LATERALS, North Side Pumping Division (9-9)—Minidoka Project, Idaho. Near Rupter, Idaho. Earthwork and structures for open laterals from 25 wells with bottom widths of from 4' to 2' and for six relift pumping plants and discharge lines.

Quantities: 260,000 c.y. lateral excavation; 20,000 mi. c.y. overhaul; 6,000 c.y. structure excavation; 530 c.y. concrete in structures; 9,000' of 15" to 30" precast concrete pipe.

CANAL STABILIZATION (9-11) — Shoshone Project, Wyo. About 20 miles north of Cody, Wyo. Constructing berms on canal above Buck Springs Creek siphon. Project involves 25,000 c.y. excavation, removal of wood culverts and replacement with corrugated metal pipe culvert.

Completion time 75 days.

Bids to be called by project manager, Cody.

DRAINS (9-14)—Shoshone Project, Wyo. Near Powell, Wyo. Constructing 3.5 mile of closed drain, 1.1 mile of open drains, converting about 1.6 mile of open and closed drains.

Completion time 250 days.

Bids to be called by project manager, Cody, Wyo.

DRAINS (9-15)—Riverton Project, Wyo. About 25 miles north and west of Riverton, Wyo. Constructin 3.5 mile of 6" and 8" closed drains, 0.25 mile of open drains.

Completion time 210 days.

Bids to be called by project manager, Riverton, Wyo.

DEEPENING DRAINS, Block 43 (9-16)—Columbia Basin Project, Wash. Near Warden, Wash. Deepening drains, constructing about 14 miles of new drains including culverts and drain inlets.

Completion time to be determined.

Bids to be called by project manager, Ephrata, Wash.

BRIDGE (9-21) — Provo River Project, Utah. Near Hailstone, Utah. Clearing river channel, constructing a timber bridge and two heavy riprap overflow controls.

Quantities: 3,500 c.y. constructing embankments; 11,000 ton riprap; 300 c.y. structure excavation; 25 c.y. concrete; 36,000 fbm timber in structures.

Completion time 150 days.

Bids to be called by regional director, Salt Lake City, Utah.

HOUSING (9-30) — Michaud Flats Project, Idaho. Near American Falls, Idaho. Constructing two two-bedroom residences. Completion time 230 days.

Bids to be called late in September by regional director, Boise.

BID CALLS EXPECTED IN OCTOBER AND NOVEMBER

DAM MODIFICATIONS (9-33)—Shoshone Project, Wyo. Replacing upstream portion of the lower outlet works with a new intake shaft and tunnel equipped with bulkhead Plugging the existing intake tunnel under gate and hoist and trashrack structure. water. Rehabilitating the existing slide gates and replacing one existing 57" balanced valve with an 84" needle valve. Replacing trashracks on the penstock intakes with new metal intake wells with cylindrical trashracks. At Buffalo Bill Dam six miles west of Cody. Chief engineer, Denver, to issue invitations.

CANAL, DIVERSION DAM (9-35)—Rogue River Basin Project, Ore. Constructing 10.3 miles of open canal including 2.3 mile of 6'x3.75' rectangular reinforced concrete flume section, 7.5 miles of 2.2' bottom width canal line with unreinforced concrete and 0.5 mile of 48" precast concrete pipe siphon; constructing a small rockfill type diversion dam with reinforced concrete core wall, sluiceway and canal headworks and 1.65 miles of 24" bottom width canal lined with unreinforced concrete. Fifteen mies east of Ashland. Chief engineer, Denver to issue invitations.

PIPE LINES (9-38)—Weber Basin Project, Utah. Furnishing, laying about 21,000' of 24", 27", 30" precast concrete pressure pipe part of which will be steel cylinder type pipe with pretensioned reinforcement and constructing one concrete lined equalizing reservoir for Davis Aqueduct trunk lines. About 10 miles north of Salt Lake City. Chief engineer, Denver, will issue invitations.

LATERALS (9-39)—Columbia Basin Project, Wash. Earthwork, structures for about 50 miles of unlined open laterals, wasteways, drains with bottom widths varying from 12' to 2". Block 85, about five miles north of Smyrna. Chief engineer, Denver, to call bids.

LATERALS (9-40)—Columbia Basin Project, Wash. Constructing irrigation facilities to serve eight new farm units in Block 74 near Quincy. Project manager, Ephrata to issue invitations.

LATERAL TURNOUTS (9-42)—Columbia Basin Project, Wash. Constructing two CHO turnouts and one concrete check for farm units 30, 31, 40 in Block 15. Near Ephrata. Project manager, Ephrata will issue invitations.

CANAL, LATERAL LINING (9-44)—Riverton Project, Wyo. Furnishing and applying asphalt lining to several reaches of canals and laterals. Near Riverton. Project manager, Riverton, to issue invitations.

DRAINS (9-45)—Yakima Project, Wash. Constructing about 12 miles of surface drains near Kennewick. Regional director, Boise, Idaho to issue invitations.

DEEPENING DRAIN, WASTEWAY (9-47)—Columbia Basin Project, Wash. Deepening about 2.5 miles of DE 229 drain, extending two culverts, reconstructing about 12 drain inlets, deepening about one mile of EL31 wasteway, removing and reconstructing a county road bridge in Block 42, near Warden. Project manager, Ephrata, to issue invitations.

DEEPENING DRAINS (9-48)—Columbia Basin Project, Wash. Deepening 11 drains in Blocks 41 and 42, near Moses Lake. Project manager, Ephrata to isue invitations.

WELL (9-49)—Pine River Project, Utah. Drilling, casing 6" diameter domestic water well to depth of about 200'. Twenty miles northeast of Durango, Colo. Regional director, Salt Lake City, Utah to issue invitations.

POWER PLANT (9-50)—Missouri River Project, Wyo. Constructing Fremont Canyon Power Plant will include an indoor type reinforced concrete structure with a structural steel superstructure frame and concrete walls housing two 33,500 hp turbines and two generators. Also included will be three miles of lined tunnel, 18' in diameter with an inlet gate shaft, hoist house, trashracks and a surge tank near power plant with two steel penstock tunnels. About 35 miles southwest of Casper. Chief engineer, Denver to isue invitations.

PUMPING PLANTS (9-51)—Chief Joseph Dam Project, Wash. Constructing the three Brewster Pumping Plants will include one outdoor pier type plant with an approach single span bridge and with fish protection facilities which is to be located on the Columbia River and is to pump 50 cfs to the second plant, a booster plant, which is to be an indoor type plant with a reinforced concrete slab and a structural steel superstructure with metal roofing and siding and a traveling crane. The third plant, a relift plant, is to be an outdoor type plant with a reinforced concrete floor slab. Work will also include steel pipe discharge lines and a steel tank reservoir. Near Brewster. Chief engineer, Denver, to issue invitations.

PUMPING PLANT (9-25)—Weber Basin Project, Utah. Constructing the P2.8R Pumping Plant which is to have four outdoor horizontal booster units, two units having a total head of 225' and 9 cfs discharge and two units having a total head of 365' and 8 cfs discharge. The pumps are to be installed on a reinforced concrete slab. Southeast of Ogden. Chief engineer, Denver, to issue invitations.

ACCESS ROAD (9-56)—Missouri River Basin Project, Wyo. Constructing five miles of road including a 140' truss bridge for access to Fremont Canyon Power Plant on North Platte River, 40 miles southwest of Casper. Chief engineer, Denver, to issue invitations.

ROAD RELOCATION (9-57)—Deschutes Project, Ore. Relocating Haystack Reservoir county road. Regional director, Boise, Idaho, to isue invitations.

HOUSING (9-59)—Columbia Basin Project, Wash. Constructing one two-bedroom frame residence with full basement and garage complete with water and sewage facilities. Near Ringold Relift Pumping Plant in Block 19. Project manager, Ephrata to issue invitations.

Advertisements for Bids

THE RATE for Advertisements for Bids is 35 cents per line for the first insertion; 25 cents per line for each insertion thereafter.

STATE HIGHWAY PROJECTS
BIDS CLOSE 9:30 A.M., SEPTEMBER 27
Helena, Montana
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:30 A.M. on September 27, 1956. The proposals will be publicly opened and read immediately thereafter.

1. **F 76(5)U2**—Grade, gravel surfacing, bituminous surface treatment and construction of small drainage structures on 4.997 miles of the Gallatin Gateway-South Road in Gallatin County, Montana and Park County, Wyoming involving about; 468,188 cu. yds. excavation; 916 cu. yds. gravel backfill; 66,040 mi. yds. overhaul; 91,914 tons crushed gravel; 37,762 gals. liquid asphalt; 37,762 gals. emulsified asphalt; 8,812 M gals. watering; 1,537 units rolling; 2,774 lin. ft. corrugated metal pipe culverts; 818 lin. ft. structural plate pipe culverts; 240 hours blading work; 130 hours scraping work; 198 cu. yds. random riprap; and other items. Project to be completed in 300 calendar days.

2. **F 164(8)**—Grade, gravel surface, bituminous surface treatment and the construction of small drainage structures on 3.546 miles of the Porter's Corner Section of the Philipsburg-Anaconda Road in Granite County involving about 164,335 cu. yds. excavation; 116 cu. yds. gravel backfill; 11,670 mi. yds. overhaul; 59,469 tons crushed gravel; 23,605 gals. liquid asphalt; 23,605 gals. emulsified asphalt; 3,638 M gals. watering; 688 units rolling; 1,128 lin. ft. reinforced pipe culverts; 72 lin. ft. reinforced concrete stockpass; 288 lin. ft. corrugated metal pipe culverts; 7,982 lbs. reinforcing steel; 43.69 cu. yds. concrete; 650 MBM Headgate lumber; and other items. Project to be completed in 130 calendar days.

3. **F 175(4)**—Grade, gravel surface, bituminous surface treatment, construction of small drainage structures and the widening of one 63.4' steel and concrete bridge on 4.157 miles of the Philipsburg-South Road in Granite County involving about 179,354 cu. yds. excavation; 88 cu. yds gravel backfill; 77,710 mi. yds. overhaul; 91,508 tons crushed gravel; 30,129 gals. liquid asphalt; 30,193 gals. emulsified asphalt; 4,500 M gals. watering; 881 units rolling 1,760 lin. ft. reinforced concrete pipe culverts; 226 lin. ft. corrugated metal pipe culverts; 13,652 lbs. reinforcing steel; 22 cu. yds. class "A" concrete; 51.30 cu. yds. class "AD" concrete; 66.17 lin. ft. concrete curb and rail; all lump sum revision of existing structure and maintain traffic and other items. Project to be completed in 180 calendar days.

4. **F 196(5)**—Grade, gravel surfacing, road mix oiling, construction of small drainage structures and construction of two 38.0' treated timber bridges on 1.050 miles of the Browning East and West Road in Glacier County involving about 72,670 cu. yds. excavation; 28,539 mi. yds. overhaul; 17,445 tons crushed gravel; 30,712 gals. liquid asphalt; 1,403 M gals. watering; 240 units rolling; 1.050 miles processing; 258 lin. ft. corrugated metal pipe culverts; lump sum remove existing structures and maintain traffic; 45.400 MBM treated timber; 1.214 MBM untreated timber; 1,445 lin. ft. treated timber piles; and other items. Project to be completed by September 15, 1957.

5. **F 213(3)**—Construction of one 1317.5' steel and concrete bridge over the Yellowstone River on the Yellowstone River Bridge-Glendive Road at Glendive in Dawson County involving about all lump sum structural steel; 225,395 lbs. reinforcing steel;

4,416.7 cu. yds. concrete; 2,638.0 lin. ft. steel bridge rail; 47,700 lbs. furnishing steel bearing piles; 864 lin. ft. driving steel bearing piles; all lump sum test piles; 56 each floor-drains; all lump sum shoring and cribs; 5,675 cu. yds. structure excavation. Project to be completed by November 30, 1958.

6. F 245(10) and F 245(11)—Construction of a structural plate pipe arch culvert on the Glendive-Sidney Road, and grade, gravel surfacing, bituminous surface treatment and the construction of small drainage structures on 0.706 miles of the Glendive-Sidney Road in Richland County involving about 64,729 cu. yds. excavation; 451 cu. yds. gravel backfill; 9,438 cu. yds. designated borrow; 2,140 mi. yds. overhaul on designated borrow; 101 mi. yds. overhaul; 3,632 tons crushed gravel; 5,933 gals. liquid asphalt; 5,933 gals. emulsified asphalt; 1,300 M gals. watering; 225 units rolling; 1,070 lin. ft. corrugated metal pipe culverts; 328 lin. ft. haul and erect State furnished structural plate pipe culvert; and other items. Project to be completed by July 31, 1957.

7. US 370(8) and S-370(10)—Grade, gravel surfacing, seal coat oiling, plant mix oiling, and the construction of small drainage structures on 0.782 miles of the North Rouse Avenue—Bozeman section of the Bozeman-Wilsall Road in Gallatin County and the gravel surfacing, seal coat oiling and plant mix oiling on 2.890 miles of the Bozeman-Wilsall Road in Gallatin County involving about 7,331 cu. yds. excavation; 8,539 tons plant mix; 44,788 tons crushed gravel; 126,903 gals. asphalt cement; 30,551 gals. liquid asphalt; 1,365 M gals. watering; 380 units rolling; 546 lin. ft. corrugated metal pipe culverts; 337.5 lin. ft. steel guard rail; 11 each adjust manholes to grade; 2,201.1 sq. ft. galvanized metal bin type retaining wall; 400 cu. yds. gravel backfill; 50 hours mechanical tamping; 105 hours blading work; 75 hours scraping work; and other items. Project to be completed by September 15, 1957.

8. S 12(8)—Construction of one 88.0' treated timber pile bridge and approaches over Thirty Mile Creek on Smith Avenue between Water Street and Park Street within the City of Harlem on the Harlem-Turner-Canadian Line Road in Blaine County involving about 530 cu. yds. excavation; 3,227 cu. yds. designated borrow; 8,867 mi. yds. overhaul on designated borrow; 48 M gal. watering; all lump sum furnish and maintain facilities for watering; 192 lin. ft. corrugated metal pipe culverts; all lump sum remove existing structure and maintain traffic; 33.064 MBM treated timber; 1.315 MBM untreated timber; 1,320 lin. ft. treated timber piles; and other items. Project to be completed by June 30, 1957.

9. S 183(1)—Grade, gravel surfacing, one 38.0' treated timber bridge over Big Otter Creek and construction of small drainage structures on 7.073 miles of the Raynesford-South Road in Judith Basin County involving about 379,059 cu. yds. excavation; 489 cu. yds. backfill; 5,358 mi. yds. overhaul; 963 cu. yds. binder; 1,926 mi. yds. overhaul on binder; 42,352 tons crushed gravel; 6,449 M gal. watering; 205 units rolling; 3,744 lin. ft. reinforced concrete pipe culverts; 372 lin. ft. structural plate pipe stockpass; 16.264 MBM treated timber; 0.607 MBM untreated timber; 505 lin. ft. treated timber piles; and other items. Project to be completed in 200 calendar days.

10. S 286(4)—Grade, gravel surfacing and construction of small drainage structures on 10.437 miles of the Glasgow-Ophiem-Canadian Line Road in Valley County involving about 521,237 cu. yds. excavation; 487 cu. yds. gravel backfill; 52,960 mi. yds. overhaul; 12,543 tons selected borrow base course uncrushed; 66,191 tons crushed gravel; 1,566 cu. yds. binder; 3,132 mi. yds. overhaul on binder; 8,593 M gals. watering; 380 units rolling; 3,618 lin. ft. corrugated metal pipe culverts; 359 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 180 calendar days.

The above listed quantities are approximate only.

All bid proposals shall be accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in his proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of bids is required.

Plans, specifications, forms of contract and bond, proposal blanks, and full instructions are on file for examination and may be obtained at the offices of the State Highway Commission in Helena, Montana. Plans and specifications for all Federal Aid Projects are also on file and may be examined in the office of the Bureau of Public Roads at Missoula.

ELEMENTARY SCHOOL
BIDS CLOSE 8 P.M., SEPTEMBER 26
Seattle, Washington
NOTICE TO CONTRACTORS

Separate sealed proposals will be received by Shoreline School District No. 412, King County, Washington, at the Shoreline School District Office, East 158th Street and 20th Avenue N.E., Seattle 55, Washington, until 8:00 P.M., September 26, 1956, for the General, Mechanical, and Electrical contracts (separate contracts), for the construction of a new Echo Lake Elementary School, and the said proposals will then and there be publicly opened and read aloud. Bids received after the time set for opening cannot be considered.

Specifications and drawings may be examined at the office of the Architects, Jones and Bindon, 715 Hoge Building, Seattle 4, Washington, at the Seattle Chapter, Associated General Contractors of America, 215 West Harrison Street, Seattle, and at the Plan Bureau, 2413 Western Avenue, Seattle, and may be obtained at the Architects' office upon deposit of $25.00 for each set of general drawings and specifications and $15.00 for each set of mechanical or electrical drawings and specifications.

The full amount of deposit for one set of documents will be refunded to actual prime contract bidders, upon return of the docu-

When You Want Bids —

Architects and public officials charged with responsibility of getting competitive bids on construction projects have found for 53 years that our **CONSTRUCTION NEWS** publications provide the most effective and economical way through which to advertise for bids.

Year after year, more projects are advertised in CONSTRUCTION NEWS BULLETIN, in PACIFIC ARCHITECT AND BUILDER, and in PACIFIC BUILDER AND ENGINEER than in any other Northwest publications.

Rates are thirty-five cents per line for the first insertion; twenty-five cents per line for subsequent insertions. Copy received up to Wednesday noon reaches our readers the following Saturday.

PACIFIC ARCHITECT AND BUILDER
3rd Saturday of Each Month

PACIFIC BUILDER & ENGINEER
First Saturday of Each Month

CONSTRUCTION NEWS BULLETIN

PACIFIC BUILDER & ENGINEER, INC., (MAin 0285) 2418 3RD AVENUE, SEATTLE 1, WASH.

ments, unmutilated and without marks or annotations, within one week after the date of the bid opening. Prime contract bidders requiring more than one set of documents and subcontract bidders desiring prints of drawings for their own use may obtain same by paying the actual cost of printing, which amount will not be refunded.

Each bid must be accompanied by a certified or bank cashier's check, or by a bid bond, each in an amount not less than 5% of the Base Bid, made payable to Shoreline School District No. 412, King County, Washington, bid bond must be furnished in the form set forth in the specifications with a State-licensed surety company as surety.

Attention of bidders is directed to State laws concerning wages, working hours, and other conditions of employment.

The Board of Directors reserves the right to reject any or all bids, and to waive informalities. No bidder may withdraw his bid after the hour set for the opening thereof, unless and until the award of contract has been delayed for a period exceeding forty-five (45) days.

By MYRON ERNST, Secretary,
Shoreline School District No. 412,
East 158th Street and 20th Ave. N.E.,
Seattle 55, Washington.

STATE HIGHWAY PROJECTS

BIDS CLOSE 9 A.M., SEPTEMBER 27 and SEPTEMBER 28

Portland, Oregon

NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Oregon State Highway Commission in the Queens Room of the Imperial Hotel in Portland, Oregon, at 9:00 a.m. on Thursday, September 27, and at 9:00 a.m. on Friday, September 28, 1956.

BIDS TO BE OPENED AT 9:00 A.M. ON THURSDAY, SEPTEMBER 27, 1956

COLUMBIA COUNTY: North Fork Scappoose Creek Bridge on the Pittsburg-Scappoose Highway, 1.3 mi. north of Scappose. FAP No. S-77(6). Construct a 100' reinforced concrete deck girder bridge over the North Fork of Scappoose Creek Requires approx. 200 cu. yds. struc. excavation; 174 cu. yds. Class "A" concrete; 44,000 lbs. metal reinforcement; and 72 lin. ft. 8" metal drain pipe.

DESCHUTES COUNTY: East Unit, Fort Rock Road-Brothers Section of the Central Oregon Highway, about 28 mi. southeast of Bend. FAP No. F-147(12). 11.97 mi grading and paving. Requires approx. 49,400 cu. yds. borrow excavation; grading on equipment rental basis; 900 lin. ft. guardrail; 26,300 cu. yds. crushed base materials; 30,600 tons asphaltic concrete mixture; 1,840 tons 85-100 asphalt; 154 tons RS-1 asphalt; 140 tons RS-2 asphalt; and 106 tons 150-200 asphalt.

DOUGLAS COUNTY: Fords Bridge Unit, Myrtle Creek-Canyonville Section of the Pacific Highway, about 6 mi. south of Myrtle Creek. Federal Interstate Project No. I-78 (33). 1.23 mi. of paving. Requires approx. 372 cu. yds. concrete in islands and curbs; 8,700 lin. ft. guardrail; 3,200 lin. ft. median barrier; 29,000 cu. yds. crushed base materials; 80 tons RC-3 asphalt; 14,000 tons asphaltic concrete mixture; 840 tons 85-100 asphalt; 32 tons RS-1 asphalt; 60 tons RS-2 asphalt; 40 tons 150-200 asphalt; 800 rods Type 2 fence; and 35 rods median fence. This project may be bid in combination with the Fords Bridge-Canyonville Grading and Paving Project in Douglas County.

DOUGLAS COUNTY: Fords Bridge-Canyonville Unit, Myrtle Creek-Canyonville Section of the Pacific Highway, north from Canyonville. Federal Interstate Project No. I-78(32). 1.79 mi. grading and paving. Requires approx. 470,000 cu. yds. excavation; 1,125 cu. yds. concrete in box culverts, curbs and islands; 80,000 lbs. metal reinforcing; 10,500 lin. ft. guardrail; 61,000 cu. yds. crushed base materails; 140 tons RC-3 asphalt; 17,100 tons asphaltic concrete mixture; 1,000 tons 85-100 asphalt; 62 tons RS-1 asphalt; 80 tons RS-2 asphalt; 130 tons 150-200 asphalt; 800 rods Type 2 fence; and 820 rods Type 3 fence. This project may be bid in combination with the Fords Bridge Paving Project in Douglas County.

DOUGLAS COUNTY: Weaver Road Structures on the relocated section of Weaver Road near Myrtle Creek. Federal Interstate Projct No. I-78(31). Construct a 228' reinf. concrete deck girder grade separation structure over the relocated Pacific Highway and a 130' reinf. concrete deck girder grade separation structure over the S. P. Railroad tracks. Requires approx. 80 cu. yds. struc. excavation; 3,920 lin. ft. treated timber piling; furnish 1,000 lin. ft. steel pile shells; drive 20 steel pile shells; 700 cu. yds. Class "A" concrete; 160,000 lbs. metal reinf.; and 180 lin. ft. 8" metal drain pipe.

GRANT COUNTY: John Day Rock Production Project on the John Day and John Day-Burns Highways, near John Day. State Project. Requires approx. 7,000 cu. yds. crushed material in stock piles.

HOOD RIVER COUNTY: Viento State Park, 7.5 mi. west of Hood River. State Project. Construct two small latrines including septic tanks, sewer lines and disposal fields.

MARION COUNTY: Salem Storage Building. State Project. Construct a 36'x288' reinf. concrete storage building on State Highway Commission property at Salem.

MULTNOMAH COUNTY: Illumination Installation, N. E. 42nd Avenue-Troutdale Section of the T. H. Banfield Expressway in Portland. State Project. Requires approx. 115 steel street light poles; 121 mercury vapor luminaires; 20,000 lin. ft. of burial cable; and 121 mast arms.

UMATILLA COUNTY: Emigrant Hill-Deadmans Pass Section of the Old Oregon Trail Highway, about 15 mi. southeast of Pendleton. Federal Interstate Project No. I-62(10). 3.06 mi. of grading. Requires approx. 1,290,000 cu. yds. excavation; 340 cu. yds. concrete in box culverts; 68,000 lbs. metal reinf.; and 2,300 rods Type 1 fence.

UMATILLA COUNTY: Umatilla River Bridge on the Hinkle-Bucks Corner Section of the Hermiston Secondary Highway. FAP No. S-86(2). Construct a 310' reinf. concrete bridge over the Umatilla River. Requires approx. 470 cu. yds. struc. excavation; 3,300 lin. ft. untreated timber piling; 630 lin. ft. treated timber piling; 757 cu. yds. Class "A" concrete; 172,000 lbs. metal reinf.; and 30 lin. ft. 8" metal drain pipe.

WHEELER COUNTY: Parish Creek Unit, Spray-Waterman Section of the Spray-Waterman County Road, about 5 mi. south of Spray. FAP No. S-175(2). 3.12 mi. of grading. Requires approx. 73,000 cu. yds. excavation.

YAMHILL COUNTY: Whiteson Section of the Pacific Highway West, about 4 mi. south of McMinnville. FAP No. F-58(2). 0.50 mi. grading and paving; also construct 275' concrete and timber bridge. Requires approx. 24,000 cu. yds. excavation; 11,200 cu. yds. crushed base materials; 12 tons RC-3 asphalt; 1,800 tons asphaltic concrete pavement; 16 tons RS-2 asphalt; 16 tons 150-200 asphalt; 4,200 lin. ft. treated timber piling; 380 cu. yds. concrete; 120,000 lbs. metal reinforcing; and 40 M-FBM treated timber.

BIDS TO BE OPENED AT 9:00 A.M. ON FRIDAY, SEPTEMBER 28, 1956

CLACKAMAS COUNTY: Zigzag River Bridge on Clackamas County Road No. 820, approx. 2 mi. from Rhododendron. County Project. Bids for this project are being received on behalf of the county. Construct a 180' reinf. concrete bridge. Requires approx. 55 cu. yds. struct. excavation; 350 cu. yds. Class "A" concrete; and 100,000 lbs. metal reinforcement.

DOUGLAS COUNTY: Missouri Bottom-Canyonville Structures on the Myrtle Creek-Canyonville Section of the relocated Pacific Highway in Douglas County. Federal Interstate Project No. I(31) and I(32). Construct twin 144' reinf. concrete overcrossings of Irwin Road; a 234' reinf. concrete undercrossing of Chadwick Lane; a 241' reinf. concrete undercrossing of Riddle Road; and twin 588' reinf. concrete and steel bridges over the South Umpqua River at Missouri Bottom. Requires approx. 1,600 cu. yds. struct. excavation; 1,470 lin. ft. steel pile shell; 3,447 cu. yds. Class "A" concrete; 762,000 lbs. metal reinf.; 967,000 lbs. structural steel; and 360 lin. ft. 8" metal drain pipe.

DOUGLAS COUNTY: Tiller Maintenance Building State Project. Construct a 32'x82' masonry block building on State Highway Commission property at Tiller.

JACKSON COUNTY: Bybee Bridge (Rogue River) Section of the Table Rock Road, about 6 mi. northwest of Central Point. FAP No. ER-32(1). 0.19 mi. of embankment repair. Requires approx. 1,080 cu. yds. of rock riprap on roadbed slopes.

JOSEPHINE COUNTY: East and West Forks Illinois River Bridge Sections of the Redwood Highway, south from Cave Junction. FAP No. F-127(6). 2.26 mi. grading and paving. Requires approx. 210,000 cu. yds. excavation; 46 cu. yds. concrete in box culverts; 5,400 lbs. metal reinf.; 1,900 lin. ft. guardrail; 670 cu. yds. sacked aggregate-cement riprap; 27,500 cu. yds. crushed base materials; 66 tons RC-3 asphalt; 8,200 tons asphaltic concrete mixture; 490 tons 85-100 asphalt; 30 tons RS-1 asphalt; 30 tons RS-2 asphalt; and 60 tons 150-200 asphalt.

MARION COUNTY: Illahee-North Jefferson Junction Section of the Pacific Highway East, about 5 mi. south of Salem. Federal Interstate Project No. I-176(12). 2.33 mi. grading and paving. Requires approx. 227,000 cu. yds. excavation; 1,100 cu. yds. concrete in curbs, islands and box culverts; 113,400 lbs. metal reinf.; 60,700 cu. yds. crushed base materials; 130 tons RC-3 asphalt; 20,500 tons asphaltic concrete mixture; 1,230 tons 85-100 asphalt; 80 tons RS-2 asphalt; 300 tons 150-200 asphalt; 125 tons RS-1 asphalt; 1,400 rods Type 2 fence; and 6,200 lin. ft. median guardrail.

MULTNOMAH COUNTY: Structure, grading and stone base on the 37th Avenue-42nd Avenue Section of the T. H. Banfield Expressway in Portland. Federal Interstate Project No. I-323(20). Construct 0.36 mi. of roadway including stone base; also construct a 125' reinf. concrete box girder extension to existing Sandy Blvd. Viaduct; and a 450-foot "on-ramp" to the Banfield Expressway. Requires approx. 2,400 cu. yds. drainage excavation; 72,000 cu. yds. general excavation; disposal of 66,000 cu. yds. excess material; 4,700 lin. ft. various sizes of sewer pipe; 15,000 cu. yds. coarse crushed material in base; 350 tons Class "B" asphaltic concrete; 2,000 cu. yds. struct. excavation; 2,550 cu. yds. Class "A" concrete; 145 cu. yds. Class "A-A" concrete; 465,000 lbs. metal reinf.; all prestressing reinforcement and prestressing required; and 1,525 lin. ft. metal rail.

UMATILLA COUNTY: DELETED.

YAMHILL COUNTY: Structure, grading and stone base on the Yamhill River (Lafayette) Bridge Section of the Lafayette-South Road in Yamhill County. FAP No. S-329(1). Construct 0.17 mi. of roadbed, including stone base, and a 378' reinf. concrete and steel girder bridge across the Yamhill River. Requires approx. 39,700 cu. yds. loose riprap; 860 cu. yds. coarse crushed material in base; 450 cu. yds. structural excavation; 1,134 lin. ft. steel pile shells; 790 cu. yds. Class "A" concrete; 150,000 lbs. metal reinf.; 145,000 lbs. struct. steel; and 780 lin. ft. metal rail.

THE MINIMUM HOURLY WAGE PAID TO LABOR EMPLOYED ON FEDERAL INTERSTATE PROJECTS SHALL BE AS SET FORTH IN THE SPECIAL PROVISIONS APPLICABLE TO THOSE RESPECTIVE PROJECTS. THE MINIMUM HOURLY WAGE PAID TO LABOR EMPLOYED ON OTHER FEDERAL-AID PROJECTS SHALL BE AS FOLLOWS: SKILLED LABOR, $2.25 PER HOUR; INTERMEDIATE LABOR, $2.00 PER HOUR; UNSKILLED LABOR, $1.75 PER HOUR.

Prequalification of bidders will be required in accordance with the provisions of ORS 279.010 to 279.024, inclusive. Full information for bidders may be obtained at the office of the Oregon State Highway Commission, State Highway Building, Salem, Oregon. Plans and specifications may be inspected at the same place and may be obtained by eligible bidders upon payment of $2.00 for each set.

Plans and specifications may also be inspected at the office of the Associated General Contractors in Portland, Seattle, Spokane, and Boise; and at the Builders Exchange Cooperative, Portland.

The right is reserved to reject any and all proposals or to accept the proposal deemed best for the State of Oregon.

CONCRETE GIRDER BRIDGES

BIDS CLOSE 10 A. M., SEPTEMBER 21

Portland, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, BUREAU OF PUBLIC ROADS, September 7, 1956. SEALED BIDS will be received at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon, mail address P. O. Box 3900, Portland, Oregon, until 10:00 o'clock A. M. on September 21, 1956, for furnishing the material and performing the work for constructing one 170-ft. and one 85-ft. Concrete Girder Bridges, Washington Forest Highway Project 13-A1, B1, D2, Unit 1, Randle-Yakima Highway, Silver Creek and Davis Creek Bridges, Gifford Pinchot National Forest, Lewis County, Washington, involving 565 Cu. Yds. Structure Excavation; 783 Cu. Yds. Concrete; 154,500 Lbs. Reinforcing Steel; and 476 Lin. Ft. Metal Hand Rail. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon. F. E. ANDREWS, Division Engineer. 5612—9-7, 8, 11

STATE HIGHWAY PROJECTS

BIDS CLOSE 10 A. M., SEPTEMBER 25

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, September 25, 1956, until 10:00 A. M., for the construction of the following improvements and will then and there be opened and publicly read:

Bids for the following projects will be opened in the Conference room on the first floor of the General Administration Building located at Eleventh and Columbia Streets on the North edge of the capitol group, instead of in the board room of the Public Service Commission where bid openings are usually held.

1. Clearing, Draining, Grading and Constructing Two Reinforced Concrete Bridges on 0.857 mile of Primary State Highway No. 1 in Thurston County, CAPITOL LAKE BRIDGE TO BOUNDARY STREET, FAP No. I-001-2(36), involving about 45 acres of Clearing, 650,500 cubic yards of Common Excavation, 75,380 units of Overhaul, 96,170 cubic yards of Excavation of Unsuitable Foundation Material, 2,846 linear feet of Concrete Pipe, 4,327 linear feet of Corrugated Metal Pipe, 2,218 cubic yards of Concrete, 392,400 pounds of Steel Reinforcing Bars, 18,200 linear feet of Treated Timber Piling and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.
2. Draining, Grading, Surfacing with Light Bituminous Surface Treatment and Constructing a Reinforced Concrete Slab Bridge on 6.028 miles of Primary State Highway No. 10 in Okanogan County, JANIS TO TONASKET, FAP No. F-029-2 (12) involving about 296,640 cubic yards of Common Excavation, 2,810 cubic yards of Solid Rock Excavation, 12,530 units of Overhaul, 57,750 tons of Selected Roadway Borrow, 37,960 tons of Crushed Stone Surfacing, Crushed Cover Stone and Crushed Screenings, 320 tons of Asphalt Cement, 878 linear feet of Precast Traffic Curb, 388 cubic yards of Concrete, 56,280 pounds of Steel Reinforcing Bars, 3,063 linear feet of Concrete Pipe, 259 linear feet of Corrugated Metal Pipe, 877 linear feet of Welded Steel Pipe, 1,346 linear feet of Beam Guard Rail, 77 Guide Posts, 1,900 cubic yards of Loose Riprap, a lump sum bid for Illuminated Terminal Nosing Assemblies and other items.
3. Draining, Grading and Surfacing with Light Bituminous Surface Treatment on 1.831 miles of Primary State Highway No. 10 in Okanogan County, RIVERSIDE VICINITY, FAP No. F-029-2(7), involving about 113,450 cubic yards of Common Excavation, 2,660 units of Overhaul, 20,115 tons of Crushed Stone Surfacing, Ballast and Crushed Cover Stone, 89 tons of Asphalt Cement, 1,470 linear feet of Concrete Pipe, 397 linear feet of Corrugated Metal Pipe and Pipe-Arch, 400 linear feet of Beam Guard Rail and other items.
4. Constructing Two Reinforced Concrete Box Girder Bridges on 0.071 mile of Primary State Highway No. 9 in Thurston County, N. P. RY. AND PERCIVAL CREEK OVERCROSSING, FAP No. F-FG-007-5(4), involving about 1,815 cubic yards of Structure Excavatiin, 2,277 cubic yards of Concrete, 1,498 linear feet of Reinforced Concrete Bridge Railing, 640,-000 pounds of Steel Reinforcing Bars, 36,000 pounds of Strurtural Steel and other items.
5. Constructing a Plate Girder Railway Bridge and Shoofly on Primary State Highway No. 1 in Thurston County, WEYERHAEUSER RAILWAY UNDERCROSSING, FAP No. IG-001-2(37), involving about 4 acres of Clearing, 16,430 cubic yards of Common Excavation, 500 cubic yards of Selected Roadway Borrow, a lump sum bid for Shoofly Trestle, 1,350 cubic yards of Structure Excavation, 610 cubic yards of Concrete, a lump sum bid for Structural Steel, 28,000 pounds of Steel Reinforcing Bars, 10.5 MBM of Treated Timber and Lumber and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.
6. Constructing a Reinforced Concrete Box Girder and Slab Bridge on 0.125 mile on Primary State Highway No. 10 in Okanogan County, OKANOGAN RIVER BRIDGE, FAP No. F-FG-029-2(10), involving about 2,000 cubic yards of Structure Excavation, 2,300 cubic yards of Concrete, 505,000 pounds of Steel Reinforcing Bars, 6,400 pounds of Structural Steel, 6,600 linear feet of Timber Piling, 560 linear feet of Concrete Piling and other items.
7. Draining, Grading, Sprfacing with Light Bituminous Surface Treatment and Paving with Type I-1 Asphaltic Concrete on 1.483 miles of Primary State Highway No. 7 in Grant County, CITIES OF EPHRATA AND SOAP LAKE, FAP No. F-031-1(5), involving about 15,535 cubic yards of Common Excavation, 2,370 tons of Sand Filler, 26,490 tons of Crushed Stone Surfacing, Ballast, Crushed Cover Stone and Mineral Aggregate, 121 tons of Asphalt Cement, 7,845 tons of Asphaltic Concrete, 3,441 linear feet of Concrete Pipe, 88 linear feet of Corrugated Metal Pipe, 8,825 linear feet of Cement Concrete Curb, 6,417 linear feet of Precast Traffic Curb and other items.
8. Draining, Grading, Surfacing with Crushed Stone and Constructing a Reinforced Concrete Girder Bridge on 0.189 mile of Kittitas County Road, TANEUM CREEK BRIDGE, FAS No. S-0563(1), involving about 4,300 cubic yards of Unclassified Excavation, 750 cubic yards Crushed Stone Surfacing, 200 cubic yards of Loose Riprap, 153 cubic yards of Concrete, 42,000 pounds of Steel Reinforcing Bars and other items.
9. Removing an obstruction from the Columbia River ship channel on Primary State Highway No. 12 in Wahkiakum County, NASSA POINT VICINITY, a State Project, involving about 20,000 tons of Dredge Excavation.
10. Removing existing Duwamish River Bridge No. 1-K/3 on Secondary State Highway No. 1-K in King County, FIRST AVENUE SOUTH BRIDGE REMOVAL, a State Project, involving a lump sum bid for Removing Existing Steel Movable Span Bridge and Timber Approaches.
11. Jacking and Leveling Existing Slab Bridge Deck on Primary State Highway No. 1 in Cowlitz County, OWL CREEK BRIDGE No. 1/712, a State Project, involving a lump sum bid for Leveling Existing Bridge, 30 cubic yards of Crushed Stone Surfacing, 150 tons of Type I-1 Asphaltic Concrete and other items.
12. Constructing a Reinforced Concrete Slab Half Bridge on 0.014 mile of Primary State Highway No. 9 in Jefferson County EAGLEMOUNT HALF BRIDGE, a State Project, involving about 100 cubic yards of Structure Excavation, 57 cubic yards of Concrete, 73 linear feet of Beam Guard Rail, 13,750 pounds of Steel Reinforcing Bars, a lump sum bid for Loading and Hauling Steel Piling and other items.

Federal funds have been allocated for items Nos. 1 to 8 inclusive.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalificaion of bidders is required. Maps, plans and specifications may be obtained from this office upon writtten request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informationl copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

TURBINE, GOVERNOR, INLET PIPE

BIDS CLOSE OCTOBER 25

Denver, Colorado

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4760) will be received at Denver, Colorado, until October 25, 1956, for furnishing one 23,500-horsepower, 600-rpm, vertical-shaft, multiple-jet, single-runner, impulse-type hydraulic turbine; one turbine governor; and one guard valve and inlet pipe for Green Springs Power Plant, Talent Division, Rogue River Basin Project, Oregon. Delivery is desired within 450 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner. 5606—9-15

PREFLIGHT FACILITIES MODERNIZATION

BIDS CLOSE 2 P. M., SEPTEMBER 27

Renton, Washington

NOTICE TO CONTRACTORS

Bids are hereby invited for installation and construction work for Phase II Preflight Modernization at Renton Field, Renton, Washington.

The work consists principally of mechanical and electrical utilities, including water, aircraft fuel, sewer, drainage, and electrical utilities, as well as earthwork, concrete and asphaltic paving, building and pavement demolition and new building construction work.

Bid, performance and payment bonds will be required. Further, unless the bidder has performed work for Boeing within the past two years, a duly certified current, (or latest available), financial statement will also be required. If the bidder has done no work for Boeing within the past four years a statement of experience will also be required in addition to the other documents specified above.

Bid documents are available for inspection at the Associated General Contractors of America, 215 West Harrison, Seattle, and 452 St. Helens Street, Tacoma; as well as at the Plan Bureau, 2413 Western Avenue, Seattle; and also at the issuing office listed below.

Request for copies of bid documents, by firms proposing to enter a prime bid or a major subcontract bid, should be directed to the office of Bouillon and Griffith, Professional Engineers, 1411 Fourth Avenue Building, Seattle, Washington. A $75 deposit will be required for each set of bid documents.

Bids will be received by Mr. C. L. Bisbee, Transport Division, Box 707, Renton, Washington, until 2:00 P. M., September 27, 1956. For site inspection, contact the Construction Engineer, Boeing Airplane Co., telephone Olive 3414, Extension 1807.

Bids will be opened privately. Each bid shall be deemed a firm offer for 30 days

after the date bids are opened and thereafter until withdrawn by a written notice received by Boeing. Boeing reserves the right to ward the contract to whomever it chooses, and may elect to reject any and all bids.

BOEING AIRPLANE COMPANY.

STEAM HEATING PLANT ALTERATIONS
BIDS CLOSE 3 P.M., P.S.T., SEPTEMBER 18
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed proposals will be received by the Director, Department of General Administration, General Administration Building, Room 218, Olympia, Washington, until 3:00 P.M., P.S.T., Tuesday, September 18, 1956, for Additions and Alterations to the Steam Heating Plants at Eastern State Hospital and at Lakeland Village, Medical Lake, Washington.

Drawings and specifications may be obtained from the office of H. Jack Reeves, Professional Engineer, Symons Building, Spokane, Washington.

The drawings, specifications and forms of contract documents, may be examined at the office of the Director, Department of General Administration, General Administration Building, Olympia, Washington, and at the office of H. Jack Reeves, Professional Engineer, Symons Building, Spokane, Washington.

A deposit of Twenty-Five Dollars ($25.00) per set for plans and specifications will be required from each bidder. This deposit will be returned to him upon the return of the drawings and specifications, in good condition, to the Engineer's office. The deposit check should be made payable to H. Jack Reeves.

The Director, Department of General Administration, reserves the right to reject any and all proposals and to waive informalities.

H. D. VAN EATON, Director
Department of General Administration

BRIDGES, PAVING, ILLUMINATION SYSTEMS
BIDS CLOSE 10 A.M., OCTOBER 9
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, October 9, 1956, until 10:00 A.M., for the construction of the following improvement and will then and there be opened and publicly read:

1. Clearing, Draining, Grading, Surfacing, Constructing a Cement Treated Base, Paving with Type I-1 Asphaltic Concrete, Relocating Government Installations, Installing Two Illumination Systems and Constructing Three Reinforced Concrete Rigid Frame Slab Bridges and a Steel Plate Girder Railway Bridge on 3.523 miles of Primary State Highway No. 1 in Pierce County, NISQUALLY TO NORTH FORT LEWIS, FAP No. IN-I-ING-001-3(14) Unit 2, involving about 86 acres of Clearing, 746,250 cubic yards of Common Excavation and Borrow, 43,650 cubic yards of Excavation of Unsuitable Material, 237,000 units of Overhaul, 52,500 tons of Gravel Surfacing, 24,850 tons of Ballast and Crushed Stone Surfacing, 404 tons of Asphalt Cement, 2,250 cubic yards of Crushed Cover Stone and Mineral Aggregate, 38,050 tons of Asphaltic Concrete, 7,170 barrels of Portland Cement, 46,100 tons of CTB Aggregate, 3,800 square yards of Cement Concrete Pavement, 9,547 linear feet of Asphaltic Shoulder Curb, 2,630 linear feet of Cement Concrete Gutter, 5,514 linear feet of Cement Concrete Curb and Gutter, 788 linear feet of Cement Concrete Curb, 6,209 linear feet of Concrete Pipe, 2,258 linear feet of Corrugated Metal Pipe, 3,979 linear feet of Sewer Pipe, 1,938 linear feet of Water Pipe, 2,578 linear feet of Beam Guard Rail, 154 Guide Posts, 1,700 square yards of Cement Concrete Sidewalk, 205 square yards of Asphaltic Concrete Sidewalk, 726 rods of Barbed Wire Fence, 8,636 linear feet of Chain Link Fence, 2 lump sum bids for Installation of Illumination Systems, a lump sum bid for Removing and Relocating Government Buildings, 2,108 cubic yards of Concrete, 307,220 pounds of Steel Reinforcing Bars, 642 linear feet of Aluminum Bridge Railing, a lump sum bid for Structural Steel and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.

Federal funds have been allocated for item No. 1.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalifications of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

GRADING, FLOOD REPAIR
BIDS CLOSE 10 A.M., SEPTEMBER 20
Portland, Oregon
NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, BUREAU OF PUBLIC ROADS, September 6, 1956. SEALED BIDS will be received at the office of the Bureau of Public Roads 753 Morgan Building, Portland, Oregon, mail address P.O. Box 3900, Portland, Oregon, until 10:00 o'clock A.M. on September 20, 1956, for furnishing the material and performing the work for constructing 7.887 Miles Grading and 9.756 Miles Flood Repair, Oregon Timber Access Road Project BLM 83-A1,B, Galice Creek Road, Bureau of Land Management-Medford District, Josephine County, Oregon, involving 78 Acres Clearing; 53 Acres Grubbing; 519,250 Cu. Yds. Unclassified Excavation; 348,000 Sta. Yds. Overhaul; 4,610 Lin. Ft. Culvert Pipe, and other small items of work. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon. F. E. ANDREWS, Division Engineer.
5608—9-8

EARTHWORK, STRUCTURES
BIDS CLOSE OCTOBER 9
Ephrata, Washington
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4758) will be received at Ephrata, Washington, until October 9, 1956, for furnishing labor and materials for Earthwork and Structures for Block 79 Laterals and Wasteways, West Canal Laterals, Columbia Basin Project, Washington. Location near Quincy, Washington. Principal items are 325,000 cu. yds. excavation; 550 cu. yds. concrete in structures; 15,900 lin. ft. concrete pipe, 15- to 54-inch; 155 metal slide gates; and other work. To be completed by March 1, 1958. For particulars, address Bureau of Reclamation, P.O. Box 368, Ephrata, Washington; or Building 53, Denver Federal Center Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5607—9-8

STEEL PIPE
BIDS CLOSE OCTOBER 9
Denver, Colorado
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4753) will be received at Denver, Colorado, until October 9, 1956, for furnishing one 51-inch steel outlet pipe; one 48-inch steel intake pipe; and other steel pipe, sizes 3-inch to 14-inch inclusive, for Casitas Dam, Ventura River Project, California. Delivery is desired within 360 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5602—9-8

CENTRIFUGAL PUMP
BIDS CLOSE OCTOBER 2
Denver, Colorado
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4755) will be received at Denver, Colorado, until October 2, 1956, for furnishing one vertical-shaft, double volute, centrifugal pump with regulating valve and connection piece, having an initial capacity of 75 cfs under 92 foot head, at a speed of 400 rpm, suitable for ultimate capacity of 100 cfs by replacing the impeller, for "C" Line Canal Pumping Plant Extension, Boise Project, Idaho. Delivery is desired within 200 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5603—9-8

BRIDGE SUPERSTRUCTURE, ROAD RELOCATION
BIDS CLOSE OCTOBER 2
Weaverville, California
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4751) will be received at Weaverville, California, until October 2 ,1956, for furnishing labor and materials for Trinity River Bridge Superstructure and County Road Relocation, Station 5#55 to Station 8#50 for Trinity Dam, Central Valley Project, California. Location near Lewiston, California, in Trinity County. Principal items are 235,000 lbs. furnishing and erecting structural steel; 290 cu. yds. concrete in bridge slab; and other work. Completion time 330 days. For particulars, address Bureau of Reclamation, Weaverville, California; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5593—8-25

DRAIN EXTENSIONS
BIDS CLOSE 10 A.M., P.S.T., SEPT. 18
Ephrata, Washington
NOTICE TO CONTRACTORS

UNITED STATES DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids, in single (Specifications No. 117C-389) will be received at the office of the Project Manager, Bureau of Reclamation, Project Office Building, Division and "C" Streets N.W., Ephrata, Washington, until 10:00 a.m., Pacific Standard Time, September 18, 1956, and then publicly opened for furnishing labor and materials and performing all work for construction of Deep Drain Extension Block 49. This work will include earthwork for approximately 2.6 miles of open drains and for approximately 0.6 mile of deepening existing wasteways; bottom width of sections vary from 2 to 4 feet; earthwork for and construction of structures along wasteways and drains, including road crossings and control drop; earthwork for and modification of an existing concrete drop structure; riprap and gravel bedding for cascade drop and gravel protection at the inlet and outlet ends of structures. Time allowed for completion will be 150 calendar days. For particulars address the Bureau of Reclamation, P. R. Nalder, Project Manager, Box 368, Ephrata, Washington.

ANOTHER EXAMPLE OF CARCO "one stop" STEEL SERVICE

FISH PASSAGE FACILITIES TO COST $5,000,000 AT PORTLAND GENERAL ELECTRIC'S PELTON PROJECT

In designing and developing the Pelton hydroelectric project on the Deschutes river near Madras, Oregon, the Portland General Electric Company has gone to unusual lengths to preserve commercial and sports fishing for present and future generations.

While the project is being built and until the permanent fish passage facilities are erected, a temporary fish elevator has just been completed. Upstream migrants enter a brail which is hoisted or elevated for dumping into a hopper which, in turn, is lifted and moved by a traveling crane for emptying into a transportation truck.

Eventually, about $5,000,000 of the $25,000,000 project cost will be spent on the fish elevator, the re-regulating dam, the fish ladder and other facilities to guide upstream and downstream salmon and steelhead migrants past the dam.

Pacific Car fabricated 30 tons of structural steel for the Pelton project's temporary fish elevator.

Let Carco help you with your structural steel problems. Pacific Car offers not only the largest fabricating facilities in the Northwest but also a "one-stop" steel service. This means money-saving ideas and suggestions, prompt engineering detail and estimates, fabrication and erection. Remember, no job is too large for Pacific Car's equipment and technical competence, nor too small to receive our interested attention.

ONLY
PUMICE
(expanded by nature)
IS SO
FIRE
RESISTANT

Pumice is the *only* structural lightweight aggregate from which building blocks of standard wall thickness can be manufactured to meet all these rigid requirements: (1) Satisfy **ASTM** specifications for class "B" block, (2) Satisfy **FHA** requirements for "U" Factor of 0.25, (3) Satisfy **Underwriters Laboratories, Inc.** specifications for a *4-hour* fire wall block — and, at the same time, possesses the other desirable qualities of lightweight aggregates.

Natural expanded Pumice cuts construction costs, too. Free, complete technical data gladly sent upon request.

A plea for design: *our very best*

A digest of an address presented by Robert Billsbrough Price at the Honor Awards banquet of the Oregon chapter, AIA, in Portland

DURING the past few years I have been very fortunate to be a guest and also to play host to a number of my colleagues, both in cities around the country and in my own city of Tacoma.

The most fascinating part of these meetings has been the exchange of ideas and to hear the various practitioners express their philosophy of architecture. However, more times than I care to count the discussion very quickly regresses to a discussion of details, client problems or how much of a financial loss the last project entailed. It is stimulating when the big approach is given: the problem (what the architect was attempting to accomplish) and finally his solution.

This facet of our complex work, I believe, is the very foundation of our professional existence. From the start of our scholastic training, all subjects are subordinate to the concept that the ability to create order, function and beauty in the fields of products, industry, building and planning is our biggest contribution to those we serve.

To realize a peak of design perfection is not a simple job, but rather one of a united and determined effort on the part of all connected with the project to give their very best.

It is my contention that one can not precisely and carefully isolate any one phase of the problem, such as design, mechanical, electrical, acoustical, landscape, sculpture and painting, from the others. Each draws strength and meaning from its relationship to the others. Each must be examined in its relationship to the others and to the whole.

To realize the very best from those participating within and without of the office, there must be a feeling of teamwork. Each participant must be made to feel that he is a real and vital part of those responsible. Any man entrusted with a phase of the work is worth listening to and given a chance to express himself. There should be in every office an atmosphere that is conducive to a free exchange of ideas.

When I hear the expression, "We are out of the design stage and are now on work drawings," it makes me boil. There is design in all phases of the job, down to the very problem of sheet composition and the cover layout for the specs. This feeling for perfection, this awareness for order and beauty, must be paramount in the minds of all participating.

There must be a leader but he should be so instilled with a desire to do his very best that it becomes contagious to all working with him.

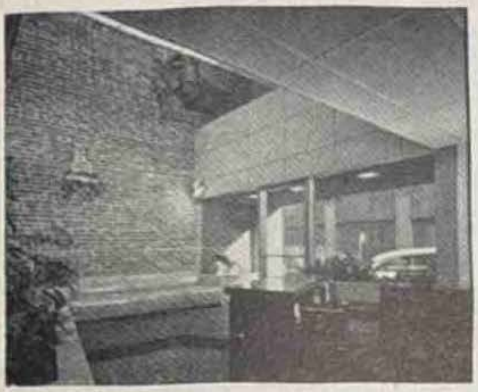
At a recent lecture dealing with the subject of better acquainting the public with an architect's services, care was taken to call attention to complete plans, specifications, competitive bidding, supervision, etc.—but not one word of design, no mention of that attribute that takes the ordinary and makes something fine.

Every job should have your very best. And each job as it is approached should be with the mind that this will be our very best. I know what you are thinking: we can't because of program, budget or the client. These are not unsurmountable problems. If the program is unrealistic make it real; it's part of your work! From the program the breath of life is given to a piece of archtecture.

The budget—a very real problem but it can be solved if the architect approaches it in an understanding way with the client. A limited budget never forced an architect to use bad proportions or to be out of scale or do a poor parti, etc. Often a limited budget has stimulated the imagination and ingenuity of the designer to the point where a wonderful solution has been the result.

The client—I will grant you the client and his desires and attitudes has much to do with the success of any project. However, too often do we hear, "Oh, the client wouldn't let us do a good job." No client ever forced us to do a bad job. Far too often the architect will hide behind this type of talk as an excuse for prostituting the greatest contribution he can make.

If all these problems become too great, don't do the job. I know again you will say we have an obligation and a service to perform. However, your first obligation should be to those truths and ideals to which at one stage of our training we all dedicated ourselves.



Every job that is executed in a poor or mediocre manner lowers the standard of the entire profession. If every job is treated as the most important commission in the office and given our very best, the results are bound to be good. And every job that is brilliantly conceived and executed adds stature to the architect as a group and to each and every member of the architectural profession.

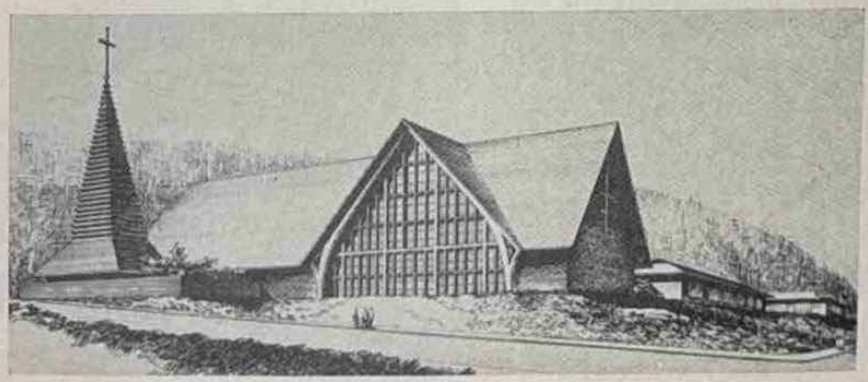
UNIVERSITY OF WASHINGTON TEACHING HOSPITAL in Seattle is shown at extreme left as it will ultimately look (except left-hand wing will have one less story) when added to Health Sciences Building. Contract awarded in May for 300-bed project provides contractor right to revert to 140-bed unit within 12-month period if sufficient funds are not available. Plans have been prepared by Naramore, Bain, Brady & Johanson, McClelland & Jones, associated architects.

PERSPECTIVES

by Pacific architects



PERFORATED ALUMINUM SCREEN will envelope headquarters and research center for Adolph's, Ltd., in Burbank, Calif., enclosing landscaped areas and assuring privacy of all offices, yet allowing full use of natural light. Slated for completion early in 1957, block-long building will be constructed entirely of glass and steel. Design by Raphael S. Soriano, AIA, calls for flexibility of office arrangements since inside walls are non-supporting. Floors will be radiant heated.

HONOLULU'S FIRST full-scale suburban shopping center will become a reality when $3 million project is completed in fall of 1957. Liberty House Department Store and 35 other diversified tenancies covering 150,000 sq. ft. will be located in one-story, light steel building cluster with generous courtyards. Victor Gruen & Associates, who designed the original Liberty House store, are architects for new center.

FIRST METHODIST CHURCH in Portland is constructing sanctuary seating 800, two Sunday school buildings and administrative unit as first step in overall project consisting of series of structures grouped around private courtyards. Church will have brick walls, wood laminated arches, stained glass window facing east and clear glass window facing court. Other buildings will be of Douglas fir. Plans have been prepared by Stewart & Richardson.

Building News - Trends - Views

ARCHITECTS WILL TAKE A LONG LOOK at the role they play in California's growth and progress during their annual state convention October 10-14 at Yosemite National Park.

In his keynote address on Thursday, October 11, Dr. Stephen C. Pepper, chairman of the department of philosophy at the University of California, will speak on architecture as it relates to the world. He also will participate in the principal convention panel on the following day, which will include both architect and lay speakers.

Committees of the California Council of Architects, sponsoring organization, will hold open seminars on current developments in three types of buildings—homes, schools and hospitals. Two other committee seminars will deal with the architect's relations with the public and conduct of his office practice.

Other program highlights outlined by chairman William Corlett of San Francisco: the California-Nevada-Hawaii regional conference, AIA, led by director Donald Beach Kirby of San Francisco; business meeting of the State Board of Architectural Examiners; and a full schedule of social events starting with a reception Wednesday evening (registration day).

The Old Yosemite Lodge, directly across from convention headquarters in the new lodge buildings, will be occupied by the building products exhibition, limited this year to 55 because of space accomodations.

THE PARADE OF BIG BUSINESS MERGERS is led this month by Owens-Illinois Glass Co. and National Container Corp., whose directors have given the green light to the proposed consolidation.

SHORTAGE OF MORTGAGE MONEY is critical, says NAHB president Joseph B. Haverstick, who offers this advice to the 39,000 members: 1) Do not start construction or advance very far in project planning without written financing commitments for your long-term mortgage needs. 2) Keep production closely related to your sales volume. This is no time to risk either unsold or unfinished inventories. 3) If using warehousing, don't depend on extensions of warehousing agreements—they not be forthcoming. 4) Don't assume that the tight money market is temporary—because it may well get tighter. 5) If your profit margin has been squeezed down to the vanishing point (as many have), cut back your production instead of risking a loss from which you may never recover.

"Builder after builder is going out of business, converting to land development work, going into custom work or building a smaller number of conventionally financed expensive homes," Haverstick declares. "This is certainly not the way to house the great masses of our American people."

HOUSING HAS BEEN MAKING NEWS in other quarters too. Apartment house owners from across the nation who met for their 15th annual convention in Portland late last month were encouraged to cooperate in local programs to modernize and rehabilitate the "central cities" but to oppose "any form of public housing" . . . The counsel for the House subcommittee on housing goes to Hawaii this month to survey military and civilian housing needs on the islands. . . . Seattle and Los Angeles are among nine metropolitan areas for which data will be provided in the 1956 National Housing Inventory to be conducted by the Bureau of the Census beginning in December.

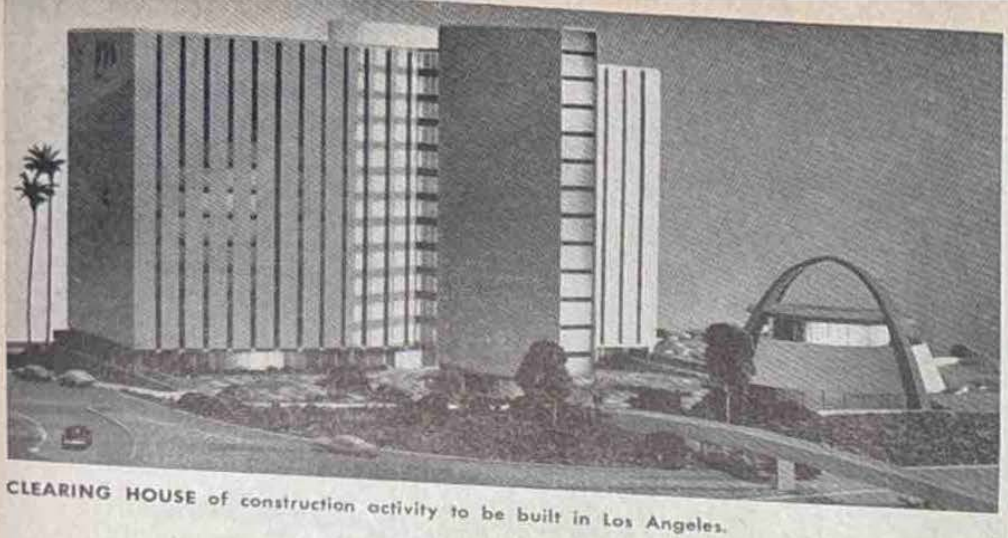
THE LOS ANGELES METROPOLITAN AREA is the third-ranking industrial center in the U.S. The Census of Manufacturers reports a 149.3% industrial increase from 1947 to 1954 in the area, forging ahead of Detroit and Philadelphia.

THE FRANK LLOYD WRIGHT ENDOWMENT FUND, a non-profit organization with offices in Chicago, will honor the architect of the proposed "cloudscraper," mile-high building to be erected on the shores of Lake Michigan near the Adler Planetarium, at a sponsored dinner in the Hotel Sherman October 17. Along with the food and an address by Wright, the guests will view an exhibit of writings, drawings and models covering his most important work during the past 65 years.

U. S. LUMBER PRODUCTION is holding steady at around 37 billion board feet annually, more than a third of the world's output.

THE TERRITORY OF ALASKA for the first time in its history is now empowered to bond itself up to the $20 million mark for public improvements. The bonding authority includes construction, alteration, equipping or acquiring all types of public buildings—schools, hospitals, colleges, offices, prisons—and other types of structures. It also provides for roads, water and sewer systems and similar public facilities.

NORTHWEST: ACCENTUATE THE REGIONAL



Winding up a most successful four-day conference in Tacoma September 9, the Northwest Regional Council, AIA, got a Sunday morning eye opener when delegates slapped the national institute on the wrist with a resolution which had almost unanimous approval. (PA&B for October will carry a complete report of the conference.) The original resolution, which would have proposed elimination of national conventions, was amended to put greater emphasis on regional conferences, including financial assistance, and to de-emphasize national meetings.

The delegates also gave full support to the architect-in-training program; and although no formal action was taken, they gave considerable discussion to the role of the AIA's public relations program. Nelson J. Morrison of the Southwest Washington host chapter was named as third member to the regional judiciary committee, with LaMonte J. Shorett of Washington State chapter as alternate.

DEAN OF TACOMA ARCHITECTS DIES

George Gove, FAIA, a leader in Tacoma architectural circles for the past half century, died August 31 at the age of 87. He was the last surviving member of the firm of Heath, Gove & Bell, which designed such projects as the Central School, Lincoln High School, First Baptist Church, Sixth Avenue Baptist Church, Central Lutheran Church and the Puget Sound Bank Building, all in Tacoma, as well as the Masonic Home in Zenith and the Northern Hospital in Sedro Woolley.

A native of Rochester, Minn., Mr. Gove came to Tacoma in 1908 following completion of architectural studies in Paris. He was a founder of the Tacoma Society of Architects nearly 40 years ago, a member of the Washington State chapter, AIA, since 1914 and elected to fellowship in the national institute in 1949. He served on the Washintgon Board of Examiners for Architecture for many years and helped to establish the Boys Ranch Home near Winlock.

CLEARING HOUSE of construction activity to be built in Los Angeles.

Los Angeles to get construction center

Ground was to have been broken this month for the $5 million, height-limit Construction Industry Center at the edge of Los Angeles' freeway network.

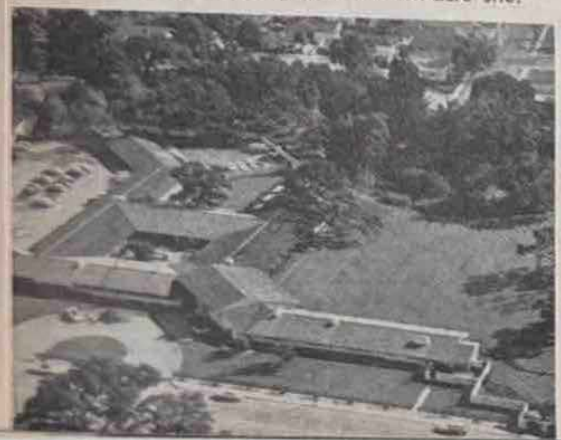
Sponsored by the 2,000 members of the Building Contractors Association of California, the center will draw together all segments of the industry into one giant headquarters when it is completed in the fall of 1957. It will include a 150,000-sq. ft., 13-floor office building, 13-floor elliptical exhibits tower, graphic arts center and tri-level parking facilities.

The center will house sales and administrative offices of product manufacturers, financial organizations, subdividers, architects, trade and professional associations. BCA president Ernani Bernardi says its completion will bring "realization of a dream we've always had for improving everybody's business with one clearing house of data and activity."

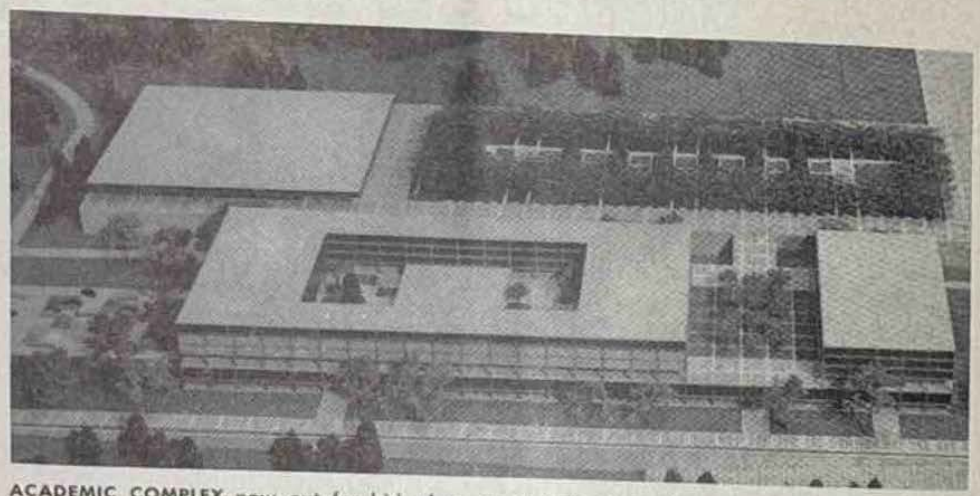
As designed by John C. Lindsay, AIA, the center plans call for dozens of features tailored to meet the needs of the construction industry, among them an expandable auditorium for sales and special events meetings. There will be facilities for closed circuit TV and the showing of sound motion pictures. Water, gas, electric and sewer outlets built in on the stage will facilitate live demonstrations for shows open to the public.

Included in the center will be a bank and a restaurant which will cater the monthly trade association meetings held elsewhere in the building. The roof garden will house the Greater Los Angeles Construction Club.

Office building construction will feature 10-ft. wall sections alternating with 36-in. glass panels, both running the full height of the structure and providing plenty of wall space for desk placement as well as natural lighting for each worker. Ceilings throughout are actually to be huge light panels with individual rheostats for increasing or diminishing light in any area.



The permanent Tower of Exhibits—the core of which is to be the first all-glass elevator in America — will connect with the office building at each of the 13 floors by glass enclosed walkways and will provide a single dramatic showcase for the entire range of building products.



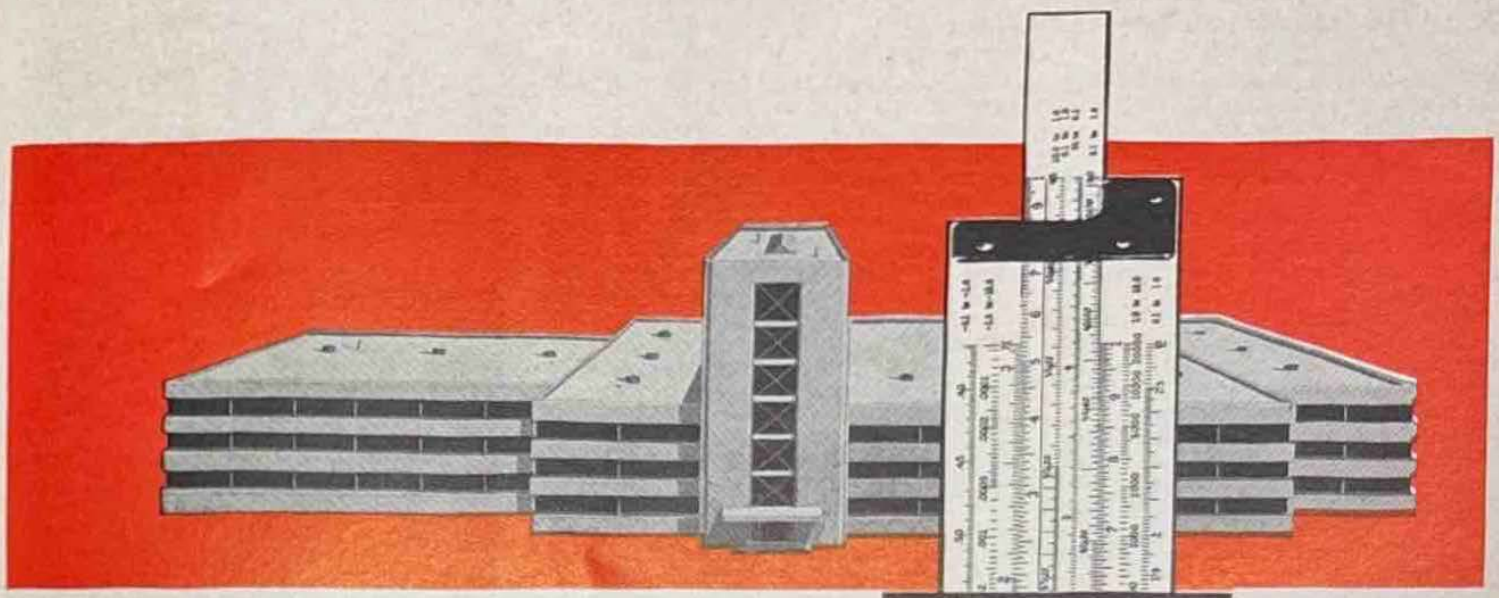
Landscaping award presented to Sunset headquarters

Built like a home but 25 times larger, the office headquarters building of Sunset magazine at Menlo Park, Calif., has been named only western winner in the third annual national "Plant America" competition for industrial landscaping, conducted by the American Association of Nurserymen. Thomas Church was landscape architect for the project, designed by Cliff May.

The ranch style structure is on a seven-acre site dotted with gardens and lawns. A 100-year-old olive tree grows beside a pond in the patio.

SUNSET HEADQUARTERS on seven-acre site.

ACADEMIC COMPLEX now out for bids does not include dining hall at upper left.



Air Force Academy to let first construction contract

With plans of all buildings, except the controversial chapel, now approved by Air Force Secretary Donald A. Quarles and his consultants, the Air Force Academy was scheduled to open bids this month on the first structure—the academic building.

