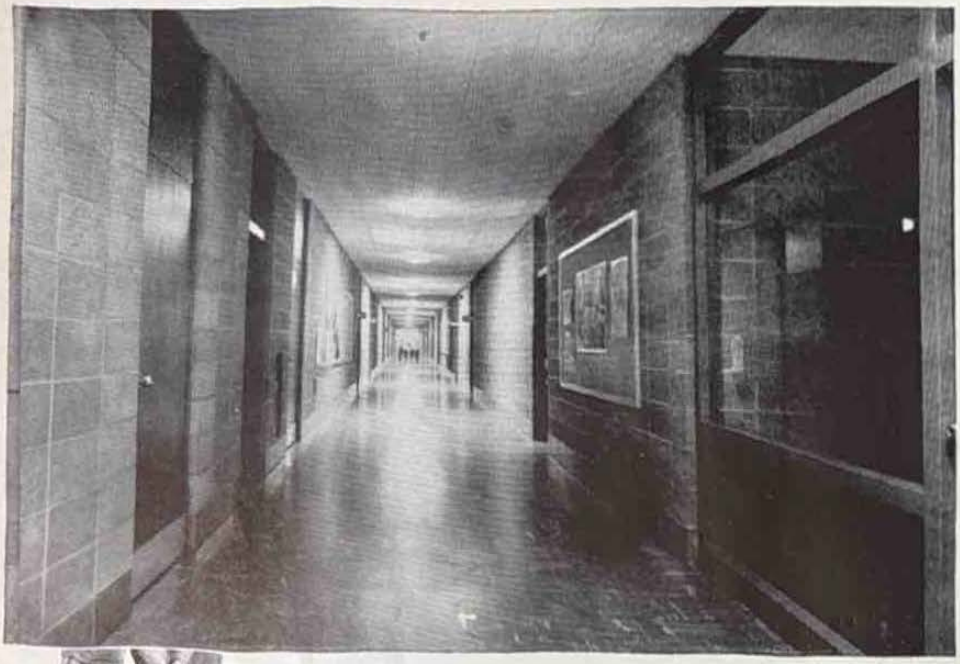
Action for small town renewal

Design: music building, two supermarkets

Building methods: ceramic veneer curtain wall

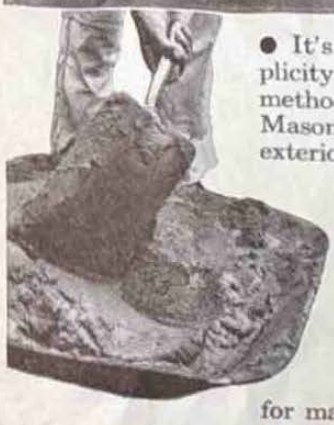
JANUARY 1958

SCHOOLMATES...



...a trowel, an "educated" hand, lightweight block and Lone Star Masonry Mortar

RESULT: low cost, low upkeep, quality schools for economy-wise Tarrytown.



● It's the familiar story of *simplicity*—simplicity of design and simplicity of construction method. These, together with Lone Star Masonry Cement—used on both interior and exterior work—gave these modern school buildings their quality plus economy.

Interior walls and partitions were built of integrally-tinted 8" Waylite block made with 'Incor'* and laid up with ready-to-use Lone Star Masonry Cement.

This high quality masonry cement is preferred by experienced masons for many reasons. It is easy to mix; no lime or portland cement need be added, no soaking or slaking necessary. Spreads smoothly, tools easily without gumming the trowel. Every batch is quality controlled for quality results. For the highest attainable standards, build with Lone Star Masonry Cement—job after job!

*Reg. U. S. Pat. Off.

YOU CAN "FEEL" THE CLEANLINESS

It was almost mealtime (4:30 P.M.) when this photograph was taken. Yet, every inch of this Agnews State Hospital kitchen was as spotlessly clean and smooth as a cup on your own table at home. The time and effort it takes to keep this kitchen clean are surprisingly little, because of the use of tile. Walls of Kraftile Glazed *Structural* Tile are impervious to grease, smoke, acids and food stains. They wipe clean with one stroke, never need patching or painting. Installed cost is clearly competitive because Kraftile combines both wall and finish. Masons do the complete installation in minimum time. Wherever sanitation is important in your jobs, consider the practical beauty and economy of Kraftile, and its easy upkeep. Clear glaze plus 12 harmonious colors in standardized sizes and shapes. For complete information including graphic standards and specifications, write

THE BUILDING MONTH: TRENDS

Construction forecasters see 1958 as a solid, if not spectacular year, with housing as one of the bright spots in the overall picture. Almost everyone agrees that housing starts, estimated at close to one million units in 1957, will exceed that figure within the next 12 months. (Building permit totals for 1957 for the five western states are found on p. 9). The AGC looks for a record year in construction across the country, sparked by a recovery in residential building and rising highway construction.

AGC convention in Dallas February 10-13 will see for the first time the incorporation of the former building, highway and heavy division meetings into general convention sessions, plus three special luncheons and a building construction workshop. In Atlantic City last month AGC executive director James D. Marshall told the Building and Construction Trade Department that "unless some means are found to stop the contribution of inflation of rising (construction) wage rates, we may be pricing ourselves out of a market for private investment in construction, alteration and repair."

Upsurge in apartment house construction is reported in Los Angeles and San Francisco. Scarcity of land and low vacancy rates of older buildings ar goading builders on.

Western pine industry is winding up a disappointing year. A preliminary estimate of lumber production during the fourth quarter is 1,720 million feet, down 12.9% from the same period of 1956. But indications are that in general the lumber industry, which started its slump ahead of some others, has been scraping bottom and may be about due for at least a mild pickup.

California's State Division of Architecture expects to begin construction on more than $170 million in state building projects this year, more than double the figure for the 1957 program. Northern California will spend $70½ million; southern California, $99½ million.

Exhibit of home construction products and materials costing some $100,000 will be provided by the Portland Home Builders Association at the Oregon Centennial Exposition and International Trade Fair, scheduled to start June 10, 1959. This is the first organization to announce plans to take major exhibit space at the show.

A study of the campus architectural style at the University of Washington, Seattle, has been proposed by the Board of Regents. A committee of architects would be asked to serve without compensation. The university's architecture, considered neo-Gothic for the most part, has long been a subject of controversy.

First all-steel movable school in the U.S. has been occupied in San Bernardino, Calif. Biggest advantage is its speed of erection, says C. K. Allen, city schools architect. It takes only 90 days from the time construction starts until it is ready for use by students.

Conference of Building Industry Associations has been formed in southern California by close to 30 trade groups. Secretary Ralph Hilton says the organization will be directed by a 12-man steering committee.

NEWS

20th-Century Fox plans mammoth transformation

Transformation of its West Los Angeles studio into a multimillion-dollar skyscraper apartment and business community has been announced by 20th Century-Fox. Plans call for groundbreaking in July, with all construction of the program—estimated to run upward to $225 million—to be completed in about seven years.

Outdoor sets on the 284-acre lot will be razed to make room for the erection of 18 20-floor apartment buildings, a 1,000-room hotel, one 30-story and three 20-story office buildings and assorted smaller structures. To be called Century City, the project is being developed by the architectural firm of Welton Becket & Associates. The studio's outdoor sets will be moved to a ranch near Malibu.

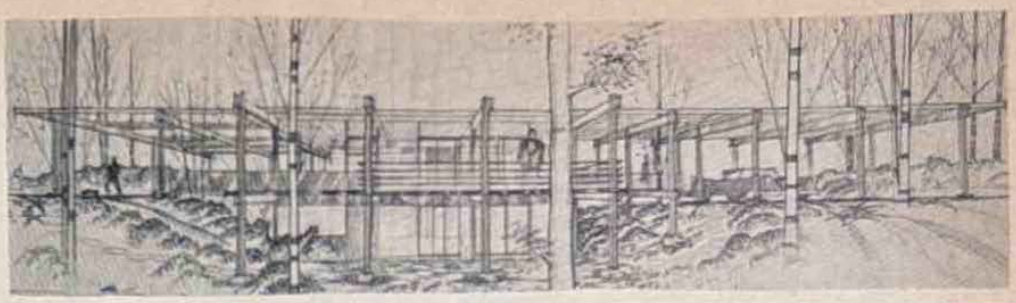
Importance of standards stressed at conference

"Wide acceptance of trade standards has helped the construction industry foster competitive bidding," Norman Hunter, Los Angeles architect and president of Construction Specifications Institute, told the Conference on Standards in San Francisco. "These standards also aid the industry in defining quality and performance of construction materials and processes."

Explaining the value of standards to the industry, Hunter said: "The usable standard is the simplest and most direct way for the specifier to transmit the desires and requirements of the design professional, the architect or the engineer to the constructors who put them into effect."

He cautioned, however, that standards should not be restrictive and all-inclusive to such a degree that the freedom and initiative of the individual is curtailed or the judgment of the professional negated.

Others who spoke at the construction specifications session of the conference, held in conjunction with the annual meeting of the American Standards Association, were J. P. Silvestri, chief engineer, Charles L. Harney Co., San Francisco; Rolf T. Retz, specification writer, State Division of Architecture, Sacramento; Albert LeRoy, LeRoy Construction Services, San Francisco; and Hal Colling, managing director, Pacific Coast Building Officials Conference, Los Angeles.



WINNING ENTRY reaches out in two levels on quiet ravine with minimum of excavation, grading and disturbance of natural growth. Upper living level has 1,310 sq. ft.; unfinished lower level is framed, has fireplace and roughed-in plumbing in place. At right James C. Chiarelli, president of Washington State Chapter, AIA, presents sculpture to architects James Greco and Carl A. Bystrom.

Seattle picks 1957 Home of the Month

A two-level residence sited in a wooded ravine won a sculptured award for the architects, James Greco and Carl A. Bystrom, and a $500 check for the owners, Mr. and Mrs. Carsten Lien, in Seattle's 1957 Home of the Month competition.

Thomas Paulsen, contractor, also was honored at a dinner in the New Washington Hotel January 9. The competition is sponsored by the Washington State Chapter, AIA, and the Seattle Times.

The architects commented that "in designing this home for a young couple of moderate means who are sympathetic to natural native surroundings, we developed a studio-like compactness in plan which was necessary within the budget limitations. Basic living spaces have been provided which will permit diverse activities as the basic family grows."

Other architects or firms whose designs were featured in 1957 were Robert E. Hugus (two entries), Arnold G. Gangnes, Ronald C. Campbell, Gena Zema, Kenneth Koehler, Ted La Course, Wortman & Wilkins, Detlie & Peck, A. O. Bumgardner and Lawrence & Hazen.

Jurors were three former AIA chapter presidents: John S. Detlie, Robert L. Durham and Lloyd J. Lovegren.

Mrs. Garnetha Moe, who served as chairman of the project for the past two years, has been succeeded by Miss Jane Hastings.

$47 million Civic Center-World Fair proposed for Seattle

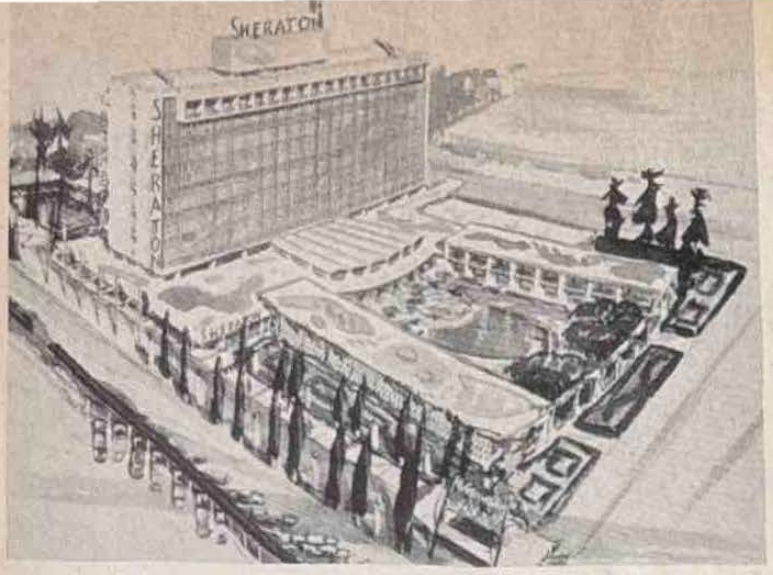
Seattle's plans for a $47 million Civic Center-World Fair project have been revealed by the seven-member design standards advisory board, headed by architect Perry Johanson.

The Civic Center Advisory Board has in general approved the recommendations, while the Washington State World Fair Commission is now studying the proposals; but the big question mark today is whether funds can be raised to carry out such an ambitious program. Original plans provided for $15 million, with the city and the state each voting $7½ million.

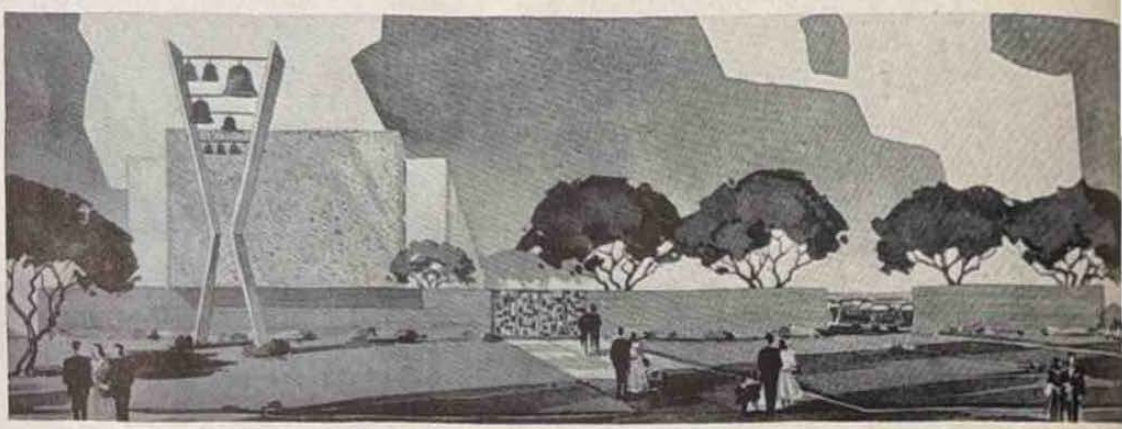
Here are the proposed permanent buildings to be erected on the Civic Center-World Fair site and estimated costs: exhibition hall—$12 million; pavilion seating 12,000 to 15,000—$7½ million; pleasure pier, with bridge or monorail connection to the exhibition hall—$8 million; concert hall involving reconstruction of the present Civic Auditorium to provide seating for 3,000—$2 million; and a small theater seating 1,000—$1½ million. Land acquision ($5 million), site development ($5,700,000) and miscellaneous costs and contingencies ($5,700,000) would bring the total to $47 million. The pavilion would replace the existing High School Memorial Stadium.

The design standards board has also recommended that the pavilion be the subject of an international architectural competition; that the small theater be limited to a Washington State competition; and that the concert hall and exhibition hall be directly commissioned by the governing bodies involved.

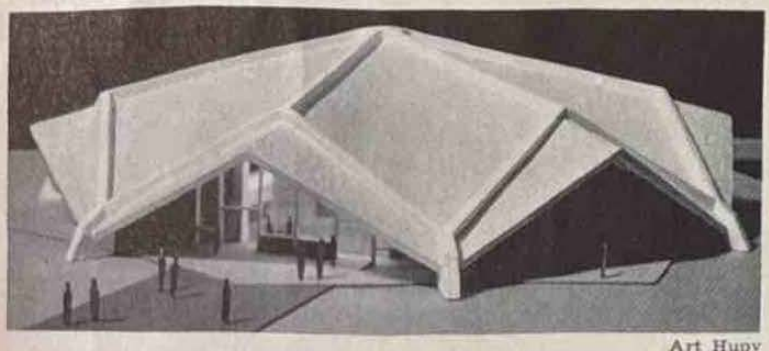
PROJECT PREVIEW



PORTLAND'S SHERATON HOTEL will be eight-story, 30[illegible]-room project, constructed to allow for future addition of 200 rooms. With swimming pool, specialty type restaurant, banquet facilities for 1,000 persons and parking for 300 cars, it will be located on four-block site facing Holladay Park and adjacent to new Lloyd Shopping Center. Construction is scheduled to begin early this year at estimated $5 million. Architects: Perry, Shaw, Hepburn & Dean, associated with Church, Newberry, Roehr & Schuette.

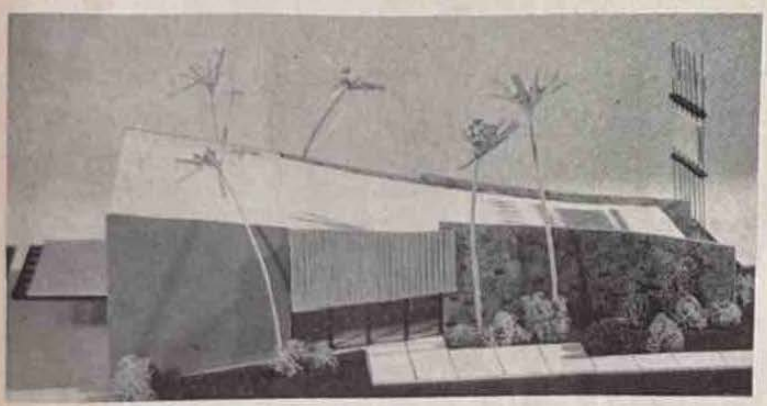


TWO NOTEWORTHY FEATURES of Holman Methodist Church project now nearing completion in Los Angeles are 1) 8-ft masonry wall broken only by gateway inset with varicolored transparencies giving effect of enormous stained glass window; and 2) dramatic tower of two concrete arms reaching skyward more than 50 ft. to support 10 giant bells. Church proper, which replaces existing structure and is first step in extended building program, has structural system of precast tilt-up concrete grilles. Seating 600 parishioners, it will be built for about $200,000. Architect: Kenneth N. Lind.



Art Hupy

ALL-PURPOSE BUILDING for high school on Mercer Island, Wash., will be roofed with thin shell concrete resting on seven small buttresses around perimeter. Walls under dome will be of masonry with full height glass panels at two principal entrances. Estimated to cost $140,000, shell will house assembly-cafeteria in center; stage, kitchen, teachers' room, storage and toilet facilities around sides and under lower portions of roof. Concealed fixtures will light roof inside and out. Architects: Bassetti & Morse.



FAN-SHAPED STRUCTURE to house Security First National Bank of San Diego, Clairemont Branch, is designed to adapt to natural flow of banking business. Executive and escrow offices are at narrow end; public entrances at center; cashiers' counters, business machines and vaults at wide end; drive-in entrance and windows and mezzanine for restrooms, employees' lounge and storage at rear. Structural frame building will have 6,500 sq. ft. Total investment will be $143,000. Architects: Richard George Wheeler & Associates.

Bring a little outside inside

With Soulé Intermediate steel windows, you specify the opening dimensions, and we'll supply the exact windows you want. There's no limit to stock sizes with Soulé steel windows. And with our design-engineering service to help you with problems concerning materials, sizes and shapes, there's no premium cost either. Big bonus advantages include Western manufacture and installation by Soulé crews—on time! You deal with one major source for windows and installation, get maximum job protection and guarantee. Call or write your nearest Soulé office for details and specifications. Our sales engineers will gladly supply you with data for your files.

Portland's Exposition-Recreation Center

Most notable feature of the design by Skidmore, Owings & Merrill for Portland's $8 million Exposition Center is the solution to the problem of covering the 360-ft. square arena building—one selected after 19 others were planned, mocked up and discarded.

The roof's structural system is described by the consulting engineers on the project, Moffatt, Nichol & Taylor, as a "folded plate made up of a series of composite glued laminated wooden girders in triangular arrangement."

Employing the girders in this fashion, supported by two laminated wood jack trusses, grew out of consideration of an acoustical problem. When use of sound baffles placed in triangular shapes was proposed, the idea developed of making the structural elements themselves the baffles.

The concrete bowl of the arena, rising inside its exterior frame of glass panels supported by wood columns, will be 330 ft. in diameter. It will provide seating for 12,496 for basketball; 10,152 for hockey; 8,566 for stage events; 13,700 for boxing; 13,000 for pageants. Permanent type seating in the bowl will hold 8,120; bleachers and removable floor seating will make up the balance. Every seat will have an unobstructed view.

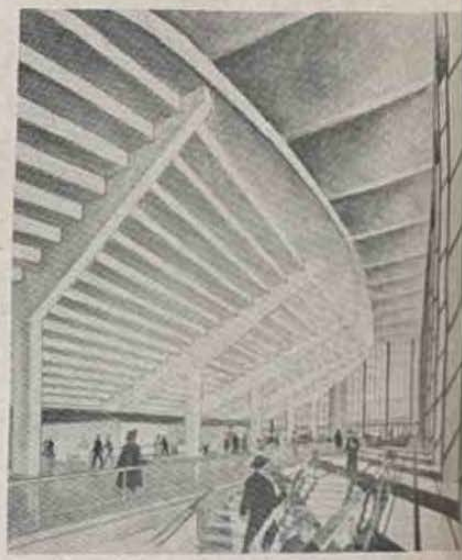
Meeting rooms on the arena floor level will accommodate 2,750 persons and central kitchen facilities will enable their use for banquets. Individual capacities will vary from 938 to 75 persons.

Plans for the center also will call for a 153,650-sq. ft. exhibition hall, a war memorial area and court and park facilities for 2,500 cars. Each of the areas is interconnected to permit joint or separate use.

The exhibition hall is recessed into the slope of the site to permit rooftop parking. Display space totals 153,650 sq. ft. and is capable of accomodating 750 booths, each 10x10 ft. Complete service and storage areas, concessions, exhibitors' facilities and restrooms are included in the plans.

As a visitor approaches the entrance pavilion, he will view the memorial court below him and to his right.

CURVED WOOD PAVILION emphasizes entrance to Portland's Exposition-Recreation Center, construction of which is expected to get underway this spring. Wood columns support glass exterior walls surrounding concrete arena bowl. Sketch below of war memorial court, off memorial room seating 250 persons, is merely architects' "suggestion." Piece of sculpture by Northwest artist is proposed for court.



EXHIBITION SPACE and covered parking will be located in foreground structure. Visitors to arena will have impressive view from concourse around concrete spectator bowl of downtown area across Willamette River. Note triangular wood sections of roof.

Building volume for year tops $2¼ billion

PERMITS

Building permit volume for 1957 in the five western states was $2,334,567,124, a decrease of $229,405,550 or 9% from 1956. The year's volume is the lowest since 1954. For comparison purposes here are the tallies for the past three years: $1956, $2,563,972,674; 1955, $2,500,425,102; and 1954, $2,227,227,495.

On a statewide basis, only Idaho has shown consistent gains the past few years. Totals for California, Oregon, Washington and Montana are below the boom years of 1956 and 1955.

A look at the records of individual reporting agencies shows that actually 40% of the 116 key agencies who participate in the survey recorded a higher dollar volume in 1957. Among the major agencies with increases over 1956 were Los Angeles, up $24½ million; Sacramento County, $6¼ million; San Bernardino County, $14 million; San Diego, $32 million; and San Francisco, $2¾ million. Los Angeles County dropped $118¼ million; Orange County, $44¾ million. Other major agencies with substantial decreases were Multnomah County, $9 million; Portland, $1½ million; King County, $3½ million; Seattle, $6½ million; and Spokane, $8 million.

The 116 agencies reported a total of $161,238,910 for the month of December, a drop of $10,891,402 from December 1956. California was down $8¼ million; Washington, $4 million. Oregon recorded a $85,745 increase; Montana was up $189,858; and Idaho, $191,423.

Following is a breakdown of building permits issued for new buildings and additions by several of the major agencies during December.

	Dwelling		Commercial & Industrial		Public	
Portland	39	$ 881,830	17	$ 190,660

POINTS OF VIEW

Three architects express themselves on the organic world and design; architecture as an art; school building costs

Organic architecture

Los Angeles architect Cornelius M. Deasy addressed the sixth annual conference of the Western Mountain Region, AIA, at Jackson Hole, Wyo.

The law of the organic world, a law nature observes with a dispassionate thoroughness, is that for each set of conditions of environment and purpose, there is a logical, even inevitable, form. Nature may protect the cactus, the sea urchin and the porcupine with similar barbs for a similar purpose, but the plant life of the northern forest is totally unlike the plants of the southern deserts. Each evolves its unique forms to suit its unique environment and purpose.

To say that this is a process that has implications for architecture is to emphasize the obvious. While recognizing the application of a universal technology it clearly indicates the need for a regional development of style. That one universal style could logically apply throughout the world or even in the varied regions of the United States is clearly inadmissible. Also dismissed as a serious or meaningful trend is the notion of universal space. The office building, the church, and the shopping center have different roles to play, different emotions to evoke. To say that they can all be solved in the same idiom is to admit that we are devoid of creative imagination.

The hotel on the Arizona desert has an entirely different environment challenge than a hotel in this mountain valley. To say that they are one problem is to concede that ours is a sterile society.

Organic architecture is not the architecture of curves; it is the architecture of logic plus. It is architecture that with a beautiful precision and economy evolves the forms that fit the need. Nature rarely uses glass to keep out the sun, never employs six legs where four will do and, so far as can be observed, is seldom influenced by the latest fashion on the concept of the annual model. Once her objectives of function are met she stops.

We can be sure that nature would not encase a steel frame in Grecian marble. We can be equally certain that she would swallow no nonsense about one universal style. She expresses structure only so far as it meets her needs, uses pattern and color for the contribution they make to the finished product.

In doing this she shows us much that we can directly use when we have the wit to understand what we see. How the cactus achieves rigid strength with a minimum of material, how the hornet creates superefficient insulation from digested wood pulp, how the bird eliminates bone weight without losing its swift strength. But if this is all we learn, we are missing the real lesson that is there to see. Not what nature does, but why, is the lesson of the organic world.

Having said this much about the logic of nature, it may seem strange to have to add that for us it is not enough. To follow a problem through logically does not necessarily lead to what we call architecture, perhaps because we do not have the capacity for being completely logical. Nevertheless, the quality of inspiration is what transforms the logical solution into memorable architecture.

Organic architecture rules out aping the cliches of the moment, bowing to the pronouncements of the professional prophets and designing for the approbation of our colleagues. It is a kind of architecture that requires each of us to be our own source of inspiration and that also offers each of us an opportunity to go as far as our individual talents can carry us.

To study the work of the leading architectural theorists of our time is a baffling experience. Certainly all of them cannot be right. Fortunately it is not necessary to guess which one is the Messiah. It is only necessary for each of us to rely on our own integrity to make a meaningful contribution to society.

'Architecture is a blindspot'

Frank Lloyd Wright spoke at an architectural vocational seminar for high school students during Chicago Dynamic Week October 27-November 2

The mother of art is architecture. Without an architecture of our own we have no soul of our own civilization. Now, of course, architecture is a blindspot of our life in America today. How many millions of students go to the university to be educated? They come away conditioned, not enlightened, and they know nothing of architecture although they have a department somewhere around—probably in the basement or maybe in some buildings where they had soldiers at one time; but architecture has not received and is not receiving now its due, if we mean by way of the word democracy a genuine culture which can become the soul of our civilization.

False economy in schools

Architect William W. Caudill of Bryan, Texas, expressed his views about the current school building picture during an interview in the New York office of National Citizens Council for Better Schools

"With unprecedented enrollments and construction at an all-time high, getting the fullest possible value in school plant facilities for each school building dollar expended has become an absolute necessity. At the same time, care must be taken to avoid false economy." That is the way in which William W. Caudill, nationally known school architect, summed up the current school construction picture.

He emphasized that reducing building costs is no trick, provided the community first decides what it wants for its schools and then is willing to pay for it. Some communities want and can afford bigger, more elaborate and more comprehensive school plants he said. As long as other phases of the educational program do not suffer in these communities, there is no reason why residents should be denied the type of schools they desire, he added, cautioning that it was entirely fallacious to depict a national trend as a result of these particular localities.

Stating that school building costs are a local issue, he said that expensive schools in New York don't jeopardize teachers' salaries on the West Coast and that an austere school in Mississippi saves no money in any other part of the country.

Contradicting the recent rash of national magazine articles which portray a nation of gold-plated schools, Caudill commented that architects and designers have been successful in recent years in the use of new construction materials and building methods which enable them to produce more attractive and more functional schools at a lower comparative cost. In general he agreed with U. S. Office of Education figures which show that

ALL ROOMS are reached from outside doors under covered porchways, eliminating interior corridors. Floors built up in semicircle provide tiers for musicians in choral and band rehearsal rooms.

MUSIC CLASSROOM BUILDING

FOURTH PERMANENT STRUCTURE erected in the ultima $22 million development of Santa Barbara College is L-shape with its 34,900 sq. ft. divided between a two-story build and a one-story wing. Main task facing the architects wa that the Music Classroom Building be consistent with the master plan of a campus for the University of Californ system.

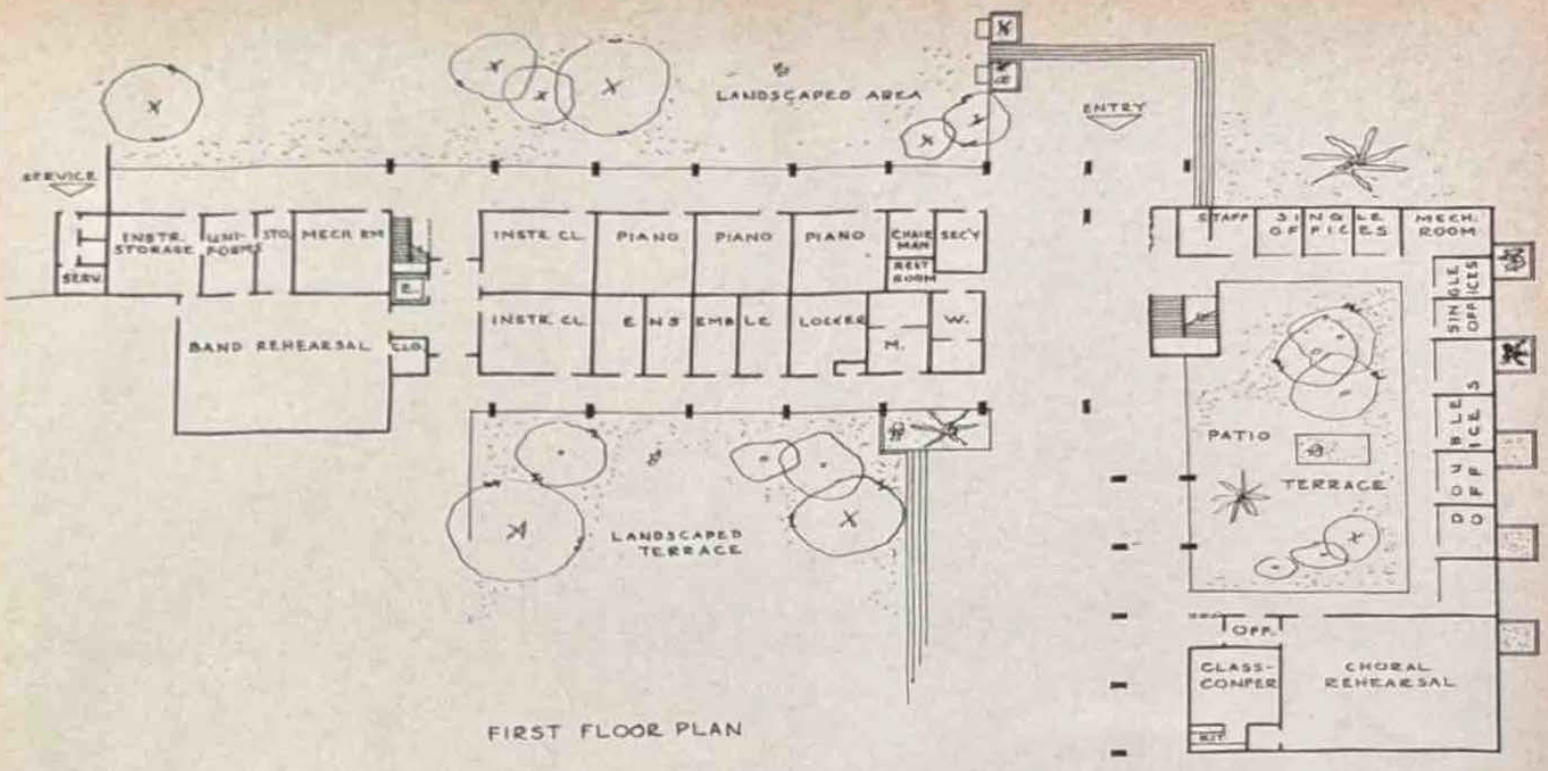
In adapting the indigenous Spanish architecture, the stric "mission" style was rejected as too frigid, formal and life less for contemporary conception of space and travel. How ever, the simple masses, plain surfaces, colonnades, deep over hang of the roofs and patios were retained to preserve the Spanish character. Special emphasis too was given to the achievement of a residential quality as opposed to the institu tional look—a quality maintained through a limit of two stories, use of exterior corridors and cantilevered stairways. A further consideration was that the design concept be appro priate to both building categories: the residential scale, i.e. the compartmented space of residence halls and classrooms and the large unbroken interiors (long span) of the gymna sium and auditorium.

To utilize the architectural vocabulary developed for al construction on the campus, the music building incorporate flat interlocking clay tile roofing, concrete spandrels and specially designed volcanic ash block. The 12-in. square uni has a corner quarter of its surface recessed ⅜ in.; the recessed portion in turn has an outside quarter of its surface recessed an additional ⅜ in., forming the completed design. Th block, which can also be perforated, is a rich cinnamon colo and is waterproofed with a silicone treatment. Walls ar sandblasted to give a textured finish which will require n painting or upkeep.

The building is designed so that it will eventually becom the eastern wing of a proposed auditorium and will be pa of an arts-music-speech center for the campus. In additio to classrooms, the one-story wing consists of department and faculty offices. At the end of the wing is a choral re hearsal room seating 136 and surrounding a sunken patio are where outdoor musical events can be presented. The secon floor is devoted to classrooms, 32 individual practice room and a listening room with control room attached.

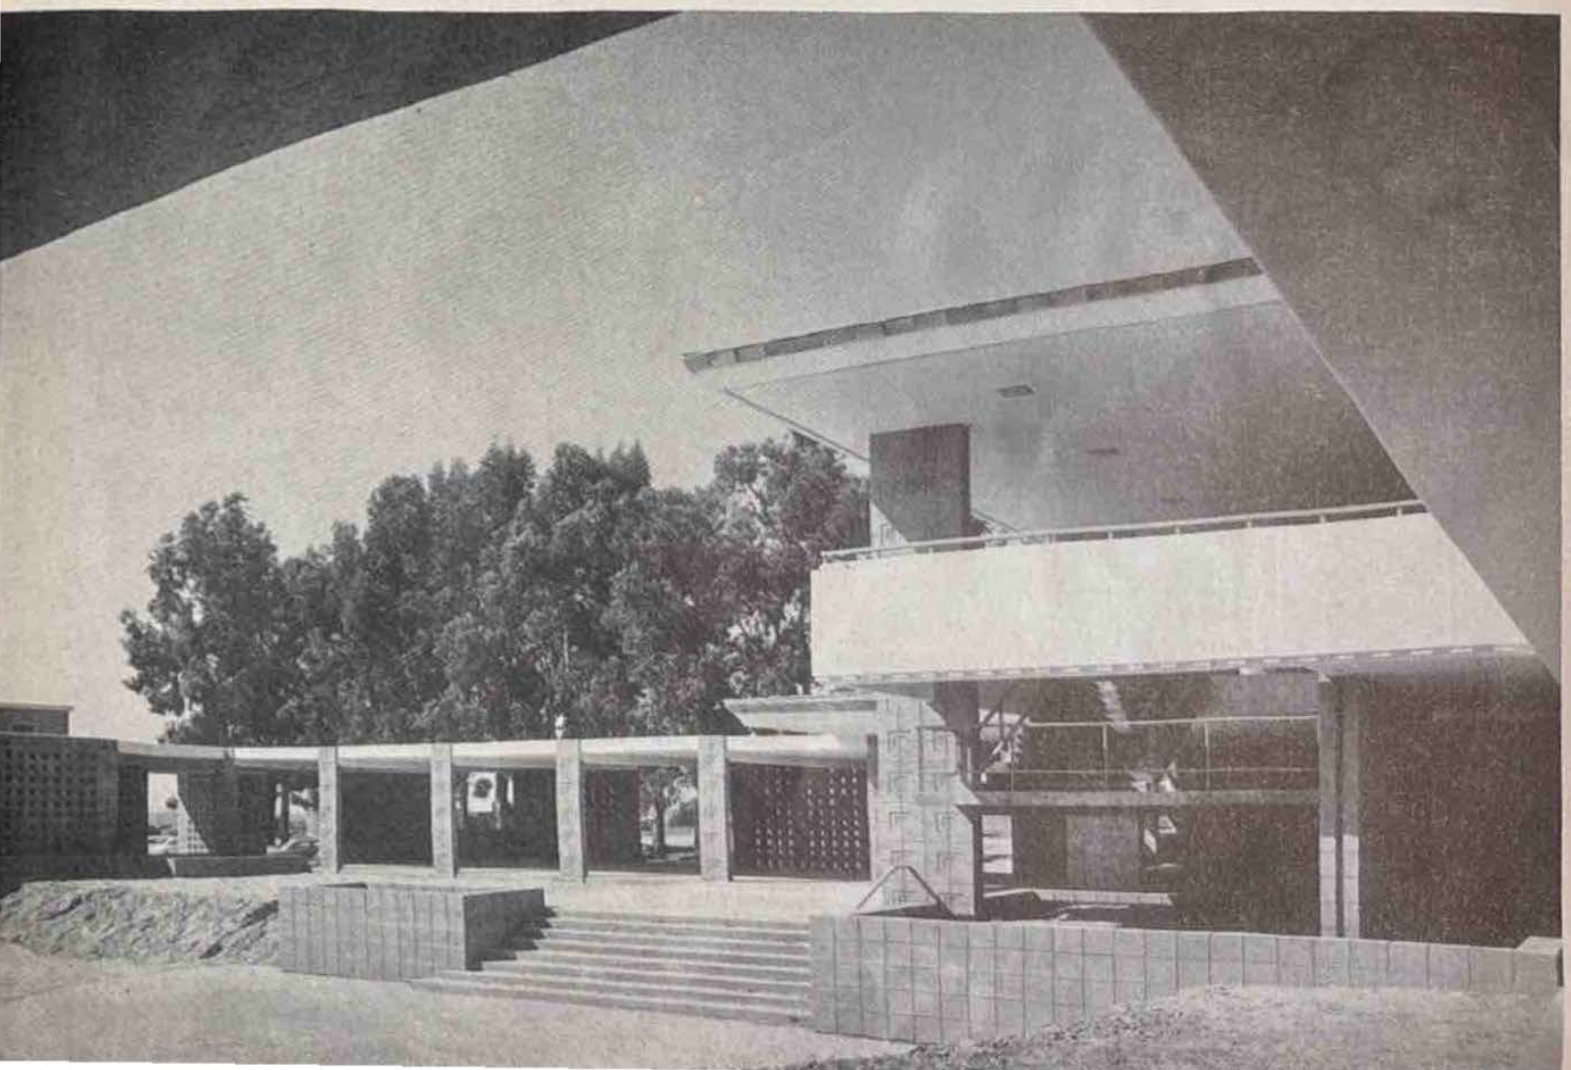
Otto H. Kilian was project manager and James H. Langeheim in charge of design for the architects; Eric Armstron handled landscaping.

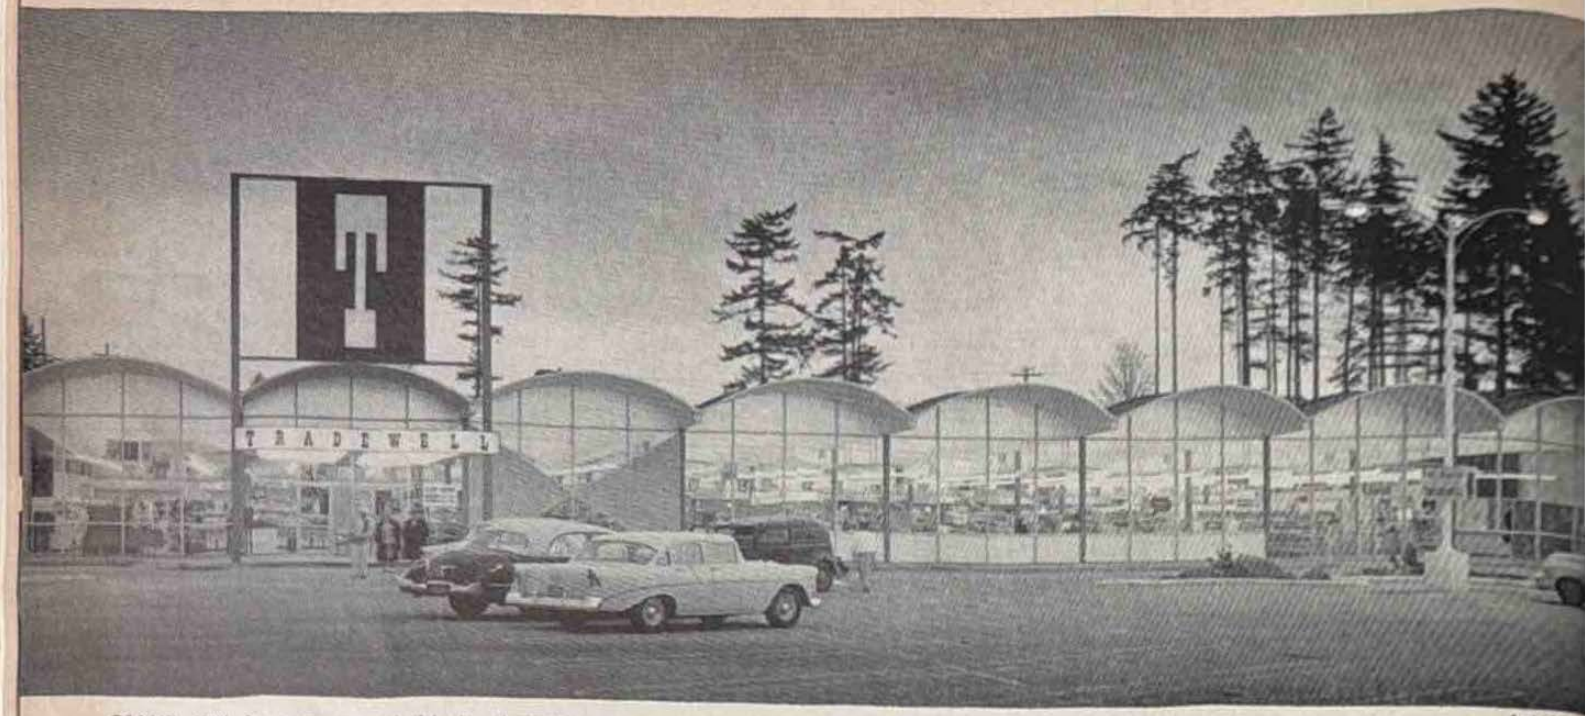
PERFORATED SCREENS along colonnades are important design feature of wind-swept ocean campus.



FIRST FLOOR PLAN

EXTERIOR COLORS range from walnut cream of spandrels, facias and eave soffits through cinnamon of ash block to terra cotta of hard-burned clay roof tiles. English red quarry tile is used in hall and foyer areas. Walkways are of light biege and terra cotta squares.





GIANT "T" in orange and black plexiglass mounted on two steel columns will identify all future Tradewell markets.

TRADEWELL STORES, INC., is setting the design pace for supermarkets in the Seattle area with a thin shell concrete vaulted roof, full glass front and 12-ft. overhang to provide a covered walkway and loading area. The cylindrical shells, which span 20 ft. between columns and whose thickness tapers from 3½ to 2½ in., not only help "sell" the store chain, but offer an expandable, economical type of structure.

First to be completed in an extensive five-year building and remodeling program which will eventually involve about 30 markets was the Burien unit, built at a cost of $275,428 or $10.50 per square foot. The 160x140-ft. store has a sales area of 15,700 sq. ft.; a 1,200-sq. ft. mezzanine for mechanical equipment and an employee's lounge; and the remaining floor area for storage, offices and work space.

A new trademark rises above the building on two steel columns flanking a steel canopied market entrance. The giant plexiglass "T" in orange and black will be the featured monogram on all future Tradewell markets, signing, merchandising and packaging.

Other exterior features are sidewalls of glass, panels of river-run rock and high windows over concrete block walls and a back wall combining concrete block with stud and plaster.

On cold days customers step into a 20-ft. strip of warm air controlled by radiant heating installed in the floor across the store front. There are no turnstiles and a solid railing separates those leaving and entering.

Inside, controlled temperatures provide the proper amount of heating and ventilating, while maintaining ideal temperatures to keep foods fresh and clean.

Floors throughout the selling area are of terrazzo. Interior lighting is fluorescent, with fixtures hung on curved cantilevered steel arms which in turn are hung from the concrete roof beams where the vaults join.

At the center of the 10 checkstands is a newly designed automatic, hydraulic box lift which holds a continuous supply of packing boxes. Market sections are easily identified with hexagonal mobiles suspended from the ceiling. Specific food islands are labeled by number and a list of items on four-winged standards can be read from any part of the store.

A lot which accomodates 262 autos, has been arranged for wide, easy angle parking and is lighted at night.

THREE-DIMENSIONAL plastic sign is attached to 9-ft. brow or overhang, sloping up and out from front of structure for its entire length.

f supermarkets In northern California

Purity Stores, Ltd.

YOUNGER BROS., INC.
General Contractors

PURITY STORES, LTD., which headquarters in San Leandro and operates about 100 supermarkets throughout northern California, has pioneered in the design and construction of "showcase" stores. Executives, in taking their company name to heart, are constantly striving to achieve natural light and a sunny atmosphere in all of the units.

The client's long-range expansion and modernization program has seen markets completed which feature a four-way dome and three facades essentially of glass. The barrel type construction allows for an uncluttered and spacious interior as well as fresh air and sunlight. Building costs have been kept well under $10 a square foot, excluding fixtures. Normally it takes about four months to erect a store ranging in floor area from 14,700 to 20,400 sq. ft.

The Palo Alto unit is the largest to date, measuring 120x170 ft. It is flat roofed and sheathed with fir plywood, reused after first having been employed as framing for the pouring of 8-in. concrete walls. In the wall forming, the plywood panels were secured with 2x4s on 12-in. centers to avoid waviness and to withstand the stress of the vibrators.

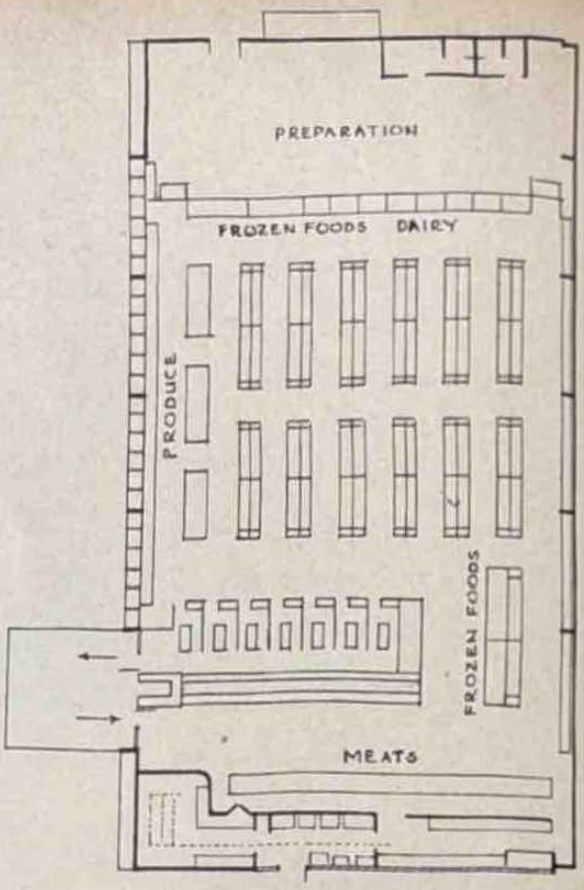
Each of the four glazed enclosures which cover the 76-sq. ft. central area has a 12-ft. rise over the flat portion of the roof. These rises were formed of wide flange sections, supported on four round steel columns filled with concrete and tapering from 15 in. at the top to 24 in. at the base. The columns, made of ⅝-in. steel, were imbedded in concrete to make the roof skeleton earthquake resistant. Two long diagonal arches were triple hinged to permit flexing in two right angle planes.

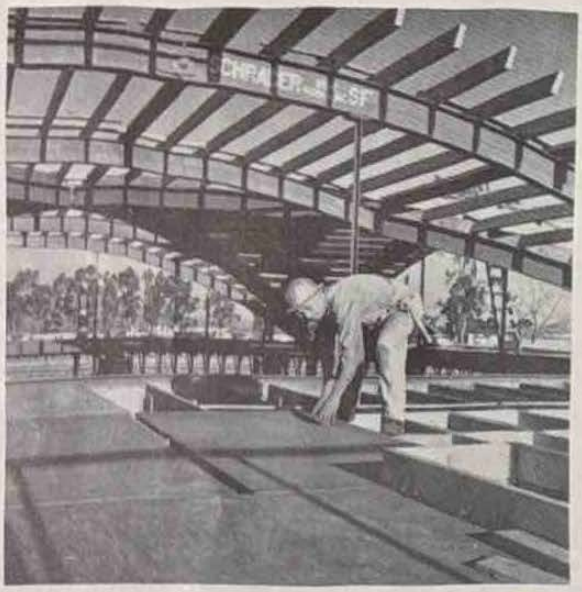
Fir plywood was nailed to 3x8-in. wood joists on 24-in. centers over the curved portion of the roof. The A-face was left exposed because it forms the finished ceiling of the interior; on the flat sections of the roof, the reused plywood was not left exposed.

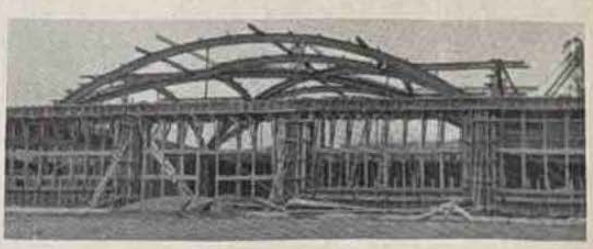
DISPLAY FIXTURES use fir plywood as basic material. All are fabricated in contractor's shop.

SUPERMARKET PROTOTYPE

Fir plywood—¼-in. with the A-side out—also was used extensively as a finish paneling for restrooms and offices. For rough sheathing on the inside walls, as well as in the storage areas, varying thicknesses were employed. All of the supermarket's non-refrigerated store fixtures were fabricated in the contractor's shop and here again fir plywood served as the basic material. These fixtures include grocery gondolas, dump bins, island ends, checkstands, work tables, bins built around the columns and hundreds of linear feet of shelving.

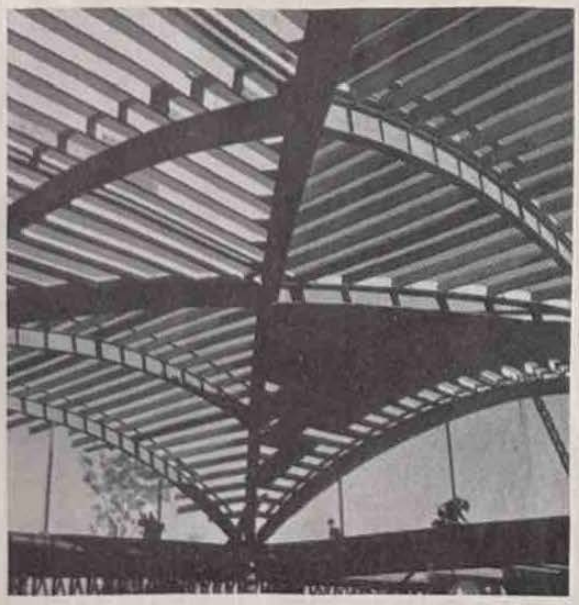






DOME PORTION at left shows application of plywood panels to roof. Joists are 3x8s on 24-in. centers. Above, steel bracing goes up. Roof edges are left protruding during construction and quickly cut off with power saw. Below, view of grained vaulted roof beams before and after sheathing was applied.

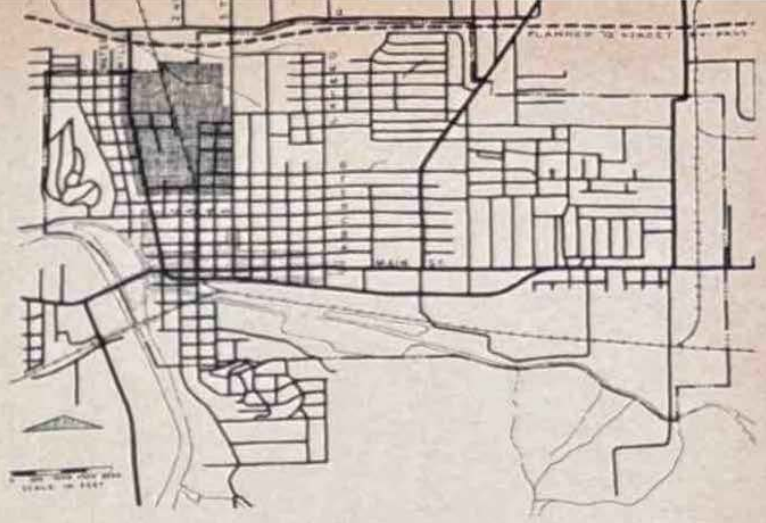
Phil Palmer



There's been much more talk than action in the field of urban renewal, but here's an exception. Springfield is one of the nation's smallest cities to have received approval and financing from HHFA for preliminary planning of its renewal project, a major achievement now in process. As a community effort and expression of a city's growing respect for itself and its future, the Springfield example has significance for our many smaller western towns.

by NORMAN J. JOHNSTON

Action for small town renewal



FOR WESTERNERS, possibly accustomed to associating blight, decay and slums with large cities, all preferably located somewhere east of the Rockies, the evidence of such deterioration in a small West Coast city may come as something of a surprise. Yet western cities are increasingly aware that they too share in the costly social and economic consequences of their physical decline and that these costs are not confined to the precincts of the large city.

So for both of these reasons a process at work in Springfield, Ore., has special significance deserving the attention of our cities, both large and small. It is a field demonstration of what steps are now available to combat existing and future deterioration and how to utilize them in a city whose size makes it more characteristic of the western pattern than some of the more heavily concentrated and complex centers of the East, which also are participating in the renewal program.

Springfield, located just across the Willamette River to the east of Eugene, has a population of some 13,250 persons. Though founded in 1848, its development, largely based on forest products, always had been somewhat in the shadow of its more sturdy neighbor. Not until the '40s and particularly following the close of World War II had it shown any considerable growth, but a growth that, when it came, was to be a heady experience, expanding the town in a 10-year (1940-50) period from 3,805 to 10,807, largely unguided by any official or unofficial planning action.

Springfield's Problem Area

An early area of industrial growth in Springfield had been located in what is now the northwest section of the city. Through here passes a branch line of the Southern Pacific Railroad with a number of industries located by it for service. The principal area of industrial growth, however, found more suitable location on the Southern Pacific's main line at the city's south edge, and the boomtown industrial expansion of the '40s accelerated this growth pattern. At the same time the residential section moved outward to the east and north to cut off this original industrial growth and make of it an island in an otherwise residential district.

Because of this growth trend, as well as the pattern of wind directions, in 1947 Springfield's first comprehensive zoning ordinance recognized the more suitable assignment of industry to the main line with residential zoning to the north, including the old branch line industries. The ordinance therefore granted them a noncomforming use status in a residential zone. The residences in turn were protected from the main line industrial zone to the south by a buffer strip of commercial zoning. Springfield's central business district along Main Street.

The result of this process had been that gradually most of the industries originally located on the branch line shut down or moved to a more suitable industrial area. The remains consisted of a mixture of residences of varying levels of construction and maintenance a few industries (lumber company, log loading yard, and storage and repair yard for heavy equipment) and several large and small tracts of vacant land whose development had been discouraged by lack of access or the negative influences of existing land uses.

Into this picture of neglect and decline there was in 1950 introduced a new factor when the Springfield School District, largely motivated by the attractions of adequate space and cheap land, purchased a site in the area's northeast corner for a new grade school to serve the now dominantly residential uses of this part of the city. But inadequacies of thoroughfares between the school site and residences to the west served to dramatize the area's generally incomplete circulation system that had been allowed to develop through the years, the extra mileage school busses turned each week insuring a continuing awareness among school administrators of existing conditions.

This then brings together the several elements which made up Springfield's problem area and their consequences: conflicting land uses, vacant and untended land, a poor street system, unpaved streets and side-

---

Architect Norman J. Johnston, assistant professor of architecture at the University of Oregon, Eugene, not only has watched the Springfield program for some time and attended community meetings concerned with it, but was employed the past summer in Lane County's planning office.

walks, abandoned mills and neglected residences, and decreasing land and property values with a consequent low tax return to the city.

Pressures for Rezoning

This luxury of neglect, indulged in by both the area's residents and the rest of the city, was found in 1953 to be one they could not much longer afford. For it was in that year that moves were begun by the owners of some of the industrial uses to rezone their property for industry as well as to extend their areas of noncomforming use beyond original limits. Remaining at first in the rumor stage, in August 1954 action was required of the Springfield City Planning Commission when it received a formal request for rezoning from a land owner to permit use of his land for warehouse construction—land which, incidentally, immediately adjoined that on which the school board had built its new elementary school. Majority action on the petition was that it be denied, a decision based on the need for adequate protection for both residential properties and the school district's investment from such an encroachment and reaffirmation of the original zoning decision that the best use of the area's land was for residential purposes.

This same process of petition and denial before the planning commission was again repeated in March 1955 and this time the city council was asked to override the planning commission's second denial. It refused to do so, but called for a public hearing to review the circumstances and hear public reaction to them. This hearing proved to be an exciting one with an overflow attendance expressing mostly resistance to the rezoning. The school board recommended denial of the petition, but main support for both council and planning commission action may be credited to the PTA, which the planning commission had contacted and whose members recognized the implications of the petition and, if granted, its effects upon the area's homes, children and the school. They therefore worked toward creating an expression of this viewpoint within the rest of the area and, in the face of overwhelming support for denial, existing zoning was preserved.