Many details are yet to be worked out but the overall design of the academy near Colorado Springs, Colo., whose cost may hit $155 million, has been accepted.

Exterior wall enclosures of the academic building include these quantities: glass and aluminum, 118,000 sq. ft.; marble and aluminum, 38,000 sq. ft.; masonry and stucco, 25,000 sq. ft. Revised plans by Skidmore, Owings & Merrill, architects-engineers, have reduced the use of glass in exterior walls of all buildings.

The first contract calls for furnishing all materials except foundation caissons and structural steel.

THE PROOF OF THE ROOF

KAISER
STRUCTURAL GYPSUM
ROOF DECK

The Kaiser structural gypsum roof system is adaptable to curved or sloped, as well as to flat roofs. This offers maximum flexibility of design to the architect and engineer. The "plastic" nature of the system minimizes structural problems occurring at skylights, curbs, and other breaks in the roof plan.

Free flowing poured gypsum concrete sets rapidly into a light, strong, fire resistant roof. The undersurface of Kaiser Gypsum form board makes a clean, beautifully finished ceiling which requires no further treatment.

Kaiser Structural Gypsum Roof Deck system is particularly adaptable for use on commercial, industrial and institutional jobs. *For additional information and A.I.A. folder, write Kaiser Gypsum Company, Inc., 1924 Broadway, Oakland 12, California.*

Two experimental houses for California

Eichler Homes X-100 is steel showcase

The Eichler Homes X-100 experimental house using light structural steel, designed by architects A. Quincy Jones and Frederick E. Emmons, is scheduled for public viewing this month.

Built in northern California at San Mateo Highlands, the all-steel Eichler home will not be offered as a production model. Instead it is being exhibited as a showcase of new ideas and new building materials as well as a preview of planning concepts that may be expected in merchant-built homes of a few years hence.

President Joseph L. Eichler, whose firm has built nearly 4,000 houses since 1946, has been a pioneer in contemporary design as applied to tract housing. His new X-100 is planned around an all exposed all-steel frame. No wall carries lateral or vertical loads and the 2,226 sq. ft. of enclosed living space are planned for maximum living.

All plumbing for the kitchen, laundry and bathrooms are contained in one central core and areas have been designed to flow into each other with complete integration of indoor and outdoor.

The house has only one hallway, between the bedrooms and the baths, and the entire space is devoted to living area, with three bedrooms, two baths, an all-purpose family room, living area, dining and kitchen related space and two special informal rooms.

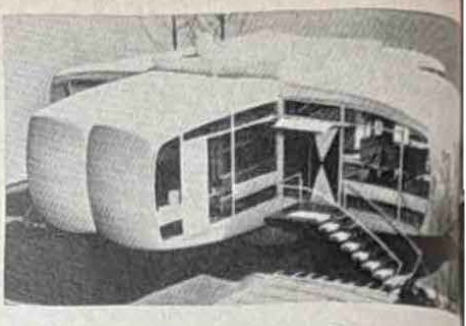
In addition, there is an enclosed workshop of 84 sq. ft. adjacent to the carport and a large playyard for children just outside the bedroom wing. The covered carport serves as a second play area for children.

The exterior walls consist of three materials: special panels of high density overlaid plywood; panels of plastic with a honeycomb core; and steel framed sliding glass doors which form the skin of the house.

The plastic panels are used in areas where it is desirable for light to filter into the house but where privacy and insulation are also required.

The high density overlaid plywood panels, developed originally for use as pouring forms for concrete jobs, are 1-in. thick, as are the plastic panels. Sliding glass doors are used throughout with no other sash.

Exposed steel decking is used for interior ceilings; walls which serve only as boundaries for the spaces, rather than as structural units, may be altered according to changing family requirements.



The latest built-in appliances for kitchen and laundry include new models in refrigeration, home freezers, wall ovens and cooking units which are an integral part of the dining table design.

Other members of the team constructing the new Eichler home include Douglas Baylis, landscape architect; Matt Kahn, artist; Knorr Interior Planners, interior designers; and Gump's, accessories.

ALL-STEEL HOUSE opens for public showing this month at San Mateo Highlands.

MONSANTO HOUSE set for Disneyland.

'House of Tomorrow'

Monsanto's "House of Tomorrow" will be built in Disneyland at Anaheim, Calif., with construction slated to start late this year.

Scheduled for completion early in 1957, the experimental house will demonstrate and test the use of plastics in home construction, the first test type model of its kind.

The novel design was created by architect Marvin Goody of Boston under the direction of Richard W. Hamilton, who heads a plastic research project sponsored by Monsanto at Massachusetts Institute of Technology.

It is based on a U-shaped molded unit, 8x16 ft., which forms part of a room's ceiling, wall and floor. In the simplest plan, eight molded units or modules are hung in pairs from a 16-ft.-square utility core to form four rooms, each 16x16 ft. The core contains kitchen, laundry and heating facilities and baths.

Several combinations of the components, including twin cores, make possible a variety of floor plans and great flexibility, comments R. C. Evans, director of marketing for Monsanto's plastics division. Rooms may be added or removed easily and economically to conform with the family's changing space needs.

The design, Evans says, is intended primarily to prove-out new architectural and engineering concepts utilizing the inherent properties of plastics and thus stimulate the use of plastics in achieving more satisfying ways of living five or ten years from now.

The design also will incorporate advanced methods of heating, ventilating, lighting, food preparations and preservation and plumbing. The use of movable and transparent walls and partitions will make the house suitable for the more leisurely indoor-outdoor living foreseen by economists and sociologists.

Evans emphasizes that while the "House of Tomorrow" lends itself to factory production, duplicates of it may not be available commercially, although many of its components or modifications may be. He adds that it was impossible now to estimate the cost of such a house or to say definitely how many or which plastics will be used in its construction.

Letters...

Civic Auditorium Competition

LOS ANGELES

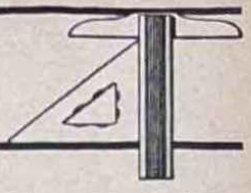
Los Angeles, which has established itself as a leader in so many industries, has never been known as a center of architectural beauty. In fact, our city is often criticized for the heterogeneous collection of buildings known as our Civic Center.

As we approach the realization of the long-awaited Civic Auditorium, it seems inconceivable that we do not take advantage of a rare opportunity to establish ourselves also as leaders in architecture and city planning.

When the UN Building was under consideration, it was opened to an international competition, with Le Corbusier — one of the founders of modern architecture — participating and ultimately acting as consultant to the New York firm that received the assignment. This focused world-wide attention on both the building and the city of New York and the civic fathers are still receiving acclaim for having executed the UN headquarters in that fashion.

There is approximately $50 million at stake and the only proof that the money will be spent wisely and to the satisfaction of Los Angeles citizens lies in selecting the proper architect for the job. It is too great a risk to just be decided by a person or by a committee, which stands to be criticized from all angles if the completed auditorium is not architecturally acceptable. If, however, we poll, through a competition, leading architects of the country and the world, then the chances that the auditorium will be successful are greatly increased. The expenses of an architectural contest for preliminary sketches are negligible compared with the project.

We should not jeopardize this opportunity to make an important step forward in the progress of our city.



The convention of the American Institute of Architects held in Los Angeles this year adopted the resolution to suggest to federal, state or municipal public agencies that they consider the possibility of using competitions in selecting architects whenever feasible.

The best architectural talents in the country and the world should be invited. The auditorium project must be treated carefully because if badly done, it will draw more fire than our city needs at this point.

GEORGE DE MASIREVICH, AIA

T-square talk

about architects • planners • engineers

PLANE TRAGEDY: A body found at the mouth of the Eel River near Eureka, Calif., late last month was identified as that of Harold Farquar, 48, of Pleasant Hill, who only recently had joined a San Francisco architectural-engineering firm as educational consultant.

Farquar and his employer, Ernest Frederick Winkler, and a fellow employee, Clarence Fong of Berkeley, have been the objects of an intensive search since their light plane vanished on a flight from Eureka to San Rafael. Winkler's briefcase and a landing light and bucket seat apparently from their plane were washed up on beaches and found by Coast Guardsmen, who report that Winkler and Fong are assumed to have perished at sea.

DIED: Ralph Wycoff, president of the Central Coast Counties chapter, AIA, died in his sleep at the age of 73 at his San Jose home August 17. Wycoff, a native of Watsonville, practiced architecture throughout northern California before he moved to San Jose 34 years ago. He designed the San Jose post office building and several structures on the San Jose State College campus.

Fred F. Willson, AIA, of Bozeman, Mont., died August 13 at the age of 79. He was credited with designing almost all of the buildings in Yellowstone National Park except for this year's construction. He was one of the first students at Montana State College, which he attended for three years before being graduated from Columbia University in 1902.

J. Leigh McKenzie, 41, Portland architect who had started his own practice last year, died July 15, following a brief illness. During his 15 years' residence in Portland, he was employed in the offices of Lee Thomas, the Vancouver Housing Authority, and Edmundson & Kochendoerfer, with time out for service in World War II. He was graduated from the University of Oregon in 1938. Among the buildings which he designed were Sandy Junior High School in association with Donald W. Edmundson, a medical clinic at Gresham and Our Savior's Lutheran Church Sunday School addition at Oswego.

NEW PARTNERSHIP Walter W. Beeson, AIA, has become a partner in the firm of Henry Charles Burge and George W. Roach of La Canada, Calif., now known as Burge, Roach & Beeson. Formerly an associate in the firm of Daniel, Mann, Johnson & Mendenhall, Beeson was 1955 president of the Pasadena chapter, AIA.

SHARE OFFICES: New offices at 1328 S.W. 14th Ave., Portland, have been opened by William L. Fletcher, Donald Blair and John W. Reese, architects; Saul Zaik, designer; and Thomas A. Welch, contractor. The five young men, ranging in age from 29 to 36, are jointly occupying a pioneer house which has been remodeled. They will work independently but collaborate on larger projects.

Graduates of the University of Oregon, Fletcher, Blair, Reese and Zaik each has been associated with several Portland architectural firms. Reese also has been self-employed for the past three years. Welch, a University of Portland graduate, has been a general contractor for the past three years, specializing in the construction of four-plexes.

ON THE MOVE: The Seattle architectural firm of Steinhart, Theriault & Anderson now is located in its own new office building, designed by the partners, at Eastlake and Galer (EAst 3222).

Mary Alice Hutchins, AIA, who maintained her own office in Portland where she prepared specifications for various architectural firms, now is associated with Law & Wilson, Honolulu architects-engineers.

Warren Cummings Heylman, AIA, has moved to Suite 207, W. 1023 Riverside Ave., Spokane (RIverside 7-2550).

NAMED: Marshall Perrow, AIA, has been elected chairman of the Tacoma Planning Commission by his fellow members.

WINS COMPETITION: Ernest J. Kump, FAIA, architect and planning consultant with offices in Palo Alto, Calif., has been announced winner of an international competition for the design of two new planned communities to be constructed in Spain for the families of off-base personnel of the Joint United States Military Mission. The projects consist of complete communities to be developed in the suburban areas of Madrid and Zaragoza.

A fellow of the Royal Society of Arts, Kump recently was one of eight architects invited by the U.S. Department of State to participate in a closed competition for the new United States embassy to be built in London. He presently is designing the new embassy residence and staff housing in Seoul for the State Department.

Design and the landscape in which we live

Excerpts from a paper presented by the Los Angeles landscape architect at the sixth annual International Design Conference in Aspen, Colo. Garrett Eckbo also addressed the Northwest Regional Council, AIA, in Tacoma earlier this month and the national AIA convention in Los Angeles.

by GARRETT ECKBO

LANDSCAPE DESIGN is most successful when it produces recognizable units or continuities of outdoor space or volume, with special characters and proportions.

The definition of this space is accomplished by the placement of buildings, trees, ground forms, shrubs, rocks, water bodies, ground surface patterns, fences, walls and shelters in such a manner as not only to solve the technical and functional problems but also to impress the user or observer with the special quality of the space between and among these elements. This is the 3-D of landscape design, more important than patterns with flowers and paving, foundation planting, or pretty pictures out the windows, and inclusive of them. It is subject to endless variation in conception and execution, even as painting and sculpture, to which it is closely allied.

In the search for background and inspiration, the landscape architect must explore the world which is behind him in time and around him in space, the world of nature, the world of man and the new forms which the interaction of these two worlds can produce. Any rich rural countryside is an encyclopedia of forms and arrangements produced by the joint action of man and nature. History is important, but not in the old formal and informal copybook sense. The allied arts are important because each produces refinements and concepts which can inspire the landscape architect.

Architecture is important to landscape design because it is the primary expression in the landscape of human creativity and control of nature. It has a great tradition of bringing magnificent order out of manifold complexities, of putting great quantities of highly variable members and elements together in such a way that the result has a new and special identity, greater than the mere accumulation of parts. At best it represents the highest levels of human imagination, the broadest connection between abstract conception and concrete reality, the greatest steps toward production of a completely humanized environment. The fact that our communities generally fail to make use of this potential should not obscure its importance.

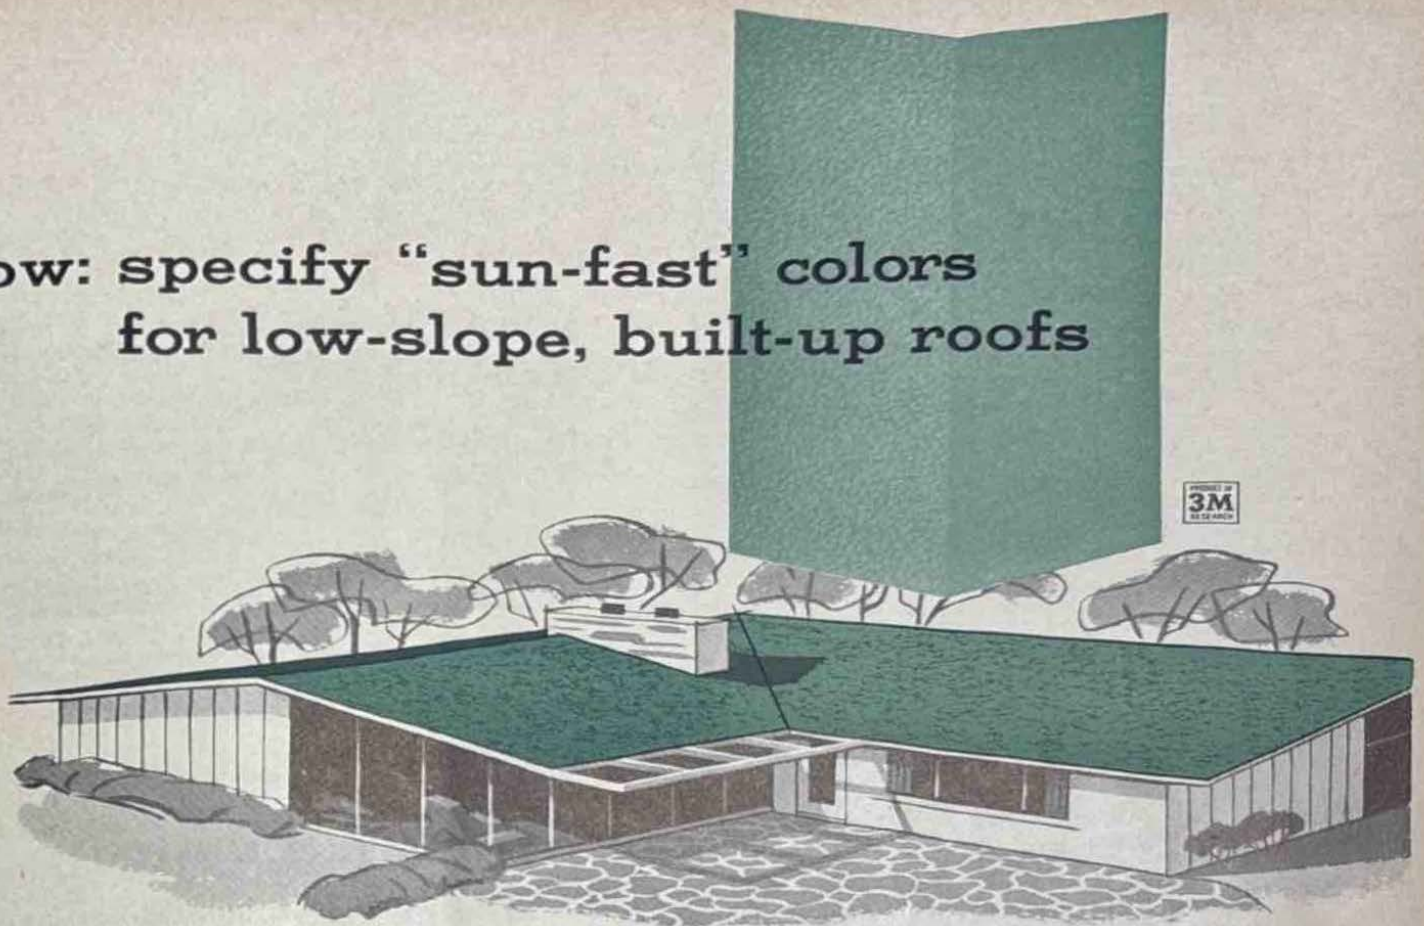
Nature is important to landscape design because it is the world of forces and processes within which we live and work, the world of which man and all his works are an inextricable part, no matter how broad the contradiction may become between his efforts to control nature and to preserve her. Although very often landscape design has to defend nature against the destructive attacks of man, its true constructive role is the establishment of connections, relations and adjustments, both physical and visual, between building sites and their surrounding landscapes, that is, between people and the total landscape around them. This means that in general landscape design must work with forms and materials derived from **both** the specific structures with which it works, and the specific sites and landscapes around them; or from **both** architecture and nature.

It is in the combination and interrelation of these diverse forces, in many complex patterns ranging from complete integration to complete contrast, that the vitality of the art lies. It is thus an art of continuity, of connections, of relations to existing forces, more than an art of pure and original conception, as architecture. Neither the Renaissance idea of forcing architecture on nature nor the romantic idea of forcing nature on architecture can solve our problems today.

Society is important to landscape design because it presents problems for solution and opportunities for production. The humanized landscape is the expression of social forces on the world of nature. For thousands of years landscape design officially solved problems for a small minority of the population — private parks, estates, villas, palaces. Central Park in New York initiated a new and unprecedented phase of landscape design in which the general public became the client.

The fact that these new park problems were solved largely with forms developed by the romantic movement in the 18th century should not obscure the importance of their impact upon the general landscape. There has been an increasing, and gradually accelerating, democratization of design processes since then. The private estate is no longer the only problem which the landscape architect will deign to touch. A whole new school of design has grown up in California around the problem of the small middle class garden. A large proportion of landscape graduates go into public service. Irrespective of the quality of work produced, the potential of these facts is for a broad improvement in the quality of the general landscape in which we all live. An unprecedented world situation in which general war has become impossible, in which we must choose between coexistence or no existence, impels us toward an unprecedented concentration upon the arts of peace.

With all this background, the primary sources of landscape inspiration lie in specifics: the specific character of the individual site, the specific nature of the people involved, the specific nature of the materials available and the specific possibilities for creation of outdoor space.



Typical landscape problems today are: small, medium and large gardens; estates; schools, hospitals, churches, clubs, community centers; shopping centers, colleges and universities, public building complexes; parks—small, medium, large. These can be boiled down to typical groups: private gardens, public grounds, parks and public recreation spaces.

Private gardens make up a large part of the total area of humanized landscape, are greatly variable in the detailed relations between house and site, the broad and intricate play of individualized creativity, personal expression by choice and whimsy, family life, and the range from visual pleasure through outdoor living to active gardening, from utility gardens through living gardens to show gardens. They also involve the greatest concentration on detailed humanized scale and intimate livability. It might also be said that the majority of private yards never become gardens in the sense of these words.

Public grounds are front yards whether for houses or city halls. They are spaces to look into rather than

Now: specify "sun-fast" colors for low-slope, built-up roofs

3M's new coarse aggregate roofing stones offer lasting beauty and protection in 8 beautiful colors

Here is a brand-new color-styling opportunity for you. 3M Brand Ceramic-Color Stone offers beauty *and* lasting protection — opens up an entirely new field of decorating possibilities because you may select from 8 color-fast shades! Colors are "fired on" by the same special process used in making 3M Roofing Granules . . . supplied to the building trades for over 30 years.

Special treatments developed by 3M Research make 3M Brand Ceramic-Color Stone dust-free and "sun-fast" — with maximum adhesion to asphalt. The material will not strip, roll or wash away leaving bare, unsightly patches. Stones are durable, uniformly graded, dense, fully opaque to provide complete protection against damaging ultra-violet rays.

The pebble-sized stones pack tightly on roof-tops . . . create the appearance of depth and ruggedness with a built-in shadow effect. 3M Brand Ceramic-Color Stone is shipped *dust-free* in 100 lb. bags. All colors available from a single source.

ALAN LIDDLE, AIA, Architect

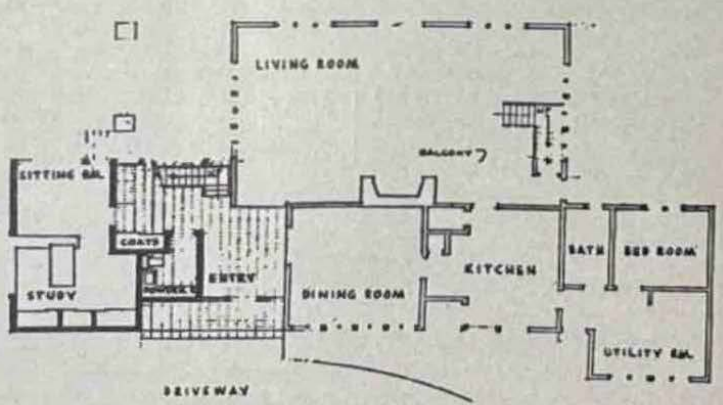
ALLEN HAMPTON, Contractor

CONTINUATION of existing roof lines and use of same type rough boards help to blend addition at left end of house with original structure. Inside, generous entry hall ties old and new portions together.

Entry hall serves as fitting transition

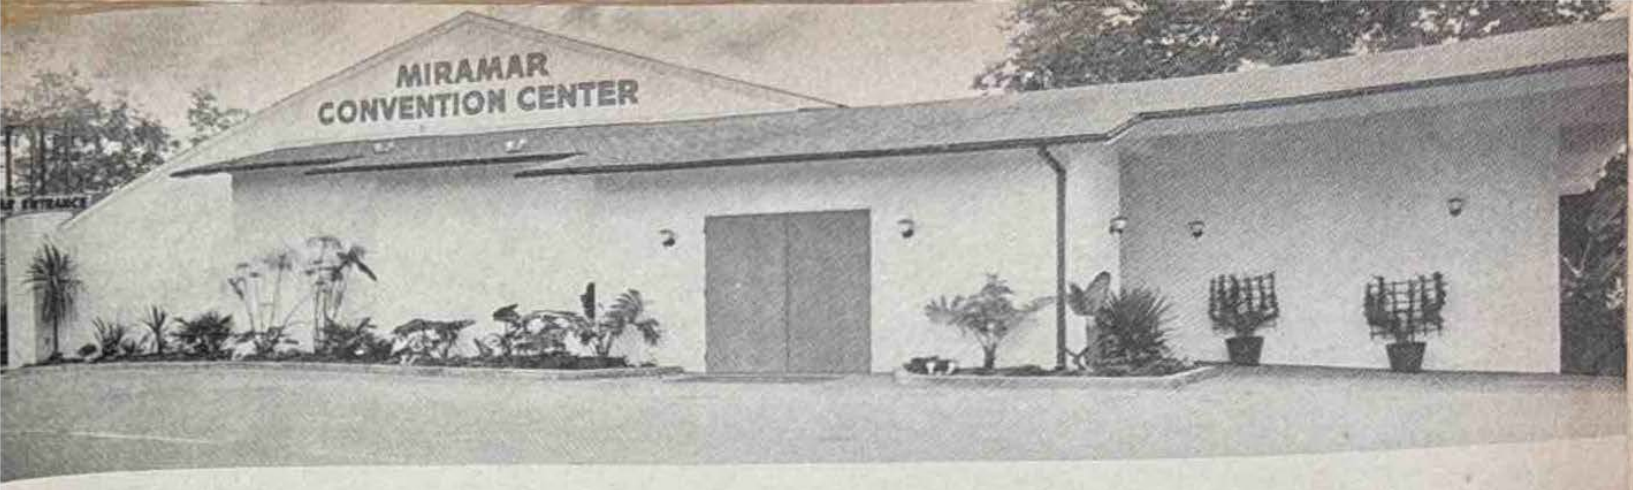
A GENEROUS ENTRY HALL served as the matchmaker in the marriage of an existing World War I house with a contemporary addition.

The clients wished to retain certain desirable features of the original house, among them large rooms and a two-story living room with a massive stone fireplace under the balcony leading to the bedrooms; they did not want to continue the dark wood paneling and small windows into the new addition.



To maintain unity, the architect continued the lines of the existing roof and used the same type rough boards for the exterior siding, painted to match.

One of the main requirements was an ample entry hall, since access to the old house was directly into the living room from the front porch. Its focal point is an open stairway, built with steel stringers and mahogany risers. It seems to float in front of a two-story window which provides a view of woods and Gravelly Lake. The hall is covered with quarry tile to accommodate the heavy traffic; the walls and ceiling are paneled with golden stained oak flooring.



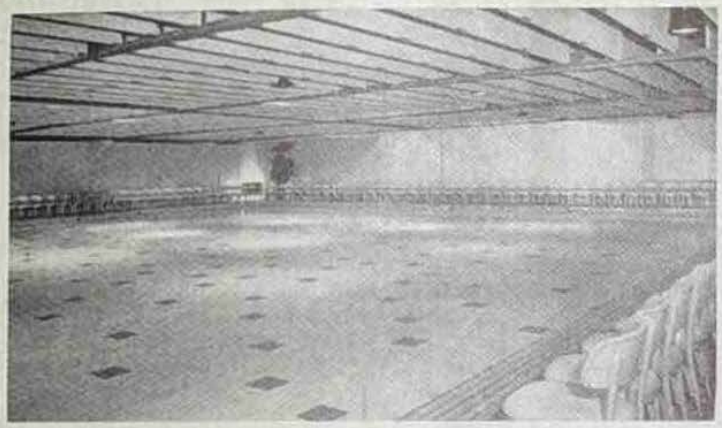
A powder room for guests and a combination study-sitting room, which doubles as an office, is off the entry. Upstairs is a master bedroom with floor-to-ceiling windows overlooking the trees and the lake. The hall connects with the existing balcony, from which the children's bedrooms are reached.

OUTLINE SPECIFICATIONS
(Addition)

Type of Construction: Frame.
Exterior Walls: Painted cedar.
Roof: Shingled.
Windows: Stopped in wood.
Doors. Wood slab, both inside and out; Pella wood folding doors.
Floors: Frame covered with quarry tile.
Interior Walls: Sheetrock and painted wood trim on drywall partitions. Oak flooring in entry.
Ceilings: Oak flooring in entry.
Stairway: Mahogany risers mounted on steel stringers.
Date of Completion: June 1954.

ADDITIONS TO FIRST FLOOR PLAN are indicated by heavier lines.

Old garage becomes a convention hall



Miramar Convention Center
Santa Barbara, California

LUTAH MARIA RIGGS, AIA, Architect

PETER DAVISON & SONS, General Contractors

GOLD ROOM (right) is ideal for meetings or banquet groups up to 130. All furniture is movable. With two stand-up bars, it also is used as registration lobby and for private parties. Fiberglass baffle arrangement in ceiling provides good acoustics for Miramar Room (below). It has capacity of 575 diners, can be used as exhibition hall.

THE MIRAMAR HOTEL, with its own private ocean beach, swimming pool, tennis courts and 200 rooms, had everything any organization could want for a successful convention — except an adequate meeting hall. The owners felt that such a hall could be obtained by using the former garage.

When the architect completed her assignment, the raw steel girders, corrugated sheet iron roof and blackened concrete floor had been converted to an ultra-modern structure with two huge rooms seating more than 700 diners under one roof and with table-free room for more than 1,000 attending meetings. The Miramar Room (5,500 sq. ft.) and the Gold Room (1,500 sq. ft.) are separated by doors and extensive use of soundproofing.

The convention center is in a steel frame building with outside walls of masonry. The concrete slab floor is covered with asphalt tile and carpeting.

The 6-in. steel basement girders supporting the floor joists and those from the ceiling struts to the roof were covered with fireproof plaster. The roof itself is the sheet iron that covered the garage, but building and fire regulations called for extra measures when the conversion took place. The roof's inner surface was coated with insulation and its top covered with plywood sheets, then a generous sheathing of insulation and a covering of asphalt shingles, painted blue in keeping with the resort's overall color scheme.

The ceiling joists of the first floor are independent of the second floor and the area between has been soundproofed. The second floor ceilings are of exposed beams, with 2-in. solid sheathing.

Fireproofed steel trusses span the 75 ft. of the building and in between each truss are suspended acoustic

OUTLINE SPECIFICATIONS

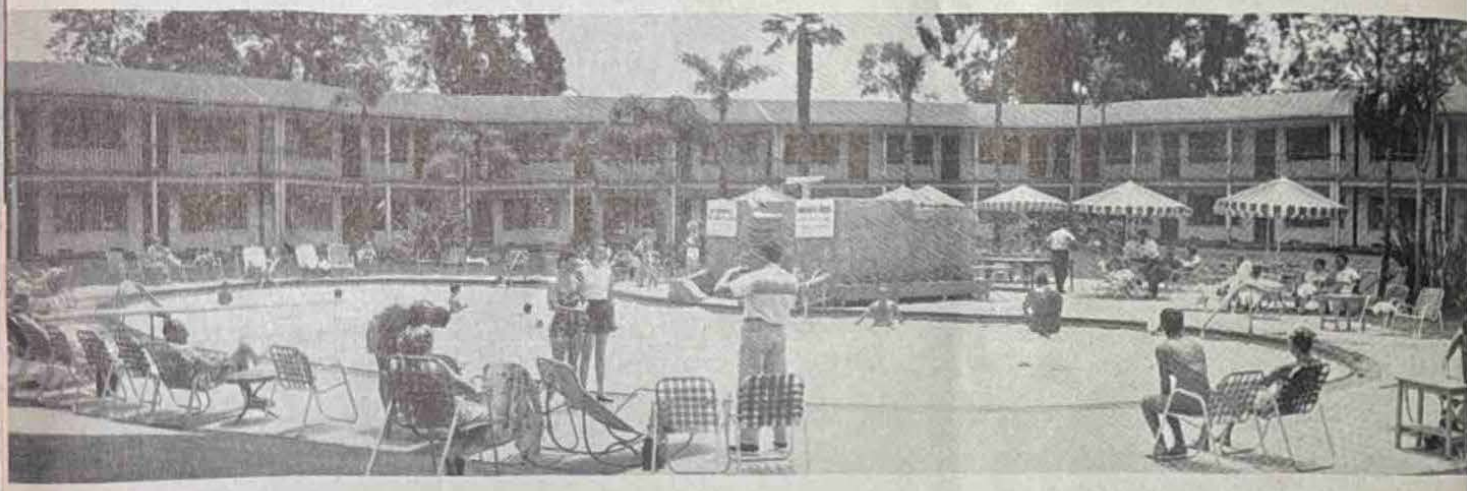
Type of Construction (original building): Steel frame, 105x78 ft.
Exterior Walls: Masonry.
Roof: Original corrugated sheet iron covered with plywood sheets, 1-in. insulation and painted asphalt shingles.
Floors: Concrete slab covered with asphalt tile and carpeting.
Ceilings: Painted acoustical plaster, Gold Room; acoustical baffles, 24 in. high and 14 in. long, spaced at 24 in. on centers, suspended between fireproof steel trusses in Miramar Room.
Lighting: Each light on separate rheostat, providing combinations of illumination on center and sides of each room.
Special Equipment: Flexible loud speaker system installed by B. E. Harberts Co. to connect eight microphones, FM and standard broadcast receivers and three-speed phonograph; fully equipped banquet kitchen with three specially designed refrigerators; two stand-up cocktail bars.
Total Cost: $200,000.

Convention Center

baffles, 24 in. high and 14 ft. long, spaced at 24 in. on centers.

A giant air conditioning and heating system installed in the basement adjusts the temperature inside the hall to changes caused by body heat of large crowds.

The center has a completely flexible loud speaker system, using 1,150 ft. of wiring to connect eight microphones, FM and standard broadcast receivers and a three-speed phonograph. Each of the two rooms has eight microphone jacks.



The lighting system provides combinations of illumination on the center and at the sides of each room. Each light is on a separate rheostat and the interior may be dimmed or brightened by twisting a knob on the switch panel.

Picture molds were installed on all walls for convention displays and all doors are wide enough for a 1½-ton truck to drive directly onto the hall floor for display purposes.

The Miramar Room, on three sides, has raised platforms covered with carpeting and designed for seating sideline audiences at auto shows, dances, etc. The Gold Room has wall-to-wall carpeting in a deep piled woolen fabric and green luxury lounge type furniture. The high-sound absorption plastered walls are used as background for original paintings by Santa Barbara artists.

Both rooms are served by a $35,000 high-speed banquet kitchen equipped to accommodate 575 diners in the Miramar Room and 130 in the Gold Room. It has three king-size specially designed refrigerators with racks to hold foods which are prepared in advance of banquets. The kitchen also is equipped with a battery of service carts, each with a 100-plate capacity and with an electric cord which is plugged to an outlet on reaching the dining room to keep food hot for an hour. Using these carts the Miramar can serve 475 steak dinners in 18 minutes flat.

The convention center can be operated by a crew of 90 which is capable of handling 700 diners and clearing the hall within 30 minutes after dinner has been completed.

Miramar Hotel Addition

Besides the convention center, the expansion and modernization program at the Miramar has added 47 new bedroom units, a $300,000 project designed and built by the same architect and general contractor. The motel type units form a semicircle around the swimming pool and look out on the Pacific Ocean at the rear. The front windows also frame the Santa Ynez Mountains.

The rooms are insulated against sound in all four walls, ceiling and floor. Windows, for example, are double panes of glass, set in felt. Built-in dressing tables and mahogany wardrobes are featured in each room; baths have built-in pullmans with tile tops.

MAJORITY OF POOLSIDE BEDROOMS are triples in that they have set of twin beds plus one full-size duo-studio bed. Each room, 16x23 ft., has ceiling-to-floor double-thickness drapes and three original water colors of Santa Barbara scenes.

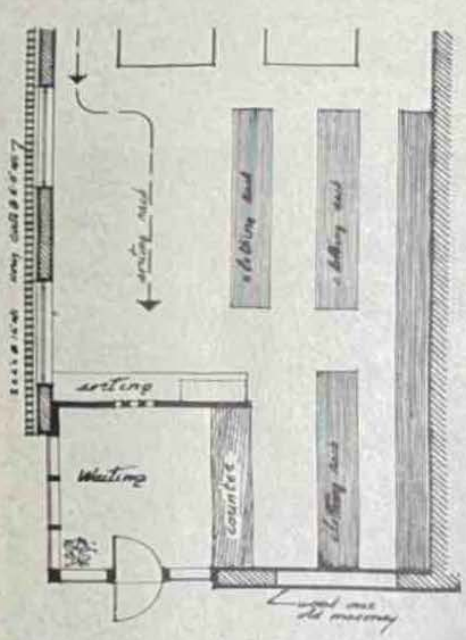
Tom Burns Jr.

Springfield Cleaners
Springfield, Oregon

DONALD H. LUTES
Architect

F. D. HOLLISTER
General Contractor

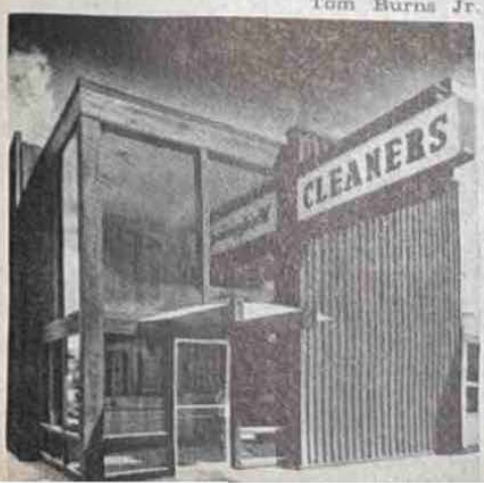
Real face lifting for $5,750



THE CLIENT DESIRED that 1) his cleaning establishment be opened up for better light on his wares and 2) additional clean clothes storage be provided. In accomplishing these two objectives, the architect hoped to make the building—originally Springfield's first bank with 12-in. masonry walls—specifically more indigenous to the lumbering town environment and generally more attractive. That he was successful is reflected in part by the fact that business increased 6% last year while other cleaners in the city were down in sales.

The first requirement was met by knocking out the corner of the structure and replacing it with glass. The designer did this with full recognition of the southwest sun problem, feeling that the added openness as a form of advertising justified some draping or screening a few months of the year. The glass is carried all the way up to the roof joists, then drops down at the sign to the existing ceiling joist level.

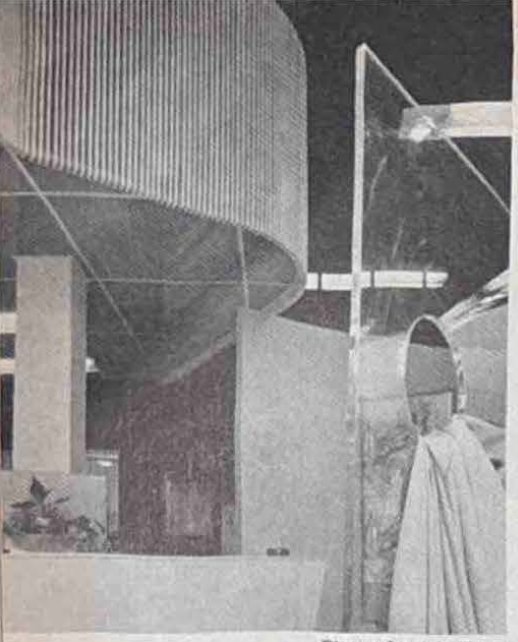
Relocation of the entry not only met the second requirement but afforded a more visible reception area. A full-length partition screens the sorting area, and three small windows (blue glass for one-way vision) allow the sorters to see customer as they enter.



The entire building is skinned with cedar. On the west side 2x4s 6 in. on center, held out from the face to permit drainage behind, cut off the view of the old wall with its many and varied openings. The front wall is faced with 1-in. rough sawn cedar; 1x2 battens cover up the old entrance. Two side doors are reached through gates in the 2x4 facing as are the windows for cleaning.

The interior is a repeat of the exterior, the finish being smooth cedar and battens with a new paint job on the plaster side walls. The ceiling tile is glued to stripping which was applied over the old plaster.

SIGN is integral part of building. Corrugated plastic between projected structural beams carries lettering and is repeated in canopy.



Tom Burns Jr.

OUTLINE SPECIFICATIONS

Exterior Walls: Stained cedar siding.
Windows: Stopped in wood.
Doors. Aluminum frame, exterior.
Floors: Concrete slab covered with linoleum in entry, asphalt tile in service areas.
Interior Walls. Smooth cedar and painted plaster; drywall partitions.
Ceilings: Acoustical tile.
Cabinets: Wood.
Lighting: Incandescent spots and floods.
Heating: Warm air from cleaning plant boiler.
Total Cost: $5,750.
Date of Completion: June 1955.

Drive-in showroom for fabrics

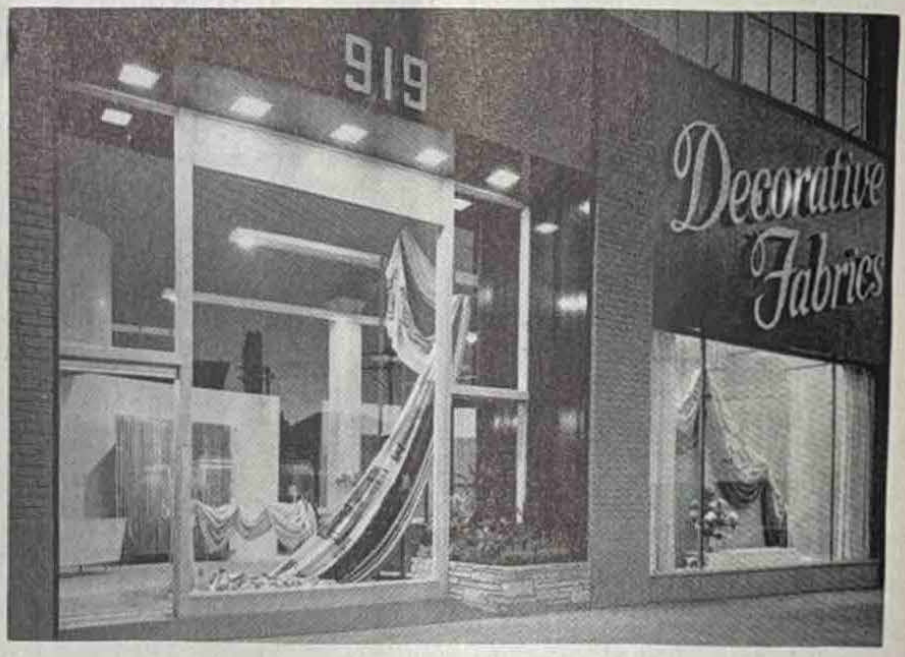
Photos by Art Hupy

PLASTIC SHEETS with circular cut-outs "float" fabrics in air at entrance window display. White birch vertical louvers serve as background.

FABRIC BUYERS throughout the Northwest and Alaska who consider this showroom to be one of the finest on the Pacific Coast probably don't realize that the building originally housed a car-dealer-garage. Its location on the very fringe of Seattle's shopping center and close proximity to department and furniture stores, specialty shops and hotels made it an ideal site with one exception: the traffic problem made parking difficult and the shipping of the wholesaler's large daily orders a slow and costly process.

The architect solved the problem by retaining the car-service entrance of the old garage and enough floor space to park 30 to 35 vehicles. Now clients need only to drive into the entrance where a uniformed attendant takes over. The loading and shipping problem was solved just as nicely. The truck ramp to the third floor from an incline side of the street was kept intact to facilitate receiving and shipping merchandise.

The front of the three-story structure was done over in stained redwood and painted brick. An Arizona sandstone planter at the entrance extends into the showroom.



Lines of seasonal importance are highlighted in the main showroom where some 500 different styles are shown from large and tall multiplex racks. Displayed from three-hinged clear plexiglass sheets with circular hole cut at varying heights, the fabrics seem to float gracefully in the air. Vertical louvered frames of white birch are used as backgrounds.

Neutral colors which do not conflict with the displayed samples are used throughout the showroom and soft colored panels hide a series of offices. An adjoining salesroom displays the firm's more prosaic lines. The remainder of the building contains ample warehouse space, cutting and processing rooms and employee lunchrooms.

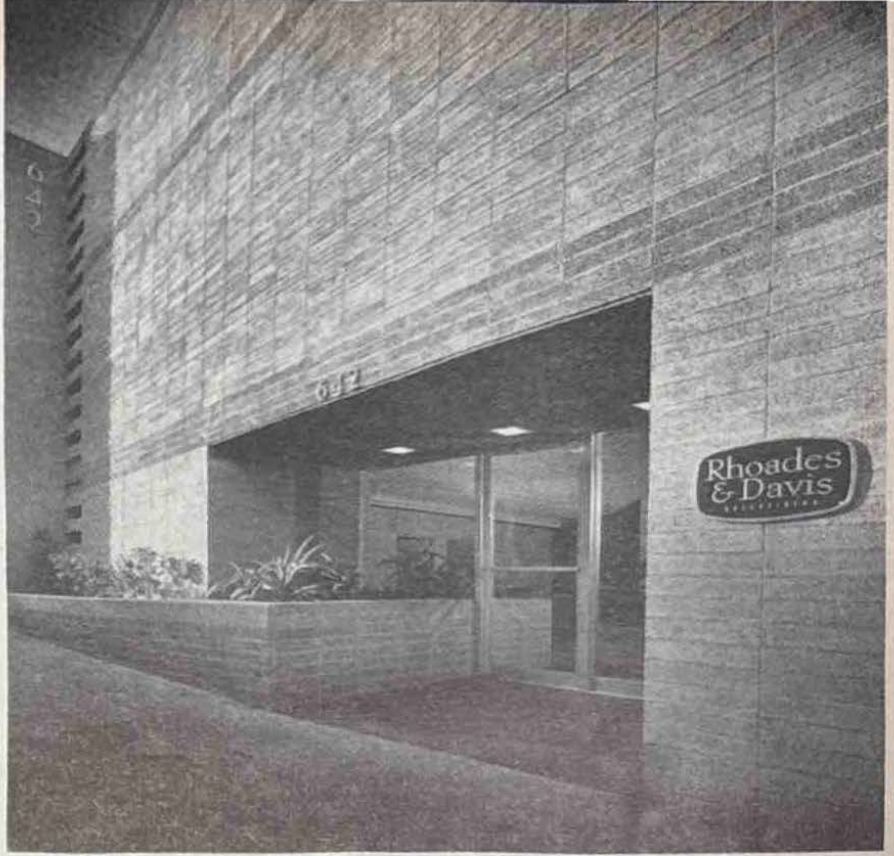
General Contractor

DRIVE-IN ENTRANCE is to right of display windows which permit full view of interior. Multiple racks are supported by expanded metal lath and black iron pipe display wing. Lucite chain from ceiling holds samples. Fabric covered plywood surrounds PBX at reception desk.



OUTLINE SPECIFICATIONS

Exterior Walls: Stained redwood and painted brick.
Doors: Tempered glass and birch slab.
Floors: Carpeting over concrete slab.
Interior Walls: Frame with plasterboard and birch slats.
Lighting: Fluorescent and recessed floodlights.
Heating: Existing hot water system.
Total Area: 40,000 sq. ft.
Total Cost: $42,000.
Date of Completion: November 1954.

ORIGINALLY PLANNED for Rhoades & Davis advertising agency, since merged with Honig-Cooper Co., windowless building now is occupied by central advertising department of Safeway Stores, Inc. Office seen above uses existing brick wall of old structure.

Advertising Headquarters
San Francisco, California

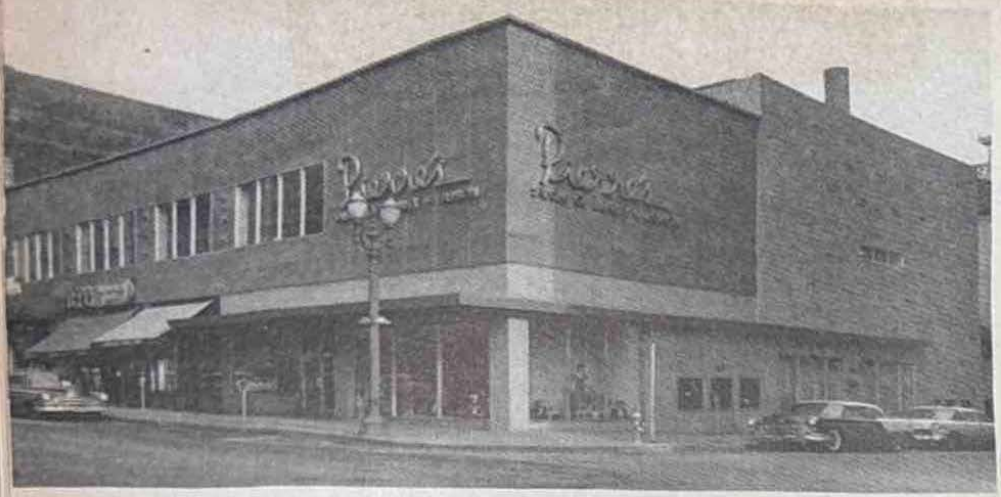
Brick walls offer point of departure

BRUCE E. HEISER, AIA
Architect

MILLS CONSTRUCTION CO.
General Contractor

OUTLINE SPECIFICATIONS

Exterior Walls: Brick and biege Basalite concrete blocks.
Roof: Pabco 20-year specification.
Floor Finish: Marble, vinyl plastic, terrazzo, Armstrong asphalt tile.
Doors: Stock mahogany.
Interior Walls: Exposed brick and Basalite concrete blocks, walnut and mahogany paneling. U. S. Gypsum Rocklath.
Ceilings: Fiberglas suspended.
Heating: Atlas plant.
Air Conditioning: Atlas plant.
Total Cost (alterations): $32,000.
Total Area: 6,290 sq. ft. (2,330 sq. ft., first floor; 1,980 sq. ft., second and third floors).
Date of completion: August 1954.



THE ORIGINAL STRUCTURE had three "beautiful" walls of rough red brick which were retained as part of the new building's interior. In view of the location, just on the fringe of San Francisco's produce market and within walking distance of Chinatown, the architect and client agreed to keep the building windowless and use the exterior as a means of beautifying the neighborhood.

The entire facade is of beige lightweight masonry blocks, and the recessed entrance and reception lobby were planned as a single unit, separated only by the plate glass walls and door. The exterior was livened up by providing a large outdoor planting area which extends through the plate glass into the lobby itself. Inside, the shrubs reach from long low planters on a black marble floor toward the glass ceiling a full three floors above.

The noise and confusion often common to advertising agency offices were eliminated by the adoption of an overall traffic plan which locates the copy, art, production and supply departments, as well as the main reception lobby and a spacious corridor, on the street level floor. The second floor houses the media department, conference room, coffee lounge and model kitchen used in testing products; the third floor, executive offices and the secretarial staff.

The architect utilized striking contrasts in textures throughout the building: smooth glass next to sandblasted brick; heavy carpeting next to polished marble; white mahogany next to pressed cork; silk screen-printed wallpaper next to rippled glass. He also used generous amounts of walnut paneling, aluminum and fiberglass and provided large planting boxes on all three floors.

The fully air conditioned building is illuminated with cold white fluorescent lighting with occasional clusters of spotlights. Specially designed cabinets were custom built into the conference room to hold television and sound film equipment.

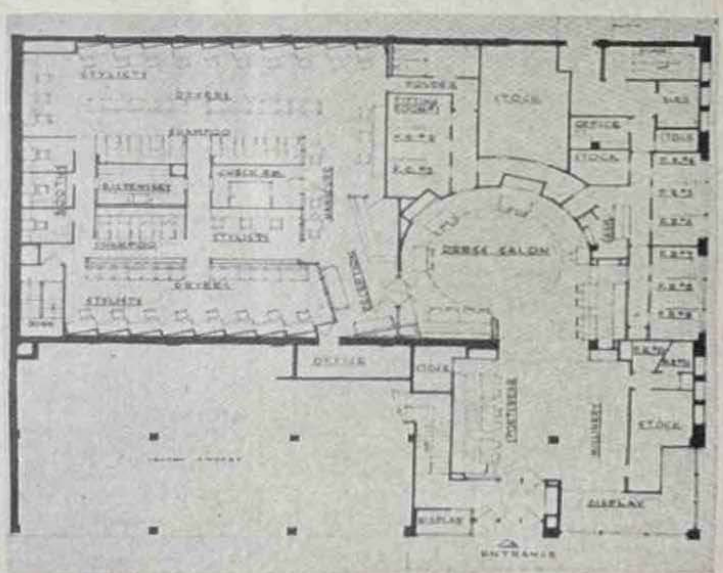
Pierre's
Portland, Oregon

High-style patrons shop in remodeled theater

REMODELING of Portland's Music Box Theater into a women's specialty shop presented a number of interesting problems. The concrete balcony was torn out and used for fill material to make a level surface for the new concrete ground floor slab; a steel frame erected to carry the second floor; stairways altered or removed and vertical traffic facilities, including a service elevator, constructed to accommodate the two floors and basement.

The concrete frame and solid brick exterior filler walls of the original structure (built in 1911 as the Peoples Theater) were left intact, while brick parapets and elaborate cornices that were added in later alterations (in 1929 when it became the Music Box) were removed. The stripping of the existing stuccoed brick veneer facing made possible the addition of new textured brick veneer and porcelain enamel panels.

Sheet metal cantilevered on steel framing is used for the marquee and eyebrow; polished cast aluminum for the design of the window mullions. The identification signs, designed by the architect, are executed in stainless steel, backlighted by cold cathode tubes.



The aluminum store front and entrance with its ceramic tile floor make a sedately attractive point of entry for the fashion-minded shopper. The bold rubber tile floor which highlights the sports and millinery departments is in sharp contrast to the rich, thick carpeting of the dress salon, which repeats the color in various tones throughout its decor. The circular salon means that customers and sales people alike have a short walk to fitting rooms, separated by three partitions and further divided by folding doors. Access to stockrooms also is speedy.

Exterior show windows are draped to enable a second use of these areas as fitting rooms during store hours. This same functionalism is found throughout the building, with work areas necessary for the operation of each salon made easily accessible. The basement and second floor are devoted almost exclusively to service operations, allowing the maximum area for sales and display on the first floor.

HOLMAN J. BARNES, AIA, Architect
LOUIS ELLINGWOOD, Structural Engineer
TELLER CONSTRUCTION CO., General Contractor

OUTLINE SPECIFICATIONS

Exterior Finish: Porcelain enamel and Willamina split tile.
Floors: Concrete slab covered with ceramic tile, vinyl tile and carpeting, first floor; Q-deck with concrete-wearing slab, second floor.
Windows: Kawneer aluminum.
Doors: Kawneer aluminum, entrance; flush birch, interior.
Interior Walls: Painted plaster.
Ceilings: Painted plaster.
Total Area (remodeled): 14,000 sq. ft.
Total Cost: $184,500.
Cost per Square Foot: $13.10 (including fixtures).
Date of Completion: November 1954.

ON THE NEWS FRONT WITH STRUCTURAL STEEL

First floor of Oregon store is twice size of city block

The first floor of Meier & Frank's new department store in Salem, Oregon, is the largest expanse of merchandise on one level in the Pacific Northwest. It is the first branch store built by Meier & Frank, well-known as Portland's largest emporium. Containing four levels—a lower level, first floor, mezzanine, and second floor—this handsome store is framed with structural steel supplied by Bethlehem to Stevens Equipment Co., Salem, who fabricated the steelwork.

For low structures, such as this store, the economies and other advantages of structural steel are just as valid as they are for multi-story buildings. Steel framing is adaptable to any architectural design; and it provides maximum flexibility of floor layout.

Architect: Welton Becket and Associates, Los Angeles; *Associate Architect:* James L. Payne, Salem; *Steel Fabricator:* Stevens Equipment Co., Salem; *Contractors:* Hoffman Construction Co., Portland and Viesko & Post, Salem.

Shoppers can step right out of their cars and walk directly into the store. Double-spiral ramps give access to space for parking 1000 cars.

Building volume eases off in August by 6%

AFTER A RECORD MONTH in July, building permit volume in the five western states nosed down to a $245 million total in August, a 6% drop from last month. The total is also 3% below August of last year.

Although three states showed increases over July, the overall total was pulled down by a 9% drop in California dollar volume and a 29% decrease in the Montana figure. Oregon was up 5% over the previous month; Washington, 25%; and Idaho, 24%.

Compared to last August, only Washington recorded an increase, 18%. California dropped 5%; Oregon, 11%; Idaho, 2%; and Montana 37%. However, August of last year was a boom month.

For the most part, major cities and counties reported decreases compared to a year ago. Los Angeles was down $5½ million; Los Angeles County, $½ million; San Francisco, $4½ million; Multnomah County, $1¼ million; Portland, $3 million; and King County, $2 million. The Seattle total, swelled by the permit for an addition to the University of Washington Teaching Hospital, was $7 million higher than last year. Orange County was up $3 million; Sacramento County, $1 million; and San Bernardino County, $1¾ million.

By the end of August the total for 116 agencies in the five states was $1,834,702,985, a bare 2% higher than the January through August figure for 1955. California is running 3% higher; Oregon, 4%; Montana, 4%; and Idaho, 7%. Washington is a bare 1% behind.

Following is a breakdown of building permits issued by several of the major agencies during August.

	DWELLING UNITS		COMMERCIAL & INDUSTRIAL		PUBLIC	
King County	547	($4,842,941)	59	($ 876,636)	8	($1,382,287)
Seattle	199	(2,769,690)	17	(264,600)	4	(9,045,700)
Tacoma	183	(610,440)	57	(647,720)	7	(366,500)
Orange County	735	(5,963,171)	63	(2,555,635)	28	(2,587,261)
Sacramento Co.	616	(5,044,086)	57	(525,454)	15	(2,002,737)

and the latest literature

TEMPERED HARDBOARD: Forest Fiber's Sandalwood, the first prefinished, light colored, tempered hardboard, is especially tough and rugged and can even be used for floors. Its baked-in surface resists weather, abrasion and staining.

Sandalwood, which can be used "as is," or painted if desired, is available with a regular or punched surface. Panel sizes go from 4x4 ft. to 4x16 ft.

(Item No. 1)

DRAFTING AID: As a reference aid for engineers and draftsmen, Johnson Research has produced a handy decimal equivalent table in the form of a ready-to-apply Transeal. Transparent with easy-to-remove waxed paper backing, it is self-adhering and can be printed to any specifications. Transeal eliminates repetitive drawing time on paper, vellum and cloth and ite matte surface readily accepts inking without the use of "non-crawl" preparations.

(Item No. 2)

ACOUSTICAL TILE: A non-combustible acoustical tile with the appearance of stippled plaster is now available for use in residential, commercial and institutional building. Latest addition to the Owens-Corning Fiberglas line is Fresco which has a rough finish.

Fresco is offered in 12x12-in. and 12x24-in. sizes with butt joints. It can be installed either on a concealed mechanical suspension system or adhered directly to the underside of any surface.

(Item No. 3)

POOL FILTER: A swimming pool filter which can be assembled in less than an hour has been designed so that owners of the smallest home installations can enjoy its advantages, although it is available in six sizes for pools ranging up to 150,000-gal. capacity.

The Fabro filter underdrain eliminates the need for layers of gravel, making it possible to use only sand in the filter. Other features: oversized leaf strainer, rustproof filter vessels, preassembled valves and fittings and chlorinator.

(Item No. 4)

SOUND-CATCHER: To minimize deafening noises that bounce around in factories and other enclosed premises where sound is "out of bounds," United States Gypsum has developed a new portable "sound-catcher" which can reduce apparent loudness level by as much as 50%.

Sold under the trade name Acousto-

INDUSTRIAL "SOUND-CATCHER"

sorber, the unit is composed of an outer sheet of perforated aluminum foil backed with a mineral fiber blanket, 2 in. thick. It is shipped in flat sheet form to the jobsite where it is easily shaped along pre-embossed lines into a boxlike pyramid. The acoustical unit is 28 in. long on a side, has an altitude of 24 in. and weighs about 1¾ lb. It is suspended from the ceiling on wires which are attached to a stapling flange on the unit.

(Item No. 5)

DRAFTING BOARD: Designed to reduce draftsman fatigue, the Easy Shift vertical drafting board has an up and down adjustment of 20 in., permitting the draftsman to work, seated or standing, at optimum visual angle in a comfortable position on any area without bending or stretching.

The board comes in two models, one with fixed angle of 15 deg. from vertical and the other adjustable through an arc of 85 deg. from vertical. A drafting machine rests on the drawing with feather touch.

The frame is of tubular steel construction; the board itself of lightweight, aluminum lined honeycomb sandwich construction, warp-proof and sufficiently rigid to withstand heavy loads without deflection.

Item No. 6)

BUILDING PAPER: A polyethylene sheet added to Richkraft's line of building papers is used as a water barrier and for moisture- and dustproofing over subflooring, under roofing, on the warm side of walls, around foundations and in crawl spaces and under slab.

Impervious to bacteria, rot or mildew, Richlite makes a low cost tarpaulin on painting jobs, serves as a waterproofing cover for equipment and material and meets all requirements for curing concrete. It is offered in 2-, 4- and 6-mil weights in widths up to 20 ft.—100 ft. to the roll.

(Item No. 7)

DIVIDER WALL: Semi-private office units can be created from open floor space in a matter of minutes with Hauserman divider wall partition. The unit is offered in two types: unglazed, at a height of 43 in. from the floor, including legs; and glazed, at a height of 66 in. from the floor. There is a 4-in. space between the bottom of all panels and the floor.

The divider wall features instant, snap-in panels, leveling devices on legs, concealed wiring channel, baked enamel finish and plastic glazing strips for inserting and removing glass panels without danger of chipping.

(Item No. 8)

RADIANT HEATING: Berko Electric has introduced its first 2,000-watt glass radiant heating unit, providing a greater concentration of wattage per square inch than previously obtained. With the increased heat output, one unit can take the place of two or three formerly required to heat large areas.

Models HW-20 and HWT-20 (with thermostat) have a tempered Pyrex brand glass heating element, capable of withstanding over seven watts per square inch output.

(Item No. 9)

Latest Handbooks, Manuals and Literature

Yours for the Asking

COMBINATION FIXTURE: The Mult-Vent Trofferlite, a dual-purpose fixture which diffuses conditioned air and provides illumination, is described in an eight-page booklet containing cutaways, exploded views, sound level charts and data pertinent to selection of correct fixture parts. Suggested installation procedures and applications are included.

(Item No. 10)

OUTDOOR LIGHTING: Architectural floodlighting and outdoor lighting for shopping centers, suburban businesses and commercial parking lots are the topics of two bulletins released by General Electric.

The eight-page publication illustrates various methods of floodlighting public and commercial buildings, fountains, industrial plants, motels, shopping centers, banks, etc. It discusses the four "musts" found in an efficient, economical floodlighting installation and includes a table of

recommended footcandle levels for buildings exteriors.

The 12-page bulletin defines basic lighting terms, describes several applications of effective outdoor lighting and provides a table designed to help in making preliminary plans for an outdoor lighting installation.

(Item No. 11)

STEEL DOORS: Recommended specifications have been prepared by the Steel Door Institute to aid the architect and builder in specifying and using standard stock items — flush type interior steel doors, frames and sliding closet door and frame units — in all types of construction. The products covered by this recommendation are generally used in residential housing, apartments, hotels, motels, schools and light commercial and industrial structures.

(Item No. 12)

WINDSTORM DAMAGE: A 40-page technical publication on how to prevent windstorm damage and help save lives and property is intended for use by architects, engineers and others concerned with building standards. Entitled "Windstorm Damage Prevention," the National Board of Fire Underwriters booklet deals with the frequency of these storms, their occurrence and characteristics and their effects on buildings.

The publication points out that windstorm losses occur in a variety of ways, ranging in extent from damaging paint by windblown debris to complete collapse of a structure. But by attention to details of design and construction, much can be done to reduce losses from hurricanes and even tornadoes.

(Item No. 13)

HOSPITAL COMMUNICATIONS: Executone's "Better Patient Care" tells how hospitals make maximum use of nursing time and skills and includes a summary of time and motion studies made by the Surgeon Generals' Offices of the Army and Air Force.

Illustrated and described in detail are multi-audio-visual nurse call systems which permit patient calls to be answered from many points on the floor; doctors' paging systems; bedside radio-sound systems providing patient entertainment through pillow speakers; and administrative intercom systems for two-way communication within and between departments.

(Item No. 14)

BATHROOMS: Gerber tells you "How to Build More Bathroom Appeal into Your Homes" in a 16-page booklet which illustrates eight ways to do it economically through proper use of new fixtures. For example, instead of chain and plug fixtures, you can have pop-up drains; instead of a washdown closet, you can have a reverse trap closet.

(Item No. 15)

STRUCTURAL STEEL IN USE

STRUCTURAL STEEL: "Steel for the Structures of America," a 24-page picture booklet issued by Allied Structural Steel, shows a number of recently completed buildings, schools, hospitals and bridges in color as well as black and white. Among the projects shown in the structural steel erection stage: the University of Kansas Fieldhouse, the Diagnostic Building of the Mayo Clinic and the Sylvania Electric Products Co. plant.

(Item No. 16)

ACOUSTICS: In its 16-page booklet Armstrong discusses technical aspects of acoustical treatment in non-technical terms. Well illustrated, "Quiet at Work" provides data needed in choosing materials for specific uses and summarizes advantages of each product type in chart form.

(Item No. 17)

SOUND SYSTEMS: Brief and non-technical text highlights three brochures, each an eight-pager devoted to RCA sound systems. One is concerned with hotels, another with churches and a third with public address sytems. Intallations in two California projects are described and illustrated: the Beverly Hilton Hotel, Beverly Hills, and Bay Meadows Race Tract, San Mateo.

(Item No. 18)

METAL LATH: Methods of attaching metal lath directly to horizontal wood supports are discussed in the latest technical bulletin published by the Metal Lath Manufacturers Association. The specifications section recommends methods for nailing metal lath to wood studs and nailing or nailing-and-tying metal lath to wood joists. Various tables and a page on wood construction details round out the bulletin.

(Item No. 19)

WINDOW PROCESS: A steel window finishing process that eliminates the need for painting is introduced in Fenestra's four-page brochure. Called Fenlite, it consists of eight steps: vapor degreasing, pickling, rinsing, liquid fluxing, oven drying, zinc alloying, passivating and chemical polishing, final product assembly. The process reportedly protects the steel with an alloy bonded, high luster, zinc surface.

(Item No. 20)

PLYWOOD TIPS: The home builder primarily will be interested in the latest United States Plywood booklet which deals with a variety of phases of hardwood plywood. Such headings as "Where to Use It," "How to Use It" and "How to Select It" indicate the scope of the material.

A section presenting ideas for treatment of individual rooms is supplemented by color plates showing the grain pattern and color of the 10 most popular hardwoods. Information about thicknesses, construction and face matching effects is another feature. A reference guide to Weldwood includes a brief description of all types of panels and suggestions for their use.

(Item No. 21)

SLIDING GLASS DOORS: To furnish architects, contractors and the public with complete information on its product, the Sliding Glass Door and Window Institute has developed a brochure for general distribution. The 12 pages include photos applicable to new residential construction and the commercial field; a nomenclature of stock door sizes; and a listing of institute activities.

CEILING DIFFUSER made by Connor Engineering Corp. is simple dome shaped fixture extending but few inches below ceiling and usually painted same color as latter.

Ceiling diffusers

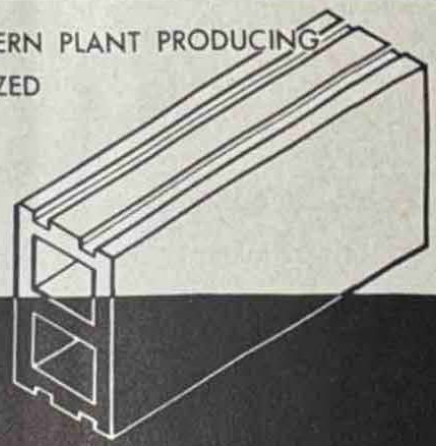
Ceiling diffusers, outlets originally developed for commercial and industrial use, are now being applied in homes, particularly where there is year-round temperature control.

These devices stem from air conditioning. Since people are more sensitive to cold than to warm air motion, warm air grilles and registers as cooled air outlets were frequently found inadequate. What was needed was a means of introducing air in such a way as to be draftless, yet provide roomwide circulation and even temperatures. Though space, occupancy and other conditions are not as critical in the average home as in many commercial buildings, requirements are still basically the same and ceiling air diffusion in homes offers several advantages.

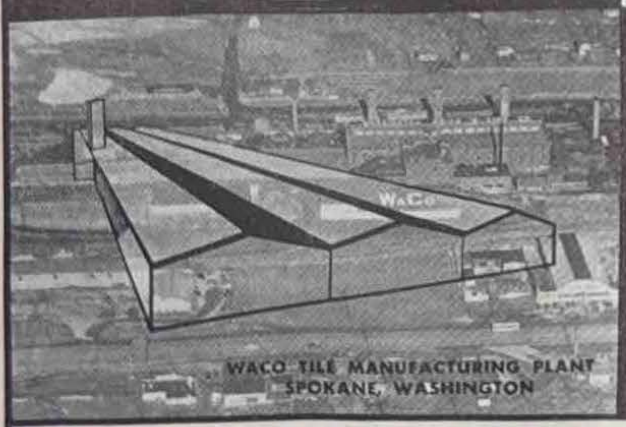
The ceiling air diffuser is really an air mixer. It mixes supply or incoming air with the room air so rapidly that by the time the mixture reaches the living area, its velocity is virtually imperceptible and temperature is at the desired level. And radial discharge distributes the cooled or heated air evenly and thoroughly in all directions. Hence with a properly designed overhead system there are no drafts nor over or under-conditioned spots.

A ceiling diffuser has roughly twice the air mixing ability of a grille because air discharge is in the form of a thin disc-shaped stream. The greater surface area of the air stream, what engineers call aspect ratio, the more room air it entrains and mixes.

An important element in the diffuser system is the return air grilles which are located in the baseboards under the windows. Warm air, being lighter, has a tendency to stratify in the upper part of the room but the grilles, continually drawing off the cooler floor level air, help to pull it down into the room.



Installation of the overhead system is the same as for forced warm air methods with the exception, of course, that the supply ducts are in the attic rather than the basement. In ranch houses ducts are laid across the joists in any way convenient and in the expansion attic house they are run between the joists and floored over.



Basement headroom is saved by making the joists serve as return ducts. This is done by joining two joists at the bottom with a strip of sheet metal.

While cooling may not be installed when the house is built, by providing for its eventual addition the owner can protect the resale value of his property. This seems all the more logical when a heating plant that can

be easily converted to cooling is well in line, costwise, with other types. The ceiling diffuser method, because it embodies accepted air conditioning features, is preferred by heating and air conditioning authorities for the all-year system.

At the Beverly Hilton

The basic design of the $17 million Beverly Hilton Hotel in Beverly Hills, Calif., consists of three slender wings, radiating out from a central service core to provide most of the 450 rooms with excellent outside exposures.

To gain full advantage of this feature, these rooms include an outdoor balcony which is given privacy by a partition of porcelain enameled, double-faced panels, laminated to honeycomb material. Colors of these separation panels vary from light pastel shades to dark blues and browns, in tones to match their surrounding decorations.

Movable shutter doors, 33 in all, were designed by Paul Heinley to form the entrances for the cabanas surrounding the swimming pool. This treatment allows swimmers and sun bathers complete privacy. Light and heat can be controlled by merely adjusting the tilt rods.

OUTER BALCONIES of Beverly Hilton are partitioned by porcelain enameled panels. Below, installation of four-panel shutter doors on cabanas lining swimming pool of hotel, designed by Welton Becket & Associates and built by Del E. Webb Construction Co.

IN WALL PANELS

"GLAZED STRUCTURAL WALLS MAKE BREWERY SANITATION EASY"

Burgermeister's vital problem of controlled sanitation has been greatly simplified and reduced in cost with walls of Western Glazed Structural Units.

In three remodeling and expansion programs since 1952, the brewery has installed 37,620 sq. ft. of this gleaming ceramic finished tile.