A Proposal for Positive Action

So far the victory was a negative one. The status quo remained, but with all its shortcomings, inconveniences and potentials for continuing deterioration and repeated future requests for rezoning action. But in November 1955 a suggestion was made to the planning commission that held the promise of positive action when Howard W. Buford, planning consultant for the Central Lane County Planning Commission (of which Springfield is a contributing member), proposed that the city initiate a request for funds from the federal government under terms of the 1954 Housing Act for an urban renewal project in the problem area. As the outcome of a public meeting to explain the implications and possibilities of urban renewal, the school board and Willamalane Park Board (which owns and operates park and playground facilities for the Springfield area) expressed reserved interest, but both the city council and the Springfield Planning Commission indorsed the idea 100%, and the CLCPC staff began the initial work leading to a request for funds for planning assistance.

This work in itself involved time and the resolving of important problems. There was the difficulty of both county and city jurisdiction within the affected area (ultimately it was confined to that lying within the Springfield city limits) and selection of an agency to administer and execute the project and meet the requirements of the Housing and Home Finance Agency, which is the federal agency administering the program at the national level (the Lane County Housing Authority agreed to act as that agency). But after a year of initial effort the application in December 1956 was approved and a $65,975 grant was made by HHFA for financing the preliminary planning of Springfield's Third Street Urban Renewal Project, giving the city the distinction of being one of the smallest in the nation as well as the first city outside Portland in the state of Oregon to receive such aid.

Following this approval the housing authority appointed a planning coordinator for the survey (Wesley Kvarsten, a planner on the CLCPC staff, since replaced by Robert W. Maffin, following Kvarsten's resignation last July) and signed a contract with the CLCPC to do the project's basic physical planning work.

At the present time the preliminary report on the land planning of the project, a product of the first half of the year's preliminary planning period, has been submitted to HHFA for approval, and work by the housing authority staff under the direction of Robert Campbell, its executive director, is well on the way toward augmenting that report with detailed plans for property acquisition, demolition, land disposal, financing, property management, etc. These are the "working drawings" of an urban renewal project, the basis for its actual realization once funds have been granted by the federal government.

The Project's Land Planning

The original problem area consisted of around 66 acres, but this has since been expanded to include adjoining troubled areas so that today's project includes about 161 acres containing 280 separate land parcels. Of its existing structures 45% of the houses have been declared to be substandard and 18 of the 22 industrial structures judged a blighting influence on adjacent residences.

Replanning has been based on a two-phase attack: 1) acquisition and complete clearance and replatting of the most seriously blighted core of about 60 acres containing 79 houses—the redevelopment phase; and 2) the rehabilitation phase for properties outside the clearance area with provisions for new public improvements including street paving and lighting, sidewalks, and sanitary and storm sewers, coupled with a campaign for voluntary property betterments through public awareness as well as application of new codes and ordinances that are a requirement for obtaining project approval for HHFA. Redevelopment and rehabilitation within the project area will be the special responsibility of the housing authority, while the city will assume leadership for realizing rehabilitation goals in the rest of Springfield.

The land plan, still in a preliminary form, proposes important changes in the area's existing land uses. Its goal is a revitalized residential section of the city, suitably served by public improvements and services to insure its continuing residential desirability. All nonconforming uses are of course eliminated in the plan, but certain additional land uses have been made. Residential land in Springfield, as well as in the project area, has been predominantly single-family to the neglect of multiple-family needs, and so appropriate acreage has been designated for such multiple-family development as low-density garden apartments. Their locations are well related to proposed major thoroughfares, schools and a park. When the project has arrived at its planned development goal it will have a total of 335 dwelling units.

Another addition to the land use pattern is classified "semi-public" and there the planners have anticipat

evelopment for such uses as churches r fraternal buildings.

An important element of public ervice to residences is adequate pub-ic parks and the present plan includes park of approximately five acres. Since the Willamalane Park Board will be the agency to develop this park, the planning staff has worked with the park board to arrive at the ize and location that best suits the oard's financial abilities as well as ts responsibilities to the rest of the ark district; alterations of earlier lans have been made to arrive at the resent proposal.

School ownership in the project area emains the same except for minor hanges due to thoroughfare pro-osals. Following the construction of the elementary school, the school oard acquired additional property just to its south on which it opened this fall a new junior high school.

Circulation within and through the area had always been inconvenient, one of the factors retarding its normal development. A new street plan has therefore been an important consider-ation in redevelopment planning. The major framework around which cir-culation has been planned is the ade-quate provision for both east-west traffic by extending K Street west to L and, more significantly, north-south traffic connecting the main business district with the projected Q Street bypass, being built as a separate highway commision project just to the north of the city limits. This route has been coordinated with the existing branch line alignment by paralleling it with a one-way route on either side to form a limited access arterial. This permits minimum interference with the potentials of the project plan as well as relieves Mill Street of some of its present traffic loads for which it is poorly suited.

The school board was at first somewhat disturbed by these thoroughfare proposals since their property was affected and they felt they had not been properly informed prior to review of the proposals by the planning commission. However subsequently the board learned its ownership totaling 31 acres in the project area would lose only 2.4 acres and saw relief for present access difficulties, so it therefore indorsed the plan.

This then summarizes the implications of the proposed project plan, still in a preliminary stage, but in general indicating the kind of thinking and direction that has been reviewed and approved by the planning commission and school and park boards. Springfield's project is one of the few renewal efforts in the country involving both redevelopment (40%) and rehabilitation (60%) and for this reason has attracted special attention as well as presenting complications in its design and administration planning.

The Workable Program

By the terms of the 1954 Housing Act under which Springfield's urban renewal project planning is operating, its plan does not involve just the future of the project area itself, but the rest of the city as well. The weakness of earlier renewal legislation was that as fast as one area might be redeveloped, existing conditions, left to themselves, would bring on decay in other areas of the city and in fact jeopardize the future of the very project that at such a cost had received renewal treatment. For this reason the 1954 Housing Act introduced the concept of the "workable program" for the purpose of stimulating local thinking and practices that will be some guarantee of safeguard for the investment a completed urban renewal project represents as well as a deterent to the need for additional projects in the future in parts of the city not now in trouble. So while work on the physical planning, design and administration of

Art integration: four citations

ART AND ITS PLACE IN ARCHITECTURE got more than the usual amount of recognition when five northern California chapters in connection with the AIA Centennial sponsored the most comprehensive design competition ever undertaken in that area. Although one of the jurors, architectural sculptor Harry Bertoia, commented that there were "very few entries that show a relationship of the arts to architecture," it is significant that four of the premiated projects—a church, a residence and two schools—also won citations for art integration. This does not mean that the pieces selected are necessarily great works of art per se; but perhaps the situation was best summed up by juror Pietro Belluschi who, in referring to one of the school murals, said: "This is not, of course, the greatest art, but it is very useful and gay. We must consider the environment we are creating for our children. There is a trend toward more variety . . . more consideration for the children and the atmosphere in which they spend so much time."

BUILDING METHODS and MATERIALS

HOSPITAL PROJECT IN ARCADIA, CALIF., is first use of prefabric ceramic veneer curtain wall which promises to reduce construc costs where method is employed. In closup view of entrance, note f full height panels, 4x10 ft., at lower right corner of photo, uti to enclose portion of main lobby.

Ceramic veneer panel joins curtain wall parade

A PREFABRICATED ceramic veneer curtain wall is available for national use in institutional and commercial type construction as a result of successful pioneering at the just completed Methodist Hospital of Southern California at Arcadia. The project, designed by architects Neptune & Thomas and constructed by Fred J. Twaits Co., was one of five which received top recognition in the Centennial Honor Awards program of the Pasadena Chapter, AIA.

Use of the high fired, glazed masonry facing material in curtain wall construction eliminates the need for a backup wall and thus reduces the required wall thickness and the weight of the exterior wall, which in turn cuts labor time and saves money.

A ceramic veneer precast panel, such as was used at the Arcadia hospital (trademarked CV Panelwall), can be placed in the wall at little more than the installed price of the ceramic veneer facing alone, an approximate cost of $4.50 to $5 per square foot in the Los Angeles or San Francisco area.

The panel is fabricated with lightweight aggregate concrete backing and is 2¼ to 3 in. thick, in units up to 30 sq. ft. A thinner lightweight panel also has been developed, which is 1½ to 1¾ in. thick, for use in window wall construction.

The panel, developed after considerable research by Gladding, McBean & Co. and the Architectural Terra Cotta Institute, is faced with 1-in. thick ceramic veneer, a de-aired extruded precisely finished clay body with an impervious finish.

In the case of the Arcadia project, a satisfactory U-factor to meet rigid air conditioning requirements was obtained by adding 1 in. of vermiculite plaster to the back of the spandrel wall after installation. This insulation covered the metal mullions as well as the masonry panel, thereby eliminating any through-wall metal connection.

Fabrication

No particular problem was encountered in casting the panels. In regard to anchoring connections, strap anchors were attached to the panel reinforcing mesh and embedded in the concrete backing. These were shaped to project at the ends of the panels for attachment to the back of the aluminum mullions. The pan were then set on the concrete fl slab in a cement mortar bed and w bolted to the back of the alumin mullions by toggle bolts through t projecting strap anchors. A fiber g ket was used for insulation betw steel and aluminum. Metal shims w also used to assure proper compres of the polyvinyl gaskets against t aluminum mullion angles. It is p sible to embed anchor points in lightweight concrete panel to m the requirements of any anchor system which the architect or en neer may design.

Installation

Panels were delivered to the j on large wooden easels and unload by forklift trucks. Handling of t panels was facilitated by threaded i serts which were welded to the re forcing mesh and into which steel ey bolts were screwed to provide lifti points. The panels were then lift into place in the four-story buildi by means of standard rigging equi ment. Installation was accomplishe by the masonry contractor, A. H. Ma ted, Inc., in less time than expecte

HOUSE OF THE FUTURE, dramatized in this night view taken at site in Disneyland Park, features four curved wings cantilevered from central utility core. Gleaming white structure is result of more than three years of research by Monsanto, MIT and 12 cooperating companies in building supply and home equipment field. Family food center has been designed not to look like kitchen when not in use. Architects: Richard W. Hamilton and Marvin E. Goody.

Plastic house undergoes test program

The plastic house of the future will be strong, weather resistant, quickly assembled and long lasting. That's the opinion of Robert P. Whittier of the plastics division, Monsanto Chemical Co., who addressed the annual meeting of the American Society of Mechanical Engineers in New York.

"Such a house has already been constructed," Whittier explained, referring to an X-shaped display house of plastic built and opened for exhibition in Anaheim, Calif., in mid-1957.

"The house which has since undergone extensive testing has come out with flying colors. It has attracted a great deal of attention from the building industry," he added.

A provocative design was chosen for the house to demonstrate what sculptured architectural shapes could be produced with commonly used plastic materials. Planning requirements were based on the needs of an average family of four.

The house consists of a square center core with basement beneath. Four wings are cantilevered from the central core which is 16 ft. square. Each wing is constructed of two 8x16-ft. floor sections and two roof sections of the same dimensions, joined together to form a sort of finger.

Limitations adhered to by the architectural staff that planned the structure were that plastics should be specified where it was felt they could offer advantages, currently or projected; that the structure and components should not be imitative merely to gain public acceptance; and that maximum dimensions should be limited to assure ease in shipipng.

Details of the extensive testing program that the house has been subjected to were discussed by Whittier. Significant conclusions gained from this work indicate that technical data currently available on plastic materials can be used to design structures by the same engineering principles applied to standard materials.

Such tests included the effect of shifting of weights within the ho such as would be experienced by f ily and furniture movements. Eff of snow, wind and earthquakes the dwelling were also calculated.

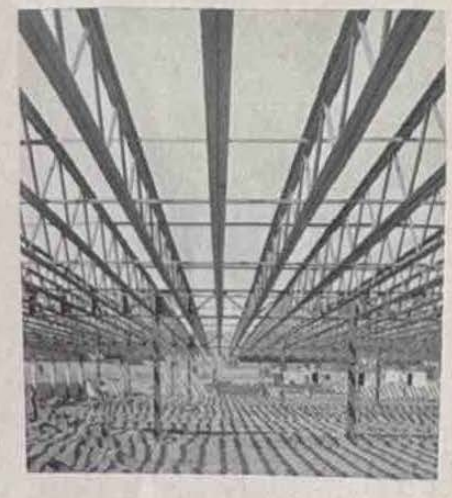
Although the house was never tended to be commercially produ its erection has proven the feasib and advantages of large-scale us plastics in the building industry, cording to Whittier, who served project engineer on the job. Edw D. Schopbach was construction e neer.

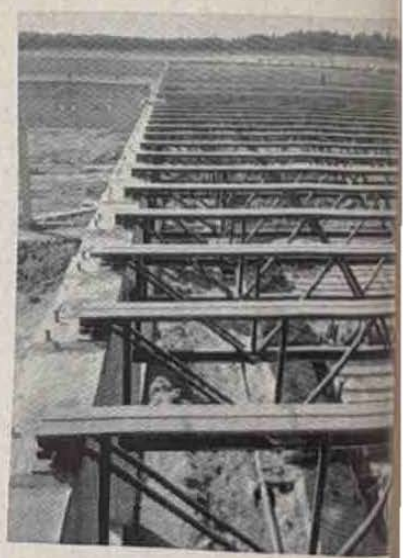
Trainload of steel for Oregon plant

Fourteen carloads of steel weighing 396 tons are framing a 108,000-sq. ft. building for the Tektronix, Inc., plant in Beaverton, Ore. Each unit of this construction is 180x12 and contains 18 bays, 20x60 ft.

The structural system employed V-Lok, an interlocking steel fra

FRAME shown during erection represents 14 carloads of steel.





which locks the roof purlins to the girders by means of wedge shaped slots into which end connectors are driven rather than using bolts, rivets or welding. Girders supporting this system were bolted to the steel columns because of the exceptionally high end reaction at these points.

This is one of the few buildings in the world in which every single structural shape is made of cold roll formed steel. Top and bottom chords of the supporting members are made of Macomber V-section. Web members in these girders and purlins are hollow tubes; steel columns are two channels welded face to face; angles are formed from strip steel. All of the roof framing members are 36 in. deep so that continuous equipment could be suspended and some bays support five-ton cranes attached to the roof purlins.

Mel Loftin was the designer and I. A. Cooper, structural engineer, both of the Tektronix organization. W. E. McChord was the contractor. Steel was fabricated in Canton, Ohio, and erected by Portland Wire & Iron Works, Macomber's representative in that area.

Concrete blocks form bowstring truss

A method of prestressing concrete blocks so that they form an arch, or bowstring roof truss, has been used in the construction of a supermarket in Alpena, Mich. The installation is said to be the first of its kind in the United States and possibly the world.

Eight trusses, each weighing approximately 20 tons, span the 100x150-ft. concrete masonry structure. They are 100 ft. long and can support a live load of 40 psf. Design is effected by special shaped soffit block featuring cast channels in which steel wires are threaded.

Hoisted into position by crane, the trusses are spaced 18 ft. 8 in. apart. Every other truss has an arch of about 13 ft.; alternate trusses rise around 11 ft. This technique gives the foor a folded shell appearance as well as a resistance to heavy snowfall indigenous to that area.

All fabrication took place right at the jobsite. The straight tension tie, or bottom chord, of the truss is composed of U-shaped lintel block (12x16 in.) filled entirely with grout. Post-tensioning is provided for by four flexible tubes, each of which encases 10 prestressing wires.

Assembly of the bow, or top chord, consists of laying two rows of 8-in. high hollow soffit block side by side on previously built light scaffolding. A single row of 6-in. high units is then placed atop the double row. Here again, prestressing wires are inserted in the special grooves.

Both chords are subsequently post-tensioned and grouted. Anchorage is supplied by precast reinforced concrete end blocks. All prestressing wire (¼ in. diameter) is cold-drawn steel, with an ultimate strength of 240,000 psi.

Vertical hangar posts (five per truss) support the bottom chord. They are made up of 8x8-in. units, filled with grout, and two mild steel bars. Roof area between trusses is built of 6-in. pretensioned soffit block planks. All told, there are approximately 25,000 concrete blocks in the roof.

The concrete masonry bow string truss was designed by the Prestressing Research and Development Corp. of San Antonio, Texas. Architect for the Kroger supermarket was A. Charles Jones of Flint, Mich.; general contractor was Elastricrete Construction Corp., a subsidiary of Besser Co. of Alpena.

PATTERNS IN CONCRETE: Plastic and rubber form liners produce an almost limitless variety of textures and patterns for concrete surfaces. The liners also can be used for facing concrete block. Both types of liners are reusable a number of times if handled carefully, need no form oil or bond breaker and produce sharp patterns with a smooth, almost glassy surface that requires no grinding or finishing. Both textured and patterned liners can be used successfully for horizontally precast panels, but only the textured liners have so far been employed in vertical cast-in-place construction. —Portland Cement Association.

(Item No. 1)

LUMINAIRE: A shallow, two-by-four type luminaire called Twin-Lux features diffusing panels with matte finish to improve light distribution and eliminate daylight reflections from windows and open doorways. Fixture is available in two styles, with 40x40-deg. plastic louvers or with acrylic or vinyl diffusing panels. The louvered style can be provided with color filters. Both styles have perforated metal trim betwen the panels. Entire unit is encased in sturdy steel housing with welded sides.—Smoot-Holman Co.

(Item No. 2)

TILE: Latest offering in the tile line is Ramona Starline, a celestial-like pattern which will be available in seven colors. Starline is designed for use with Ramona wall trim and Krystal-glaze tile and will sell at a competitive price with plain color tile.—Pacific Tile and Porcelain Co.

(Item No. 3)

HEAVY-DUTY FLOORING. For durable, slip-resistant floors in industrial plants, offices, hospitals and other similar installations, a composition, trowel applied flooring material is being offered in nine colors and more than 40 different formulations. Selbalith, a magnesium oxychloride cement, can be applied over wood, concrete or steel. It is hard enough to withstand trucking and weight of heavy furniture without indenting, yet sufficiently resilient to stand on over long periods of time without causing fatigue, the manufacturer says.—Selby, Battersby & Co.

(Item No. 4)

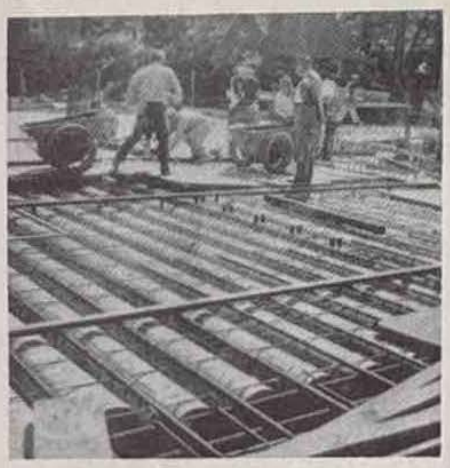
CABINETS: A West Coast firm organized just a few months ago has developed a system for modular cabinets which features precut fir plywood components locked together with a pair of aluminum frames. Assembly of the Arcware cabinets can be accomplished on the jobsite by the builder's crew. No skilled labor is required since the system eliminates all special joinery and makes glue, nails and screws unnecessary. Cabinet faces can be made of any ¾-in. material. All hardware, including knobs, hinges, catches and shelf standards can be premounted on the plywood components while they are flat on a bench or assembly line. — Architectural Hardware Corp.

(Item No. 5)

FIBERGLASS SCREENING: U. S. Steel has entered the fiberglass screening field with a product to be distributed in the West through the Cyclone Fence sales offices. The lightweight, corrosion-proof cloth, woven from glass filaments, is being manufactured in a midwest plant in all standard widths.—American Steel and Wire Division, U. S. Steel Corp.

(Item No. 6)

HOLLOW CONCRETE SLABS: A construction method that produces hollow concrete slabs is said to be not only economical, but also to increase the practical span limits. System is a monlithic one-way concrete plate slab, cast in place and using paper tubes to form the hollows within the slab. Tubes can be cut and positioned to accommodate a variety of design, for placing overhangs, stairs and other architectural features. Hollow spaces



can be used for channels or ducts [illegible] mechanical installations and for [illegible] air ducts.—The Tube Slab Co.

(Item No. [illegible])

HOME INTERCOMS: The Fanf[illegible] combination music and voice int[illegible] communication system is packaged [illegible] two kits for simpler installation. O[illegible] kit is for use when the rough-in wo[illegible] is done, the other is an electronic [illegible] for final installation. The Musi-T[illegible] system incorporates a six-tube print[illegible] circuit AM radio that permits pip[illegible] of programs to as many remote st[illegible] tions as desired.

(Item No. [illegible])

ASPHALT SHINGLE: A giant si[illegible] asphalt shingle is expected to spe[illegible] roof applications and add to the col[illegible] effect. Roofmaster shingles measu[illegible] 16x42.85 in., are tightly sealed to ea[illegible] other by a thick band of Sta-Seal a[illegible] hesive which works without depen[illegible] ing on the heat of the sun. Large ar[illegible] of the shingle reduces the blacko[illegible] effect of numerous edges. — Phili[illegible] Carey Manufacturing Co.

(Item No. [illegible])

DRAINBOARD CAP: Low rolled ed[illegible] of the Hermosa Nu-Vit Lock-set drai[illegible] board cap provides a trim shape lo[illegible] enough for easier maintenance an[illegible] cleaning, yet high enough to preve[illegible] any dripping on cabinets or floor[illegible] Locking device provides a permane[illegible] bond between the cap and the settin[illegible] cement. Installation is easier an[illegible] faster, the manufacturer says, wit[illegible] lock-set groove filled at the same tim[illegible] the entire back is buttered.—Glad[illegible] ding, McBean & Co.

(Item No. [illegible])

CURTAIN WALL SEALER: A cold[illegible] flow bonding agent that can be in[illegible] jected into horizontal or vertica[illegible] seams to provide a permanent, pli[illegible] able seal unaffected by weather o[illegible] other corrosive agents is being mar[illegible] keted under the trade name Panel[illegible] seal. While developed primarily t[illegible] seal seams or joints between two ver[illegible] smooth surfaces such as glass an[illegible] metal, it can be used on other porou[illegible] and non-porous building surfaces[illegible] Panelseal will stretch or contract a[illegible] adjacent panels expand or contract[illegible] A single-component caulking sealant[illegible] it eliminates the need for on-the-jo[illegible] preparation; is supplied in aluminum[illegible] lined cartridges with disposable plas[illegible] tic tips or in bulk packs.—Pepco Divi[illegible] sion, The Bettinger Corp.

LITERATURE

EPHEMERIS: The 1958 edition of the Gurley Ephemeris is now ready for distribution to surveyors and engineers and to instructors and students of surveying. For the third year, the Ephemeris features charts to simplify computation of Polaris. Also included is an almanac listing 28 selected stars for determining stellar observations, charts for the sun and Polaris, as well as definitions of astronomical terms and a number of sample problems. Tables are abridged from the American Ephermis and Nautical Almanac and the Standard Field Tables of the Bureau of Land Management.—W. & L. E. Gurley.

(Item No. 12)

METAL LATH: A four-page specification check list should be a valuable aid to architects, engineers, contractors in preparing metal lath and plaster specifications. Each of the principal metal lath assemblies including partitions are covered. Brief and to the point, in outline form, the required materials are named, followed by each operation.—Metal Lath Manufacturers Association.

(Item No. 13)

GLASS BLOCK: The recently introduced color glass blocks and the comparatively new concept of glass block curtain walls are described in a handsome 32-page publication. Full information is given on light transmission, insulation values, accessory materials and specifications. Included are seven pages of detail drawings of elevations and sections of typical glass block panels. Physical performance data is outlined, as well as guides to the selection of the proper type of block.—Pittsburgh Corning Corp.

(Item No. 14)

STONE: "The Modern Stone Age Is Here" offers suggested uses of stones and stone patterns for many types of construction. Other features include a pictorial review of the use of stone through the ages from the time of the cave man on through Egyptian, Grecian, Roman, Medieval, etc., periods to the present time. Every type of quarried stone is depicted in natural colors.—Building Stone Institute.

(Item No. 15)

PRESSURE TREATED WOOD: The "Architect's Guide" gives a brief, concise description of the damage that decay, insects and termites can do to untreated wood. Among the illustrations is a drawing depicting how termites build runways over obstructions and towers to wood that is not in direct contact with the earth. Last half of the eight-page brochure lists recommendations for use of pressure treated wood for vital structural members (and for the entire wood framing if drywood termites are prevalent). Typical building specifications are included.—Western Wood Preserving Operators Association.

(Item No. 16)

SLIDING GLASS DOORS: Excellent color photographs dominate a 16-page publication on the Ador line of sliding glass doors. The brochure introduces the new Thermo door designed exclusively for use with 1-in. dual glazing. Actually two doors in one, it has an outer frame and an inner frame separated by continuous strips of non-metallic insulation for control of heat flow and to reduce condensation. Brochure also contains extensive drawings and closeup installation details.—Ador Sales, Inc.

(Item No. 17)

PRESTRESSED CONCRETE: A number of brochures and magazine reprints have been assembled in a binder offering engineering data and technical information on prestressed concrete. Dimensions, physical properties and table of loadings for double tees, channels and joists are included, as well as drawings and construction photographs.—Leap Associates.

(Item No. 18)

PAINT: To assist architects in the selection and specification of the proper finish for most types of surfaces, Glidden has prepared a 28-page manual which includes a comprehensive chart that matches various painting systems with materials, surfaces or problems and types of finishes. Manual also includes an evaluation of painting systems, detailed specifications for both exteriors and interiors and a quick-reference index.—The Glidden Co.

(Item No. 19)

PLUG-IN BUSWAY: General Electric introduces the company's new 100-ampere plug-in Flex-A-Power busway with a 12-page bulletin giving complete details on the unit and its installation. Available in both three- and four-pole construction, the busway was designed for indoor use in industrial plants, commercial buildings, manual training shops and laboratories where plug-in receptacles over a wide area are necessary. — General Electric Co.

(Item No. 20)

STEEL FRAMING: Design details are shown in drawings and photographs in a 40-page reference manual on V-Lok steel framing. The brochure includes a typical framing plan for an industrial layout, selected details for gymnasium roof, school corridor and masonry wall and a two-page overall view of the system in a complete school layout.—Macomber, Inc.

(Item No. 21)

VENTS: A four-page brochure depicts modular brick size vents in cast aluminum designed for stormproof venting of confined spaces. C-S vents are recommended for air conditioning intakes, ventilation of roof spaces, crawl spaces, pipe tunnels, hung ceilings, bathrooms and other installations. Five sizes are supplied for standard brick and two sizes for jumbo brick.—Construction Specialties, Inc.

(Item No. 22)

SUPPLIERS

• **Portland Cement Association** has named Daniel E. Seymour as public relations representative for Washington and 11 counties in Idaho.

• **Kaiser Gypsum Co.** of Oakland, has named William R. Soule as administrative assistant to Claude E. Harper, vice president and general manager.

• **T. M. Pollard** of Spokane has been appointed distributor of GRID unit heaters, blast heaters and radiators, covering 18 counties in Washington, seven in Idaho and eight in Montana.

• **O'Keefe & Merritt** of Los Angeles has promoted W. W. (Wally) St. Clair to general sales manager.

• **Peerless Electric Co.** of San Francisco has a new national sales manager, John C. Epperson, who also is vice chairman of the Golden Gate Section, Illuminating Engineering Society.

• **Trueforms, Inc.**, with headquarters at 414 Times Square Bldg., Seattle, has introduced in the Northwest a new type of concrete form tie and hardware system for all kinds of concrete forming. Homer Allen, president and general manager, says that one of the system's advantages is the ability to provide an architectural concrete finish economically.

• **Williamson Cascade Pumice Co.** of Bend, Ore., has become Cascade Pumice Corp., following its sale to Boise Cascade Corp., with headquarters in Boise, Idaho. Former owner Lloyd A. Williamson, who is president and general manager of the new corporation, has announced the addition of a sales manager, Ralph H. Young of Seattle.

• **Weber Showcase and Fixture Co., Inc.**, of Los Angeles has a new director of industrial relations, Albert E. Johann.

• **The Payne Co.**, which has opened a new plant facility and home office in La Puente, Calif., has appointed two new factory sales engineers—William F. Steiner in northern California and Dick Judson in Oregon and southern Idaho.

• **Tamco Corp.** has appointed Harold G. Ward as regional sales manager for northern California, with headquarters in Pleasant Hill.

• **Trimview Metal Products** of Covina, Calif., has allocated an initial grant of $500 to the California College of Arts and Crafts in Oakland to help promote a student project of designing new handles for aluminum sliding glass doors.

• **Forest Fiber Products Co.** of Forest Grove, Ore., has a new merchandising manager, John W. Cain, most recently account executive for the Gerber Advertising Agency.

• **Pacific Tile and Porcelain Co.** of Los Angeles has appointed Walter F. Pruter Jr., formerly with Kaiser Aluminum and Chemical Sales, Inc., as general sales manager.

• **Ruby Lighting Corp.** has completed a major expansion move into new manufacturing facilities at the Whittier, Calif., plant of the parent company, Ekco Products Co.

• **Fibreboard Paper Products Corp.** has appointed Paul E. Fischer as manager of manufacturing-building materials division, with headquarters at the company's executive offices in San Francisco.

• **Pack River Tree Farm Products** through its Thompson Falls, Mont., lumber manufacturing plant received the 1957 citation award for Mos during National Employ the Phys ly Handicapped Week.

• **United States Plywood Corp.** named Wallace E. Williams as dire of its newly created West Coast wood purchasing headquarters in attle.

• **Westinghouse Electric Corp.** appointed William L. Constance Pacific Coast regional manager air conditioning division, working of Los Angeles for the present.

• **Southern Sash of California,** is the name of a new branch sales fice and warehouse opened at 720 liams St., San Leandro, Calif., Southern Sash Sales & Supply Inc., with Pat Madden as sales ma ager.

• **United States Ceramic Tile Co.** its subsidiary, Sparta Ceramic Co., part of its new marketing program southern California, has named D nis Affeldt as district manager opens display and warehouse servi at 813 N. La Brea Ave., Los Ange this month.

• **DeVilbiss Co.** has named Georg Fulton to the post of West Coast gional sales manager, with headqua ers at the firm's direct factory bra in Los Angeles.

• **Stran-Steel Corp.** has appoin Virgil D. Brown as architectural ducts zone engineer for six west states—California, Washington, O gon, Nevada, Idaho and Arizona maintaining headquarters in Francisco.

• **Douglas Fir Plywood Associat** of Tacoma has promoted Stanley Taylor to field promotion direct succeeding Joseph Weston, who retired after serving the organi tion since 1938.

• **Laminated Woods, Inc.**, of Seat wholesale distributor of Rilco Weyerhaeuser products, has appoin Charles B. Bay as sales engineer. company's warehouse, first of its k in the nation, supplies builders w immediate delivery of stock sizes laminated beams for commercial residential construction which p viously took from six to eight we

• **Structural Laminates, Inc.**, is a n firm in Beaverton, Ore., devoted manufacturing panels for roof, fl and wall construction.

OFFICE BUILDING at new headquarters of western division, Titan Metal Manufacturing Co. on southeastern edge of Newark, Calif., is one of three structures just completed. Facilities establish new source of brass products for industries throughout 11 western states and is only brass mill in northern California. Architects-engineers: Garretson & Elmendorf; general contractor: Rosendahl Corp.

An Exclusive Gladding, McBean & Co. Product

EQUAL PERFECTION ON ALL FACES

The dry press process is used by Gladding, McBean & Co. to produce SCR brick for partition walls that have both sides exposed. No kiln marking on one face as found in brick made by the stiff-mud process.

ENDURING BEAUTY WITH STRENGTH

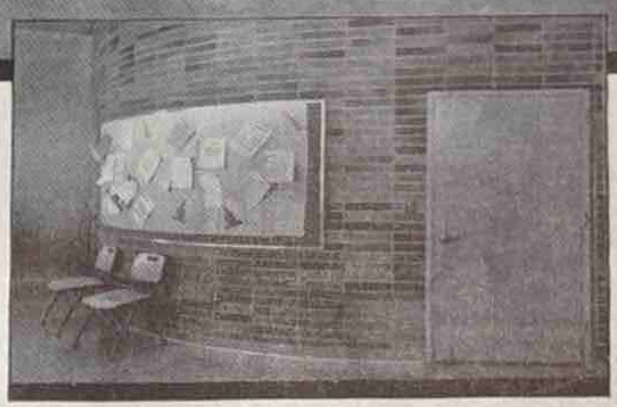
Partitions have the warm color of burned natural clay with pleasing variations in shading, and with strength to support roof beams.

EASE OF INSTALLATION

Gladding, McBean's SCR dry press units are cored with 5 holes large enough for ⅝ inch reinforcing rods, and electrical conduits. Voids around reinforcing steel are slushed full with grout.

LOW COST AND MAINTENANCE

Gladding, McBean's dry press SCR brick was installed in the McLoughlin Junior High School at "in-the-wall" costs competitive with non-masonry construction. Total cost of this school was $11.74 per sq. ft. of floor area. SCR requires no extra surfacing and offers the extremely low maintenance associated traditionally with the beauty of brick.



IN VANCOUVER, architects McCoy and Bradbury selected the new dry press SCR brick for the McLoughlin Junior High School. General Contractor: LEWIS CONSTRUCTION CO. Masonry Contractor: PAUL PARKER.

T-SQUARE TALK

New Firms, Associates

Albert Sigal Jr. and Milton F. Johnson have formed a partnership for the practice of architecture, with offices at the Stanford Professional Center, Palo Alto, Calif. Both were graduated in 1952 as members of Stanford's first masters class in architecture Sigal has conducted his own office in San Francisco since 1956; Johnson has been associated almost continuously with Stanford since his graduation.

The San Francisco architectural firm of Ambrose & Spencer is now known as Spencer & Lee, with Eldridge T. Spencer and Alton S. Lee as participating partners. William Clement Ambrose, a partner in the firm since 1943, has retired from active practice. He recently received an honorary award from the Building Industry Conference Board.

Clark Goldsworthy, a graduate of Washington State College, has been made an associate in the office of Thomas F. Hargis, AIA, of Yakima, Wash.

Office Moves

A. O. Bumgardner, AIA, to 2017 Broadway N., Seattle (MInor 8178).

Deaths

Charles T. Miller, AIA, of Seattle, died of a heart attack December 26. A graduate of the University of Michigan, he was a partner in the architectural firm of Miller & Ahlson.

Frederick Law Olmsted Jr., 87 landscape architect who drew up the master plan of California's state park system, died December 25 at Malibu Beach where he had lived the past year. Educated at Harvard University, he served his apprenticeship under his father, Frederick L. Olmsted Sr., who designed New York's Central Park and helped plan the Stanford University campus.

Appointments

James J. Chiarelli, president of the Washington State Chapter, AIA, has been appointed to a three-year term on Seattle's Board of Adjustment, which acts on applications for zoning variance and conditional use permits.

Marvin I. Kudroff, associate in the Los Angeles architectural-engineering firm of Daniel, Mann, Johnson & Mendenhall, has been named director of engineering.

Vinton Frost, who has been with the office of John C. Lindsay, AIA, as business administrator the last five years, has been appointed vice president.

Elections

Camile Van De Weghe has been elected 1958 president of the San Francisco Architectural Club, which holds spring classes in architecture at 507 Howard St. Other officers: O. Hichenlooper, vice president; James O. Brummett, secretary; and J. W. Tasker, treasurer.

Wendell R. Spackman, AIA, of San Francisco has been elected 1958 chairman of the Bay city's Building Industry Conference Board, succeeding K. E. Parker, contractor. New vice chairman is Dudley Deane, consulting engineer, and William E. Hauge of AGC continues as honorary secretary.

Magazine Awards

Paul Hayden Kirk of Seattle has won four of the five cash prizes presented in House & Garden's 1957 architectural awards competition. He won both first and second prizes ($1,000 and $500) in the class for larger houses and two of the three cash prizes ($500 each) for houses under 1,800 sq. ft. Other West Coast winners: $500—Smith & Williams of Los Angeles; special mentions —Robert Billsbrough Price (2) of Tacoma and Paul Thiry of Seattle. Only other winner was a Houston firm—Preston Bolton and Howard Barnstone.

Six of the seven top awards in the fourth annual interior design awards program sponsored by Institutions Magazine have gone to West Coast architects and designers. Douglas Bennett of Seattle won an award of special distinction for the Chart Room and Westward Lounge of the Westward Hotel, Anchorage. Awards of merit went to Victor Gruen Associates, Beverly Hills; Mario Gaidano, San Francisco; Thorton Ladd & Associates, Pasadena; Robert K. Grubb, Portland; and George Vernon Russell, Los Angeles.

Correction

Architect Ray Densmore has opened his own office at 140 N. Robertson Blvd., Beverly Hills, Calif., rather than in Pasadena, as was reported last month.

With the AIA

Howard L. Cook will be inst as president of the Hawaii Cha AIA, at the annual awards dinn Honolulu January 24. Other newly elected officers are Douglas W. Freeth, vice president; Clifford F. Young, treasurer; and Frank S. Haines, secretary. Directors are retiring president Richard N. Dennis, Frank Slavsky and William D. Merrill.

A partner in the firm of Wimb & Cook, the new president is a g uate of the University of Wash ton. In 1940 he went to Hawaii w he was employed as an architec military work at Pearl Harbor.

Coast Valleys Chapter, AIA, California has elected W. L. Higg president; Paul Huston, vice pr dent; William Daseking, treasu and E. N. Chamberlain, secretary

IN SAN DIEGO—Retiring president of chapter, Sim Bruce Richards, presents gav Raymond Lee Eggers, while Glenn Bakh, heads California Council, AIA, looks on.

San Diego Chapter, AIA, has ele ed these officers: Raymond Lee E ers, president; William F. Wilmu vice president; Lloyd P. A. Ruoc secretary; Delmar S. Mitchell, tre urer; and John C. Deardorf, Richa George Wheeler and retiring preside Sim Bruce Richards, directors.

The Women's Architectural Leag has named this slate: Mrs. Earl MacDonald, president; Mrs. Robert Des Lauriers, vice president; M Frank D. Harrington, recording sec tary; Mrs. William Lumpkins, trea urer; and Mrs. Richard Pinnell, co responding secretary.

Officers of both organizations we installed at the annual Christm party December 11 at the San Die Yacht Club.

MOVIES

The Man from Missouri. Asbestos-Cement Association, 509 Madison Ave., New York 22, N.Y. 16mm sound, color, 18 min.

Illustrates how builders throughout U.S. are using cement-asbestos siding to increase sales of medium and higher priced homes. Written by Newton Meltzer whose credits include "Kraft Theater" and "You Are There" TV programs.

Steel in Concrete. Modern Talking Picture Service, 3 E. 54th St., New York, N.Y. 16mm sound, color, 38 min.

Covers theory and use of steel reinforcing bars in concrete structures. Actual laboratory demonstrations are conducted to show effects of stresses and strains upon unreinforced structures, interpreted and applied by designing engineer and/or architect. Also discusses problems of crack control, bond and anchorage which enables steel and concrete to act together as a unit, and ductility which determines ability of new billet steel reinforcing bars to be bent safely.

Lift Slab. Great Lakes Lift Slab Corp., 5306 W. Lawrence, Chicago, Ill. 30 min.

On-the-job shots show 1) pouring footings, 2) erecting columns, 3) pouring slabs one on top of the other, 4) lifting and securing slabs in place. Engineering limitations and freedoms of method are described.

This above All. Insulation Board Institute, 111 W. Washington St., Chicago 2, Ill. 16mm sound, color, 13½ min.

Traces development of roofs from prehistoric times to present, showing newest type of roof deck slab produced by insulation board manufacturers. Largely done in animation.

One Hundred Years of Roofing Experience. Johns-Manville, 22 E. 40th, New York, N.Y., 16mm sound, color, 20 min.

Shows step-by-step procedure for applying built-up roofing and results of several laboratory tests.

Planning a School Library. Remington Rand Division, Sperry Rand Corp., 315 Fourth Ave., New York 10, N.Y. 16mm sound, color, 23 min.

Demonstrates purpose and use of furniture, correct space allocation, arrangement of various types of equipment and need for correct lighting effects and floor coverings. Directed toward architect, administrator and librarian.

Controlled Climate. Armstrong Furnace Co., 851 W. Third Ave., Columbus 8, Ohio.

Tells story of man's search for comfort from his days as caveman up until the present in non-commercial way. Accompanied by 24-page, full color comic book to be used as pass-out piece after movie has been shown.

The Modern Touch. Resin Division National Starch Products, Inc., 270 Madison Ave., New York 16, N.Y., 16mm sound, color, 15 min.

Presents colorful demonstration of vinyl paint applications at both indoor and outdoor locations. Shows how these paints can be applied over surfaces alkaline in nature and uneven in absorption without telltale marks.

bond plastic foam insulation to smooth walls better with

FOAM FAST*

ADHESIVE

*Trademark Registered

FOAM FAST provides a superior bond between plastic foam insulation and smooth surfaces of concrete, masonry, metal or wood. Just follow simple mixing instructions combining FOAM FAST Latex and FOAM FAST Powder. There's nothing else to add. FOAM FAST is easily applied with push box or trowel. Write or call for specifications and prices.

SEATTLE • PORTLAND • SPOKANE

the Third Street Urban Renewal Project has been going on, action has been taken which will effect all other sections of Springfield and their citizens.

A first step, with recommendations from Springfield's Mayor Edward C. Harms Jr., was appointment by the housing authority chairman Douglas Spencer, of a 17-member Citizens' Advisory Board to work toward developing public understanding, advice and support for the renewal idea. Its members represent a wide range of backgrounds, as is required by the law, and in this case includes housewives, realtors, bankers and businessmen, a builder, sales manager, architect, former city councilman and high school principal.

The board's responsibility has been to work toward sufficient community understanding of and participation in the urban renewal project that it will be received and developed as the product of local efforts deserving interest and support and not some imported plan imposed by a distant agency, at the same time avoiding false information, rumor and misunderstanding. To date the board has published one pamphlet mailed to all households in Springfield, which in very general terms explains what the renewal project means for Springfield, and is in the process of preparing another more elaborate publication to answer the questions of local citizens as later phases of the program are reached. Board members have also been made available to all types of community organizations such as service clubs and church groups to explain the purposes and opportunities of the project.

In addition to their basic responsibility of community awareness, the board has been further organized into four separate committees, each assigned to work simultaneously on specific phases of the workable program:

1. Committee on Codes, Ordinances and Administrative Organization: This committee is working to see that the city has an adequate zoning ordinance as well as building, fire prevention and housing codes. In some cases this means acceptance of or minor revisions to existing codes and ordinances (as the zoning code) or submission of new ones to the city council for passage (as in the case of the new housing code which the committee has prepared). This is in addition to proposals the committee will make to HHFA as to what steps the city has taken and proposes to take to achieve the workable program in all its phases.

2. Committee on Neighborhood Analysis and the Comprehensive Community Plan: Analysis of existing conditions throughout the city's residential areas to find out what exists and what is needed for good living environments is this committee's assignment. It has been encouraging the formation of neighborhood councils to act as a do-it-yourself force for community betterment, each council to have jurisdiction over a neighborhood area, developing a spirit of unity and participation within these units of the community pattern.

The work the planning commission has already done toward developing the city's comprehensive plan is being augmented by the work of this committee, including studies for land use, thoroughfares, public facilities and a capital improvement program.

3. Committee on Citizen Participation: The appointment of the advisory board is in itself the result of the broad citizen participation required by the workable program. This subcommittee works particularly with those people living within the project area. Members have visited each of these families to give detailed explanations to the residents of what urban renewal means to them and to answer questions that may develop as the project planning progresses.

4. Committee on Finances and Housing of Displaced Families: The financing phases of the program appear quite bright for Springfield and the committee. The renewal project, cost of which is estimated to be $668,634, is financed by a sharing of that cost between the federal government and the city in which the former pays two-thirds and the city the remaining one-third. This financing covers the deficit between what it will cost the city to acquire and clear the land and what it will receive when it sells the land to private owners for actual redevelopment.

The city is permitted payment of its share by receiving credits for improvements it makes in the project area, including street and sidewalk paving, storm and sanitary sewers and school construction (the new junior high school is eligible for credit). The city manager, E. Robert Turner, has informed the committee that Springfield's share of the project cost can probably be financed out of its normal operating funds over the three-year realization period in which actual clearance and renewal takes place, once approved.

It has been realized that one of the issues of potential opposition to renewal is that of displacing families now living within the clearance area. The subcommittee is still at work this rather touchy phase of its assignment; a requirement of the workable program is that plans for the rehousing of all displaced families in decent, safe and sanitary dwellings must be prepared and approved before renewal funds are granted.

If Approved, What Then?

It is now expected that the first year's preliminary planning phase, including land planning studies, administrative and financing details and the workable program, will be finished some time during the first half of next year. If approved, what then?

First, it will be up to the people of Springfield, through their city council, to decide whether to proceed with the actual renewal as called for in the plan. Presumably, on the basis of the understanding and support the advisory board has developed in the city, this approval will be given.

Then will follow a three-year period during which time the housing authority plan for land acquisition, financing, development, etc., will go into operation. Once cleared, the land will be made available to public and private developers for its improvement as indicated by the final development plan and within a "reasonable period" of time. These requirements will be contained within the deed transferring the land to its new owners. The ultimate product will be a redesigned and revitalized area as envisioned by the development plan, taking its place in a community which is in the meantime going through a process of self-help and improvement intended to insure that the conditions bringing on deterioration and blight will not repeat themselves in Springfield in the years ahead.

The Springfield Spirit

So far Springfield's progress toward renewal has been marked by minor misunderstanding and opposition. The people living in the clearance area have been mostly cooperative and helpful in their attitude toward their place in its ultimate redevelopment, and good work has been accomplished through the activities of the Citizens' Advisory Board. On the other hand, there have been some in the city who might normally be expected to provide leadership for a movement of such importance to Springfield's future, but are reluctant to do so because of a political philosophy which tends to resist the participation of the federal government in local affairs. Or there are plain cases of misinformation: in

r housing Hungarian refugees, or is e land to be cleared and trees anted? But on the whole the pro- am has received considerable public couragement and participation.

This technique of citizen committee as been widely used in Springfield d much of the city's past success in ch programs as street tree planting, ain Street closure for a "shoppers' radise," passage of a library bond sue and voter approval of expansion the city's tax base indicate how ell it has worked on issues besides ban renewal.

Why is this true in Springfield? hat factors have permitted this rela- vely small city to tackle its prob- ms in a constructive and progressive ay which is too seldom found? In pringfield it is phrased quite simply: nfidence in government. In recent ears the average age of key people the community has been low Mayor Harms, City Manager Turner d City Planning Commission Chair- an Donald H. Lutes, an architect, e all in their early 30s) and this obably has something to do with eir willingness to consider new ideas d, once accepted, to back them with thusiasm. From the city council d city departments has come a similar spirit of cooperation and enthusiasm.

To this kind of leadership Springfield citizens have responded with non-partisan confidence and support. Much is yet ahead; urban renewal, still in a planning stage, is one of the more dramatic evidences of the Springfield spirit. So it seems particularly appropriate that both in its planning and in its ultimate realization, renewal is asking of Springfield people the kind of democratic spirit that it appears they are, by their own past evidence, most able to give: citizens cooperatively working to achieve a quality of community worthy of their individual aspirations and the promise that Oregon and the West Coast suggest for their city's future.

Ed. Note: The "shoppers' paradise" experiment will be covered in an early issue.

School costs (Cont'd from p. 10)

school building costs have risen 2½ times in the last 20 years, while the overall building cost index has risen three times in the same period.

Caudill said that citizens should think in terms of the total cost of the school and its effect on the tax bill, not in terms of square foot costs or other per unit costs. "Nobody buys a square foot of school," he declared, and challenged anyone to accurately define such a unit and then have that definition unanimously accepted.

"Square foot cost is dangerous because the easiest way to sell anything is on a cost basis," Caudill said. "Therefore, districts use different means of figuring unroofed walking space, overhanging roofs, corridors, ducts and tunnels." Practically any trick will be resorted to in order to increase the total area for this type of construction, he explained. Because it is so deceiving, it is one of the biggest problems.

He cited several variable, and often uncontrollable, factors which enter into the final cost of a school. Some of these are climate, soil conditions, nature of site, number of children, quality of construction and educational program.

Per pupil cost is just as dangerous, he pointed out. Many schools build just the central facilities or the core and then add other facilities at a later time. This gives a low original per pupil cost, but is not an accurate determination. Methods in computing enrollments also cause variations in this system, he added.

Today's homebuyers are sold on complete telephone planning

Elmer V. Moss, award-winning Seattle builder, says "I wouldn't think of building a home without telephone plans." His 250 homes, ranging from $13,250 to $30,000, feature concealed wiring and most of them have three conveniently-located telephone outlets.

Concealed wiring, built-in outlets, color telephones, kitchen and bedroom phones — these are features your buyers look for! Leading architects and builders include some or all of these in every new home. They know how much telephone planning adds to the value of a home . . . that it makes for better-built homes and satisfied buyers.

Pacific Telephone

We'll be glad to help you plan built-in telephone facilities. Just call our business office and ask for our free Architects & Builders Service.

It pays to include Telephone Planning in every home you build!

THE CALENDAR

Landscape architects hear related professionals

Interprofessional relations was the theme when the California Council of Landscape Architects held its third annual convention at Monterey recently.

William Penn Mott Jr., Oakland superintendent of parks, was the featured speaker on a panel discussion entitled "Should More Public Works Be Designed by the Landscape Architect in Private Practice?" Other panel members were Raymond E. Page of Beverly Hills and Donald van Riper of Sacramento. Howard O. Boltz, head of the landscape architecture major at California Polytechnic College, was the moderator.

Guest speaker from other professions included three representatives of the California Council, AIA—William Glenn Balch, president; L. F. Richards, vice president; and Melton Ferris, executive director; J. Warren Nute, California Legislative Council of Professional Engineers; Frank Lombardi, president, California Chapter, American Institute of Planners; Willis Stribling, president, and Elmer Merz, executive secretary, California Association of Nurserymen; Jack Anderson, president, and Kenneth Jes... executive secretary, California La... scape Contractors' Association.

New officers of the landscape ar... tects' group are C. Mason Whit... Berkeley, president; Courtland P... Pasadena, vice president; and L... M. F. Harris, Oakland, continues executive secretary.

FENCING TREATMENT is part of job at ... Hotel swimming pool in San Mateo, Calif., ... won 1957 sweepstakes trophy of Calif... Landscape Contractors' Association for Ha... & Schromm, Inc., of Palo Alto. Planned ... landscape architects Eckbo, Royston & Wi... of San Francisco, project includes unusual ... binations of planting stone work and ... terns in concrete drives and walks.

Chehalis Red Norman Brick

. . . distinguishes new St. Rita Catholic Church in Portland's Parkrose District

Large areas of glass were combined with extensive use of beautiful Chehalis Matt Face Red Norman Brick by Architects McCoy and Bradbury to achieve the strikingly effective design of this recent addition to Portland's church community. Chehalis Brick—the Northwest's most distinctive brick—takes pride in having been selected to play such a major role in contributing to the charm and beauty of this distinguished new church building.

SHOPPING CENTER— Salem, Ore.
(Estimated cost $2,000,000)

Plans announced by Al Isaak & Co., realtors, 3035 Portland Road, Salem, for construction of a shopping center to be located on an 11-acre tract on Market St. between the city limits and the Salem Bypass section of the Pacific Highway, about 2½ mi. from downtown Salem. Largest store in the tract will be a food market for McKay Bros. to occupy 10,000 sq. ft. Other retail outlets in the center will include a service station, ladies' and men's apparel, a drug store, hardware, a shoe shop and restaurant. Space will be set aside for eventual inclusion of a medical center. The supermarket and some of the variety stores are to be ready for business by June, 1959. SC 1-11

●HOUSING REHABILITATION— Springfield, Ore.

Contractors are submitting bids to Federal Housing Administration, Washington, D.C., for rehabilitation of 28 dwellings in the Marylhurst Addition, Springfield. Remodeling work includes installation of new heating systems, new floors and construction of new carports or garages. Fronts will be changed on some of the dwellings. SC 1-14

HARDBOARD MILL— Swisshome, Ore.
(Estimated cost $2,500,000)

Plans are progressing on the proposed 100-ton hardboard mill to be erected at Swisshome. It is thought by Haskins Lumber Co. officials, who will build the mill, that arrangements for the financing will be completed soon. DC 1-14

HIGH SCHOOL ADDITION— Weston, Ore.
(Estimated cost $125,000)

Project has been temporarily postponed by Umatilla County Union High School District No. 8, George Bowers, superintendent, Weston, for construction of a brick veneer addition to the Weston High School. Architect for the project is Charles B. Miller, Bond Bldg., Pendleton. The addition has been planned with concrete floors and hot water heating system.

SHOPPING CENTER— Bellevue, Wash.
(Estimated cost $500,000)

Bids may be called about the first of February by Highway 10 Development Co., owner, for construction of a three-building shopping center on a five-acre tract at 156th S.E. and Lake Hills, near Bellevue. Plans by Turner & Hargreaves, architects, Exchange Bldg., Seattle. The main building will contain 15,200 sq. ft., the two other buildings each 7,500 sq. ft. Some of the following description may be changed when final drawings are completed.

Concrete slab-on-grade; steel post and glued laminated beams (steel beam alternate); wood joist roof, blanket insulation in roof; pumice block, plate glass, some stone exterior; drywall partitions; acoustical tile ceilings; asphalt tile, vinyl asbestos flooring; fluorescent lighting, incandescent spotlights; gas unit heaters.

The asphaltic concrete parking area and the landscaping will be let under separate contract, after construction begins under this contract. Refrigeration will be under separate contract. Covered walkways will extend from parking area to the buildings, which will house a supermarket, a bank, and various other community-type businesses.

PD 1-15

APARTMENT HOUSE— Bellingham, Wash.
(Estimated cost $50,000)

Construction will start in the spring by Paul H. Johanson, owner-builder, 915 Cornwall, Bellingham, on a two-story and basement stucco apartment building at 490 S. State St. in Bellingham. The structure was designed by the owner and will include two family units and owner's apartment in basement, four units on main level and four units on top story.

GYMNASIUM FIRE— Omak, Wash.

A fire which occurred January 4 destroyed the gymnasium at St. Mary's Mission in Omak, incurring a $75,000 loss. Flames also destroyed the dormitory which was housed in the west end of the 100' long steel shelled structure. SC 1-11

CITY HALL— Omak, Wash.

The Omak City Planning Commission and City Council have considered three alternatives proposed by H. Brandt Gessel, architect, 214 E. Birch, Walla Walla, concerning the alleviation of congestion at the Omak City Hall, and have favored a suggestion made by Councilman Greg Andrews that a new jail and fire station be built on property immediately north of the City Hall.

Proposals recommended by the architect last December were as follows: (1) Construction of a new city hall at the present location at a cost of $142,000. 2) Construction of new quarters at the present Pioneer Motors location in north Omak at an estimated cost of $156,000. (3) Lease-purchase agreement on the same property with part of the city administration to be moved there and part remaining at the present city hall.

The Planning Commission recommended to the City Council that the architect provide an estimate of cost for the new plan. It would allow some remodeling of present quarters to permit expansion of offices that would remain there. The architect previously said that the present structure was not worth remodeling at a high price.

PLANT SCIENCES BUILDING— Pullman, Wash.
(Estimated cost $3,352,000)

Plans will be completed about mid-February by Jones, Lovegren, Helms & Jones, architects, 706 Republic Bldg., Seattle, for a two-wing, four-story and basement, 175,000 sq. ft., reinforced concrete plant sciences building across Stadium Way, east of Rogers Field, in Pullman, for Washington State College. It is hoped a construction contract can be awarded by mid-March, with completion scheduled for late 1960 or early 1961. Funds totaling $1,900,000 are available and have been authorized by the State Legislature for the structure, plus $363,000 originally provided in 1955 and reappropriated toward the cost of equipping the building.

Plans call for the main concrete frame and shell to be completed in the first stage of construction, with the majority of the finishing items to be financed through funds to become available in an election later this year (bond issue for construction on campuses of higher institutions).

The building will consist of two main sections, a 420'x84' laboratory wing and a 144'x54' classroom wing containing six classrooms and a 200-person capacity sloping floor lecture room. The unit will also house a computing center.

Aluminum curtain wall exterior, panels to be of porcelain, asbestos-cement or pre-cast concrete; flat concrete roof slab, no beams; concrete bearing wall partitions, and drywall or plaster partitions; asphalt tile, ceramic tile, terrazzo flooring; rigid insulation in roof, rigid and batt insulation in walls.

●CATHEDRAL ADDITIONS— **Yakima, Wash.**

Bids will be opened 2 p.m., February 5, by Roman Catholic Diocese of Yakima, Most Rev. Joseph P. Dougherty, bishop, Liberty Bldg., Yakima, for construction of a 2,500 sq. ft. addition to St. Paul's Cathedral, 12th and Chestnut streets, Yakima, to contain sacristy and baptistry. Plans with Hargis & Goldsworthy, architects, Miller Bldg., Yakima. $25 deposit. Structural engineer is Alexander Hargis, Lloyd Bldg., Seattle.

Bids were opened in October and rejected later on construction of a rectory and of additions and renovations to the existing church structure. Proposals submitted were too high. The church decided to break the work up into smaller sections and issue several bid calls, so as to give small contractors a chance to bid.

The addition which will house the sacristy and baptistry will contain 2,500 sq. ft. Plans call for concrete walls; concrete floors; steel windows; plaster and paint finish in interior walls; plaster on wood lath partitions; quarry and vinyl flooring; plaster, acoustical tile ceilings; wood doors; vault door; new heating system for the entire Cathedral of hot water, oil fired. IG 1-10

ELEMENTARY SCHOOL— Yakima, Wash.

Preliminary plans underway by Gochnour & Marble, architects, Miller Bldg., Yakima, for elementary school at N. 28th and Lincoln avenues in Yakima, for Yakima School District No. 7, Milton Martin, superintendent, Administration Bldg., S. 7th Ave., Yakima. Tentative plans call for a cluster type school having four rooms to each unit.

The architects were retained about two years ago for this school but the project was dropped due to lack of funds. IG 1-11

RESIDENCE— Yakima, Wash.

Construction underway by Louis Irwin, 807 S. 9th St., Yakima, for a residence at 213 S. 35th Ave. in Yakima, for Henry Holmen, 3408 Vendome Ave., Yakima. ▲BRIDGE APPROACHES— Portland, Ore.

Seven bids received by Multnomah County Commissioners, John W. West, purchasing agent, 504 Multnomah County Courthouse, Portland, for construction of the new west approaches of the Hawthorne Bridge in Portland. Plans were prepared by Moffatt, Nichol & Taylor, structural engineers, 1845 N.E. Couch St., Portland. Bids opened January 14.