Wall and finish are one — no framing, lathing, plastering or finishing required. Hard, smooth surface resists wear, stains, odors; never needs painting. Clear glaze, plus 12 attractive colors. Standardized sizes and shapes for every requirement. For shape chart and specification details write to KRAFTILE CO., Niles, Calif.; or WASHINGTON BRICK & LIME CO., Spokane, Washington; members of

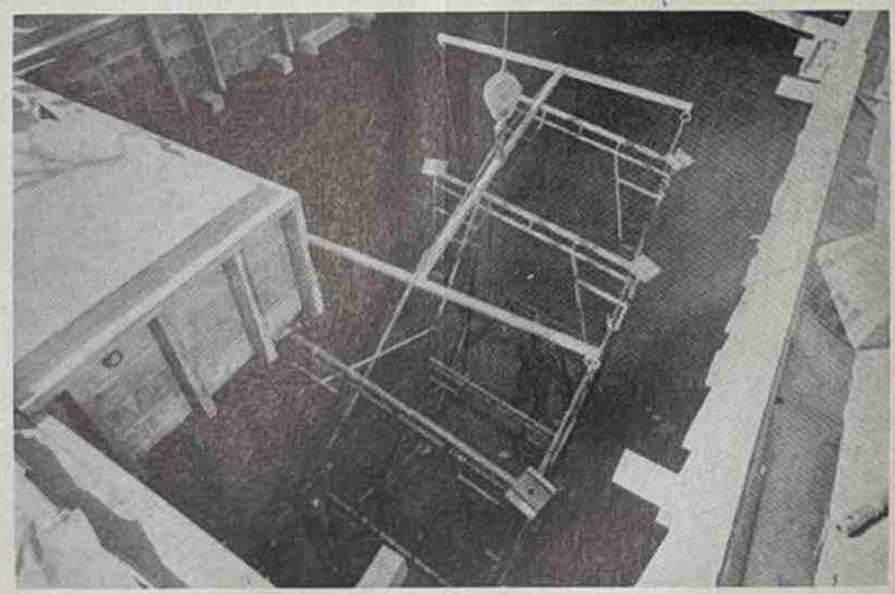
WESTERN STRUCTURAL TILE INSTITUTE

Here's what they're doing with sectional shoring

ALERT CONTRACTORS successfully applied several new techniques recently which further increased the versatility and efficiency of sectional steel shoring, the workhorse of modern concrete construction.

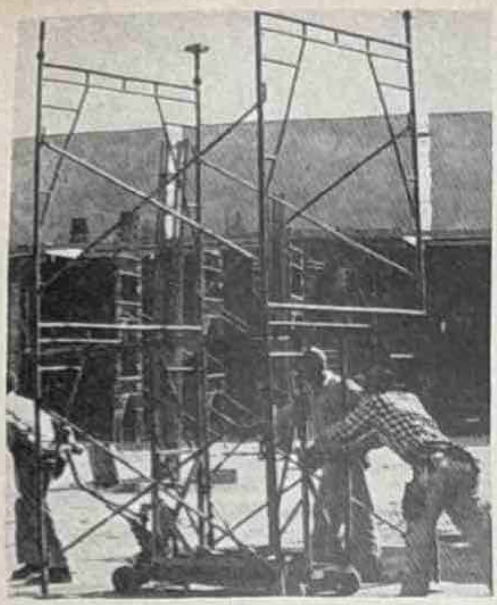
In one case the contractor rolled prefabricated shoring units from pour to pour on a wheeled dolly and lifted them to the next floor by an electric crane. In another instance shoring units were slid on greased wood sills. And in other cases, contractors used 5-ft.-wide units to support precast roof planks, to support isolated, exterior spandrel beams and to support a unique, poured concrete pitched roof.

The techniques, impractical or impossible with built-on-the-job wood shoring, all utilized Patent Scaffolding's steel, frame type shoring called Trouble Saver. In each case the shoring was quickly assembled on the job from base plates, 20-in. adjustable extension legs, welded 5-ft.-wide frames and diagonal braces. Fast-acting SlideLoks or wing nuts are used to secure the braces to the frame.



In Anaheim, Calif., a mechanized handling system was devised for moving sectional steel shoring both horizontally and vertically on the multi-storied Broadway-Hale Department Store. Contractor Ford J. Twaits Co. used rubber-tired hydraulic lift trucks to transport the sections horizontally to either a stair well or escalator block-out. There the sections were raised to the next floor by means of a monorail mounted hoist which in turn releases each section to a lift truck working that level (photo right).

The assembled sections were moved quickly into position and joined to existing shoring by cross braces. Construction manager L. E. Douglas reported that the mechanized movement of the shoring permitted unusually big pours. Single pours from 550 to 660 cu. yd. were not uncommon. These pours covered from 16,000 to 18,000 sq. ft. and were made at rates up to 93 cu. yd. per hour.



Another project involving horizontal movement of shoring sections was the Emporium-Capwell Co. warehouse, Oakland, Calif., with William J. Moran Co. as contractor (photo below).

A system of sliding entire sections of sectional steel shoring to new pour areas was used on the Monsanto Chemical Co. warehouse, Kearney, N. J. Eleven shoring sections, each covering 720 sq. ft. were pulled on greased wood sills by a hand winch. Each section was slid three times for succeeding pours on the 189-ft. by 231-ft. structure.

Sectional steel shoring is as adaptable to precast roof planks as it is to poured construction as proved by two one-story jobs. On a 46,000-sq. ft. warehouse in Dallas, 710 6-ft. 6-in.-high steel end frames spaced 6 ft. apart shored a 15-ft.-high ceiling

WHEELED HYDRAULIC DOLLY is used to move four-frame unit shoring horizontally to next pour on Emporium-Capwell Co. warehouse, Oakland.

SIX-FRAME shoring section is lifted from floor to floor of three-story department store in Anaheim, Calif., through escalator black-out. Unit is picked up by four chains hung from corners of H-shaped bridle.

made of 12-in.-thick precast planks. On a Kansas City building, 160 frames shored 2-ft.-and 5-ft.-wide poured beams as well as 24-ft.-long by 12-in.-thick precast roof planks.

While constructing a 100-ft. dia. digestion tank in Jersey City, N. J., the contractor was faced with the problem of supporting a concrete roof slab 32 ft. high and 12 in. thick from a difficult cone shaped base. The lowest point of the floor dipped to 12 ft. 6 in. below the bottom of the wall. The unusual floor condition was overcome with sectional steel shoring frames of various heights and by making leveling adjustments with the 20-in. adjustable legs. A datum line was projected on a level with the bottom of the 32-ft.-high tank wall and the shoring base frames brought to that level.

A concrete contractor put sectional steel shoring to good use while building a high school in North Arlington, N. J. The shoring supported formwork for the pouring of heavy, isolated exterior spandrel beams which were 120 ft. long, 1 ft. 4 in. wide and 3 ft. 5 in. deep. The shoring frames also provided a ready-made "built-in" scaffold for stripping of the forms.

In Miami, sectional shoring frames easily handled the job of supporting forms for a unique, poured concrete pitched roof on a new school, as well as shoring the flat slab.

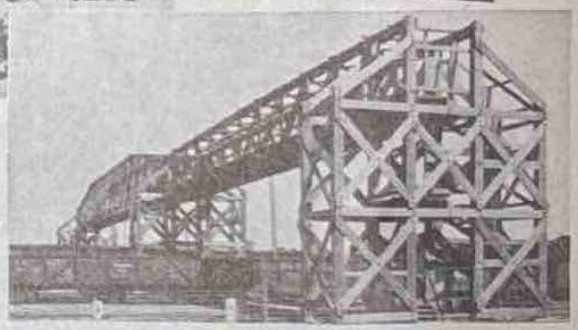
Naturally these shoring "tricks" are not always required in everyday use. But they do reflect one of the major advantages of sectional steel shoring —its versatility that makes it the workhouse on routine jobs.

Three honored for role in modular measure

Three men have been recognized by the American Standards Association for their part in the past year to encourage the use of modular measure in building. They are Leonard G. Haeger, technical director, Levitt & Sons, Inc., Levittown, Pa.; Fred M. Hauserman, president, The E. F. Hauserman Co., Cleveland manufacturer of metal partitions; and H. B. Zackrison, chief, engineering department, U. S. Army Corps of Engineers.

Presentation of awards was made in Los Angeles by C. W. Kraft, president of Kraftile Co. of Niles, Calif., who received an ASA award in 1954.

"Modular measure is a self-sustaining movement, with no high-pressure promotion behind it," Kraft explained. "The individual efforts of enthusiastic builders, producers, contractors and architects are of immense importance in speeding the present trend to modular dimensioning in building. Their work will accrue to the benefit of the American people in terms of lower building costs. The ASA modular measure award symbolizes the sponsors' appreciation of the essential contribution being made by individuals throughout the industry."



Sponsors of the movement, which uses the 4-in. module as a "least common denominator" are AIA, Producers' Council, NAHB and AGC.

Builders and Suppliers

headlining the news

• **Evertru Products Co.** of Moses Lake, Wash., has appointed Charles Smith as manager, replacing L. O. Kalbrenner who recently resigned. The concrete block plant is a newly acquired subsidiary of Washington Brick and Lime Co. of Spokane.

• **Monsanto Chemical Co.** has occupied a new office and warehouse structure at 6670 E. Flotilla St. in the Vail Field area of Los Angeles to serve as a distribution center for all of the company's marketing activities in southern California.

• **Kaiser Steel Corp.** has named Harry L. Warner as sales manager of its Fontana fabricating division. He previously was manager of contract sales at Kaiser's Napa fabricating division.

• **Ruby Lighting Co.** of Los Angeles and Dallas, maker of industrial fluorescent lighting fixtures, has been purchased by Ekco Products Co., marking the initial phase of an expansion program in which the latter plans to acquire a number of factories in the builders hardware and architectural field.

The Los Angeles Ruby Lighting operations will be moved into Ekco's new enlarged Whittier factory. Ekco chairman Arthur Keating says his firm's interest in the lighting field will be confined to industrial applications such as factories, offices, hospitals, etc.

Robert L. Lang, recently appointed vice president of the parent company, and Ralph Simon have been elected chairman and president, respectively, of the Ruby firm. Albert Jassin has been named executive vice president in Los Angeles.

• **Pomona Tile Manufacturing Co.** has been appointed distributor of Summitville quarry tile in several Pacific Coast and mountain states, including California.

• **Superior Scaffold Co.** of Culver City has a new sales manager, Robert Gray, formerly western regional sales manager of roofing products for U. S. Gypsum Co.

VOGEL

BOGET

• **Gladding, McBean & Co.** has formed an architectural division, a consolidation of Hermosa tile and masonry products. Named to head the new product division as vice president and general manager is Verne W. Boget, who previously has held the same posts in the Hermosa tile division.

Pete Vogel, for five years vice president in charge of sales in the 11 western states for Miracle Adhesives, has been appointed general sales manager for Hermosa tile and other tile products. He will have his office at the company's headquarters in Los Angeles.

• **Airtemp Division,** Chrysler Corp., has named George Sharkey West Coast assistant regional manager, succeeding L. D. Brosell who resigned.

• **NAHB** and Household magazine in a jointly sponsored design competition for small-volume builders have awarded honorable mentions to two California firms: Calvin R. Campbell of Pasadena and Security Development Corp. of Monterey.

• **National Electric Products Corp.** will construct a warehouse for electrical distribution systems, fittings and accessories at 6400 Corvette St., Los Angeles, and will discontinue production operations at its Torrance, Calif., plant.

• **Building Components, Inc.,** of Los Angeles has been appointed factory representative for southern California by Iron Fireman Manufacturing Co.

• **Portland Cement Association** in an expansion of its field services to cement users has opened a regional office in Los Angeles to supervise activities of the district office there and in Seattle.

Hugh Barnes has been named western regional manager with headquarters at 816 W. Fifth St. He joined the association in 1937 and has been

Attractive Olympia Memorial Clinic *features*

Chehalis Red Roman Brick

The warm, pleasing texture of Chehalis Red Romans—the Pacific Northwest's most distinctive brick—was selected by the architect to distinguish this modern clinic building in Olympia.

Here is functional design at its eye-appealing best—permanent, practical, fire-safe . . . and economical to build and maintain! Only brick—and preferably CHEHALIS BRICK—combines all these advantages so well.

SCPI

CHEHALIS BRICK and TILE Co.

BOX 868, CHEHALIS, WASHINGTON

Los Angeles district engineer since 1942. Barnes has been succeeded by John M. McNerney, with the association since 1941 and most recently statewide paving engineer for the Los Angeles office.

The expansion program raises the number of the association's regional offices to five and of its district offices to 32, covering almost the entire United States as well as British Columbia.

• **Gunite Contractors Association** has elected these officers: J. C. Fredericks, F. W. Case Corp., president; James Enbody, H. W. Enbody & Sons, secretary; N. R. Sanders, Johnson Western Gunite, treasurer. Stanley Zynda will continue as manager.

Members have agreed on four meetings a year, two in San Francisco and two in Los Angeles.

• **Associated Home Builders of the Greater East Bay** have elected Don T. Groom, partner in the Oakland firm of Groom-Moyer, to succeed McKie W. Roth of Walnut Creek as president.

William G. McFarland has been named field secretary of the group, succeeding Ronald L. Pardini who resigned to join Perma Bilt Homes at Sacremento.

The association has established a Livermore chapter, electing Roy N. Jensen its first president and Masud Mehran secretary.

• **Roddis Plywood Corp.** has established a fir plywood industrial sales division in the Ardel Building, 33 E. 10th Ave., Eugene, Ore., with Richard L. Rinde as newly appointed manager. A graduate of the University of Oregon, he formerly was assistant sales manager of Clear Fir Sales Co., Springfield, Ore.

• **Ralph Yoder** of Seattle, who heads the Washington State chapter, Producers' Council, will address the annual chapter presidents' conference at the Wade Park Manor Hotel in Cleveland September 25.

In announcing Yoder's selection, managing director John Haynes of Washington, D.C., commented: "We pick our speakers from the most successful chapters during the preceding year. In 1955 the Washington State chapter ranked 11th in guest-per-member ratio at its monthly informational meetings for architects. This is a sharp rise from the 21st ranking of the previous year."

• **Orr & Sembower, Inc.**, has added a sales representative to handle its automatic boilers in Boise: Richardson Equipment Co., 612 Front St.

• **Southwestern Idaho Association of Homebuilders** has elected Charles R. Kreiensieck of Boise as its first president. Other officers are DeWayne Bills, vice president, and Earl Hardy, secretary-treasurer, both of Boise.

• **W. P. Fuller & Co.** has announced changes in its administrative structure, highlighted by the creation of a new marketing division under the direction of W. P. Fuller 3rd, vice president and great-grandson of the company's founder. The new division brings together for the first time both paint and glass sales management.

C. E. Ide, at present manager of Fuller's intermountain district, will take over the newly created position of director of sales, paint and allied products about the first of the year. J. P. Walsh will continue in his present position as director of sales, glass and building products. Vice president H. S. Margetts will be in charge of division operations, which includes responsibility for the Fuller branch system throughout the West, Hawaii and Alaska.

• **Home Builders Institute of Los Angeles** has a new director of public relations, Richard D. McNish, who has been field representative since 1954. He is a graduate of California State Polytechnic College.

• **Calaveras Cement Co.** has opened a bulk cement transfer plant in San

Leandro to serve the San Francisco and East Bay construction industry. The $100,000 installation has a storage capacity of 5,000 bbl. of cement.

• **Robertshaw-Fulton Controls Co.** has named Harold W. Rice director of its West Coast research and development laboratory in Los Angeles. Rice, a member of the firm for more than 20 years, succeeds H. W. Geyer, who resigned.

• **Kaiser Aluminum and Chemical Sales, Inc.,** is expanding its service to architects in the Los Angeles area with the appointment of Walter F. Pruter Jr. to the newly created post of district architectural representative. A former senior service engineer, he joined Kaiser Aluminum in 1955 and was associated with the sales staff of United States Gypsum Co. for six years.

• **Permanente Cement Co.** has established a new contractor sales division in the Russ Building, 235 Montgomery St., San Francisco, with C. C. (Cless) Moore as division sales manager.

"As the name implies, the new unit will concentrate on serving major contractors," says James K. Beatty, vice president in charge of sales, "thus allowing the regular line salesmen to give their full attention to the requirements of batch plant operators and building material dealers."

Permanente's sixth kiln, latest unit in its $35 million expansion program, went into production near Los Altos, Calif., last month.

• **Empire Building Material Co.** of Portland has appointed Richard (Dick) Mason as district sales manager in Oregon and southern Washington. For the past two years he has been plant foreman.

• **Evans Products Co.** has doubled its timber supply on the West Coast by acquisition of cutting rights on a half-billion feet in Oregon to help supply veneer for production of the Michigan company's Evaneer plywood operations.

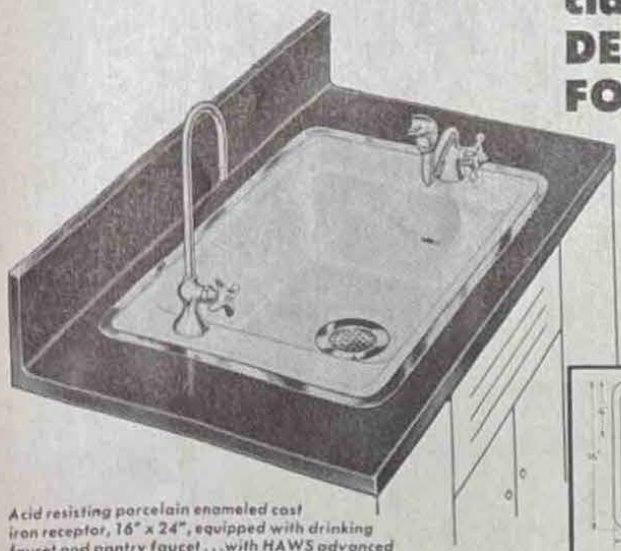
• **Symons Clamp and Manufacturing Co.** has opened a new concrete forming equipment plant in San Leandro, Calif., representing a major expansion of its West Coast operations.

Joseph Von Drasek has been named vice president in charge of the California factory, first to be built outside of Chicago. Assisting him in sales is Richard G. Allen. Robert P. Tross has been transferred from Chicago headquarters to act as chief engineer.

• **Harvey Aluminum** of Torrance, Calif., has resumed work at its 54,000-ton aluminum reduction plant at The Dalles, Ore., with an announcement that all financial and contractual arrangements have been finalized for construction, which was interrupted four years ago. On a 500-acre site, the plant is scheduled for completion late in 1957.

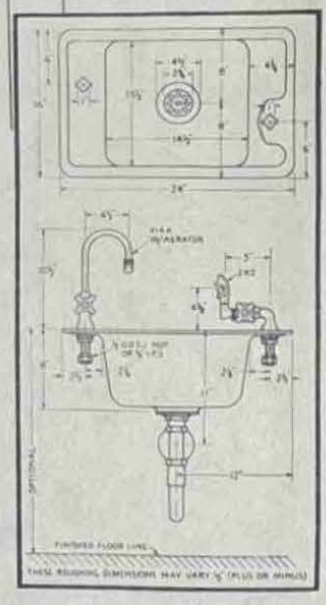
• **Gordon Tongue,** president of Northwestern Portland Cement Co. of Seattle, has been elected to the board of directors of the Portland Cement Association.

• **General Electric Co.** will construct a $2 million lamp division warehouse, distribution and office center in the Vail Field area of Los Angeles. Albert C. Martin & Associates are architects-engineers for the single-story, reinforced concrete structure, and Noyes Roach and C. L. Peck are joint contractors.



GE has opened its first Alaskan facility, a branch supply and apparatus house of General Electric Supply Co., in Anchorage, with George H. Smith, formerly of Portland and Medford, Ore., as manager.

• **Fibreboard Paper Products Corp.** has named Patrick H. Ryan to serve as merchandise manager of the Pabco building materials division in the firm's San Francisco headquarters. He was with the Pabco floor cover-



New School Project on the Board?

...add "the touch" that makes it really new... HAWS classroom DECK-TYPE FOUNTAINS

ing division as assistant to the vice president in 1954-55 and then became vice president and general manager of Building Products Corp. in Milwaukee.

• **Allmetal Screw Products Co.** has moved its West Coast division to larger quarters at 2978 Wilshire Blvd., Los Angeles (DUnkirk 5-6357).

• **A. C. Horn Co., Inc.**, has a new branch manager in its Los Angeles office, Harry D. Kennedy, who served as district sales representative in the Tacoma, Wash., area.

• **Pioneer Manufacturing Co.** has named W. Q. (Chris) Kringle sales manager for its Bay area office, succeeding William Bucknum who was recently appointed sales manager of Pioneer Range Co., a subsidiary.

Carl F. Hurley is Pioneer's new representative in San Diego.

• **Smith-Davis Co.** of Los Angeles, in conjunction with its parent company, Maas & Waldstein Co., is sponsoring a year-long series of technical clinics for painting contractors throughout the 11 western states. Sessions are being conducted by Hal Palmer, sales manager of the firm's architectural division.

• **Westinghouse Electric Corp.** has appointed William L. Trudgian as Pacific Coast regional agency and construction manager, with headquarters in San Francisco. Ray T. Killen succeeds Trudgian as district agency and construction manager in Seattle.

Robert E. Ralstin has been named to the newly established position of area sales manager for apparatus in the Portland office.

• **Georgia-Pacific Corp.** has appointed Robert O. Lee, formerly with Pacific Telephone in Seattle and San Francisco, as advertising manager and public relations director.

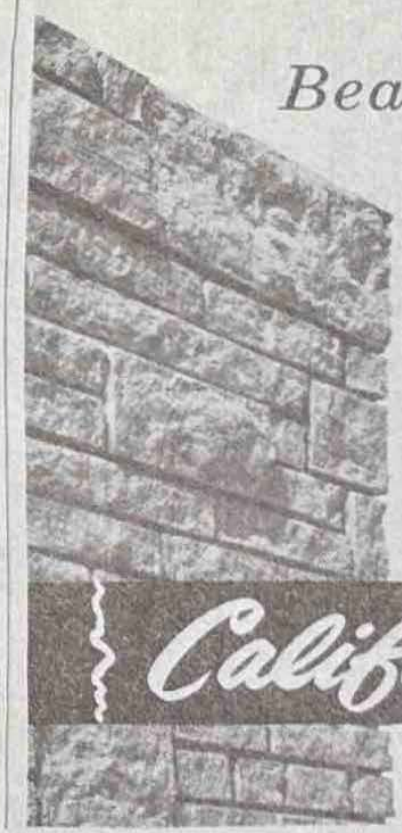
• **Textron, Inc.**, will construct a second plywood plant at Coquille, Ore., a $2 million operation adjacent to the present facility.

• **Drywall Contractors Association** (Southern California) has reelected its president, Wayne Vaughan of West Los Angeles. Frank Donaldson, Santa Ana, is vice president; Fletch Reynolds, La Habra, secretary; Reuben Casey, Garden Grove, treasurer. New directors are S. Douglas Hartley, Canoga Park, and M. R. McColley, San Diego.

• **Arcadia Metal Products** has moved its southern California sales office, headed by Bob Reed, to the new half-million-dollar plant at 801 S. Acacia Ave., Fullerton (MIchigan 3908, LAmbert 5-0291).

Design and the landscape in which we live (cont'd. from p. 12)

to use, and their primary functions are to provide settings for buildings and to impress the passerby. In doing this they have a potentially great contribution to make to the community landscape. This is rarely realized through failure to make use of the full possibilities inherent in free arrangements of trees, shrubs, flowers, ground cover and grass. Maintenance problems are also an inhibiting factor, basically through inadequate budgets. When these public grounds are adequate in size a good sense of outdoor space can be created.



Parks are sections of green outdoor space large enough to be used for circulation and relaxation by the general public. A "keep off the grass" sign will convert a park space to a public grounds space, to see only. Parks are pure humanized landscapes with a primary potential for saving our commmunities from speculative constructivism and the auto. We should all live in parks rather than having to go to parks. Parks embody the greatest opportunities for free landscape design with elements derived largely from nature and a minimum of construction.

Active public recreation spaces and facilities are quite specific and positive in their requirements. Playfields, game courts, playground areas and community buildings tend to be treated in a mechanized functional manner without grace of conscious design. The result is that many of them are about as attractive as a parking lot or a warehouse. When these active programs are merged with passive park spaces the latter may lose more than the former gains. However sensitive design control can take advantage of the more dynamic patterns which result, with multiple variations in combination and contrast.

Most of these landscape problems, except parks, are intimately involved with buildings, that is, with architecture. The relations between these two arts are constant and unavoidable. Architecture, as the art of shelter, enclosing and creating indoor space, has a maximum impact on the landscape around it. As practiced, landscape design and architecture differ in certain important aspects:

1. **Material.** Architecture uses the complex variety of construction materials. Landscape design uses some of these, but primarily the materials of the natural landscape—rock, earth, water, plants. These are also complex in their variations.

2. **Discipline.** Technique and function are usually less dictatorical in

Sandstone Beauty and Texture IN COLOR

Save 40%. California Stone (manufactured sandstone) in eleven subtle decorator-selected colors and shades exceeds natural sandstone in range of colors, and ease of handling with the strength and beauty of the natural product. You save 40% in material cost. Sizes available to give a random ashlar effect. Write or phone for complete details.

landscape design than in architecture. The parts of a garden don't hold each other up, and a garden space may have no function at all except to provide a pleasant experience for those looking into or passing through it.

3. Scale. The scale of architecture is a compound of human scale and structural economy, often reflecting the site scale. The scale of landscape design is a compound of human scale and site scale, often reflecting the scale of the surrounding landscape.

4. Continuity. Architecture tends to produce buildings which are complete and self-sufficient works of art, however carefully they may be related to the site. Landscape design must almost always establish a relation or connection between building, site and surrounding landscape. Therefore it tends to establish continuity between them, must relate itself to their forms and hence cannot be self-sufficient. Of course, when architecture is expressed in groups of buildings it also becomes concerned with continuity.

In the final analysis architecture and landscape design are both parts of a larger art of site-space design. In an urban skyscraper there may be no landscape design; in a rural park there may be no architecture. Most problems fall between these extremes, and the proportions of responsibility and control falling to the two fields will likewise vary. Each parcel of land has a block of air-space above it, and the three-dimensional development of this space for use and pleasure is the joint responsibility of architecture and landscape design.

In the most final analysis the landscape is indivisible. It stretches from ocean to ocean, and its limits are those of human vision and motion and such physical obstacles as may exist or be established. The landscape is everything an individual can see from a given station point or circulation route, colored by everything he has seen before and everything he has heard or read about it. This landscape, especially in the more developed urban and suburban areas, is compounded of many separate parcels of real estate and of all the multiple disconnected decisions made by different people at different times on those different parcels.

This is the basic process of landscape design in the large sense. The problem of how to unify and coordinate these multiple decisions so as to produce a harmonious community landscape is being tackled today by planners and redevelopers, but tomorrow it will be ours. Once the proper relations between overall control and democratic processes is worked out, the community landscape will become a physical design problem.

Landscape design today begins with backyards and front yards and all the miscellaneous open spaces left over by buildings, street and utility construction, within the preconceived patterns of standard subdivision and land planning practices. It expands from these problems into larger planned open spaces—parks, school and college grounds, other institutions, parkways and freeways, country clubs, golf courses, etc.

In the future landscape design will become synonymous with the unified design of the humanized landscape. The basic vocabulary for this includes ground forms, buildings, trees, vehicular circulation, pedestrian circulation, green open space, paved open space, water forms. The secondary vocabulary includes all the multiple furnishing, equipping and enriching detailed elements of the man-made world and the world of nature.

Thus landscape design begins with the common or garden variety of local landscaper and ends with the merging of all the space-planning professions and all the other fields of design concerned with improving our world.

I've no worries about TERMITES or ROT...

I built with BOLIDEN SALT pressure-treated lumber

Architects and builders in steadily growing numbers are recommending and using Boliden Salt Pressure-Treated Lumber in home construction because it provides dependable protection against termites and rot. The small extra cost now is a long-range saving.

Time-tested Boliden Salt is approved as a standard preservative by the American Wood Preservers' Assn., American Assn. of State Highway officials, Federal, State and Local agencies and the P.C.B.O.B.

BOLIDEN SALT

Boliden Salt is Clean, Odorless, Fire-Resistant, Nearly Colorless, Paints Readily

Buyers look for telephone planning in today's homes

say WELDON B. MANSFIELD *and* SHELDON W. PARKER,
partners, Western Enterprises, Inc.
Sacramento, California

Buyers of new homes "just naturally expect" built-in telephone outlets in convenient locations, report builders Mansfield and Parker. The same goes for concealed telephone wiring. Western Enterprises' newest development offers these features—plus two color telephones and six-months' service *free of charge* for each home.

To successful builders like Messrs. Mansfield and Parker, who are setting living standards in the Pacific West, complete telephone planning is as basic as adequate electrical wiring. Pacific Telephone is always ready to help you plan built-in telephone facilities. Just call us and ask for our free Architects and Builders Service.

Specify built-in telephone facilities

For further information, write to L. N. McClellan, chief engineer, Denver Federal Center, Denver, Colo., referring to the project by title and number.

BID CALLS EXPECTED IN SEPTEMBER

DAM, Anchor (9-1), Missouri River Basin Project, Wyo. On South Fork of Owl Creek about 35 miles west of Thermopolis, Wyo. Bids will be received on the two following alternate proposals: 1 — Constructing an earthfill dam with crest of 175' above streambed and 460' in length, a spillway with approach channel, concrete inlet structure, concrete lined tunnel, concrete conduit and stilling basin, riprap lined outlet channel, outlet works with concrete intake structure, lined tunnel, gate chamber, adit and access shaft, shaft house, ventilating system and one mile of access road with drainage structures. 2—Constructing a 66,000 cu. yd. concrete arch dam 200' high and 550' long and constructing one mile of access road with drainage structures.

Quantities: Earthfill Dam—59,000 c.y. excavation, overburden in open cut, 12,000 c.y. bedrock excavation in open cut; 7,000 c.y. excavation in tunnels and shafts; 641,000 c.y. excavation from borrow; 22,000 c.y. pervious backfill; 544,000 c.y. earthfill in dam embankment; 8,600 sacks pressure grouting; 800,000 lb. reinforcing steel; 2,750 lb. piping; 58,000 lb. metalwork, equipment. Concrete Arch Dam—diversion and care of river; 44,000 c.y. overburden excavation; 20,000 c.y. bedrock excavation; 26,000 c.y. roadway excavation; 5,000' grout holes; 5,000 sacks grouting; 66,000 c.y. concrete; 31,000 lb. mechanical equipment; 83,000 lb. metal work.

Completion time 900 days.

Bids will be called by the chief engineer, Denver, Colo. late in September.

DAM, Howard Prairie (9-2)—Rogue River Basin Project, Ore. On Beaver Creek about 27 miles east of Ashland, Ore. Constructing an 86' high, 990' long earth and rockfill dam; a spillway with approach channel, concrete crest structure, chute and stilling basin; an outlet works with concrete intake structure, fish screen structure, conduit, gate chamber, control house and stilling basin.

Quantities: 34,000 c.y. common excavation for dam; 825 c.y. rock excavation for dam; 367,000 c.y. excavation from borrow; 400,000 c.y. fill in dam embankment; 26,000 c.y. excavation for structures; 2,000 c.y. concrete in structures; 13,000 c.y. pressure grouting; 250,000 lb. reinforcing steel; 5,000 lb. metalwork; 41,000 lb. government furnished metalwork, equipment; 16,000 lb. outlet pipe.

Completion time 750 days.

Bids will be called by the chief engineer, Denver, late in September.

TUNNEL—Helena Valley (9-3) — Missouri River Basin Project, Mont. Fifteen miles east of Helena adjacent to Canyon Ferry Dam, Mont. Constructing a seven foot diameter horseshoe tunnel about 2.6 miles long.

Quantities: 31,000 c.y. excavation in tunnel; 10,000 c.y. concrete in tunnel lining; 100 c.y. concrete in structures; 600,000 lb. steel supports; 14,000' roof bolt supports; 50,000 lb. tunnel liner plate; 200 mbm permanent timbering.

Completion time 800 days.

Bids to be called late in September by the chief engineer, Denver.

POWER PLANTS—Wanship and Gateway (9-4)—Weber Basin Project, Utah.

Wanship Power Plant, south of Wanship, Utah—Constructing a reinforced concrete, outdoor type power plant including steel penstock, concrete tailrace structure and channel, installing one 2,000 hp. turbine, one 1,400 kw generator, one 54" butterfly valve, one gate shaft type governor, furnishing and installing one bulkhead gate and a package type substation, construction a wood pole transmission line 1,700' long. Quantities: 3,800 c.y. common excavation; 20 c.y. rock excavation; 390 c.y. concrete; 50,000 lb. reinforcing steel; 50,000 lb. of 54" steel penstock; 3,560 lb bulkhead gate.

Gateway Power Plant, ten miles southwest of Ogden, Utah on the south bank of the Weber River—Constructing a reinforced concrete, outdoor type power plant including steel penstock and concrete penstock anchor, concrete tailrace structure and channel, installing two 2,900 hp turbines, two 2,000 kw generators, two 54" butterfly valves, two gate shaft type governors and furnishing and installing bulkhead gate, one radial gate and a package type substation. Project also includes construction of timber bridge across existing wasteway structure and an access road 1,000' long. Quantities: 29,000 c.y. common excavation; 1,000 c.y. rock excavation; 1,600 c.y. concrete; 170,000 lb. reinforcing steel; 400,000 lb. 54" steel penstock; 4,165 lb. bulkhead gate.

Completion time 520 days.

Bids to be called soon by chief engineer, Denver.

PUMPING PLANT, Helena Valley (9-5)—Missouri River Basin Project, Mont. Near Helena, Mont. Constructing an outdoor type pumping plant of reinforced concrete with a structural steel crane runway and overhead traveling crane and an approach bridge. Work includes installing two 150 cfs, hydraulic turbine driven pumps and other government furnished equipment. Water for both pumps and turbines will come from Canyon Ferry Reservoir about 500' upstream.

QUANTITIES: 10,000 c.y. excavation; 6,300 c.y. concrete; 136,000 lb. structural steel; 80,000 lb. reinforcing steel; 670,000 lb. government furnished reinforcing steel; 500,000 lb. government furnished penstock, discharge pipe and manifolds; 225,000 lb. government furnished gates and valves; 171,000 lb. miscellaneous metalwork including trashracks.

Completion time 750 days.

Bids to be called by the chief engineer, Denver, late in September.

PUMPING PLANT, White Bluffs (9-6)—Columbia Basin Project, Wash. Near Othello, Wash. Constructing an indoor type pumping plant with four electrically driven, horizontal pumping units of 178 cfs total capacity. The substructure is to be reinforced concrete, the superstructure a structural steel frame with uninsulated metal panel siding, and the framing to carry a crane runway for a six ton, hand operated traveling crane. Also included is construction of the inlet transition, pump discharge line, outlet structure and switchyard and installation of pumping units and electrical equipment.

Quantities: 56,000 c.y. lateral excavation; 22,000 c.y. excavation for structures and discharge line; 10,000 c.y. backfill; 700 c.y. concrete; 60,000 lb. structural steel;48,000 lb. steel pipes and manifold; 1,650' of 21" and 66" concrete pipe.

Completion time 650 days.

Bids to be called late in September by the chief engineer, Denver.

LATERALS, North Side Pumping Division (9-9)—Minidoka Project, Idaho. Near Rupter, Idaho. Earthwork and structures for open laterals from 25 wells with bottom widths of from 4' to 2' and for six relift pumping plants and discharge lines.

Quantities: 260,000 c.y. lateral excavation; 20,000 mi. c.y. overhaul; 6,000 c.y. structure excavation; 530 c.y. concrete in structures; 9,000' of 15" to 30" precast concrete pipe.

CANAL STABILIZATION (9-11) — Shoshone Project, Wyo. About 20 miles north of Cody, Wyo. Constructing berms on canal above Buck Springs Creek siphon. Project involves 25,000 c.y. excavation, removal of wood culverts and replacement with corrugated metal pipe culvert.

Completion time 75 days.

Bids to be called by project manager, Cody.

DRAINS (9-14)—Shoshone Project, Wyo. Near Powell, Wyo. Constructing 3.5 mile of closed drain, 1.1 mile of open drains, converting about 1.6 mile of open and closed drains.

Completion time 250 days.

Bids to be called by project manager, Cody, Wyo.

DRAINS (9-15)—Riverton Project, Wyo. About 25 miles north and west of Riverton, Wyo. Constructin 3.5 mile of 6" and 8" closed drains, 0.25 mile of open drains.

Completion time 210 days.

Bids to be called by project manager, Riverton, Wyo.

DEEPENING DRAINS, Block 43 (9-16)—Columbia Basin Project, Wash. Near Warden, Wash. Deepening drains, constructing about 14 miles of new drains including culverts and drain inlets.

Completion time to be determined.

Bids to be called by project manager, Ephrata, Wash.

BRIDGE (9-21) — Provo River Project, Utah. Near Hailstone, Utah. Clearing river channel, constructing a timber bridge and two heavy riprap overflow controls.

Quantities: 3,500 c.y. constructing embankments; 11,000 ton riprap; 300 c.y. structure excavation; 25 c.y. concrete; 36,000 fbm timber in structures.

Completion time 150 days.

Bids to be called by regional director, Salt Lake City, Utah.

HOUSING (9-30) — Michaud Flats Project, Idaho. Near American Falls, Idaho. Constructing two two-bedroom residences. Completion time 230 days.

Bids to be called late in September by regional director, Boise.

BID CALLS EXPECTED IN OCTOBER AND NOVEMBER

DAM MODIFICATIONS (9-33)—Shoshone Project, Wyo. Replacing upstream portion of the lower outlet works with a new intake shaft and tunnel equipped with bulkhead Plugging the existing intake tunnel under gate and hoist and trashrack structure. water. Rehabilitating the existing slide gates and replacing one existing 57" balanced valve with an 84" needle valve. Replacing trashracks on the penstock intakes with new metal intake wells with cylindrical trashracks. At Buffalo Bill Dam six miles west of Cody. Chief engineer, Denver, to issue invitations.

CANAL, DIVERSION DAM (9-35)—Rogue River Basin Project, Ore. Constructing 10.3 miles of open canal including 2.3 mile of 6'x3.75' rectangular reinforced concrete flume section, 7.5 miles of 2.2' bottom width canal line with unreinforced concrete and 0.5 mile of 48" precast concrete pipe siphon; constructing a small rockfill type diversion dam with reinforced concrete core wall, sluiceway and canal headworks and 1.65 miles of 24" bottom width canal lined with unreinforced concrete. Fifteen mies east of Ashland. Chief engineer, Denver to issue invitations.

PIPE LINES (9-38)—Weber Basin Project, Utah. Furnishing, laying about 21,000' of 24", 27", 30" precast concrete pressure pipe part of which will be steel cylinder type pipe with pretensioned reinforcement and constructing one concrete lined equalizing reservoir for Davis Aqueduct trunk lines. About 10 miles north of Salt Lake City. Chief engineer, Denver, will issue invitations.

LATERALS (9-39)—Columbia Basin Project, Wash. Earthwork, structures for about 50 miles of unlined open laterals, wasteways, drains with bottom widths varying from 12' to 2". Block 85, about five miles north of Smyrna. Chief engineer, Denver, to call bids.

LATERALS (9-40)—Columbia Basin Project, Wash. Constructing irrigation facilities to serve eight new farm units in Block 74 near Quincy. Project manager, Ephrata to issue invitations.

LATERAL TURNOUTS (9-42)—Columbia Basin Project, Wash. Constructing two CHO turnouts and one concrete check for farm units 30, 31, 40 in Block 15. Near Ephrata. Project manager, Ephrata will issue invitations.

CANAL, LATERAL LINING (9-44)—Riverton Project, Wyo. Furnishing and applying asphalt lining to several reaches of canals and laterals. Near Riverton. Project manager, Riverton, to issue invitations.

DRAINS (9-45)—Yakima Project, Wash. Constructing about 12 miles of surface drains near Kennewick. Regional director, Boise, Idaho to issue invitations.

DEEPENING DRAIN, WASTEWAY (9-47)—Columbia Basin Project, Wash. Deepening about 2.5 miles of DE 229 drain, extending two culverts, reconstructing about 12 drain inlets, deepening about one mile of EL31 wasteway, removing and reconstructing a county road bridge in Block 42, near Warden. Project manager, Ephrata, to issue invitations.

DEEPENING DRAINS (9-48)—Columbia Basin Project, Wash. Deepening 11 drains in Blocks 41 and 42, near Moses Lake. Project manager, Ephrata to isue invitations.

WELL (9-49)—Pine River Project, Utah. Drilling, casing 6" diameter domestic water well to depth of about 200'. Twenty miles northeast of Durango, Colo. Regional director, Salt Lake City, Utah to issue invitations.

POWER PLANT (9-50)—Missouri River Project, Wyo. Constructing Fremont Canyon Power Plant will include an indoor type reinforced concrete structure with a structural steel superstructure frame and concrete walls housing two 33,500 hp turbines and two generators. Also included will be three miles of lined tunnel, 18' in diameter with an inlet gate shaft, hoist house, trashracks and a surge tank near power plant with two steel penstock tunnels. About 35 miles southwest of Casper. Chief engineer, Denver to isue invitations.

PUMPING PLANTS (9-51)—Chief Joseph Dam Project, Wash. Constructing the three Brewster Pumping Plants will include one outdoor pier type plant with an approach single span bridge and with fish protection facilities which is to be located on the Columbia River and is to pump 50 cfs to the second plant, a booster plant, which is to be an indoor type plant with a reinforced concrete slab and a structural steel superstructure with metal roofing and siding and a traveling crane. The third plant, a relift plant, is to be an outdoor type plant with a reinforced concrete floor slab. Work will also include steel pipe discharge lines and a steel tank reservoir. Near Brewster. Chief engineer, Denver, to issue invitations.

PUMPING PLANT (9-25)—Weber Basin Project, Utah. Constructing the P2.8R Pumping Plant which is to have four outdoor horizontal booster units, two units having a total head of 225' and 9 cfs discharge and two units having a total head of 365' and 8 cfs discharge. The pumps are to be installed on a reinforced concrete slab. Southeast of Ogden. Chief engineer, Denver, to issue invitations.

ACCESS ROAD (9-56)—Missouri River Basin Project, Wyo. Constructing five miles of road including a 140' truss bridge for access to Fremont Canyon Power Plant on North Platte River, 40 miles southwest of Casper. Chief engineer, Denver, to issue invitations.

ROAD RELOCATION (9-57)—Deschutes Project, Ore. Relocating Haystack Reservoir county road. Regional director, Boise, Idaho, to isue invitations.

HOUSING (9-59)—Columbia Basin Project, Wash. Constructing one two-bedroom frame residence with full basement and garage complete with water and sewage facilities. Near Ringold Relift Pumping Plant in Block 19. Project manager, Ephrata to issue invitations.

Advertisements for Bids

Advertisements reaching us not later than Wednesday noon will appear the same week.

THE RATE for Advertisements for Bids is 35 cents per line for the first insertion; 25 cents per line for each insertion thereafter.

STATE HIGHWAY PROJECTS
BIDS CLOSE 9:30 A.M., SEPTEMBER 27
Helena, Montana
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:30 A.M. on September 27, 1956. The proposals will be publicly opened and read immediately thereafter.

1. **F 76(5)U2**—Grade, gravel surfacing, bituminous surface treatment and construction of small drainage structures on 4.997 miles of the Gallatin Gateway-South Road in Gallatin County, Montana and Park County, Wyoming involving about; 468,188 cu. yds. excavation; 916 cu. yds. gravel backfill; 66,040 mi. yds. overhaul; 91,914 tons crushed gravel; 37,762 gals. liquid asphalt; 37,762 gals. emulsified asphalt; 8,812 M gals. watering; 1,537 units rolling; 2,774 lin. ft. corrugated metal pipe culverts; 818 lin. ft. structural plate pipe culverts; 240 hours blading work; 130 hours scraping work; 198 cu. yds. random riprap; and other items. Project to be completed in 300 calendar days.

2. **F 164(8)**—Grade, gravel surface, bituminous surface treatment and the construction of small drainage structures on 3.546 miles of the Porter's Corner Section of the Philipsburg-Anaconda Road in Granite County involving about 164,335 cu. yds. excavation; 116 cu. yds. gravel backfill; 11,670 mi. yds. overhaul; 59,469 tons crushed gravel; 23,605 gals. liquid asphalt; 23,605 gals. emulsified asphalt; 3,638 M gals. watering; 688 units rolling; 1,128 lin. ft. reinforced pipe culverts; 72 lin. ft. reinforced concrete stockpass; 288 lin. ft. corrugated metal pipe culverts; 7,982 lbs. reinforcing steel; 43.69 cu. yds. concrete; 650 MBM Headgate lumber; and other items. Project to be completed in 130 calendar days.

3. **F 175(4)**—Grade, gravel surface, bituminous surface treatment, construction of small drainage structures and the widening of one 63.4' steel and concrete bridge on 4.157 miles of the Philipsburg-South Road in Granite County involving about 179,354 cu. yds. excavation; 88 cu. yds gravel backfill; 77,710 mi. yds. overhaul; 91,508 tons crushed gravel; 30,129 gals. liquid asphalt; 30,193 gals. emulsified asphalt; 4,500 M gals. watering; 881 units rolling 1,760 lin. ft. reinforced concrete pipe culverts; 226 lin. ft. corrugated metal pipe culverts; 13,652 lbs. reinforcing steel; 22 cu. yds. class "A" concrete; 51.30 cu. yds. class "AD" concrete; 66.17 lin. ft. concrete curb and rail; all lump sum revision of existing structure and maintain traffic and other items. Project to be completed in 180 calendar days.

4. **F 196(5)**—Grade, gravel surfacing, road mix oiling, construction of small drainage structures and construction of two 38.0' treated timber bridges on 1.050 miles of the Browning East and West Road in Glacier County involving about 72,670 cu. yds. excavation; 28,539 mi. yds. overhaul; 17,445 tons crushed gravel; 30,712 gals. liquid asphalt; 1,403 M gals. watering; 240 units rolling; 1.050 miles processing; 258 lin. ft. corrugated metal pipe culverts; lump sum remove existing structures and maintain traffic; 45.400 MBM treated timber; 1.214 MBM untreated timber; 1,445 lin. ft. treated timber piles; and other items. Project to be completed by September 15, 1957.

5. **F 213(3)**—Construction of one 1317.5' steel and concrete bridge over the Yellowstone River on the Yellowstone River Bridge-Glendive Road at Glendive in Dawson County involving about all lump sum structural steel; 225,395 lbs. reinforcing steel;

4,416.7 cu. yds. concrete; 2,638.0 lin. ft. steel bridge rail; 47,700 lbs. furnishing steel bearing piles; 864 lin. ft. driving steel bearing piles; all lump sum test piles; 56 each floor-drains; all lump sum shoring and cribs; 5,675 cu. yds. structure excavation. Project to be completed by November 30, 1958.

6. F 245(10) and F 245(11)—Construction of a structural plate pipe arch culvert on the Glendive-Sidney Road, and grade, gravel surfacing, bituminous surface treatment and the construction of small drainage structures on 0.706 miles of the Glendive-Sidney Road in Richland County involving about 64,729 cu. yds. excavation; 451 cu. yds. gravel backfill; 9,438 cu. yds. designated borrow; 2,140 mi. yds. overhaul on designated borrow; 101 mi. yds. overhaul; 3,632 tons crushed gravel; 5,933 gals. liquid asphalt; 5,933 gals. emulsified asphalt; 1,300 M gals. watering; 225 units rolling; 1,070 lin. ft. corrugated metal pipe culverts; 328 lin. ft. haul and erect State furnished structural plate pipe culvert; and other items. Project to be completed by July 31, 1957.

7. US 370(8) and S-370(10)—Grade, gravel surfacing, seal coat oiling, plant mix oiling, and the construction of small drainage structures on 0.782 miles of the North Rouse Avenue—Bozeman section of the Bozeman-Wilsall Road in Gallatin County and the gravel surfacing, seal coat oiling and plant mix oiling on 2.890 miles of the Bozeman-Wilsall Road in Gallatin County involving about 7,331 cu. yds. excavation; 8,539 tons plant mix; 44,788 tons crushed gravel; 126,903 gals. asphalt cement; 30,551 gals. liquid asphalt; 1,365 M gals. watering; 380 units rolling; 546 lin. ft. corrugated metal pipe culverts; 337.5 lin. ft. steel guard rail; 11 each adjust manholes to grade; 2,201.1 sq. ft. galvanized metal bin type retaining wall; 400 cu. yds. gravel backfill; 50 hours mechanical tamping; 105 hours blading work; 75 hours scraping work; and other items. Project to be completed by September 15, 1957.

8. S 12(8)—Construction of one 88.0' treated timber pile bridge and approaches over Thirty Mile Creek on Smith Avenue between Water Street and Park Street within the City of Harlem on the Harlem-Turner-Canadian Line Road in Blaine County involving about 530 cu. yds. excavation; 3,227 cu. yds. designated borrow; 8,867 mi. yds. overhaul on designated borrow; 48 M gal. watering; all lump sum furnish and maintain facilities for watering; 192 lin. ft. corrugated metal pipe culverts; all lump sum remove existing structure and maintain traffic; 33.064 MBM treated timber; 1.315 MBM untreated timber; 1,320 lin. ft. treated timber piles; and other items. Project to be completed by June 30, 1957.

9. S 183(1)—Grade, gravel surfacing, one 38.0' treated timber bridge over Big Otter Creek and construction of small drainage structures on 7.073 miles of the Raynesford-South Road in Judith Basin County involving about 379,059 cu. yds. excavation; 489 cu. yds. backfill; 5,358 mi. yds. overhaul; 963 cu. yds. binder; 1,926 mi. yds. overhaul on binder; 42,352 tons crushed gravel; 6,449 M gal. watering; 205 units rolling; 3,744 lin. ft. reinforced concrete pipe culverts; 372 lin. ft. structural plate pipe stockpass; 16.264 MBM treated timber; 0.607 MBM untreated timber; 505 lin. ft. treated timber piles; and other items. Project to be completed in 200 calendar days.

10. S 286(4)—Grade, gravel surfacing and construction of small drainage structures on 10.437 miles of the Glasgow-Ophiem-Canadian Line Road in Valley County involving about 521,237 cu. yds. excavation; 487 cu. yds. gravel backfill; 52,960 mi. yds. overhaul; 12,543 tons selected borrow base course uncrushed; 66,191 tons crushed gravel; 1,566 cu. yds. binder; 3,132 mi. yds. overhaul on binder; 8,593 M gals. watering; 380 units rolling; 3,618 lin. ft. corrugated metal pipe culverts; 359 lin. ft. structural plate pipe culverts; and other items. Project to be completed in 180 calendar days.

The above listed quantities are approximate only.

All bid proposals shall be accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in his proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of bids is required.

Plans, specifications, forms of contract and bond, proposal blanks, and full instructions are on file for examination and may be obtained at the offices of the State Highway Commission in Helena, Montana. Plans and specifications for all Federal Aid Projects are also on file and may be examined in the office of the Bureau of Public Roads at Missoula.

Frank G. Connelly, Chairman
Scott P. Hart, State Highway Engineer

ELEMENTARY SCHOOL
BIDS CLOSE 8 P.M., SEPTEMBER 26
Seattle, Washington
NOTICE TO CONTRACTORS

Separate sealed proposals will be received by Shoreline School District No. 412, King County, Washington, at the Shoreline School District Office, East 158th Street and 20th Avenue N.E., Seattle 55, Washington, until 8:00 P.M., September 26, 1956, for the General, Mechanical, and Electrical contracts (separate contracts), for the construction of a new Echo Lake Elementary School, and the said proposals will then and there be publicly opened and read aloud. Bids received after the time set for opening cannot be considered.

Specifications and drawings may be examined at the office of the Architects, Jones and Bindon, 715 Hoge Building, Seattle 4, Washington, at the Seattle Chapter, Associated General Contractors of America, 215 West Harrison Street, Seattle, and at the Plan Bureau, 2413 Western Avenue, Seattle, and may be obtained at the Architects' office upon deposit of $25.00 for each set of general drawings and specifications and $15.00 for each set of mechanical or electrical drawings and specifications.

The full amount of deposit for one set of documents will be refunded to actual prime contract bidders, upon return of the docu-

When You Want Bids —

Architects and public officials charged with responsibility of getting competitive bids on construction projects have found for 53 years that our **CONSTRUCTION NEWS** publications provide the most effective and economical way through which to advertise for bids.

Year after year, more projects are advertised in CONSTRUCTION NEWS BULLETIN, in PACIFIC ARCHITECT AND BUILDER, and in PACIFIC BUILDER AND ENGINEER than in any other Northwest publications.

Rates are thirty-five cents per line for the first insertion; twenty-five cents per line for subsequent insertions. Copy received up to Wednesday noon reaches our readers the following Saturday.

PACIFIC ARCHITECT AND BUILDER
3rd Saturday of Each Month

PACIFIC BUILDER & ENGINEER
First Saturday of Each Month

CONSTRUCTION NEWS BULLETIN
2nd, 4th and 5th Saturdays

PACIFIC BUILDER & ENGINEER, INC., (MAin 0285) 2418 3RD AVENUE, SEATTLE 1, WASH.

ments, unmutilated and without marks or annotations, within one week after the date of the bid opening. Prime contract bidders requiring more than one set of documents and subcontract bidders desiring prints of drawings for their own use may obtain same by paying the actual cost of printing, which amount will not be refunded.

Each bid must be accompanied by a certified or bank cashier's check, or by a bid bond, each in an amount not less than 5% of the Base Bid, made payable to Shoreline School District No. 412, King County, Washington, bid bond must be furnished in the form set forth in the specifications with a State-licensed surety company as surety.

Attention of bidders is directed to State laws concerning wages, working hours, and other conditions of employment.

The Board of Directors reserves the right to reject any or all bids, and to waive informalities. No bidder may withdraw his bid after the hour set for the opening thereof, unless and until the award of contract has been delayed for a period exceeding forty-five (45) days.

By MYRON ERNST, Secretary,
Shoreline School District No. 412,
East 158th Street and 20th Ave. N.E.,
Seattle 55, Washington.

STATE HIGHWAY PROJECTS

BIDS CLOSE 9 A.M., SEPTEMBER 27 and SEPTEMBER 28

Portland, Oregon

NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Oregon State Highway Commission in the Queens Room of the Imperial Hotel in Portland, Oregon, at 9:00 a.m. on Thursday, September 27, and at 9:00 a.m. on Friday, September 28, 1956.

BIDS TO BE OPENED AT 9:00 A.M. ON THURSDAY, SEPTEMBER 27, 1956

COLUMBIA COUNTY: North Fork Scappoose Creek Bridge on the Pittsburg-Scappoose Highway, 1.3 mi. north of Scappose. FAP No. S-77(6). Construct a 100' reinforced concrete deck girder bridge over the North Fork of Scappoose Creek Requires approx. 200 cu. yds. struc. excavation; 174 cu. yds. Class "A" concrete; 44,000 lbs. metal reinforcement; and 72 lin. ft. 8" metal drain pipe.

DESCHUTES COUNTY: East Unit, Fort Rock Road-Brothers Section of the Central Oregon Highway, about 28 mi. southeast of Bend. FAP No. F-147(12). 11.97 mi grading and paving. Requires approx. 49,400 cu. yds. borrow excavation; grading on equipment rental basis; 900 lin. ft. guardrail; 26,300 cu. yds. crushed base materials; 30,600 tons asphaltic concrete mixture; 1,840 tons 85-100 asphalt; 154 tons RS-1 asphalt; 140 tons RS-2 asphalt; and 106 tons 150-200 asphalt.

DOUGLAS COUNTY: Fords Bridge Unit, Myrtle Creek-Canyonville Section of the Pacific Highway, about 6 mi. south of Myrtle Creek. Federal Interstate Project No. I-78 (33). 1.23 mi. of paving. Requires approx. 372 cu. yds. concrete in islands and curbs; 8,700 lin. ft. guardrail; 3,200 lin. ft. median barrier; 29,000 cu. yds. crushed base materials; 80 tons RC-3 asphalt; 14,000 tons asphaltic concrete mixture; 840 tons 85-100 asphalt; 32 tons RS-1 asphalt; 60 tons RS-2 asphalt; 40 tons 150-200 asphalt; 800 rods Type 2 fence; and 35 rods median fence. This project may be bid in combination with the Fords Bridge-Canyonville Grading and Paving Project in Douglas County.

DOUGLAS COUNTY: Fords Bridge-Canyonville Unit, Myrtle Creek-Canyonville Section of the Pacific Highway, north from Canyonville. Federal Interstate Project No. I-78(32). 1.79 mi. grading and paving. Requires approx. 470,000 cu. yds. excavation; 1,125 cu. yds. concrete in box culverts, curbs and islands; 80,000 lbs. metal reinforcing; 10,500 lin. ft. guardrail; 61,000 cu. yds. crushed base materails; 140 tons RC-3 asphalt; 17,100 tons asphaltic concrete mixture; 1,000 tons 85-100 asphalt; 62 tons RS-1 asphalt; 80 tons RS-2 asphalt; 130 tons 150-200 asphalt; 800 rods Type 2 fence; and 820 rods Type 3 fence. This project may be bid in combination with the Fords Bridge Paving Project in Douglas County.

DOUGLAS COUNTY: Weaver Road Structures on the relocated section of Weaver Road near Myrtle Creek. Federal Interstate Projct No. I-78(31). Construct a 228' reinf. concrete deck girder grade separation structure over the relocated Pacific Highway and a 130' reinf. concrete deck girder grade separation structure over the S. P. Railroad tracks. Requires approx. 80 cu. yds. struc. excavation; 3,920 lin. ft. treated timber piling; furnish 1,000 lin. ft. steel pile shells; drive 20 steel pile shells; 700 cu. yds. Class "A" concrete; 160,000 lbs. metal reinf.; and 180 lin. ft. 8" metal drain pipe.

GRANT COUNTY: John Day Rock Production Project on the John Day and John Day-Burns Highways, near John Day. State Project. Requires approx. 7,000 cu. yds. crushed material in stock piles.

HOOD RIVER COUNTY: Viento State Park, 7.5 mi. west of Hood River. State Project. Construct two small latrines including septic tanks, sewer lines and disposal fields.

MARION COUNTY: Salem Storage Building. State Project. Construct a 36'x288' reinf. concrete storage building on State Highway Commission property at Salem.

MULTNOMAH COUNTY: Illumination Installation, N. E. 42nd Avenue-Troutdale Section of the T. H. Banfield Expressway in Portland. State Project. Requires approx. 115 steel street light poles; 121 mercury vapor luminaires; 20,000 lin. ft. of burial cable; and 121 mast arms.

UMATILLA COUNTY: Emigrant Hill-Deadmans Pass Section of the Old Oregon Trail Highway, about 15 mi. southeast of Pendleton. Federal Interstate Project No. I-62(10). 3.06 mi. of grading. Requires approx. 1,290,000 cu. yds. excavation; 340 cu. yds. concrete in box culverts; 68,000 lbs. metal reinf.; and 2,300 rods Type 1 fence.

UMATILLA COUNTY: Umatilla River Bridge on the Hinkle-Bucks Corner Section of the Hermiston Secondary Highway. FAP No. S-86(2). Construct a 310' reinf. concrete bridge over the Umatilla River. Requires approx. 470 cu. yds. struc. excavation; 3,300 lin. ft. untreated timber piling; 630 lin. ft. treated timber piling; 757 cu. yds. Class "A" concrete; 172,000 lbs. metal reinf.; and 30 lin. ft. 8" metal drain pipe.

WHEELER COUNTY: Parish Creek Unit, Spray-Waterman Section of the Spray-Waterman County Road, about 5 mi. south of Spray. FAP No. S-175(2). 3.12 mi. of grading. Requires approx. 73,000 cu. yds. excavation.

YAMHILL COUNTY: Whiteson Section of the Pacific Highway West, about 4 mi. south of McMinnville. FAP No. F-58(2). 0.50 mi. grading and paving; also construct 275' concrete and timber bridge. Requires approx. 24,000 cu. yds. excavation; 11,200 cu. yds. crushed base materials; 12 tons RC-3 asphalt; 1,800 tons asphaltic concrete pavement; 16 tons RS-2 asphalt; 16 tons 150-200 asphalt; 4,200 lin. ft. treated timber piling; 380 cu. yds. concrete; 120,000 lbs. metal reinforcing; and 40 M-FBM treated timber.

BIDS TO BE OPENED AT 9:00 A.M. ON FRIDAY, SEPTEMBER 28, 1956

CLACKAMAS COUNTY: Zigzag River Bridge on Clackamas County Road No. 820, approx. 2 mi. from Rhododendron. County Project. Bids for this project are being received on behalf of the county. Construct a 180' reinf. concrete bridge. Requires approx. 55 cu. yds. struct. excavation; 350 cu. yds. Class "A" concrete; and 100,000 lbs. metal reinforcement.

DOUGLAS COUNTY: Missouri Bottom-Canyonville Structures on the Myrtle Creek-Canyonville Section of the relocated Pacific Highway in Douglas County. Federal Interstate Project No. I(31) and I(32). Construct twin 144' reinf. concrete overcrossings of Irwin Road; a 234' reinf. concrete undercrossing of Chadwick Lane; a 241' reinf. concrete undercrossing of Riddle Road; and twin 588' reinf. concrete and steel bridges over the South Umpqua River at Missouri Bottom. Requires approx. 1,600 cu. yds. struct. excavation; 1,470 lin. ft. steel pile shell; 3,447 cu. yds. Class "A" concrete; 762,000 lbs. metal reinf.; 967,000 lbs. structural steel; and 360 lin. ft. 8" metal drain pipe.

DOUGLAS COUNTY: Tiller Maintenance Building State Project. Construct a 32'x82' masonry block building on State Highway Commission property at Tiller.

JACKSON COUNTY: Bybee Bridge (Rogue River) Section of the Table Rock Road, about 6 mi. northwest of Central Point. FAP No. ER-32(1). 0.19 mi. of embankment repair. Requires approx. 1,080 cu. yds. of rock riprap on roadbed slopes.

JOSEPHINE COUNTY: East and West Forks Illinois River Bridge Sections of the Redwood Highway, south from Cave Junction. FAP No. F-127(6). 2.26 mi. grading and paving. Requires approx. 210,000 cu. yds. excavation; 46 cu. yds. concrete in box culverts; 5,400 lbs. metal reinf.; 1,900 lin. ft. guardrail; 670 cu. yds. sacked aggregate-cement riprap; 27,500 cu. yds. crushed base materials; 66 tons RC-3 asphalt; 8,200 tons asphaltic concrete mixture; 490 tons 85-100 asphalt; 30 tons RS-1 asphalt; 30 tons RS-2 asphalt; and 60 tons 150-200 asphalt.

MARION COUNTY: Illahee-North Jefferson Junction Section of the Pacific Highway East, about 5 mi. south of Salem. Federal Interstate Project No. I-176(12). 2.33 mi. grading and paving. Requires approx. 227,000 cu. yds. excavation; 1,100 cu. yds. concrete in curbs, islands and box culverts; 113,400 lbs. metal reinf.; 60,700 cu. yds. crushed base materials; 130 tons RC-3 asphalt; 20,500 tons asphaltic concrete mixture; 1,230 tons 85-100 asphalt; 80 tons RS-2 asphalt; 300 tons 150-200 asphalt; 125 tons RS-1 asphalt; 1,400 rods Type 2 fence; and 6,200 lin. ft. median guardrail.

MULTNOMAH COUNTY: Structure, grading and stone base on the 37th Avenue-42nd Avenue Section of the T. H. Banfield Expressway in Portland. Federal Interstate Project No. I-323(20). Construct 0.36 mi. of roadway including stone base; also construct a 125' reinf. concrete box girder extension to existing Sandy Blvd. Viaduct; and a 450-foot "on-ramp" to the Banfield Expressway. Requires approx. 2,400 cu. yds. drainage excavation; 72,000 cu. yds. general excavation; disposal of 66,000 cu. yds. excess material; 4,700 lin. ft. various sizes of sewer pipe; 15,000 cu. yds. coarse crushed material in base; 350 tons Class "B" asphaltic concrete; 2,000 cu. yds. struct. excavation; 2,550 cu. yds. Class "A" concrete; 145 cu. yds. Class "A-A" concrete; 465,000 lbs. metal reinf.; all prestressing reinforcement and prestressing required; and 1,525 lin. ft. metal rail.

UMATILLA COUNTY: DELETED.

YAMHILL COUNTY: Structure, grading and stone base on the Yamhill River (Lafayette) Bridge Section of the Lafayette-South Road in Yamhill County. FAP No. S-329(1). Construct 0.17 mi. of roadbed, including stone base, and a 378' reinf. concrete and steel girder bridge across the Yamhill River. Requires approx. 39,700 cu. yds. loose riprap; 860 cu. yds. coarse crushed material in base; 450 cu. yds. structural excavation; 1,134 lin. ft. steel pile shells; 790 cu. yds. Class "A" concrete; 150,000 lbs. metal reinf.; 145,000 lbs. struct. steel; and 780 lin. ft. metal rail.

THE MINIMUM HOURLY WAGE PAID TO LABOR EMPLOYED ON FEDERAL INTERSTATE PROJECTS SHALL BE AS SET FORTH IN THE SPECIAL PROVISIONS APPLICABLE TO THOSE RESPECTIVE PROJECTS. THE MINIMUM HOURLY WAGE PAID TO LABOR EMPLOYED ON OTHER FEDERAL-AID PROJECTS SHALL BE AS FOLLOWS: SKILLED LABOR, $2.25 PER HOUR; INTERMEDIATE LABOR, $2.00 PER HOUR; UNSKILLED LABOR, $1.75 PER HOUR.

Prequalification of bidders will be required in accordance with the provisions of ORS 279.010 to 279.024, inclusive. Full information for bidders may be obtained at the office of the Oregon State Highway Commission, State Highway Building, Salem, Oregon. Plans and specifications may be inspected at the same place and may be obtained by eligible bidders upon payment of $2.00 for each set.

Plans and specifications may also be inspected at the office of the Associated General Contractors in Portland, Seattle, Spokane, and Boise; and at the Builders Exchange Cooperative, Portland.

The right is reserved to reject any and all proposals or to accept the proposal deemed best for the State of Oregon.

CONCRETE GIRDER BRIDGES

BIDS CLOSE 10 A. M., SEPTEMBER 21

Portland, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, BUREAU OF PUBLIC ROADS, September 7, 1956. SEALED BIDS will be received at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon, mail address P. O. Box 3900, Portland, Oregon, until 10:00 o'clock A. M. on September 21, 1956, for furnishing the material and performing the work for constructing one 170-ft. and one 85-ft. Concrete Girder Bridges, Washington Forest Highway Project 13-A1, B1, D2, Unit 1, Randle-Yakima Highway, Silver Creek and Davis Creek Bridges, Gifford Pinchot National Forest, Lewis County, Washington, involving 565 Cu. Yds. Structure Excavation; 783 Cu. Yds. Concrete; 154,500 Lbs. Reinforcing Steel; and 476 Lin. Ft. Metal Hand Rail. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon. F. E. ANDREWS, Division Engineer. 5612—9-7, 8, 11

STATE HIGHWAY PROJECTS

BIDS CLOSE 10 A. M., SEPTEMBER 25

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, September 25, 1956, until 10:00 A. M., for the construction of the following improvements and will then and there be opened and publicly read:

Bids for the following projects will be opened in the Conference room on the first floor of the General Administration Building located at Eleventh and Columbia Streets on the North edge of the capitol group, instead of in the board room of the Public Service Commission where bid openings are usually held.

1. Clearing, Draining, Grading and Constructing Two Reinforced Concrete Bridges on 0.857 mile of Primary State Highway No. 1 in Thurston County, CAPITOL LAKE BRIDGE TO BOUNDARY STREET, FAP No. I-001-2(36), involving about 45 acres of Clearing, 650,500 cubic yards of Common Excavation, 75,380 units of Overhaul, 96,170 cubic yards of Excavation of Unsuitable Foundation Material, 2,846 linear feet of Concrete Pipe, 4,327 linear feet of Corrugated Metal Pipe, 2,218 cubic yards of Concrete, 392,400 pounds of Steel Reinforcing Bars, 18,200 linear feet of Treated Timber Piling and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.
2. Draining, Grading, Surfacing with Light Bituminous Surface Treatment and Constructing a Reinforced Concrete Slab Bridge on 6.028 miles of Primary State Highway No. 10 in Okanogan County, JANIS TO TONASKET, FAP No. F-029-2 (12) involving about 296,640 cubic yards of Common Excavation, 2,810 cubic yards of Solid Rock Excavation, 12,530 units of Overhaul, 57,750 tons of Selected Roadway Borrow, 37,960 tons of Crushed Stone Surfacing, Crushed Cover Stone and Crushed Screenings, 320 tons of Asphalt Cement, 878 linear feet of Precast Traffic Curb, 388 cubic yards of Concrete, 56,280 pounds of Steel Reinforcing Bars, 3,063 linear feet of Concrete Pipe, 259 linear feet of Corrugated Metal Pipe, 877 linear feet of Welded Steel Pipe, 1,346 linear feet of Beam Guard Rail, 77 Guide Posts, 1,900 cubic yards of Loose Riprap, a lump sum bid for Illuminated Terminal Nosing Assemblies and other items.
3. Draining, Grading and Surfacing with Light Bituminous Surface Treatment on 1.831 miles of Primary State Highway No. 10 in Okanogan County, RIVERSIDE VICINITY, FAP No. F-029-2(7), involving about 113,450 cubic yards of Common Excavation, 2,660 units of Overhaul, 20,115 tons of Crushed Stone Surfacing, Ballast and Crushed Cover Stone, 89 tons of Asphalt Cement, 1,470 linear feet of Concrete Pipe, 397 linear feet of Corrugated Metal Pipe and Pipe-Arch, 400 linear feet of Beam Guard Rail and other items.
4. Constructing Two Reinforced Concrete Box Girder Bridges on 0.071 mile of Primary State Highway No. 9 in Thurston County, N. P. RY. AND PERCIVAL CREEK OVERCROSSING, FAP No. F-FG-007-5(4), involving about 1,815 cubic yards of Structure Excavatiin, 2,277 cubic yards of Concrete, 1,498 linear feet of Reinforced Concrete Bridge Railing, 640,-000 pounds of Steel Reinforcing Bars, 36,000 pounds of Strurtural Steel and other items.
5. Constructing a Plate Girder Railway Bridge and Shoofly on Primary State Highway No. 1 in Thurston County, WEYERHAEUSER RAILWAY UNDERCROSSING, FAP No. IG-001-2(37), involving about 4 acres of Clearing, 16,430 cubic yards of Common Excavation, 500 cubic yards of Selected Roadway Borrow, a lump sum bid for Shoofly Trestle, 1,350 cubic yards of Structure Excavation, 610 cubic yards of Concrete, a lump sum bid for Structural Steel, 28,000 pounds of Steel Reinforcing Bars, 10.5 MBM of Treated Timber and Lumber and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.
6. Constructing a Reinforced Concrete Box Girder and Slab Bridge on 0.125 mile on Primary State Highway No. 10 in Okanogan County, OKANOGAN RIVER BRIDGE, FAP No. F-FG-029-2(10), involving about 2,000 cubic yards of Structure Excavation, 2,300 cubic yards of Concrete, 505,000 pounds of Steel Reinforcing Bars, 6,400 pounds of Structural Steel, 6,600 linear feet of Timber Piling, 560 linear feet of Concrete Piling and other items.
7. Draining, Grading, Sprfacing with Light Bituminous Surface Treatment and Paving with Type I-1 Asphaltic Concrete on 1.483 miles of Primary State Highway No. 7 in Grant County, CITIES OF EPHRATA AND SOAP LAKE, FAP No. F-031-1(5), involving about 15,535 cubic yards of Common Excavation, 2,370 tons of Sand Filler, 26,490 tons of Crushed Stone Surfacing, Ballast, Crushed Cover Stone and Mineral Aggregate, 121 tons of Asphalt Cement, 7,845 tons of Asphaltic Concrete, 3,441 linear feet of Concrete Pipe, 88 linear feet of Corrugated Metal Pipe, 8,825 linear feet of Cement Concrete Curb, 6,417 linear feet of Precast Traffic Curb and other items.
8. Draining, Grading, Surfacing with Crushed Stone and Constructing a Reinforced Concrete Girder Bridge on 0.189 mile of Kittitas County Road, TANEUM CREEK BRIDGE, FAS No. S-0563(1), involving about 4,300 cubic yards of Unclassified Excavation, 750 cubic yards Crushed Stone Surfacing, 200 cubic yards of Loose Riprap, 153 cubic yards of Concrete, 42,000 pounds of Steel Reinforcing Bars and other items.
9. Removing an obstruction from the Columbia River ship channel on Primary State Highway No. 12 in Wahkiakum County, NASSA POINT VICINITY, a State Project, involving about 20,000 tons of Dredge Excavation.
10. Removing existing Duwamish River Bridge No. 1-K/3 on Secondary State Highway No. 1-K in King County, FIRST AVENUE SOUTH BRIDGE REMOVAL, a State Project, involving a lump sum bid for Removing Existing Steel Movable Span Bridge and Timber Approaches.
11. Jacking and Leveling Existing Slab Bridge Deck on Primary State Highway No. 1 in Cowlitz County, OWL CREEK BRIDGE No. 1/712, a State Project, involving a lump sum bid for Leveling Existing Bridge, 30 cubic yards of Crushed Stone Surfacing, 150 tons of Type I-1 Asphaltic Concrete and other items.
12. Constructing a Reinforced Concrete Slab Half Bridge on 0.014 mile of Primary State Highway No. 9 in Jefferson County EAGLEMOUNT HALF BRIDGE, a State Project, involving about 100 cubic yards of Structure Excavation, 57 cubic yards of Concrete, 73 linear feet of Beam Guard Rail, 13,750 pounds of Steel Reinforcing Bars, a lump sum bid for Loading and Hauling Steel Piling and other items.

Federal funds have been allocated for items Nos. 1 to 8 inclusive.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalificaion of bidders is required. Maps, plans and specifications may be obtained from this office upon writtten request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informationl copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

E. C. HUNTLEY, Chairman
W. A. BUGGE, Director of Highways

TURBINE, GOVERNOR, INLET PIPE

BIDS CLOSE OCTOBER 25

Denver, Colorado

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4760) will be received at Denver, Colorado, until October 25, 1956, for furnishing one 23,500-horsepower, 600-rpm, vertical-shaft, multiple-jet, single-runner, impulse-type hydraulic turbine; one turbine governor; and one guard valve and inlet pipe for Green Springs Power Plant, Talent Division, Rogue River Basin Project, Oregon. Delivery is desired within 450 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner. 5606—9-15

PREFLIGHT FACILITIES MODERNIZATION

BIDS CLOSE 2 P. M., SEPTEMBER 27

Renton, Washington

NOTICE TO CONTRACTORS

Bids are hereby invited for installation and construction work for Phase II Preflight Modernization at Renton Field, Renton, Washington.

The work consists principally of mechanical and electrical utilities, including water, aircraft fuel, sewer, drainage, and electrical utilities, as well as earthwork, concrete and asphaltic paving, building and pavement demolition and new building construction work.

Bid, performance and payment bonds will be required. Further, unless the bidder has performed work for Boeing within the past two years, a duly certified current, (or latest available), financial statement will also be required. If the bidder has done no work for Boeing within the past four years a statement of experience will also be required in addition to the other documents specified above.

Bid documents are available for inspection at the Associated General Contractors of America, 215 West Harrison, Seattle, and 452 St. Helens Street, Tacoma; as well as at the Plan Bureau, 2413 Western Avenue, Seattle; and also at the issuing office listed below.

Request for copies of bid documents, by firms proposing to enter a prime bid or a major subcontract bid, should be directed to the office of Bouillon and Griffith, Professional Engineers, 1411 Fourth Avenue Building, Seattle, Washington. A $75 deposit will be required for each set of bid documents.

Bids will be received by Mr. C. L. Bisbee, Transport Division, Box 707, Renton, Washington, until 2:00 P. M., September 27, 1956. For site inspection, contact the Construction Engineer, Boeing Airplane Co., telephone Olive 3414, Extension 1807.

Bids will be opened privately. Each bid shall be deemed a firm offer for 30 days

after the date bids are opened and thereafter until withdrawn by a written notice received by Boeing. Boeing reserves the right to ward the contract to whomever it chooses, and may elect to reject any and all bids.

BOEING AIRPLANE COMPANY.

STEAM HEATING PLANT ALTERATIONS
BIDS CLOSE 3 P.M., P.S.T., SEPTEMBER 18
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed proposals will be received by the Director, Department of General Administration, General Administration Building, Room 218, Olympia, Washington, until 3:00 P.M., P.S.T., Tuesday, September 18, 1956, for Additions and Alterations to the Steam Heating Plants at Eastern State Hospital and at Lakeland Village, Medical Lake, Washington.

Drawings and specifications may be obtained from the office of H. Jack Reeves, Professional Engineer, Symons Building, Spokane, Washington.

The drawings, specifications and forms of contract documents, may be examined at the office of the Director, Department of General Administration, General Administration Building, Olympia, Washington, and at the office of H. Jack Reeves, Professional Engineer, Symons Building, Spokane, Washington.

A deposit of Twenty-Five Dollars ($25.00) per set for plans and specifications will be required from each bidder. This deposit will be returned to him upon the return of the drawings and specifications, in good condition, to the Engineer's office. The deposit check should be made payable to H. Jack Reeves.

The Director, Department of General Administration, reserves the right to reject any and all proposals and to waive informalities.

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-4755) will be received at Denver, Colorado, until October 2, 1956, for furnishing one vertical-shaft, double volute, centrifugal pump with regulating valve and connection piece, having an initial capacity of 75 cfs under 92 foot head, at a speed of 400 rpm, suitable for ultimate capacity of 100 cfs by replacing the impeller, for "C" Line Canal Pumping Plant Extension, Boise Project, Idaho. Delivery is desired within 200 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

BRIDGE SUPERSTRUCTURE, ROAD RELOCATION
BIDS CLOSE OCTOBER 2
Weaverville, California
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4751) will be received at Weaverville, California, until October 2 ,1956, for furnishing labor and materials for Trinity River Bridge Superstructure and County Road Relocation, Station 5#55 to Station 8#50 for Trinity Dam, Central Valley Project, California. Location near Lewiston, California, in Trinity County. Principal items are 235,000 lbs. furnishing and erecting structural steel; 290 cu. yds. concrete in bridge slab; and other work. Completion time 330 days. For particulars, address Bureau of Reclamation, Weaverville, California; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.

DRAIN EXTENSIONS
BIDS CLOSE 10 A.M., P.S.T., SEPT. 18
Ephrata, Washington
NOTICE TO CONTRACTORS

UNITED STATES DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids, in single (Specifications No. 117C-389) will be received at the office of the Project Manager, Bureau of Reclamation, Project Office Building, Division and "C" Streets N.W., Ephrata, Washington, until 10:00 a.m., Pacific Standard Time, September 18, 1956, and then publicly opened for furnishing labor and materials and performing all work for construction of Deep Drain Extension Block 49. This work will include earthwork for approximately 2.6 miles of open drains and for approximately 0.6 mile of deepening existing wasteways; bottom width of sections vary from 2 to 4 feet; earthwork for and construction of structures along wasteways and drains, including road crossings and control drop; earthwork for and modification of an existing concrete drop structure; riprap and gravel bedding for cascade drop and gravel protection at the inlet and outlet ends of structures. Time allowed for completion will be 150 calendar days. For particulars address the Bureau of Reclamation, P. R. Nalder, Project Manager, Box 368, Ephrata, Washington.

WERE THE STRUCTURAL DESIGNERS AND CONTRACTORS SEEKING A BETTER, MORE ECONOMICAL FRAMING UNIT?

THEY ALWAYS ARE

and the MACOMBER V-BEAM

PATENTED

AMERICAN INSTITUTE OF STEEL CONSTRUCTION INC. AISC FOUNDED 1921

SEND FOR YOUR V-BEAM CATALOG

— PROVED TO BE THE PERFECT ANSWER

When a framing member is lighter and stronger and costs less than other steel framing members for floors and roofs, it DOES get the immediate acceptance—NATION-WIDE—heaped upon the V-BEAM.

One trial is so convincing to architects, so successful for the General Contractor—repeat orders follow.

Send for the V-BEAM Catalog. Consult the Loading Table. Then contact your Macomber Representative and you will be convinced—as others have—that V-BEAMS have no equal as steel framing members.

KRAFTILE VENEER

with 60% Savings in Space and Weight

Glazed ceramic veneer panels of 3/8" thickness, weighing only 4 lbs. per sq. ft. offer construction economies, permanent beauty and ease of maintenance. For modernization or new construction, Kraftile Veneer permits much faster handling, on-the-job cutting, and reduced structural support. Install over wood, steel or concrete by common adhesion method. Select color range. Write for Fact File of shapes, specifications and installation examples.

About FLW and his 'awesome needle'

LAST MONTH we attended an exhibit of the work of Frank Lloyd Wright in the famous Bal Tabarin in Chicago's Sherman Hotel. We attended not so much to see the exhibit—which we have seen before—as to study the people who were so patently interested in architecture as to pay a fee and ascend to the sixth floor of the hotel in the heart of a busy city.

There were the usual students and artists and architects, of course, but also a strong segment of the curious laymen, displaying what seemed to us a resurgent interest in architecture. Not all understood what they saw but they did seem to appreciate that here was displayed a profound greatness that needed understanding.

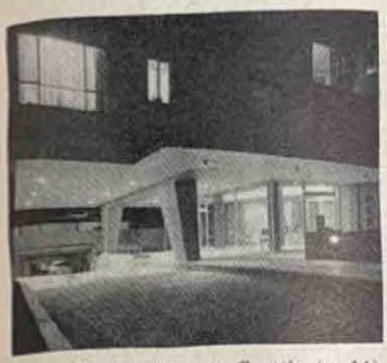
The major attraction, naturally, was a display promoting the Illinois Building, Wright's proposed mile-high structure to be built on the shores of Lake Michigan.

Undoubtedly that attracted the crowds but they stayed to spend much time studying the remarkable diversity of architecture which spanned half a century. They studied the 1940 Martin Pence House built in Hilo, Hawaii, the first house having no interior corridors; they studied murals of the famous Imperial Hotel in Tokyo and models of the Monona Terrace Civic Center now being built in Madison, Wisconsin's capital city not far from Taliesin.

They saw graphically the benefits of architectural design when they viewed photographs of the Frederick Robie House built in Chicago in 1909—almost as modern as today—exhibiting the first use of space with the exterior as a natural result.

And from homes they turned to a model that will be built next year on Fifth Avenue in New York, of the Solomon R. Guggenheim Museum which solves for the first time the problem of circulation by taking people to the roof in elevators and allowing them to descend spiral ramps which pass all exhibits.

If this signifies an intensification of interest in architecture on the part of the average man, it is an item worth the interest of every architect.



The people came to see the design of the Illinois Building but they stayed to study structures of more commonplace importance to them. The impact of the Illinois Building was almost too much to absorb. The perspective hanging on the wall of the Bal Tabarin was itself some 30 ft. high and yet the building, stretching for that height, was no more than 18 in. at its widest in the drawing. The Illinois Building will be a 58-story cantilevered structure, 5,280 ft. high with an additional 480 ft. of aerial at its top. It is a central pylon with a taproot foundation, carrying cantilevered floor slabs with screen walls of glass and metal—an awesome needle into the sky.

OVERSEAS-AIRMAIL POST OFFICE, shown in foreground, will be built at Seattle-Tacoma International Airport by Port of Seattle. To cost about $400,000, one-story steel frame building will have brick curtain wall. Conveyor tunnel will provide direct access from post office to airplane loading apron. Architects-engineers: Young, Richardson, Carleton & Detlie.

MODEL OF BEVERLY TOWER, 22-story, $10 million cooperative apartment building which will soon be under construction at edge of Beverly Hills. Unique terrace design will permit housing of 102 units, varying in size and price. Among luxury features will be swimming pool, cabanas, private gardens and health club. Owner-tenants also will be entitled to membership in Sky Club, to be housed on roof, with such facilities as men's grill, dining room, lounge and private party-dancing room. Slope of side street will allow three-level garage under tower, each with separate entrance direct from street. Architects-engineers: Pereira & Luckman.

WALDO JUNIOR HIGH SCHOOL, with 100,000 sq. ft. will be constructed in Salem, Ore., for an estimated $1,200,000. It will have brick and concrete exterior walls, aluminum windows and roofing, brick structural facing tile interior walls and plastic skylights full length of classrooms. Architect: William I. Williams, AIA.

Building News - Trends - Views

SOLAR BATTERIES INSTALLED ON ROOFTOPS may heat, cool and light houses of the future. Norman F. Barnes, General Electric engineering expert, points out that fossil fuels and even uranium fuels will eventually be exhausted and man will have to turn to the sun as his chief source of energy. A solar reflector 33 ft. in diameter, he explains, could be used as a steam generator to produce as much as 100 lb. of steam an hour at 100 lb. per square inch pressure.

Meanwhile, Eugene C. Starr, chief engineer of the Bonneville Power Administration, told members of the BPA advisory board that atomic power won't be a factor in the Pacific Northwest before the 1970-75 period. He said that future energy needs of this region would be met first by new hydroelectric plants and by blended steam and hydro power before nuclear plants are feasible.

HAWAII'S BUILDING INDUSTRY, spurred on by shorter travel time which will soon be cut in half by jet-plane transportation from the mainland, is reported to be virtually the second largest on the islands today. While Honolulu is planning toward convention hotels, the outer islands also are preparing accommodations for tourists who want to visit each separate island.

THE SOUTHERN PACIFIC RAILROAD plans to build a multimillion dollar addition to its San Francisco headquarters building near the foot of Market Street. Plans call for an annex two-thirds the size of the present structure which occupies the entire front of the block. The addition will be sited on part of a present parking lot to the rear of the main building.

THE BEAUX-ARTS INSTITUTE OF DESIGN has changed the name of its corporate title to the National Institute for Architectural Education. The new name of the New York institute says Alonzo W. Clark, 3rd, board chairman, "reflects more correctly than the old one the current and contemplated functions and activities of the organization" which for decades has provided a strong link between faculty and students of architecture and the practicing profession.

NATIONAL HOUSING CENTER in Washington, D.C., has named Bernard E. Loshbough, deputy representative for India for the Ford Foundation, as general manager. Sydney H. Kasper, former director of publications for the Housing and Home Finance Agency, is public relations director.

REYNOLDS METALS CO. STEALS BUILDING INDUSTRY SPOTLIGHT

Three West Coast cities were the scenes of gayla gatherings November 12 as Reynolds Metals Co. nationally marked the publication of a two-volume work "Aluminum in Modern Architecture" and announced an annual $25,000 architectural award.

While a formal crowd of architects, engineers and businessmen dined in the Grand Ballroom of the Waldorf-Astoria Hotel, where an hour-long closed circuit television broadcast emanated, more informal get-togethers were held in Portland, San Francisco and Los Angeles, plus 12 other cities across the country. The Portland affair was actually a three-city celebration, for Operation Airlift brought 135 visitors from Seattle and Tacoma, including the mayors of both cities and chamber of commerce officials.

In New York City, Richard S. Reynolds Jr., president of the sponsoring aluminum firm, revealed the $25,000 award, in honor of his late father, founder of Reynolds Metals. The award will be given each year to an architect who, in the judgment of a committee representing the profession, has made a most significent contribution to the use of aluminum, aesthetically or structurally, in the building field.

The R. S. Reynolds Memorial Award will be international in scope. It may be conferred upon an architect of any nationality for work done in any country. "Prime consideration," the announcement said, "will be given to the creative value of the contribution and its potential influence on the architecture of our times rather than to the size or type of structure. Preference will be given to work completed during the 12 months preceding the award but the judges, if they wish to do so, may acknowledge earlier work in selecting award recipients."

The telecast included a 13-minute preview of a new public service motion picture on modern architecture, which surveys new developments in the field both in the United States and abroad. It will be available for public showing.

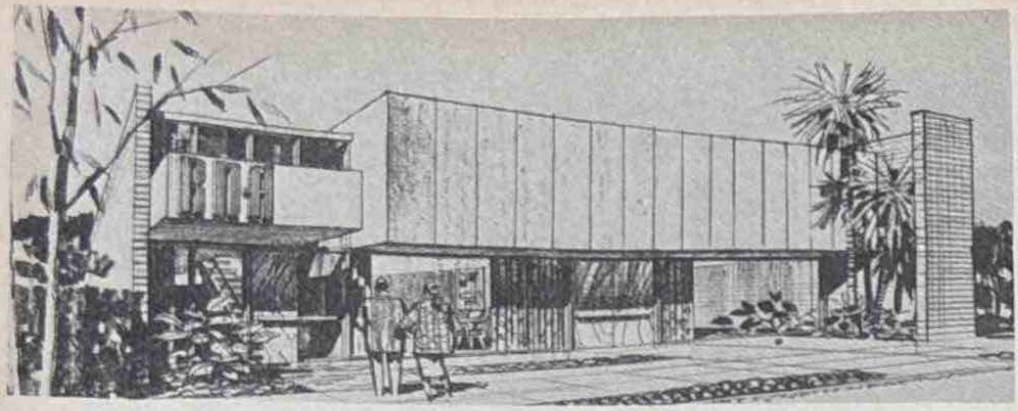
Principal speaker was Dr. Gaylord P. Harnwell, president of the University of Pennsylvania, who called establishment of the award "a torch which is handed by industry to genius. The award indirectly benefits us all," he said, "for architecture has always been a social art."

Douglas Haskell, editor of Architectural Forum, hailed the appearance in architecture of "a light metal which, naked, could stand up 'for keeps'" and which "opened flood gates of imagination."

Authors of "Aluminum In Modern Architecture" are John Peter, a consulting editor of Look and a former editor of Life magazine, and Paul Weidlinger, well known in this country, Europe and South America as a building engineer.

Volume I pictures aluminum in 101 important buildings throughout the world. Designed for the architect, the engineer, the builder and the client, it shows how aluminum looks in its many uses and tells exactly where and why aluminum was selected in each building. Tape-recorded conversations of 26 leading architects like Mies van der Rohe, Walter Gropius, Richard Neutra and Eero Saarinen offer thoughts about the future of aluminum in modern architecture.

Volume II is a technical handbook of aluminum engineering, design and detail. It represents the organization and editing of architectural aluminum data from all the important aluminum producers and fabricators in this country and abroad, including the standards adopted by the industry associations. It also translates the advanced aluminum construction developments in the aeronautical engineering field into architectural engineering terms.

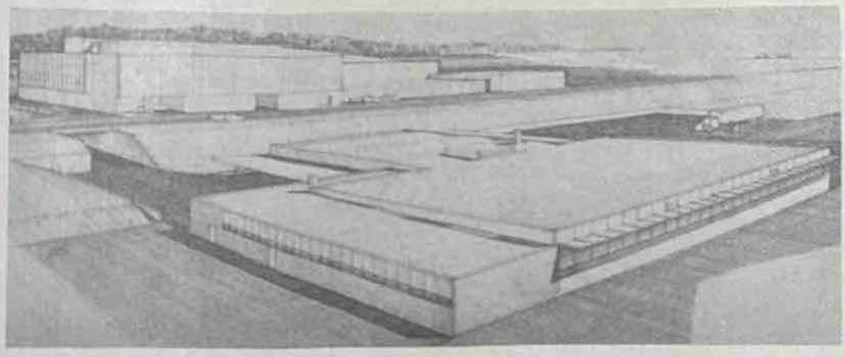


Describing the need for such volumes on architectural applications of aluminum, Peter said:

"Lack of organized information was seriously hampering use of the material. Reynolds Metals Co. saw the need and, let's be frank about it, the opportunity. They did the job in a characteristically all-out way.

"We were given a completely free editorial assignment.

"They (architects) gave us a view of aluminum and a glimpse of the future that should make really significant and inspiring reading."



These views were echoed by Weidlinger, author of Volume II.

These views were echoed by Weidlinger, author of Volume II.

A report on what the nation's women want in housing

American women want individuality without uniformity in their houses, coupled with neighborhood compatibility and no extremes. Emphasis is on good design in terms of contemporary living and on appropriateness.

The "no extremes" is expressed in the absence of a clear-cut acceptance of traditional or contemporary. The request is for a blending of the two, retaining what is good in each. They do not like contemporary housing as such but would prefer some modification, leaning toward the traditional.

This is the consensus of the 103 delegates to the Women's Congress on Housing held last April, a complete report of which has just been released by the sponsor, the Housing and Home Finance Agency. (Copies of the 82-page report may be obtained at 60c per copy from the U.S. Government Printing Office, Washington, D.C.)

The delegates, the majority chosen on the basis of letters written to the HHFA expressing their views on the modern home, were arranged in groups representative of similar climatic and geographic areas, each with an architectural adviser. What they did was to discuss family needs for living and how those needs could be met. The report has assembled their thinking in three parts.

The first is a comprehensive study on the results of the 2½ days of roundtable discussions covering all aspects of home planning and design. In the second part the report undertakes to identify the things all of a majority of the groups have in common—that is, the basic essentials of a house, whether it be in Maine or California and regardless of architectural style or type of structure. For example, a majority of the groups agreed on the following as constituting a minimum combination of components for a middle-income family with children:

> A kitchen-family room with space for table and six chairs; separate laundry-utility room on the first floor; rear entry into laundry-utility room; half-bath adjacent to rear entry; parlor type living room; enclosed front foyer; guest coat closet; parents' bedroom with two closets; two other bedrooms, with one closet each; main bath with single lavatory; linen and broom closets; one-car garage with storage in the North, single carport in the South; a basement for homes in the northern part of the country.

Along with the text the second part of the report also contains a series of diagrammatic layouts of sketches which are intended to show the overall planning proposals of the women delegates in an easy-to-understand graphic form.

Of particular interest to the architect and builder is the third part which presents the reasons why women want certain specific things in a house arranged in certain ways. The high points of that section are summarized below:

Kitchen Work Area: The kitchen located at the rear, with other rooms and spaces properly arranged around it, permits a coordination of housekeeping tasks with child supervision and training. They want a window overlooking the rear yard so as to be able to supervise the children at out-of-doors play. Indoors the children may be nearby in the dining or family area. These areas may be separated from the work area in varying degrees or remain open to form a single area. They prefer the work area to face in a southerly direction. They want the kitchen equipment arranged in a compact, logical working sequence. Space between equipment should be large enough for two persons to work conveniently. They do not want traffic through the work area. Strip and L-shaped arrangements are acceptable but a majority seem to prefer a U-shaped layout.

Informal Dining or Family Area: It also should preferably overlook the rear yard. Space should be provided for a table and six chairs for informal dining and possibly formal dining. There should be space for a sofa or sofa type bed and easy chairs. Shelves or storage cabinets for games, toys, etc., should be provided along the walls. Some groups propose using the family room for guest sleeping. In general, it is to be used for informal activities, either by parents or children, according to agreement or choice at specific times.

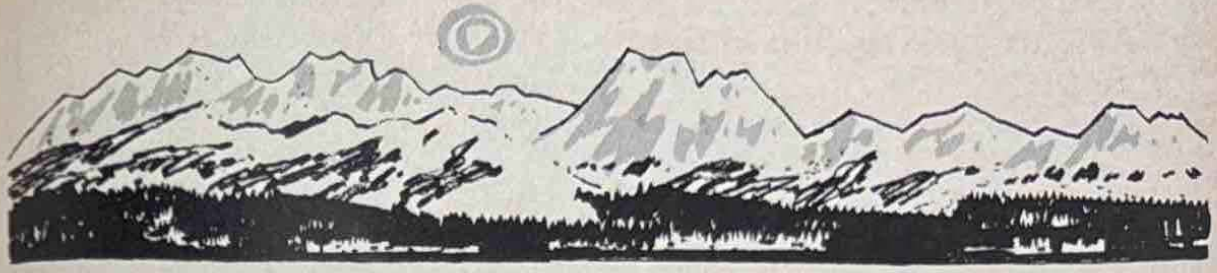
Laundry-Utility: The women do not want to do laundering in the kitchen but the equipment should be adjacent to the kitchen for convenience in combining work activities. It should provide space where an ironing board and the clothes to be ironed may be left out for working on at intervals. This applies to sewing and mending. The laundry also should be located near the drying yard since certain types of clothing must be, or are better, dried in the open air.

Rear entrance: This access to the rear yard from the laundry also serves as the family entry to the house. The women advocate that this importance be recognized in design. They would like it to be made attractive, emphasizing its friendly character. From a functional point of view, some women would prefer a small foyer, giving access to the half-bath, the basement stairs, the laundry and through it to the kitchen. However planned, they do not want direct entry into the kitchen.

Half-bath: Adjacent to the rear entry they want a half-bath. It allows the children to get those innumerable drinks of water or use the bathroom without entering the rest of the house; it provides father with a place to remove the dirt of maintenance jobs; it simplifies the job of taking care of baby or small children requiring help at the toilet; it provides a convenience for guests when the family room is used for guest sleeping.

Basement Stairs: These should be convenient to the rear entry and to the kitchen. In two-story houses, basement stairs should be placed under the stairs to the second floor.

Basement: There is still a widespread interest in and a desire for basements. In this discussion the advantages outweighed the disadvantages. The women hold that basements provide space for the lowest dollar cost. If money was not a consideration, the majority on a national basis would prefer a one-story house without a basement. However, they conclude that if they are to have the space they need at prices they can afford, they must accept the inconvenience of a basement.



Basement Influences Choice of Components: It is the inclusion or rejection of a basement which influences, directly or indirectly, the range of choices that the women made as they moved from desirable arrangements to acceptable compromises between cost and convenience. The diagrammatic layouts illustrate how economy is sought by reduction of the first floor area through removal to the basement of functions for which it would be desirable to have space on the first floor, if money was available. The family room, laundry-utility room, mud room and half-bath successively are relocated in the basement, as lower costs are sought. The attic, the garage or carport and out-

WEST COAST DELEGATES

Among the 103 delegates to the Women's Congress on Housing were the following seven from the territory covered by PA&B:

Mrs. R. H. Bell, Seattle
Mrs. H. W. Furchner, Blackfoot, Idaho
Mrs. Lillian Gaines, San Francisco
Mrs. Grant Hess, Boise
Mrs. Raymond D. Hull, Eureka, Calif.
Mrs. Mason D. McQuiston, Salem, Ore.
Mrs. Evelyn Walworth, Downey, Calif.

Yosemite plays host to 700 plus as CCA holds 11th convention

Philosopher's appraisal of architects keynotes sessions

by KENNETH R. MacDONALD, Contributing Editor

FACED WITH an assortment of problems ranging from the perennial public relations to vital legislation, more than 700 delegates to the 11th annual convention of the California Council of Architects met October 10-15 at Yosemite National Park in settings of natural architecture any one of them would have been glad to have designed.

The tone of the entire meeting was set by Dr. Stephen C. Pepper, chairman of the University of California's department of philosophy at Berkeley, and the convention's major panel discussion on "Population Pressures and Architecture" moderated by Cornelius M. Deasy (Southern California). Each of the five speakers who addressed specific sessions of the meeting participated in this panel discussion.

The new Yosemite Lodge, designed by E. T. Spencer, FAIA, San Francisco, served as headquarters for the meetings, with delegates, wives, Producers' Council members, and guests shuttling back and forth between Camp Curry and the Ahwahnee Hotel.

Delegates paid a remarkable degree of attention to the business at hand, despite fine weather and the natural attractions of Yosemite. All sessions, including those directed to routine council affairs, were open and well attended, with seminars devoted to school building, the home building industry, hospital design, public relations and the problem of population growth.

The Producers' Council was present, with 55 firms exhibiting their products in the old Yosemite Lodge converted for this occasion into a display center.

Council president John Lyon Reid (Northern California) presided over the convention which was arranged this year by a convention advisory committee under chairman William Corlett (Northern California). While last year's meeting at Santa Barbara had a preponderance of architects on the program, the emphasis at the Yosemite gathering was on speakers from outside the profession, chosen for the contribution they could make in stimulating architects to new thought and new action.

Also new at Yosemite was an exhibit of photographs and models of distinguished California architecture, selected by local AIA chapters and arranged by building types by architectural students under direction of George Hasslein, head of the department of architectural engineering at California State Polytechnic College.

Speakers, in addition to Dr. Pepper who delivered the keynote address, included Joseph Eichler, Palo Alto builder of contemporary style tract homes designed by architects; Archibald Shaw, superintendent of schools at Scarsdale, N.Y.; Dr. Dwight Bentel, dean of the department of journalism at San Jose State College; Gordon Cumming, chief of the Bureau of Hospitals, California Department of Public Health. In addition, Robert E. Alexander, FAIA (Southern California), participated in the major population pressure panel.

The convention theme "Planning for a Decade of Growth" was set, according to president Reid and chairman Corlett, "because architects face a tremendous challenge in expanding California's already jammed facilities to care for an additional 4½ million people expected by 1966."

Both speakers and architects agreed that California's population probably will exceed 18 million by this date, but there was not complete agreement on the extent of the problem or on methods by which the architects could meet it.

KEYNOTE SPEAKER Dr. Stephen C. Pepper, chairman of University of California's department of philosophy, whose long overdue appraisal of "The Architect as Artist" will be published in its entirety in next month's PA&B.

One point of agreement, however, came in the acceptance by architects present of a responsibility to the public in not only advancing the cause of good design, with high aesthetic values, but also in a very evident desire to develop programs of public relations intended to educate the general public into wanting good design.

Dr. Pepper warned in his keynote address and again during the panel discussion that the greatest dangers architects face in promoting good design are "the hard-headed man" and the "imitative man."

"The hard-headed man," Dr. Pepper asserted, "is the excessively practical man who is opposed to beauty or aesthetic appeal on the grounds that it is a waste of money, a thing which is impractical and effiminate and possibly suspect of being un-American.

"The imitative man," Dr. Pepper continued, "although likely to be a man of considerable cultivation, is aesthetically timid and unhappy in the highly experimental and exuberant architectural era. He wants the architecture of the present and the future to resemble the architecture of the past. This is the sort of man who has demanded conformity to his taste in many of our largest building programs."

In offering suggestions to guide California architects in planning for a decade of growth, Dr. Pepper struck the note of "public responsibility" reiterated by other speakers and supported articulately and positively by the architects.

These suggestions emphasized the following points:

1) **The architectural profession has a great social responsibility for the future character and personality of California.**

2) **Architects must see to it that there is an adequate number of architec-**

CONVENTION PANELISTS discuss "Population Pressures and Architecture" (l. to r.): Robert E. Alexander, FAIA; Joseph Eichler, builder; Dr. Dwight Bentel, dean of department of journalism, San Jose State College; moderator Cornelius Deasy, AIA; Dr. Stephen C. Pepper; Archibald Shaw, superintendent of schools, Scarsdale, N.Y.; and Gordon Cumming, chief of Bureau of Hospitals, California Department of Public Health.

REGIONAL COUNCIL MEETS

The California-Nevada-Hawaii Regional Council of the AIA, meeting concurrently with the California Council at Yosemite, held a special luncheon at the Friday convention session and elected two new members to its important judiciary committee.

The meeting, presided over by director Donald Beach Kirby (Northern California) selected Walter Zich (Las Vegas) to succeed Herman Light, (Southern California) for a three-year term on the committee.

Charles Fry (Southern California) was chosen as an alternate to succeed Keith Lockhard (Reno).

tural schools from which the profession can recruit its new members.

3) The architect has a responsibility in educating the public in the character of good architecture and in stimulating a public demand for high aesthetic values.

Deasy, during the panel discussion, commented that "architects have a deplorable tendency to talk to other architects rather than to the public" and pointed out that experts in the statistical field predict this public in California will number 21½ million by 1975.

Alexander explained that there should be 3,000 architects practicing in California by 1966 and that their greatest professional opportunities may come in providing well designed housing in the smaller towns and suburbs for the under 20- and the over 60-age group.

"The anticipated population increase," Alexander declared, "will demand 175,000 new homes a year for the next 10 years, plus new schools, garages, some 50,000 acres of new parking spaces for added automobiles and a minimum of nine million feet of new shopping areas."

Statistics such as these, Dr. Pepper warned, present the possibility of a chaos of building. He suggested that a need exists for planning and controls to avoid ugliness and to retain individuality.

Eichler, based on his experience in building and selling homes, took exception to the extent of the problem and cautioned that the population growth tends to be erratic geographically, with newcomers to the state concentrating in specific areas.

The size of the state's growth is not as important as the fact that all public facilities **must** be expanded," Cummings told the architects. "This expansion will require the combined skills of all of us."

Hospital construction in California, for example, has barely kept pace with growing needs in the past 10

IN WALL PANELS

its the SURFACE that SELLS!

FINEWOOD®

means FINER SURFACES!

Quality construction is important—sure! But in wall panels, its the *Surface that Sells!* And FineWood means not only quality construction, but also the *finest, most beautiful surfaces of any Pre-Finished Hardwood Panels!* One wall or a room paneled with FineWood precedes all else in a perfect setting for future decor and furniture.

FINER CONSTRUCTION Even back and center veneers are specially selected to guarantee a permanent glue bond assuring a perfect face surface always.

SPECIAL PROCESS FINISH FineWood's exclusive finish contains basic ingredients that enhance the lustre and stability of the panels, making them resistant to moisture. In addition the natural color finish gives added beauty and prevents any change in color and texture.

GREATER VARIETY *Nine* select hardwoods—Birch, Maple, Mahogany, Red Oak, White Oak, Sycamore, Walnut, Cherry, and Limba. Other special woods available on request.

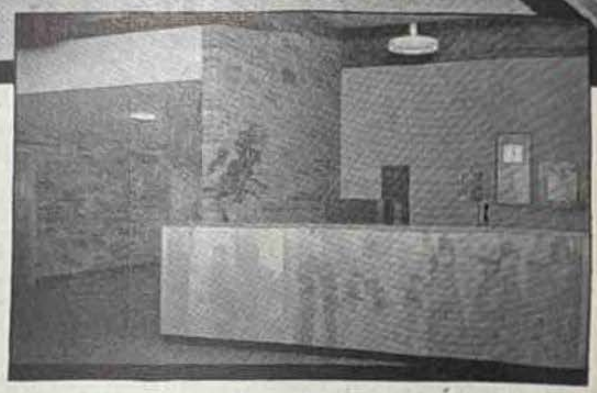
An Exclusive Gladding, McBean Product

EQUAL PERFECTION ON ALL FACES

The dry press process is used by Gladding, McBean & Co. to produce SCR brick for partition walls that have both sides exposed. No kiln marking on one face as found in brick made by the stiff-mud process.

ENDURING BEAUTY WITH STRENGTH



Partitions have the warm color of burned natural clay with pleasing variations in shading, and with strength to support roof beams.

EASE OF INSTALLATION

Gladding, McBean's SCR dry press units are cored with 5 holes large enough for ⅝ inch reinforcing rods, and electrical conduits. Voids around reinforcing steel are slushed full with grout.

LOW COST AND MAINTENANCE

Gladding, McBean's dry press SCR brick was installed in the McLoughlin Junior High School at "in-the-wall" costs competitive with non-masonry construction. Total cost of this school was $11.74 per sq. ft. of floor area. SCR requires no extra surfacing and offers the extremely low maintenance associated traditionally with the beauty of brick.

AT BENJAMIN FRANKLIN SCHOOL, Vancouver, Wash., architect, COBURN ACKLEY wisely made use of Gladding, McBean & Co.'s dry press SCR brick in corridors where faces were also exposed in classrooms. Partitions also serve as bearing walls. General Contractor: LARRY O. COLLINS, INC. Masonry Contractor: PAUL D. PARKER.

LOVELL CONSTRUCTION CO., General Contractor

OVERLOOKING SEATTLE high on Queen Anne Hill, Skyline House was conceived by the architects and the builder-owner as an answer to apartment house dwellers who wish to combine a pleasant, reasonably quiet neighborhood environment with the convenience of being close to the city center for work and for play.

The 156x125-ft. site, just across from Kinnear Park, has a grade differential of 31 ft. from front to rear. Every effort was made to take full advantage of the unsurpassed view: a panorama of snow-capped mountains, bustling harbor and Puget Sound, and the fairyland spectacle after dark. The T-shaped plan layout, besides providing an interesting approach and entrance reception area, produces the greatest number of vantage apartments.

The front projection of the reinforced concrete structure cantilevers over the driveway to form a porte-cochere which integrates the approach to the lower level garage facilities and the glass-enclosed reception area equipped with two automatic elevators. By placing the main approach to the lobby to the east, the code-regulated height limitations were fully exploited to add a floor encompassing 12 units.

The building comprises 85 luxury type units, the majority of which have individual projecting balconies with wire mesh railings painted in the primary colors. A typical floor plan includes 12 units—five two-bedroom apartments, six one-bedroom apartments and one bachelor apartment. All are served from an enclosed central corridor.

Among other features: radiant heating with individual apartment controls; an electric fan installation in every kitchen; a storage closet which is an integral part of every unit; and ceramic tiled baths with both showers and tubs.

OUTLINE SPECIFICATIONS

Type of Construction: Reinforced concrete.

Exterior Walls: Reinforced concrete with Zolotone finish.

Roof: Flat with fiberglass insulation.

Floors: Concrete slab covered with asphalt tile, rubber tile in lobby, ceramic tile in baths, carpeting in corridors.

Windows: Double-strength glass in aluminum frames.

Doors: Aluminum frame and glass, exterior; hollow metal, interior; folding in all bedrooms and closets.

Interior Walls and Partitions: Paint and Zolotone over 2-in. solid plaster and gypsum lath; corrugated plastic panels between kitchen and dining area.

Kitchen Cabinets: Japanese senwood.

Heating: Oil fired radiant hot water.

Ceilings: Plaster and acoustical.

Total Area: 88,300 sq. ft.

Total Cost: $1,350,000.

Date of Completion: April 1956.

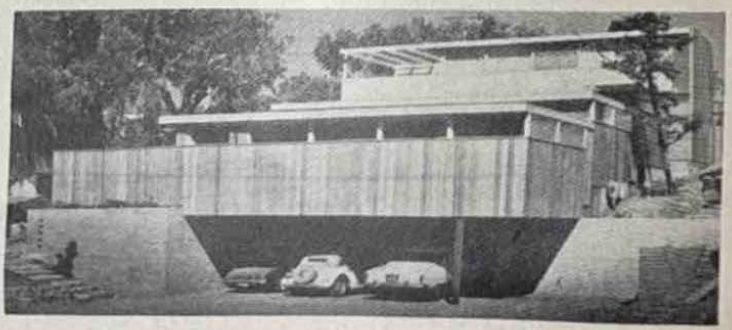
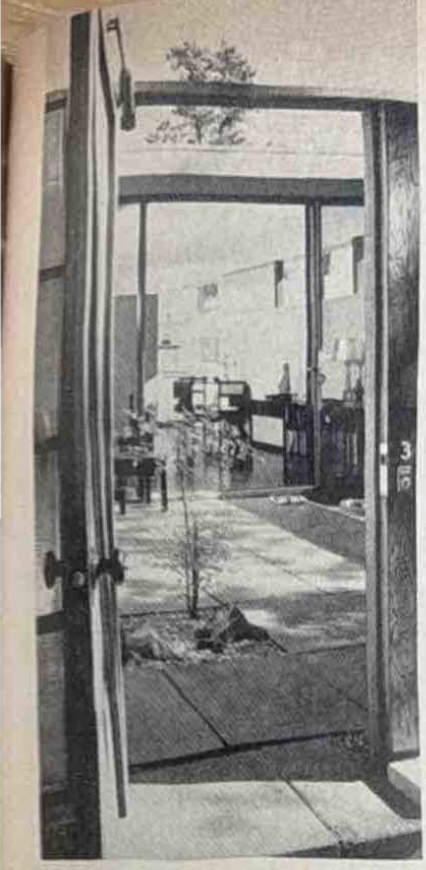
Five-unit economy project in Los Angeles

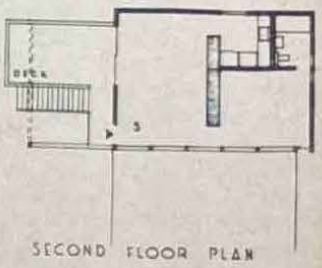


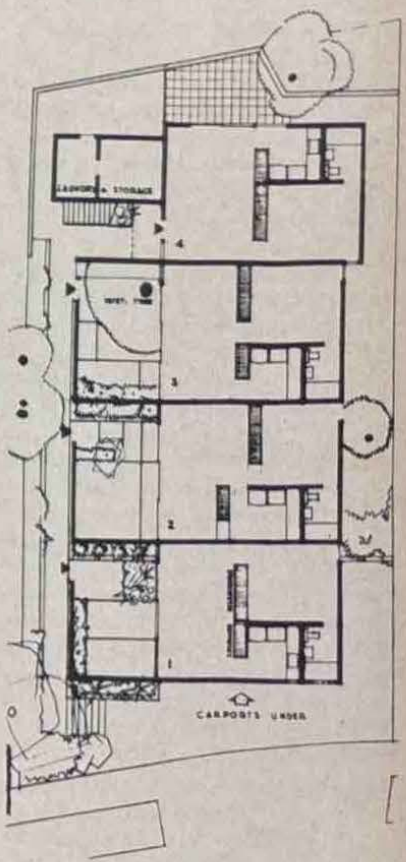
CARL LOUIS MASTON, AIA
Architect and Builder



Julius Shulman photos

CALIFORNIA REDWOOD EXTERIOR and simple structural system complement wooded site. Each of four ground units is repetitive walled enclosure, roofed only for indoor living spaces; fifth (second floor) unit was included to justify land cost.





GARDEN ENCLOSURES ARE INTEGRAL PART of plan, giving unity to entire project. Interiors have gypsum board walls, drywall ceilings.

SECOND FLOOR PLAN

THE ARCHITECT who designed this five-unit apartment house in a rural-like site in Los Angeles also built the project and operates it as a landlord. While it may be somewhat unusual for a designer to get involved in such a three-way operation, his objective was to create an income-producing investment with a minimum of capital in a field where, because of his training, he perhaps was more expert than most.

Built at $9 per sq. ft. the 3,350-sq. ft. structure is sited on a fairly steep lot which is located in a geographic area frowned upon by most lending agencies. "In spite of the typical coolness on the part of the lenders," says the architect, "it was the appeal of the site's rural character that determined my choice.

"I think that the soundness of judgment was verified by the fact that all the apartments were leased prior to their completion, at a rental far above that which prevails for the area. This popularity undoubtedly was due in great measure to the private gardens which were integrally incorporated in each apartment."

Without basement, the structure was built on reinforced concrete and concrete block footings. With the exception of the second floor unit at the rear, included to economically justify the land cost, each of the apartment units was designed as an individual, repetitive walled enclosure, roofed only for indoor living spaces. This resulted in more unity for the project, both from within and without, than a building with garden enclosures simply "added on."

The architect utilized an orthodox frame structural system but with considerable emphasis on elemental simplicity in the overall structural shape and details.

OUTLINE SPECIFICATIONS

Type of Construction: Frame on reinforced concrete and concrete block footings.

Exterior Walls: 1x6 t&g California redwood.

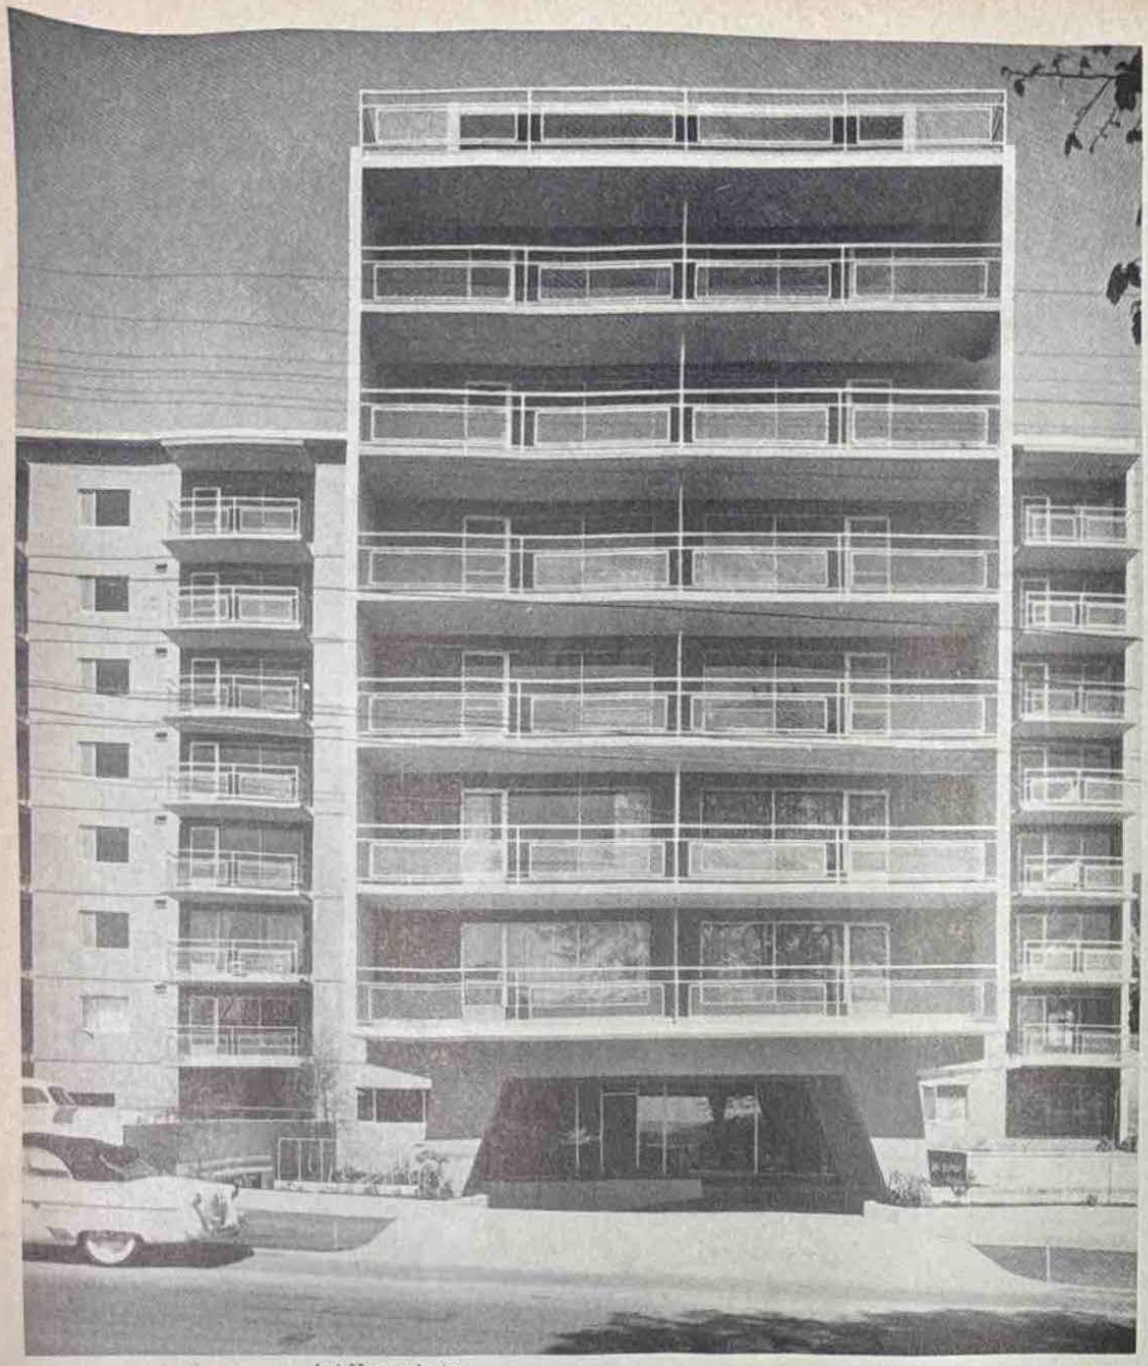
Roof: Tar and gravel.

Floors: Cork and asphalt tile finish.

Windows: Louvered glass stopped in wood.

Doors: Slidemaster glass, exterior; U. S. Plywood hollow core slab, interior.

Interior Walls: ½-in. gypsum board on wood studs.



Ceilings: U. S. Gypsum drywall.

Heating: Thermador electric installation.

Total Area: 3,350 sq. ft.

Cost per Square Foot: $9.

Date of Completion: September 1954.

An engineer's provocative statement about the design profession

ARCHITECTURE UNLIMITED

by EDGARDO CONTINI, ASCE, ACI

An address presented before the Northwest Regional Council, AIA

TO BE INVITED to speak not only on architecture but on architecture unlimited is a sobering honor and I think it would be a sobering honor for other than an engineer as well. The term "unlimited" brings to my mind, I am sorry to say, by association, the mushrooming, unmanageable FHA-approved, sanitary and uninspired tract housing expansion that surrounds and suffocates our largest cities. If architecture unlimited is to ride the coattails of expansion unlimited and prosperity unlimited, I believe that we will all reach the end of our professional life with well filled pocket books and empty souls. This is so because the function of architecture is to limit in the classical sense, to bring order, measure, scale and, indeed, pleasure.

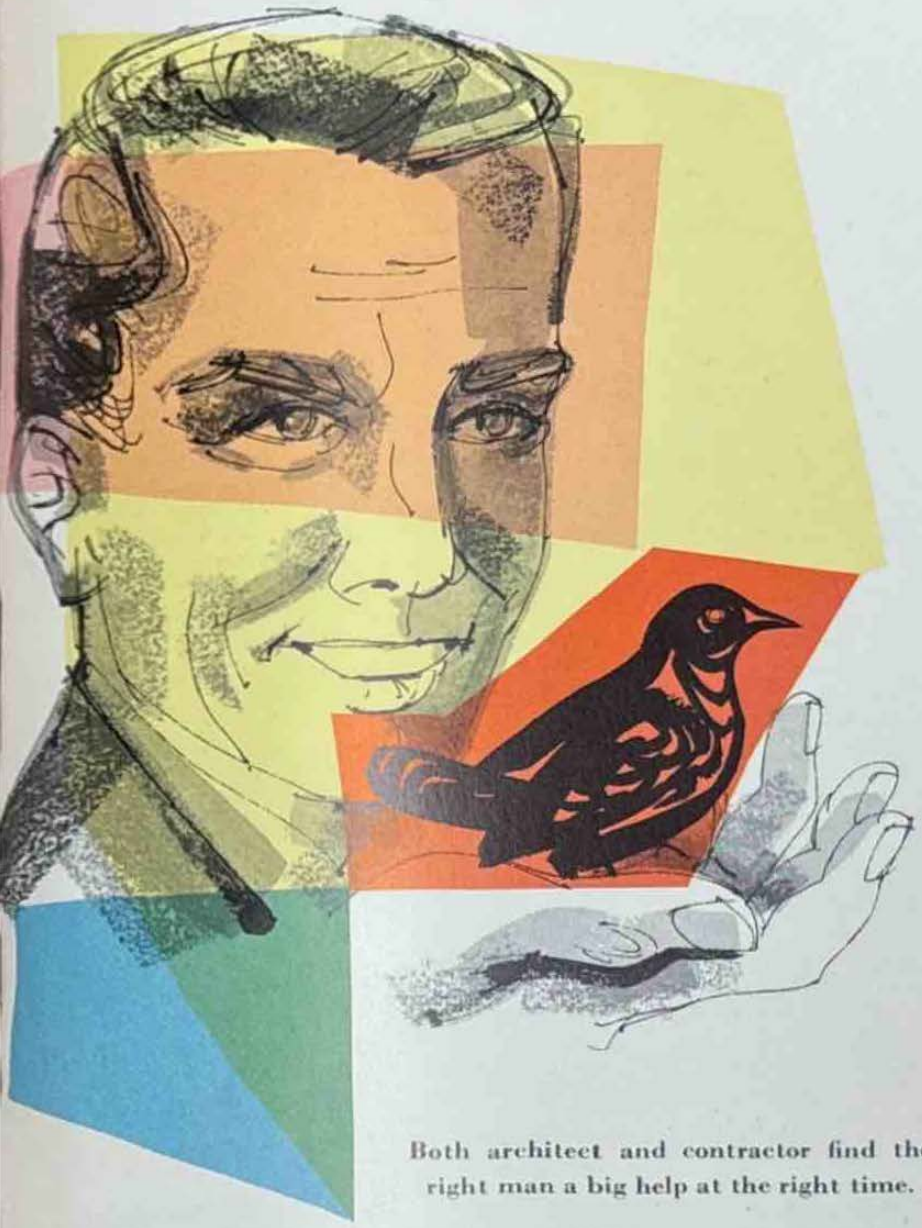
It's fairly clear by now that by architecture I am not referring specifically to the business thereof but to its historical meaning: architecture of a country at a given time being the environment that it has created for its inhabitants. It is the result of creating genius, individual and communal will and culture. In this meaning, the architecture of the U.S.A. today is not the AIA, not Mr. Wright, not Levittown, not Architectural Forum nor the all-bronze, new ornament coming up in Park Avenue. It would perhaps be nice if it were the sum of all these items and more allied, but such is not the case.

Architecture today is represented by our cities as they are, by our suburbs as they are growing, by our garrish, measureless streets. There is where we must start from and if we start from there, we are forced to conclude that architecture in our country and our time has very little power of limiting and is indeed critically limited itself in the realization of its creative potentials. I believe that we must become well aware of the nature and significance of such limited influences if we are to succeed in the years to come in exercising more fully our professional confidence and our moral responsibility in the shaping of future environments of our land.

The main reason for the low level of the average architectural consciousness is probably very simple but unfortunately very serious. It is the general lack of interest in the civic environment, the lack of interest then in architecture. This is a strange and sad by-product of the growth of our standard of living. As people can afford a larger and better house, they transfer all interest, affection, monetary outlays and personal efforts to their own individual kingdoms and the community assets lose significance. To the citizen then, the city becomes no more than a maze of means of communication to go to work, to shop and to visit. The running water in every kitchen did away with the fountain. No fountain—no city square; no city square—no city green, etc. The inhabitant of the much-too-cramped Mediterranean apartments or New York's old tenements sits on the front steps to enjoy the sunshine or strolls up and down his street. Grandma in New England still rocks her chair on the front porch and watches the passersby on her street. But now ranch homes and packaged homes—our own doing I am afraid—complete the process of introversion and houses and inhabitants alike turn their backs to the street and their interest away from the community.

It has not always been so and in times past the interest in the shape of the city in the architectural things of the city has been high, indeed. The controversies between Bramante and Brunelleschi were in Florence a matter of public domain. They were a matter for great headlines in the paper and as recently as the time when I was a student in Rome when the station in Florence (the new station) was to be launched, the arguments, the discussion, the personal interest of all citizens in whether this new station should be built, whether modern architecture should live side by side with the church of Santa Maria Novella became as important an item as the latest murder case.

This phenomena of the retreat of interest from things civic is not so bad per se as for its consequences of disinterest and blindness to the shape of the community framework. This framework is then reduced to traffic and commercial function and is allowed to take any shape or misshape it wishes. If anyone should from his establishment emit obnoxious noises or odors, protests would be immediate and the law ready to protect the citizens' delicate noses and ears. But of the owner of the establishment decides to put up a garrish, blinking, bigger-than-yours sign over his facade, no law is usually there to prevent him because nobody asks for such a law because the citizens' eyes are no longer so sensitive; they are, in fact, blind. And the blind citizenry is not conducive to architecture unlimited. The real maker of the visual environment of our city is not you or us but Foster & Kleiser.



It is not long ago that the city council of a major city, which shall go unnamed, made a resolution: Whereas, all of the public buildings to be erected from now on should be designed for the maximum economy and efficiency. they should have no ornamentation, no sculpture, nothing that would not be justified by the absolute minimum requirements of economy—a proud commentary to a major city in the country with the highest standard of living. This culture of blindness is probably the greatest factor limiting architecture today.

Within its framework other factors have worked their way in. At first commercial pressures — community amenities are not mass producible, not mass marketable, not mass advertisable, but refrigerators, cars and motorized lawn mowers are. Thus advertising skill has convinced almost all of us into measuring the standard of living by quantity of goods

Continued on page 23

"Grandma in New England still rocks her chair on the front porch and watches the passerby on her street. But now ranch homes and package homes —our own doing I am afraid—complete the process of introversion, and houses and inhabitants alike turn their backs to the street and their interest away from the community."

A bird in the hand

Both architect and contractor find the right man a big help at the right time.

A feeling of well being came over the architect as he drove through the crisp Fall countryside.

He was on his way to make a final inspection of his school job.

Contractor had just telephoned to report he was ready to turn over the key.

Job looked pretty good he said. Almost exactly like the rendering.

The architect whistled soundlessly. One of those few times when everything looked right.

Should be right. He'd planned everything carefully and completely and then stuck firm on details of materials and equipment. Careful selection of suppliers paid off.

Like that time when he had been making his periodic inspection of the job and was told that some louvers for the Kawneer Aluminum Canopy had been damaged on the job. The Kawneer dealer had checked around the area for replacements. No luck—no louvers available.

Then a guy he thought he recognized drove up.

"Where have I seen him before?" he'd asked the contractor.

"Kawneer field sales engineer," the contractor answered. "Comes around to check their products and installation. Kawneer dealer called him on those louvers."

"Where's the phone?" the sales engineer asked.

"Won't do any good to call," the contractor observed. "Nobody around here has any."

"I guessed the dealer had already checked that possibility," said the Kawneer man. "I'm going to phone our warehouse."

The contractor flatly ruled. "We can't afford to wait until they get here from the plant!"

"I'm not calling headquarters," the Kawneer man pointed out. "I'm going to order replacements from one of our Factory Assembling Warehouses. We've got 'em spotted all over the country."

He turned to the phone, talked to the warehouse, describing requirements. Hanging up, he turned to the Kawneer dealer.

"That's it," he announced. "They'll be here in three to four hours."

Then he walked over to the job to go over the installation with the men.

When he was beyond earshot, the contractor turned to the architect.

"I guess a bird in the hand saves money and time at that," he cracked.

"Especially when you don't have to put salt on its tail to get service," the architect had agreed.

Driving up to the site of his finished school, the architect reflected further on the Kawneer incident. The cost of a product doesn't tell the whole story in this business, he thought.

"Installed cost is what really counts," he said through the windshield.

The gravel slithered under the tires as he pulled into the schoolyard.

He whistled again—this time out loud.

His new school building settled into the landscape as if it had grown there by itself. Just as a school should look—light, bright and cool. Spaciously inviting.

Good job, he thought.

With a big boost from modern, factory-engineered materials and first class service from the manufacturer, he amended.

Another one of those few times when everything, somehow, went right.

All because of a bird in the hand. The End

UNIT WALL FOR 1 & 2 STORY BUILDINGS—A new modular assembly with wide selection of color, unit types, sizes and proportions. See Kawneer, Sweet's Catalog $\frac{3d}{Ka}$ for details and description. *Branch Office & Warehouse, Upjohn Co., Washington, D.C., Engineers & builders: The Austin Co.*

METAL CURTAIN WALL—Kawneer will engineer your design to insure integrity of reproduction and will manufacture and install "shop-prefabricated" metal wall units. See Kawneer, Sweet's Catalog $\frac{3d}{Ka}$ for more information. *Mutual Benefit Life Insurance Co. Building, Newark, N. J. Architect: Eggers and Higgins. Contractor: George A. Fuller Co.*

STORE FRONTS—Kawneer sash is designed and engineered for safety and long life. The resiliency of the most popular assemblies permit the use of large glass areas. See Kawneer, Sweet's Catalog $\frac{21}{Kaw}$ for complete details. *Elm Farm Super Market, Dorchester, Mass. Architect: Sumner Schein, Boston. Contractor: J. J. Powers Co., Cambridge.*

ENTRANCES—Durability with lightweight and trim appearance describe the new Kawneer narrow-stile doors. These doors feature the new Kawneer interchangeable hardware, two types with identification push plates. See Sweet's Catalog $\frac{10a}{Kaw}$ *Palms Shopping Center, Houston. Architect: Irving R. Klein & Assoc. Contractor: Fisher Construction Company.*

A SINGLE SOURCE

—to save you hours of planning, detailing and estimating time.

Whether your project requires sun-deflecting louvers or one of six other product lines, Kawneer is prepared to work with you. Your design is our first consideration. Second, the installation. Third, your client satisfaction. Kawneer research, engineering, field service, estimating and detailing services are available to you. The Kawneer stock-line is strategically warehoused throughout the country. Custom assemblies are available from 3 plants. Your Kawneer district office is listed on the back of Kawneer Sweet's Catalogs.

KAWNEER TOUCH gives you *extra* confidence in your Kawneer specifications.

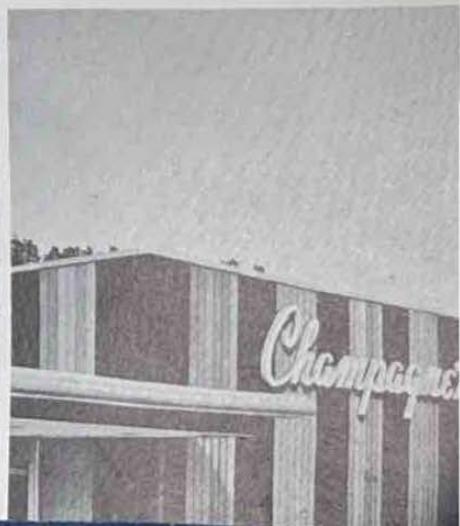
THE KAWNEER TOUCH consists of those benefits that satisfy the three cost requirements of a specification: 1. Product Cost; 2. Installation Cost; 3. User Approval Cost. The Kawneer Touch comes from: Extensive Kawneer research and development facilities; 50 years' experience producing architectural metals; Close relationship with the architectural profession; Strategically located factories and warehouses; 1200 factory-trained installing dealers; Nationwide network of sales engineers and service specialists; Special architectural detailing and estimating services.



SUN CONTROL PRODUCTS—The Kawneer Canopy protects store fronts, walks and parking areas. Kawneer K-Louvers, fixed or operating, help solve sun and glare control problems. See Sweet's Catalog $\frac{19e}{Ka}$ for details. *Morton Salt Company, Woodstock, Ill. Architects and engineers: Elmer C. Carlson & Assoc., Chicago. Contractor: Sherman Olson, Inc.*

ALUMINUM WINDOWS FOR CURTAIN WALL JOBS—Pivoted or vent types with expansion, contraction and weather-tightness features. All-aluminum for corrosion resistance and light weight. See Sweet's Catalog $\frac{17a}{Ka}$ for details. *Territorial Headquarters, The Salvation Army, Chicago. Architect: Skadberg-Olson Co. Contractor: Paschen Contractors, Inc.*

ZOURITE FACING—Kawneer porcelain enamel and alumilited facing. The 2" narrow face in 10 colors and the 6" bold face in 4 colors. Combinations of colors and sizes provide individuality of design. See Kawneer, Sweet's Catalog $\frac{6d}{Ka}$ for details. *Champagne Supermarket, Manchester, N. H. Architect: Koehler & Isaak. Contractor: Davison Construction Company.*

"The Kawneer Unit Wall is a creative tool for the architect in developing outstanding exterior walls from modular panels"

"Yes, gentlemen, the new Kawneer Unit Wall is a system offering complete flexibility of design treatment through a wide selection of color, unit types, unit sizes and a choice of proportions within the units themselves. The system is completely modular with split mullions that interlock, providing for horizontal expansion and contraction. The glazing beads are recessed to be flush with the mullion, providing clean sight lines and unobstructed vision. This vinyl weatherstripping throughout reduces glazing time and assures long life. Notice the fasteners are concealed giving a clean, uninterrupted face. I could go on and on pointing out details that result from the 'Kawneer Touch.' Just a little more of your time is needed. A special meeting can be arranged with myself and your local Kawneer installing dealer, Just contact my office. See the back of Kawneer Sweet's Catalogs for the address and telephone number."

Architecture unlimited

(cont'd. from p. 18)

"When the opportunity for planning comes, as it is coming, it is not time for timidity."

rather than quality of environment.

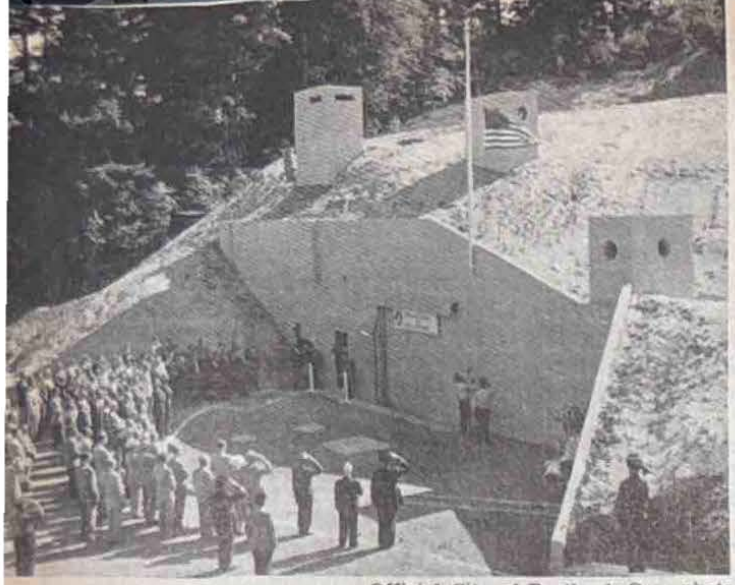
Then financial patterns—the availability of easy and inexpensive financing is indeed one of the great factors of our well-being but to architecture unlimited it is a mixed blessing because it faces the architect with an invisible, illusive and unapproachable client—the real client, often enough the mortgage bank, is very likely to say "no" to the firm client, the one to whom, with a great deal of zeal and energy, you have convinced the validity of your forward-looking solution. We certainly have the pressure of technical progress which is again a reason of mixed blessings to the development of architecture. We have acquired technical abilities superior to those of our ancestors, but probably our ability to translate technical knowledge into mature expression is not more rapid than of our fathers several generations ago; and with new techniques, new materials, new products, we find ourselves forever tempted into experimenting rather than improving.

Thus our architecture is limited by the facts that so few opportunities for maturing our ideas are ever offered to it. We remain somewhat behind schedule. We still design our tall buildings under the delusion that the engineer has given us the ultimate answer because of the limitation of height and dimensions that the steel frame imposes. Nothing could be farther from the truth. Along the ultimate limits of technical—and I should not speak like this as an engineer—the ultimate limits were reached long ago with the Empire State Building. Today we don't build buildings up to the limit because other considerations and techniques force us to stay lower. These limits are a ratio of land values and elevator costs and they establish for each city pretty level tops to our construction—about 36 stories in New York, about 22 stories in downtown Los Angeles when they lift the limit. And within these limits technically we could do many more things that architecturally we are expressing today under the delusions that we are still giving the right response to the proper structure. This is an invitation to forget about the engineer, which you would not have heard a few years ago.

The parallel to this is the emphasis on technological and economic approach. For better or for worse, we are very little arbiters of the dimensions, proportions, shapes of the buildings that we are entrusted to design. As I mentioned, the height is more than anything likely to be determined by the alliance of the elevator experts with the real estate land brokers. The depth of the building is more than likely to establish at its optimum by the leasing agent who will tell you how much is needed for a doctor and you are quite fortunate if the client's public relations man will not put his say-so on type of finish and color of exterior.

A last limiting factor and a relatively recent one, implications of which are very hard to evaluate today in terms of their conflict with our cultural heritage, is the concept of forced obsolescence, which has sneaked in slowly and which will force a complete reevaluation of the values that we have given to architectural standards. By forced obsolescence I mean that there has been introduced a few years ago in the handkerchief business — Kleenex, which has its own forced obsolescence built in—one use. The next step has been the automobile. We are finding more and more rapidly that it pays to change your car rather than to fix it and we accept the fact that we don't keep a car as we kept our dear horse, up to its dying day! We change it. Its obsolescence is also built in. Fortunately most of the tract housing that is going up today has its own built-in obsolescence and for this we cannot but be grateful. When combined with a built-in obsolescence we have the additional factor of social shift from one region of the city to the other, we have rapid forced obsolescence which has created all of the slum areas in the region between our old downtown and the first ring of industrial development. These are now being cleared and made ready for a complete new development.

Now this is probably the first example of a pattern that will become prevalent in the future as the pace of technical advances in the construction of the home in particular and in construction of office buildings as well. I may mention another example of forced obsolescence: the wholesale demolition of perfectly sound buildings in New York, built about 35 to 40 years ago, to be substituted by buildings not any higher, oddly enough, but simply equipped with up-to-date air conditioning and up-to-date finishes, often enough, paradoxically, leaving the steel skelton in, the only thing that has not advanced in 35 years.



I cannot tell you what forced obsolescence means other than I am sure you realize it brings about an entirely new frame of reference in evaluating what we are designing and what we are building for. Now these are all limiting factors but they are not straight jackets and if they are understood and coped with, they may actually become active challenges. In fact, some of them have already become such. Cumulatively, they point to two main directions for the work to come. First, because of the fact of economics, the individual building, the isolated project, important as it may be to its individual creator or as a precedent, loses in architectural significance while the overall space-creating project acquires new importance. Second, there is a great deal that the architect can do to relieve the pressures of the limiting factors and to move toward architecture unlimited.

Of course, the architect is not supposed to be a reformer or a missionary—at least not any more than any other citizen—but more than any other he knows the direction in which we must move if we are to accomplish a better environment, a fuller expression of architecture for the days ahead. He cannot therefore afford to miss any opportunity of trying for the best. Occasionally an exceptional project, an exceptional client, comes forth which opens great new avenues and he may steal a page from Madison Avenue and promote and advertise the real values of plan environment and aggressively throw in the competition for the citizens' spare dollars and spare hours: urban redevelopment, parks, green belts, better zoning practices against Coca Cola, longer and bigger convertibles and chewing gum.

When the opportunity for planning comes, as it is coming, it is not time for timidity. Past are the days when admitting one's interest in plan development would bring forth a discrete inquiry from the FBI. Today you are more than likely to be invited by the Chamber of Commerce. Past are the days when aggressive solu-

DEDICATED IN SEPTEMBER, control center is complete, except for radio tower and antenna, to be enclosed by security fence. Top of building has been seeded to grass and will be landscaped for use as public park.

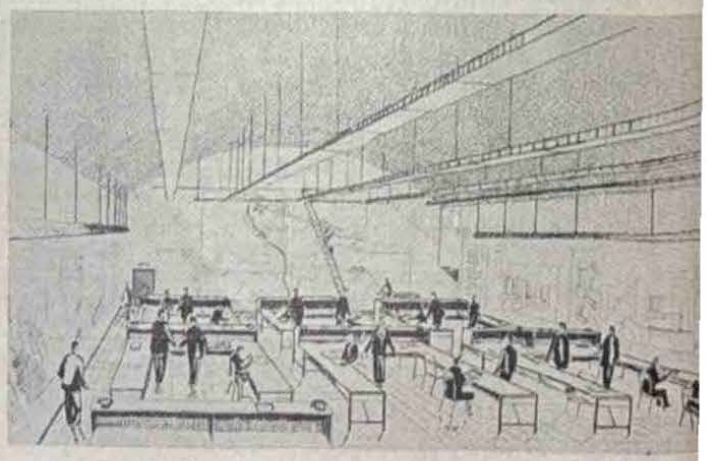
by R. EVAN KENNEDY

A methods report by the designing engineer of Portland's civil defense communications hub, being used as a model for projects in Phoenix, Salt Lake City, Boston and Tampa

Country's first underground CD control center

THE CITY OF PORTLAND is completing the construction of an underground control center for civil defense purposes which will be the nerve center of the entire metropolitan area for the direction of rehabilitation if and when a disaster occurs or an attack is made on the city. The control center will also be the emergency seat of the city government.