BIDS: Kuckenberg Construction Co., 11104 N.E. Holman St., Portland, $758,182; General Construction Co., 4850 N.W. Front Ave., Portland, $790,724; Donald M. Drake, 1600 N.W. Savier, Portland, $912,424; Manson Construction and Engineering Co., 5209 E. Marginal Way, Seattle $931,895; C. H. Strong Engineering and Construction Co., 3871 Royal Ave., Eugene, $981,073; Gibbons & Reed Construction Co., Box 2429, Salt Lake City, Utah, $1,050,022; Carl M. Halvorson, Inc., 10626 S.W. Pacific Highway, Portland $1,076-789. WB 1-15. Previous report 1-4

INDUSTRIAL SITE— Prineville, Ore.

The Prineville City Council has approved the purchase of a 50-acre industrial tract adjacent to the Prineville Railway. The property has 1,380' of track frontage. Most of the property averages a 400' depth along the railroad, and about four-fifths of the tract is usable without drainage or fill. SC 1-14

MEMORIAL PARK— Salem, Ore.

Signatures are being sought by Polk County residents on petitions requesting Polk County Commissioners, Courthouse, Dallas, to obtain approximately 350 acres of land along the west side of the Willamette River from the present Wallace-Albert Marine Park in Salem northward to a point just across stream from the Keizer and Manbrin Gardens area for development of a recreational area. The proposed project would adjoin the present Wallace-Albert park and would be called Wallace Memorial Park.

Considerable diking would be necessary for the project, as well as dredging. A major feature would be a long water racing course and large mooring. Included in the projected development would be a community building; golf course; parking areas (three entrances); group picnic sites; facilities for tennis, archery, badminton, handball, horseshoes, volleyball and softball; experimental gardens; clubhouse; service station; scull house, boat rental and fishing grounds. SC 1-10

●DRAINAGE— St. Helens, Ore.

Bids will be opened 8 p.m., P.S.T., January 28, by City Council, R. E. Singleton, recorder, City Hall, St. Helens, for furnishing drainage and miscellaneous materials. Specifications with above address and with N.W. Haner & Associates, 220 S.W. Alder, Portland. No charge. Bid bond 5%.

Quantities—Sched. 1: 175' of 18" to 30" corrugated metal pipe, asphalt coated; 190' of 43"x27" and 50"x31" pipe arches. Sched. 2: 7,830' of 8" to 30" plain and reinforced concrete culvert and sewer pipe. Sched. 3: 38 pieces of 8" to 24" concrete pipe fittings. Sched. 4: 55 items, 9,400 lb. cast iron rings, coverings and gratings. Sched. 5: miscellaneous materials, namely, 3,800 lb. steel reinforcing bars, 5,760 lb. welded wire fabric, 1,400 sacks type 1 portland cement. DC 1-14

●SEWAGE SYSTEM (Materials)— St. Helens, Ore.

Bids will be opened 8 p.m., January 28, by R. E. Singleton, city recorder, City Hall, St. Helens, for materials for sanitary and storm drainage system in the city. (Construction bids for the sewers and treatment plant will be called in early spring.) Specifications with recorder, or with N. W. Haner & Associates, consulting engineers, 220 S.W. Alder St., Portland. Bid security 5%. Materials will be required under the following five schedules:

SCHEDULE 1: 175' of 18" to 30" corrugated metal pipe, asphalt coated; 190' pipe arches, 43"x27" and 50"x31". SCHEDULE 2: 7,830' of 8" to 30" plain and reinforced concrete culvert and sewer pipe. SCHEDULE 3: 38 pieces concrete pipe fittings, 8" to 24". SCHEDULE 4: 55 items, of 9,400 lbs. cast iron rings, covers and gratings. SCHEDULE 5: 3,800 lbs. steel reinforcing bars, light; 5,760 lbs. welded wire fabric; 1,400 sacks Type 1 Portland cement. WB 1-15. Previous report 11-14

TELEPHONE FACILITIES—Sunnyside, Ore.

R.E.A. loan for $562,000 approved for Sunnyside Telephone Co., Lambert D. Miller, president and manager, Sunnyside, for improvement and expansion of rural telephone services in Clackamas and Yamhill counties. New construction planned includes dial central offices at Sunnyside and Yamhill, and 24 miles of line. New and expanded dial facilities will be installed in the existing Lafayette building; headquarters facilities in Sunnyside will be used with minor rehabilitation; twenty miles of existing line will be rebuilt. WB 1-8

★CHAIN HOISTS— The Dalles, Ore.

BIDDERS: Waterworks Supplies Co., 4455 S.E. 24th Ave., $108.40 each; Utilities Supply Co., 7830 N.E. Halsey St., $108.40; Johns-Manville Sales Corp., Terminal Sales Bldg., $122.30. All of Portland. Bids opened January 8. Award will be made January 15.
WB 1-11. Previous report 12-26

STREET LIGHTING— West Linn, Ore.

Bids will be called immediately by City Council, City Hall, West Linn, for installation of seven street lights along Willamette Falls Drive between Sunset Ave. and Willamette. Bid opening date will be announced this week, according to Andy Harila, city recorder. DC 1-14

WATER SUPPLY— West Linn, Ore.

The Robinwood Water District has asked the City Council of West Linn for information on availability of domestic water supplies for the Robinwood area, which lies north of West Linn. A study will be made by the City from data compiled by the district on water needs, delivery and pertinent factors. DC 1-15

WASHINGTON

▲CHANNEL LIGHT REPLACEMENT— Aberdeen, Wash.

Two bids received by 13th Coast District, room 922, 618 2nd Ave., Seattle, for replacing Grays Harbor North Channel light No. 57 in the vicinity of Aberdeen; Inv. No. FS-1697. Bids opened January 10. ONLY BIDS: Grays Harbor Construction Co., 412 S. Park Ave., Aberdeen, $1,875; Quigg Bros.-McDonald, Inc., 1500 Riverside Ave., Hoquiam, $2,130.
SP 1-11. Previous report 12-28

●WELL DRILLING— Alderwood Manor, Wash.

Bids will be opened January 27 by Alderwood Water District, James Davis, secretary, Alderwood Manor, for drilling of permanent wells at sites near Martha Lake and at the district 3,000,000-gal. reservoir in Alderwood Manor. Specifications with above office.

Test wells at the two sites, drilled by L. R. Gaudio, Brown's Point, Tacoma, under a separate contract, have indicated the permanent wells will produce about 1,000,000 gallons of water a day each. A third test well is also being drilled. SC 1-11

ROAD IMPROVEMENTS— Bellingham, Wash.
(Estimated cost $44,000)

Four road projects have been approved by Whatcom County Commissioners, Courthouse, Bellingham, including work on the Anderson Road, Henderson Road, Guide-Meridian and the Duer, Dewey and Van Wyck roads.

Projects as follows: (1) 1/10 mi. on Anderson Road, easterly from the Sumas-Kendall Road, to be covered with 5,069 c.y. select roadway borrow and 1,268 c.y. crushed rock. Estimated cost $9,060. (2) Reinforced concrete pipe and quarry rock at Henderson Road Bridge. Estimated cost $1,320. (3) Guide-Meridian from the Hemmi Road to the Pole Road to be improved at a cost of more than $17,290. (4) Improvement of Duer Road from Hannegan Road to Dewey Road, the Dewey Road from Van Wyck Road to Mount Baker Highway, and the Van Wyck Road from the Hannegan to the Dewey, a distance of 22 miles. Project will include 9,378 c.y. select roadway ballast and 2,345 c.y. crushed rock. Estimated cost $16,650. ET 1-10

BAKER LAKE ROAD— Bellingham, Wash.
(Estimated cost $24,000)

Whatcom County Commissioners, Courthouse, Bellingham, have approved the above final cost estimate on the first phase of improvement to the Baker Lake Road, involving one mi. length of road. Cost for three bridge repair projects and general road work is under consideration. ET 1-10

ROAD WIDENING, RECONSTRUCTION— Bellingham, Wash.
(Estimated cost $17,175)

Whatcom County Commissioners, Courthouse, Bellingham, have approved a road project involving reconstruction and widening of the Doren Road from Deming on the Wickersham Highway easterly for one mile. Project will include raising and widening a bridge on the road.

Work will start soon and will be completed by April 1. Included are 12,960 c.y. select roadway ballast, 1,130 c.y. crushed rock and 740 c.y. excavation. ET 1-11

▲MOTOR GRADER— Bellingham, Wash.

Bids received by Whatcom County Commissioners, Courthouse, Bellingham, for a diesel motor grader with blade for the county road departments. Bids opened January 10. BIDS: N. C. Machinery Co., Box 130, Mount Vernon, $21,284; Howard-Cooper Corp., 5045 4th Ave. S., Seattle, $20,600, $20,040 (alt.), $22,070 (alt.); Columbia Equipment Co., 1240 S.E. 12th Ave., Portland, Ore., $25,044. Above items do not include deduction for trade-in or sales tax.
ET 1-14. Previous report 12-21

●REINFORCED CONCRETE PIPE— Bellingham, Wash.

Bids will be opened 10 a.m., January 28, by Whatcom County Commissioners, Courthouse, Bellingham, for furnishing 118' reinforced concrete culvert pipe to be delivered to two job sites in the county for the pending Henderson Bridge and Lake Louise Bridge projects. Specifications with county engineer, above address. Specifications call for 40' of 60" and 78' of 72" elliptically reinforced concrete culvert pipe. ET 1-14

ATHLETIC FIELD RELOCATION— Blaine, Wash.

The state has agreed to relocate Blaine High School's athletic field from the west to the east side of the proposed state truck route through the city. Plans call for a truck spur off the main freeway where it enters Blaine. The spur will be built due north to the special truck customs station about one mi. east of the main customs and immigration headquarters.

Tentative location of the new athletic site is in an area just southeast of the school buildings. ET 1-11

SEWER SYSTEM— Blaine, Wash.

The Blaine City Council has voted to begin negotiations for a preliminary engineering survey to determine the overall sewage system needs at Blaine. Such a survey is necessary before the city can apply for federal matching funds to help finance a sewage treatment plant. The City of Blaine has been urged to install a new sewer system before the proposed new freeway is constructed. IF 1-14. Previous report 1-14

STEAM PLANT— Cle Elum, Wash.

Studies will be started immediately on feasibility of a steam plant using low-grade coal, in the vicinity of Cle Elum. The State Power Commission will finance the Kittitas County Public Utility District, Cle Elum, in a survey of the possibilities of constructing a coal-fired steam plant at the foot of Lake Cle Elum.

An initial allocation of $100,000 will open the survey. $250,000 was appropriated by the Legislature for this purpose. The steam plant itself would be financed by sales of revenue bonds. DC 1-14. Previous report 9-20

●STREET IMPROVEMENT— Edmonds, Wash.

Bids will be opened 8 p.m., February 18, by City Council, City Hall, Edmonds, for improvement of 3rd Ave. south of Main St., LID No. 82, Edmonds. Specifications with city engineer, above address. HH 1-14

●EARTH LINING, CHUTE REPAIR— Ephrata, Wash.

Bids will be opened 10 a.m., January 30, by Bureau of Reclamation, Box 368, Ephrata, for earth lining and chute repair, Lind Coulee Wasteway, Sta. 0+00 to 15+70, about 5 mi. east of Warden, Adams County, Wash.; Spec. No. 117C-495. Specifications with above office. Bid bond 10%.

Features of the work include: (a) Earthwork for refilling seven test holes in the existing Lind Coulee Wasteway between approximately Stations 0+00 to 9+20. (b) Earthwork required to excavate the existing wasteway between Stations 9+00 and 9+50 for constructing compacted blended earth lining; for placing riprap; and for placing coarse cover over compacted blended earth lining. (c) Earthwork for and repair of existing concrete chute structure between approximately Stations 14+61 and 15+50.16 including the filling of open voids under the structure; removing reinforced concrete in floor slab of the structure; constructing reinforced concrete cutoff wall, sand and gravel filter, concrete pipe drain, and graded gravel filter; replacing reinforced concrete removed from the floor slab of the structure; and replacing barbed wire fencing along both sides of the structure.

Quantities: 800 c.y. common excavation from wasteway; 350 c.y. common excavation for structure; 25 c.y. rock excavation for structure; 350 c.y. backfill about structures; 55 c.y. excavation from borrow; 30 c.y. compacting backfill about structures; 55 c.y. mi. overhaul; 40 c.y. sluiced fill; 560 c.y. compacted blended earth lining; 75 c.y. refill above earth lining; 70 c.y. protective cover; 70 c.y. riprap; 20 c.y. sand or gravel bedding for riprap; 170 c.y. compacted refill of existing test holes; 16 c.y. concrete in structures; 21 bbl. cement; 27 cu. ft. gravity grouting under chute floor; 110 c.y. sand and gravel in drains. SP 1-10

●RADIAL GATE CONTROLS— Ephrata, Wash.

Bids will be opened 10 a.m., January 28, by Bureau of Reclamation, Box 368, Ephrata, for automatic controls for seven radial gate checks, Potholes East Canal, 4th Section, west of Eltopia, Franklin County, Wash.; Spec. No. 117C-494. Specifications with above office. Bid bond 10%. SP 1-11

★EARTHWORK, LINING, STRUCTURES— Ephrata, Wash.

Award to Donald M. Drake Co., 1600 N.W. Savier, Portland, $2,681,004, by Bureau of Reclamation, Box 368, Ephrata, for earthwork, concrete lining and structures for Esquatzel Diversion Canal, Station 0+00 to 555+82, Columbia Basin Project, Wash.; Spec. No. DC-5000.

Features of the work include: (a) Earthwork for about 10 mi. of concrete-lined canal with bottom width of 8'. (b) Earthwork for, and construction of, about 1.3 mi. unlined lateral and wasteways. Bottoms widths vary from 2' to 6'. (c) Earthwork for, and construction of dikes, structures along canal including diversion structure consisting of an emergency wasteway and a headworks structure, irrigation pipe crossing, corrugated metal pipe drainage inlets, bridges, gauging station, gauge house and well, and chute. (d) Earthwork for, and construction of structures along laterals and drains including check, drop, road crossing, division boxes and tunnels. (e) Installing radial gate furnished by the Government. Furnishing and installing radial gate hoist. (f) Furnishing and installing slide gates, adjustable weirs, and miscellaneous metalwork. (g) Furnishing and installing electrical system for headworks, gate structure. (a) Furnishing and installing materials for fencing and gauging station cableway.

SEWER IMPROVEMENTS— Snohomish, Wash.

A general obligation bond issue for $110,000 to help finance sewer improvements will be placed before Snohomish voters March 11. Surveys being made by Carey & Kramer, consulting engineers, 1917 1st Ave., Seattle, for the City Council, Snohomish, on proposed construction of additional sewer collection systems, interceptor trunk lines, pumping stations and a lagoon-type sewage treatment plant. Plans call for division of the city into approximately eight drainage areas with provision for future expansion.

Present plans call for purchase of approximately 53 acres of land west of Snohomish for construction of a lagoon type sewage treatment system. The site of the lagoon which will take less than half of the property will be west of the new Highway 1-A right of way between Cemetery Road and the river. Diking will protect the lagoon from flood waters.

CITY DEVELOPMENT— Tacoma, Wash.

The Tacoma City Council has voted unanimously to place two bond issues for improvements on the March ballot and postponed action of two others. On the ballot are a $2,775,000 bond issue for improvements and extension of the city's storm drains and a $1,040,000 bond issue for street lighting. The council deferred action on a $350,000 bond issue for public buildings after defeating a proposal to add $400,000 to the item to provide for acquisition of a site for a civic auditorium. Also deferred was action on a $4,073,000 bond issue for street and bridge improvements.

DRIVING PILES, DOLPHINS— Vancouver, Wash.

W. H. Forsyth, 6017 Beach Drive, Vancouver, has applied to the Corps of Engineers, Portland District, 628 Pittock Block, Portland, for a permit to drive piles and dolphins for a small boat moorage in the Columbia River about 4.3 mi. upstream from the Interstate Highway Bridge at Vancouver. The site for the proposed moorage is in front of Forsyth's property on the Washington shore extending upstream from Leiser Point. Piling for the moorage will be driven in two rows parallel to the low water line with the channelward row about 120' from the low water line. Channelward limit will be about 1500' north of the center line of the ship canal.

Colonel Jackson Graham, Portland district engineer, has invited letters concerning the effect of the work on navigation and has asked that they reach his office not later than January 22. SP 1-10

▲ROAD RESURFACING, WIDENING— Vashon Island, Wash.

Seven bids received by King County Commissioners, 402 County City Bldg., Seattle, for construction of a third lane and resurfacing existing pavement with asphaltic concrete, on 1.2 mi. of Vashon Island Blvd. (Ferry Dock to top of hill) on Vashon Island. Bids opened January 13. BIDS: Western General Construction Co., 7721 36th S.W., $61,777 (there appears to be an error in tabulation of this bid); Bass Construction Co., 12526 Aurora, $79,005; Washington Asphalt Co., 309 W. 39th, $80,838; S. C. Bard Co., Vashon Island, $88,163; All City Excavating Co., 8114 9th Ave. S.W., $88,236; J. H. McGrath, Inc., 13825 N.E. 20th, Bellevue, $90,320; L. L. Newburn Construction Co., 6262 14th Ave. S., $93,844. All of Seattle unless noted. SP 1-14. Previous report 1-9

GROUT CUTOFF— Wenatchee, Wash.

Quantities listed on construction of a grout cutoff on the east bank (Douglas County) side of the Rocky Reach hydroelectric project near Wenatchee on which bids will be opened 10 a.m., February 5, by Chelan County Public Utility District No. 1, Kirby Billingsley, manager, 327 N. Wenatchee Ave., Wenatchee. Specifications are with Stone & Webster Engineering Corp., 707 Lloyd Bldg., Seattle.

Contract calls for grouting an average depth of 40' to 45' from bedrock up to a layer of silt on the left bank of the river, over a total distance of about 1,500'. Grouting will be required through three lines of drill holes on staggered spacing.

STREET SURFACING— Billings, Mont.
(Estimated cost $31,281)

The proposed RSID No. 401 for blacktopping several streets in west Billings has been taken under advisement by the Billings City Council as a result of several protests which were registered at a public hearing held January 7 by the council. The protests appear to be due to an error in the public hearing notice which indicated that cost per average lot would be about $800, rather that the correct figure of $170.

Work proposed includes the following sections: Broadwater and Wyoming avenues from 24th St. W. to Parkview Drive; Yellowstone Ave. from 24th St. W. to west line of lot 39, Block 6, Lillis Subdivision; Clark Ave. from 25th St. W. to west line of Lot 14, Block 7, Lillis Subdivision; Clark Ave. from 25th St. W. to west line of Lot 39, Block 9, Lillis Subdivision; Lillis Lane from 24th St. W. to west line of Lot 4, Block 9, Lillis Subdivision; 24th St. W. from Broadwater Ave. to Lillis Lane.

●CHANNEL PROBING, PILING— Ketchikan, Alaska

Bids will be opened for the second time at 2 p.m., A.S.T., February 5, by Corps of Engineers, Alaska District, D-E Bldg., Anchorage, for channel probing and control piling installation at Dry Pass, about 90 mi. north and west of Ketchikan, and at Dry Pass, about 35 air mi. farther north, in Alaska; CIVENG-95-507-58-6. Specifications with above office and with Seattle branch office, 4735 E. Marginal Way, Seattle, Wash. Bid bond 20%.

Bids were previously advertised under CIVENG-95-507-58-5 for opening last December 17, at which time only one bid was received and subsequently rejected.

Work will consist of furnishing and operating a pile driving plant in channel probing operations for approximately 160 hours and furnishing and driving approximately 750' of untreated timber piling. The work is preliminary to channel dredging scheduled in both Rocky Pass and Dry Pass this year.

WATER SUPPLY— Kodiak, Alaska

Bids will be called about February 3 by Alaska Public Works, Box 1181, Juneau, for water supply project for Kodiak; Proj. Aaa 50-A-327.
JU 1-14

PAVING— Petersburg, Alaska

Bids will be called in February by Alaska Public Works, Box 1181, Juneau, for paving in Petersburg; Proj. Aaa 50-A-328. JU 1-14

★STREET IMPROVEMENTS— Skagway, Alaska

Award to Hildre Sand and Gravel and R. J. Sommers Construction Co., Box 1115, Juneau, $126,012, by Alaska Public Works, Box 1181, Juneau, for street improvements involving asphalt surfacing of 3.264 mi. streets and stockpiling 8,000 c.y. crushed rock for aggregate at Skagway; Proj. Aaa 50-A-281. JU 1-11. Previous report 11-14

●HYDROELECTRIC PROJECT— Sitka, Alaska

Quantities are listed below on the first phase contract of the proposed Blue Lake hydroelectric and water supply project on which bids will be opened simultaneously 1 p.m., January 30 in the City Hall at Sitka by the City Council and in the office of Carey & Kramer, consulting engineers, 1917 1st Ave., Seattle.

Quantities: 1,270' of 12" main power tunnel; 200' of 12" power intake tunnel branch; 340' of 12" diversion tunnel branch; 1,600' of 2½" pipe casing for pressure grouting at dam; 4 set up for tunnel lining; 55 set up for drilling and pressure grouting at dam; 2,200' drilling grout holes at dam; 2,500 sacks cement for pressure grouting at dam; 4,180 c.y. concrete and rock excavation for base plug of dam below elevation 200; 3,650 c.y. concrete for arch dam above elevation 200; 2,400 c.y. rock excavation for dam abutments above elevation 200; 6,000 lbs. reinforcing steel in arch dam.

The second phase on the project will add 120' to the height of the dam, and will include construction of the power house, power transmission line and steel penstock.

A select list of bidders will submit proposals on the project. No more plans or specifications are available from the engineers.

Engineering cost of the entire project is placed under $4,000,000. Cost estimated on the first phase which involves this bid call is $1,500,000.

First Phase Contract—Construct tunnel, concrete headworks, portion of a concrete arch dam across the Medvetcha River. The unlined tunnel in solid rock will be 1,800' long and 12' in diameter and will have a circular cross section. A concrete dam 400' below the outlet of Blue Lake will be constructed on bedrock estimated to lie at elevation 150', to a temporary height of elevation 240'. Elevation of the river bed is 190'.

Completion time of first phase is January 1, 1960.

The dam completion, construction of outlet works and powerhouse will be in the second phase contract on which bids will be called at a later date. Also scheduled for the future are construction of water supply pipeline and furnishing equipment for the powerhouse which will have two 3,000 kw generators.

Electricity generated will be used by the city for general domestic, commercial and industrial uses. Water will also be furnished to the pulp mill which will be constructed by Howard S. Wright & Co., Inc., Seattle, and Guy F. Atkinson, San Francisco, for the Alaska Lumber and Pulp Co.

★PARK CONSTRUCTION— Fairfield, Calif.

Award to Vaca Construction Co., 147 Brown St., Vacaville, $32,188, by City Council, City Hall, Fairfield, for the construction of a public park on West Texas St. in Fairfield. Bids opened January 3.
RM 1-18. Previous report 12-28

SEWER SYSTEM— Loomis, Calif.

Directors of the Rocklin-Loomis Municipal Utilities District have retained Harold S. Prescott and Associates, civil engineers, of Placerville, to draw plans and specifications for a sewer system and treatment plant. The district recently was granted a Federal loan of $30,000 to complete the engineering work. A bond election to raise money for the sewer construction will be held in April or May. If the bond issue passes the work could begin this summer and the sewer system to serve about 3,200 residents of Rocklin, Loomis and surrounding areas could be completed in about a year. RC 1-18

SEWER FARM IMPROVEMENT— Los Banos, Calif.

William Bedesen, Los Banos city engineer, has forwarded plans for the construction of an estimated $34,000 sewer farm improvement project to the State Department of Public Health for approval. The sewer farm plans are on the construction of a series of six ponds, levees to enclose the ponds, the installation of a pumping system, pipe and release gates. About 37,600 c.y. of earth will be moved to build the ponds within an area of 40 areas. RC 1-18

●STREET RESURFACING—Martinez, Calif.

Bids will be opened 11 a.m., January 28, by Contra Costa County Board of Supervisors, Martinez, for resurfacing a portion of Alpine Road and resurfacing of Beau Rivage and Golden Gate Ave.; Proj. Nos. 0965-57-2, 3, 4. Specifications available from Contra Costa County Public Works Dept., Box 509, Martinez. Completion time: 30 days.

Quantities: 10 c.y. removing concrete; 1,370 tons untreated base; 670 tons plantmixed surfacing; 10 tons liquid asphalt SC-1 (prime coat); 175' plantmixed dike; 2 type C inlet; 2 concrete "L" head wall; 50 c.y. concrete lined ditch; 4 install guide posts and markers; 34' of 12", 4' of 15" corrugated metal pipe (16 gage); 6 adjust manhole and lamphole covers; 6 adjust water valve covers; 24 remove and reset mail boxes.
RM 1-18

●PLANTMIX PAVING— Martinez, Calif.

Bids will be opened 11 a.m., January 28, by Contra Costa County Board of Supervisors, Martinez, for constructing Minaker Drive extension from Wilbur Ave. north 0.1 mi.; Proj. No. 7185-57-1. Specifications available from Contra Costa County Public Works Dept., Box 509, Martinez. $2.50 charge.

Quantities: 24,000 gals. furnishing and applying water; 96 c.y. roadway excavation; 400 c.y. imported borrow; 825 tons untreated base; 3.5 tons liquid asphalt SC-1 (prime coat); 300 tons plantmixed surfacing.
RM 1-18

WATER SUPPLY— Oakland, Calif.

Preliminary plans for a $275,000,000 East Bay Municipal Utility District construction and development program have been approved by the Bechtel Corporation, an independent engineering firm, after four months of study. District engineers now will make a final study of the plan, which includes engineering and economic features to meet the area's needs for water in the next 10 years. John W. McFarland, EBMUD general manager, said details of the plan and an announcement of the start of construction will be made after the EBMUD engineers finish the final study, probably in about 30 days.

ELEMENTARY SCHOOL
BIDS CLOSE 8 P. M., JANARY 28
Onalaska, Washington
NOTICE TO CONTRACTORS

NOTICE is hereby given that the Onalaska School District No. 300, Lewis County, Washington, hereinafter called the OWNER, will receive separate bids on General, Mechanical and Electrical Work for an elementary school building located in Onalaska, Washington. (A Combined General, Electrical and Mechanical Bid may also be submitted.) Such bids must be sealed and will be received up to 8 p.m., January 28, 1958, at the office of the School Administration, Onalaska, Washington. All bids will there and then be opened and read aloud. Bids received after the above-named date and time cannot be considered.

Each bid must conform and be responsive to the following:

The Information for Bidders, The Specifications, all Drawings and other documents, such as; Addenda, issued not later than five (5) calednar days before the bid opening date. All above-named items are part of the Contract Documents and shall, together with the Contract Agreement, constitute the actual Contract. All Contract Documents required for preparation of bids shall be on file and open for public inspection at the following places:

McCOY & BRADBURY, 7007 Highway 99, Vancouver, Washington.

Builders' Exchange, Builders' Exchange Bldg., Portland, Oregon.

Associated General Contractors, Seattle, Washington.

Bonafide contractors may obtain such documents from the Architect upon deposit of $25.00. Plan holders who do not enter a bonafide bid and/or who do not return plans and specifications undamaged by at least ten (10) days prior to bid opening will forfeit their deposits.

Each bid shall be made out on the Bid Form furnished by the Architect and shall be accompanied by the required surety as follows:

A certified or cashier's check for five (5%) per cent of the maximum amount of the bid or in lieu of such check, a Bid Bond in the same amount. Checks or Bid Bonds shall be made in favor of the Owner. Such check or Bid Bond shall be given as surety that the bidder shall execute the Contract if awarded him.

The successful bidder shall be required to post a 100% Performance Bond and a 50% Payment Bond before being authorized to proceed with the work. Said Bond shall be posted within five (5) calendar days after official notice by the OWNER to the selected Contractor that the award has been made.

The Owner reserves the privilege of rejecting any or all bids and to waive any irregularities or informalities in any bid or in the bidding.

No bidder shall be permitted to withdraw his bid within a period of thirty (30) days after the actual date on which the bids are opened.

WILBUR STONEX,
Clerk, Board of Directors, Onalaska School District No. 300, Lewis County, Onalaska, Washington.
6022—1-18

HIGH SCHOOL BUILDING
BIDS CLOSE 7:30 P. M., JANUARY 21
Kennewick, Washington
NOTICE TO CONTRACTORS

1. **NOTICE TO CONTRACTORS**
Sealed bids will be received by the BOARD OF DIRECTORS, KENNEWICK SCHOOL DISTRICT NO. 17 in the library of the Kennewick Senior High School, Kennewick, Washington, until 7:30 P.M., Tuesday, January 21, 1958, for (a) General Contract, (b) Mechanical Contract, and (c) Electrical Contract, separately, for the construction of a JUNIOR HIGH SCHOOL BUILDING, and the said bids will then and there be publicly opened and read aloud. Bidders and others properly interested are invited to be present at the bid opening. Bids received after the time fixed for opening cannot be considered.

2. **BID DOCUMENTS**
Specifications, including bid and contract documents, and drawings, may be examined at the office of the Architect, John S. Villesvik, 109 North Third Street, Yakima, Washington, at the plan centers in Yakima, Tri Cities, Spokane, Seattle, Portland, Tacoma, Wenatchee, Moses Lake, and may be obtained at the Architect's office upon deposit of a check payable to the Architect in the amount of $25.00 for each set.

3. **REFUND OF DEPOSITS**
The full amount of deposit for one set of documents will be refunded to general, mechanical, or electrical contractors upon return of the documents in good condition to the Architect's office within 10 days of the time set for opening bids. Other deposits will be refunded with deductions for the actual cost of reproducing the documents, under the same conditions, unless the documents are returned within 48 hours after taking them out. If returned within four days, one-half of this cost will be refunded. Time consumed by the mails is in addition to the above.