The $500,000 building is the result of more than three years of planning. It furnishes space for full activities of the city government and civil defense organization under emergency operations. This requires facilities for the police, fire, engineering, medical, welfare, warden and headquarter departments. There is also space for liaison with state and county authorities and with the military department. Provision is also made for press and emergency radio transmission.



The building will be an entirely self-sufficient unit capable of housing 300 people for seven days without any of them leaving the quarters. The structure is a concrete arch more than 2 ft. thick, spanning 85 ft. and with a length of 140 ft. Within this concrete arch is a second floor occupying 85 ft. of the length and made of concrete slab on steel framing. This leaves 55 ft. of length as a large operations room with side walls and the end wall devoted to maps.

In addition to the shell there is an entrance structure that houses the fan room, personnel decontamination facilities and entrance security provisions.

Of considerable interest to engineers and architects is the design and construction of the structure. The two-hinged tied arch was the result of a great deal of planning that was required to get the facilities desired into the shape that could be covered by the concrete arch of this nature. A study was made of several possible positions on the site. Foundation analyses were made to assure sufficient soil-bearing capacity to enable an arch of this nature to be used, since extremely high reactions occur under each foundation wall. Final position placed the building in a draw on the side of a hill. The soil is a gravely sand with some clay. After being cleared of trees the site for the building was excavated, the structure built into position, backfilling carried on over the top and the contours adjusted to produce a desired loading on the arch.

In order to furnish information as to the true conditions occurring in the arch during the backfilling, strain gauges were installed at two points

OPERATIONS ROOM will feature wall maps to provide CD heads with last-minute details on damage and repairs in metropolitan area.

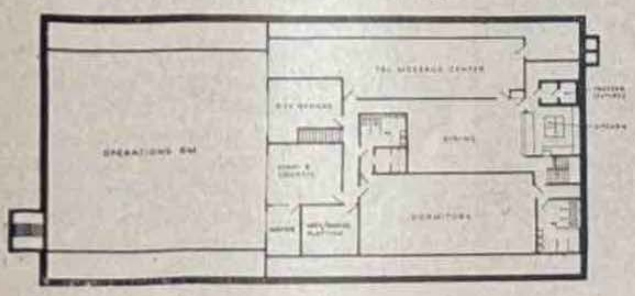
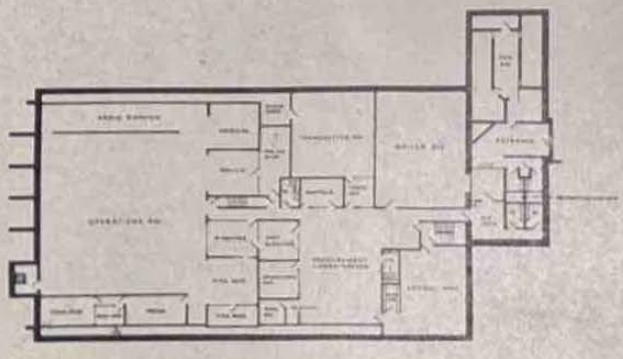
in the arch and one point in the arch tie. These strain gauges were read frequently and this information used to slightly adjust the backfilling operations on the top. These strain gauges are now being read to watch the condition of the arch as the overburden settles the arch into its final permanent position.

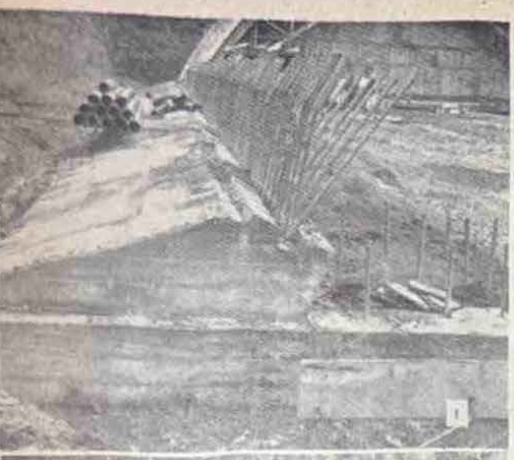
Some deflection of the arch was expected as the overburden was replaced on the top. At this date the strain has not ceased but is proceeding at an extremely limited rate. The overburden has been on the top of the arch less than one month. It is expected that the strains will gradually decrease until at the end of 90 days of loading they will become so small as to be nearly impossible to detect. The shape of the arch is such that pure thrust is produced along the arch shape itself in the final loaded condition. The radius and the elevation of the top of the arch was adjusted until this condition was achieved. The shape of the arch and the loading diagram was carefully correlated so that the final condition produces very little bending but mostly compression in the shell itself.



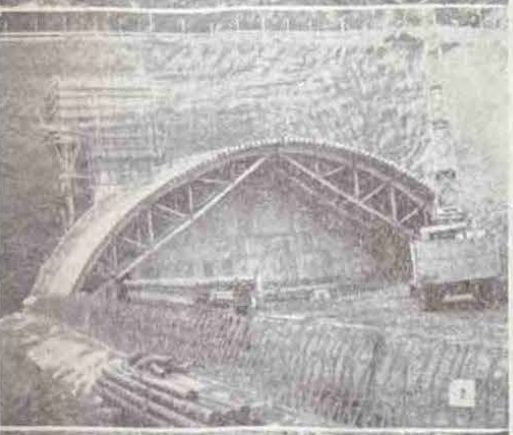
A uniform thickness shell was used in order to provide protection against penetration and to furnish an economical forming design. This shell was formed on prefabricated wood trusses which were supported on jacks of sand. These trusses were three-hinged plate connected trusses which supported joists, which in turn were covered by sheathing. The sheathing was covered by a material called Insulrock, a wood fiber impregnated with cement. This Insulrock was laid on the truss sheathing in 4x8-ft. panels, the edges sealed and then the reinforcing and concrete placed upon these. The result was an arch that is lined with Insulrock, which gives a high degree of acoustical correction and prevents the echoing sounds that would normally be expected in a concrete structure.



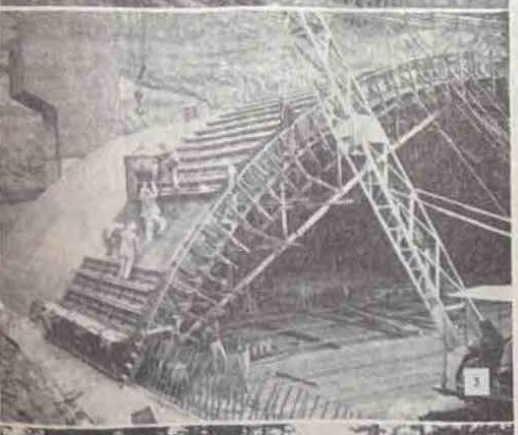
When the concrete in the arch had set up sufficiently to support its own weight, the trusses were lowered by pulling the sand out from underneath the truss support points and letting them down to rest upon wheels which in turn rolled on steel angles. The truss form work was then pulled outward to the next pouring position, jacked up to its true alignment and again supported on sand jacks.



The alignment at the top of the arch was maintained within plus or minus 1 in. from the theoretical desired elevation by the careful positioning of the trusses. Since the trusses were loaded by the wet concrete at the sides, for the concrete was poured by placing it on one side of the arch and then the other and thus gradually built up to the top, the top of the arch was placed only slightly above its final position. The load of the wet concrete produced an expected deflection bringing the crown down to the desired elevation at the end of the pour.



Considerable design attention was given to the ventilation of this building. Since this facility will house a large number of people, a fresh, highly usable air supply is very important. Air is drawn into the building through a shaft that extends a short distance above the ground and has protected openings. The air coming down the intake shaft is taken into the fan



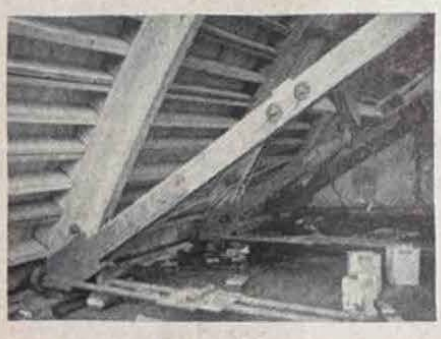
UPPER FLOOR, below; **LOWER FLOOR**, right.

No. 1: Footings and dowels, designed as hinged support. No. 2: Timber Structures wood trusses in position for first pour. No. 3: Concrete of arch is placed by bucket on alternate sides. No. 4: Entrance and air structure also houses water well. Right: Truss reaction is on steel box filled with sand. Box side is removed to remove sand and lower truss to rollers.

room where it can be distributed through two different systems. One system, to be used when the air is not contaminated in any way, diverts the air through standard dust filters and then through cooling and heating coils after which it is distributed through the building by ducts. The other system, which has to be used if the air is suspected of being contaminated, passes the air through a filter that removes radioactive particles and then distributes it to the building.

If conditions are such that outside air cannot be used at all, then the entire building can be sealed off and all air recirculated. In that case, used air is passed through activated carbon filters, freshened by the addition of oxygen, cooled, and redistributed into the building. This recirculated air can be mixed in any desired ratio with outside air so that a very small quantity of outside air may occasionally be drawn to improve the quality of the inside air being reused.

The building is under pressure so that all air leakage is outward, thus protecting against contaminated air leaking in. The entrance has an air lock system so doors can be operated against the pressure.



The entire structure is divided into two zones for ventilation purposes. Zone 1 is for the space ordinarily used from day to day. Zone 2 is for the balance of the space provided for emergency use. Thus, Zone 1 ventilation is quite light by comparison to the total requirements. Under crash condtitions, when this full building will be utilized by 300 people, the ventilation load becomes very great. Changing from Zone 1 to Zones 1 and 2 is accomplished by merely flipping a few switches that actuate valves and fans to produce the revised ventilation requirements.

As this building is underground, it will experience very little heat loss. Hence, the expected heat load is relatively light. However, under normal conditions when the occupancy is relatively low and when the outside air is cold, it is expected that some heat will be necessary for comfort. This heat is obtained from one of two sources. Very low requirements are satisfied by an electric furnace that is expected to be able to supply the needs 75% of the time. When more heat is required, the heat demand automatically starts one of the standby generators with heat obtained from the generator's cooling system. And when demand drops to capacity of the electric furnace, the generator automatically shuts off.

Since the control center would be inoperative without electricity, great attention was given to the standby power facilities for the plant. The electrical system is believed to be one of the most complete that has yet been developed for this purpose. It includes standby generators which come on automatically if and when outside power sources should fail. And as the standby generators are going to be available anyway, the diesel units automatically go in service when interior load on the electric supply system exceeds 90 kw. This means that under ordinary operating conditions on a day-to-day basis, when occupancy as well as the heat and ventilation load is very light, the outside source of power will serve the needs. But under crash conditions or under any conditions where all lights and all ventilation units are in full service, the standby diesel units will be activated and the supply of electricity from outside will be cut off. When the inside load drops back down to below 90 kw., the generators will turn off after 15 minutes and the outside electric source, if available, will again be utilized for the power.

Entrance security includes electric eye protection, closed circuit television, complete intercommunication and an electrically controlled door lock which is operable from two inside stations. Television is viewed at two inside stations and intercommunication is from outside to some 30 inside stations.

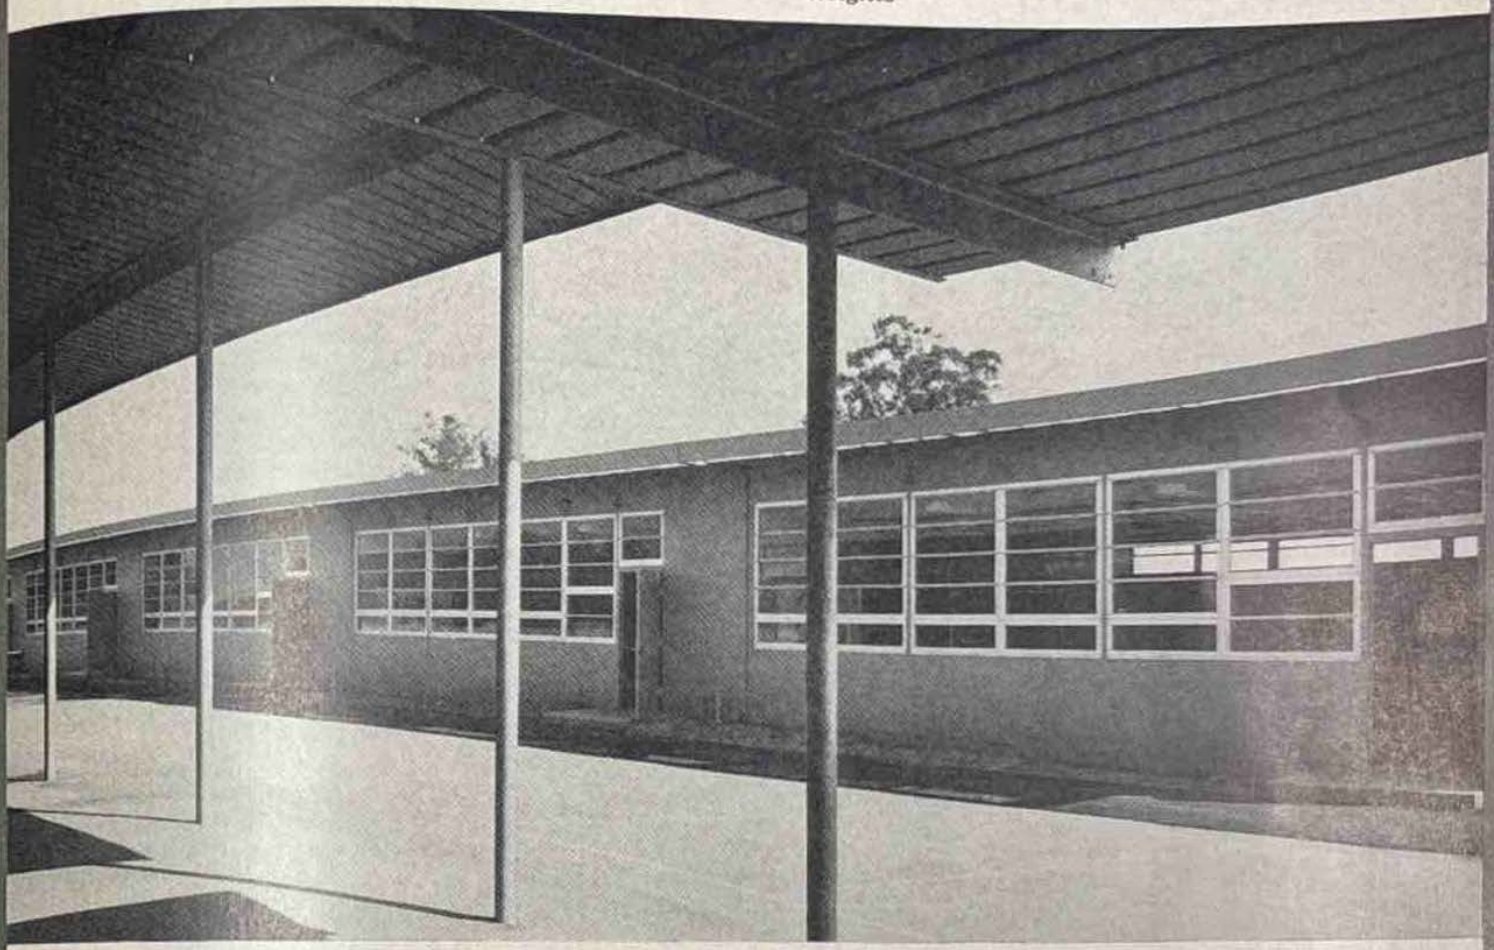
PROJECT DEVELOPMENT



(Initiated by Jack Lowe, director of the city's Bureau of Disaster Relief and Civil Defense, under Mayor Fred L. Peterson)

Preliminary planning started	Feb. 1952
Special levy approved	Nov. 1952
Architect - Engineer retained	Oct. 1953
Initial allocation FCDA funds	June 1954
Construction started	July 1955
Dedication	Sept. 1956
Building operational	Jan. 1957

CALCOR "C" WALL PANEL—Exterior View

The Calcor classroom is shop fabricated in these modular steel panels. A unique interlocking mechanism makes the building simple to disassemble and relocate. The panel is formed from 20-gauge United States Steel Sheet. The inside and outside surfaces are separated 3 inches with steel stiffeners running vertically on 16-inch centers. No exposed fasteners inside.

Steel prefabs reduce schoolroom costs one-third

Calcor Corporation, Los Angeles, has developed a revolutionary new modular prefab classroom. The mass produced unit can be erected in a week for a price 30% less than conventional wood-frame schoolrooms.

The use of steel for framing, walls and roof decking gives the building an earthquake-safe rigidity. The entire structure is incombustible. Fiberglas is used in both roof and walls to obtain insulation quality equal to more than a foot of masonry. The Calcor modular-prefab system has sufficient design flexibility to accommodate the desired classroom features of architects and school districts. Full scale tests of the buildings have gained the approval of the California State Division of Architecture as well as the Department of Building and Safety, City of Los Angeles.

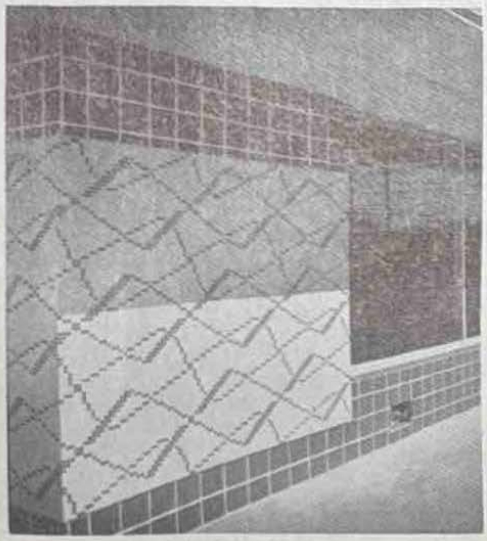
Ceramic mosaics

MEDICAL BUILDING, BEVERLY HILLS. Architect: Herman Light, AIA. Tile contractor: Frank Young. Building front: 2 3/16-in. squares, straight-edge Granitex, sand tan. Columns: light chocolate Velvetex, ¾-in. squares. Entrance: ¾-in. squares, scatter pattern, white, light chocolate Velvetex, dark chocolate Velvetex and brown.

Original Impetus in California

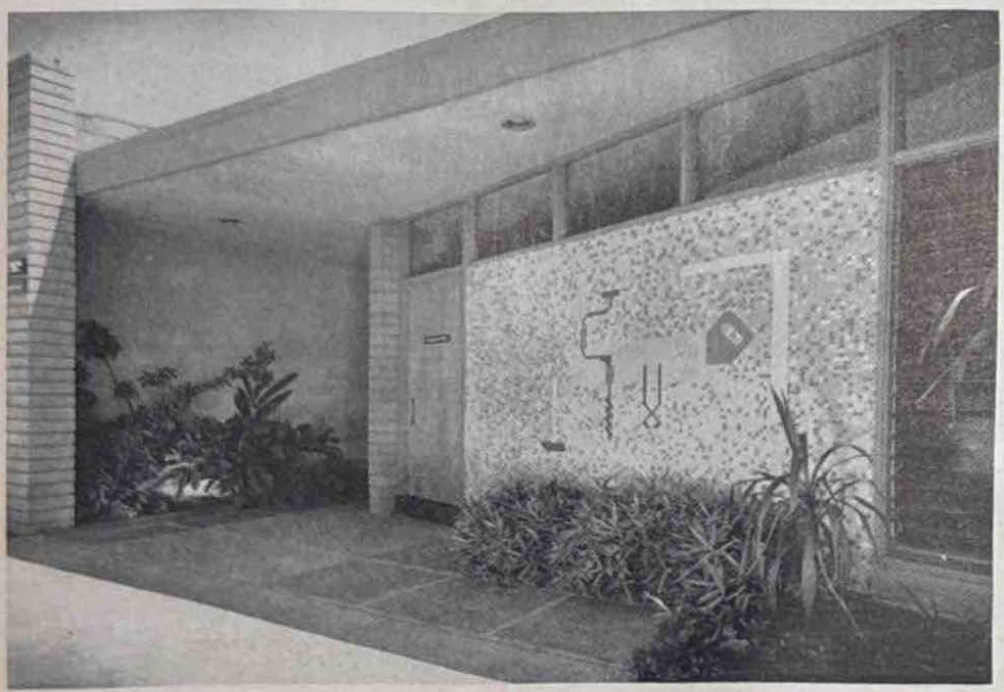
CENTURIES AGO the ancient Egyptians brought beauty to the beholder of their buildings by decorative ornamentation which in many instances has lasted down through the ages.

Modern architects, particularly in the southern California area, are following the pattern set by the Egyptians. As a result, there has been a resurgence of interest in the use of mosaic tile as exteriors for commercial structures.



Architects have discovered that tile, one of the oldest building materials known, is as applicable to modern design and modern construction as it was to the building of ancient times; those who try to avoid the use of materials that simply imitate another type appreciate the beauty and functional values of tile.

Most of the unglazed ceramic mosaics now being used in commercial building throughout the West are dust-pressed and the colors become an integral part of the entire tile. They are durable, weatherproof and resistant to stains, grease or wear.

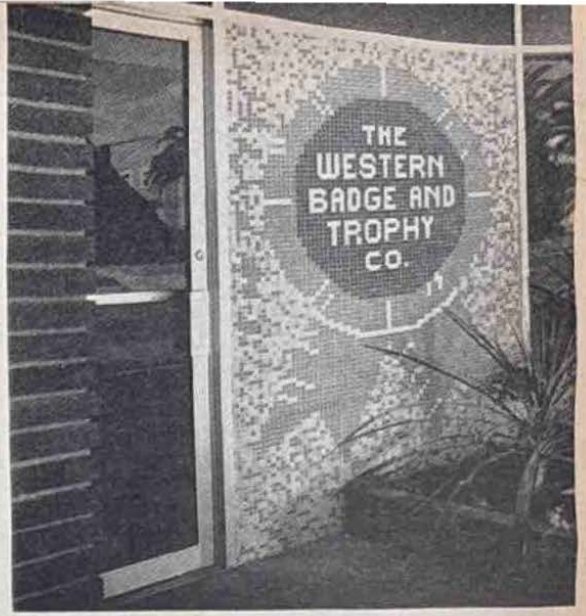


Thus, because of the long life and low maintenance costs, tile is rapidly becoming what many architects consider the ideal material for exteriors as well as for interior construction.

All of the tile used in the photographs to illustrate this article on mosaic tile installations were manufactured at the Jordan Tile Manufacturing Co. plant at Corona, Calif., a subsidiary of The Mosaic Tile Co.

The Jordan plant is the only one of its kind on the West Coast and the small, unglazed ceramic mosaics are mounted at the Corona factory on 1x2-ft. sheets so that the tile contractor may make his installations one sheet at a time. The special designs are worked out at the factory

SAFEWAY MARKET, SAN DIEGO. Tile contractor: Fritz Barthel. Store front: unglazed ceramic mosaics on dark yellow ground combining red and black in Formfree pattern. Framed with 6x6 quarry tile, Sequoia red.



SY-ART CONSTRUCTION CO. BUILDING, LOS ANGELES. Tile contractor: Fleishman Tile Co. Front exterior panel: ¾-in. squares unglazed ceramic mosaics on background of white, light and dark gray, light chocolate Velvetex and dark yellow. Design of white, dark yellow, black and dark gray.

put on a good front

and are then mounted on the sheets after which they are ready for shipment to the tile contractor.

All of the designs illustrated were made for the specific job, with the exception of the Safeway store shown. Here the pattern used is called the Formfree pattern.

The quarry tile also was made at the Jordan plant. This tile, a rugged material, gets its color from the clays used and the tile is manufactured by an extrusion process.

WESTERN BADGE AND TROPHY CO., LOS ANGELES. Designer: Frank Miller. Tile contractor: Beverly Hills Tile. Front panel: white letters on dark red ground, surrounded by dark blue. Design on a spatter background of light tan, dark yellow and dark chocolate, all in ¾-in. squares, unglazed ceramic mosaics.

And the trend gains momentum in the East

When a Los Angeles architect specified ceramic tile for exterior wall use in Philadelphia last year, he may have started a new trend in eastern building circles.

Covering the entire second and parts of the first and third stories of the split-level structure, 20,000 sq. ft. of ceramic tile in four colors was installed in Gimbel's new store, designed by Welton Becket & Associates, in suburban Cheltenham.

It was the first time that unglazed ceramic mosaics had been used in the East on such a large scale in combining structural form with chromatic beauty. A medley of two shades of brown Velvetex, whites and grays was employed, set in 1 9/16-in. squares.

Prior to installation, this extended use of ceramic tile for exteriors was viewed with some skepticism. Since then, many have commented on it as a favorable contrast to the white brick that also was used on the store's exterior. And the same tile pattern and color blend have repeated on several smaller jobs since the store's opening last August.

Peter Verna, who supervised the tile installation, says the Cheltenham project presented no special problem. The tile was shipped cross-country from the Jordan plant in blocks of 30 sq. ft., the installation occupying about six weeks.

"As I understand it, the use of ceramic tile in large exterior areas started in California and I expect it to be used more widely here," Verna comments. "It is a fine modern idea and could easily become a trend."

A more recent example is the installation of four large cut ceramic mosaic murals on two wall exteriors of Leighton's new men's clothing store on New York's Fifth Avenue. The murals, 14 ft. high and 5 ft. 9 in. wide, depict four major style changes in men's fashions—Roman, Renaissance, American Colonial and Victorian.

The murals were executed by Ada Korsakaite of Los Angeles and commissioned by the store's architect, Victor Gruen. They were shipped to New York in numbered divisions. Giacomo De Lazzero, an officer of the tile contracting firm, supervised the installation "since this was the largest and most spectacular job of its type ever done in the city."

Following several weeks of research through art histories and costume books, Miss Korsakaite spent two months in constructing the panels. Her original designs were sketched out on brown paper in full scale and the mosaic tile, cut in small pieces by nippers, was glued to the paper in a soluble adhesive to be removed later.

Ten shades of colors were used, with grays and blacks contrasting with colorful blends of pinks, reds and chocolate browns. In the four panels about 250,000 individual pieces of cut tile were used.

Ada Korsakaite, muralist in ceramic mosaics

COMMISSIONED by architect Victor Gruen, muralist places cut mosaics on designs she created for facade of clothing store on New York's Fifth Avenue.

Twice in her teens Lithuanian-born Ada Korsakaite narrowly escaped capture by westward advancing Soviet armies. Today, at 23, she stands on the threshold of recognition in America as an artist in the design and fabrication of cut ceramic mosaic murals.

After four years in a U. S.-sponsored displaced persons camp in Kassael, Miss Korsakaite and her relatives arrived in this country and settled in Los Angeles in 1948. She worked in a pottery plant for a year, during which she learned English, and then entered Immaculate Heart College where she studied painting, ceramics and other art courses.

Her work, which includes both religious and secular themes, has been on display in 25 juried art exhibits in various part of the nation. Currently four Stations of the Cross which she executed in ceramic mosaics are on tour with the Western Association of the Museum Director Traveling Exhibit.

For the past year Miss Korsakaite has been employed by The Mosaic Tile Co. in its western division in Los Angeles and currently is in New York City.

Building volume in October up slightly

AFTER A BIG DIP in September, building volume in the five western states inched up to a $194,182,428 total for October, an 11% increase over the previous month, unusual for this time of year. It was California that solely accounted for the gain, for all other state totals were down.

Gains and losses were pretty evenly divided among the 116 building permit agencies, with 65 reporting decreases and 51 reporting increases. Among those with significant gains were Los Angeles County, up $8 million; San Diego, up $11½ million; Seattle, $3¼ million; and Portland, $1¾ million. Substantial losses were reported by Los Angeles, $6 million; King County, $2¼ million; and Sacramento, $2 million. The Los Angeles County figure was the second highest October on record, with tract housing accounting for one-third of the total. Permits issued for 856 dwellings were valued at $10,745,650.

The five-state total was 5% higher than October 1955. On a statewide basis only Washington, which has been consistently down all year, showed a decrease—3%. California was up 6%; Oregon, 26%; Montana, 3%; Idaho, 24%.

Volume for the year is still slightly higher than the first 10 months of 1955. The total through October is $2,204,610,228, a bare 1% higher than a year ago. Only Washington, down 4%, has dropped. California is up 1%; Oregon, 7%; Montana, 5%; and Idaho, 4%.

Following is a breakdown of building permits issued by several of the major agencies during October.

	DWELLING UNITS		COMMERCIAL & INDUSTRIAL		PUBLIC	
King County	295	($2,799,530)	25	($ 683,200)	1	($ 1,500)
Seattle	131	(2,361,050)	19	(884,500)	4	(1,225,000)
Tacoma	79	(525,250)	6	(209,400)		
Orange County	473	(5,064,805)	42	(558,142)	2	(93,006)
Sacramento Co.	412	(3,439,849)	78	(238,825)	6	(142,543)
Los Angeles Co.	1563	(20,509,920)	1718	(7,721,941)	33	(946,150)
Portland	60	(1,226,750)	31	(1,411,455)	2	(185,000)

Architecture unlimited

(cont'd. from p. 23)

tions were timidly shelved by the client on the day of presentation.

It is not very long ago—about five years—that we were called to prepare the plans for the redevelopment of a small community in Wisconsin. It was a minor project in scale but the proposed solution embodied certain principles of total renewal of the downtown of the small community, which we felt would be mandatory if any long-range good was to be done at all. When we presented it to the client, he was horrified. He paid the bill but he was horrified, put the thing in the drawer and never talked to us again until a few months ago. During this four-year period, a tremendous amount of unexpected activity in terms of urban renewal has taken place and is taking place, which would have been impossible to foresee in a relatively short period of time. And what the next four or six years will bring about could be the most astounding revolution in the pattern of change in our urban areas that we ever witnessed.

There are of course two main tasks ahead for us all. One is the renewal of the urban core and the other is the creation of the new suburban environment. The renewal of the urban core is the one in which one of the limiting factors that used to hamper us is now our ally. Things have generally become so bad economically that those who might have been against planning are now those who will follow us and induce us into drastic action. It is quite true that there are still limiting factors because often enough things have gone so far that there has remained very little to the downtown area to spur the changing of pace from deterioration being reverted into progress; but in most cases the downtown area is still, by location, the center of the total city and therefore the best location you could ever find. It is by social significance still the center of the civic organization and it has usually still enough vitality left to make it worthwhile to drastically operate on it to make it come to terms with the automobile age.

More difficult, in a sense, is going to be the creation of good and permanent new communities because their main source of life is speculative development. On the positive side, we are seeing more and more projects carried on on a very large scale. Extremely large tracts of land are being planned and developed so that they will contain within themselves all of the elements of interrelated requirements and facilities for suburban living. But on the other hand, the lack of restrictive zoning and the lack of systems whereby we can leave some portions of the area surrounding our cities as green belts or agricultural areas makes the growth into the suburbs an overall blanket, which will eventually suffocate the downtown if we don't ask for a better system.

If we look farther ahead, we find that both the urban renewal and the growth of the new communities and generally the cultural maturity that we have to reach will have to be fit within the framework of major regional plans. These plans will have to extend past county and state lines bringing together the verge authorities and facing the task of planned and guided growth of the whole country within the ultimate boundaries with the same spirit, vitality and pioneering energy that not so long ago brought all of us to such boundaries. It will be only when properly related within such orderly overall framework that your buildings and my bridges will reach the fullest significance.

IN STEP with advanced school design...

HAWS Deck-Type Drinking Fountains meet the demands of your school building program for improved water facilities inside the class room! Your choice of optional combinations of HAWS Faucets and Fixtures make these fountains adaptable to *all modern classroom needs.* Teachers and students alike, benefit from HAWS!

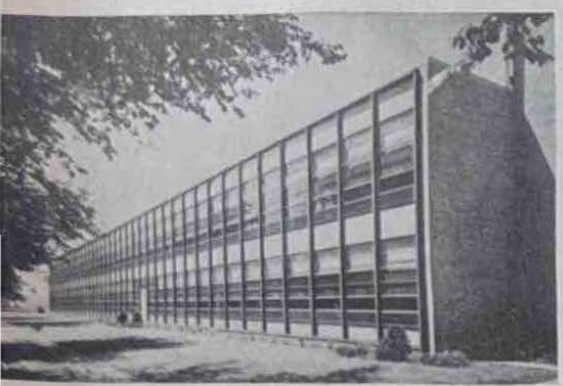
and the latest literature

RED CEDAR PLYWOOD: Characterized by an unusual grain pattern, rotary cut red cedar panels are being produced by West Coast Plywood in thicknesses from ¼-in. to ¾-in. and in a 48x96 size. Waterproof glues only are used, permitting either interior or exterior applications.



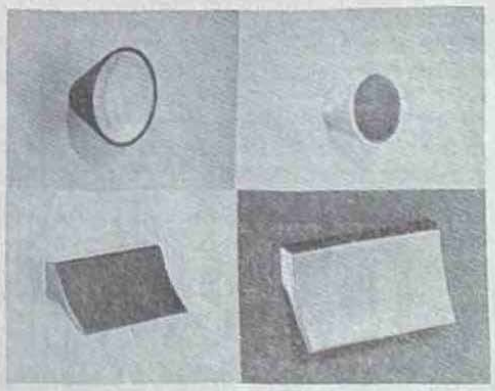
Since a minimum of patching is required with many clear faces developing, attractive natural finishes are easily obtained. Clear lacquer and wax, sealer and two coats of varnish, stain or a tinted sealer and varnish are among the more popular techniques. In addition to interior and exterior paneling, Tru-Bilt panels are being utilized for soffits, cabinet doors and closet lining.

(Item No. 1)

CENTRAL VACUUMING: "Sequoia's central built-in vacuum cleaning system places the tank type receptacle with motor in the garage. Pneumatic 2-in. aluminum tubing extends under floors or overhead to desired locations on the floor plan, emerging at floor or low-wall inlet sockets.

(Item No. 2)

CURTAIN WALL SYSTEM: To give the architect greater flexibility in the design of contemporary, functional



THIN WALL CONSTRUCTION

structures and the contractor faster, more efficient building methods, Fenestra has developed a new curtain wall type of construction. The Fenestrawall system incorporates simple installation details and makes use of the firm's intermediate windows along with porcelain or other type panel inserts.

Frame finishes include Bonderized prime-painted or the new Fenlite finish which reportedly never requires maintenance protective painting. Porcelain inserts can be furnished in almost any color desired.

(Item No. 3)

NEW LINE OF DOOR PULLS

CABINET HARDWARE: The new line of Tempo cabinet hardware introduced by Washington Steel Products combines a velvety black with polished bronze, brass or copper in two styles of pulls. The Tempo line features two sizes of fitted cones and knobs and two sizes of rectangular pulls and plates. All parts of each type and size are interchangeable.

Decorative laminate plates, such as Formica, can be fitted into the cones on the door pulls so they will match other surfaces in counters, cabinets and furniture.

(Item No. 4)

CHALKBOARD: Korok's direct-to-wall installation of its steel chalkboard eliminates the lamination, core, backing and plaster grounds and provides a surface plane that is completely flat. Butt seams are so indiscernable that they can be written across with ease.

The panels, coated with green vitrified enamel fused to the surface, bond firmly to plastered walls, masonry walls or over old slate. Tests show that Korok resists loosening when applying up to 300 lb. shear pull per square inch.

(Item No. 5)

INTERIOR DOOR: Developed to resist protracted abuse in public buildings, the Weldwood Custom Royal door is surfaced with Micarta, a dense, high-pressure laminate widely used for bars and tabletops. It is virtually immune to stain, will not chip, splinter or corrode and requires no push-plates or kick-plates because of its sturdy surface.

United States Plywood offers the door in four Trugrain faces, facsimiles of mahogany, oak, maple and walnut. It is available in an extensive selection of lights and louvers.

(Item No. 6)

POWERIZED BLEACHERS: Universal's powerized bleachers enables one man, without any physical effort, to open or close any section of 10, 15, 20 or more rows in a few seconds and all sections of a gymnasium in a few minutes. To operate Poweroller, a compact mobile electric power unit, the custodian merely directs an extended gripper arm into a small opening under the front row seat. This engages an attachment bar under the bleacher section. A touch of the handle switch starts action.

Pneumatic tires protect the gymnasium floor, yet gives Poweroller enough traction for easy opening or closing of bleachers. The operator simply guides the unit from section to section and directs its action. Bleachers may also be opened or closed by hand if desired.

(Item No. 7)

VENTILATING HOOD: To give even the budget house an efficient ventilating system, Trade-Wind Motorfans has introduced the Patrician. It is made up of four units: a hood available in 30-, 36-, 39-, 42- and 48-in. lengths and in Coppertone are well as colors; a 300-cfm. axial flow ventilator; a 9-in. filter grille that takes the grease from the air being exhausted; and an underhood light with a single switch that operates both light and ventilator so that they can be turned on separately or simultaneously.

(Item No. 8)

Latest Handbooks, Manuals and Literature

Yours for the Asking

GLASS MOSAIC TILE: Although a brochure put out by Saivo, Italy's largest manufacturer of architectural and decorative glass tile, is published in the native tongue, it has some interest because of three pages of colored illustrations showing contemporary Italian work.

The literature is being distributed by an eastern importer who is stocking the glass mosaic tiles, ¾-in. square and 3/16-in. thick. The tiles are pasted on paper sheets 1 ft. square for delivery. Dozens of bright colors are available, as are black, gold and silver.

Glass mosaic tiling, which has been used for construction in Italy for 3,000 years, now shows indications of

acceptance in this country. It is used for floors, walls, ceilings and for decorative purposes inside and out of homes, stores, churches and public buildings; also in bathrooms, kitchens and swimming pools.

(Item No. 9)

SHOPPING CENTERS: anyone concerned with the design and construction of shopping centers will want to add to his reference file a 16-page booklet published by the American Institute of Steel Construction. It is invaluble if only for a two-page table which gives vital statistics for 41 centers—regional, district and neighborhood—located throughout the United States.

"Shopping Centers Framed with Steel" represents a cross-section of the types of centers already planned or built. Those described in the booklet represent some of the finest examples and show quite naturally the advantages of building with structural steel.

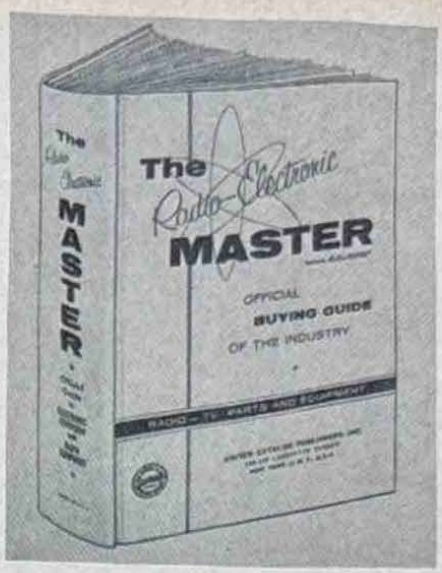
(Item No. 10)

WOOD SCHOOLS: How the school district of Massapequa, Long Island, N. Y. solved the problem of providing modern educational facitities for its mushrooming enrollment, without imposing a crippling tax burden on the community, is described and pictured in "The Massapequa Story."

The booklet shows how architect George J. Dippell used the Teco system of engineered timber construction in four structures that provide complete facilities and at a 35% reduction in building costs, which were as low as $13.26 per square foot, or $859 per pupil, including furniture allowances and site development.

(Item No. 11)

BONDING AGENT: Thorobond, a new liquid agent for improving adhesion between old and new concrete, plaster and many other materials, is described in an eight-page folder. Typical uses are illustrated.



(Item No. 12)

HANDSPLIT CEDAR SHAKES: Three distinctive types of handsplit shakes—handsplit-resawn, straight-split and tapersplit—are described by the Red Cedar Shingle Bureau in its latest four-page folder. Clear and concise drawings of actual shake construction on roof and side walls and easy-to-follow directions on applications round out the brochure.

(Item No. 13)

LIGHTING: Candlepower distribution curves are one of the features of Prescolite's "Specification Drawings for Architects, Engineers and Builders," which also includes illumination data. At least half of the 28-page booklet is devoted to illustrative material.

(Item No. 14)

THOUSANDS OF ITEMS

RADIO-ELECTRONICS: An industry-wide referance volume which meets the critical requirements of those who specify, design and buy electronic parts and equipment will be available in December. Largest catalog ever published for the industry, "The Radio-Electronic Master" has more than 125,000 items of 350 manufacturers and more than 11,250 illustrations.

Among the products listed in the buying guide are antennas and accessories, recordings and PA systems, hi-fi equipment, hardware, transmitters, communication receivers, speakers, microphones, switches and volume controls.

(Item No. 15)

VENTILATORS: Features of the Herman Nelson AUDIvent are amply illustrated in a 12-page catalog for consulting engineers, architects and contractors. This auditorium unit ventilator is designed for the heating, ventilating and natural cooling of areas such as gymnasiums, cafeterias, libraries, churches and similar large capacity rooms.

Another booklet, an eight-pager sparked with cartoons, depicts the advantages of three methods of hot water perimeter piping systems for classroom unit ventilators: wall-mounted, cabinet-base and recessed-edge.

(Item No. 16)

POLE STRUCTURES: To illustrate many uses being made of pole buildings, Dow Chemical has prepared an eight-page booklet. "Low-Cost Pole Buildings for Industry" includes manufacturing operations, warehousing, lumber storage and garage facilities.

(Item No. 17)

WINDOWS: Geyser wood bar windows for either unit openings or continuous fenestration are described in an eight-page bulletin. Specifications, complete size data and panel diagrams and standard details are given, as well as several illustrations of completed installations.

(Item No. 18)

BUILDING INSULATION: Pittsburgh Corning has intended "Foamglas Building Insulation" as both a catalog and reference booklet for architectural, engineering and maintenance personnel. It contains complete information on the latest recommended procedures for the application of cellular glass insulation on flat roofs, pitched roofs, parking decks, curtain walls, wall linings, ceilings and perimeters.

(Item No. 19)

FLOOR STAIN REMOVAL: Architects, builders and suppliers who would like to pass on some maintenance tips to their clients will find help in an eight-page booklet, "How to Remove Stains from Floors." Huntington Laboratories give steps for general stain and spot removal from all floors, then list separate, specific instructions for soft floors like asphalt tile, mastic, rubber, wood, cork, linoleum and magnesite; and for hard floors like concrete, marble, and ceramic tile.

NEW FIRM: John W. Maloney, AIA, of Seattle has announced that the Yakima branch of his practice, operating under the firm name of Maloney & Whitney in the Larson Building, has been purchased by James D. Cowan, AIA, and Wm. E. Paddock, AIA. The new partners, both life-long residents of Yakima Valley, will practice under the firm name of Cowan & Paddock. Cowan is a graduate of Yale University, Paddock of the University of Washington.

The new firm will retain the staff of 21 persons who have been identified with Maloney and the late John Whitney over a period of years.

OPEN OFFICES: Former partner and associate with Ernest J. Kump Associates of Palo Alto, Delp W. Johnson, AIA, has established an office for the practice of architecture at 166 Geary St., Suite 140, San Francisco (EXbrook 2-3589).

John Stewart Detlie, AIA, has opened an office for the general practice of architecture at 330 Republic Bldg., Seattle (MUtual 6071). For many years he was a partner in the architectural-engineering firm of Young, Richardson, Carleton & Detlie, which now becomes Young, Richardson & Carleton.

An artist in his own right as a painter, Detlie has been a leading spokesman for the city's civic and cultural interests, particularly through Allied Arts of Seattle which he served as its first president. He currently heads the Seattle Art Commission.

•

TWO ARCHITECTS, Arthur F. O'Leary, AIA (left), and Paul Williams, AIA, second from right), join Mrs. Winifred Pike, chairman of Operation Home Improvement committee of Los Angeles, for panel discussion at convention of National Association of Real Estate Brokers held in that city. Moderator James M. Woods, construction firm president, is at right. All are Angelenos. (A summary of O'Leary's remarks appeared in last month's PA&B.)

NEW ASSOCIATES: George Lionakis, AIA, and Harry T. Nyland have been named associates in the Sacramento architectural firm of Cox & Liske. Both are graduates of the University of Oregon and have been with the firm since 1954.

RESUMES PRACTICE: After 2½ years in Juneau, Alaska, with the Department of the Interior, Arch N. Torbitt, AIA, has resumed his private practice of architecture at 1807 N. 51st St., Seattle (MElrose 7842). He served as an architectural supervisor and inspector during his stay in the territory.

ON THE MOVE: The architectural office of Kenneth T. Thompson & Associate has moved from Pacific Palisades, Calif., to 9278 Santa Monica Blvd., Beverly Hills (BRadshaw 2-1697).

Green, Sibold & Associates have moved their architectural offices from the Securities Bldg. to Room 301, White-Henry-Stuart Bldg., Seattle.

APPOINTED: The San Diego architectural firm of Richard George Wheeler & Associates has named Tom Tucker, AIA, as chief architect and Edwin M. Bennett as chief of engineering. The appointments are in line with the firm's current expansion program which is designed to provide a complete package-service for clients.

Pereira & Luckman, Los Angeles architects-engineers, have appointed G. P. Ellington as director of public relations, succeeding A. W. McKelvey, who has been advanced to director of programming. New personnel manager is Robert J. Kremple.

WORLD FAIR DESIGNER: Los Angeles architect Earl T. Heitschmidt, FAIA, has been selected by the State Department to head a design group planning America's entry in the 1958 Universal and International Exposition to be held in Brussels, Belgium. The project will include the construction of an exposition building to house U.S. entries at a cost of $8 million.

TO EUROPE: Los Angeles architect Charles E. Fry, AIA, is in Europe inspecting NATO Air Force installations as commanding officer of the 9083rd Air Reserve Group, Pasadena. Col. Fry is visiting Frankfurt, Wiesbaden, Paris and London.

Pacific Architect and Builder

Builders and Suppliers

headlining the news

• **Kaiser Gypsum Co., Inc.,** has purchased the physical assets of Fir-Tex Insulating Board, Inc., in a multimillion dollar transaction and has named Robert A. Costa as vice president and assistant general manager in charge of the newly created insulating board division.

COSTA

Costa will maintain his office at the firm's general headquarters in Oakland, says Claude E. Harper, vice president and general manager of Kaiser Gypsum.

The acquisition includes the principal Fir-Tex plant at St. Helen's, Ore. (see photo), more than 16,000 acres of timberland in Oregon and Washington, and Western Insulated Products, Inc., a wholly-owned subsidiary.

Costa, formerly merchandise manager for Kaiser Gypsum, joined the firm in 1950 as administrative assistant to the general sales manager, following several years with Arabian-American Oil Co. as assistant to the chief engineer.

• **Pomona Tile Manufacturing Co.** has appointed Charles E. Thew as Oregon district sales representative with headquarters at 3842 S.E. Morrison St., Portland. He was manager of Carlton Tile Co. of Portland from 1945 until this year.

• **Clay Pipe Institute** has a new Northwest district engineer, Owen B. Williams Jr., who will cover Washington, Oregon and British Columbia, with headquarters at 903 Roanoke Seattle. Formerly with The Austin Co. on Boeing's experimental and development center, he earlier was with the Corps of Engineers for 14 years.

• **Rheem Manufacturing Co.** has consolidated its Wedgewood Division, making gas ranges, with Standard Enameling Co., parent of Western-Holly Appliance Co. Operations are being carried out through Standard Enameling, which becomes a new Rheem subsidiary.

Standard Enameling will continue and expand manufacture and marketing of Wedgewood and Western-Holly free-standing and built-in gas cooking ranges, in addition to furnaces and other home appliances. Both lines will be marketed by their present sales organizations.

• **National Electric Products Corp.** has transferred two sales representatives C. E. Heggs from Denver to Seattle and K. F. Whittlesey from Seattle to Portland.

• **Pacific Tile and Porcelain Co.** has opened an office in Seattle at 2213 15th Ave. W. and has appointed Loren Bartlett as sales manager of the newly formed Northwest division. He has been associated with the tile industry for the past 11 years.

BARTLETT

The new office will have Washington and Oregon as its primary marketing area. Among the products manufactured by Pacific Tile, which was organized in 1933, are Ramona wall and Ramona Krystal-glaze tile, Ceratile and Ceratile Accents.

• **Washington Door Co.** and **Washington Manufacturing Co.** of Tacoma, affiliated pioneer lumber products firms headed by John E. Manley, have gone out of business.

Joseph Manley, secretary of Washington Door, said the company was forced to shut down because "we lost the market for fir panel doors, we were too far from our sources of raw materials and the union wouldn't let us run the business."

August VonBoecklin, manager of Washington Manufacturing, blamed generally rising costs, largely due to the "increasing remoteness of the raw materials." The firm in recent years had been making door frames, moldings and wood gutters.

NATIONAL NOTES

• **United States Gypsum Co.** has promoted E. E. Ellwood from assistant manager to manager of its architect service department. He has been with the firm since 1941.

• **Dulaney Plywood Corp.** has appointed Alan Denton as sales manager of its newly created soft woods division which will operate in the wholesale field.

• **Schemenauer Manufacturing Corp.** has acquired Recoy Products Co. of Canton, Ohio, which will be operated as the Recoy Division at Holland. President Harold Schemenauer states that the move is part of an expansion plan of his firm which since 1945 has manufactured fin coil, wall and baseboard radiation and unit ventilators for all types of installations.

• **Facing Tile Institute** has elected J. Carvel Tefft, vice president of The Claycraft Co. of Columbus, Ohio, as chairman.

• **Wayne Iron Works** of Wayne, Pa., is offering a gymnasium seating advisory service to school officials, architects and engineers, which includes design and engineering plans and sight-line studies to determine maximum visibility.

• **Timber Engineering Co.,** research affiliate of the National Lumber Manufacturers' Association, is bringing the why and know-how of trussed rafters to the builder's home ground through the cooperation of his local home builders' association. The presentation includes the assembly of a full-scale, 21-ft. Teco trussed rafter. Building organizations can arrange to have the program at a local meeting by contacting Teco at 1319 18th St. N.W., Washington 6, D. C.

• **Structural Clay Products Institute** has opened the doors of its $500,000 research center at Geneva, Ill., under the direction of Robert B. Taylor and his staff of 27 scientists and technicians.

PRINCIPAL PLANT AT ST. HELENS, ORE., is among physical assets of Fir-Tex Insulating Board, Inc., purchased by Kaiser Gypsum Co., Inc. One of four plants producing insulation board in West, it includes 14 major buildings covering 175 acres which front Scappoose Bay of Columbia River, about 29 mi. northwest of Portland. Annual plant capacity is 118 million square feet of equivalent ½-in. board products. River, about 29 mi. northwest of Portland. Plant produces complete line of insulation board for residential and commercial construction, refrigeration units and other uses, decorative board for interior finishing and acoustical products. Annual plant capacity is 118 million square feet of equivalent ½-in. board products.

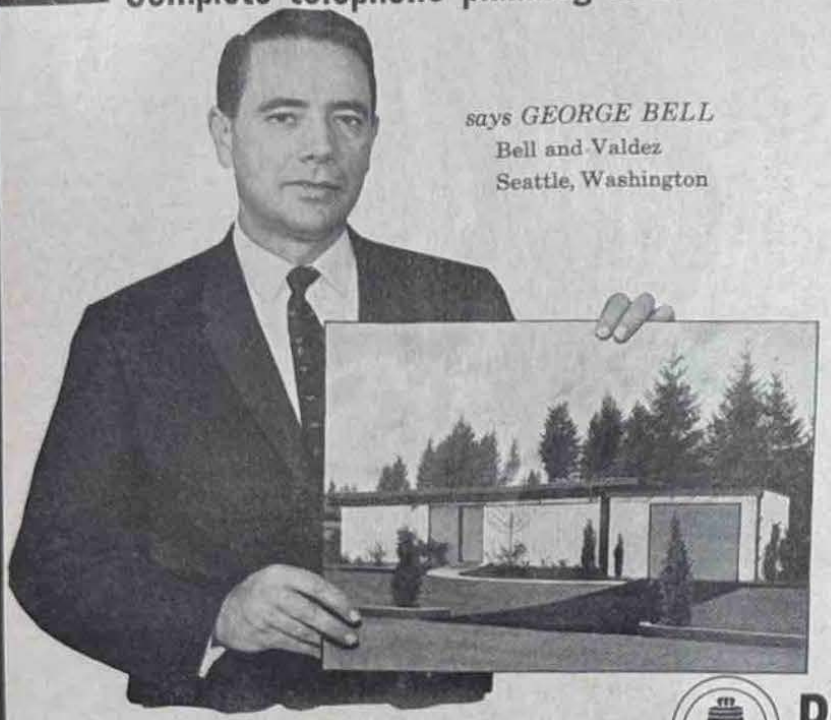
What American women want in housing (cont'd. from p. 8)

door storage for wheel toys, garden tools, furniture, screens and storm sash can be eliminated and space for their function still made available in the basement. Some recognize that split-level houses offer a satisfactory compromise between space cost and stair inconvenience. Many reject them on the basis of unsatisfactory appearance when built on flat land.

Basementless House: By contrast, if there is no basement, then space must be found elsewhere for many purposes and items and an attic with a disappearing stair is wanted. An oversized single-car garage or carport or an outdoor storage shed becomes a necessity.

Dining Room: The majority of the women want a separate dining room. Faced with the fact of cost, they give it up but reluctantly. They try compromising on a dining L off the living room, then the family room and finally accept the informal dining area of the kitchen with buffet service in the living room for guest meals—but they don't like it. The women have placed a different emphasis on the use of the dining room. They say it is necessary for teaching children manners.

Living Room: With the family group together in the one area where they can all be together—the kitchen where mother must be working—, the function of the living room as the "togetherness" room is lessened. But it is needed as a formal room for multiple uses. Some women refer to this room as the old-fashioned parlor. For its many purposes, it need not be too large. They are willing to accept a parlor smaller in size than living rooms which have been designed on the basis of general family activity rooms. This reduced area compensates somewhat for the area added by the family room. It should be located away from the lines of traffic within the house and isolated to the greatest practical degree from the family or other activity areas. Because this room is used for social contacts with people outside the family group, it is preferred to be located near their place of entry, on the street side of the house.



Front Entrance: The women want privacy; they do not want the living room, dining room, kitchen or bathroom in direct view of the public. They prefer an enclosed entry foyer. As an economy they will accept some type of screening.

Bedrooms: Privacy, both visual and sound, are essential for the bedrooms. They want them insulated, as much as possible from the sounds and noises generated in the major activity area of the house, through the use of corridors and closets. It was pointed out that the laundry room would be used as a sound buffer since it is seldom used at night. There should be access to the bedrooms from the kitchen-family area without going through the dining-living areas. Each child should have a space that is its own and since a separate bedroom for each child is rarely possible, there should be a bed for each child. Two closets in each bedroom are desirable and they should extend to the ceiling with two shelves instead of the normal one. The women claim that this is cheap storage space.

Bathroom: A complete bath in addition to a half-bath at the rear entry is considered minimum in a three-bedroom house. Some would want two lavatories in the bath as a minimum. They want counter-mounted lavatories with storage space beneath for bathroom supplies and equipment. They do not want a window over the tub; it is drafty, difficult to open and close, hazardous to clean and deteriorates from water damage. Regarding the problem of cleaning around the toilet, one group proposed that it be wall-hung; another that it be enclosed in some manner. Two full baths in addition to the half-bath at the rear, of course, are considered desirable and should be provided if cost considerations permit.

Other Storage: Linen closet in the hall, adjacent to the bathroom; broom closet, large enough for a stand-up type vacuum cleaner and arranged

Complete telephone planning is as basic as good electric wiring

says GEORGE BELL
Bell and Valdez
Seattle, Washington

"Home buyers expect built-in telephone facilities just as much as adequate electrical wiring," says Mr. Bell. "We like to include complete telephone plans as a standard item in every home—outlets in rooms that are used most, near work and leisure spots. And, of course, concealed wiring. These things make a home worth much more."

Successful builders like Bell and Valdez, who are setting living standards in the Pacific West, recognize the value of complete telephone planning. And Pacific Telephone is always ready to help you plan built-in telephone facilities. Just call us and ask for our *free* Architects and Builders Service.

Specify built-in telephone facilities —a sign of good planning

Pacific Telephone

for cleaning fluids, etc., located in the kitchen or adjacent laundry-utility room; off-season clothing storage, preferably a closet that is mothproofed and sealed, located in the bedroom section of the house.

Garages and Carports: They are wanted but apparently not primarily for protection of automobiles. There is no difference in trade-in allowance between a car kept in a garage and one that is left out-of-doors. If there is no basement, the need for a garage or carport with storage becomes more imperative. The final determinate is climate. In cold areas, a garage will be used for the comfort and convenience of starting the car in the morning; and in these areas the house, most likely, will have a basement which will take care of many of the other uses for which a garage is wanted.

Homemaking Appliances: The proposal of the majority was that space should be provided first with the money the builder might spend on including homemaking appliances. Many object to the payment of interest over a long period of time. Some of the women object to the initial installation of appliances by the builder because they want to make their own choice of brand, type and model. There was concern expressed over the difficulty of getting local service for items of equipment for which there was no local representative.

California architects meet in Yosemite (cont'd. from p. 11)

years, according to Cummings. Construction has not caught up with shortages and many of the facilities built prior to World War II are now obsolete.

Cummings advised architects that in hospital design they should recognize the fact that the purposes of hospital facilities are changing and the great need now is for long-range care and care for the aged.

Shaw, who with council president Reid developed the so-called "Random Falls Idea" of secondary education, asserted that "architecture can serve populations—but the architect must serve people.

"I'm not worried," Shaw declared, "over any possibility of our overbuilding or overplanning. Population waves tend to reproduce themselves and the need becomes a continuing problem."

"In school design and construction," Shaw said, "the mere providing for a need guarantees population growth to utilize the facilities provided."

Bentel, who addressed the architects in a seperate session devoted to public relations, reiterated the contentions of both Eichler and Dr. Pepper on the architect's responsibility to the public.

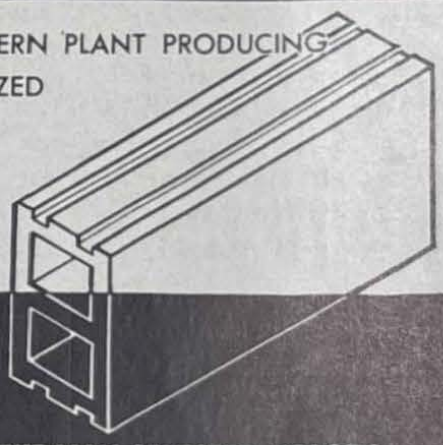
"Newcomers to our state," Bentel asserted, "are being packed almost wall to wall in very limited geographic areas and they may find themselves in the years ahead living in California's slums of the future."

"Architects must do everything possible to resist the deterioration of architectural and building standards," Bentel urged. "They must also resist the pressure to just get things built to meet population growth."

"Public opinion must be called into play to maintain high architectural design standards and architects and builders alike must accept their responsibility to marshall such public opinion."

Alexander synthesized the attitudes of the architects present in his comment that "the architect has a responsibility to the community to visualize a better environment and then to help the community achieve that environment."

Convention sidelights



School design

School design and school construction having become a major field of activity for many California architects, the session devoted to school architecture had one of the heaviest attendance of any of the panel sessions.

schools at Scarsdale, N. Y., was introduced by John Lyon Reid, council president, who with Shaw originated the now nationally known "Random Falls Idea," an educational and architectural effort to develop analysis of school problems.

Asserting that architecture is a "culmination of idealism and practicality," Shaw took as his text a quotation from Ruskin: "The greatest thing that the human soul ever did in the world is to see something clearly and tell what it saw in a plain way."

The role of the architect, Shaw declared, is to "see plainly that schools are for people; that school buildings are places where human beings live and grow; and to design such buildings so that they promote, not retard the learning process."

Schools built on the so-called campus plan, where as many as 2,000 pupils are shuffled from room to room at the end of each period in a manner comparable to the mass movement in the New York subway, are little kingdoms built for the convenience of teachers rather than a carefully thought out organizational plan for the growth of students as individuals."

"Such systems," Shaw declared, "are efficient. But I question whether they are educationally effective."

In contrast Shaw recommended schools such as the Heathcote Elementary School which consists of clusters of four rooms around a common core.

"This type of school," the educator explained, "becomes a world in which each child remains for several years with the same teachers who have an opportunity to know and appreciate the worth of each individual child.

"In planning school buildings architects are truly shaping human environment. Thus the architect's role should be to ask significant questions which will reveal how student needs are to be met. The architect must take the primary responsibility of keeping educational needs in sight; in pointing out the various implications in the use of buildings; of planning for flexibility and the suitability of school buildings for use 10 or 20 years hence."

Hospital committee

The hospital and health committee of the council, meeting at Yosemite, recommended that an architect be appointed to serve on the advisory committee of the State Hospital Board which is responsible for approving hospital design plans.

The council also voted its formal disapproval of "secrecy" involved in a proposed reorganization of the State Department of Professional and Vocational Standards.

The department, council members said, is planning to put all state design and construction licensing agencies into one of five proposed new divisions of the department.

Melton Ferris, executive director of the council, explained that public groups and the public itself have not had the opportunity to see the proposed plan and review its merits.

"Even if the plan itself is good," Ferris explained, "the secrecy with which it is being handled is abhorrent and wrong."

The board of directors, at its final session Saturday morning at Yosemite Lodge, approved a resolution urging the Governor to make the plan available for public study and to hold off any official action until organizations affected have had a chance to study the proposal.

Home builders

Home builders are "pricing themselves right out of the market," in the opinion of Joseph L. Eichler, president of Eichler Homes, Palo Alto.

"The rising costs of production," Eichler told the architects at Yosemite, "are placing new homes beyond the reach of the middle income groups."

He put much of the blame for these increased costs on unnecessary and stringent regulations of existing government agencies in the home building field, along with the shortage of financing.

Architects and home builders alike, Eichler said, have failed to keep pace with advances made in other industries and many builders who formerly built large numbers of homes are now turning to other phases of business, such as land development.

The only major advancements in home building, he declared, have been the standardization of components, organization of crews to handle single operations, precutting and large-scale purchasing.

"With the exception of these major changes the actual technique of building a home is pretty much the same today as it was a hundred years ago."

The homes of the future, predicted Eichler who has made a national reputation for his building of architect-designed contemporary style houses, will be built of materials and with techniques not known or used at present.

He also declared that planning commissions are "not trained or qualified to meet the problems of mass home building. Along with this, many building codes are archaic and actually harmful to sound, modern design and building practices."

The lowest priced Eichler-built home today, the Palo Alto developer explained, now sells at $20,000 "and it is becoming more and more difficult due to government interference to qualify buyers.

"A house that sold for $10,000 a year or a year and a half ago, today must bring $13 to $14,000 and in the San Francisco Bay area the price is averaging closer to $14,500.

"Present FHA requirements and

VA procedures definitely are tending to slow down construction and add appreciably to the cost of construction. Many of these requirements add nothing to the beauty or the soundness or the value of the home and many simply reflect the pressures of special interest groups."

Eichler warned that because the home building industry has been "pushed into a position where it will be difficult for it to supply homes for the middle income group" public housing may become the only solution.

Eichler listed the following as the factors involved in today's high cost of new homes:

1. **The cost of just doing business.**
2. **Sales costs.**
3. **Land costs.**
4. **Merchandising costs.**
5. **Financing costs (including the cost of financing the actual construction as well as financing buyers who want to purchase the house).**

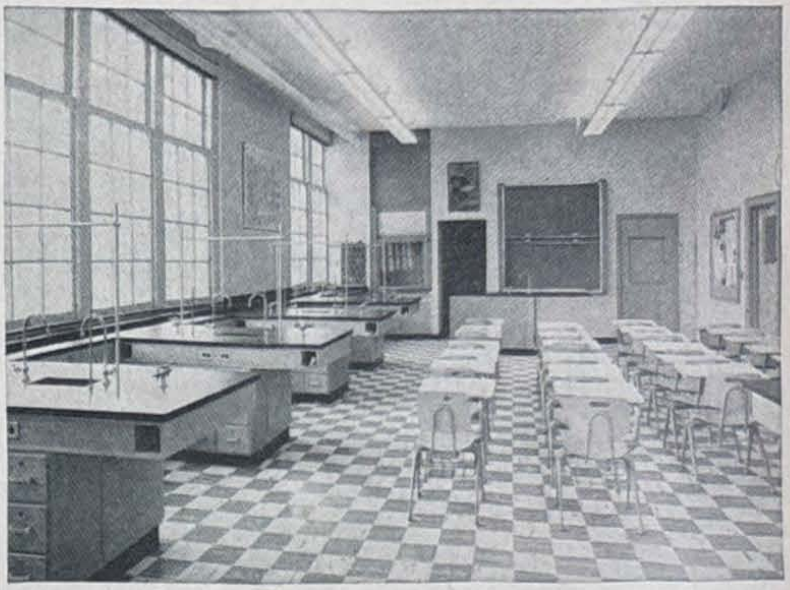
Licensing

In a report presented to the AIA convention at Yosemite, the California State Board of Architectural Examiners, which met concurrently with the architects, revealed the growth of architecture in California by presenting a set of statistics hitherto not disclosed.

Since the start of regulating architectural practice by law in 1901, the board reported, the total of 253 architects licensed by January 1902 has increased to a present 2,575.

"This current total," declared C. J. Paderewski, AIA, San Diego board president, "represents approximately 14% of all the architects registered to practice in the United States. The number of architects has steadily increased with the exception only of the war years."

"The rate of increase in the number of licentiates and the number of applicants," Paderewski said, "indicates a definite surge upward in the past year."



A total of 692 candidates took the examination in June this year, as compared with 157 in June of 1946, and a total of 2,533 separate sections of the examination were taken in 1956 as compared to 777 in 1946.

The board, which consists of Paderewski, Malcolm Reynolds, Earl Heitschmidt and Wendell R. Spackman, also reported that 201 candidates have been certified to practice architecture in California since October 1955. Of the candidates eligible and qualified to take the entire examination, 25.3% passed in the December 1955 examination and 24.4% passed the examination this past June, while 45.6% passed the individual examination sections in December 1955 and 37.2% in June.

The board also reported on new policies and indicated that renewal

PLANNING
makes the difference

in Kewaunee Educational Furniture for
SCIENCE, ARTS & CRAFTS, HOMEMAKING LABORATORIES

From first to last—from the initial design of every unit to its final installation—*planning* makes the difference in Kewaunee Educational Equipment.

Based on a half century of experience in the educational field, each Kewaunee unit and complete floor layout is *planned* for maximum classroom efficiency, maximum flexibility, long life and low cost per year of service.

Whatever *your* educational equipment needs may be—for science, arts and crafts, or homemaking laboratories—consult Kewaunee. Our *planning* services are yours for the asking, without cost or obligation.

TO SERVE YOU BETTER!

Kewaunee Manufacturing Company is pleased to announce that sales and service of Kewaunee equipment in the entire state of California will now be handled *exclusively* by

notification cards have been revised and that the board now reviews partnership applications from architects and non-licensed applicants as to form of letterhead and partnership name.

The board has adopted a new rule in which any candidate for licensing who fails to appear for three consecutive examination periods will be required to file a new application and have his past examination record abandoned.

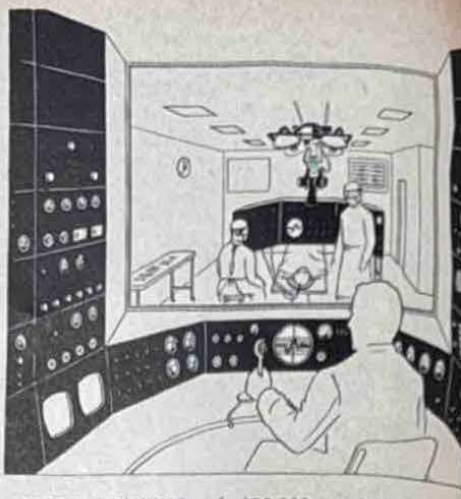
Spackman was introduced as the newest board member, appointed recently by Gov. Goodwin J. Knight to fill the vacancy due to the resignation of Norman Blanchard. The vacancy created by the resignation of U. F. Rible has not yet been filled.

Annual banquet

Leon Chatelain Jr. of Washington, D. C., national AIA president flew to the Yosemite meeting to participate with council president John Lyon Reid at the annual banquet honoring past presidents of the council.

The occasion also was utilized for presentation of the AIA's Citation of Honor to Miss Pearl Chase, chairman, and the plans and planning committee of the Community Art Association of Santa Barbara for their work in helping to promote good design in that southern California community.

Architects help design first push-button surgery suite



One of the most unique hospital operating rooms in the world has been completed in San Francisco where brain surgery will be performed in an atmosphere typical of the futuristic dreams of an avid science-fiction fan.

Mount Zion Hospital becomes the first institution anywhere for use of radically new push-button procedures in what amounts to brain surgery by mathematics.

The elaborate operating room of the future has been designed for Mount Zion's Neurosurgical Institute for the Study of Human Physiology and recently perfected "stereotaxic" operating techniques will be used by institute surgeons for exploring and treating the brain's deep recesses.

The technique was developed largely by research experts in Sweden and utilizes an intricate aiming device which, after proper mathematical measurements have been fed into it, permit the surgeon to insert a needle or an electrode deep into the brain with every assurance that the needle will "land right on the target."

Planned and designed by Skidmore, Owings & Merrill, hospital architects and a team of physicians, surgeons, physicists, biologists and electronics engineers, the neurosurgery suite is a mass of electronically controlled equipment.

ARTIST'S DRAWING of $75,000 push-button surgery suite planned at Mount Zion Hospital.

The procedure is so painless that it can be conducted under a local anesthetic, with the patient remaining conscious at all times and, in many of the operations, actually capable by his or her own comment of helping the surgeon.

The technique provides a revolutionary new method for studying and treating some types of cancer, certain psychotic and psychoneurotic conditions, intractable pain, cerebral palsy, hypertension and nervous and muscular disorders.

The stereotaxic technique requires the use of extremely sensitive electronic equipment which records the minute electrical variations which emanate from the brain. Therefore the entire operating suite is electrostatically shielded with a copper screen imbedded in the walls which seal it off from the rest of the hospital.

The walls, floor and ceiling are completely lined with lead to permit the use of radiant energy without penetration to other rooms. And the entire area is as nearly germ-proof, dust-proof and explosion-proof as it is humanly possible to achieve.

A movable, sterile, control panel in the operating room will enable the surgeons to manipulate their various instruments such as the electronic stimulator, high-frequency diathermy unit, ultra-sonic microwave apparatus and a variety of recording devices.

A television camera will be nested in a battery of special lights mounted on a movable carriage above the operating table. Close-up, normal and wide-view TV shots will be possible and showings of stereotaxic operations may be viewed and heard on a two way inter-communication system in Mount Zion's auditorium.

Immediately adjacent to the operating suite, in a control booth, an electronics engineer will be on duty during all operations. He will manipulate a complete set of control panels duplicating those within the operating room.

RECREATIONAL CENTER— Portland, Ore.
(Estimated cost $8,000,000)

Measure to place Exposition - Recreation Center partly in Public Auditorium and partly in Delta Park area has been defeated by voters of Portland. Another measure to repeal the restriction approved last May to limit the center to the east side and restore original powers to the E-R commission was also defeated. This means that the center must be built on the east side, and it is thought that the courts will have to determine if the May measure deprived the commission of its authority. WB 11-10

PARKING FACILITIES— Portland, Ore.

Measure defeated for City, Fred L. Peterson, mayor, City Hall, Portland, to set up a City Parking Commission with authority to locate and construct parking facilities.

(Estimated cost $2,00,000)

Bids to be opened 2 p. m., December 11, by Archdiocese of Seattle, Most Rev. Thomas A. Connolly, archbishop, 907 Terry Ave., Seattle, for construction of a new major seminary to be known as the St. Thomas seminary, and located on a 350-acre tract about ¼ mi. from the existing St. Edwards' seminary on north shore of Lake Washington between Juanita and Kenmore. Plans with John W. Maloney, architect, 754 Central Bldg., Seattle. $50 deposit. Certified check, cashier's check or bid bond 5%.

Project includes chapel, estimated cost

$350,000; two-story administration offices; five-story C-shaped dormitory unit with wing for dining area and kitchen; prayer hall attached to dormitory wing; library adjacent to loggia in front of the building. A student court will be separated from a formal garden by a low passage connecting both portions of the building.

Concrete walls, with dampproofing on outer surface, brick veneer; limestone trim; concrete slab floors; flat plate type structure with no beams or columns; built-up gravel roof; 2 plaster partitions, some with plaster on steel studs, some concrete block; concrete stairways with quarry tile surfacing and ceramic wainscots; aluminum windows; rigid insulation on deck; public areas to have acoustical ceilings, bedrooms to have painted concrete; all exterior doors to be hollo steel painted, interior doors steel package type with steel frames; lower floors, wood with metal frames; built-in wardrobes in all bedrooms; four walk-in refrigerators; asphalt tile flooring, terrazzo in kitchen and main chapel, ceramic in toilets and showers; glazed block in kitchen walls and toilets and showers.

This project was negotiated with Campbell Construction Co., 1150 Folsom St., San Francisco, but when the sub-bids were in the figures were too high.

●HANGAR— Moses Lake, Wash.

Bids to be opened 2 p.m., P.S.T., December 28, by Boeing Airplane Co. in the Engineering Bldg., Plant 2, 7755 E. Marginal Way, Seattle, for construction of a two-place hangar including earthwork, paving, utilities and miscellaneous items of work at the Moses Lake Flight Center, Larson Air Force Base, Grant County, Wash. This project was previously advertised as four separate packages: 9B—structural steel work; 9C—hangar doors; 9A—construction to grade; 9—structures, paving and utilities. Package 9B has been awarded and retains its separate identity until assigned to the successful bidder on Package 9. Packages 9A and 9C are now consolidated with Package 9.

The work in the present bid call includes but is not limited to the following: 1—two-place hangar, not including structural steel frame; 2—concrete apron and yard paving including excavation, grading and subgrade; 3—asphaltic concrete access road and fuel truck parking area; 4—domestic and fire protection water lines; 5—air from existing service line; 6—additions to and modification of existing boiler plant including two steam generating units and steam and pumped return lines for the hangar and paint storage building; 7—storm and sanitary sewers; 8—electrical distribution and communications system from existing services.

The present contract will constitute a subcontract under a prime contract between Boeing Airplane Co. and the U. S. Government, and it will include by assignment the structural steel work contract, Package 9B previously awarded to Judson Pacific-Murphy Steel Works, Emeryville, Calif., $865,000.

Plans obtainable on or about November 26 from Naramore, Bain, Brady & Johanson, architects and engineers, 904 7th Ave., Seattle. $100 deposit. Bids on excavation, basement construction for the hangar were received in October and subsequently rejected, and a previous invitation to bid on the hangar including utilities and the hangar doors was withdrawn.

WELLS HYDROELECTRIC PROJECT— Wenatchee, Wash.

Following is a description of the land involved in the Wells Dam project on the Columbia River, 45 miles upstream from Wenatchee, for which a Federal Power Commission license may soon be secured by Douglas County PUD, George Hamilton, president, 20 N. Main, East Wenatchee. The area included in the hydro-electric project was outlined in the preliminary engineering report by Kaiser Engineers, 1924 Broadway, Oakland, Calif.

Part of the Azwell orchard would be flooded for the project and most of the Starr-Bonita orchards, both on the Chelan County side, and the Kirk, Crane and Wade orchards on the Douglas County bank. Part of Bridgeport Bar will be inundated and half of the Indian lands at the mouth of the Okanogan River. The motor base in the Bureau of Reclamation pumping plant for Brewster Flat irrigation project will have to be raised but the Bridgeport Bar plant will not be affected. Six and a half miles of the Great Northern line to Oroville will have to be raised on the west bank directly

above the dam at Azwell and three miles near Pateros will have to be shifted. At the dam, the average raise will be 12', at Pateros about 6'. Two miles of Highway No. 97 will have to be relocated near the dam and one mile of the road near Pateros. A bridge across the Oakanogan River and a few miles of Highway No. 10, between Brewster and Bridgeport, must be raised. Very few electrical and telephone lines will be interferred with.

SC 11-13. Previous report 11-8

DRAINING, GRADING, SURFACING— Yakima, Wash.

The Yakima County Commissioners, Courthouse, Yakima, have in their 1957 budget provided for grading, ballasting and surfacing with light bituminous treatment of the following five roads in Yakima County: Cowiche Mill Road, approximately 1.9 mi., estimated cost $39,000; Thompson Road, 1.0 mi., cost $21,000; Pioneer Way, 0.25 mi., cost $5,250; Elliott Road 1.0 mi., cost $21,000; Hatton Road, 0.25 mi., cost $5,250. IG 11-10

OVERPASS— Yakima, Wash.

Bond issue for $1,200,000 defeated in November 6 election held by City Commission, City Hall, Yakima. Bids will be opened 2 p.m., November 26, by Bureau of Reclamation, Bldg. 63, Denver Federal Center, Denver, Colo., for furnishing and delivering fob Casper, three current transformers and three potential transformers; Inv. No. (D) D-22, 153-A. Specifications with above office. SP 11-9

AIRPORT EXPANSION— Casper, Wyo.
(Estimated cost $1,000,000)

Plans announced for improvements to the Natrona County Airport, Casper, to improve the terminal's facilities for training Air National Guardsmen and for commercial use. Improvements will include the following: runway extension to be constructed with the aid of federal funds, estimated cost $592,000; extension of runway lighting, $60,000; necessary cut and earthfill work, $200,000 to $260,000; rerouting U. S. Highway 20-26 if necessary for runway extension, $250,000.

SC 11-13

● STATE HIGHWAY PROJECTS— Cheyenne, Wyo.

Bids will be opened 9:30 a.m., November 20, by Wyoming State Highway Commission, State Office Bldg., Cheyenne, for highway construction. Specifications with above office. Certified check or cashier's check 5%.

HYNDS BOULEVARD ROUTE—Construction of 1.269 miles grading, draining, selected material surfacing, irrigation sprinkling system, landscaping, four rigid-frame bridges on Lake Absarraca (Country Club Lake) and miscellaneous work in the City of Cheyenne, Laramie County; FAIP No. 1-223(10) Unit 1 and 1-233(18) Unit 1. For information on irrigation sprinkler system, planting and landscaping work, contact J. T. Banner & Associates, consulting engineers, 409 B South 4th St., Laramie.

Quantities: 566,983 c.y. excavation; 417,000 c.y. mi. haul; 35,600 ton selected material surfacing; 142,920 ton mi. surfacing haul; 1,114' reinforced concrete pipe; 9,170' combined curb and gutter; 460 sq. yd. concrete sidewalk; 1,600' reinforced concrete face paving; 1,622.7 c.f. class B concrete; 230,520 lb. reinforcing steel; 27,630 lb. structural

stel; 894 c.y. wet and dry excavation for bridges.

SARATOGA-RIVERSIDE ROAD—Grading, draining, base course surfacing, plantmix surface course, stone chip seal coat, including combined curb and gutter and storm sewer in the Town of Saratoga, construction of four 12'x6'6" reinforced concrete culverts, two structural plate stockpasses, construction of one bridge consisting of three continuous reinforced concrete slab spans over Spring Creek and miscellaneous work on 5 632 miles road in Carbon County; FAP No. F-022-1(1).

Quantities—GRADING CONTRACT: 433,820 c.y. excavation; 104,500 c.y. mi. haul; 72,000 ton crushed gravel base course; 1,140 ton asphaltic material; 12,460 ton plantmixed surface course; 1,200 ton stone chips; 439.3 c.y. concrete; 62,100 lb. reinforcing steel; 2,008' reinforced concrete pipe; 3,370' corrugated metal pipe and arch culverts; 168' structural plate stockpasses; 190 c.y. riprap; 1,200' concrete ditch paving; 220 c.y. excavation for drains; 210 c.y. gravel for drains. STRUCTURE CONTRACT: 200 c.y. wet and dry excavation for bridges; 158.9 c.y. concrete; 4,760 lb. structural steel; 37,600 lb. reinforcing steel.

DIVERSION DAM-DUBOIS ROAD—Grading, draining, base course surfacing, plantmix surface course, stone chip seal coat, one 8'x8'x50' reinforced concrete culvert, construction of two bridges consisting of three continuous reinforced concrete slab spans over Red Creek and five continuous reinforced concrete slab spans over Little Red Creek and miscellaneous work on 4.545 mile road in Fremont County; FAP No. F-030-2(1).

Quantities—GRADING CONTRACT: 340,050 c.y. excavation; 112,000 c.y. mi. haul; 22,000 ton selected material surfacing; 18,800 ton crushed gravel base course; 9,450 ton plantmixed surface course; 750 ton stone chips; 69,300 ton mi. surface haul; 855 ton asphaltic material; 2,679' corrugated metal pipe; 380 c.y. excavation for pipe culverts; 280 c.y. riprap; 13,000 c.y. special rock fill; 75.8 c.y. concrete; 7,680 lb. reinforcing steel. STRUCTURE CONTRACT: 90,250 lb. reinforcing steel; 740 c.y. dry and wet bridge excavation; 406.1 c.y. concrete; 11,470 lb. structural steel.

LOVELL-GREYBULL ROAD—Construction of one five continuous reinforced concrete slab span bridge over Little Dry Creek and miscellaneous work on road in Big Horn County; FAP No. F-034-5(4).

Quantities: 24,000 c.y. excavation; 2,400 c.y. mi. haul; 180 c.y. wet and dry excavation for bridges; 231.1 c.y. concrete; 7,160 lb. structural steel; 52,850 lb. reinforcing steel; 100 c.y. riprap.

THERMOPOLIS-SHOSHONI ROAD—Grading, draining, base course surfacing, oil treatment by the roadmix method, sand-gravel seal coat and miscellaneous work on 3.123 mile and metal plate guard fence on an additional 2.965 mile road in Wind River Canyon, Hot Springs County; FAP Nos. F-118(9), F-118(10) and F.L.H.P.-12(2).

Quantities: 432,600 c.y. excavation; 13,500 ton selected material surfacing; 32,600 ton crushed gravel base course; 8,700 ton crushed gravel surfacing; 500 ton crushed sand-gravel; 665 ton asphaltic material; 3,054' corrugated metal pipe; 100', 8" perforated corrugated metal pipe; 30 c.y. gravel for drains; 200 c.y. riprap; 395 c.y. excavation for pipe culverts and drains; 150 c.y. structure excavation; 12,931' metal plate guard fence.

ALBIN CONNECTION ROAD — Grading, draining, base course surfacing, plantmixed surfacing course, stone chips seal coat and miscellaneous work on 9.218 mile road in Laramie County; FASP No. S-27(4).

Quantities: 202,500 c.y. excavation; 30,000 c.y. mi. haul; 45,000 ton selected material surfacing; 17,200 ton crushed gravel base course; 7,000 c.y. binder; 1,360 ton stone chips; 10,700 ton plantmix surface course; 23,500 c.y. mi. haul binder haul; 1,065 ton asphaltic material; 670' corrugated metal pipe; 368' reinforced concrete pipe; 190 c.y. excavation for pipe culverts.

ZERO ROAD—Grading, draining, special embankment and miscellaneous work on 9.912 mile road in Natrona County; State Project No. SC-CFM 4217.

Quantities: 169,500 c.y. excavation; 15,000 c.y. special embankment; 1,000 c.y. stripping; 1,922' corrugated metal pipe (installed only); 30 c.y. riprap; 37.8 concrete; 3,020 lb. reinforcing steel; 65 c.y. structure excavation.

ESPONDA ROAD—Base course surfacing and miscellaneous work on 3.8 mile road in Johnson County; State Project No. SC-CFM 4435.

Quantities: 12,000 ton gravel base course; 25,300 ton mile surfacing material haul.

SSMP No. 4413—Crushing and stockpiling of crushed gravel surfacing (½" max.) at various locations in Natrona and Converse Counties, involving 12,000 ton crushed gravel surfacing and 15,000 ton mile haul.

SSMP 4433—Crushing and stockpiling crushed gravel surfacing (½" max.) at various locations in Lincoln, Sublette and Sweetwater Counties, involving 25,000 ton crushed gravel surfacing and 28,000 ton mi. haul.

SSMP 4439—Crushing and stockpiling of crushed gravel surfacing (½" max.) at various locations in Campbell, Crook, Johnson, Sheridan and Weston Counties, involving 30,500 ton crushed gravel surfacing and 219,550 ton. mi. haul. SP 11-13

▲CLOSED DRAINS— Cody, Wyo.

Bids received by Bureau of Reclamation, Box 839, Cody, for construction of closed drains, Heart Mountain Division, Shoshone Project, Wyo.; Spec. No. 601C-49. Bids opened November 8. LOW BIDS: W. C. & R. C. Tucker Construction Co., Box 1005, Riverton, $6,495; King Engineers, Box 488, Riverton, $6,960; Husman Bros., Inc., 1200 Big Horn Ave., Sheridan, $7,640.

●GLENN HIGHWAY BRIDGES— Juneau, Alaska

Bids will be opened 11 a. m., December 12, by Bureau of Public Roads, room 319, Federal Bldg., Juneau, for construction of four bridges located on the Glenn Highway at Miles 54.9, 61, 62.5 and 89.3 respectively, Third Judicial Division, Territory of Alaska. Specifications with BPR, room 311, Federal Bldg., Box 1961, Juneau. Bid bond 5%. Completion time September 1, 1958.

Work includes the following bridges: MOOSE CREEK—a 180'x24' continuous one-beam structure with 55', 70' and 55' spans on steel rail piling and concrete substructure, concrete deck. ESKA CREEK—a 27'x24' continuous one-beam structure with wood abutments and rail steel piling, and with concrete deck. GRANITE CREEK—a 180'x24' continuous one-beam structure with 55'x70' and 55' spans on steel rail piling and concrete substructure, and with concrete deck. PURITAN CREEK—a 20'x24' one-beam structure with wood abutments, steel H piling, and with concrete deck. SP 11-13

16 Major Reclamation Projects . . .

. . . Invitations To Be Issued by Bureau of Reclamation

Bids will be called by the Bureau of Reclamation during the next three months on 16 major projects. Among these items are the Fremont Canyon Power plant in Wyoming, drains, wasteways and laterals for the Columbia Basin project, the Glen Canyon dam and power plant and pipe lines in the Weber Basin. Additional information may be obtained from the office issuing invitations, as listed at the end of each item. Requests should refer to title and number of each item.

BID CALLS EXPECTED IN NOVEMBER

POWER PLANT AND PRESSURE TUNNEL (11-2)—Fremont Canyon, Missouri River Basin Project, Wyo. Construct indoor-type power plant and lined pressure tunnel. Power plant is to include reinforced concrete superstructure walls enclosing structural steel frame for two 33,500-hp. turbines and two 25,263 kva generators, installation of two butterfly valves about 12′ in diameter, one 100-ton crane and two draft-tube bulkhead gates, furnishing and installing two 10′ 9″ diameter steel penstocks 400′ long. Pressure tunnel is to be 18′ in diameter about 3 miles long and will include a cut and cover section, an inlet gate shaft with control house and a surge tank at the tunnel outlet. Time allowed for completion, 900 days. Bids to be called soon by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

LATERALS, Blocks 72 and 74 (11-7)—Columbia Basin Project, near Quincy, Wash. Construct irrigation facilities to serve one farm unit in Block 72 and 8 new farm units in Block 74. Bids to be called soon by P. R. Nalder, project manager, Box 368, Ephrata, Wash.

DRAINS, Block 43 (11-8)—Columbia Basin Project near Warden, Wash. Construct about 4.5 miles of deep and semi-deep drains on the DE44.5, DE53.5, and DE53.5A systems, constructing a road crossing and pipe inlets. Bids to be called soon by P. R. Nalder, project manager, Box 368, Ephrata, Wash.

WASTEWAY EXTENSION, Block 89 (11-9)—Columbia Basin Project near Moses Lake, Wash. Extend 4 wasteways on the W20 lateral system including 80,000 c.y. excavation for wasteways and 3,000 c.y. excavation for structures, 150 c.y. concrete. Bids to be called son by P. R. Nalder, project manager, Box 368, Ephrata, Wash.

LATERAL TURNOUTS, Block 15 (11-11)—Columbia Basin Project, near Eltopia, Wash. Construct two CHO turnouts and one concrete check for Farm Units 30, 31 and 40. Bids to be called soon by P. R. Nalder, project manager, Box 368, Ephrata, Wash.

WELLS, Blocks 79 and 46 (11-13)—Columbia Basin Project near Quincy and Othello, Wash. Drilling, casing and testing two 8″ to 10″ domestic water supply wells to depths of 250′ and 450′. Time allowed for completion 120 days. Bids to be called soon by P. R. Nalder, Project Manager, Box 368, Ephrata, Wash.

ROAD, Haystack Reservoir (11-15)—Deschutes Project near Culver, Ore. Excavating, grading, gravel surfacing and structures for 2.4 miles of relocated county road. Time allowed for completion 300 days. Bids to be called soon by Regional Director, Fairgrounds, Boise, Idaho.

BID CALLS EXPECTED IN DECEMBER AND JANUARY

DAM AND POWER PLANT (11-21)—Colorado River Storage Project, Arizona. Constructing 700′ high concrete arch Glen Canyon Dam with 1,400′ long crest containing 4,770,000 c.y. of concrete and indoor-type power plant 665′ long, 112′ wide and 160′ high, located about 500′ downstream from the axis of the dam. Power plant substructure and intermediate structure is to be of reinforced concrete and superstructure of structural steel with concrete enclosure. On the Colorado River about 135 miles North of Flagstaff. Bids to be called by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

CANAL (11-25) — Missouri River Basin Project, Mont. Earthwork and structures for about 8 miles of the 14′ bottom width Helena Valley Canal, east of Helena. Bids to be called by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

LATERALS (11-27)—Columbia Basin Project, Wash. Earthwork and structures for about 85 miles of laterals and wasteways and constructing 8 minor relift pumping plants in Block 20 about 10 miles northwest of Mesa. Bids to be called by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

PIPE LATERALS AND PUMPING PLANT (11-28)—Weber Basin Project, Utah. Construct about 14 miles of Uintah Bench pipe laterals consisting of about 11 miles of 12″ to 36″ precast reinforced concrete pipe about 1.5 miles of 12″ to 24″ precast concrete steel cylinder-type pipe and about 1.5 miles of 8″ and 10″ steel or asbestos-cement pipe, including pipe turnouts, manholes, blowoffs, air valves, gate valves and line meters. Construct P2.8R pumping plant which is to have four outdoor, horizontal booster units, two units having a total head of 225′ and 9 cfs discharge and two units having a total head of 365′ and 8 cfs discharge. South of Ogden. Bids to be called by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

PIPE LINES (11-29)—Weber Basin Project, Utah. Furnishing and laying about 21,000′ of 24″, 27″ and 30″ precast concrete pressure pipe part, of which will be steel cylinder-type pipe with pretensioned reinforcement and constructing one concrete-lined equalizing reservoir for Davis Aqueduct trunk lines. About 10 miles north of Salt Lake City. Bids to be called by L. N. McClellan, chief engineer, Building 53, Denver, Colo.

PIPE LATERALS (11-30)—Michaud Flats Project, Idaho. Constructing 7.5 miles of welded steel pipe laterals for sprinkler-type irrigation. Near American Falls. Bids to be called by Regional Director, Fairgrounds, Boise, Idaho.

DISTRIBUTION SYSTEM (11-31) — Chief Joseph Dam Project, Wash. Construct Brewster Flat Distribution System, including 8,000′ of 4″ to 30″ steel pipe, 12,000′ of 4″ to 12″ asbestos-cement pipe and appurtenant structures. Near Brewster. Bids to be called by L. N. McClellan, chief engineers, Building 53, Denver, Colo.

LATERAL LINING (11-32) — Columbia Basin Project, Wash. Construct about 4,500′ of blended earth lining on the EL85 lateral in Block 18. Bids to be called by P. R. Nalder, Project Manager, Box 368, Ephrata, Wash.

DRAINS (11-35)—Kendrick Project, Wyo. Constructing open drains and appurtenant structures near Casper. Bids to be called by Regional Director, Denver Federal Center, Denver, Colo.

DEEPENING DRAINS AND WASTEWAY (11-37) — Columbia Basin Project, Wash. Deepening about 2.5 miles of DE229 drain, extending 2 culverts, reconstructing about 12 drain inlets, deepening about one mile of EL31 wasteway and removing and reconstructing a county road bridge in Block 42. Deepening 8 other drains in Blocks 41 and 42. Near Warden and Moses Lake. Bids to be called by P. R. Nalder, Project Manager, Box 368, Ephrata, Wash.

DEEPENING DRAIN AND WASTEWAYS (11-38) — Columbia Basin Project, Wash. Deepening one drain, constructing 7 new drains, 2 wasteways and one pumping plant in block 45 near Othello. Bids to be called by P. R. Nalder, Propject Manager, Box 368, Ephrata, Wash.

Advertisements for Bids

Advertisements reaching us not later than Wednesday noon will appear the same week.

THE RATE for Advertisements for Bids is 35 cents per line for the first insertion; 25 cents per line for each insertion thereafter.

GRADING

BIDS CLOSE 10 A.M., NOVEMBER 29

Portland, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, BUREAU OF PUBLIC ROADS November 14, 1956. SEALED BIDS will be received at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon, mail address P. O. Box 3900, Portland, Oregon, until 10:00 o'clock A.M. on November 29, 1956, for furnishing the material and performing the work for constructing 6.830 Miles Grading, Oregon Timber Access Road Project BLM 6-A, Yellowstone Creek Road, Bureau of Land Management-Salem District, Linn County, Oregon, involving 52 Acres Clearing; 35 Acres Grubbing; 329,100 Cu. Yds. Excavation; 136 Cu. Yds. Concrete; 2,428 Lin. Ft. Culvert Pipe, and other small items of work. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 753 Morgan Building, Portland, Oregon. F. E. ANDREWS, Division Engineer.

5671—11-17

CLASSROOM ADDITION

BIDS CLOSE 7:30 P.M., DECEMBER 18

Klamath Falls, Oregon

NOTICE TO CONTRACTORS

Sealed bids are requested for the construction of a two story classroom addition to the Klamath Union High School at Klamath Falls, Oregon. In addition to classrooms, building will include a large cafeteria and kitchen; stage and dressing rooms for future auditorium; science suite, instrumental and vocal music facilities. Floor area is approximately 32,130 sq. ft.

Exterior walls will be concrete with brick veneer. Asbestos board insulated panels and aluminum sash in aluminum curtain walls. Interior: wood frame with glulam beams, plaster walls and ceiling; floor finishes: linoleum, asphalt, vinyl tile and ceramic tile in toilets; building acoustically designed, roofing, built-up type on wood decks. Low pressure steam, with mechanical ventilation. Lighting, flourescent fixtures. Contract will include wrecking and removal of the old County Library Building, now on the site.

There will be one general bid which will include all items of work.

Bids are to be delivered to the Clerk of Klamath Union High School District No. 2, Room 200, Klamath Union High School, Klamath Falls, Oregon, on or before 7:30 p.m., Tuesday, December 18, 1956.

All bidders must comply with the laws of the State of Oregon, relating to the prequalification of bidders, Chapter 279, Oregon

Revised Statutes. Prequalification forms are immediately available at the office of the Architect.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid form provided by the Architect, and accompanied by a certified check or bid bond, executed in favor of Klamath Union High School District No. 2, in an amount not less than five per cent (5%) of the total amount of the bid, to be forfeited as liquidated damages, should the bidder neglect or refuse to enter into a contract, and provide 100% surety bond for the faithful performance of the work, in the event the contract is awarded to him.

No bidder may withdraw his bid after the hour set for the opening thereof, until after the elapse of 30 days from the bid opening.

The Board of Directors of Klamath Union High School District No. 2, reserves the right to reject any or all bids and to waive any informalities.

The drawings, specifications and contract documents may be examined at the Builders Exchange in Portland, Salem, Eugene, and San Francisco; at the Daily Pacific Builder Plan Room, 465 Tenth Street, San Francisco, California; and at the office of the Architect.

PUMPING PLANT

BIDS CLOSE DECEMBER 4

Canyon Ferry, Montana

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-4783) will be received at Government Camp, Canyon Ferry, Montana, until December 4, 1956, for furnishing labor and materials for Helena Valley Pumping Plant, Helena-Great Falls Division, Missouri River Basin Project, Montana. Location near Helena, Montana. Principal items are 10,000 cu. yds. excavation; 6,300 cu. yds. concrete; 500,000 pounds installing penstock and discharge pipe; installing two 5,000-hp. hydraulic turbine-driven pumping units; and other work. Completion time 730 days. For particulars, address Bureau of Reclamation, P. O. Box 2553, Billings, Montana; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
5645—10-20

INSTALL MECHANICAL, ELECTRICAL EQUIPMENT

BIDS CLOSE 10 A.M., NOVEMBER 20

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, November 20, 1956, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therfor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

The improvement for which bids will be received follows:

1. Installing Mechanical and Electrical Equipment on Primary State Highway No. 12 in Wahkiakum County, DEEP RIVER BRIDGE, a State Project, involving a lump sum bid for Furnishing and Installing Mechanical and Electrical Equipment.

E. C. HUNTLEY, Chairman
W. A. BUGGE, Director of Highways

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A. M., DECEMBER 4
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, December 4, 1956, until 10 A. M., and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal funds have been allocated for items Nos. 1 and 2.

The improvements for which bids will be received follow:

1. Clearing, Draining, Grading, Surfacing, Constructing a Cement Treated Base and Paving with Type I-1 Asphaltic Concrete on 1.640 miles of Primary State Highway No. 13 in Pacific County, RAYMOND NORTH, FAP No. F-006-1(7), involving about 43 acres of Clearing, 531,320 cubic yards of Unclassified Excavation, 199,200 units of Overhaul, 46,950 tons of Crushed Stone Surfacing, Ballast, Maintenance Rock and Mineral Aggregates, 4,520 tons of Asphaltic Concrete, 44 tons of Asphalt Cement, 10,790 tons of CTB Aggregate, 1,650 barrels of Portland Cement, 290 cubic yards of Mineral Aggregate, 67 cubic yards of Concrete, 12,210 pounds of Steel Reinforcing Bars, 3,408 linear feet of Concrete Pipe, 286 Guide Posts and other items.
2. Constructing a Reinforced Concrete Slab Bridge on Primary State Highway No. 1 in Thurston County, SLEATER-KINNEY ROAD UNDERCROSSING, FAP No. I-001-2(45), involving about 200 cubic yards of Common Excavation, 740 cubic yards of Selected Roadway Borrow, 180 cubic yards of Crushed Stone Surfacing and Mineral Aggregate, 200 tons of Asphaltic Concrete, 106 linear feet of Beam Guard Rail, 862 cubic yards of Concrete, 138,000 pounds of Steel Reinforcing Bars and other items. Minimum Wage Rates for this project have been predetermined as required by law and are set forth in the bid proposal.
3. Constructing a Treated Timber and Pile Trestle Bridge on 0.007 mile of Secondary State Highway No. 9-A in Clallam County, DRY CREEK BRIDGE NO. 9-A/1, a State Project, involving about 60 cubic yards of Selected Roadway Borrow and Crushed Stone Surfacing, 22 MBM of Treated Timber and Lumber, 600 linear feet of Treated Timber Piling and other items.

E. C. HUNTLEY, Chairman.
W. A. BUGGE, Director of Highways.

SCHOOL ADDITION
BIDS CLOSE 7:30 P. M., DECEMBER 18
Klamath Falls, Oregon
NOTICE TO CONTRACTORS

Sealed bids are requested for the construction of a two-story classroom addition to the Klamath Union High School at Klamath Falls, Oregon. In addition to classrooms, building will include a large cafeteria and kitchen; stage and dressing rooms for future auditorium; science suite, instumental and vocal music facilities. Floor area is approximately 32,130 sq. ft.

Exterior walls will be concrete with brick veneer. Asbestos board insulated panels and aluminum sash in aluminum curtain walls. Interior: wood frame with glulam beams, plaster walls and ceiling; floor finishes: linoleum, asphalt, vinyl tile and ceramic tile in toilets; building acoustically designed, roofing, built-up type on wood decks. Low pressure steam, with mechanical ventilation. Lighting, fluorescent fixtures. Contract will include wrecking and removal of the old County Library Building, now on the site.

There will be one general bid which will include all items of work.

Bids are to be delivered to the Clerk of Klamath Union High School District No. 2, Room 200, Klamath Union High School, Klamath Falls, Oregon, on or before 7:30 p. m., Tuesday, December 18, 1956.

All bidders must comply with the laws of the State of Oregon, relating to the prequalification of bidders, Chapter 279, Oregon Revised Statutes. Prequalification forms are immediately available at the office of the Architect.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid form provided by the Architect, and accompanied by a certified check or a bid bond, executed in favor of Klamath Union High School District No. 2, in an amount not less than five per cent (5%) of the total amount of the bid, to be forfeited as liquidated damages, should the bidder neglect or refuse to enter into a contract, and provide 100 per cent surety bond for the faithful performance of the work, in the event the contract is awarded to him.

No bidder may withdraw his bid after the hour set for the opening thereof, until after the elapse of 30 days from the bid opening.

The Board of Directors of Klamath Union High School District No. 2 reserves the right to reject any or all bids and to waive any informalities.

The drawings, specifications and contract documents may be examined at the Builders Exchange in Portland, Salem, Eugene, and San Francisco; at the Daily Pacific Builder Plan Room, 465 Tenth Street, San Francisco, California; and at the office of the Architect, Howard R. Perrin, 1121 Main Street, Klamath Falls, Ore.

HANGAR, PAVING, STRUCTURES, UTILITIES
BIDS CLOSE 2 P.M., P.S.T., DECEMBER 28
Moses Lake, Washington
NOTICE TO CONTRACTORS

Sealed bids are hereby invited for the construction of a two-place hangar, including earthwork, paving, utilities and miscellaneous items of work. The project is for the Boeing Airplane Company, Seattle Division, and will be located at the Moses Lake Flight Center, Larson Air Force Base, Grant County, Washington.

The project was previously advertised as four separate packages:

Package 9B Structural Steel Work
Package 9C Hangar Doors
Package 9A Construction to Grade
Package 9 Structures, Paving & Utilities

Package 9B has been awarded and retains its separate identity until assigned to the successful bidder on Package 9. Packages 9A and 9C are now consolidated with Package 9. The work includes but is not limited to the following:

(1) Two-Place Hangar, not including structural steel frame.
(2) Concrete apron and Yard Paving, including Excavation, Grading and Subgrade in connection therewith.
(3) Asphaltic Concrete Access Road and Fuel Truck Parking Area.
(4) Domestic and Fire Protection Water Lines.
(5) Air from Existing Service Line.
(6) Additions to and Modification of Existing Boiler Plant including Two Steam Generating Units and Steam and Pumped Return Lines for the Hangar and Paint Storage Building.
(7) Storm and Sanitary Sewers.
(8) Electrical Distribution and Communications System from Existing Services.

This contract will include by assignment the Structural Steel Work contract (Package No. 9B) previously awarded.

This contract will constitute a sub-contract under a prime contract between Boeing Airplane Company and the United States Government.

Bid, Performance and Payment Bonds will be required.

Not more than three sets of contract documents may be obtained by each General Contractor Bidder on or about November 26, 1956. A deposit of $100.00 (one hundred dollars) in the form of a certified check will be required on each set of contract documents upon application at the offices of Naramore, Bain, Brady and Johanson, Architects and Engineers, 904 Seventh Avenue, Seattle 4, Washington. Deposits will be refunded upon return of document sets in good condition to the offices of the

JUNIOR HIGH SCHOOL BUILDING
BIDS CLOSE 2 P.M., DECEMBER 12
Great Falls, Mont.
NOTICE TO CONTRACTORS

Sealed proposals will be received by the Clerk of the Board of School Trustees, School District No. 1, Great Falls, Montana, at his office in the Washington School, 1015 First Avenue North, until 1:30 P.M. (MST) and in the auditorium of the Largent School, 915 First Avenue South, from 1:45 P.M. until 2:00 P.M. (MST) on Wednesday, December 12, 1956, for the construction including grounds of a Junior High School Building, to be located in School District No. 1, Great Falls, Montana, for each of the following portions of the work:

(1) General Construction
(2) Mechanical Work
(3) Electrical Work

Proposals will be opened and publically read in the Largent Auditorium at 2:00 P.M. (MST) December 12, 1956.

All proposals shall be submitted in duplicate on the forms supplied and made a part of the proposed contract documents which may be examined at the office of McIver, Hess and Haugsjaa, Architect, 603 Strain Building, Great Falls, Montana. Prime bidders may obtain plans and specifications from the Architect for a deposit of $100 per set, not to exceed two for General Construction bidders only. The deposit will be returned to the bidder after the bid opening, provided the documents are returned to the Architect's office in good condition. Material suppliers and others not prime bidders may avail themselves of the documents at the various builders exchanges where they are on file. A list of these exchanges may be procured from the Architect.

The character and amount of the bid guarantee, performance bond, and liability insurance is stated in the documents. Bidders shall enter on the proposal and containing envelope the number and class of their Montana State Contractor's license.

No bidder may withdraw his bid for at least fifteen (15) days after the scheduled closing time for the receipt of the bids.

The Board of School Trustees reserves the right to reject any or all bids and to waive informalities.

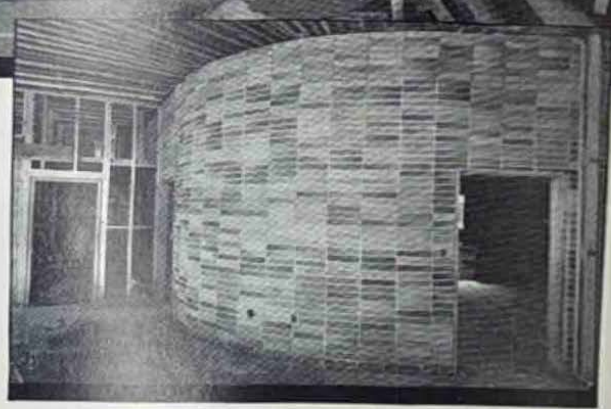
An Exclusive Gladding, McBean Product

EQUAL PERFECTION ON ALL FACES

The dry press process is used by Gladding, McBean & Co. to produce SCR brick for partition walls that have both sides exposed. No kiln marking on one face as found in brick made by the stiff-mud process.

ENDURING BEAUTY WITH STRENGTH



Partitions have the warm color of burned natural clay with pleasing variations in shading, and with strength to support roof beams.

EASE OF INSTALLATION

Gladding, McBean's SCR dry press units are cored with 5 holes large enough for ⅝ inch reinforcing rods, and electrical conduits. Voids around reinforcing steel are slushed full with grout.

LOW COST AND MAINTENANCE

Gladding, McBean's dry press SCR brick was installed in the Benjamin Franklin School at "in-the-wall" costs competitive with non-masonry construction. Total cost of this school was $9.60 per sq. ft. of floor area. SCR requires no extra surfacing and offers the extremely low maintenance associated traditionally with the beauty of brick.

IN VANCOUVER, architects McCoy and Bradbury selected the new dry press SCR brick for the McLoughlin Junior High School. General Contractor: LEWIS CONSTRUCTION CO. Masonry Contractor: PAUL PARKER.

CALCOR "C" WALL PANEL—Exterior View

The Calcor classroom is shop fabricated in these modular steel panels. A unique interlocking mechanism makes the building simple to disassemble and relocate. The panel is formed from 20-gauge United States Steel Sheet. The inside and outside surfaces are separated 3 inches with steel stiffeners running vertically on 16-inch centers. No exposed fasteners inside.

Steel prefabs reduce schoolroom costs one-third

Calcor Corporation, Los Angeles, has developed a revolutionary new modular prefab classroom. The mass produced unit can be erected in a week for a price 30% less than conventional wood-frame schoolrooms.

The use of steel for framing, walls and roof decking gives the building an earthquake-safe rigidity. The entire structure is incombustible. Fiberglas is used in both roof and walls to obtain insulation quality equal to more than a foot of masonry. The Calcor modular-prefab system has sufficient design flexibility to accommodate the desired classroom features of architects and school districts. Full scale tests of the buildings have gained the approval of the California State Division of Architecture as well as the Department of Building and Safety, City of Los Angeles.

intro

We guess that every editor has an odd collection of news releases and clippings that he doesn't want to put in the round file but just don't seem to fit any particular department in his publication. We dusted off our "assorted items" folder the other day and after reviewing its contents, decided to resume the column formerly known as "From the Editor's Notebook" under the title seen above. It will give us an opportunity to relate what we feel are some interesting sidelights and perhaps an occasional humorous tidbit and to comment on more serious matters which do not lend themselves to a full-length editorial.

A $350,000 animal shelter has opened in New York City complete with soft music, running water—and red hydrants.

for toastie tootsies

Despite the weather propaganda issued in the Chamber of Commerce brochures, in the interest of objective reporting we'll have to admit that Seattle has done a bit of shivering the past few weeks. So much so, in fact, that our Girl Friday was forced to unpack her foot warmer. A year ago Christmas we gave her the 14x 21-in. neoprene mat — compliments of General Industrial Co. — as a sort of gag but it turned out to be one of her most useful presents. If your secretary is threatening to wear fur-lined mukluks at her desk (assuming, of course, that your quarters were not designed or built by you), we'll be happy to send you the manufacturer's address.

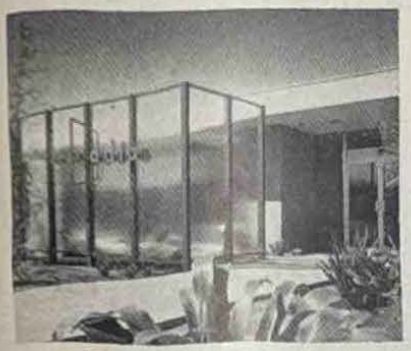
publicity tie-in

The topic of Christmas brings with it the gift tie plague. One that we received much earlier this year (and which is out of our price range) has become a favorite of ours. Called "Perennial Classic" from the Graeco-Roman collection of Manhattan haberdasher Bronzini, it copies "almost intact" the stainless steel facade of the 45-story Socony-Mobil Building, designed by architects Harrison & Abramovitz. Bronzini president W. D. Blackwell says the basic design elements are "unmistakably Greek and Roman" but handled in "20th century American."

wright-hand man

PA&B's Salem correspondent and photographer-newsman of the Oregon Statesman, Thomas G. Wright Jr., has been named administrative assistant in charge of press relations for Governor-elect Robert Holmes. Wife Marguerite is taking over Tom's assignment of supplying our readers with building news from that area. He joined the staff of the Statesman in 1948 and earlier was with the Eugene Register Guard while attending the University of Oregon.

nays have it



Lest the architect feels that he is being neglected by society, let us cite a recent front-page story in the Seattle Times concerning Washington State school superintendents in defense of today's educational trends. In declaring that the Seattle public school system has always emphasized fundamentals, its head explained: "The architect, for example, may have gotten his first vision of his career through the woodworking or drawing class." Let's have a show of hands!

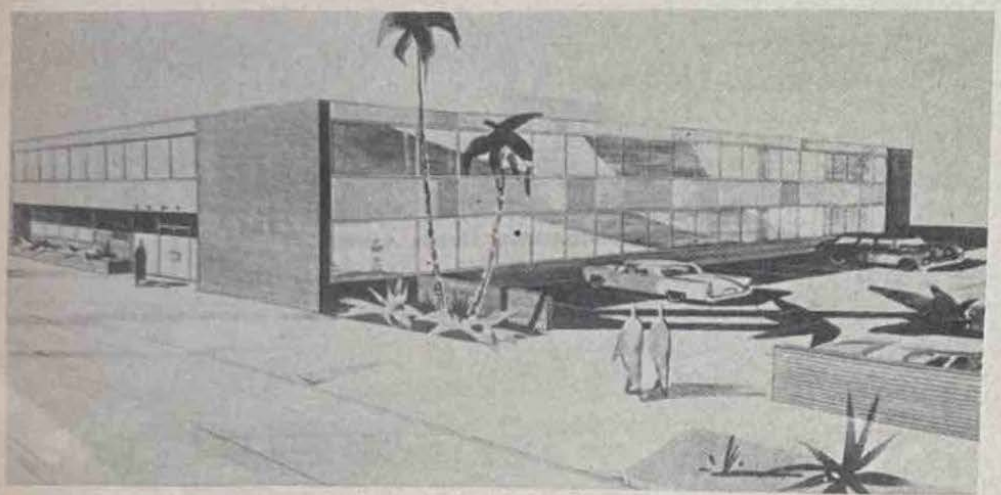
PERSPECTIVES



by Pacific architects

SEVEN-STORY ADDITION to St. Francis Xavier Cabrini Hospital (formerly Columbus Hospital) in Seattle will be faced with marble and brick and equipped with operating aluminum mold bar sash. One entrance will be through landscaped courtyard. Addition and alterations to existing building will bring bed capacity to 300. Architects-engineers: John Graham & Co.

PROPOSED $6 MILLION COURTHOUSE for San Joaquin County in Stockton, Calif., will be windowless structure except for few offices on entrance street level. Preliminary plans call for use of precast concrete walls and granite facings. Site on Weber Point is surrounded on three sides by Stockton Channel. Architects: Mayo, Johnson & de Wolf associated with Clowdsley & Whipple; consulting architects: Austin, Field & Fry; complete space study, desk by desk, by Michael Saphier Associates, Inc., New York.

NEARING COMPLETION in Los Angeles is two-story steel frame and reinforced brick office building for Century Properties. Aluminum frame windows and porcelain enamel wall panels have been used in design as well as structural elements. Lobby features free-standing "floating" steel stairway with terrazzo treads. Plan provides for complete flexibility of utility installations. Architect: Daniel L. Dworsky, AIA.

Building News - Trends - Views

FOUR WEST COAST ARCHITECTS (or firms) are among the five preliminary winners in a nationwide competition for the design of a Corregidor-Bataan Memorial, to include both a school and a library, for which Congress allocated $6 million in 1953. They are Paul Thiry, and Naramore, Bain, Brady & Johanson, both of Seattle; and Donald Powers Smith and Anshen & Allen, both of San Francisco. The fifth is a New York City firm—Katz, Waisman, Blumenkranz, Stein, Weber.

On the basis of brochures submitted to define their qualifications to do such a structure, 52 firms were invited to compete for the commission. The five preliminary winners will next compete with five additional firms who have done similar government work in the past. The memorial is intended "to reflect the hemispheric scope of the war in the Pacific."

SELECTION OF AN ARCHITECT to design Seattle's new public library apparently is the closing chapter in a controversy which was waged between the city librarian and the former Library Board, whose members were replaced several months ago. The commission has gone to the firm of Jones & Bindon, who had done preliminary design work without charge under a "gentlemen's agreement" with library head John S. Richards. The firm of Decker, Christenson & Kitchin was named associate architect.

The feud over the selection of an architect broke into the open shortly after voters approved a $5 million bond issue last spring to build the new library.

PRESSING PROBLEMS OF 1957—money, taxes, merchandising, materials and building methods—will get a going-over in panel discussions, workshops and general sessions when the NAHB holds its 13th annual convention and exposition in Chicago January 20-24. Among the speakers will be Dr. Ralph Lapp, director, Nuclear Science Service, who will discuss "Looking Ahead with America."

VOTERS LAST MONTH STIMULATED the construction boom by approving a record $2.5 billion worth of bond issues, the Associated General Contractors of America reports. The approved projects—mostly roads, schools, water works and housing—represented 93% of all bond proposals submitted on state, city and county ballots November 6. (See p. 33 for a roundup of Northwest projects.)

ANCHORAGE, ALASKA, ARCHITECTS are attempting to "educate" the Board of Education in how to cut school building costs by better planning. In a recent two-hour meeting, representatives of three firms suggested several methods to reduce costs on specific projects. All agreed that if the board gives architects more time to draw plans and allows more time for bidding and construction, cheaper schools can be built.

HOUSING DESIGN IN THE NORTHWEST has greatly impressed the editor in chief of the magazine Living for Young Homemakers, Edith Brazwell, who was in Seattle December 7 to address the Red Cedar Shingle Bureau annual convention. "Of course we could expect that," Miss Brazwell commented, "because Seattle has some of the best builders in the country and certainly some of the outstanding architects."

Miss Brazwell quite naturally had something nice to say about red cedar shingles too, explaining, "Our contemporary architecture needs the textured quality of shingles and shakes to offset the hard surfaces of so many materials used in housing today. The outside uses of these materials are well known but why not use a little ingenuity and develop uses for them inside the house."

R. D. Mackie of Aberdeen, Wash., was elected bureau president; Norman A. English, Vancouver, B.C., vice president; and Virgil G. Peterson, Seattle, reelected secretary-manager.

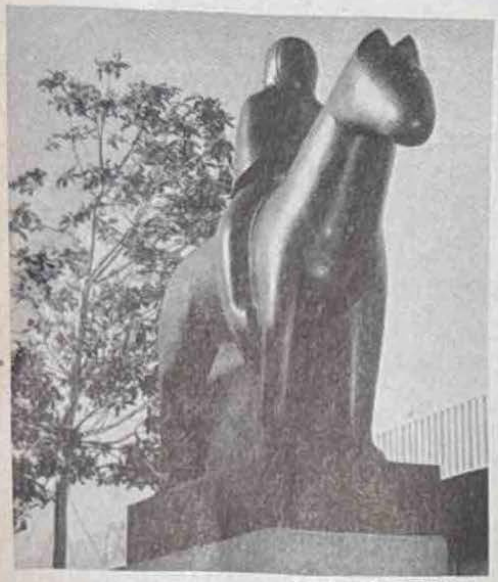
A NEW RECOGNITION OF WOOD as a remarkable and versatile material has resulted from "engineered timber construction," the American Society of Mechanical Engineers were told at their November annual meeting in New York. J. C. Van Dyke of Unit Structures, Inc., pointed out that the most spectacular example of huge laminated wood arches is the Jai Alai Sports Arena in West Palm Beach, Fla., which uses the world's largest glued-laminated arch, a span of almost 250 ft., rising to a height of 75 ft.

COLOR AND LIGHTING should be combined into a single architectural pattern to attain "character" and to suit the purpose of the proposed building or room, a British lighting engineer told a symposium at Cornell University last month. In hospital design, for example, he recommended a combination of natural and artificial ward lighting, so arranged that neither light source serves as a discomfort to bedridden patients.

In many instances a patient will be seriously disturbed by the brightness of a blue sky that would delight him if he were well and active, the engineer observed. Therefore, a direct view of the sky from a hospital bed is an impractical design, he concluded. Similarly, bright colored walls can be as great a source of irritation to a patient as the scrubbed white walls traditional to a large percentage of hospitals. He suggested soft pastel colors combined with concealed direct-indirect lighting as most suitable for hospital rooms.

A NEW CENTURY BECKONS will be the theme of the 89th national convention of the AIA in Washington, D.C., May 14-17, 1957, marking its 100th birthday.

A NEW BUILDING TECHNIQUE that promises to reduce framing costs on new houses by as much as 30% has been announced by the Los Angeles architectural firm of Palmer & Krisel. Speaking at a NAHB-sponsored housing conference in Washington, D.C., William Krisel, AIA, revealed that his firm is already designing houses for which entire walls, including doors and windows, will be manufactured to the architect's specifications at a local factory and assembled on the site.



Unlike prefabricated homes which utilize standard machine-built sections in various arrangements, the new method is adaptable to custom houses and "represents a necessary step toward the eventual mass production of American housing without sacrificing the individuality that the consumer demands," Krisel said.

FIVE OF POLAND'S leading construction experts who are touring the nation to study housing and building development have included the West Coast on their itinerary. The group is being led by Prof. Czeslaw Babinski, deputy minister of building.

SALE OF GYPSUM BOARDS has increased about 35% since 1953, reflecting their use in all types of construction.

HOUSING NOTES: Of the houses built in the U.S. last year, 7.7% were constructed in Los Angeles and 49% in the six states of California, New York, Texas, Illinois, Michigan and Ohio. . . . Almost 10,000 new single-family nonfarm homes will be built this year in the nation without bathrooms. . . . The government has forecast a further decline in home building next year. However, total construction is expected to set a record, about $46.5 billion.

Shopping centers make news up and down the coast

Norton Pearl photo

ST. FRANCIS ON HORSEBACK: three tons of California black granite, 8 ft. 4 in. tall.

Peninsula's Hillsdale features Bufano's statuary

Boasting one of the finest art collections ever shown in combination with a commercial area, Hillsdale Regional Shopping Center in San Mateo, Calif., is now in business with 72 retail outlets, including such names as Macy's, Liebes, Newberry's, C. H. Baker and Sears.

A group of 11 statues by sculptor Beniamino Bufano is a part of a permanent installation of the landscaped pedestrian mall of the center, developed by the David D. Bohannon Organization and designed by Welton Becket & Associates.

Comprised of animals, Bufano's statuary is done in a simplified modern treatment and executed, for the most part, in California black granite. The pieces vary in height from a 3-ft. frog to a 12-ft. owl. The latter is a first for Bufano, in which he has combined two of the oldest forms of sculpture—wood carving and mosaic—with the most modern—stainless steel.

Born just outside of Rome, Italy, he has been sculpturing in various mediums all of his life. His San Francisco statue of Sun Yat-sen is stainless steel with a granite head and his popular "St. Francis" and "Peace" are done in this same combination. The museum at Stanford University has a collection of nearly 100 pieces of his work.

The driving force behind the acquisition of Bufano's statuary was Bohannon's belief that a shopping area is a true social as well as commercial center. He feels it is important to the attitude of a community to integrate the cultural atmosphere in the shopping areas along with the many advantages inherent in today's regional shopping center.

Tacoma center to be one of largest in Northwest

One of the Pacific Northwest's largest shopping centers is now under construction in Tacoma's Lakewood District, the 50-acre, $5 million Villa Plaza. Ultimate development of the project, to include apartment house units, will represent more than $10 million.

The 33 shops and stores in the central plaza will be connected by covered walkways. Building areas will cover 266,000 sq. ft. in the original development. Permanent parking will be provided for 4,000 cars. A reflection pool, lined with plantings, will be featured on the main mall approach.

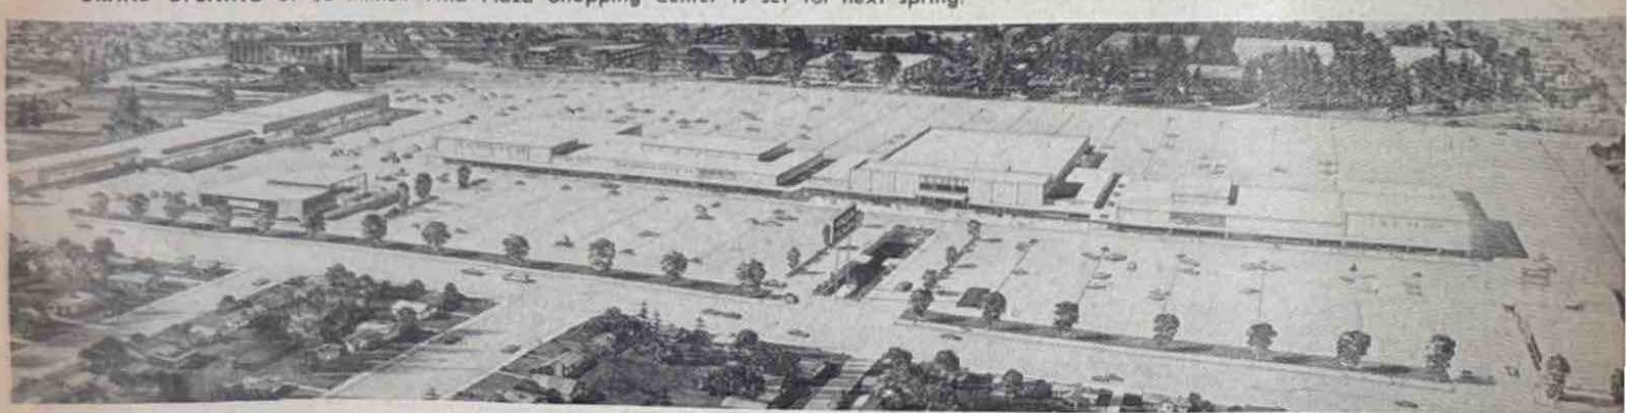
To date 14 retailers have leased space. The Rhodes store, central unit, will have tilt-up concrete walls and concrete floors and roof. Other buildings will have concrete and concrete block walls, concrete floors and glued-laminated beam and purlin roof construction.

Natural gas will be used for all heating plants.

Entrances will be placed to provide for balanced traffic flow through the area.

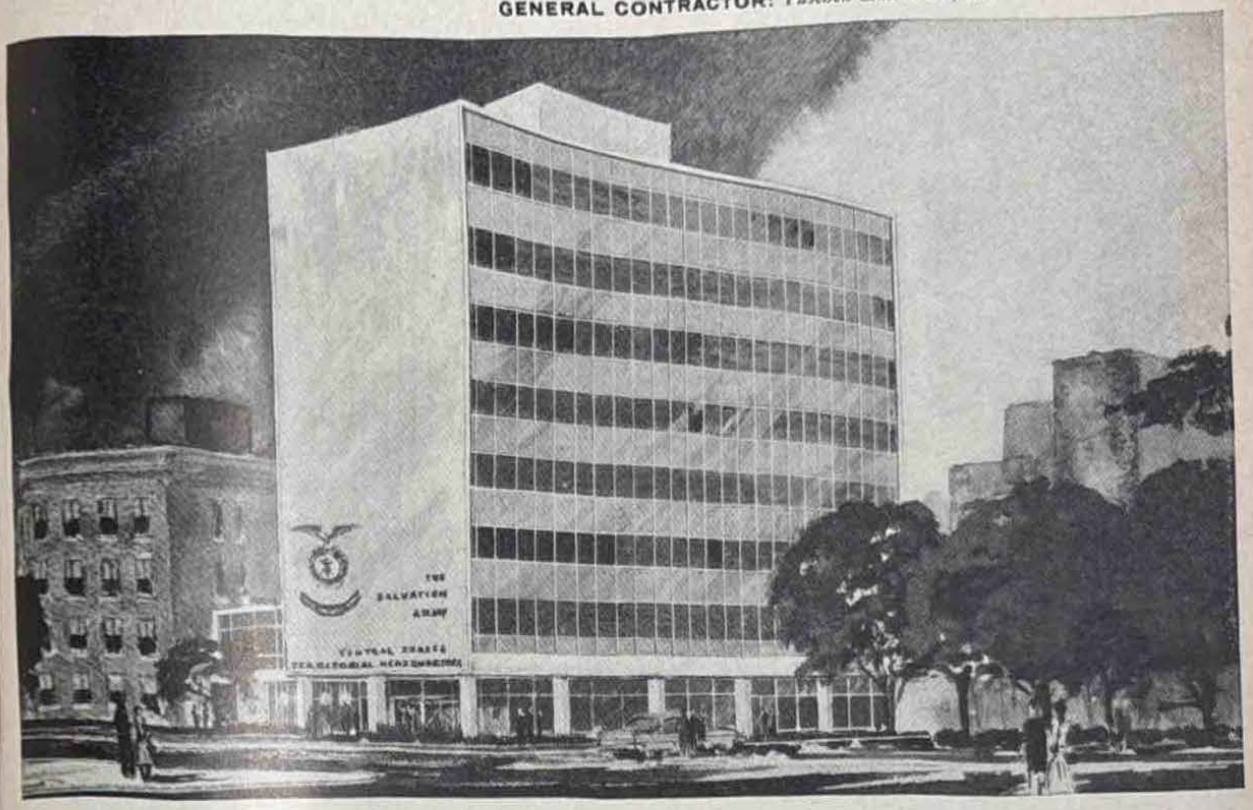
Sites for future expansion are provided for in the design. In addition to the apartment house development, a separate location has been reserved for a hospital.

Thomas Albert Smith, AIA, of Seattle is architect for the overall project and supervising architect for the Rhodes and F. W. Woolworth units, designed by A. E. Alexander of San Francisco. Worthen & Wing are consulting engineers; Merritt Construction Co. is general contractor. Both are Tacoma firms.



State's largest supermarket set for Montana project

While not a giant like some others being built in the West, the $2 million Miracle Mile Shopping Center planned for Great Falls, Mont., will give merchandising in that area a shot in the arm.



The center will occupy two blocks, with buildings occupying 73,295 sq. ft. Planned by architects George H. Shanley and Frank B. Shanley, it will provide facilities for 20 stores and shops. A major tenant will be Buttrey Foods, whose president, R. S. Williams, promises the most modern and largest supermarket in the state. With 21,000 sq. ft. of space, it will have 300 ft. of refrigeration cases and 10 automatic check stands.

The suburban project will provide parking for 600 cars.

GRAND OPENING of $5 million Villa Plaza Shopping Center is set for next spring.

TERRITORIAL HEADQUARTERS, THE SALVATION ARMY
ARCHITECT: *Skidberg-Olson Co., Chicago*
GENERAL CONTRACTOR: *Paschen Contractors, Inc.*

KAWNEER METAL WALL / *responsibility from the anchors on out!*

The new Salvation Army Territorial Headquarters in Chicago is another example of Kawneer's ability to engineer, produce and install a complete skin from the anchors on out. Kawneer works closely with the architect by helping him establish his design budget well in advance of the bids. Kawneer assures him that the translation of his design will be true and accurate. The curtain wall of this building will consist of Ingram Richardson 2" insulated porcelain enameled steel sandwich panels, double-glazed pivoted Kawneer aluminum windows and self-supporting aluminum mullions. Special weather-tightness features, adequate provision for expansion and contraction, and tested prefabrication methods assure the architect complete client satisfaction. For further information on how Kawneer can assist you in metal wall engineering write: Metal Wall Department, Kawneer, Niles, Michigan.

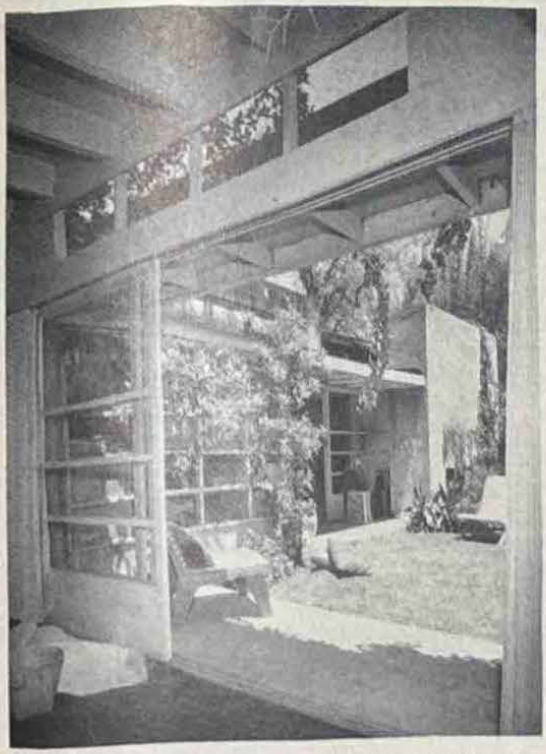
Handsomely economical use of **prefabricated panels** is demonstrated by Bernard Maybeck in **1910 Christian Science** Church at Berkeley.

A landmark in more ways than one, this **Frank Lloyd Wright** textile block house was built in 1922, **foreshadowed** use of severe planes in contemporary architecture.

Still comparatively new, fantastic in 1900, this use of laminated wood arches as seen in Hearst Gymnasium by Bernard Maybeck. Building was destroyed by fire in 1922.



ONTEMPORARY CALIFORNIA ARCHITECTURE

The 1900 to 1930 work of

IRVING GILL
GREENE & GREENE
BERNARD MAYBECK
RICHARD NEUTRA
R. M. SCHINDLER
FRANK LLOYD WRIGHT

A SURVEY OF ARCHITECTURE done in California between 1900 and 1930 by men ahead of their time has become a traveling display after its initial showing at the Municipal Art Gallery in Barnsdall Park, Los Angeles. "Roots of California Contemporary Architecture" focuses attention on the contributions of Irving Gill, Greene & Greene, Bernard Maybeck, Richard Neutra, R. M. Schindler and Frank Lloyd Wright, all important technical and artistic innovators in that area. Through scores of photo-murals, models, drawings and explanatory texts, their work emerges as roots to a development which has been jet-propelled by the incredible population and industrial growth of southern California.

Maybeck's daring 1900 gymnasium with its use of laminated wood arches; Neutra's use of pneumatically applied concrete and Wright's use of concrete blocks; the airy space projections by Greene and Greene and the severe lack of ornamentation in Gill's houses; Schindler's cast concrete tilt-up wall construction—all of these find recognition in this survey arranged by the Architectural Panel, a group of Los Angeles professional and lay people interested in increasing public awareness of good contemporary architecture.

Indoor-outdoor integration as done in 1922 by R. M. Schindler who used cast concrete tilt-up walls.

Father of bungalow, 1907 Greene & Greene house shows many unusual advances—wide overhangs, exposed beams, oriental influences.

Built in 1917, this Irving Gill house was clearly ahead of its time in use of 90-deg. angles, integration of severe planes.

Setting standard for modern houses down to present day, this 1927 residence by Richard Neutra pioneered use of light framing members, employed asymetrical vertical and horizontal planes.

The architect as artist

by Dr. STEPHEN C. PEPPER

'As a profession, you have a social responsibility equal to that of doctors or teachers. You are responsible for the beauty of our environment, as doctors are for its health and educators for its intellectual integrity.'

FIRST OF ALL, I should like to consider for a few minutes what a work of architecture is.

Every structure, of course, is not a work of architecture. Many of them are just practical instruments with no aesthetic appeal. They are not even ugly. They are just aesthetically negligible. They may become ugly, however, if they are in a context of environment where they are called upon to be beautiful. But within a town or a city which has an overall beauty, they may be inoffensibly incorporated as a sort of texture surrounding building of positive beauty. A work of architecture is, properly speaking, a work of art.

What is a building as a work of art? It is not simply the physical materials as these would be described by a physicist or chemist. Perhaps I could best bring this out by reference to another kind of work of art easier to describe in aesthetic terms than a building—namely, a picture.

A picture as a work of art is not primarily its canvas and pigments. The properties of a canvas and pigments are basically those which a physicist or chemist would ascribe to these materials. These properties as customarily named by the physical scientists do not have color or line or texture as these are seen by the eye for aesthetic appreciation. The physical canvas and pigments stored in a closet emit no color or perceptual shape or texture, no contrasts of surface, no spatial composition, and clearly no representation of objects of nature if the picture happens to be a landscape or a portrait.

For these characters of a picture to emerge, the picture must be seen by a human eye. The physico-chemical picture must be brought out into the light where it can reflect light from its pigmented surface, so that the diverse rays of light can stimulate the eye and stir up a response in a human mind. In short, the picture that is appreciated for its colors and lines and masses in composition, and for its representative meanings as a landscape or a portrait must be a mental perception.

The object of appreciation when we look at a picture is clearly not the physical canvas and chemical pigments but the mentally perceived composition of color lines, meaningful representations and the like. It is a perception.

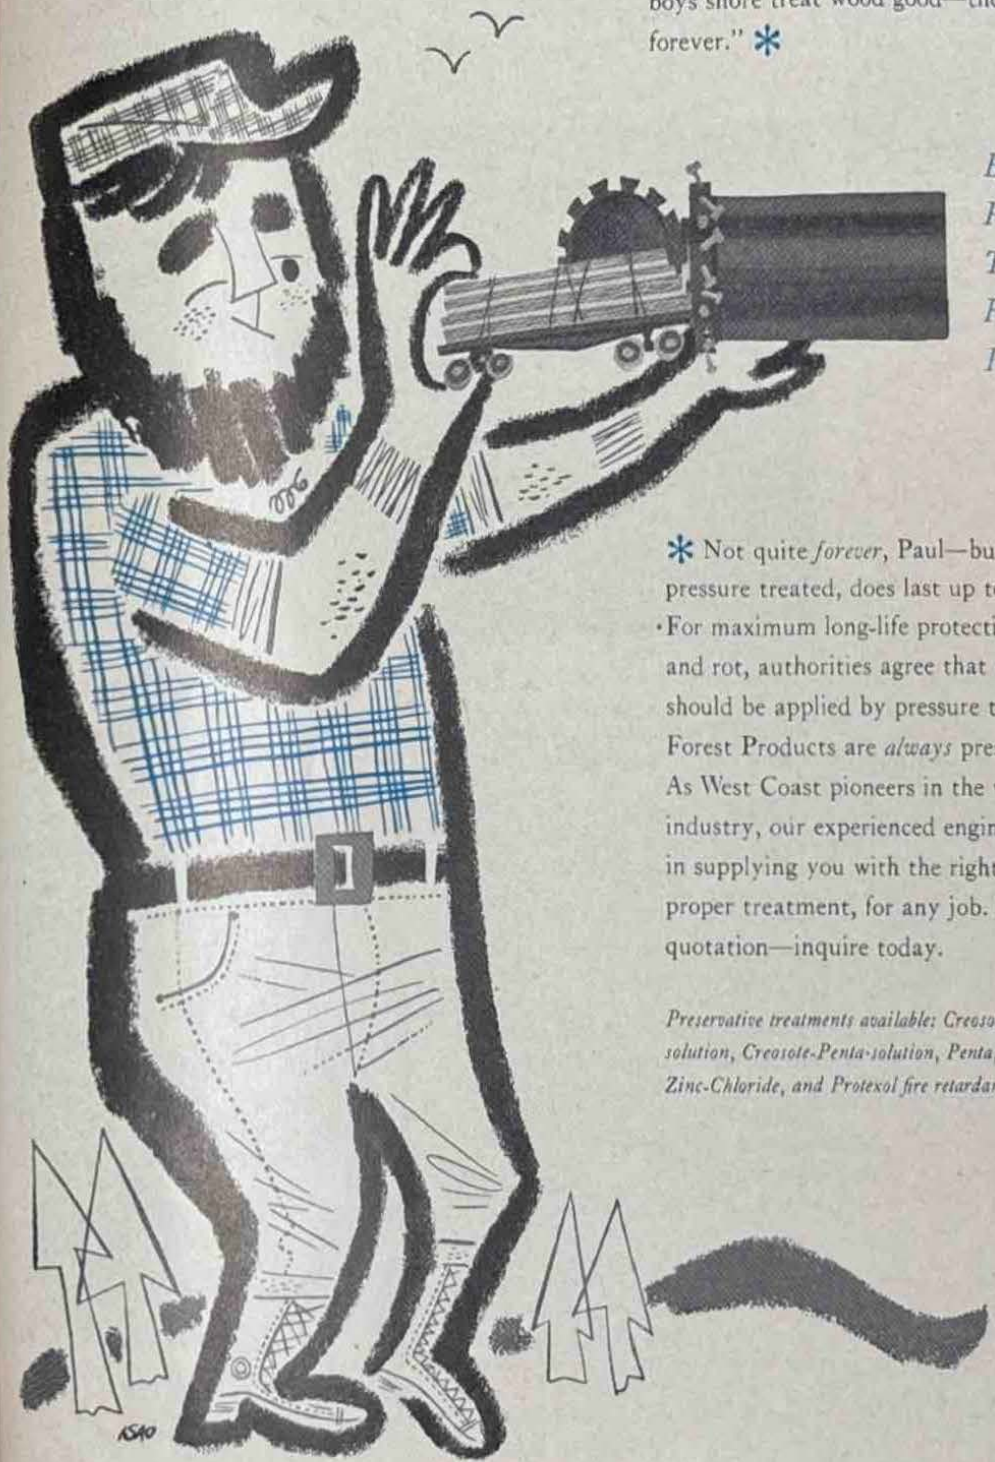
But this is not all. One momentary mental perception of a picture is not enough for grasping the complete picture as a thing of beauty. To get the full appreciation of a picture one must pass his eye over the picture and change the focus and center of attention from one detail to another: note the balance across the surface of one feature by another, the contrast of one form by another, the tensions of shape with shape, the texture and quality of colored surface, the graduations of colors and shapes, the repetitions and variations of motives, the skill of the brushwork; and if there is representation of men or of nature, the skill of draftsmanship, the placing of the figures, and perhaps their dramatic effect, the catching of the mood of the scene, or the character of the sitter. All these details that belong to the fully appreciated picture take time to appreciate and many successive perceptions to grasp in the mind.

What I am bringing to your attention here is that the fully appreciated work of art is an assemblage, a synthesis, a funding of many single perceptions. One momentary perception cannot grasp it all. Certainly one first glance at a complex work of art cannot take it all in at a single glance.

Now, what has come out of this brief analysis it that a work of art is not a single object but a nest of three closely interrelated objects. There is, first, the physical object that controls the stimuli for perception. There is, second, the perceptions stimulated at any one time by the physical object. And there is, third, the synthesis, the gathering together, of the successive momentary perceptions into the total aesthetic object, which is the fully appreciated picture. It is convenient to have separate terms for these three objects that are involved in a work of art. The first may be called the **control object**, since this is the object that controls the stimuli for the perceptions. The second may be called the **perceptual object**; and the third, the **object of criticism**, for this is the ultimate aesthetic object which we critically evaluate for aesthetic worth or beauty.

In a work of architecture, the control object is the structure of physical materials ordinarily built up on a site by a contractor under the supervision of the architect who had made the plans. The perceptual object is any single momentary perception by a person who visits the finished physical structure and is stimulated by some visual aspect of it.

Since a physical building is a three-dimensional object with an inside and an outside, there is no difficulty here in realizing that no single glance at the building is adequate for a full appreciation and critical comprehension of it as a total object of aesthetic worth. This total aesthetic object is clearly the result of many perceptual responses to the building from many aspects within and without together with the mental consideration of how these many visual aspects function together with one another in relation to the purpose for which the building was built.



What is headed for as total aesthetic object in a building as a work of art is this final gathering together of all the perceptions a discriminating spectator can have of this building in its setting. This is a very complex thing. No one can be more aware of the complexity of this thing than you here who have had many occasions to plan and supervise the construction of such buildings.

The physical building is simply the control object for the final aesthetic object which is something perceived and comprehended by a human mind. If there were no human minds to respond to the physical building, there would be no final aesthetic object—no object of criticism — but simply some sticks and stones whirled round the sun like any other loose sticks and stones scattered over the surface of our globe. The ultimate aesthetic object — the thing of beauty — is a human thing, a thing of the human mind and for the human mind, and it is a thing of great value to man.

Continued on page 20

An address presented by Dr. Pepper, chairman of the University of California's department of philosophy, before the California Council of Architects.