4. **RIGHT TO REJECT BIDS**
The owner reserves the right to reject any or all bids and to waive informalities.

MULTIPURPOSE SCHOOL BUILDING
BIDS CLOSE 2 P.M., JANUARY 22
Mercer Island, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Clerk of the School Board, School District No. 400, Mercer Island, King County, Wash., at the office of the School Superintendent at Mercer Crest School, 86th S.E. and S.E. 42nd, Mercer Island, Wash., until 2:00 p.m., January 22, 1958, for the construction of the Multipurpose Building for Mercer Island High School, and will then and there be opened and publicly read aloud. Bids received after the time set for opening cannot be considered.

Separate bids should be submitted for General, Mechanical and Electrical Work respectively.

Plans and specifications and form of contract documents may be examined at the offices of the Architects, Bassetti & Morse, 1602 Tower Bldg., Seattle, at the office of the Associated General Contractors of America, 215 West Harrison Street, and at the Plan Bureau, 2413 Western Avenue, Seattle. Bona fide bidders may obtain one set of plans, specifications and documents upon deposit of a check payable to Bassetti & Morse in the amount of $50.00 for General Work and $25.00 for Mechanical or Electrical Work. Additional sets of plans may be obtained upon payment of the actual cost of blueprinting.

The deposit will be refunded to actual bidders upon return of the documents in good condition within ten (10) days after

the time set for the opening of bids.

Each bid must be accompanied by a certified check, cashier's check, or bid bond with a State-licensed surety or sureties in an amount of not less than five per cent (5%) of the base bid, payable to Mercer Island School District No. 400.

The right is reserved to accept or reject any or all bids and to waive claims.

No bidder may withdraw his bid after the time set for the opening thereof, unless the award of contract is delayed for a period exceeding thirty (30) days.

By order of Mercer Island School District No. 400, Mercer Island, King County, Washington.

ROBERT S. STUDEBAKER
Supt. of School District

Bids will be opened . . .

PLANS HAVE BEEN COMPLETED
BIDS ARE WANTED for Construction
Equipment
Supplies
Materials

You want— The lowest possible bid consistent with responsible workmanship.

You need— To publish a bid call where it will reach every major contractor, subcontractor and supplier in your territory.

When you advertise in Pacific Builder & Engineer publications, you reach directly more contractors, subcontractors and suppliers than would see your ad in dozens of newspaper type publications. You are advertisting in construction trade journals that cover thoroughly all of Oregon, Washington, Northern California, Idaho, Montana and Alaska, both in editorial content and circulation.

Pacific Builder & Engineer publications are the only true business journals devoted entirely to *construction* published in this territory. They penetrate every branch of the industry. They are the only business papers specializing in construction news that furnish their advertisers audited circulation statements.

Advertisements for bids are placed in PB&E columns by state highway departments, cities, counties, school districts, PUD's, state agencies, federal bureaus—and by architects and consulting engineers.

If the purpose of your advertisement is to GET BIDS, advertise in a CONSTRUCTION paper.

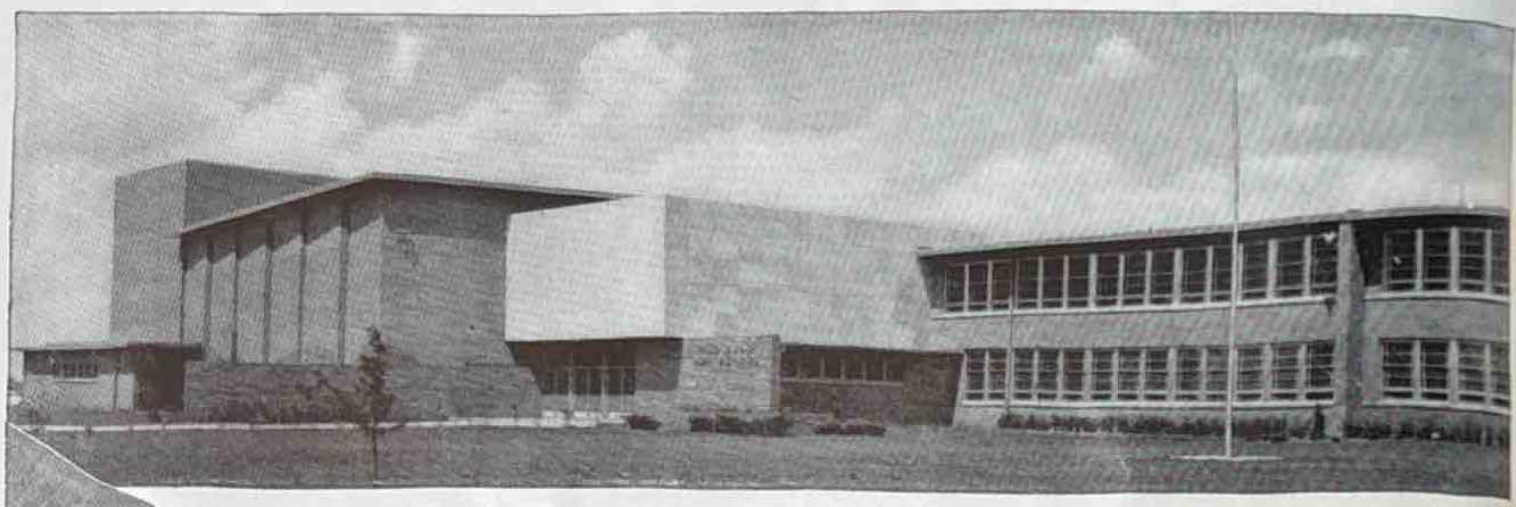
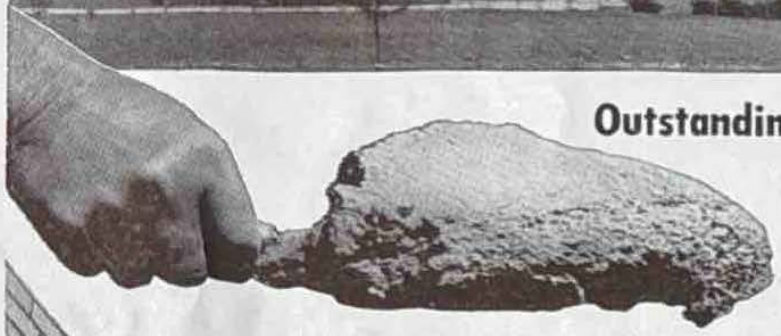
Educated Choice!





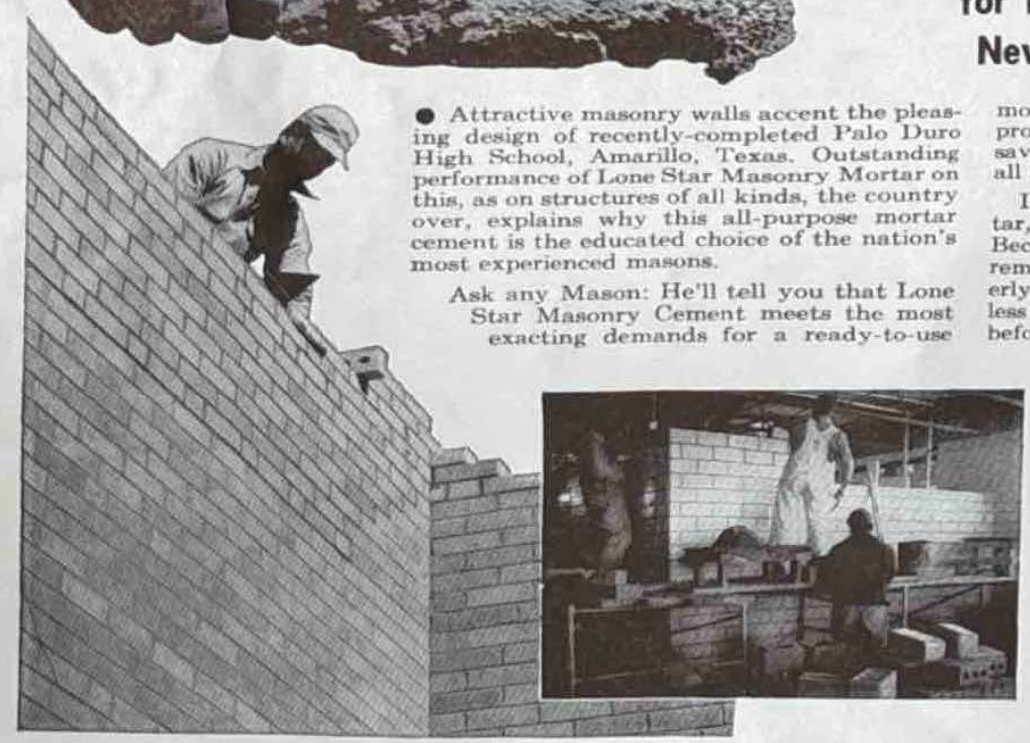
Outstanding Performance Confirms Wisdom of Using LONE STAR MASONRY CEMENT for Eye-pleasing Walls of New Texas High School

● Attractive masonry walls accent the pleasing design of recently-completed Palo Duro High School, Amarillo, Texas. Outstanding performance of Lone Star Masonry Mortar on this, as on structures of all kinds, the country over, explains why this all-purpose mortar cement is the educated choice of the nation's most experienced masons.

Ask any Mason: He'll tell you that Lone Star Masonry Cement meets the most exacting demands for a ready-to-use mortar combining all the properties formerly provided by two or more materials—with a saving in cost and time, and added assurance all along the line.

It's the butter-smooth, easy-spreading mortar, for good yield and economical operation. Because of high water retention, this Mortar remains plastic so brick and block can be properly bedded and good bond assured. There's less lost motion — you can go header high before striking joints — smooth, weather-resistant joints that are the good Mason's hallmark.

In a word, it's *Lone Star quality*, which means the highest standard of dependability, always.



PALO DURO HIGH SCHOOL, Amarillo, Texas

THE BUILDING MONTH: HIGHLIGHTS/TRENDS

Seattle's World Fair Corp., a nonprofit organization working on preliminary plans for the proposed 1961 show, has outlined a basic program for financing the international exposition. Part of the money needed to construct the buildings would be raised through the sale of nonprofit bonds, public subscriptions, foundation aid and federal government support; but the big share of the cost would come from exhibitors and concessionaires, as was the case at New York and San Francisco and now at the Brussels exposition. The fair and Seattle's Civic Center program, for which the city has already passed a $7½ million bond issue, are separate projects, but the former would help boost the latter, particularly since the fair buildings would be designed for future use.

Ordinance concerning seismic designs has been okayed by the Los Angeles City Council. The ordinance, based on a report by members of the Structural Engineers Association of Southern California, represents minimum design requirements necessary to prevent major structural damage, but superficial damage may be expected in the event of a moderate earthquake.

March 1 is deadline for entries in the 1958 building products literature competition, sponsored annually by the AIA and the Producers' Council, Inc. Joint committee of both groups met in Oberlin, Ohio, last month for its 49th meeting, with San Francisco architect William Corlett representing the West Coast.

Structural steel is now readily available and can be delivered promptly in 1958. This situation, says the American Institute of Steel Construction, stems from two factors: a 29% increase in shipments of plain material to structural steel fabricating plants and sizeable expansion in capacity of manufacturing facilities.

Portland will save between $150,000 and $250,000 in construction of its Exposition-Recreation Center (PA&B for January 1958) through a program in which several manufacturers of forest products will provide materials at cost or, in some cases, without cost.

National Labor Relations Board has adopted a major policy change which gives relief to employers caught in the middle of union jurisdictional disputes. A Long Island attorney, appearing before the board as a "friend of the court" in a case involving two Cleveland construction trades unions, declared that NLRB's long-established interpretation of the Taft-Hartley regulations should not apply when private mediation agencies fail to settle a jurisdictional dispute and a work stoppage occurs.

Shopping center industry will have its first trade show at the Hotel Statler in New York, opening February 24 as part of a three-day convention of the International Council of Shopping Centers.

Largest single loan—$18 million—ever made under HHFA's college housing program has been obtained by the University of California to help finance construction of 37 new buildings and additions to three structures on campuses throughout the state. Total project, costing $31.5 million, of which the university will put up $13.5 million, will provide housing for 6,054 single students and 151 married students in reinforced concrete buildings.

Four classes in architecture are being sponsored by the San Francisco Architectural Club, with all sessions held at the club headquarters, 507 Howard St. Classes include structural engineering for architectural students; the business side of operating an architect's office; a review course for those planning on taking the California state architectural examination; and beginning and advanced studies of architectural design.

Use of wood in school construction got a plug when school officials, architects and civic leaders attended a forum in Tacoma February 12 sponsored by the Tacoma Lumbermen's Club. Speakers included Robert B. Price, Tacoma architect; Lloyd J. Andrews, state superintendent of public instruction; and James Hopkins, assistant superintendent of Tacoma schools.

First technical seminar on curtain wall construction aimed at helping architectural understanding of this building technique will be held in New York March 5, under the chairmanship of Robert A. Weaver Jr., president of Bettinger Corp., Waltham, Mass.

New method to determine amount of light needed for specific working tasks will be discussed at a two-day symposium sponsored by the Illuminating Engineering Research Institute in Dearborn, Mich., March 3-4. Then lighting engineers, architects and others will critically examine the standards at a three-day course beginning March 19 at the University of Michigan, Ann Arbor. Special faculty members will include architect Henry L. Wright of Los Angeles.

Metropolitan plan for the Seattle area, which will appear on the March 11 ballot, is being watched with interest across the country. The plan would establish a cooperative agency to handle mutual problems of sewage disposal, rapid transportation and planning for Seattle and suburban areas.

International Drywall Contractors Association, holding its first convention in Chicago January 16-17, reelected the original slate of officers, headed by Wayne Vaughan of Los Angeles.

New AGC national vice president is James W. Cawdrey, partner in the Seattle building construction firm of Cawdrey & Vemo and chairman of the Building Division in 1955. Fred W. Heldenfels Jr., Texas highway contractor is 1958 president, installed during the 39th annual convention which met in Dallas earlier this month.

World's biggest landlord, Public Housing Administration, will be the subject of a showdown when its program comes up in Congress this year for renewal and reevaluation. The Administration does not plan to ask for any new public housing authorization, while some Democrats charge that footdragging has virtually stymied the program.

Western Retail Lumbermen's Association will hear a panel discuss "The Revolution in Distribution—What It Means to You," when it holds its 55th annual convention and building materials exhibit at the Olympic Hotel, Seattle, February 25-27.

Glazed structural tile by Kraftile

CHEER FOR THE ILL & INJURED

A sense of cleanliness brings a feeling of comfort and security to the ill or injured. Color gives them optimism and quiets their fears. In this First Aid Room, cheerful attractiveness and hospital cleanliness will go hand in hand for the life of the building. Walls are colorful, gleaming Kraftile, chosen because of its low annual cost. Harsh, heavy-duty soaps and detergents, cleansing powders, bleaches and antiseptics cannot dull the sheen of Kraftile surfaces. Repeated scrubbings throughout the day, year in and year out, cannot wear it out. Chemicals and bleaches cannot change or fade its glowing colors. Construction with Kraftile goes with astonishing speed. When you specify Kraftile glazed *structural* tile, costs are competitive. Kraftile construction requires no carpentry, plastering or finishing. Standard sizes and shapes for every need, in 12 architect-selected colors and clear glaze. Write for specifications, graphic standards, and color samples.

about a grain of sand

February is always a very special month for all of us at Pacific Architect and Builder. It was three years ago that we extended our editorial coverage to include California and just one year ago that we appointed A. O. (Al) Bumgardner, AIA, as architectural advisor, heading up an informal advisory board which reviews design projects submitted for publication. We sincerely believe that we have made considerable progress, particularly in this past year, but we would like to hear from our readers to learn how we can better serve our function as the "Magazine of West Coast Architecture." In this regard we want to say a few words about our name in answer to those who seem to think that "architect and builder" are editorially incompatible.

Consider a grain of sand applied in a neatly textured swirl of acoustical plaster on the ceiling of our ideal building. The grain of sand is there because the architect studied his client's needs, counseled and advised him on the necessity for that type of material for several reasons—climate, cost, usage of room. It will stay there and perform the desired purpose because the builder properly interpreted and appreciated the architect's ideas. He prepared the proper mix, not only because the specifications were properly written, but because he wanted to do the job correctly. He applied the mix properly, on a properly cured brown coat, because he recognized the architect's aims. (He could have rushed the stuff on, fought for his money and gotten away from the job before the cracks appeared.) He was able to achieve the desired effects because other contractors, working with machinery manufacturers, had developed a rig that would blow that grain of sand into just the right place on the ceiling. As a result the builder was able to give the architect just what he wanted at a price the client was able to pay.

What is true of that ridiculously little grain of sand is just as surely true of each fiber of wood, every molecule of metal in that structure. Where could you find two men with a stronger need for a close bond of common interests, understanding and spirit of cooperation? It took two of them—architect and builder—working together to put that grain of sand in place. If there is not this bond between architect and builder, then it is the individual's fault, not that of the profession or the industry.

the second 50 years

A man who didn't particularly want to celebrate completion of 50 years in business, but who prefers to announce the start of his "second 50 years," is William Anderson, chairman of the board of Eagle Metals Co. Anderson founded the non-ferrous metals distributorship in Seattle in 1907, seven years after coming to this country from his native Scotland and guided it to a position of leadership in the Northwest. With branches in Portland and Spokane, the firm now handles stainless steel and Monel steel in addition to mill lines of copper, brass, bronze, aluminum and nickel alloys. Anderson also became interested in construction publishing some 40 years ago and has served as a director and officer in Pacific Builder & Engineer, Inc., publisher of PA&B. He is vice president of the firm today.

NAHB elects Californian as president

• Builders voice optimism at Chicago sessions

Nels G. Severin of San Diego was elected president of the National Association of Home Builders at its 14th annual convention-exposition in Chicago January 19-23, during which both delegates and speakers expressed a note of confidence.

Severin, who succeeds George S. Goodyear of Charlotte, N.C., served as first vice president and chairman of the legislative committee in 1957. He is a banker as well as a builder who constructs about 200 houses a year.

Other officers for 1958 are Carl T. Mitnick, Merchantsville, N.J., first vice president; Martin Bartling, Knoxville, Tenn., second vice president; Edward W. (Ted) Pratt, Royal Oak, Mich., treasurer; and E. J. (Jim) Burke, San Antonio, Texas, secretary.

Among the 21 regional vice presidents are four from the West: A. W. Brunt, Idaho Falls, Idaho; Lloyd Hammerstad, Yakima, Wash.; George M. Pardee Jr., Los Angeles; and William Blackfield, San Francisco (reelected).

1.1 million housing starts

As to home building itself, predictions were freely heard that there would be both money and markets for 1.1 million new homes or an increase of about 10% over last year. A preliminary total of 1,039,200 starts was recorded in 1957, of which 989,700 were private.

In other official business, the charter of the Building Contractors Association of California was revoked by the board of directors on the grounds that the organization no longer was representative of the home building industry in its area.

The board approved a vigorous policy statement drafted by the resolutions committee under the chairmanship of past president Earl Smith of El Cerrito, Calif. The statement underscores the fact that "home building cannot of itself cure an ailing economy just as today's economy cannot thrive without a healthy home building industry" and lists these six principles as essential to a resurgence of housing:

1. The home building industry is a basic foundation stone of our economy and our democratic society; it must not be treated as a mere economic safety valve.

2. Home building must have a fair share of private investment funds.

3. The home building industry is handicapped by a patchwork mortgage finance system which must be effectively modernized. A true central mortgage bank is essential.

4. The cost of buying a home is being dangerously increased by 1) heedless and unrealistic building requirements imposed at all levels of government and 2) a scarcity of suitable building sites caused by the inability of municipalities to provide necessary community facilities.

5. A continuous and uninterrupted urban renewal and slum clearance program must be developed.

6. Manufacturers, labor and builders should unite to keep increases in home costs to the barest minimum.

The builders divided their time between 789 exhibits and the program itself which brought 315 speakers to rostrums and panel platforms. There was general agreement that for the first six months of 1958 recessionary pressures on the economy would be forcible. Beyond that, some felt there would be a pickup; others were not so sure.

Cole is optimistic

U. S. Housing Administrator Albert M. Cole, unable to attend the sessions because of illness, in a paper he had prepared predicted that 1958 should be about 10% better for home builders than 1957. "There is reason to believe we have turned a corner," he declared. "Housing production has been rising. Construction costs seem to be stabilizing. There has been no increase in the vacancy rate. Signs point to an easing of the money market as the weeks pass by."

FHA Commissioner Norman P. Mason gave new impetus to the drive for elimination of discount controls, telling the convention: "We hope that the Congress will accept President Eisenhower's request to do away with discount controls. This is a form of price control and as such it is abhorrent to the American public and businessmen."

Shopping center makes bid as West's largest

Construction has started at Hayward, Calif., on the $28 million Palma Ceia Shopping Plaza, ranked by the Urban Land Institute as the largest regional shopping center on the West Coast and sixth in store area in the U. S. First unit to get underway is the $3 million Sears, Roebuck & Co. building, also in the "largest in the West" category, as far as Sears is concerned.

When finished in 1959 the center will contain 107 different business activities, including two department stores and a heliport, as well as paved parking for 48,000 cars in 8,000 separate stalls. The entire operation will employ 3,500 persons with a yearly payroll of $10 million.

Branden Enterprises is the developer; David T. Johnson of Oakland is the architect except for the Sears building, being designed by the Oakland architectural firm of Reynolds & Chamberlain. Hilp & Rhodes of San Francisco are the general contractors.

DESIGN FEATURE of West's largest shopping center will be 1,000-ft. long mall, forming interior court for many shops. Store fronts facing onto mall will be constructed in off-set plan to avoid "squared-off" appearance so common in shopping districts.

Courtesy of California Historical Society

MINT BUILDING constructed in 1874 is subject of controversy in San Francisco.

Fight to save Mint Building gains steam

San Francisco architects are up in arms over a proposal to demolish the historic old Mint Building at Fifth and Mission streets made by Mayor George Christopher and other city officials.

William Wurster, dean of the University of California College of Architecture, declared wrathfully: "We have too few mementos of the past remaining and we should preserve one of the very fine old buildings we have in San Francisco."

Earl H. Reed of Chicago, chairman of the AIA committee on the preservation of historic buildings, got into the affair with a telegram to the mayor in which he said, "We respectfully request your aid in averting destruction of a noble monument. Its loss would be a severe blow to San Francisco and the nation."

And William Corlett, president of the Northern California Chapter, AIA, added, "The building is one of those that several years ago the chapter included in a list of 10 buildings that we feel should be preserved. Our executive committee has just reaffirmed that position."

The building is considered to be the masterpiece of Abram B. Mullet who from 1865 to 1875 was official architect for the federal government. He designed it in a federal Greek revival.

The structure, built in 1874, survived the 1906 earthquake and fire, but since 1935 there has been pressure to tear the building down and return the site to private owernship.

Court decision regarding school favors Portland architects

Decision of an arbitration board favoring the architectural firm of Stewart & Richardson, Portland, in a controversy concerning Hudson's Bay High School, Vancouver, Wash., has been confirmed by Superior Court Judge Eugene Cushing.

The defendant, Vancouver School District No. 37, had claimed $42,360.34 from the architects for alleged sound defects, heat gain in classrooms and miscellaneous items; the architects had claimed $14,661.02 for unpaid fees plus accumulated interest over periods from one and one-half to four years.

The arbitration board, made up of attorney Lamar Tooze, Walter E. Church and contractor E. F. Balgeman, all of Portland, awarded Stewart & Richardson $17,251.14 unpaid fees and interest. It awarded the school district $2,446.93 for correcting a sound condition in music practice rooms and for two change orders.

Judge Cushing ruled as follows: "It was contended by the defendant that there was an implied warranty on the part of the architects that the work which they undertook would be of proper workmanship and reasonable fitness for its intended use, and that architects furnishing specifications and plans for a contractor to follow in a construction job thereby impliedly warrant their sufficiency for the purpose in view. This position is supported by some authorities.

"On the other hand, the majority of authorities in the United States hold that an architect does not insure or warrant the success, satisfaction or results of his work. His responsibility is that he has the special skills possessed by architects generally and that, in doing his work, he will exercise those skills reasonably and prudently and in accordance with the general standard of skill exercised by architects generally.

"Decisions in other jurisdictions also hold: 'The law does not imply such a warranty for the guarantee for perfection of his plans. The result may show a mistake or defect in them, although he may have exercised the reasonable skill required. The law requires only the exercise of ordinary skill and care in the light of present knowledge.' It has also been held that 'disputed questions of fact are settled by the findings which are tantamount to a verdict.'"

CORRECTION

PA&B regrets that the names of the general contractors, Williams & Burrows, Inc., and Carl N. Swenson Co., Inc., for the Music Classroom Building, Santa Barbara College, were incorrectly identified in the January issue.

Need for density control in San Francisco cited

Millions of dollars in federal aid needed to redevelop San Francisco's old Product Market area will be withheld unless some form of density control is adopted, M. Justin Herman, HHFA regional administrator, has told that city's Board of Supervisors, which recently rejected a proposed limit on the height of new buildings.

The height-limit formula rejected by the supervisors is the only density control over commercial buildings in the pending new zoning ordinance. It would have prohibited solid, towering blocks of buildings.

Herman said that federal officials regard density control as good planning. Such control, however, could be imposed inside the project boundaries by making it a part of the project plan.

The supervisors, however, would have to change the zoning ordinance to impose density controls outside the project boundaries.

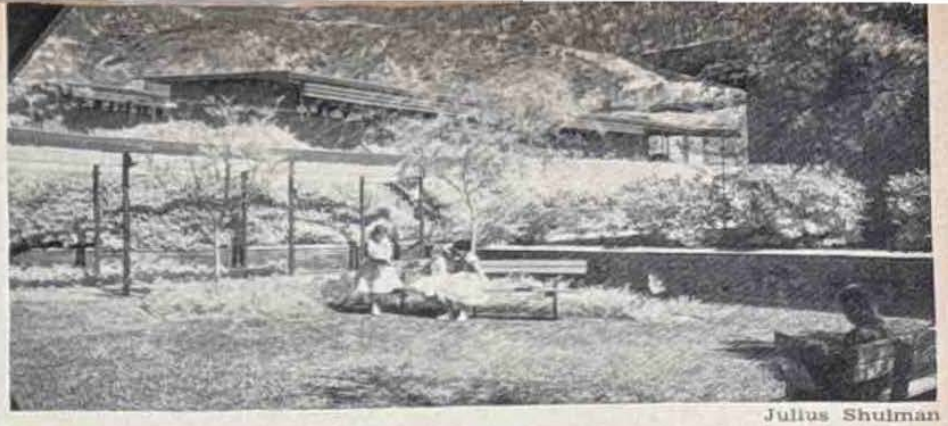
Death takes Record's Shear at age of 40

One of the nation's leaders in the architectural profession, John Knox Shear, 40, editor in chief of Architectural Record, died January 10 in the East. Before assuming that post in 1954, he had served as head of the department of architecture at Carnegie Institute of Technology in Pittsburgh, where he also was actively engaged in practice.

A member of the AIA, Shear participated in the Northwest regional conference at Gearhart, Ore., last October.

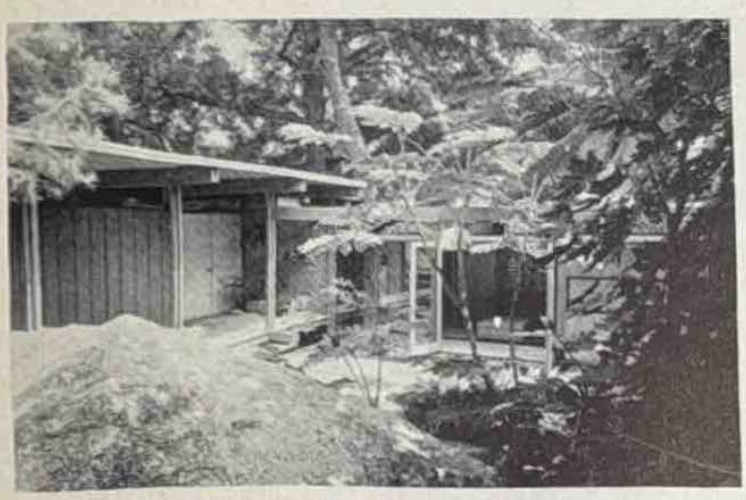
Pasadena AIA gives five honor awards

In its Centennial Honor Awards program the Pasadena Chapter, AIA, cited the five projects shown here for top honors and nine others for merit awards (December 1957 PA&B). Jurors were architects Ulysses Floyd Rible, Henry Eggers, A. Quincy Jones; landscape architect Garrett Eckbo; industrial designer Henry Dreyfuss; sculptor Bernard Rosenthal.



Julius Shulman

ARTHUR AMOS NOYES ELEMENTARY SCHOOL, Pasadena: Boyd Georgi and Lee B. Kline, associated architects; Hight Construction Co.-Stephen F. Owers, contractors. "Exceptionally well-executed site development on an extremely difficult site."



RESIDENCE FOR RICHARD LEITCH, Altadena: Richard Leitch, architect and contractor. "Total integration of garden and house. A most successful blending of landscape and architectural structure."

MOUNTAIN HOUSE FOR J. HOWARD MARSHALL, Lake Arrowhead: Burge-Roach, Henry Charles Burge, architect; Burke Malcolm, contractor. "A distinguished design possessing warmth and friendliness."