"Babe, this here's a ree-tort," explained Paul Bunyan to his faithful Blue Ox. "Fer pressure treatin' wood. Them Baxter folks never dunk it, er spray it, er paint it. They got a real fancy process: They stick the wood inside this ree-tort, lock her up fer 20 hours, and when she comes out she's BAXCO pressure treated—chock full o' presarvatives." The great logger scratched his head with a pine tree. "I dunno how they do it, Babe, but them Baxter boys shore treat wood good—they make it last forever." *

BAXCO PRESSURE TREATED FOREST PRODUCTS

* Not quite *forever*, Paul—but wood, properly pressure treated, does last up to ten times longer. For maximum long-life protection against insects and rot, authorities agree that wood preservatives should be applied by pressure treating—and BAXCO Forest Products are *always* pressure treated. As West Coast pioneers in the wood preserving industry, our experienced engineering staff can assist in supplying you with the right preservative, the proper treatment, for any job. For a prompt quotation—inquire today.

Preservative treatments available: Creosote, Creosote-Petroleum solution, Creosote-Penta-solution, Penta, Chemonite, Chromated-Zinc-Chloride, and Protexol fire retardants.

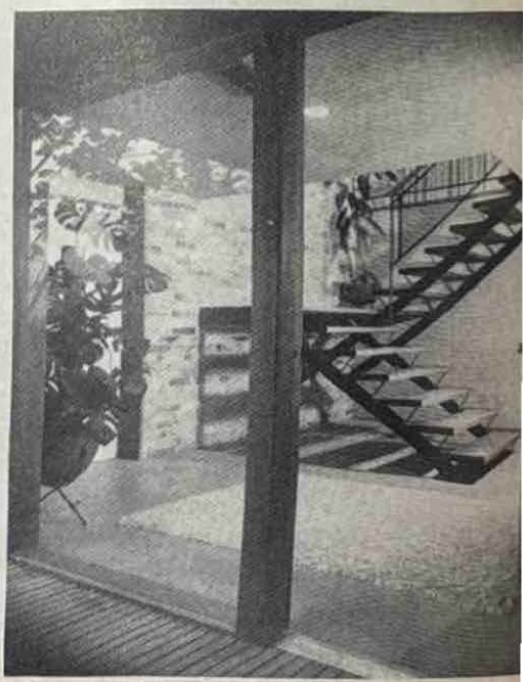
Douglas Simmonds photos

LIVING ROOM gets its color scheme from warm tones of used brick in fireplace and stairwell partition. Circulation pattern centers around central stairwell, from which all rooms are accessible. Exposed masonry wall separates stairway from dining area (right).

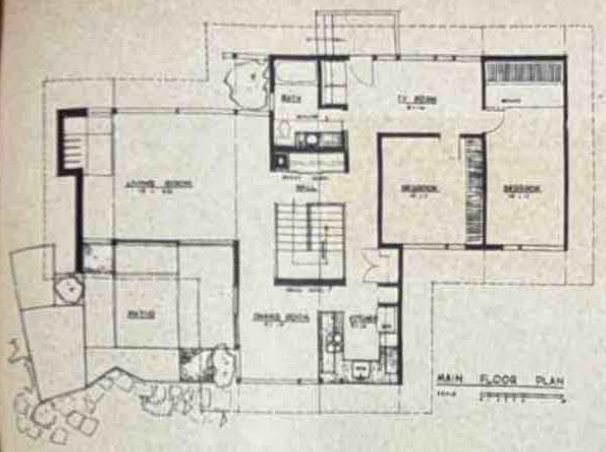
A HILLSIDE LOT, with sweeping view of Lake Washington and Mount Rainier, offered an interesting challenge to the architect in designing his own home.

He located the carport and main entrance on the lower level and made the central stairwell to the top level a focal point of design for the entire house. The stairwell serves as the heart of the traffic system for both floors, giving easy access to every room from the single area. All principal rooms are located toward the view.

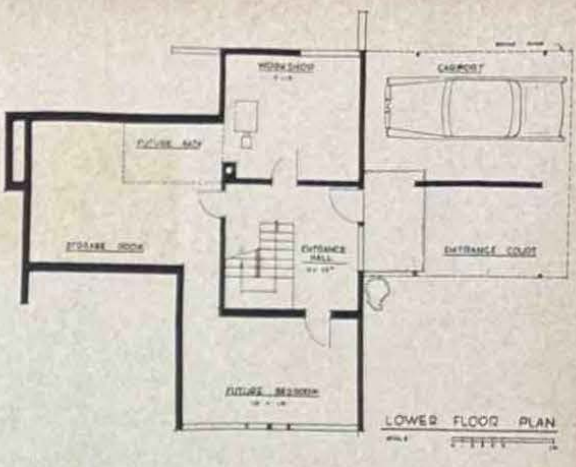
The entrance and three minor rooms occupy the lower level, with one-third of the top level overhanging an outside carport and entrance court.



Rising from the floor of the lower level almost to the ceiling of the top level is a two-story exposed wall of used firebrick, matching the fireplace wall in the living room. The central wall provides a support for the stairway on the lower level, serves as a partition to separate the dining room from the hall and stairway on the top level, and makes an interesting visual feature in the center of the house.



Glass areas are treated as walls and, where possible, extend from floor to ceiling.



Materials and colors are natural for the most part, blending with the earthy colors of the used firebrick in the walls of fireplace and central partition. The colors are brown, beige, soft oranges, yellows and off-white. "The attempt was to coordinate a soft blending of color from the interior to the exterior with as little interruption as possible," the designer-client says.

Common in commercial construction but more unusual in a home is the laminated timber roof. It consists of No. 1 and No. 2 common cedar 2x4s, laid on edge. The architect likes it because it "offers thermal insulation, strength, fireproof qualities and handsome appearance."

FIR TREADS of stairs are supported by black-steel channels and single masonry wall. Ceiling and three walls of lower level entrance are covered by natural-colored burlap.

OUTLINE SPECIFICATIONS

Type of Construction: Poured concrete and frame.

Exterior Walls: Floor-to-ceiling glass and rough-sawn cedar.

Roof: Laminated 2x4 cedar on fir beams, 10 ft. and 12 ft. on centers.

Floors: Frame, with finish of masonite cut into 12x12-in. tiles.

Windows: Stopped in wood, aluminum vents.

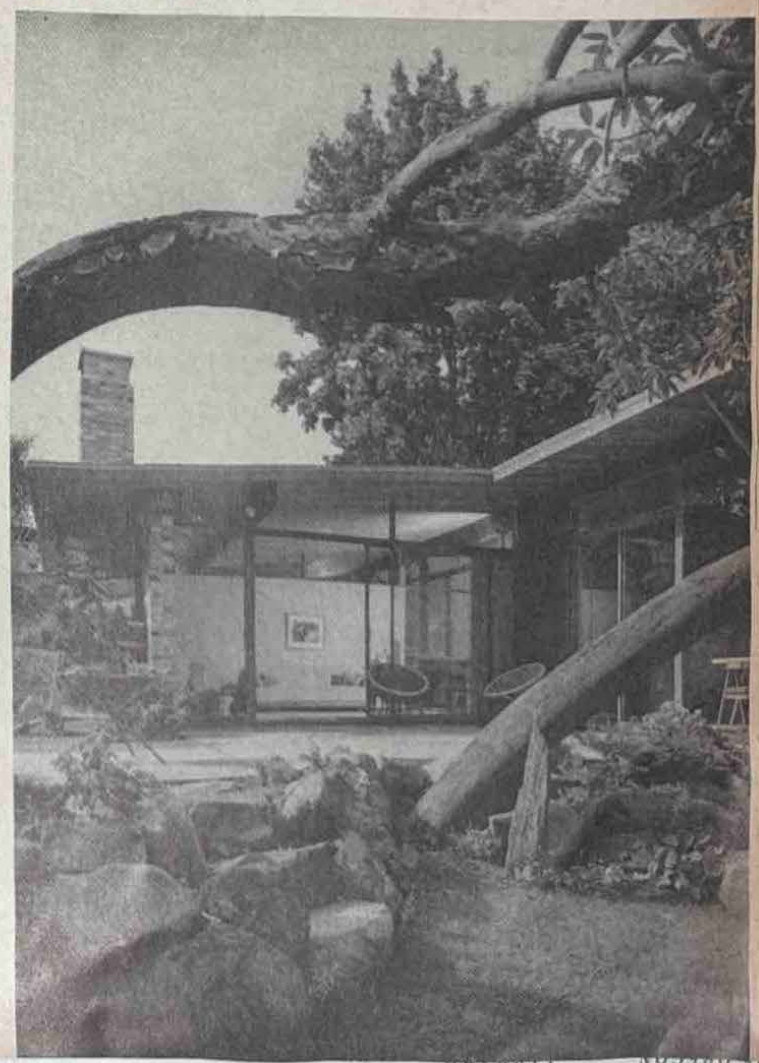
Doors: Solid core fir exterior doors, hollow core masonite interior doors.

Interior Walls: Rough-sawn cedar and plasterboard on dry-wall partitions.

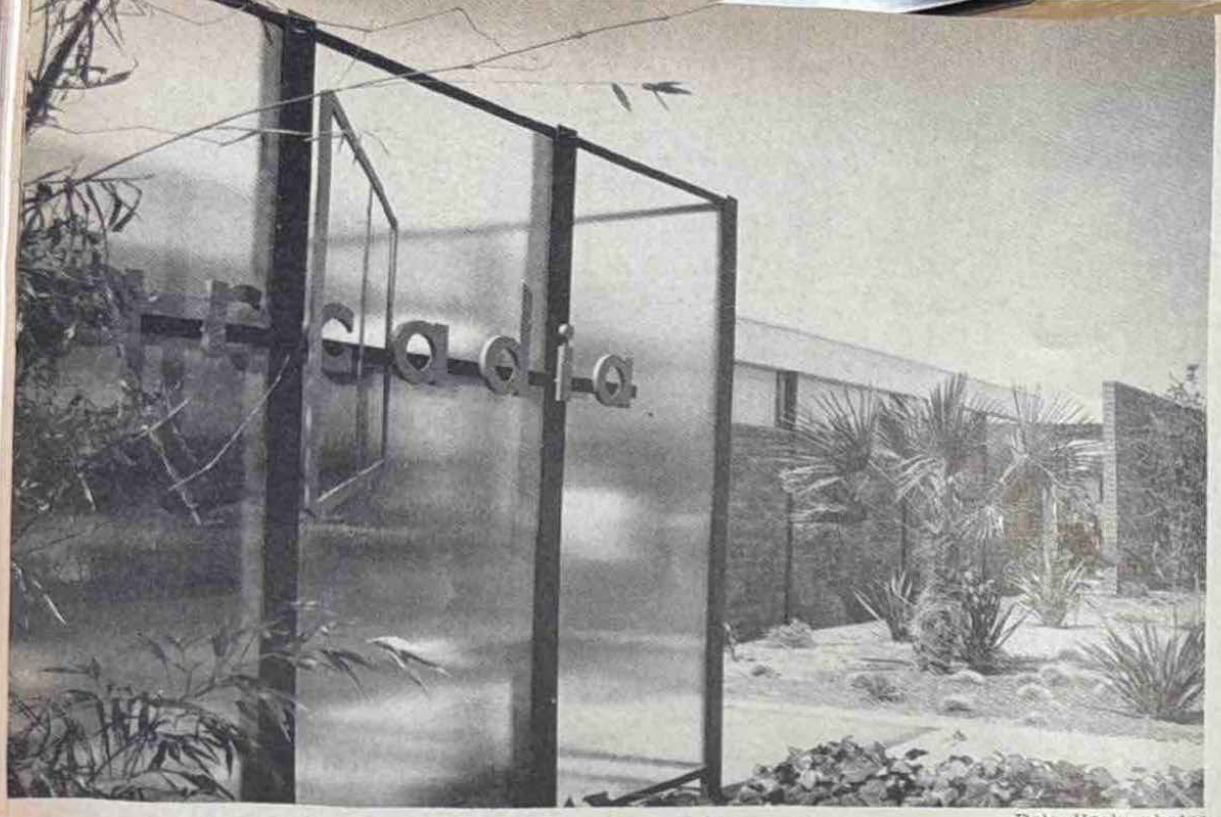
Fireplace: Used firebrick, with Wilkison stone slab bench.

Heating: Forced warm air.

Total Cost: $20,000 including land, loan costs, construction costs and owner's labor figured at reasonable market cost of $3,000.



Total Area: 2,050 sq. ft. (1,260 sq. ft., main level; 800 sq. ft., lower level).



Cost per Square Foot: $12 for main floor; $6 for lower floor.

OPEN PLAN of kitchen and dining area includes central hanging storage cabinets with sliding doors that open into both kitchen and dining room.

PATIO IS ENCLOSED by living room (left) and dining room, with access through sliding glass doors from both rooms. Broad roof overhangs and floor-to-ceiling glass walls give feeling of spaciousness.

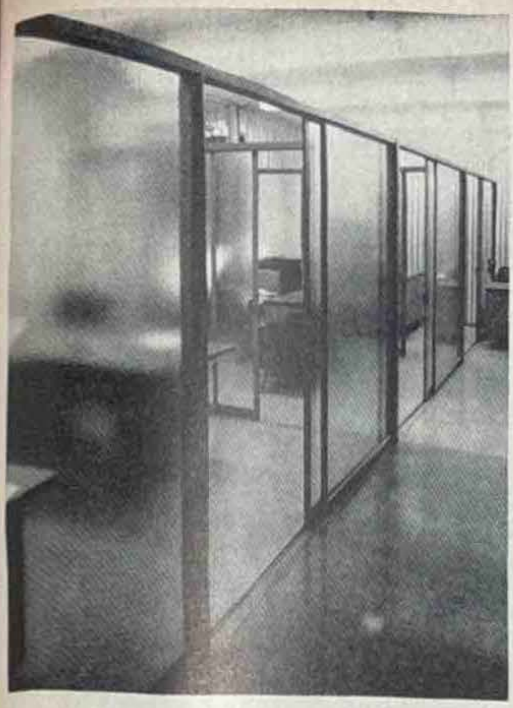
OBSCURE GLASS SCREEN allows privacy to sales offices which open to garden behind. Fire-red dimensional steel sign was designed by architects from manufacturer's trademark.

A masterpiece of indoor-outdoor integration

Arcadia Metal Products Offices and Factory
Fullerton, California

THE PHRASE "indoor-outdoor integration" has been so widely used and abused that it is almost in the category of an architectural cliche. But in this smart, low office structure which fronts a manufacturing plant in a flat, industrial area, the architects have given the expression new meaning.

A significant part of their contribution has been to design the building, on a 10-acre site, "into" the surrounding orange groves. To accomplish this, they have used the client's own products—sliding glass doors—to good advantage so that the offices in reality double as a showroom. Flexibility of open planning also has been achieved. This is best illustrated in the continuous flow of space through the president's office, the vice president's office and its interior garden which forms the terminus of the lobby. The atrium provides overhead lighting through the day and gives a spacious character to the lobby area which never fails to please visitors.



The small garden outside the president's office is one of several private terraces. A wood screen affords privacy and eliminates distractions from cars that travel on a side road. The height of the screen, however, allows enjoyment of the orange grove. The sales offices and the engineering department also open out to garden areas. Privacy is attained with free-standing masonry walls, wood screens and obscure glass screens.

Honest use of materials—predominantly brick and steel besides glass—are used in the same way both inside and out to provide a unified feeling. For example, the masonry wall of the brick entry continues into the lobby, as does the walkway itself; and even the roughened concrete paved area outside is repeated in the texture of the carpet in one office.

The offices have been planned on a 10-ft. module, allowing for use of sliding doors as wide as 20 ft., floor to ceiling in height. The slab type roof, supported on steel posts, provides a 5-ft. overhang where the sun condition requires protective planning.

The simple contemporary furnishings are in complete accord with the clean-cut design. Blue, brown and pumpkin are the major colors.

The architects planned the overall area for the factory although they did not design its interior. It has tilt-up concrete wall panels with poured-in-place concrete columns, interior steel columns and a concrete floor of dock height. A corrugated iron wall at the west end of the plant can be removed to allow for expansion of floor space as needed.

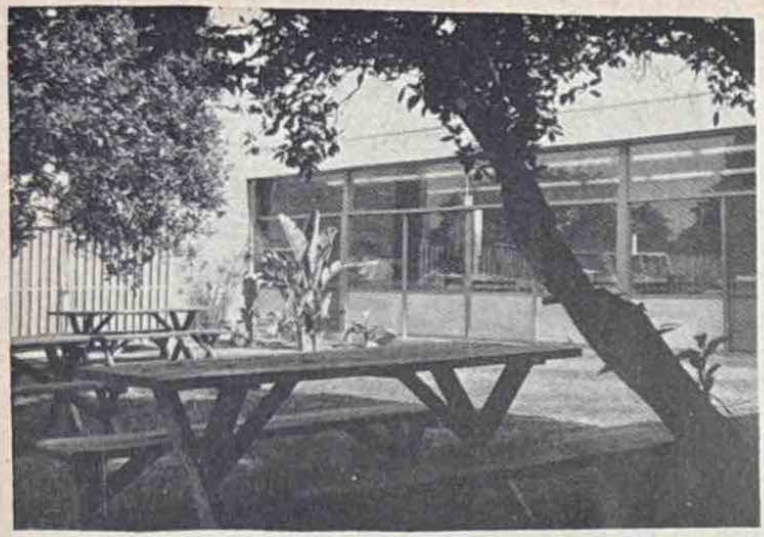
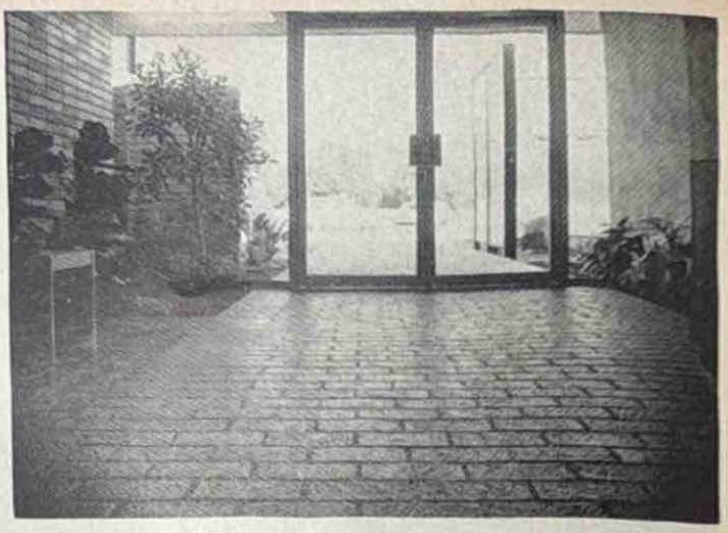
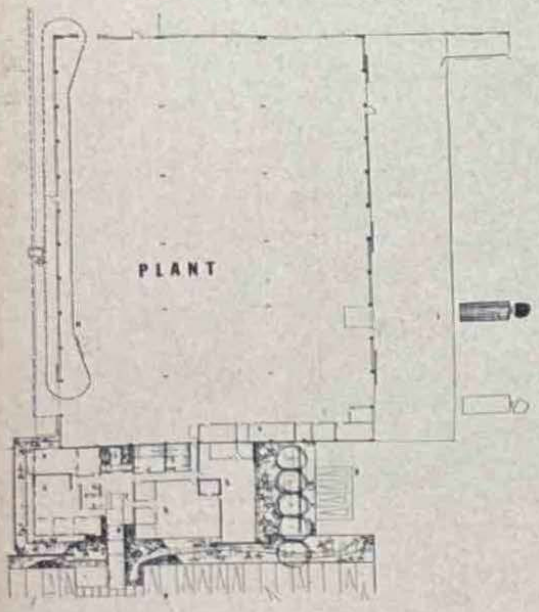
SALES OFFICES open to terraces and are divided by sliding screens, specially designed with two plate glass surfaces for sound protection. Below, looking into atrium from built-in reception desk. Interiors were done by Harry Saunders of architectural firm.

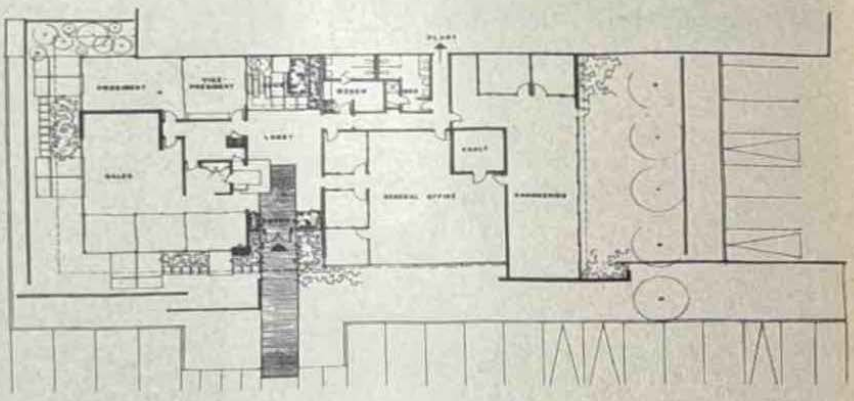


EXTERIOR BRICK WALL set in steel columns continues into lobby from entry walk and terminates in front of reception desk.



VIEW FROM LOBBY through interior garden which is open to sky; trees will eventually be visible from outside of building. Vice president's office is in background.





ENGINEERING OFFICE WALLS which open to outdoor garden are manufacturer's doors with masonite kick panels.

BRICK FLOOR OF LOBBY is continuation of entry walk; remainder of lobby is in cork-appearing tile.

Arcadia Offices and Factory

PERSPECTIVE INDICATES how architectural devices—free-standing masonry walls, wood screens and obscure glass screens—afford privacy for glass-walled offices.

OUTLINE SPECIFICATIONS
(offices only)

Type of Construction: Poured concrete.

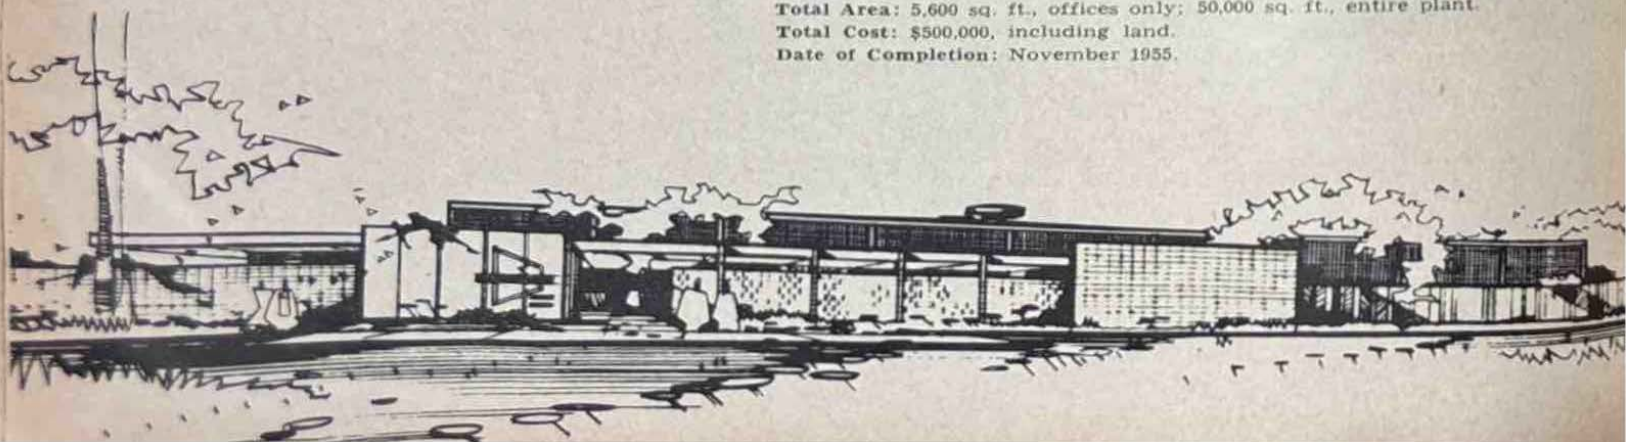
Exterior Walls: Arcadia sliding glass, Davidson steel-tied brick and painted plaster; also free-standing brick walls, obscure glass screens and wood screens.

Roof: Concrete slab supported on steel posts.

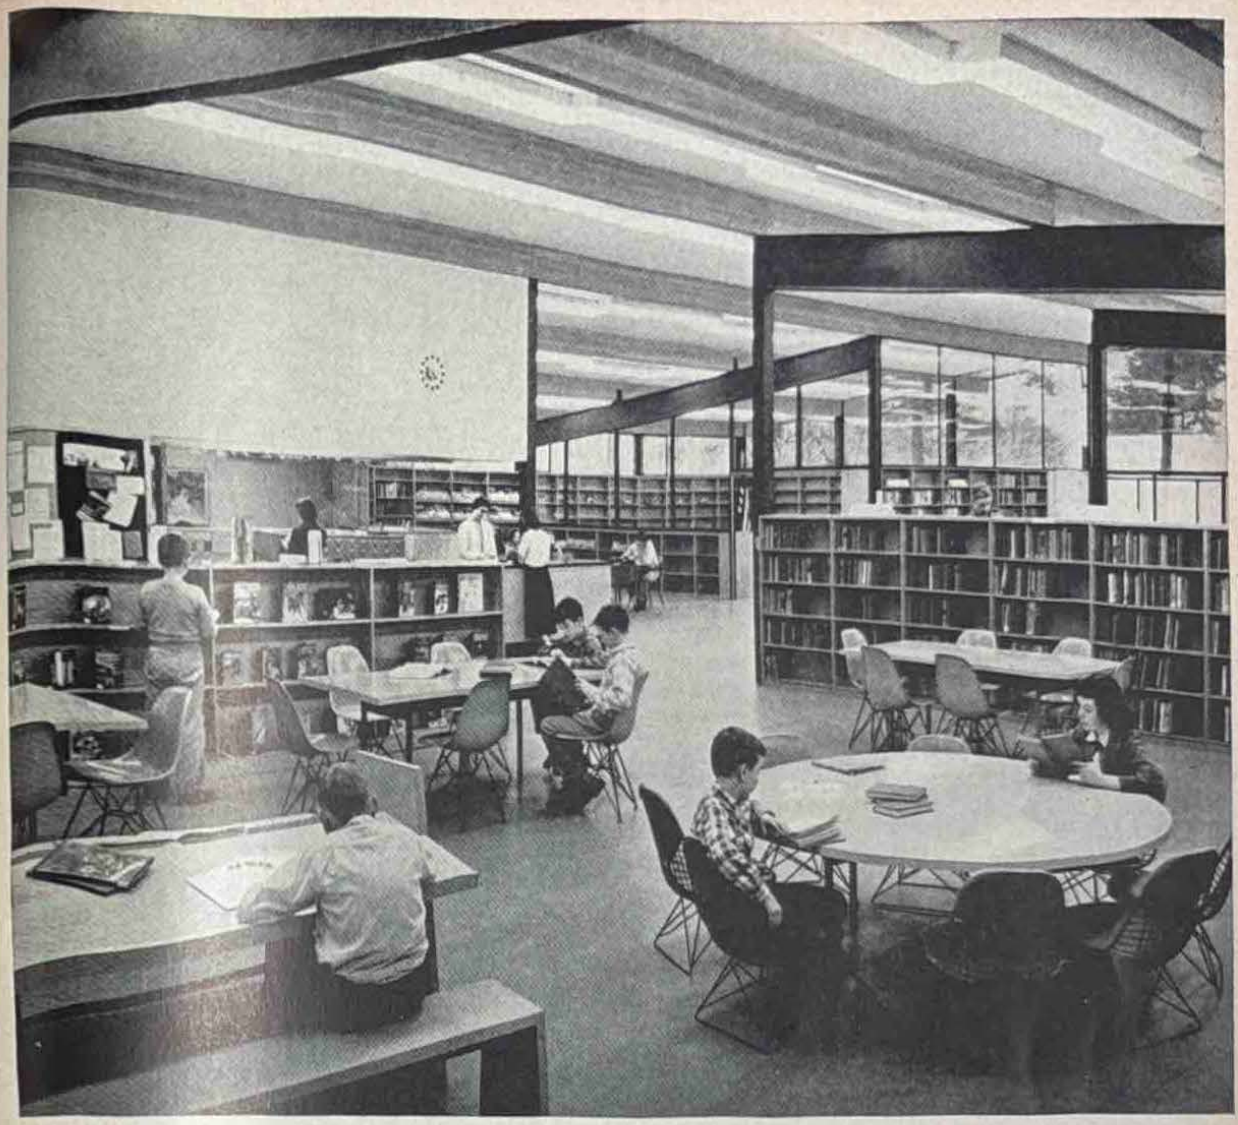
Floors: Concrete slab with wood float finish of concrete at entrance walk, Maticork in lobby and halls, asphalt tile in offices, marbelized Maticork elsewhere; rough slab under paving brick used in entry walk and into lobby; pebble washed finish concrete for patio and garden court.

Doors: Arcadia sliding glass; some specially designed with two plate glass surfaces for sound protection.

Interior Partitions: Arcadia sliding glass doors; frame, lath and plaster.



Interior Walls and Finish: Exposed Davidson steel-tied brick, wood paneling in lobby.



Ceilings: Flintkote ⅝-in., 12x12 random.

Total Area: 5,600 sq. ft., offices only; 50,000 sq. ft., entire plant.

Total Cost: $500,000, including land.

Date of Completion: November 1955.

Award winning library features exposed structural steel

This new Northeast Branch of Seattle's public library is a good example of exposed structural steel design. One of 15 branch libraries in Seattle, the building has won two architectural awards for beauty and utility. The steel beams, supplied by Bethlehem Pacific, span one-half of the library's width from outside to center, allowing large areas of interior space, uncluttered by an excess of supporting columns. Large areas of glass provide maximum daylight.

Architect: Paul Thiry; General Contractor: The Lewis Construction Co., both of Seattle.

The architect as artist (cont'd. from p. 12)

My reason for dwelling on this ultimate aesthetic object — this object of architectural criticism — is that it can be so easily lost sight of in the complexity of an architect's problem in making a building for a client who often does not fully know what he wants and yet must be satisfied. In relation to the central subject of these meetings here today (that of what we all should keep in mind toward surrounding ourselves in California with a congenial and, we hope, a beautiful architectural environment in the face of a great population influx that is predicted for the decades just ahead and the tremendous building boom this influx will stimulate), it is not the bare physical object with which we are concerned, nor is it the simple perception of a passing stranger, but it is this total thing of beauty which we are to be living with year in year out.

To maintain and enhance the beauty of our exceptional natural environment, we shall have to keep constantly in mind that the buildings and the cities to be built are not mere constructions of sticks and stones nor, to allude to another well known phrase, "machines for living," but are organizations of human perceptions and meanings. These organizations must be rich and satisfying. A beautiful building is like a person and has a character. A person's character is preserved in his physical body. But the physical body is not the person. A man's personality is an organization of human dispositions which we come to perceive and appreciate in terms of acts and intentions and emotional warmth — all mentally apprehended just as with the building taken in as an aesthetic object of appreciation. What we have to keep in mind in building up our coming California environment is the ultimate aim that our buildings and our cities have character.

With this in mind, let us consider a few things that we shall have to guard against and then some things we may positively seek to attain.

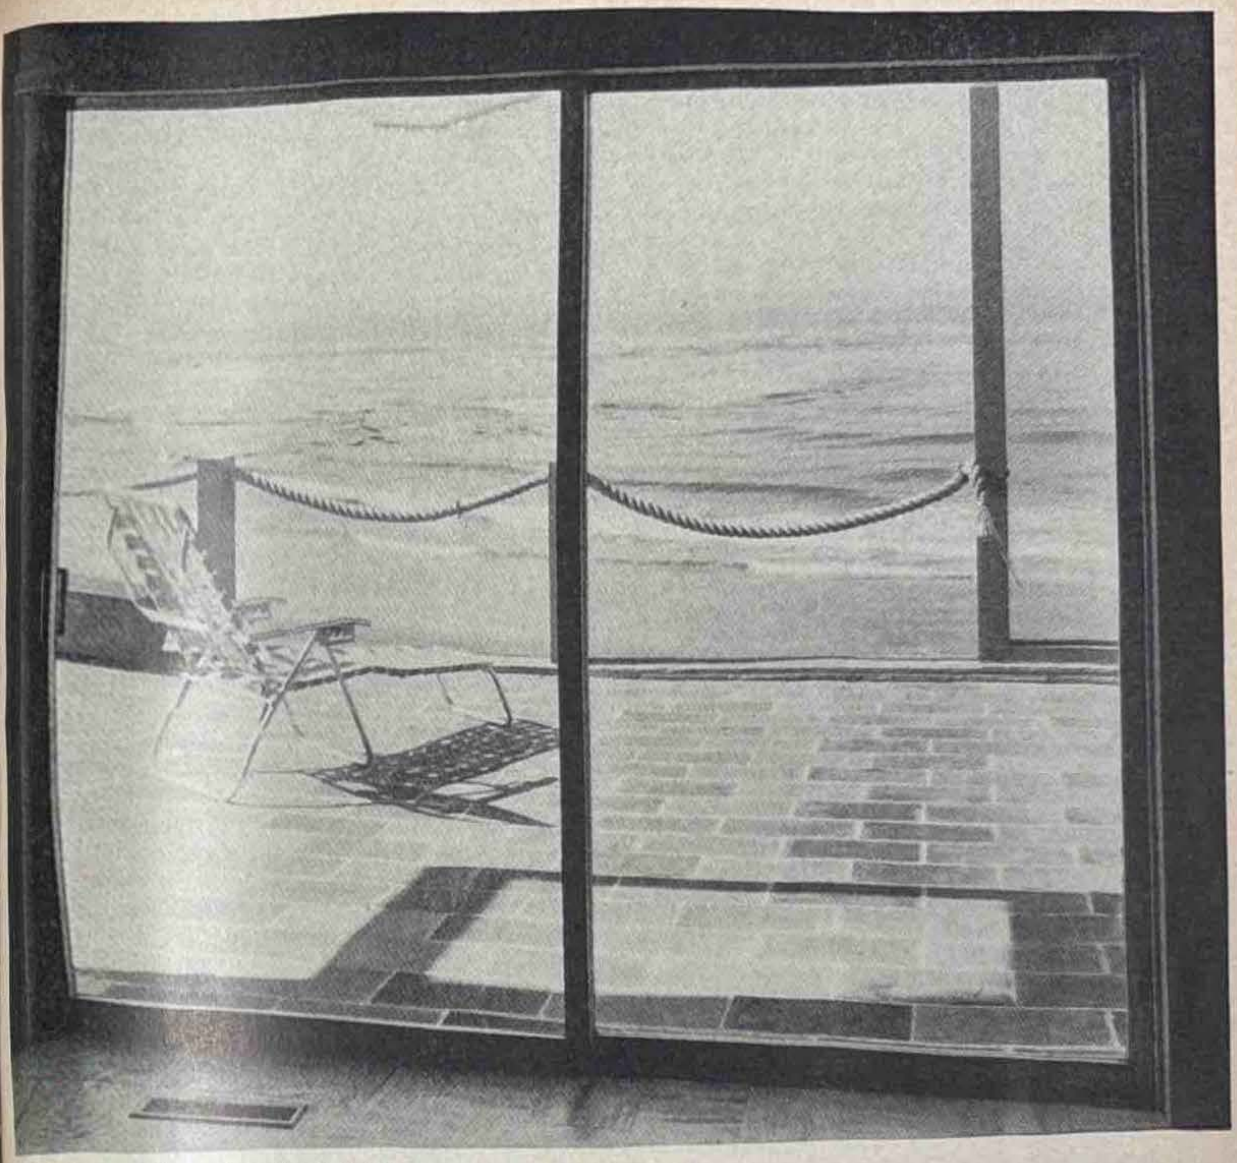
Among the many things to be guarded against, a number of them can be gathered under two heads: the menance of the hard-headed man and the menace of the imitative man. These two menaces are serious, for most men of power and wealth in our society turn out to be one or the other of these two menaces, or at least to have menacing tendencies in these directions.

The hard-headed man is the excessively practical man whose life has been devoted to money-making or to politics or to engineering or some other absorbing but narrow calling. Almost in proportion to his success in his calling, he is a source of danger to the future comfort and beauty of our state. The very terms "comfort," "beauty," "art," "aesthetic" and the like are repulsive to his nature. Propose anything on the grounds of its beauty or aesthetic appeal and he is at once against it as a waste of money, as a thing impractical, and effeminate, and possibly suspect of being un-American.

Two contemporary instances of the action of typical hard-headed men, first, are the roller-coaster bridge across San Francisco Bay from Richmond to San Rafael. This one can see, just to look at it, was the construction of some very hard-headed men. Even if something less ungainly would have cost more in money, it should have been undertaken in view of the cost to men's eyes and feelings that structure will incure for generations to come. And San Francisco Bay is one of the great objects of natural beauty in the world. Seeing this Richmond-San Rafael Bridge, I marvel how we are so fortunate as to have inherited such pleasing structures as the Bay Bridge and the Golden Gate Bridge. Whatever accounted for that difference, can we possibly take this lesson to heart and avoid repetitions over our landscape of such things as the Richmond-San Raphael Bridge.

The other instance is what is now going on about the plaza in front of the Ferry Building in San Francisco. Here too we perceive the action of a hard-headed man being supported evidently by admirers of hard-headed men, by which a beautiful feature enhancing one of the really beautiful cities in America is threatened with mutilation by a straight and uncompromising elevated highway planned for cheapness only and without any consideration for the character and charm of the city.

These are the sort of things that hard-headed men in positions of power and authority are likely to ram through without seeking the advice of aesthetically informed architects or of other competent men, indeed rejecting such advice when proferred.



One of the great problems in dealing with this situation is the excessive admiration so many Americans have for this type of narrow, uncompromising hard-headedness. We are a people and this is a great virtue in the wide sphere where practicality is appropriate. But when practicality is carried to the excess of mutilating our cities and countryside, it is no longer humanly practical. How can we get this simple truth across to our hard-headed compatriots who are so unknowingly threatening the peace and comfort of our future?

A second menace, I said, is the imitative man. He is likely to be a man of considerable cultivation but aesthetically timid and unhappy in a highly experimental and exuberant architectural era. He wants the architecture of the present and the future to resemble the architecture of the past. In a static period, his influence would not be noticed and would on the whole be beneficial. But in a developmental period, he is a drag. This is the sort of man who has demanded conformity to his tastes in many of our largest building programs. He is the man whose taste has controlled the designs of many of our bank and office buildings, many state and federal buildings, including the building of schools, universities and post offices.

The way it works is this: the architect is chosen who is believed to be amenable. Besides, an architect is always under obligation to consider the desires of his client. The architect if given leaway could have designed a building of distinction. But he knows the limitations of his client's tastes and restrains his imagination. He comes out with something that is a compromise between his architectural ideals and the conservatism of his client. The resulting building is dull and uninspired. And such are often the buildings in prominent places. They set the character of a town into something that is itself dull and uninspiring. Remember the rivalry of the cathedral towns in the 12th and 13th centuries to excel one another in the excellence and imaginativeness of their central public structures.

In too many of our towns the aim appears to be only to put up buildings exactly imitating the buildings in the next town or county. So town after town as you drive through them has no more character than a row of tenpins all turned off of the same machine. This might not be so bad if the original tenpin design were itself imaginative — though still monotony has never been an aesthetic virtue. But I do not need to remind you of the architectural dullness of the model itself for so many of our town and city structures, especially today.

For today we are in an era of architectural awakening the like of which has not occurred for a number of centuries. We have become architecturally aware of the potentialities of a great variety of new materials and of modes of construction congen-

ial to these materials. This is an age of steel and concrete when previously in our culture stone masonry construction dominated conceptions of architectural design.

The first realization of this change emerged in the period of rampant functionalism. The achievement of this extreme movement was to clear away old traditional **beaux arts** preconceptions and open minds to the vast architectural potentialities of new materials and modes of construction and design. This first shock attack upon deeply entrenched traditional conceptions has achieved its objective. What remains is to consolidate the new territory that has been won and realize its full potentialities. The present is one of the great developmental eras in architecture. Never has the creative imagination of the architect had greater scope for original and outstanding achievement. And here in California not only is the architect fortunate in the era in which he is born but also in being given an unusual chance to build. For we learn there is to be an enormous influx of population, capital and social need requiring a huge amount of building.

But we must earnestly try to find some way of overcoming the drag of the imitative man on the creative freedom of the architect who will be called upon to do the planning for this upsurge of building. The disposition of the funds for this period of building are likely to be very largely in the hands of either hard-headed or imitative men or both. Unless many of these men can be persuaded of the social damage they may be doing, we shall have much to apprehend in the decades ahead.

And at this point let me add that if among architects themselves as a professional group there happen to be some who are not appreciative of the present creative potentialities of their art — some even who may be classified among hard-headed or imitative men—then here is a special task of education close at home to be coped with.

Having pointed out certain dangers to be guarded against, I should like to turn to some positive suggestions for the decades of building expansion ahead.

First and perhaps most important of these is that the architectural profession notice the unusually great social responsibility it has for the future character of the cities and countryside of this state. The very character of California for 1960 and 1970 and on for a century or more is to be molded largely by their hands—by the hands of the present generation of California architects in cooperation with the city and regional planners.

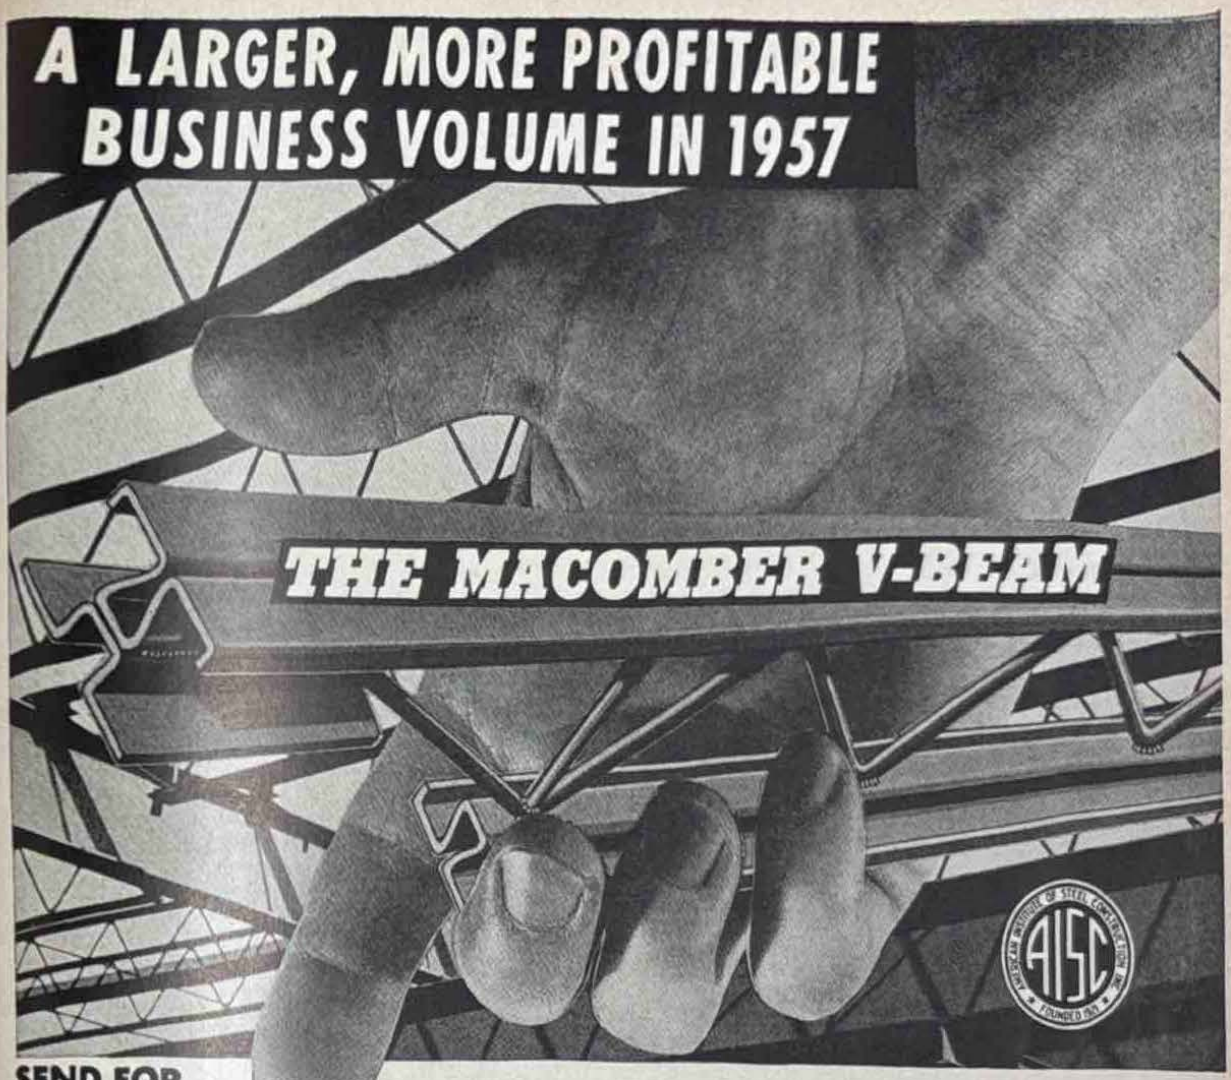
One reason for my taking this time at the beginning to show what it is that an architect does in planning a building which is a work of art was to show that a building or a city as a thing of beauty is a being with a character, a sort of personality with which we may be friends. But if our city has an ugly personality, it will be a constant source of irritation and even disgust and hostility. It is the major responsibility of architects to give us towns and cities with a character of which we can be proud and with which we can be friendly. You must not let us who are your clients down. As a profession, you have a social responsibility equal to that of doctors or teachers. You are responsible for the beauty of our environment, as doctors are for its health and educators for its intellectual integrity. To be aware of the seriousness of this responsibility is essential to its being successfully met.

Other positive suggestions are all in the way of means for carrying out this central responsibility.

One such suggestion is to see to it that there is an adequate number of architectural schools from which to recruit your profession and that they are adequately staffed. As a profession your influence in this area is strong even if used indirectly. It is on the advise of architects known to be competent that administrative officers fill positions in architectural schools. The standing of a school is always essentially its standing in the judgment of the profession. It is most important that this judgment be honest, aesthetically sound and readily available. But where a new school is needed, the profession could actively move to get it into being.

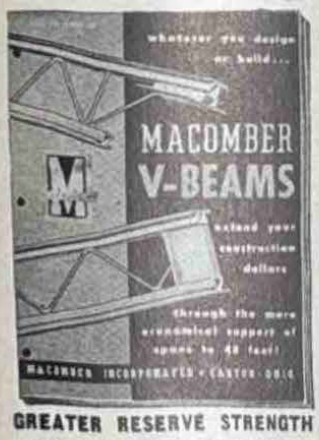
Then also there is a great need to educate the public in the character of good architecture and in the awareness that a building is not an isolated entity but is a part of an environment in a neighborhood of other buildings and on a site with a natural setting. Something is accomplished in universities and colleges toward informing our future public about these aesthetic principles. Such is part of my personal responsibility as a teacher, and I trust that I and my colleagues have some effect.

But in the bulk, we teachers cannot reach many out of this total community, even though it is persons out of a picked group that we do reach. The architectural profession could help by supporting the need of instruction in the arts in higher education, because it is something rather new and still open to suspicion by many in the academic field. There is a strong tendency among scientific specialists and administration to try to make all art instruction scientific, in a pedantic way—to demand MA's and PhD's and verbal research papers, of all art instructors (including architects). For some art instruction these degrees are appropriate but not for all. So there is need of watchfulness here and the assistance of the architectural profession can be helpful.



But there are other ways of educating the public, which have a wider (if less intensive) influence. Architectural exhibitions in museums or elsewhere can reach a wide public.

There is also another way that could be widely educative and that is the encouragement of newspapers and journals to engage competent architectural critics comparable to the music and literary critics they employ. This is something that would need special initiative on the part of the architectural profession and some mode of gaining security against legal or other punitive action by large architectural firms in case of unfavorable criticism. For except in a few journals like the New Yorker, which seems to have plenty of financial backing, one looks in vain for articles or columns of architectural criticism.



I have heard that the newspapers do not dare have architectural critics for fear of reprisal. A painter or poet or musician has no way of hurting a big daily. But there is, I have heard, fear that a big architectural firm might well do so. The result is unfortunate for there is no quicker way of arousing public interest and encouraging public discrimination in architecture than by developing a vigorous controversy over the quality of a building.

Quite apart from the accusations of being poor sports, a profession which keeps its achievements closed to free discussion likewise keeps them closed to public evaluation. If a thing can be given no worth, it is not known or appreciated and presently comes to be thought of as worthless. To show up the worth of a good thing and the unworthiness of its opposite, what is more educative and benificial than such an aesthetic discussion as the one that has just now been going on over the Ferry Building Plaza? Every architect should welcome free public criticism of his works for his own instruction (since who is omniscient?) but more especially for its educative value to his public. For by such means the architects' achievements can become publicly elevated to the place of great community worth which in truth when successful they do possess and through the ages have always possessed.

November building volume maintains lead

WITH HOME BUILDERS warily eyeing the future, the dollar volume of building permits in the five western states for November continued to hold a small lead over last year. The total for 116 major agencies is 9% higher than November 1955.

Gains ranged from 7% in Washington to 25% in Montana, with California reporting a 9% rise; Oregon, 16%; and Idaho, 13%. The pattern so far as individual agencies were concerned was fairly evenly divided, with 55% of the cities and counties reporting increases.

From the strictly home building viewpoint, Joseph B. Haverstick, president of the National Association of Home Builders, has termed 1956 the lowest profit year for builders since 1949 and estimated that home starts in 1957 would only approximate the 1 million expected by the end of this year. Another speaker at the recent National Association of Real Estate Boards convention, Albert M. Cole, Federal Housing and Home Finance Agency administrator, blamed the tight mortgage market on the 17% decrease in housing starts.

With 11 months already tucked away the picture in the five western states is just a shade brighter. The dollar volume now stands at $2,392,160,493, a bare 2% lead over the January to November total for 1955. All states report gains, with the exception of Washington which is down 3%. Oregon is up 8%; Montana, 6%; Idaho, 5%; and California, 2%.

Following is a breakdown of building permits issued by several of the major agencies during November.

	DWELLING UNITS		COMMERCIAL & INDUSTRIAL		PUBLIC	
Portland	75	($ 892,850)	24	($ 872,200)		
King County	249	(2,320,220)	38	(326,690)	7	($2,288,000)
Seattle	139	(2,060,960)	16	(969,500)	1	(15,000)
Tacoma	72	(348,875)	33	(457,965)

ANOTHER EXAMPLE OF CARCO "One Stop" STEEL SERVICE

Engineers — Austin Associates, Seattle
Builders — The Austin Company, Seattle

LARGE NEW BOEING OFFICE FACILITY USES CARCO FABRICATED STEEL

The introduction and sale of the Boeing 707 Intercontinental, a larger airplane than the Boeing 707 Stratoliner, make necessary additional manufacturing space.

As a result, the Boeing Airplane Company of Seattle is currently erecting new company-financed facilities to the extent of about $35,000,000.

Part of this large expansion program are new manufacturing and office buildings at Renton, Washington. The cost of the new Renton facilities is estimated at $13,000,000.

The office building occupies about 300,000 square feet. When completed it will house the company's new Transport Division.

This new building is to be a completely air-conditioned and sprinklered one-story steel frame structure with four penthouses to contain the heating, ventilating, air-conditioning and some of the electrical equipment.

Bay spacing of the steel columns is 24' by 36'. The fabricated steel beams are framed in the 24' direction. Open web bar joists spanning 36' at 6' centers are welded to the steel beams.

Pacific Car fabricated 360 tons of structural steel for the Boeing Transport Division's new office facility.

Carco offers buyers of structural steel not only the largest fabricating facilities in the Northwest but also a "one stop" steel service. This means money-saving ideas and suggestions, prompt engineering detail and estimates, fabrication and erection. Let Pacific Car help you solve your structural steel problems, whether your needs are large or small.

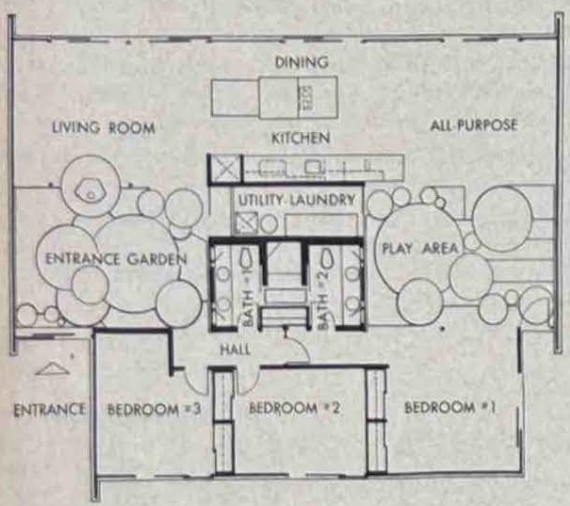
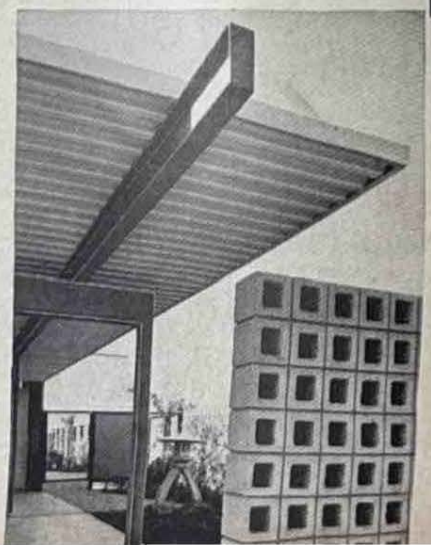
News of another steel home from United States Steel

Steel brings the wide open spaces indoors



Eichler Homes' new experimental house, the X-100, takes a long, hard look into the future of production dwellings. Many of the forward-looking features previewed in this research house are steel, or they depend on steel: unconfined, inter-related space, indoor-outdoor integration and maximum design flexibility.

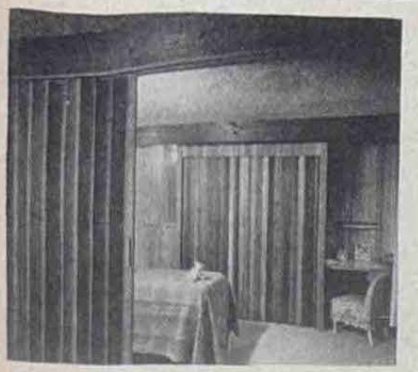


Discussing their interest in steel homes, Edward Eichler underlined the great stability and permanence of steel construction . . . the fact that it doesn't check or warp and paints economically. There's the barest minimum of upkeep necessary with a steel frame house and, of course, termites cease to be a problem.

Entering through this dramatic garden court, you pass into the living, dining, kitchen, all-purpose and children's play area without a wall to break the openness Eichler seeks. Only the bedrooms and "utility core" have partitions (non-bearing) or draw-drapes for privacy (and these can be moved according to the needs of a growing family or new owners.)

The X-100 was designed to utilize standard United States Steel sections: 4" H13# for vertical columns; 8" WF13# and 10" WF17# for roof beams. There was also a variety of small angles, T's and channels involved. Steel roof decking was fabricated by H. H. Robertson.

The thin crisp lines of small steel members produce a light, elegant feeling and a "floating roof." To replace an 8" steel ceiling beam (spanning 26') with a wood member of equivalent strength, the architect would need to specify bulky 16" timbers.



rchitect: A. Quincy Jones and Frederick Emmons, AIA, Los Angeles
teel Erection: Herrick Iron Works, Oakland
-100 Location: San Mateo Highlands, Calif.

ARCHITECTS & ENGINEERS: If you are interested in receiving more information on the use of United States Steel in residential construction, send us your name and address and we will forward the material as it becomes available. Write; Architects & Engineers Service, United States Steel Corporation, Columbia-Geneva Steel Division, 120 Montgomery Street, San Francisco 6, California.

estern homes of the future are now building with steel... **UNITED STATES STEEL**

Materials – Products – Tools

and the latest literature

WOOD PANEL FOLDING DOORS

FOLDING DOORS: A new line of folding doors with lifetime vinyl hinges are available in three woods: Alaska cedar, western red cedar and Philippine mahogany. Marketed as Space-Saver Dors by Wood Specialty Products, they are offered in two sizes, regular and giant. The former (3½-in. panels) is used generally in home and office installations; the latter (5½-in. panels) in commercial installations and may be specified to any size for custom production.

The wood panels are 7/16-in. thick and are kiln-dried to prevent warping or checking. The doors are easily hung and suspended from the track at the top of the door opening. There is no floor track.

(Item No. 1)

CERAMIC VENEER: To promote general purpose ceramic tile construction having the brick veneer appearance but with four-fifths of regular brick weight eliminated, Empress Bricktile has devised a drywall method of setting unglazed clay tiles for interior and exterior wall facing. The method employs small nailable clips in the vertical mortal joints between brick tiles. Each clip serves as an automatic space for both horizontal and vertical joints.

(Item No. 2)

INTERIOR PAINT: A new Zolatone process for interior painting called TextureTones, which resists chipping and scratching to a far greater degree than conventional finishes, comes in 42 different colors and gives a stippled effect. Its non-static quality keeps surfaces cleaner longer, making this finish especially suitable in the kitchen.

(Item No. 3)

SPACE DIVIDER: An 84-in. high partition of steel with aluminum trim permits an unlimited variety of office arrangements since the 20-gauge panels and 16-gauge posts are completely interchangeable. The Space Setter, newest addition to Rockaway's line of dividers, is free standing and does not interfere with existing lighting, heating or ventilating systems.

The partition is constructed of 39 in. of stretcher leveled steel, topped by 32 in. of clear flat, clear fluted or frosted fluted glass and by 12 in. of tempered hardboard. The standard size glass panel or all-steel door is equipped with aluminum hardware and rides on a full piano hinge. Glass inserts can be replaced with masonite, pegboard or acoustical material. Base panels that snap easily on to specially designed brackets are available for areas where complete base closure is desirable.

(Item No. 4)

FIREPROOFING STEEL: A method of fireproofing structural steel members and steel floor units in building construction developed by Keasbey & Mattison has been approved by Underwriters' Laboratories. Using sprayed Limpet asbestos, this method also presents a new concept for the protection of structural steel members against corrosion. Pure asbestos fibers are combined with an inorganic hydraulic-setting bonding material. The thickness of the coating on different members is varied as required to provide the desired rating in hours of fire protection.

(Item No. 5)

COOLING UNIT: To make its absorption cooling machine available to smaller buildings, Carrier has introduced 60- and 80-ton sizes. Electronically controlled by a stop-go push-button, time clock or thermostat, the unit produces variable cooling as required. Low pressure or waste steam, or any hot fluid can be used to provide refrigeration. All of the parts which would ever need to be replaced reportedly can be carried in a small briefcase.

(Item No. 6)

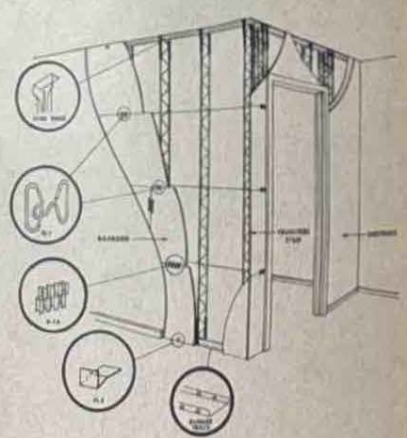
DOOR SAFETY DEVICE: An entrance door safety device developed by Overly Manufacturing is one answer to the hazard of smashed fingers. Called the Fing-R-Gard edge, it is intended for use on doorways for all types of institutional, industrial and commercial buildings.

Besides protecting unwary fingers, the door edge is weatherproof and seals out cold or heat and moisture. It is made of vinyl plastic and attached as an integral part of the door, shaped in the form of a U and applied to the door's entire length.

(Item No. 7)

SHEET COPPER: For both interior and exterior applications, Chase's newest sheet copper pattern features a deep ripple or wave design which produces interesting shadow effects. Available in standard 16-oz. weight, 39x 96-in. sheets, the pattern lends itself to such uses as cornices, box gutters, fireplace hoods, range canopies, paneling, flower boxes wood baskets and other decorative effects.

(Item No. 8)



WIREWAY: General Electric's hinged-cover wireway, completely open for lay-in wiring, is particularly useful where space is limited and building contours are complicated. Labeled Type HW, it eliminates the customary method of threading the conductor through collars. The wireway comes in 1-, 2-, 3-, 4- and 5-ft. lengths and is made in three different sizes—4x4 in., 6x6 in. and 8x8 in. A complete line of standardized fittings also is available.

(Item No. 9)

DRYWALL ASSEMBLY: U. S. Gypsum recommends its drywall construction assembly for non-load bearing and free-standing partitions in commercial, institutional and multiple-unit residential construction. Designated the Sheetrock-Trussteel stud partition system, its components are metal studs, attachment clips, metal runner tracks, stud shoes, a new product called Baxbord and ⅜-in. Sheetrock wallboard.

The system is adaptable to new construction or remodeling where ceiling height or free-standing partitions are specified. Partitions are hollow, permitting electrical conduits and pipes to be run vertically or horizontally. Baxbord provides an easy-to-handle, low cost base for lamination of the Sheetrock face layer.

Item No. 10)

PARTITION SYSTEM

Latest Handbooks, Manuals and Literature

Yours for the Asking

FIRE STATION DESIGN: Architects and engineers with assignments for designing municipal fire stations, city halls or combination fire-police buildings will want to add Circul-Air's 64-page publication to their reference library. "Fire Station Design" presents floor plans, perspectives and descriptive data for about 100 of America's newest stations from all sections of the country. Almost every conceivable type of structure—from single-engine companies to central headquarters—is represented in a wide range of architectural treatment costing from $20,000 to $500,000.

(Item No. 11)

METAL DOORS, FRAMES: United Steel Fabricators describe their standardized modular dimensioned, metal doors and frames for residential and commercial applications in a 12-page bulletin. It shows some production steps in their forming, complete specifications on doors and frames, illustrations of both swinging and sliding standard doors, detail drawings of typical frame installations and standard frame designs, and engineering details of hardware reinforcements and locations.

(Item No. 12)

STRUCTURAL WOOD: Latest information on solid timber structural assemblies is found in Rilco's 12-page booklet. "Structural Wood Products" contains technical data on fabricated timber systems such as roof trusses, post and beam construction, arch centering, theater screen towers and falsework and bridge stringers.

(Item No. 13)

EXTERIOR SIDINGS: Numerous color photographs of houses which illustrate the various siding materials developed by Masonite highlight a 16-page booklet, "For Modern Exteriors Choose Modern Materials." These include horizontal siding and vertical panel siding in various treatments and textures. Installation directions are given in brief form.

(Item No. 14)

WOOD PRESERVATION: "Recommendations for Preservation of Wood in Building Construction" covers the types of preservatives, methods of treatment and degree of treatment required for the various items of lumber, millwork, etc., commonly used in residential construction.

In developing these specifications Protection Products Manufacturing has employed the same geographical regions as were used by the Building Research Advisory Board in the studies which it recently completed for the FHA: Region 1—California, Gulf Coast states and southeastern states; Region 2—the balance of the states except a strip across the northern part of the country; Region 3—extreme northern part of the country.

Recommendations also are provided in detail for the three basic types of residential construction: slab on ground, basement and crawl space.

(Item No. 15)

NUCLEAR POWER: For anyone interested in nuclear reactor power plants, a 12-page handsome bulletin published by Alco is a must. The publication features a five-page transvision of a pressurized water reactor core designed and built by Alco for the Army Package Power Reactor. It also depicts photographically the company's new Criticality Facility at Schenectady and contains a heat balance diagram of a typical Alco nuclear power design with an accompanying characteristics chart.

COMMERCIAL ATOMIC PLANTS

(Item No. 16)

PRESTRESSED CONCRETE: Advantages of prestressed concrete structural products are described in an eight-page brochure, along with the method of making and installing the Leap double tee. Three pages are devoted to tables of loading for roof and floor members.

(Item No. 17)

CURTAIN WALL: An exterior curtain wall system incorporating 10 standard modular components and specifically planned for one-, two- and three-story construction is introduced in Kawneer's 10-page brochure. Called Unit Wall, the system permits a total of 2,852 possible design combinations, using the complete range of sizes and types of panels, sash and doors.

(Item No. 18)

SCHOOL FRAMES, WINDOWS: "Wood Frames and Windows in Modern Schools" is the title of the latest in a series of brochures issued by the Architectural Woodwork Institute. The 20-page booklet contains photographs and details of 15 outstanding woodwork installations in schools in all sections of the country and Canada.

(Item No. 19)

CEMENT COLOR CARD: Landers-Segal is offering a pocket-size cement color card which illustrates 24 shades to architects, builders, concrete manufacturers, mason contractors and building material dealers. Also available is a companion folder, "Suggestions for Using Lansco Cement Colors."

(Item No. 20)

WEATHER CONTROLS: A chart scheduling the most suitable outdoor controls for use with different types of heating systems under varying conditions and requirements highlights a bulletin prepared by Automatic Devices. Also included are guide specifications in outline form.

(Item No. 21)

PERLITE PLASTER: A six-page booklet, "Perlite Plaster for Quality Home Construction," is designed for builders as a promotion piece to be given to prospective home buyers. The Perlite Institute discusses the fireproofing, noise reducing, insulating and strength - with - lightness characteristics of perlite plaster.

T-square talk

about architects • planners • engineers

NEW OFFICE: Kalispell, Mont., architects Taylor, Thon, Schwartz & Kirkpatrick have opened a new office in the First State Bank Building in Libby, where the firm will be represented by Kenneth Kirkpatrick.

ON THE MOVE: Harry L. Percy Jr., architect, and Sidney P. Lathrop, engineer, are now located in a new building at 1975 S.W. Fifth Ave., Portland.

✓ Architect Dan F. Miller of Edmonds, Wash., is now practicing in the Beeson Building (MYrtle 2929).

DIED: Johannes Van Teylingen, 64, senior partner in the architectural firm of Van Teylingen, Knight & Van Teylingen, Great Falls, Mont., died November 13. He designed many of the major buildings in that city and served as president of the Montana chapter, AIA, in 1952.

A native of Holland, Van Teylingen was a widely known chess player, having won at least six state, national and international chess titles.

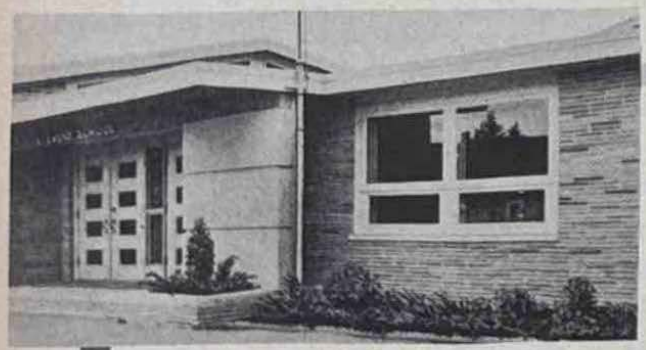
✓ Death took Roy C. Stanley, 70, an architect and structural engineer, in Seattle last month. His partnership with Arden Steinhart, formed in 1951, expanded to the firm of Steinhart, Stanley, Theriault & Anderson, with whom he was associated before he became ill in July.

A graduate of the University of California in 1910, Stanley came to Seattle from Los Angeles. In the 1930s he was a regional architectural engineer for the Public Works Agency and later the Federal Works Agency.

REORGANIZED FIRM: Reorganization of the San Francisco architectural-engineering firm of Ernest Frederick Winkler and Harold M. Hansen has been announced by Hansen and Edwin Winkler, brother of the partner who met his death in an airplane accident last August. Known as Hansen & Winkler, the reorganized firm, with offices at 251 Post St., is continuing the work of school planning and designing of hospitals and other public buildings which made up a substantial part of the business of the predecessor organization.

A graduate of Columbia University School of Architecture, Hansen joined Ernest Frederick Winkler shortly after the latter established his practice in 1946. Edwin Winkler also was associated with his brother as field engineer for supervision of construction and administration of contracts. He holds a degree in mechanical engineering from the University of California.

NEW ASSOCIATES of architectural firm of Wilmsen & Endicott, Eugene, Ore., are Richard R. Rhodes (left), AIA, and James C. Longwood (right), AIA. In center is Ramon Gonzalez of Montevideo, Uruguay, who was associated with firm during first half of 1956 before returning home in August.



HONORED: Designer Robert K. Grubb of Portland has received an Award of Merit from Institutions magazine for his work on Palaske's Hillvilla Restaurant (featured in PA&B for April 1956).

NAMED: Robert L. Durham, AIA, has been chosen president of the Seattle Art Commission, succeeding another architect, John S. Detlie, AIA.

PR HEAD: Welton Becket & Associates, architects-engineers, have named Jack Whitehouse as director of the firm's newly created department of public relations, with headquarters in Los Angeles. He formerly headed Pacific Coast press relations for Shell Oil Co.

PLANNERS: Thomas F. Hargis Jr., AIA, has been appointed to the Yakima (Wash.) City Planning Commission.

✓ The City of Bellingham, Wash., has hired its first full-time city planner, 30-year-old Bruce G. Finke, who has been associated with Hadley & Hadley, Seattle consulting engineering firm, in structural design work.

Chehalis Buff Roman Brick

. . . adds charm, color, economy
to new **Stevens School** in Aberdeen

More and more architects are specifying the Northwest's most distinctive brick—Chehalis Brick—for school construction. Chehalis Brick combines the appealing colors and textures that are typical of the area with all the natural advantages of brick: attractive design, permanence, and fire-safety—plus the long-range economy of lower maintenance costs.

Builders and Suppliers

headlining the news

• **Crown Zellerbach Corp.** has created a fiber division, headed by William R. Works, at its San Francisco headquarters to promote Crezon, a weatherproof overlay for plywood. He will be assisted by sales representatives J. H. O'Donnell of Seattle and E. C. Stadler Jr. of Portland.

Now used by seven plywood manufacturers on their panels, Crezon was actually perfected in 1950 but was not fully developed and ready for an extensive marketing program until mid-1955.

• **American Fabricators** has opened a branch office in the Pittock Block, Portland, with A. C. (Clayt) Heffelfinger as manager. The glue-laminated timber company, which has its fabrication plant in Bellingham, Wash., now is represented nationally.

• **United States Plywood Corp.** has opened a branch operation, including a warehouse and office at Santa Ana, Calif. Beryl Abbott, with the company since 1936, has been made manager.

• **Ray Johnston Co.** of Seattle has been appointed as Pacific Northwest representative for the sales of industrial slides by Grant Pulley and Hardware Corp. of Los Angeles and New York.

• **Symons Clamp and Mfg. Co.** has named J. Frank Pearson as its manager of West Coast operations at the firm's new plant in San Leandro, Calif.

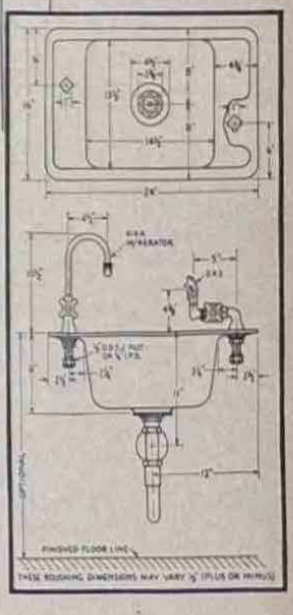
• **Worthington Corp.** has acquired a West Coast manufacturing plant in Alhambra, Calif., as a further step in the company's expansion in the year-round home air conditioning field.

ALMOST EVERY MAJOR MARKET on the West Coast will be visited by Worthington Corp's. "Climate Van" by March 1, 1957. Looking like an ordinary truck when in transit, van converts into combination showroom, conference room and motion picture theater when set up for exhibit. Turn lever and sides, roof and floor of vehicle slide out to width of 15 ft. 2 in.; stairway folds out from rear to provide entrance.

• **Simpson Logging Co.** of Shelton, Wash., has integrated the Oregon plywood and door plants of the former M and M Wood Working Co. into a single division headed by Hal W. McClary of Shelton, plywood and door manager.

Sales headquarters for the enlarged Simpson organization have been established in the former M and M offices at 2301 N. Columbia Blvd., Portland. Harold Johns, Simpson plywood and door sales manager, has transferred to the Portland sales office from Shelton.

Clay Brown, who headed M and M Wood Working prior to the integration, is now devoting full time to his



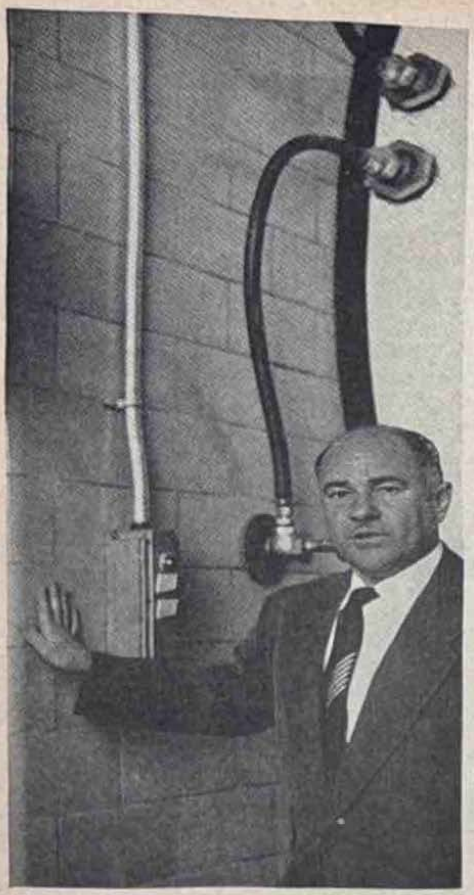
New School Project on the Board?

...add "the touch" that makes it really new...

HAWS classroom DECK-TYPE FOUNTAINS

Acid resisting porcelain enameled cast iron receptor, 16" x 24", equipped with drinking faucet and pantry faucet...with HAWS advanced sanitation features for utmost cleanliness and safety.

Specify water facilities where they're needed most—right in the classroom! HAWS versatile deck-type fountains are available with optional combinations of VANDAL-PROOF faucets and fixtures to meet any classroom need.



And for appearance... they can't be beat! Handsomely designed in lifetime stainless steel or *acid resisting* enameled iron, they add pleasing functional beauty. Five basic series fit every space and service situation. Make your school refreshingly new *throughout*—with HAWS Deck-Type Fountains. *Write for detailed information...TODAY!*

HAWS features complete lines of drinking fountains, electric water coolers, emergency eye-wash fountains—and **KRAMER Flush Valves,** *for every make plumbing fixture.*

"GLAZED STRUCTURAL WALLS MAKE BREWERY SANITATION EASY"

Burgermeister's vital problem of controlled sanitation has been greatly simplified and reduced in cost with walls of Western Glazed Structural Units.

In three remodeling and expansion programs since 1952, the brewery has installed 37,620 sq. ft. of this gleaming ceramic finished tile.

Wall and finish are one — no framing, lathing, plastering or finishing required. Hard, smooth surface resists wear, stains, odors; never needs painting. Clear glaze, plus 12 attractive colors. Standardized sizes and shapes for every requirement. For shape chart and specification details write to KRAFTILE Co., Niles, Calif.; or WASHINGTON BRICK & LIME CO., Spokane, Washington; members of

WESTERN STRUCTURAL TILE INSTITUTE

personal business interests in Oregon and California. He is president of Brown Timber Co. of Portland, general manager of the Fortuna Sawmills at Fortuna, Calif., and owner of the Eureka Redwood Lumber Co. sales yard in Downey, Calif., Brown currently is president of the Portland Pacific Coast League baseball club.

● **Sequoia Manufacturing Co.** of San Carlos, Calif., has named David C. Lindsey to head up its national sales organization planned for its new Sequoia Vacuum System subsidiary. The vice president of sales has been active for the past three years in the design and development of the central built-in vacuum cleaning system which the firm is now ready to market and install through a network of heating dealers.

● **Georgia-Pacific Corp.** has purchased all the assets of Hammond Lumber Co., with principal places of business in San Francisco and Samoa, Calif., and Chicago, for a total of about $75 million, the largest financial transaction ever recorded in the forest products industry in California.

● **Utility Fan Corp.** of Los Angeles has a new sales engineer, Marc W. McGuire who will travel throughout the United States on his new assignment. A graduate of the University of Southern California's School of Engineering, he was sales engineer for U. S. Electrical Motors prior to joining Utility.

● **Acme Concrete Co.** of Spokane, which recently completed a $100,000 modernization program, has appointed Donald H. Herak as manager. He formerly was with the Portland Cement Association in charge of its Spokane district office, which has been closed. However, the association will have a field engineer, Walter C. Cram, in the Spokane area.

● **Douglas Fir Plywood Association** has named B. V. Hancock, executive vice president of Cascades Plywood Corp. of Lebanon, Ore., as president to serve the unexpired term of Howard Garrison, who resigned after leaving the fir plywood industry. The latter was former vice president of Evans Products Co. of Coos Bay, Ore.

● **Long-Bell Division** of International Paper Co. will continue operations of the newly merged organizations, Long-Bell Lumber Co. and Long-Bell Lumber Corp. J. D. Leland, formerly head of both Long-Bell companies and now vice president of International Paper, will be in charge of Northwest activities with headquarters in Longview, Wash. The parent firm's home city is Kansas City, Mo.

NATIONAL NOTES

STRUCTURAL DEVELOPMENT LABORATORY being built by Portland Cement Association in Skokie, Ill., will be of tilt-up wall construction, with decorative designs cast into concrete wall panels. This project and companion structure, Fire Reasearch Center, will cost $2,750,000. Plans were drawn by Chicago architects Dunlap & Esgar, Inc., in cooperation with PCA staff.

●

● **Structural Clay Products Institute** has reelected John H. Stewart, who heads Stark Ceramics, Inc., Canton, Ohio, as its president for 1956-57. The 39-member board of directors includes Alex Corbett, Granger Clay Products Co., Yakima, Wash., and four Californians — John C. Boggs, Stockton Brick and Tile Co., Stockton; Norman J. Gatzert, San Jose Brick and Tile Ltd., Oakland; John W. Rice Jr., Union Brick Co., San Diego; and A. E. Barnes, Gladding, McBean & Co., San Francisco.

● **Roof Drainage Manufacturers Institute** at its organizational meeting in Chicago last month elected E. J. Cullen of Inland Steel Products Co. as chairman of the board; R. L. Seiple of Republic Steel Corp., Berger Division, vice chairman; and Hunter-Thomas, Associates of Cleveland, managing directors. Among the charter members is William Wallace Co. of Belmont, Calif.

BUILDING PRODUCTS LITERATURE COMPETITION

Building products literature and space advertising published since December 31, 1955, will be considered in the 1957 competition co-sponsored by the AIA and Producers' Council. A panel of five nationally known architects will judge the submissions, and the award winners will be exhibited at the AIA's centennial celebration in Washington, D.C., May 14-17, 1957.

The ninth annual competition is open to all manufacturers of building materials and equipment, to associations of such manufacturers and to other firms who have technical literature of value to the architect. Complete details can be obtained by writing the Publications Department, Producers' Council, Inc., 2029 K St., N.W., Washington 6, D.C.

A roundup of bond issues approved by Northwest voters

PUBLIC WORKS in the Pacific Northwest will zoom to new levels in 1957, judging from the large number of bond issues for schools, hospitals, city halls and fire stations approved by the voters this year.

In the November 6 elections alone, voters in Oregon, Washington, Idaho, and Montana okayed a whopping $68,893,661 in bond issues and special levies, mostly for schools. With the $26,111,894 already approved at special elections, the total comes to $95,005,555, of which $76 million will be spent on schools.

In a generous mood voters accepted plans for 87% of the projects submitted to them, slightly under the average for the entire nation, estimated at 93% by the Associated General Contractors of America.

The summary below, divided according to states, gives the city, amount allocated, type of work planned, name of school district or other agency in charge, architect if one has been retained and status of plans wherever possible. Bond issues starred were passed in November 6 elections.

WASHINGTON

AMANDA PARK — $13,000 — School construction. A 10-mill levy will go into school building fund. Work includes school bus garage of rigid frame steel construction. Quinault School District No. 97, Amanda Park. **Contract for bus garage awarded to Barton-Swanson Steel Building Co., Olympia for $9,597.**

ANACORTES — $600,000 — Elementary School. Money will finance construction of school at Gibraltar road site. Plans call for 12 classrooms, gymnasium and kindergarten facilities. Fidalgo School District No. 2, Skagit County, Anacortes; architect, William Arild Johnson & Associates, First National Bank Building, Everett. **Preliminary plans completed; bids to be called soon.**

ANACORTES — $100,000, plus levy for $110,000—Elementary school. Bond issue plus the 20-mill levy will finance 12-room elementary school at 24th and J Streets. Anacortes School District No. 322; architect, Don L. McKee, 915 Fifth St., Anacortes. **Plans underway. Bonds sold in October.**

ARLINGTON—$95,000—Additions and remodeling. Levy will finance addition to physical education plant, razing a classroom portion of junior high school and rebuilding entrance to auditorium and gymnasium, plus work at Lincoln school. Arlington School District.

BAY CENTER—levy—School—Special 60-mill levy will finance school building. Bay Center School District No. 22.

*BELLEVUE—$1,950,000 — Schools. Money will go for various projects in the district. Bellevue School District No. 405, Box 67, Bellevue.

*BELLEVUE—$25,000—Maintenance shop. Work will include street equipment yard and shop for city. City Council, City Hall, Bellevue.

*BELLINGHAM — $700,000 — School additions. Funds plus proposed state matching funds will finance $179,000 addition to Columbia School, $377,000 addition to Fairhaven Junior High School, $35,000 addition to Carl Cozier School, music rooms and bus garage at Bellingham High School costing $126,000. Bellingham School District No. 501, Gordon Carter, superintendent, Roeder School, Bellingham; architect, Galen Bentley, 1130 State St., Bellingham. **Work will start when it has been determined which of the projects are needed first.**

BENGE—$64,000—School. Money will finance construction of school building to replace one destroyed by fire in July. School will have two classrooms and multipurpose room. It will be one-story, solid masonry brick, block walls, concrete slab floors, steel girders, flat steel roof. Benge Consolidated School District No. 122; architect, Culler, Gale, Martell & Norrie, 615 Realty Bldg., Spokane. **Bids to be opened December 13.**

BURLINGTON — $600,000 — Elementary school and other work. Program includes modernization and renovations to Edison Elementary School; construction of new 16-room elementary school in southeast district of Burlington and addition of science-home economics unit for high school. Burlington - Edison Consolidated School Districts, Burlington; architect, Galen Bentley, 1130 State St., Bellingham.

CARNATION—$30,000—Schools. Tax levy of 10 mills will finance school construction.

The latest in modern savings institutions: a drive-in facility . . . made finer with the last word in construction. Here, on Los Angeles' fashionable Wilshire Boulevard, beautiful porcelain enamel panels match the luxury surroundings. The broad spandrel belt is faced with Aircomb-insulated porcelain enamel panels, assuring lasting color quality, resistance to deterioration, and freedom from maintenance.

KEWAUNEE MFG. COMPANY
5124 S. Center St., Adrian, Michigan

Lower Snoqualmie Valley School District No. 407, Box 218, Carnation.

CENTRALIA—$1,000,000, plus $70,000 by levy—New junior high school, elementary school reconstruction. Bond issue will finance junior high school in western part of the city. Levy is for consolidation of two grade schools and reconstruction work. State matching funds of $360,000 will be added to the total. Junior high school will consist of four separate buildings, all one-story with poured concrete, frame walls, concrete slab floors, timber girders, beams, columns; glued laminated roof; plaster interior wall finish; concrete exterior. Units will include two general classroom sections, vocational shops and physical education. Centralia School District No. 410, 415 W. Fear St., Centralia; architect, William Arild Johnson & Asociates, First National Bank Building, Everett.

*CHEHALIS—$125,000—City hall construction. City Council, City Hall, Chehalis.

CLARKSTON—5-mill levy — School construction. Clarkston School District No. 250.

COLTON—Est. $25,000—Vocational agriculture shop. Building fund of $8,000, plus the estimated $25,000 from 8.3 mill special levy will finance building. Shop is one-story with steel, rigid frame walls, corrugated sheathing walls and roof. Colton School District No. 306, Joe Reisenauer, clerk, Colton; architect, McClure & Adkison, N. 108 Washington St., Spokane. **Contract awarded to General Machinery Co., Spokane, $29,516.**

*CONCRETE—$220,000—School construction. Concrete School District No. 102, Concrete.

CONNELL—$43,000—Renovation and bus garage. Levy for $24,000 will finance renovation expenses in the district; $19,000 will pay for construction of bus garage and maintenance building. Connell School District No. J51-162, Connell.

*DARRINGTON — $172,000 — High school. New high school will be built on five-acre site adjoining Community Center land. Application for state funds will be made. Darrington Consolidated School District No. 330, Harry Edwards, superintendent, Darrington.

*DES MOINES — $60,000 — Fire station. Bond issue will finance construction of fire station and equipping it. King County Fire District No. 26, Seattle.

ELTOPIA — $10,900 — Help finance school construction. Money will come from 12-mill levy. Addition to elementary school will include eight classrooms and multi-purpose unit. Building will be one-story with tilt-up concrete walls, glued laminated arches in multipurpose room, glued-laminated beams in classrooms. Eltopia School District No. 15, Franklin County, Everett Jones, district clerk, Eltopia; architect, Charles A. Baylon & Associates, 912 Elliott Ave. W., Seattle. **Working drawings underway; bids to be called early in 1957.**

*ENUMCLAW—$70,000—Farm shop addition. Enumclaw School District No. 216, 2222 Porter St., Enumclaw.

*EPHRATA—$86,500—New library. Plans call for one-story and basement structure, concrete block and brick walls, built-up roof and concrete slab floors. Building will be designed to handle 60,000 volumes. City Council, City Hall, Ephrata; architect, John I. Mattson & Associates, Lowman Building, Seattle. **Plans underway.**

FORKS—$400,000—Additions at elementary and high school. Improvements will include $150,000 combination shop, science, home economics and band room building, a $175,000 physical education building, $75,000 addition to Forks Elementary School. Additions are wood frame with laminated beams, plaster walls, acoustical tile ceilings. Quillayute Valley School District 402, Forks.

ing to be located adjacent to the courthouse at Lewiston. Levy will be matched by Hill-Burton funds. Plans call for semi-fireproof structure, exterior of Transite panels and brick with reception room, business office, library, conference, examination and x-ray rooms, laboratory and offices for North Central District Health Department. Nez Perce County Commissioners, Courhouse, Lewiston; architect, Hugh Richardson, Weisgerber Building, Lewiston. **Tentative plans completed. Construction cannot start until spring of 1958 since tax money will not be collected until late 1957 or early 1958.**

*MERIDIAN—$1,450,000—New high school and other work. Money will finance a new high school and addition to the Eagle Junior High School, estimated at $730,000 and an elementary school building program expected to cost $720,000. This was a resubmission of a bond proposition defeated in June. Joint Class A School District No. 2, Ada and Canyon counties, Roy G. Denton, superintendent, Meridian.

NAMPA — $562,000 — Additions at high school, primary school. Bonds will finance construction of three additional units at the campus-type high school site, including a one-story classroom building, a vocational building and a gymnasium and physical education building; a one-story primary addition and a heating plant at Sunny Ridge School. Class A School District No. 131, Nampa; architect, Anton E. Dropping, 2504 Kootenai Ave., Boise. **Following contracts awarded: additional classroom at high school, G & M Construction Co., Boise, $123,990; addition to Sunny Ridge School, Emery Conner, Nampa, $18,146; vocational building, G & M Construction Co., $99,000; and gymnasium, Kreiger Construction Co., Nampa, $226,300.**

POCATELLO—$1,225,000—New schools and additions. Program includes combined junior high-elementary school, $825,000; nine-room elementary school, neighborhood type $100,000; addition of domestic science and manual arts rooms and extensive renovations to Franklin Junior High School, $100,000; renovation of existing buildings, school equipment and sites, $200,000. Class A School District 25, Gerald R. Wallace, superintendent, Pocatello; architect (for junior high school), Ray Hunter, Dietrich Building, Pocatello. **Following awards made: additions to Franklin Junior High School, Erhardt Andersen Construction Co., 167 Foothill Blvd., Pocatello, $111,400; junior high school, C. H. Elle Construction Co., Pocatello, $785,831; elementary school, Erhardt Andersen, $103,000.**

POTLATCH — $165,000—School additions. Plans include six-classroom addition to elementary school, improvements in high school gymnasium, modernization of science classrooms, construction of sidewalks and playground. Potlatch School District, J. Lowell Scott, superintendent, Potlatch; architects, Ralph J. Bishop, W. 1526 Riverside; and George C. Ritter, Hyde Building, both of Spokane. **Bids for elementary school received in October; low bidder, Hansen & Parr, Spokane, $127,500. Other work completed.**

RUEBENS—$8,000—City Hall, City Council, Wallace Scott, city clerk, City Hall, Ruebens.

WALLACE—$735,000—Construction of new schools and improvements to existing structures. Work will include two-story addition to Osburn elementary school. School District No. 393, Wallace; architect, George M. Rasque & Son, Washington Trust Building, Spokane.

MONTANA

BIGFORK—$50,000 — Vocational education building. Work also includes remodeling of existing shop room into school lunchroom at high school. Bigfork High School District, Board of Trustees, Arthur B. Whitney, chairman, Bigfork. **Award in September to Collins Construction Co., Kalispell, $32,713 (general).**

BILLINGS—$26,000—Help finance school addition. Building at site of existing school southeast of Billings will be of masonry and wood construction and include two classrooms, lavatories, storage space and kitchen. Yellowstone County School District No. 17, Billings; architect, Vernon Drake, Empire Building, Billings. **Contract awarded in November to B. E. Clark Construction Co., Billings, $46,446.**

*BROWNING — $45,000 — New city hall. Browning City Council.

*BUTTE—$2,100,000—County hospital. New hospital will be constructed adjacent to present Silver Bow County General Hospital, south of Butte. Four-story building will have 150-bed capacity, expandable to 200; old building will be used as home for the aged. Silver Bow County Commissioners, Courthouse, Butte; architects, Norman J. Hamill, 122 W. Granite St., Butte.

*CHESTER — $80,000 — Hospital addition. Funds will finance 15-bed addition to Liberty County Hospital in Chester. Liberty County Commissioners, Chester; architect, Holland & Lund, Electric Building, Great Falls.

*COLUMBIA FALLS—$1,490,000—New high school. Building will house 600 students and will be located on an 8.4-acre site on Fourth Avenue West in Columbia Falls. Plans call for one story housing cafeteria, theater and offices and two-story classroom wing with 110,000 sq. ft. space; reinforced concrete footings and foundation. Flathead School District No. 6, Columbia Falls; architect, Weed & Fehlberg, Sundelius Building, Kalispell; mechanical engineer, W. M. Walterskirchen, 107 E. Main, Missoula; electrical engineer, General Engineers Co., 320 N. Higgins Ave., Missoula. **Plans are expected to be completed in May; construction completed by January 1960.**

*CONRAD—$330,000—Home for the aged. Pondera County Commissioners, Courthouse, Conrad.

GLENDIVE—$450,000—Elementary school. Dawson County School District No. 1, Glendive; architect, Carlo DiCicco, 117½ N. Merrill Ave., Glendive.

*GREAT FALLS — $1,900,000—County hospital and convalescent home. Building in Great Falls will be one-story with wing for administration section, children's section, general hospitalization, assembly room, wing for kitchen and dining room. Cascade County Commissioners, Courthouse, Great Falls; architect, Van Teylingen, Knight & Van Teylingen, Medical Arts Building, Great Falls. **Final selection of site has not been made; construction will start in 1957.**

HARDIN—$125,000—Hospital addition. Big Horn County Commissioners, Courthouse, Billings; architect, Nordquist & Sundell, 1233 N. 27th, Billings.

HIGHWOOD — $16,000 — School repairs. Work includes installation of oil burner, miscellaneous repairs and one classroom addition. Highwood High School District No. 4 and School District No. 28, Choteau County, Highwood. **Awards made to Ace Plumbing & Heating Co., Fort Benton, $3,724 for oil burner and Dent Construction Co., Great Falls, $10,866 for addition and repairs.**

KALISPELL—$39,240—New grade school. Three-classroom structure will be first stage of six-classroom unit. Evergreen School District, Kalispell; architect, Taylor, Thom, Schwartz & Kirkpatrick, Ford Block, Kalispell.

POWER—$105,000—Three-classroom addition. Power School District.

*SHELBY — $175,000 — Hospital addition. Bond issue and federal funds will finance 34-bed addition to Toole County Hospital at Shelby. Building will be two-story, reinforced concrete with brick exterior. Toole County Commissioners, Courthouse, Shelby; architect, McIver, Hess & Haugsjaa, Strain Building, Great Falls.

SHELBY — $300,000 — School additions. School District No. 14, Toole County, Shelby.

*STANFORD—$270,000—New grade school and high school remodeling. Project includes constructing one-story 25,000 sq. ft. building with reinforced concrete footings and foundation. Some 10,000 sq. ft. of high school will be remodeled. Judith Basin School District No. 12, Stanford; architect, Bordeleau, Pannell & Amundson, 309 First Ave. N., Great Falls. **Plans will be completed in March.**

*WHITEFISH—$175,000 — Remodeling and extension of City Hall. City Council, City Hall, Whitefish; architect, Taylor, Thom, Schwartz & Kirkpatrick, Ford Block, Kalispell. **Bids will be called in February and construction to be completed by end of 1957.**

VIDA—$50,000—Elementary school. Building includes three classrooms, gymnasium, toilets and furnace room. It is one-story, concrete block walls, glued laminated beams and post construction. Vida School District No. 134; architect, Carlo DiCicco, 117½ N. Merrill Ave., Glendive. **Award to Schwartz Construction Co., Glendive, $35,580 (general).**

BUILDING NEWS

(Continued from page 38)

MANUFACTURING PLANT—Portland, Ore.

Zone changes approved for Oregon Saw Chain Co., 9701 S.E. McLoughlin Blvd., for manufacturing plant for new division of the company, Precision Cast Parts Co., at S.E. Harney Drive and S.E. 45th Ave. Edward Cooley will manage the new division. Plans are underway for 20,000 sq. ft. concrete structure, and construction is expected to start late December. WB 12-12

NEWSPAPER PLANT— Roseburg, Ore.

A 4.7-acre tract of land has been purchased by Roseburg News-Review Co., Charles V. Stanton, editor and general manager, 540 S.E. Main St., Roseburg, for construction of a one-story factory-type newspaper plant with provision for future expansion. The site is located in North Roseburg at the corner of Prune and Vine streets, in a new suburban business center about one mile from Roseburg city limits. Construction may start early in the 1957 building season. ZZ 12-5

● COUNTY SHOP BUILDING— Roseburg, Ore.

Bids will be opened 10 a. m., December 27, by Douglas County Commissioners, Courthouse, Roseburg, for construction of a county shop building to be located on Diamond Lake Blvd. and Rifle Range Road, just east of Roseburg city limits. Plans with Lyle Blenn, architect, 309 Pacific Bldg., Roseburg. $50 deposit.

Rigid steel frame construction; 8" concrete block on lower walls and galvanized corrugated steel on upper walls; concrete slab floors; steel sash with some corrugated plastic inserts; insulation in roof; asphalt tile, quarry tile flooring; plastered walls and acoustical ceilings in office; fluorescent lighting; radiant heat in floor slab, some unit heaters. There will be three 30' bays. Center bay will carry a 10-ton crane the full length; one side bay will support 5-ton crane; other side bay will contain large storage area with one-ton monorail hoist. SC 12-12

SHOPPING CENTER, SAFEWAY STORE— Salem, Ore.

Development of a new shopping center on Portland Road, north of Salem city center, seems assured now by the zoning action taken by Salem Planning Commission. A

new Safeway store will also be constructed just north of the proposed new shopping center site. TW 12-5

TRADING POST— Seaside, Ore.

The Oregon Trail Trading Post recently destroyed by fire will be rebuilt soon. Construction to get underway very soon, according to J. H. Knox, owner, Seaside, and work will be completed by March 1, 1957. GC 12-7

■HIGH SCHOOL ADDITION— Sweet Home, Ore.

Planholders announced for construction of an addition to the high school at Sweet Home. Bids will be opened 8 p. m., December 28, by Union High School District No. 2, Harold Dishaw, superintendent, Sweet Home. Plans with Raymond Kermit Thompson and Pelly Povey Thompson, architects, 1728 N.W. 32nd Ave., Portland.

Planholders: Thomas E. Gates, 120 Oak St., Lebanon; Starr Builders, 1765 Main, Lebanon; Cutts Construction Co., Box 84, Lebanon; H. G. Carl Construction Co., Box 387, Salem. DW 12-11. Previous report 12-7

SCHOOL EXPANSION— Victor Point, Ore.

Bond election is being held today, December 11, by Victor Point School District, Victor Point, for a $22,000 bond issue to finance an expansion program at the Victor Point School. The planned expansion includes enlargement and alteration of the kitchen, addition of a janitor's supply storage room, a small office for the principal's use and an additional classroom. A new furnace will be installed to meet the need of heating the larger room volume. SC 12-11

MENTAL HOSPITAL— Wilsonville, Ore.
(Estimated cost $14,000,000)

General layout for new mental hospital at Wilsonville has been approved by Oregon State Board of Control, room 124, State Capitol Bldg., Salem. Architects, Stanton, Boles, Maguire & Church, 500 Concord Bldg., Portland, have been authorized to make over-all plans for 1,500 bed institution. However only $,631,000 has been appropriated to date, and initial construction will include heating plant, sewage disposal plant, well drilling, administration building, outpatient clinic, 70 receiving beds, 100 intensive treatment beds, 100 convalescent beds, 90 medical beds, 50 surgical beds and 90 beds for chronic medical convalescents. WB 12-8. Previous report 10-6

●CONCRETE FOUNDATIONS— Winchester Bay, Ore.

Bid opening extended from December 16 to 2 p. m., December 17, by Coast Guard District, room 922, 618 2nd Ave., Seattle, for constructing a concrete footing, concrete block foundation wall with vents, treated sill plate and replacing rotted structural structures and framing at the Umpqua River Lifeboat Station, Winchester Bay, Ore.; Inv. No. FS-1508. Plans with Coast Guard. DM 12-12. Previous report 12-6

Profitable leads on building and engineering projects in the six Pacific Northwest states and Alaska appear in these columns.

WASHINGTON

OIL REFINERY— Anacortes, Wash.

Final decisions on construction, procedures and contracts are yet to be made on the proposed $500,000,000 Texaco Oil refinery for the Anacortes district. Facts and figures on the location of the refinery are still being assembled and analyzed at the New York office of the oil concern. A company official has reported that research and analysis is still to be done and that any speculation as to the actual date construction might begin would be premature.

Almost all options at the proposed refinery site have been picked up. The refinery will occupy portions of an 880-acre site at March's Point, near Anacortes. ET 12-7

GAP FILLER FACILITIES— Anacortes, Wash.

Bids will be called soon for the second time for a bid opening early in January, by Corps of Engineers, Seattle District, 4735 E. Marginal Way, Seattle, for construction of gap filler facilities at Anacortes; ENG-45-108-57-91. Bids were originally called for a July opening under ENG-45-108-56-211 but the call was cancelled in September. Upon issuance, plans may be obtained from the Seattle district office.

Project involves construction of a communication building which will have approximately 1,420 sq. ft. floor space, concrete foundation and floor slab, concrete block walls, open web steel roof joists and metal deck with insulation and built-up roof; heating and ventilating system; perimeter chain link fence, concrete walks, reinforced concrete tower foundation. DM 12-6

▲JUNIOR HIGH SCHOOL— Auburn, Wash.

Bids received by Auburn School District No. 408, King County, Rolland C. Upton, superintendent, 9420 240th Place, Auburn, for construction of the five-building junior high school in Auburn. Bids were opened December 4. GENERAL: Leavitt-Chandler & Co., Box 6, Bellevue, $364,000; Wick Construction Co., 720 N. 35th, Seattle, $369,322; Ness Construction Co., 1125 W. 53rd, Seattle, $376,910; Brady Construction Co., 707 Spokane, Seattle, $414,000; Mowat Bros. Construction Co., 2833 Eastlake, Seattle, $424,480; H. Halvorson, Inc., 10054 Pacific Highway S., Seattle, $427,707; Hedeen Construction Co., 1404 N. 143rd, Seattle, $452,400. Bids on the mechanical and electrical contracts for the school will be opened 8 p. m., December 18, by the school district in Auburn.

Six one-story buildings; 46,000 sq. ft. total area; covered walkways will connect the buildings. Plans, which were prepared by Jones, Lovegren, Helms & Jones, architects, 706 Republic Bldg., Seattle, provide for future expansion. Structural components and finishes: wood frame, concrete slab floor, brick veneer end walls, glass sidewalls, built-up roofing with batt insulation, glued laminated beams, aluminum sash, plastered interior wall finish, asphalt tile flooring with ceramic tile over glazed block in toilets and showers, acoustical tile ceilings, wood doors, chalk and tack boards, built-in wood cabinets, oil fired hot water heating system with two boilers. DM 12-7. Previous report 11-28

BANK— Bellingham, Wash.

Architects, John W. Maloney, 754 Central Bldg., Seattle, has been retained by Seattle First National Bank, Lawrence M. Arnold, president, Main Office, 2nd and Cherry, Seattle, to draw plans for the construction of a new branch bank in Bellingham. New structure will be on the site of the existing bank. The new building will occupy site of the present bank building which will be razed to make room for the new structure. GW 12-5

BUILDINGS— Bellingham, Wash.

Value of new buildings erected in Bellingham during the 11 months just passed comes to $4,739,000. During that period, 140 new homes were erected, accounting for $1,464,000 of the figure. The total value surpassed the report for the same period one year ago by $1,130,000. New home valuations, however, were down a bit in 1956 as compared with the 1955 figure. Overall building during the month just passed was higher than during November 1955 by $44,000. (November of 1956 accounted for $242,000 worth as against $148,000 for November of 1955.)

November's tally in Bellingham was far less than the count for October of 1956, $409,000. One reason according to Wayne Beasley, building inspector, is the weather, as winter months usually result in considerable drop in both commercial and residential building activity. ET 12-6

SCHOOL ADDITION— Benton City, Wash.

Bond issue for $100,000 and special levy of 15 mills approved by voters in November election to finance school construction. Kiona-Benton City School District No. 52, Robert Anderson, superintendent, Benton City, will use the funds for financing construction of a six-classroom addition to the elementary school, proposition No. 1, a two-classroom addition to the high school, proposition No. 2. The third proposition was to raise $33,000 to raze the old building. GW 12-7. Previous report 10-12

TUNGSTEN PLANT— Blaine, Wash.

Factory representatives of Kennametal, Inc., of Latrobe, Pa., are considering the Blaine area as a possible location for the tungsten ore processing plant. An option to purchase a 60-acre site near Ferndale was not renewed by the firm. ET 12-5. Previous report 1117, under Ferndale

●STEEL BUILDING— Bremerton, Wash.

Bids will be opened 10 a.m., December 19, by E. H. T. McGowan, city clerk, City Hall, Bremerton, for the erection of a steel building, approximately 50'x100', for the Water Department. Specifications with above office. SC 12-8

●MAINTENANCE BUILDING ADDITION— Buckley, Wash.

Bids will be opened 3 p.m., December 20,

TELEVISION PROJECTS— Spokane, Wash.
(Estimated cost $5,000 per new channel)

Paramount Agencies, Don R. Carmichael, field engineer, S. 121 Monroe St., Spokane, has reported several Washington, Oregon and Idaho television projects now underway or being surveyed. Paramount Agencies will supply the necessary equipment for the

Built-in telephone outlets are a big selling point in today's home

says H. J. HARLOW, Jr., Harlow Construction Company, Sacramento, California

Homes built by the Harlow Construction Company have telephone outlets located for maximum convenience—in rooms where the family spends a lot of time. Concealed telephone wiring is another feature that adds to the livability and value of Harlow homes.

To successful builders like Mr. Harlow, who are setting living standards in the Pacific West, complete telephone planning is as basic as adequate electrical wiring. Pacific Telephone is always ready to help you plan built-in telephone facilities. Just call us and ask for our *free* Architects and Builders Service.

Specify built-in telephone facilities —a sign of good planning

Pacific Telephone

local distributor for each project. No major construction is involved in these projects which will include construction of small buildings, wire stringing and equipment installation. The following projects are included: 1—Ellensburg: construction underway and equipment being tested for translator station to be operated by Kittitas Valley TV Association. 2—Salmon, Idaho: preliminary engineering survey underway for translator station to pick up television from Idaho Falls. 3—La Grande, Ore.: engineering completed and application filed with Federal Communications Commission for translator station to pick up television from Spokane. 4—Lewiston, Idaho: two application filed for translator stations at Lewiston Orchards. 5—Manson, Wash.: experimental station on the air, applications filed for two stations. 6—Benton City, West Richland, Wash.: engineering completed for translator station, however, plan lacks approval of Atomic Energy Commission for placing equipment on Rattlesnake Mountain overlooking Hanford project. 7—John Day, Ore.: survey underway for translator station to pick up Boise TV stations. 8—Milton-Freewater, Ore.: survey underway for station to pick up TV from Spokane stations. 9—West Glacier, Mont.: survey underway for station to pick up Spokane stations. 10—Oxbow, Brownlee, Idaho (sites of two of the three Idaho Power Co. dams in Hells Canyon part of Snake River): surveys completed and applications filed for stations. PN 12-12

VOCATIONAL SCHOOL ADDITION— Tacoma, Wash.

Working drawings underway by Maguire & Muri, architects, 231 Broadway, Tacoma, for construction of an addition to the Tacoma Vocational-Technical school at 1101 S. Yakima, Tacoma. (Estimated cost $100,000)

Bids will be called in spring of 1957 by Gold Hill Evangelical Lutheran Church, Rev. Fred D. Dommer, pastor, 934 Placer St., Butte, for construction of a new youth center and church addition for the church. Plans by Eldred F. Moyle, architect of Kestle-Godtland-Moyle, 409 Silver Bow Bldg., Box 1965, Butte.

The addition will be constructed as an L-shaped building merging with the present structure. The two-story structure will provide the following: 16 classrooms plus other areas available for classes; Sunday school office; nursery; pastor's study and church office; extension of church worship sanctuary permitting enlarged choir and chancel facilities; fellowship hall; full kitchen facilities; fireside fellowship room; choir room facilities; large children's chapel; added lavatory facilities. A building fund campaign is now unedway under the direction of D. J. McCaig, chairman of the committee. SP 12-11. Previous report 10-27

SCHOOL CONSTRUCTION— Butte, Mont.

Construction of two new elementary schools and repairs and alterations to nine existing schools have been recommended by Board of Trustees, School District No. 1, Silver Bow County, 111 N. Montana St., Butte. Report recommends the school district be bonded for $2,000,000. New building is recommended for the present Baline school to be located in a more centralized area west of the existing school building and east of McGlone Heights; Lincoln school to be replaced with a new one-story primary building for grades one, two and three on the same site. Consideration will be given a new junior high school in the northern part of the city; new building to replace and consolidate the Harrison and Franklin schools and another building to replace the Monroe and Jefferson schools. A new building will also be required in the Emerson district. GC 12-7

COUNTY HOME FOR THE AGED— Conrad, Mont.

Plans are underway by Holland & Lund, architects, Electric Bldg., Great Falls, on a pioneer home for the aged for Pondera County. An election was held recently by Pondera County Commissioners, Courthouse, Conrad, at which a $330,000 bond issue was approved by the voters to finance construction of the building. EE 12-7. Previous report 11-15

JET TEST CELL— Glasgow AFB, Mont.

Bids will be called soon and opened about January 16 by Corps of Engineers, Walla Walla District, Bldg. 602, City-County Airport, Walla Walla, for construction of a jet test cell at Glasgow AFB near Glasgow, Valley County, Mont.; ENG-45-164-57-16. Bid bond 20%. Plans will be with the Walla Walla district office.

Project involves: (a) Jet test cell structure having reinforced concrete roof, walls and floors, jet engine test augmentor and insulated tuned duct, insulation protected with aluminized steel pumphouse with metal roof and siding; fuel (one 100, one 300 and one 2,500 gal. tank), water (one 2,500 gal. tank), drainage, carbon dioxide and electrical systems; and installation of government furnished equipment. (b) Exterior work involving site grading, extension of water, sewer and electrical distribution system. DM 12-8

● TEACHER APARTMENTS— Wyola, Mont.

(Estimated cost $13,000)

Bids opening extended from December 20 to 8 p.m., January 9, by Big Horn County School District No. 29, Wyola, for remodeling the existing Wyola grade school to provide three teacher apartments. Plans with Drake & Gustavson, architects, Empire Bldg., Billings. $35 deposit. Project includes new partitions and new plumbing. EE 12-12. Previous report 12-5

● ELEMENTARY SCHOOL— Wyola, Mont.

Lincolnway, Cheyenne. LOW BID: Continental Construction Co., 1509 Carbon, Cheyenne, $26,500. SC 12-8

▲SCHOOL ALTERATIONS— Dayton, Wyo.

Bids received and subsequently rejected by Tongue River School District, Sheridan County, Wyo., for remodeling the activity center at a school near Dayton. Plans by Harrison L. Cook & Associates, architects, 119 N. Main, Sheridan. Bids opened November 9. LY 12-11. Previous report 11-7

UTAH

COMMUNITY TOWNSHIP— Utah, Arizona

Plans for a new community near the $400,000,000 Glen Canyon damsite near the Utah-Arizona border, were announced by Grand Development Co., Theodore I. Geurts, president, 169 E. 4th S., Salt Lake City. The 320-acre tract will be known as Canyon City and will be located about five miles northwest of the damsite. It will be in Arizon, but accessible only from the Utah side of the Colorado River.

Plans call for streets, water, drainage, light and other facilities, designed to serve a community of 10,000. GC 12-7

CLASSROOM ADDITIONS— Bountiful, Layton, Utah

Federal funds of $500,000 to $600,000 has been requested by Davis County Board of Education, Samuel Morgan, superintendent, Farmington, for classroom additions at Bountiful and Layton. If the funds are granted, 24 to 28 new classrooms will be constructed, including additions to the Central junior high school and Tolman elementary school at Bountiful and possibly a complete new school building in the district. GH 12-11

FORESTRY, BIOLOGICAL SCIENCE BUILDING— Logan, Utah

Plans announced by Utah State Building Board, Jerry G. King, superintendent of construction, 419 State Capitol Bldg., Salt Lake City, for construction of a new forestry and biological science building for the Utah State Agricultural College in Logan. An appropriation of $2,399,325 will be sought from the next legislature. The new building is to be located immediately north of the new agricultural science building on 9th East between 6th and 7th North in Logan. GH 12-11

HILLCREST ELEMENTARY SCHOOL— Ogden, Utah

(Estimated cost $570,000)

Working drawings will be complete January 1 for construction of the Hillcrest elementary school to be located northeast of the new Ben Lomand high school on 7th St. and Van Buren Ave. in Ogden. Plans by Eber F. and John L. Piers, architects, 2726 Harrison Blvd., Ogden. GH 12-11. Previous report 10-2

SHOPPING CENTER— Orem, Utah

Plans announced by Orem Investment & Development Co., George B. Carter, director, Orem, for a new shopping center to be located on the west side of State St. in Orem. First Security Bank has purchased the first lot in the new development. GH 12-11

COUNTY BUILDING— Price, Utah

(Estimated cost $55,000)

Working drawings underway by Fred L. Markham, architect, 45 N. University Ave., Provo, for construction of a new county building to be located at the corner of Carbon Ave. and 1st Ave. N. in Price. The building will house new offices, courtroom and jail for Carbon County Commissioners, Courthouse, Price. GH 12-11. Previous report 10-19

CHURCH UNIT— Roy, Utah

Haines & Purhonen, architects, 65 E. 4th South, Salt Lake City, have been retained by Our Savior Evangelical Lutheran Church, Rev. A. E. Wickstrom, pastor, Roy, to prepare plans for construction of the first phase of the church building program, a worship, social and educational unit, in Roy. GH 12-11

HOSPITAL— Roy, Utah

Preliminary plans approved by Weber County Commissioners, Municipal Bldg., Ogden, for a new 200-bed chronic disease hospital in Roy. Plans by Keith W. Wilcox, architect, 410 Kiesel Bldg., Ogden. The building is to be constructed behind the present structure which will be razed when the new building is completed. One-story building with six wings will contain 96,000 sq. ft., including partial basement. GH 12-11

SCHOOL ADMINISTRATION ADDITION— Salt Lake City, Utah

Preliminary plans underway for construction of an addition to the administration building at 1st South and 4th East, to be used for warehouse space, for Salt Lake City Board of Education, Dr. M. Bennion, superintendent, 440 E. 1st South, Salt Lake City. Plans by Fetzer & Fetzer, architects, 415 Zions Savings Bank Bldg., Salt Lake City.

COUNTY JAIL RENOVATION— **Salt Lake City, Utah**

(Estimated cost $109,900, first phase)

Deseret Architects & Engineers, Ness Bldg., Salt Lake City, have been retained by Salt Lake County Commissioners, Lamont B. Gunderson, chairman, City-County Bldg., Salt Lake City, to prepare plans for renovation of the county jail in Salt Lake City. The first phase of the repair work includes renovation of the plumbing system ($40,000), roof work ($3,500), cell remodeling ($25,000), cell gates, tracks and controls ($17,500), shower room repair ($3,900) and new wiring ($10,000). GH 12-11

GOVERNOR'S RESIDENCE— **Salt Lake City, Utah**

Governor-elect George D. Clyde will recommend to the legislature the construction of a Governor's residence. By virtue of a bill adopted in the 1955 legislature the present mansion at 603 E. S. Temple, Salt Lake City, will pass to the State Historical Society when Governor J. Bracken Lee moves out. GC 12-7

●**OFFICE, DISPLAY, WAREHOUSE BUILDING—** **Salt Lake City, Utah**

Sub-bids are being taken by General Builders Supply, owner-builder, 255 W. 27th South, Salt Lake City, for construction of a new office, display and warehouse building at the present site in Salt Lake City. Plans by Bruce J. McDermott, architect, 366 S. 5th East, room 105, Salt Lake City.

One-story; brick and lava block exterior walls; glued laminated beams; built-up gravel roofing; air conditioning in office and display area. GH 12-11

★**OFFICE, WAREHOUSE BUILDING—** **Salt Lake City, Utah**

(Estimated cost $55,000)

Contract negotiated with John DeYoung, general contractor, 1466 S. 10th East, Salt Lake City, by Dunkley Distributing & Produce Co., 70 E. Kelsey Ave., Salt Lake City, for construction of a new office and warehouse building to be located at California St. and 1st West in Salt Lake City. Plans by Bruce J. McDemott, architect, 366 S. 5th East, Salt Lake City.

GH 12-11. Previous report 11-9

●■**OFFICE HEADQUARTERS REMODELING—** **Vernal, Utah**

Bids will be opened 3 p.m., December 18, by Moon Lake Electrical Association, Vernal, for remodeling the office headquarters at Vernal. Plans with Jackson & Jackson, architects, 457 S. 3rd East, Salt Lake City. Bid bond 5%. A recent federal loan grant will finance this and two other projects.

Work includes converting part of building into new office area, 2,000 sq. ft.; new floor coverings and ceilings; alterations to heating plant; electrical work.

Planholders: Mitchell & Allred, Altamont; Campbell & Hatch, Vernal; Turner Construtcion Co., Vernal. GH 12-11

ALASKA

VILLAGE REHABILITATION— **Fairbanks, Alaska**

The Alaska Rural Development Board, James Hawkins, director, Juneau, has authorized an initial expenditure of $15,000 to aid the rehabilitation of the native village of Beaver, about 100 miles north of Fairbanks. The village, which is slowly being washed away by erosion from the Yukon River, will be rebuilt next spring, ½ mile from the present site. SC 12-8

●**WALL FOUNDATION REPLACEMENT—** **Ketchikan, Alaska**

Bids will be opened 2 p.m., December 20, by Alaska Communication System, Contracting Officer, 4735 E. Marginal Way, Seattle, for replacement of north wall foundation for sill of Alaska Communication System building No. 200 (two-family quarters) in Ketchikan; DA 45-041-sc-57-15. Specifications with above office. Completion time September 1, 1957. Project consists of excavating, filling and backfilling for building, concrete work and carpentry.

SP 12-11

■**WINDOW REPLACEMENT—** **Ladd and Eielson AFB, Alaska**

Planholders announced for replacing windows in one 500-man barracks and six 200-man barracks at Ladd AFB, and in nine 200-man barracks at Eielson AFB; ENG-95-507-57-53. Bids will be opened 11 a.m., December 18, by Corps of Engineers, Alaska District, D-E Bldg., Anchorage.

Planholders: The Coast Sash & Door Co., 1002 E. F St., Tacoma; Xato Products, Inc., North County Road, Rocky Point, L. I., N.Y.; B-E-C-K Constructors, 3647 Stone Way, Seattle; J. H. Manning, Inc., 29 Harriett Ave., Fairbanks; Elmer-Moody Millwork Co., 3635 Thorndyke Ave., Seattle; Palmer G. Lewis Co., Inc., 550 W. Idaho St., Seattle; Wayne Construction Co., 3810 Stone Way, Seattle; Grove, Shepherd, Wilson & Kruge, 120 6th Ave. N., Seattle; Acme Millwork, Inc., Box 668, Kirkland; C P & L Millwork, 24300 W. 60th St., Mountlake Terrace; Austin Millwork Co., 811 W. 47th St., Seattle.

SP 12-11. Previous report 12-4

PULP MILL— **Sitka, Alaska**

(Estimated cost $50,000,000)

In a public hearing at Sitka, conducted recently by the territorial Water Pollution Control Board, several reports were given concerning the proposed construction of a pulp mill in the Sitka area by Alaska Lumber & Pulp Co., 201 Central Bldg., Seattle. Plans by Harold D. Cavin, consulting engineer, 4840 Fremont, Bellingham. The head of the Commercial Fisheries Section of the Fish & Wildlife Service disclaimed any intention of delaying the construction. However, financing apparently has been slowed pending final clearance of the construction plan, principally that portion dealing with water pollution in the Silver Bay herring-spawning ground. It was proposed that a permit be granted under which final location of the mill's waste system would depend on completion of scientific surveys next year. A preliminary report of ocean currents in the Silver Bay area said there was still insufficient data available on the water flow during the winter and spring months. Donald L. McKernan, member of the Water Pollution Control Board, favored approval of a plan providing that construction of the discharge units be made at a maximum point outside the bay. These plans then could be changed if the new studies show less expensive control efforts are needed.

★PUMP INSTALLATION—Anacortes, Wash.

Award to B & B Plumbing & Heating Co., 501 Commercial, Anacortes, $1,393 (installation), $350 to $400 (electrical work), by City Hall, Anacortes, for installation of a third pump at the city's Ranney well water installation at Anacortes. ET 12-11

STORM SEWER— Anacortes, Wash.

Bond issue defeated by voters in the November election, for construction of a storm sewer in Anacortes. City council plans to again place the measure on the ballot early in 1957. ET 12-7

STREET IMPROVEMENTS, SEWERS— Anacortes, Wash.

Election will be held again in March in Anacortes on a bond issue to finance storm sewers and street improvements in Anacortes. A bond issue of $225,000 for this project was defeated in the November election. ET 12-8. Previous report 11-10

BREAKWATER— Anacortes, Wash.

Material is expected to arrive by December 15 for construction of one of the Cap Sant breakwaters, according to Lloyd Foster, port manager, Anacortes. Larson Construction Co., Box 120, Astoria, Ore., was awarded the contract for dredging the waterway and expects to move its dredger to Anacortes by the middle of the month. ET 12-7

BRIDGE, CULVERT, FILL— Bellingham, Wash.

A $200,000 general obligation bond issue was approved December 3 by City Council, Alfred B. Loop, city comptroller, City Hall, Bellingham, to finance construction of a bridge and a culvert and fill in Bellingham. The bridge will be located on the west end of Central Ave., giving access to Pacific Coast Paper Co. and Puget Sound Pulp Mill operations in Bellingham. The culvert and fill are known as the Commercial and Young St. Project, and crosses Whatcom Creek, adjacent to the City Hall, connecting the Bellingham business area with residential and school areas directly to the north. Both spans will be placed in areas of heavy traffic and will offer shorter routes, speedier accommodations and better means of fire protection to the city. With the passage of the ordinance, city engineer, Ted Scholz has been asked to prepare the plans and specifications for the two projects.

ET 12-7. Previous report 11-27

NATURAL GAS CORPORATION FRANCHISE— Bellingham, Wash.

The Cascade Natural Gas Corp., Securities Bldg., Seattle, has been granted a 50-year franchise to locate, construct, operate and maintain, and finally remove, gas transmission and distribution pipelines in, over along and under Whatcom County roads, highways and other county property. The franchise provides that all construction and installation work where crossing county roads or rights-of-way or other county property outside of corporate limits of any incorporated town are subject to approval and pass the inspection of the county engineer. ET 12-7

■ WATER MAIN— Bellevue, Wash.

Planholders announced for the furnishing and installing 3,500′ of 8″ and 1,200′ of 6″ class 150 asbestos-cement water main; alternate bids will be accepted on class 150 cast iron, mechanical joint water main. Bids will be opened 8 p.m., December 17, by King County Water District No. 68, Richard Montgomery, secretary, district office, Meydenbauer Hill, S.E. 7th and 96th S.E., Bellevue. Plans with Howard T. Harstad & Associates, consulting engineers, 1000 Lenora, Seattle. $10 deposit. Certified check 5%.

Planholders: Frank Coluccio Construction Co., 7778 Seward Park Ave.; Shoreline Construction Co., 12519 15th Ave. N.E.; Lauray Crane Service Co., 1438 130th N.E., Bellevue; Pacific Waterworks Supply Co., 2900 1st Ave. S.; H. D. Fowler Co., Inc., 901 Lane; Deer Construction Co., 4223 Graham; West Coast Construction Co., Inc., 835 W. 48th; Bellevue Plumbing and Heating Co., 102nd and Main, Bellevue. All of Seattle, unless otherwise stated.

▲SANITARY SEWER— Tacoma, Wash.

Bids received by Board of Contracts and Awards, David D. Rowlands, chairman, room 404, City Hall, Tacoma, for construction of a sanitary sewer in LID No. 1963, in Tacoma. LOW BIDS: Rogers Construction Co., Tacoma, $2,520; E. J. Rody & Sons, 1608 E. 72nd, $2,697; Paine & Gallucci, 1521 S. Grant, Tacoma, $2,760. Bids opened December 10. GW 12-11. Previous report 12-5

AIRPORT IMPROVEMENTS—Yakima, Wash.

Project postponed indefinitely by City Council, City Hall, Yakima, for construction of a 500' asphaltic concrete runway extension (this is being delayed in court as an access road has not been constructed as promised), including relocation of Washington Ave., and installation of a high intensive lighting system on Runway 9-27 at the Yakima Municipal Airport. Specifications by Sam Hobbs, city engineer, City Hall, Yakima (runway, road relocation) and Leo Daly & Associates, civil engineers, Securities Bldg., Seattle (lighting). The project has been postponed because of financial trouble. IG 12-11. Previous report 11-15

BRIDGE— Yakima, Wash.

(Estimated cost $27,000)

Plans will be completed early in 1957 by Harold Sweel, Yakima County engineer, Old Courthouse Bldg., Yakima, for a steel and reinforced concrete bridge to replace the existing Gurley Road bridge in Yakima County. It is planned by the county commissioners to call for bids so that contract can be awarded and construction underway in February, according to Lee Crossen, chairman of the board.

The structure will be located on Thacker Road about 0.1 mile north of the Gurley Road and will be approximately 0.85' long and 24' wide. IG 12-7

INDUSTRIAL SEWER SYSTEM— Yakima, Wash.

(Estimated cost $395,000)

The City Council has authorized Sam Hobbs, city engineer, to prepare plans for an industrial sewer system in the city. The project is contingent upon matching funds from the federal government. It would be necessary to have a separate line paralleling the railroad tracks in order to collect sewage and cannery wastes and to conduct it to the city disposal plant. IG 12-7

IDAHO

SUBSTATION— American Falls, Idaho

(Estimated cost $3,500,000)

Construction will start this winer, weather permitting, by Idaho Power Co., L. W. Brainard, division manager, 807 Idaho St., Boise, for a new substation at American Falls. The substation will transform electricity from 230,000 to 138,000 volts and the lines of the latter voltage connecting American Falls and Pocatello will be increased from two to three. The substation, designed to be one of the two largest in Idaho Power's system, will include four 100,000-kva transformers and two synchronous condensers, one weighing approximately 180 tons. Some preliminary work has been completed and some of the materials for the terminal have arrived. SC 12-11

POWER PROJECT— Boise, Idaho

System-wide transmission and substation developments now underway, including a $3,500,000 American Falls substation (see Substation, American Falls in this issue), will provide for the increasing electric requirements of this area, according to L. W. Brainard, division manager, Idaho Power Co., 807 Idaho St., Boise. In the future, electricity will be flowing from the west to the teminal in American Falls over 230,000-volt trunk lines. There will be two 230,000-volt lines into American Falls from Boise where a substation is being built to handle the higher voltage. The Boise substation will be fed by three big lines from the company's $63,000,000 Brownlee hydroelectric development. These and other developments are part of an expansion program which will double and then quadruple Idaho Power's capacity. The Brownlee project, on the Snake River upstream from Hells Canyon, will be first to have four generators capable of producing 360,000 kilowatts. Plans provide for the addition of two more generators. The company also is licensed to develop the Oxbow and Hells Canyon sites below Brownlee. Three microwave stations, one at American Falls, one at the Don substation, and a repeat station southeast of American Falls, are being installed to increase these stations to a total of 13, reaching from Brownlee all the way across the valley to Pocatello. SC 12-11

★BRIDGE— Boise, Idaho

Award announced by City Council, City Hall, Boise, for removal of the existing concrete structure and construction of a reinforced concrete bridge on Owyhee St. across the Ridenbaugh Canal south of Rose Hill St. in Boise. ★GALVANIZED IRON— Boise, Idaho

Award to Salt Lake Hardware Co., 702 S. 8th, Boise, $895, by Ted Cramer, state purchasing agent, 225 State House, for galvanized iron for the highway department. Bids were opened December 3. DM 12-7. Previous report 11-28

★BLACK IRON PIPE— Boise, Idaho

Award to Waterwork Equipment Co., 149 W. 2 S., Salt Lake City, Utah, $1,045, by Ted Cramer, state purchasing agent, 225 State House, Boise, for black iron pipe for the highway department. Bids were opened December 3. DM 12-7. Previous report 11-28

★TRUCKS, DUMP BODIES— Boise, Idaho

Award to Starline Equipment Co., 503 S. 16th, Boise, $72,147, by Ted Cramer, state purchasing agent, 225 State House, Boise, for 15 trucks and dump bodies for the highway department. Bids were opened November 30. DM 12-7. Previous report 11-21

★TREE REMOVAL— Boise, Idaho

Award to Cluster Tree Service, Boise, $1,116, by Boise Independent School District, Clyde Langlois, assistant superintendent, School Administration Bldg., 1207 Fort St., Boise, for the removal of trees at Washington school in Boise. Bids opened November 26 and were held under advisement. SP 12-12. Previous report 11-17

RAILROAD EXTENSION—Idaho Falls, Idaho

(Estimated cost $250,000)

Bids will be called late in December by Atomic Energy Commission, Box 1221, Idaho Falls, for extension of railroad from CPP junction to the Naval Reactor Facility at the National Reactor Testing Station in Idaho; Inv. No. AT(10-1)-886. Completion time 150 calendar days. Bidders must visit the site of the work, just west of Idaho Falls, and will be required to check in with the Security Office in the Central Facilities Area at the site, which will arrange for a representative of the Construction Branch to give information necessary at the site.

Project includes the following: Construction of a 40' bridge with concrete abutments and wing walls, steel deck and center pier; construction of approximately 6.1 miles of single track railroad and 0.9 miles of spur trackage complete with appurtenant roadbed, drainage system (including pipe culverts, ditches, sump pump), road crossings, motor-car set off, track and roadway signs, wheel stops and derails. SP 12-12

TRANSMISSION LOOP (PHASE 2)— Idaho Falls, Idaho
(Estimated cost $1,500,000)

Bids will be called late in December by Atomic Energy Commission, Box 1221, Idaho Falls, for construction of 132-kv transmission loop (Phase 2) at the National Reactor Testing Station in Idaho; Inv. No. AT(10-1)-879. Completion time 330 calendar days. Project will include the following: 1—Construction of approximately 50 miles of 132-kv transmission line and approximately 2 miles of 13.8-kv transmission feeder lines. 2—Modification of existing 132/13.8-kv substation at ANP Area including extension of switching facilities and installation of one government-owned transformer. 3—Construction o 132-kv switching yard adjacent to existing MTR substation. 4—Construction of a new 132-kv switching station (Station "A") in ANP Area including a control house and switching yard. 5—Construction of a 132-13.8-kv (2,000-kva) semiportable substation.
SP 12-12

●**CURB, SIDEWALKS— Jerome, Idaho**

Bids will be opened 8 p. m., December 18, by Guy S. Simons, city clerk, City Hall, Jerome, for construction of curb and sidewalks in Improvement District No. 9, Jerome. Specifications with Carrol F. Wilcomb and Sumner M. Johnson, consulting engineers, Box 1131, Jerome. $15 deposit. Certified check or bid bond 5%. SC 12-11

SEWAGE TREATMENT PLANT, SEWERS— Lewiston, Idaho

A second bond election will be held January 8 by Lewiston Orchards Sewer District No. 1, to provide funds for a sewage collection and disposal system. At the November election, the $784,000 bond issue was defeated. Plans for the project were prepared by Walter L. Woodward, consulting engineers, 206 Empire State Bldg., Spokane.
DC 12-11. Previous report 12-6

SEWERS, TREATMENT PLANT— Priest River, Idaho

Preliminary plans underway by Walter L. Woodward, consulting engineer, Empire State Bldg., Spokane, for a new sewer system and treatment plant for the City of Priest River. The sewers may cost from $15,000 to $20,000 and the treatment plant approximately $75,000. PN 12-7

NATURAL GAS DISTRIBUTION SYSTEM— Sandpoint, Idaho

The City Council, City Hall, Sandpoint, has granted Bonner Gas, Inc., Sandpoint, the right to consruct, maintain and operate a natural gas transmission and distribution system throughout the city. The right extends to include a 50-year period and construction of the system may start next spring. MH 12-12

▲**LEVEE RESTORATION—St. Maries, Idaho**

Bids received by Corps of Engineers, Seattle District, 4735 E. Marginal Way, Seattle, for restoration of the levee, St. Joe River, in the vicinity of St. Maries, Idaho; CIVENG-45-108-57-36. LOW BID: P. J. Anderson & Sons, 13501 Aurora, Seattle, Wash., $6,385. ONLY OTHER BID: Carl Hohner, E. 6208 Sharp, Spokane, $15,700. Engineer's estimate, $7,749. Bids opened December 7.
GW 12-8. Previous report 11-17

MONTANA

★**TRACTOR SHOVEL— Billings, Mont.**

Award by Yellowstone County Commissioners, Courthouse, Billings, for furnishing a tractor shovel of 1½ c.y. capacity. AWARD: Industrial Equipment Co., 415 N. 27th St., Billings, $14,624. OTHER BIDS: Montana Powder & Equipment Co., 1204 4th Ave. N., Billings, $16,955; Western Construction and Equipment Co., 505 N. 24th, Billings, $17,478. Engineer's estimate $441,627.
SP 12-12. Previous report 11-3

★**STATE HIGHWAY PROJECT— Cheyenne, Wyo.**

Award by Wyoming State Highway Comission, State Office Bldg., Cheyenne, on the following project on which bids were opened November 20.

THERMOPOLIS-SHOSHONI ROAD—Grading, draining, base course surfacing oil treatment by the roadmix method, sand-gravel seal coat and miscellaneous work on 3.123 mile and metal plate guard fence on an addition 2.965 mile road in Wind River Canyon, Hot Springs County; FAP Nos. F-118(9), F-118(10) and F.L.H.-12(2).

AWARD: Taggart Construction Co., Cody, $693,422. DM 12-11. Previous report 12-7

★**STATE HIGHWAY PROJECTS— Cheyenne, Wyo.**

Awards have been made by the Wyoming State Highway Commission, State Office Bldg., Cheyenne, on two highway projects on which the awards have been held up since the November 20 bid opening. One other job on which award was held at the above bid opening, is still delayed.

ALBIN CONNECTION ROAD — Grading, draining, base course surfacing, plantmixed

surfacing course, stone chips seal road in Laramie County; FASP No. S-27(4).

AWARD: Blanchard Construction Co., Derby, Colo., $357,338.

SARATOGA-RIVERSIDE ROAD—Grading, draining, base course surfacing, plantmix surface course, stone chip seal coat, including combined curb and gutter and storm sewer in the Town of Saratoga, construction of four 12'x6'6" reinforced concrete culverts, two structural plate stockpasses, construction of one bridge consisting of three continuous reinforced concrete slab spans over Spring Creek and miscellaneous work on 5.632 miles road in Carbon County; FAP No. F-022-1(1).

AWARD: W. E. Barling, Inc., Meeteetse, $590,872.

THERMOPOLIS-SHOSHONI ROAD—Grading, draining, base course surfacing oil treatment by the roadmix method, sand-gravel seal coat and miscellaneous work on 3.123 mile and metal plate guard fence on an addition 2.965 mile road in Wind River Canyon, Hot Springs County; FAP Nos. F-118(9), F-118(10) and F.L.H.-12(2).

Award is still pending on this project. Low bidder was Taggart Construction Co., Cody, $693,422.

DC 12-7. Previous report 11-24

BRIDGE— Cheyenne, Wyo.
(Estimated cost $7,000)

Project approved by City Council, City Hall, Cheyenne, for construction of a concrete and wood bridge across Crow Creek at 5th and Pioneer in Cheyenne. Construction will start soon by the city street department. SC 12-11

● COPPER CABLE— Glendo, Wyo.

Bids will be opened 2 p. m., December 19, by Bureau of Reclamation, Bldg. 53, Denver Federal Center, Denver, Colo., for furnishing and delivering fob Glendo, 97,000 M ft. (Sched. 1), 12,600 M ft. (Sched. 2), 220 M ft. (Sched. 3) and 370 M ft. (Sched. 4) copper cable; Spec. No. (D) 69, 755-A. Specifications with above office. Delivery time 120 calendar days. SP 12-8

TRUCK ROUTE— Sheridan, Wyo.
(Estimated cost $2,000,000)

Voters in Sheridan approved the city's truck route proposal in the December 4 special election, according to George R. Anderson, northeast district engineer, Wyoming State Highway Commission, Sheridan. Construction may start next fall on the two-year project which includes a 10-mile route east of Sheridan. To meet federal requirements of access for the route, the State Highway Department found construction of bypasses would be the only feasible means. Similar bypasses have been approved in Buffalo, Newcastle and Manville. The bypass is in operation around Buffalo and under construction at Casper and Cheyenne. Requests for location surveys which would show where bypasses would be placed have been received from eleven other Wyoming towns. LY 12-8

UTAH

★PAVING— Ogden, Utah

Award to Wheelwright Construction Co., Box 109, Ogden, $20,578, by City Council, Municipal Bldg., Ogden, for furnishing labor and materials for constructing Paving District No. 177. DM 12-7. Previous report 11-7

● STATE HIGHWAY PROJECTS— Salt Lake City, Utah

Bids to be opened 2 p. m., December 21, by Utah State Road Commission, State Capitol, Salt Lake City, for two highway construction projects. Plans with commission office in Salt Lake City. $2 deposit. Certified check, cashier's check or bid bond 5%.

HENEFER-DEVILA SLIDE SECTION—Plantmix bituminous surfacing 5.809 mi. U.S. No. 30-S, Morgan and Summit counties. FAP F-023-1, First Contract.

Quantities: 33,300 ton plantmix; 2,790 ton bituminous material; 86,200 ton gravel; 696,000 c.y. unclassified roadway excavation; 21,343' deep beam highway guard rail (concrete posts).

UTAH-ARIZONA LINE SECTION—Roadmix bituminous surfacing, 2½" on 12.041 mi. F.A. Route No. 35, Kane County, between nine miles east of Paria Creek and the Utah-Arizona state line; FAP FLP 32(1) and SP 1583.

Quantities: 2,289 ton bituminous material; 178,500 ton gravel; 696,000 c.y. unclassified roadway excavation. DM 12-7

● NATURAL GAS SUPPLY LINE— Vernal, Utah

Bids will be opened 2 p. m., December 18, by Moon Lake Electric Association, Inc., Vernal, for installation of pipe equipment and other materials for approximately 3.5 mile of 4' natural gas supply pipeline at Vernal. Plans with C. H. Guernsey & Co., engineers, 2701 N. Oklahoma, Oklahoma City, Okla. $5 deposit. Bid bond 5%. LY 12-8

▲PUMPING UNITS— Weber Basin Project, Utah

ALASKA

HARBOR IMPROVEMENT, FLOOD CONTROL PROJECTS— Anchorage, Alaska
(Estimated cost $5,500,000)

Seven harbor improvements and flood control projects have been scheduled for 1957 under the Civil Works Program of the Alaska District, Corps of Engineers, D-E Bldg., Anchorage. Work now remaining to be done at Petersburg and Wrangell under the present construction contract is expected to be completed by the end of this year, thus completing all 1956 dredging and construction work. Following is a brief description of projects scheduled to be awarded in fiscal year 1957 with work planned for calendar year 1957. Ketchikan and Kodiak Harbor work will start in spring of 1957 with continuation of work after July 1 contingent upon further allocation of funds by Congress.

CRAIG HARBOR: Dredging mooring basin at South Cove 11' deep at mean lower low water, 225' wide and 700' long, including entrance channel at same depth, over width of 100'. Bids to be opened about March 11, 1957; estimate $100,000 to $1,000,000. ELFIN COVE: Off Cross Sound on northern tip of Chichagof Island. Dredging channel 10' deep at mean lower low water and 60' wide through other entrance, and channel 8' deep at mean lower low water and 40' wide through the inner entrance to a natural landlocked harbor. Bids to be opened about April 25, 1957; estimate $100,000 to $1,000,000. GOLD CREEK, JUNEAU: Construction of reinforced concrete channel lining 1,717' long for the portion of Gold Creek remaining to be lined (passes through Juneau), together with necessary intake and downstream energy dissipating structure. Bids to be opened about February 5, 1957; estimate $1000,000 to $1,000,000. KETCHIKAN HARBOR: Dredging additional small boat basin at Bar Point 780,000 sq. ft. area to depth of 15' below mean lower low water or to rock, and construction of two rock breakwaters 700' to 1,100' long. Bids to be opened about March 11, 1957; estimate $1,000,000 to $5,000,000. KODIAK HARBOR: Dredging small boat basin, 11.7 acres area with dept of 8' at mean lower low water for the inner 20% to 12' for the remaining 80%, and construction of two rock breakwaters 1,250' and 780' long. Bids about March 11; estimate $1,000,000 to $5,000,000. PELICAN HARBOR: Dredging small boat basin, 250,000 sq. ft. area to a depth of 12' at mean lower low water, and construction of a rock breakwater 900' long. Bids about March 11; estimate $100,000 to $1,000,000. VALDEZ HARBOR: Construction of rock breakwater, about 475' long, along southeast side of small boat harbor, and a timber piling breakwater 330' long along the southwest side. Bids about January 21, 1957; estimate $100,000 to $1,000,000. SP 12-11

NOTICE TO CONTRACTORS

Sealed bids will be received by the undersigned at the office of George M. Rasque and Son, Architects in the Washington Trust Building at Spokane, Washington, up to 2:00 p. m., January 3, 1957, for construction of an Elementary School Building at Mesa, Washington for School District No. 51-162, Connell, Washington and will then and there be opened and publicly read aloud in his office. Bids received after the time for opening will not be considered.

Plans and Specifications may be obtained from the office of George M. Rasque & Son, Washington Trust Building, Spokane, Washington, upon deposit of $25.00, which sum will be returned to the bidder provided plans are returned within 6 days after issued if no bid is to be submitted.

The character and amount of security to be furnished by each bidder is stated in the specifications.

The Board of Directors reserves the right to reject any or all bids or to accept the proposal deemed best for the District and to waive informalities.

CLASSROOM ADDITION
BIDS CLOSE 7:30 P.M., DECEMBER 18
Klamath Falls, Oregon
NOTICE TO CONTRACTORS

Sealed bids are requested for the construction of a two story classroom addition to the Klamath Union High School at Klamath Falls, Oregon. In addition to classrooms, building will include a large cafeteria and kitchen; stage and dressing rooms for future auditorium; science suite, instrumental and vocal music facilities. Floor area is approximately 32,130 sq. ft.

Exterior walls will be concrete with brick veneer. Asbestos board insulated panels and aluminum sash in aluminum curtain walls. Interior: wood frame with glulam beams, plaster walls and ceiling; floor finishes; linoleum, asphalt, vinyl tile and ceramic tile in toilets; building acoustically designed, roofing, built-up type on wood decks. Low pressure steam, with mechanical ventilation. Lighting, flourescent fixtures. Contract will include wrecking and removal of the old County Library Building, now on the site.

There will be one general bid which will include all items of work.

Bids are to be delivered to the Clerk of Klamath Union High School District No. 2, Room 200, Klamath Union High School, Klamath Falls, Oregon, on or before 7:30 p.m., Tuesday, December 18, 1956.

All bidders must comply with the laws of the State of Oregon, relating to the prequalification of bidders, Chapter 279, Oregon Revised Statutes. Prequalification forms are immediately available at the office of the Architect.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid form provided by the Architect, and accompanied by a certified check or bid bond, executed in favor of Klamath Union High School District No. 2, in an amount not less than five per cent (5%) of the total amount of the bid, to be forfeited as liquidated damages, should the bidder neglect or refuse to enter into a contract, and provide 100% surety bond for the faithful performance of the work, in the event the contract is awarded to him.

No bidder may withdraw his bid after the hour set for the opening thereof, until after the elapse of 30 days from the bid opening.

The Board of Directors of Klamath Union High School District No. 2, reserves the right to reject any or all bids and to waive any informalities.

The drawings, specifications and contract documents may be examined at the Builders Exchange in Portland, Salem, Eugene, and San Francisco; at the Daily Pacific Builder Plan Room, 465 Tenth Street, San Francisco, California; and at the office of the Architect, Howard R. Perrin, 1121 Main Street, Klamath Falls, Ore.

KLAMATH UNION HIGH
SCHOOL DISTRICT NO. 2.