Julius Shulman

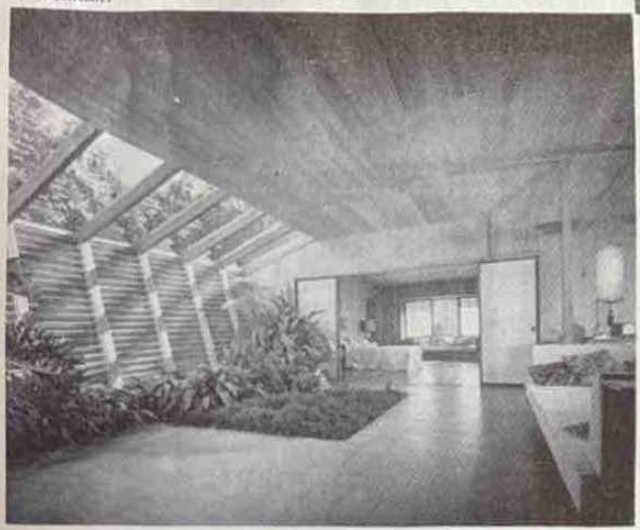
MOBIL SERVICE CENTER, Santa Ana: Smith & Williams, architects; Roulac Co., contractor. "A light, total structure making maximum use of the site, well-integrated industrial design of the components."

METHODIST HOSPITAL OF SOUTHERN CALIFORNIA, Arcadia: Neptune & Thomas, architects; Twaits-Wittenberg Co., contractor. "A simple composition of extremely complex facilities, especially noted for a pleasing and total landscape development."

Design competition staged in Hawaii

ORCHARD HILLS TRACT HOUSE, Aiea Heights: Wood, Weed & Kubala, Ltd., architects.

R. Wenkam



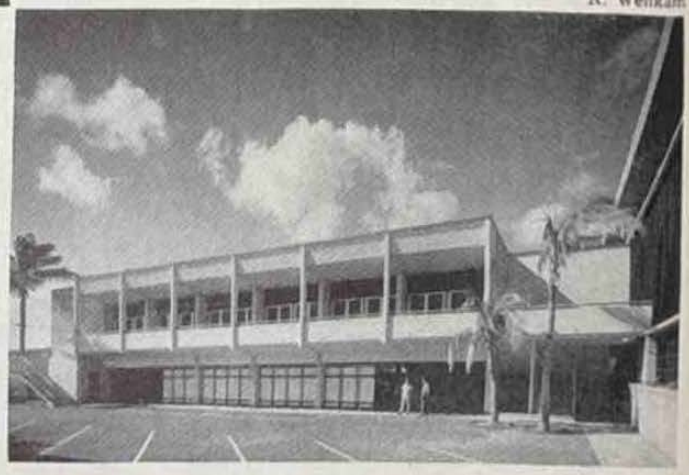
RESIDENCE FOR ALICE C. GUTHRIE, Honolulu: Richard N. Dennis, architect.

Architects for six Honolulu area buildings and the first foreign architect to be honored for his work in the Pacific area were awarded citations by the Hawaii Chapter, AIA, at a dinner meeting in the Reef Hotel January 24. In addition to the honor award projects shown here, honorable mentions went to Philip C. Fisk for his own residence at Kaneohe; Alfred Preis for the Gustav Ecke residence in Honolulu; and Wood, Weed & Associates for the Board of Water Supply pumping station at Kuliouou. Gordon Bradley headed the awards committee, while the jury, made up of past honor award winners, included Harry Seckel as chairman, Vladmir Ossipoff, Allen Johnson, William Merrill and Cy Lemmon.

The first annual Pan-Pacific Architectural Citation went to Kenzo Tange of Tokyo, who flew to Honolulu to accept the award for the Children's Library at Hiroshima. "Purpose of the award," said Seckel, who also headed the Pan-Pacific committee, "is to honor outstanding architectural achievement and for the purpose of making architects in the Pacific area more cognizant of the best efforts of their foreign colleagues. In so doing, we are accepting a responsibility suggested by our unique geographical location. It can be expected that over a period of time the citations will be conferred upon architects of various countries bordering the Pacific Ocean."

AWARD WINNERS in Hawaii AIA competition are Alfred Preis, Richard N. Dennis, Kenzo Tange of Tokyo (first annual Pan-Pacific architectural citation), Howard Wallace representing Wood, Weed & Kubala, Ltd., and Donald Chapman of Chapman & Fisk.

R. Wenkam



UNION HALL ADDITION, ILWU BUILDING, Honolulu: Alfred Preis, architect.

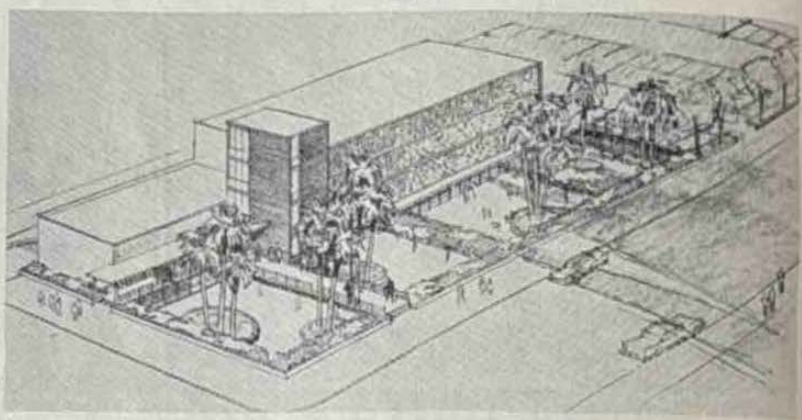
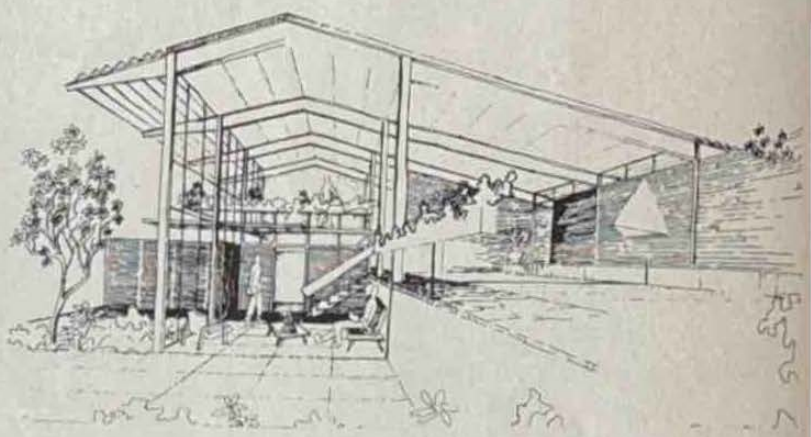
INTERDENOMINATIONAL CHAPEL proposed for Montana State Tuberculosis Sanitarium at Galen will be attached to main building by glassed hallway, but designed to break away from same rigid architecture. Plans call for walls of natural wood finishes inside and out, roof of cedar shingles. Estimated to cost $42,500 completely furnished, chapel will have 90 seats and room for wheel chair patients. Architects: O. Berg Jr. & Associates.

CITY HALL for Modesto, Calif., will be constructed on site of burned out hotel, its excavated foundation hole providing for garden forecourt at lower level and naturally lighted ground floor. Solar screen will be used on long east and west facades, reducing air conditioning load about 20%. Reinforced concrete, flat slab structure will have 38,000 sq. ft. of total area. Architect: Milton T. Pflueger.



PROJECT PREVIEW



EXTENSIVE EXPANSION of Oakland's Hotel Claremont costing almost $2 million will feature eight-story building with 85 hotel apartments. Old and new facilities will be joined by structure housing coffee shop. Below present hotel will be new outdoor dining terrace, skating rink, private club with swimming pool and building for association offices, among them Eastbay Chapter, AIA. Architect: Angus McSweeney.

FOUR DORMITORY BUILDINGS for Reed College in Portland will be identical split-level structures adapted to wooded site across lake from Eliot Hall. Each unit in $400,000 project will accommodate 25 men. Sketch shows main entry lounge and study at left, upper level, which opens onto glass walled lounge. Cantilevered wood deck is 6 ft. wide, with redwood louvers. Architects: Farnham, Shell & Hoyt.

January building volume up $22 million

PERMITS

Building permit volume for January in the five western states climbed to $183,685,720, a jump of $22½ million over the December total. California picked up the biggest gain, $17¼ million. Washington was up $4 million; Oregon, $¾ million; and Montana, $¼ million. Idaho dropped $¼ million.

Compared to a year ago the 116 key building permit agencies surveyed by PA&B reported a $4 million increase. Dollar volume in California topped last January by $7¼ million; in Washington by $1½ million. Oregon dropped $4¼ million; Idaho, $½ million. Montana's total was down a bare $90,000.

Among the major building permit agencies, Los Angeles started the new year with a $9 million increase over January 1957 and Torrance was up $5 million, while Los Angeles County dropped $7½ million and San Diego was down $3½ million. In the Bay area, San Mateo County was up $3 million; Sunnyvale, $2¼ million; San Francisco, $1 million; and San Jose $1¼ million. Oakland dropped $2 million. Seattle, with a $1¼ million increase, was the only major agency in the Pacific Northwest to show a substantial rise over last year.

Following is a breakdown of building permits issued for new buildings and additions by several of the major agencies during December. (Number of permits is followed by total dollar volume.)

ANALYSIS OF TYPICAL AREAS—JANUARY

	Dwelling		Commercial & Industrial		Public

POINTS OF VIEW

Is city planning branch of architecture?

Sydney H. Williams, architect associated with Pacific Planning and Research, Palo Alto, gives his answer to this vital question in the December bulletin of the Northern California Chapter, AIA. The article is not reprinted in its entirety.

THERE are few architects who, like myself, have been devoted for years almost exclusively to the practice of city planning. I am conscious that I work in a field which is substantially different from architecture—different to some extent in attitudes and values, as well as techniques. At the same time I am aware that many architects believe that urban planning is—or ought to be—a branch of architecture, practiced by architects. To what extent is such a belief correct: is city planning a branch of architecture?

It must be granted that architecture and city planning (together with many other fields such as engineering and geography) are directly concerned with man's physical environment. I submit four instances in which the city planner and the architect are conditioned to approach that environment differently: scale, time, the client, accomplishment of plans.

Scale. An architect normally deals with thousands of square feet of enclosed space or with the arrangement of enclosed and open space upon a limited site. A city planner is primarily concerned with the organization of square miles or hundreds of square miles of urban and suburban development. Thus the city planner's natural tendency is to approach the study of small areas from the point of view of the organization of the whole community.

Time. The time span for the design and construction of an architectural project can usually be measured in a few years at the most. Even though a major work of architecture is expected to be useful for many years, principal changes in function seldom occur between conception and completion. By contrast, an urban master or general plan is designed specifically to serve the anticipated needs of a community 20 to 30 years in the future. Study of past trends as well as present characteristics is necessary in order to forecast future needs (which can never be precisely determined). Thus the city planner has a tendency to approach problems of the present or the near future from a very broad scale of time. He becomes aware of the impermanence of most "permanent" solutions to urban problems and emphasizes the need for flexibility in any long-range project.

The Client. Architects are conscious of the problem of working for municipal and corporate clients (as opposed to individual clients); they know that it is usually more difficult to satisfy a committee than to satisfy an individual. The city planner must endeavor to meet the needs in a long-range city plan of a faceless multitude, estimating the needs and desires of the public through the approximate methods of the social sciences. To carry out his plans, the planner must gain the acceptance of an outspoken minority—the political bodies who must adopt plans officially.

Accomplishment of Plans. Well-established practices exist to turn architectural designs into final construction. The architect counts on the completion of his work as a tangible three-dimensional product. By contrast, a general plan is carried out over a period of many years by a complex series of governmental procedures: by zoning and subdivision ordinances, by capital improvement programs and ultimately in actual construction by the work of many individual architects and engineers over whose work he has little control.

I believe that the foregoing are significant examples of differences between city planning and architecture. As examples, they show that the city planner needs to bring a special approach to the design and control of the physical environment and that he must be able to supply knowledge in fields of minor significance to architecture such as sociology, political science, economics and law. Furthermore, city planning as a field merges into and is a highly dependent upon broad regional planning in which knowledge of three-dimensional physical design is of minor importance. The relationship between regional planning and architecture is remote. City planning, to the extent it is related to regional planning, is not a branch of architecture.

City planning, however, is—or should be—intimately related to architecture in other equally important respects. Many architects frankly refer to city planners as "administrators" or "statisticians." What does this criticism means? To me it means that many city planners neglect, to the peril of their profession, the three-dimensional reality of the final product of city planning. Too many well-staffed city planning departments have produced drab, uninspiring plans and have prepared zoning and subdivision ordinances which may lead to built-in and surburban monotony in future years. A city must satisfy fundamental human needs for beauty as well as economic, political and functional needs. If a city planner is trained to think in terms of an urban scale, can he continue to neglect the aesthetic implications of the environment that he creates at that scale?

Although the planner has developed techniques for preparing and carrying out long-range urban plans, he frequently has lost touch with the most elementary techniques of three-dimensional design. Beautiful cities will not be obtained solely by planting street trees and removing billboards. A well-designed civic center will not make up for endless miles of suburban monotony. I do not think that any city planner can escape direct and personal responsibilities for large-scale urban design, any more than an architect can turn over to someone else the responsibility for the appearance of a building. Perhaps a more or less specialized field of urban design will emerge from the design professions, but city planning, as well as architecture and landscape architecture, is a necessary part of the urban designer's background. To the extent that city planning deals with the three-dimensional design of the city, I regard it as a branch of architecture.

From the city planner's point of view, the architect can frequently be criticized for neglecting the relationship of his projects to the urban area as a whole. Otherwise well-designed buildings have been built without proper attention to serious problems of parking and circulation, have been wrongly located for their purpose to the community, have been designed without respect to their streets.

The lack of communication between city planners and architects suggested above is less significant to me, however, than the lack of exploration by architects of design projects intermediate in scale between architecture and city planning. This work, which includes large shopping centers, urban renewal projects, large residential and industrial jobs cannot be done by city planners who are unable to design or by architects who do not understand city planning.

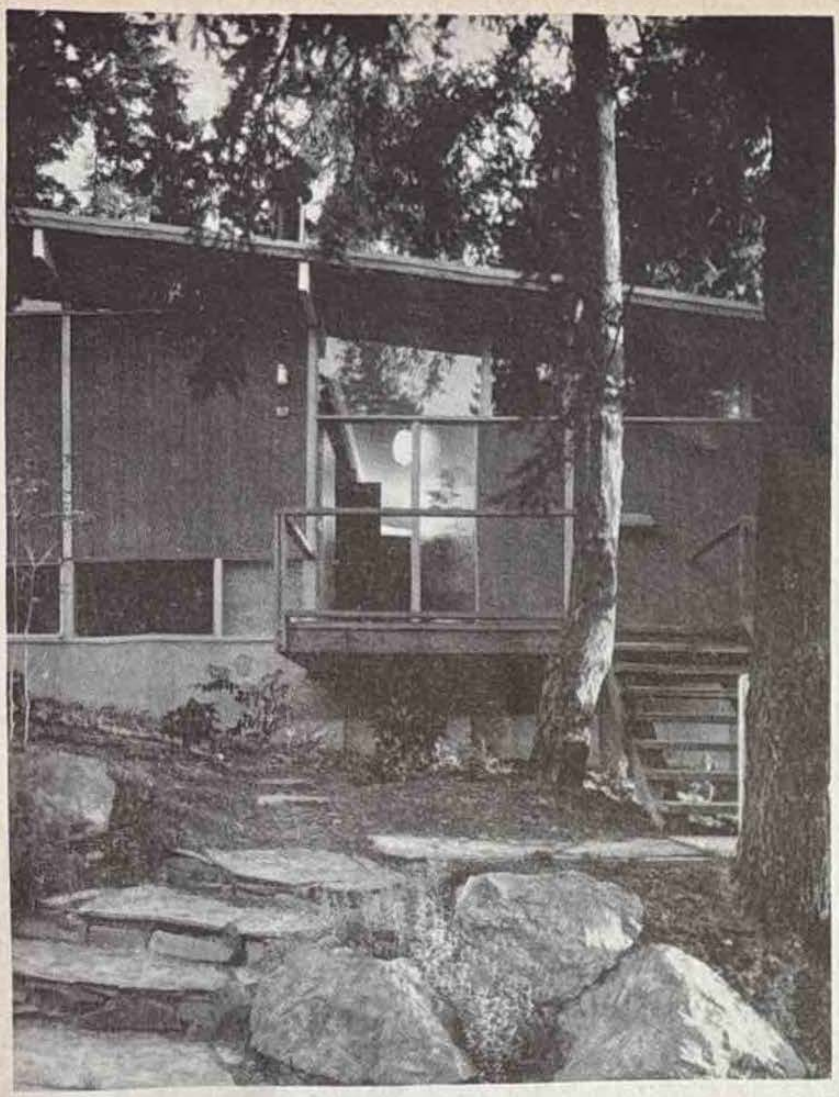
Young family living in the Northwest

Walter D. Widmeyer Residence
Tacoma, Washington

WALTER D. WIDMEYER
Architect

ALLEN HAMPTON
Contractor



FRONT ENTRANCE of cantilevered deck, natural stone steps and rockery compliment wooded site. Entry hall with its high ceiling continuous from living room on upper level creates feeling of spaciousness. Brick fireplace wall is 7 ft. high, accented by brightly painted metal stacks.

THIS SMALL HOUSE which the architect designed when his family numbered four (the two boys were joined by a sister last year) truly belies its actual size—1,200 sq. ft., not including the basement level and carport. Living areas are enlarged visually as well as functionally by generous overhangs with extensions of ceiling surfaces and walls beyond glass, by a split-level open plan and by a terrace which is an integral part of the house.

Sited in the Fircrest community on a steeply sloping corner lot only 50 ft. wide, the plan was developed to follow the contours, with a change of level occurring between the living and sleeping areas; directly below, the basement and carport spaces are split in an identical manner. The sloped ceiling surfaces give a continuity in the transition between the upper levels and their varying heights introduce an ever-changing feeling of spacious living. High windows on the entrance side afford privacy from the street and allow the towering firs to be enjoyed from every room—a delightful experience, particularly on the rainy days which are not uncommon in the Pacific Northwest.

The kitchen, which houses washer and dryer, is called the most pleasant room in the house by the architect's wife. ("I love to bake.") It is separated from the living room by a 7-ft. partition topped with indirect lighting and from the dining space by a serving counter with an overhead cabinet, suspended from a beam. Windows have been brought

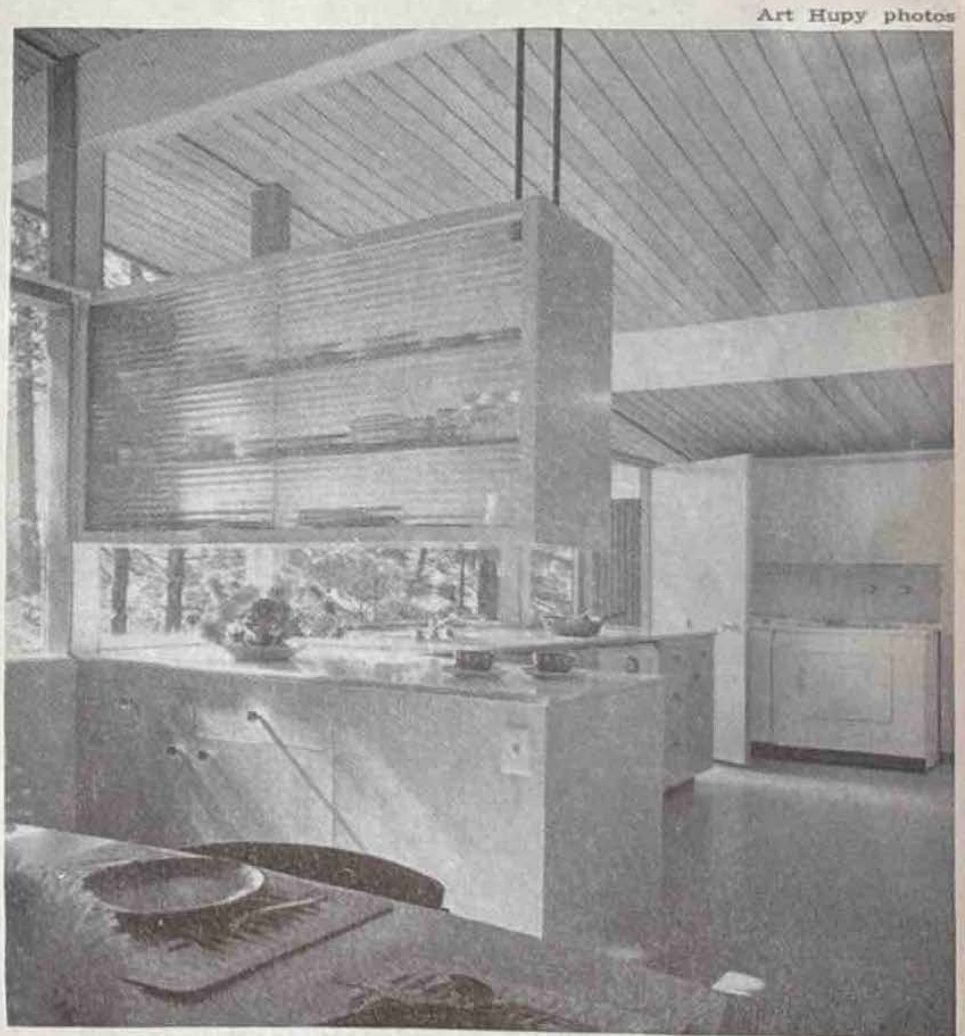
flush to the surface of the extra wide countertops. Another noteworthy feature is the abundance of well-organized storage: sliding shelves for easier access below the counter level, shallow shelving for canned goods, storage door in the utility closet for polishes, etc.

The living room allows for conversation around the fireplace and an activity area near the patio window. The open plan facilitates informal entertaining, which is the rule rather than the exception. During frequent neighborhood coffee hours the mothers can observe the children playing on the patio; and on other occasions the youngsters generally are content to occupy the lower bedroom area. Both the architect and his wife enjoy music, each having studied an instrument for several years, and find that the acoustics are excellent for piano. A high-fidelity installation backing the kitchen partition is next on the family agenda.

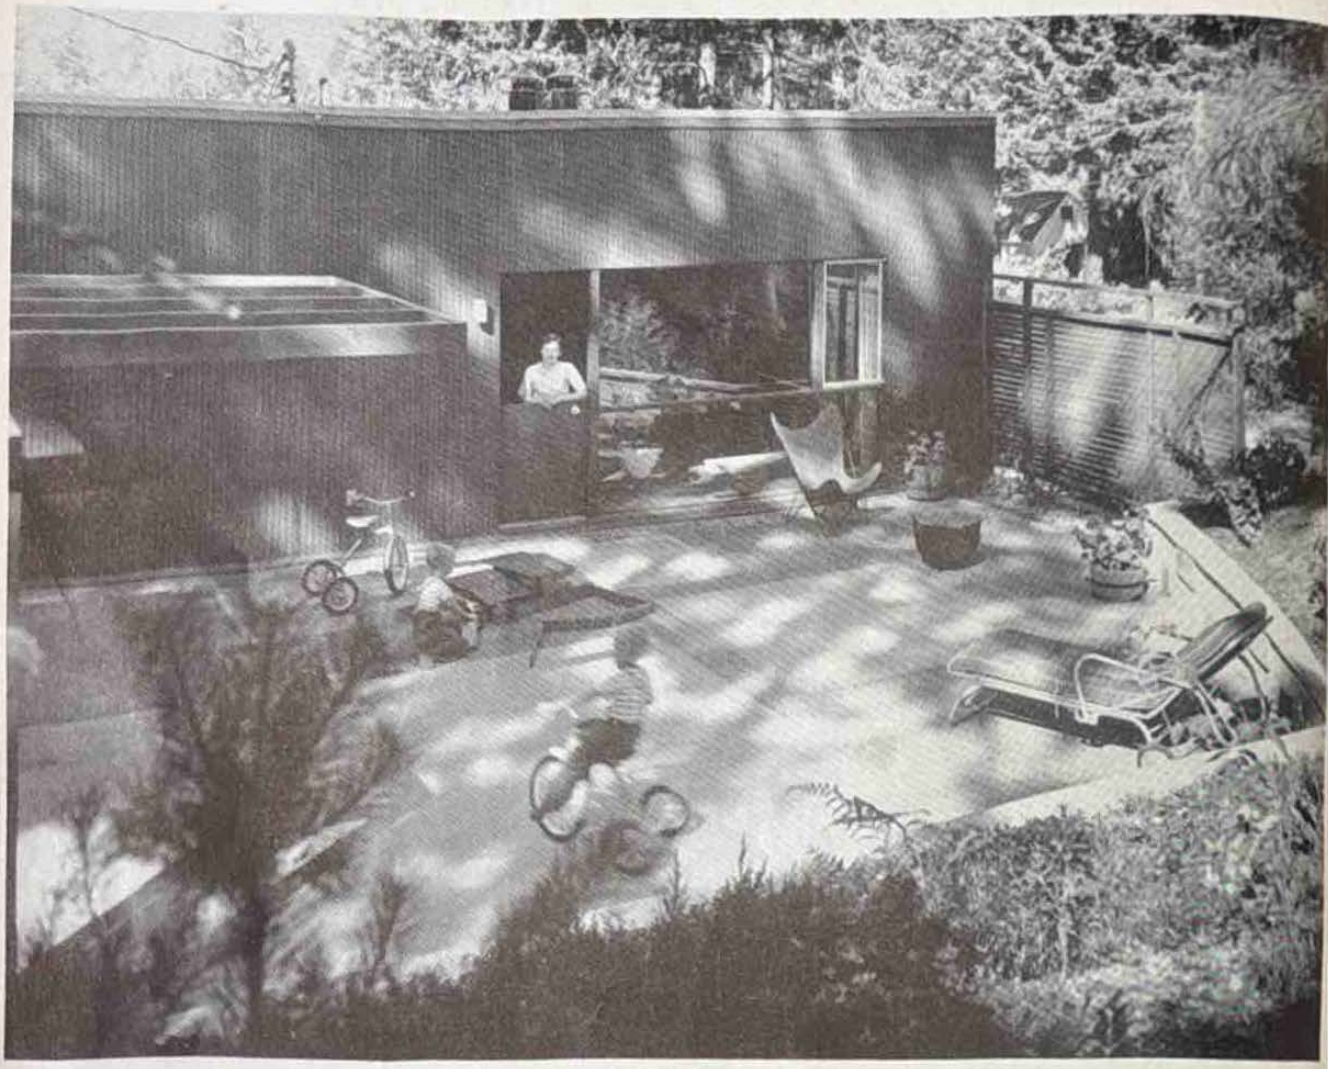
When the basement area is finished, it will include a larger bedroom for the boys, an additional bath and a storage room. The sleeping area, equipped with such facilities as a train table and low beds to serve as sofas, will double as a rumpus room. The room presently occupied by the boys will be used to accommodate guests.

The ceiling of exposed, slightly stained hemlock decking throughout the house is supported by posts and laminated beams painted bone white. Fir plywood, perforated hardboard and plasterboard provide contrasting wall textures; browns, soft yellows and gray-greens are accented by red-orange; white asphalt tile is splattered in a gray and black pattern.

Art Hupy photos

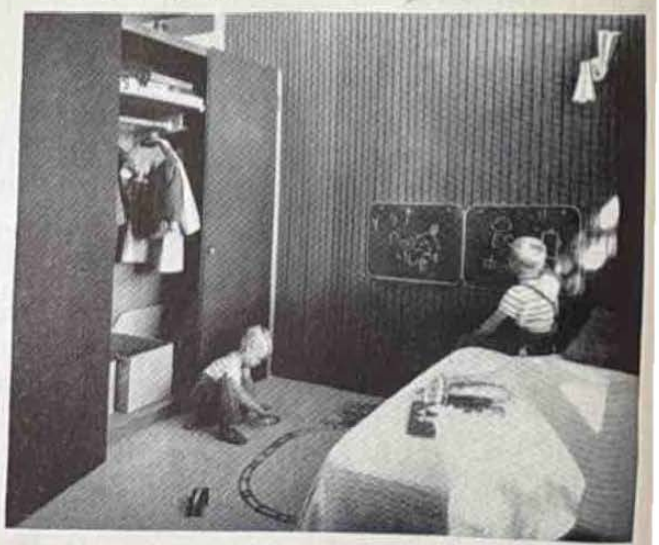


CABINETWORK has plastic surfaced countertops and natural birch fronts. Sliding glass doors of hanging unit provide access from both kitchen and dining space.



TERRACE consists of large concrete slab integrated with exposed aggregate surface to form random pattern. Lath screen and landscaped bank cut off street. Living room window overlooking patio has fluorescent fixture across top.

CUSTOM BUILT WARDROBE is installed as unit to separate boys' bedroom from hallway. One wall of 2-in. grooved plywood presents interesting change of pace.



OUTLINE SPECIFICATIONS

Structure: post and beam on 8-ft. module, painted white; 2x4 t&g roof on laminated fir beams; frame floor.

Exterior Walls: 2-in. Texture One-Eleven and striated exterior fir plywood; stain—Olympic Stained Products Co.

Roof Surfacing: split-sheet, four-ply built-up.

Windows: stopped in wood; vents—Bilt-Rite Aluminum Products.

Doors: exterior: solid core birch and gumwood; interior: hollow core masonite.

Floor Surfacing: asphalt tile—Kentile, Inc., carpeting in master bedroom.

Interior Walls: 2-in. Texture One-Eleven fir plywood; perforated hardboard; plasterboard.

Ceilings: exposed 2x4 t&g hemlock.

Cabinetwork: fir plywood with birch veneer fronts; countertops—The Formica Co.; hardware—Washington Steel Products, Inc.

Insulation: 1½-in. rigid over roof decking; Rockwool batts in walls.

Fireplace: buff roman brick with prefabricated metal stacks.

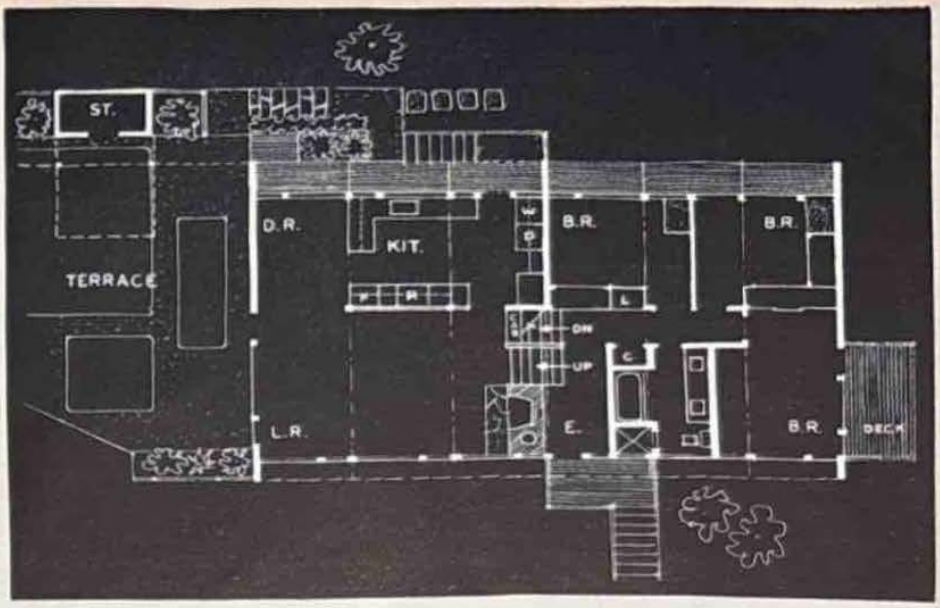
Heating: oil fired warm air unit—Armstrong Furnace Co.

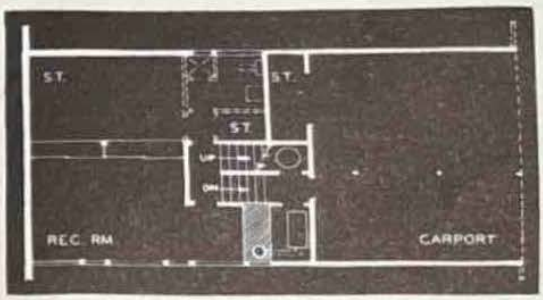
Total Area: 1,200 sq. ft., not including basement level and carport.

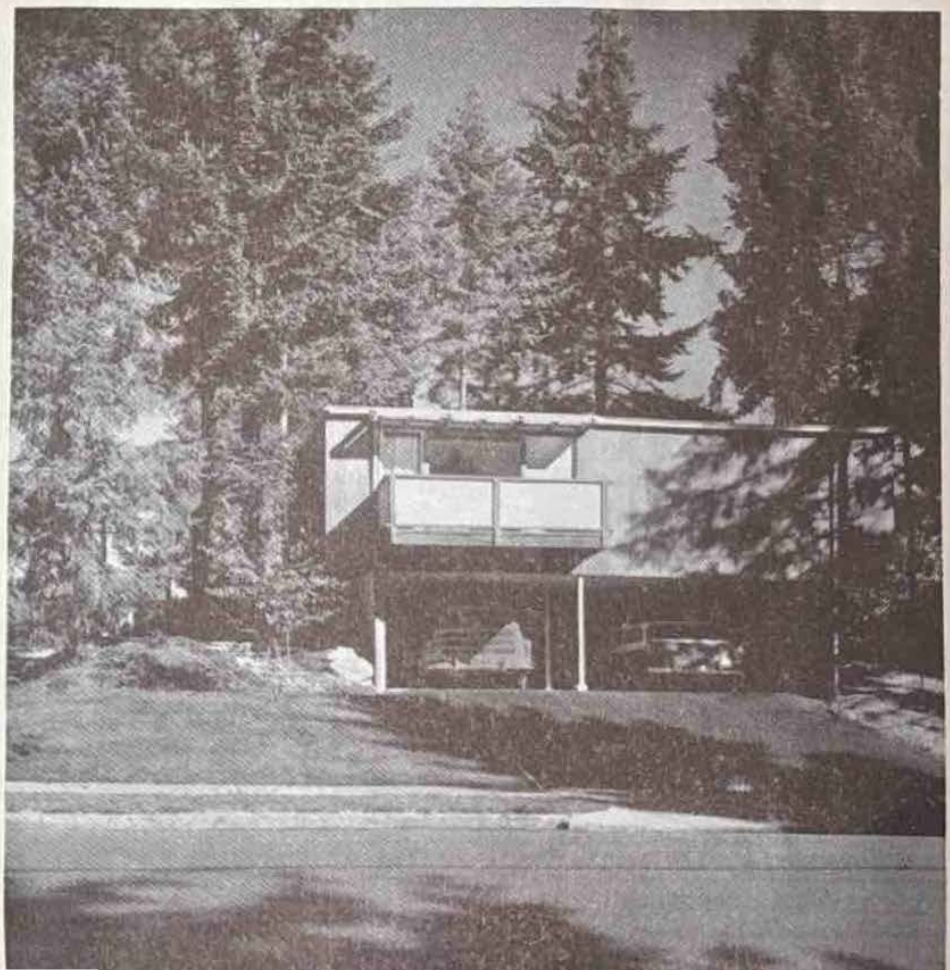
Total Cost: $15,000, not including owner's labor figured at market cost of $1,800.

Cost per Square Foot: $12.50.

Date of Completion: December 1954.







DOUBLE CARPORT located directly below bedroom area has easy access to central stairway. Wood deck with asbestos cement panels off master bedroom affords privacy from street.

Church 'campus' designed for children

Religious Education Building
Neighborhood Church
Pasadena, California

SMITH & WILLIAMS
Architects

ECKBO, ROYSTON & WILLIAMS
Landscape Architects

TED TYLER
General Contractor

THIRD NEW STRUCTURE built for the children of Pasadena's oldest congregation becomes a compatible neighbor to the Children's Chapel and Nursery School through the same patterns of low roofs, exposed beams, overhanging eaves and wide expanses of glass. Diamond shaped trusses and rough carved supports shelter the walks which connect the three buildings, lending a continuity that makes each unit an integral part of the whole; thus the "campus" is of one piece. Simplicity, openness, honesty are the architectural concepts expressed—qualities which it is hoped will have significance for the children who study and worship here.

The Religious Education Building is on three ground levels to fit the contours of the site, with a half-floor difference between the wings running north and south and the building running east and west. The exterior harmonizes with the existing redwood structures. Plaster is always used as an inset panel, framed by wood supporting members. Long beams that hold up the balcony extend through the building and support the floor and, in one instance, a balcony on the other side. Vertical posts extend through two floors, forming the mullions.

Glass walls slide open to extend the work and play area; rooms can be divided by folding partitions to suit the many purposes for which the building was designed. In addition to housing classrooms for the first eight grades, it provides for a church school library, crafts rooms (including space in which the students can leave their artwork and materials from week to week) and staff offices. More than half of the 8,121-sq. ft. of total area is devoted to teaching space.

"Few religious establishments have offered such extensive facilities for children," the architects point out. "The youngsters have a total of 12,300 sq. ft. in the three structures, each of which was designed specifically for child use."

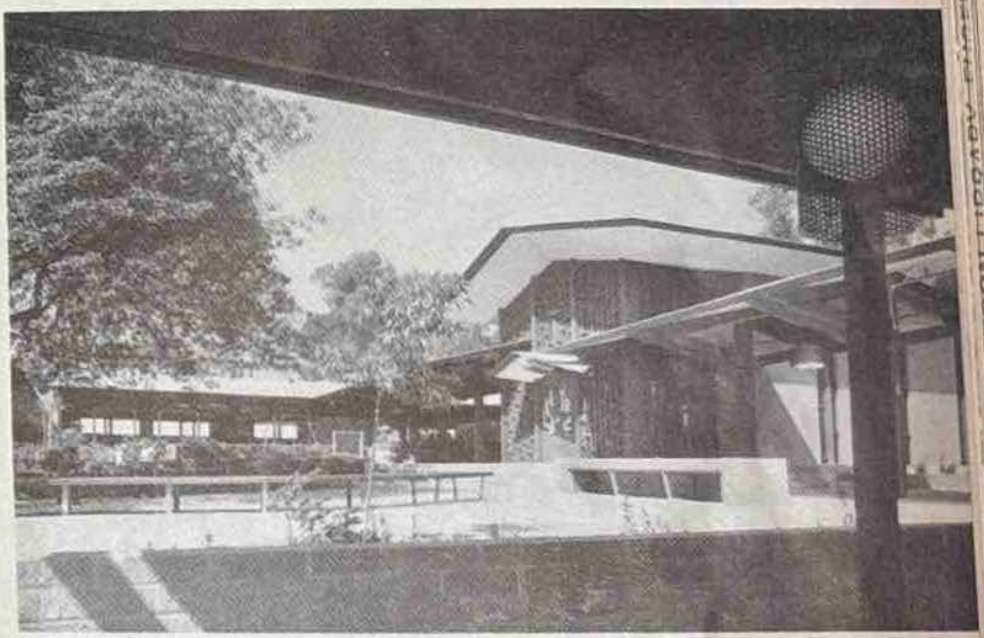
REDWOOD AND PLASTER of exterior harmonizes with other existing structures. Stairwells are covered with broad screens of T-pattern redwood boards. Balcony guards of metal mesh are deep blue.

Julius Shulman photos

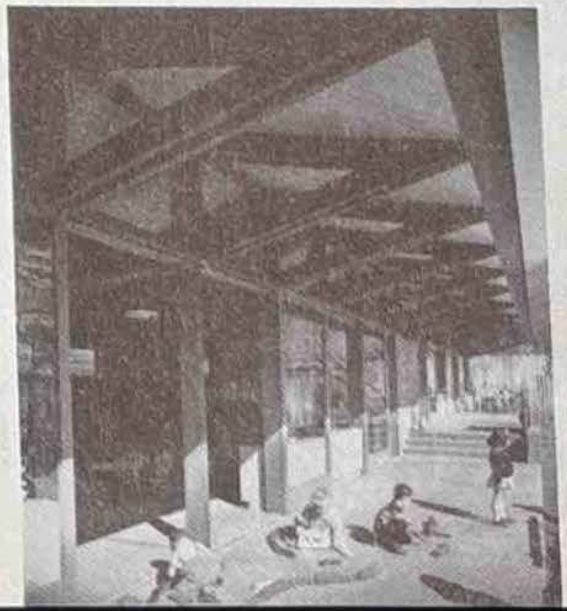
All three of the buildings have been cited for utilitarian and design excellence. Here briefly are the noteworthy features of the other two structures which make up the complex.

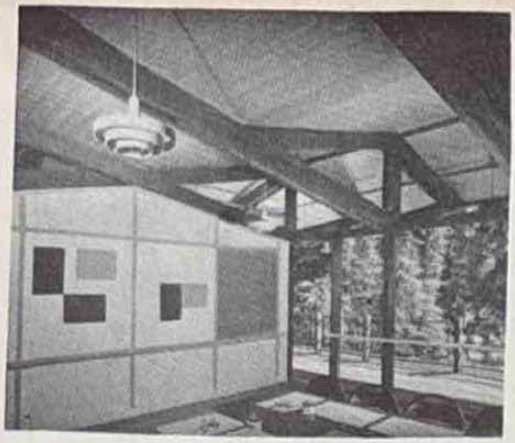
CHILDREN'S CHAPEL: Standing alone, yet linked to the others, it gives the children a church of their own, right next to the classrooms and playgrounds. It is no replica of the main church (almost 50 years old), but uses the same redwood and earth colors, retaining a family resemblance; and more important, it is scaled down to child size. A red brick wall which complies with a four-hour fire protection ordinance became a design feature when it was pulled free of the building, creating an access way to the rear of the altar and capturing garden sunlight as a worship backdrop. The entrance is highlighted by a redwood grille. Sculptural figures secured to the chapel door were carved in ashwood by Albert Stewart. The chapel was completed in 1954; general contractor: Roulac Co.

NURSERY SCHOOL: On a tree-shaded lot adjoining the church property, the first structure containing four large classrooms and central utilities was laid out to house pre-kindergarten children. Here again folding partitions permit flexibility and glass walls on the garden side open into a single work and play area. The back wall which is on the property line has high obscured wire-glass windows; the space below is fitted with tackboards to display artwork and illustrations for lessons. A rustic fence of narrow redwood palings is used to separate the playground from the garden, where the children can gather around a table with their teacher for a quiet story. The school was completed in 1948; general contractor: William C. Crowell Co.



CENTRAL PAVED PATIO, dominated by old Pittosporum tree, provides easy approach to all buildings connected by covered walks. Relationship of three is indicated in photo directly above, showing view of Children's Chapel and Nursery School from Religious Education Building. Diamond shaped trusses and rough carved supports are evident in closeup below.





SUSPENDED DROP FIXTURES with concentric ring baffles are used for artificial lighting of classrooms when needed. Chapel accomodates 80, has acoustical tile ceiling, cork on concrete slab floor.

OUTLINE SPECIFICATIONS

(Religious Education Building)

Structure: Douglas fir plywood frames, spaced 6 ft. o.c., cantilevered 8 ft. beyond building line to support second floor balconies; 2-in. t&g Douglas fir roof; concrete slab and 3-in. t&g Douglas fir floors.

Exterior Finish: Screens of 2x6 and 2x4 redwood in staggered T- pattern; Cabot stains; plaster.

Balcony Rail: Porcelain enameled expanded metal.

Roof Surfacing: Composition and rock.

Windows: Plate glass between posts; glass louvers.

Doors: Sliding glass.

Floor Surfacing: Asphalt tile.

Interior Finish: Plaster.

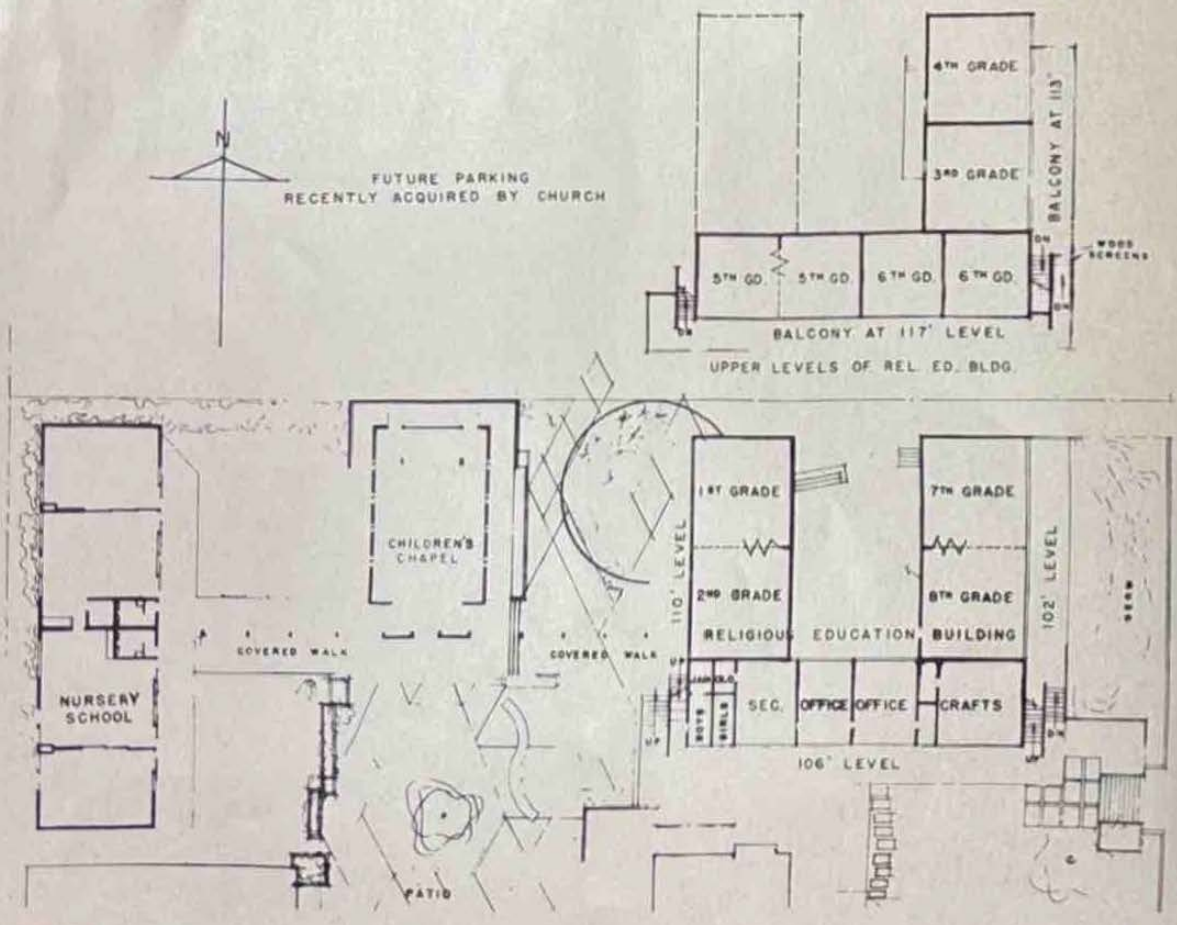
Ceilings: Acoustical plaster, exposed wood beams.

Lighting: Suspended fixtures with concentric ring baffles.

Total Area: 8,121 sq. ft., including balconies and covered walks (1,597 sq. ft.).

Date of Completion: January 1956.

SITE PLAN does not show neighborhood house, church proper and minister's house, all located south of new buildings which make up children's complex. Area marked "future parking" has been completed.



Mountain Savings and Loan Association, Boulder, Colorado
Architect: Hobart D. Wagener, Boulder, Colorado
Contractor: Wilkins Company, Inc., Boulder, Colorado

This bank wanted a fresh approach—commented the architect, "A building to show the cordial comfortable informal glow. Banking institutions often are cold and forbidding . . . we thought that people coming to discuss home loans would like the atmosphere of a home.

"We believe the exposed RILCO laminated wood beams and posts are successful materials for fulfilling the requirement of both the residential and commercial atmosphere. The warmth of wood and the clear expression of the fine material seem to suggest simple clarity to those visiting the building."

That this design was eminently successful is evidenced by the regional award of merit from the Western Mountain Division, American Institute of Architects. We like to feel that the rich warmth of the RILCO laminated members helped win this coveted award. For RILCO brings the functional beauty that only wood possesses, and keeps this beauty for years with minimum maintenance . . . because RILCO members resist cracking, warping.

RILCO laminated wood beams and columns inside and out. Beams 3¼" x 9¾" x 24' 1"; and 3¼" x 9¾" x 21'; Columns 3¼" x 4⅞".

To quote the contractor—"Well pleased with cost results . . . accuracy of construction . . . careful attention to finish and protection of members in shipment."

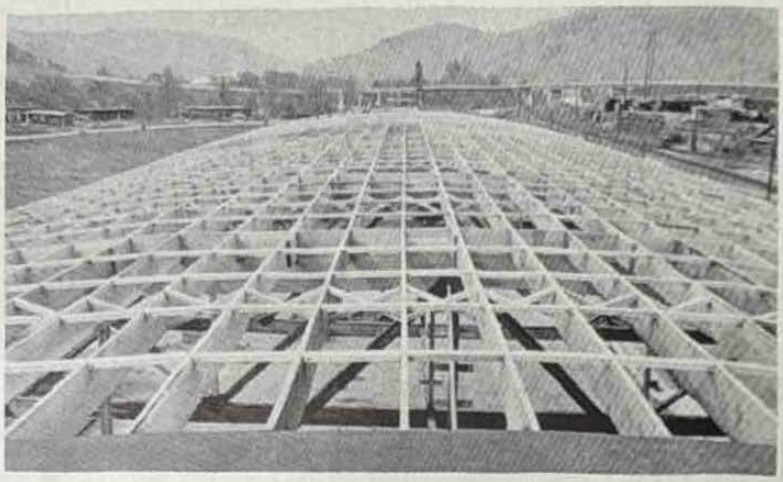
RILCO LAMINATED PRODUCTS, INC.
236 Tacoma Building • Tacoma 1, Washington



INDUSTRIAL BUILDING being constructed at Roseburg, Ore., uses plywood roof deck and spray coat surface to replace conventional three-ply built-up roof.

FIRST STEP in new system involves application of 3-in. flexible tape to plywood joints.

Roof system cuts costs of industrial jobs

NEXT STEP is key to entire system. Here workman sprays compound over tape joints.

FINAL COAT of aluminum based spraying compound may be employed to provide heat reflected surface, reducing inside temperatures of plants. Finished roof expanse should last for years with occasional coating such as that used on conventional roofs.

NEW APPROACH to surfacing industrial roofs which is being used by several plywood mills in the Pacific Northwest may find acceptance in other regions because of a cost advantage.

The idea eliminates the conventional three- or five-ply built-up roof in favor of a fir plywood decking, spray coated with a flexible compound. Joints are taped and the Portland manufacturer, Tropical Paint Co., declares that the system produces a high quality job at one-half to one-third the cost of a conventional roof.

Generally the progress of the job begins with the application of the plywood roof deck, PlyScord sheathing with exterior glue being recommended. Panels can be ⅜ to ¾ in., depending upon the framing scheme utilized in the building.

Joints are sprayed or brushed with the compound (trademarked Tropical Roofkoter), taped and then the entire surface sprayed. The material remains flexible so that joints should not leak. Each step can follow one upon the other without delays for drying time or other reasons, permitting the course of the job to flow smoothly and efficiently.

On a recent job Umpqua Plywood Corp. reports that it used ⅝-in. plywood decking over arch trusses and conventional purlins with panels blocked at all edges. "We used one heavy coat of the material sprayed directly onto the decking," a company spokesman says. "The job cost about one-half that of a conventional tar and paper roof. So far it is free of leaks and easier to maintain."

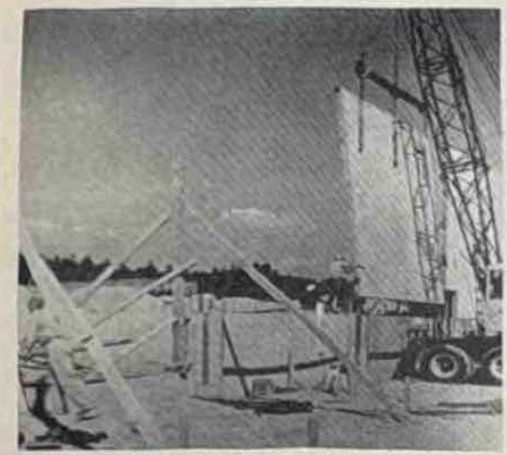
After two years' experience with the material, a Menasha Plywood Corp. official comments that it cuts the cost of a built-up roof, assuming a plywood deck is used, by about two-thirds. He states that "the cost speaks for itself and there is no reason why it will not last indefinitely with an additional coating from time to time, just as it is needed for a built-up roof."

Tropical Paint's own cost figures tend to vary with the demands of individual jobs, as Floyd Campbell, western division manager, points out: "This kind of roof will run about $7 to $8 a square in this part of the country compared with $15 to $20 a square for a three-ply built-up roof. The figures vary, of course, but on a job in Cleveland they came in at $6.50 a square for the spray coat applied directly to the plywood compared with $18 for a built-up surface."

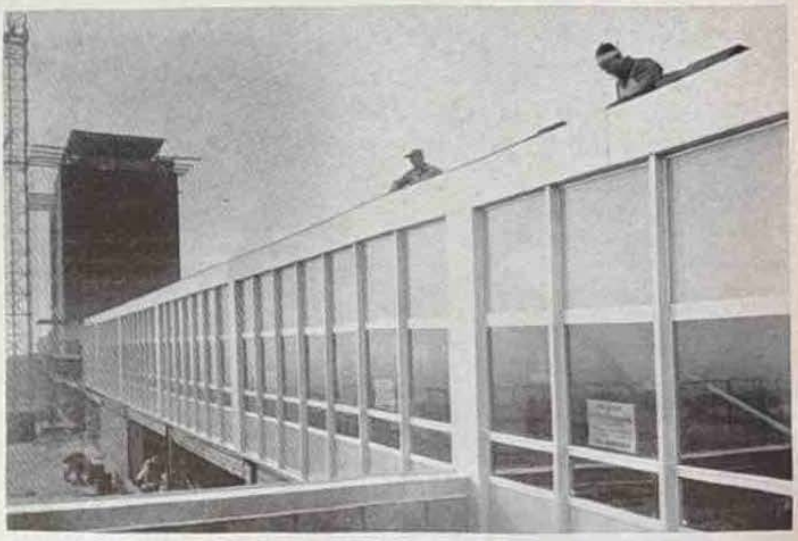
In a number of instances plywood and lumber plants using this system are adding an aluminum base liquid surfacing to provide for a minimum cost heat reflective surface tending to reduce inside temperatures substantially.

EATING SHELTER at $5 million Newport Harbor Union High School, Costa Mesa, Calif., is 100-ft. diameter dome suspended on three points, utilizing standard rolled beams with poured gypsum roof over asbestos formboard. Roof thickness is only 6 in. General contractor: Noyes Roach Co.; architects: Lind, Pleger, Blurock & Hougan.

CONSTRUCTION FRONT

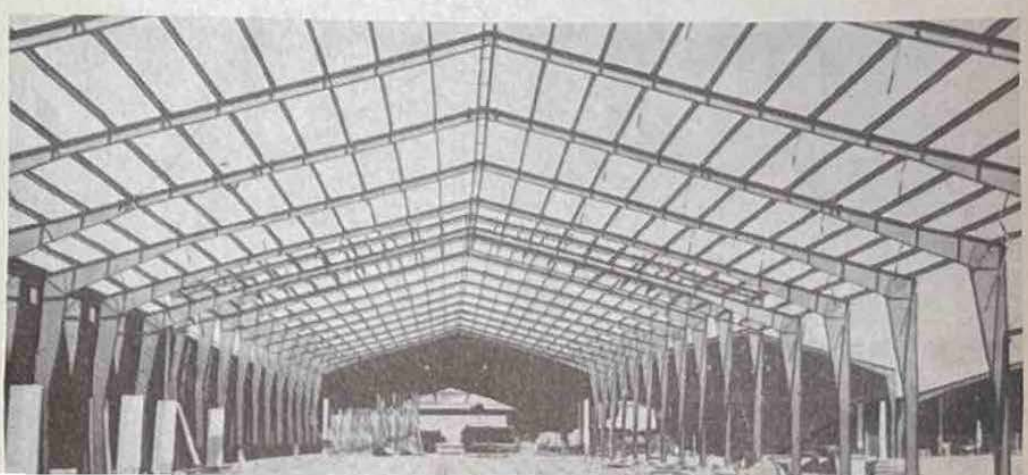


TILT-UP PANEL is erected for fluid milk plant of Seattle's Lucerne Dairy with Hinds Pick-up Arms which also act as temporary scaffolding after serving their initial purpose. Costing $500,000, 33,000-sq. ft. building contains 36 panels each weighing in excess of 18 tons. General contractor: Brazier Construction Co.; architects: Leo A. Daly & Associates.

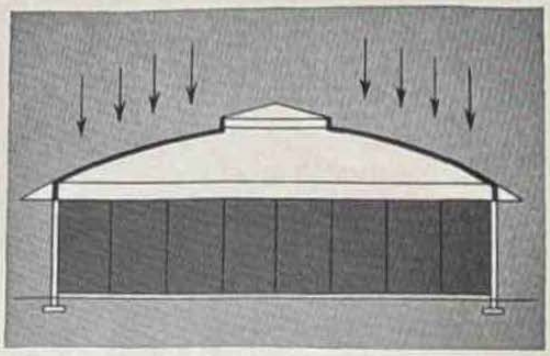


THIRD-LEVEL FRONT of Portland International Airport's new terminal building, now more than 70% completed, will be occupied by rental offices which will enjoy unobstructed view of much field activity. Control tower at left rises another five stories and will accomodate both Port of Portland offices and CAA operations. General contractor: Ross B. Hammond Co.; architects: Burn, Bear, McNeil & Schneider.

ONE OF LARGEST steel frame buildings in world is 500,000-sq. ft., $4 million Convair off-site warehouse at San Diego. Excavation for 800,000 cu. yd. of earth that had to be moved in order to prepare site was begun at almost same moment that design phase got underway. Clay loam of poor-bearing qualities presented compaction problems. Because of urgency of time, 90-ft. span prefabricated Soule steel framing was used, while prestressed concrete girders and columns were specified to support 800-ft. craneways. General contractor: James Stewart Co.; architects: Richard George Wheeler & Associates.



new approaches to structural design with fir plywood



Engineering tests by Douglas Fir Plywood Association showed vault resists three-times-normal roof load. Deflection at midspan was negligible. Note how door-high roof line saves wall area.

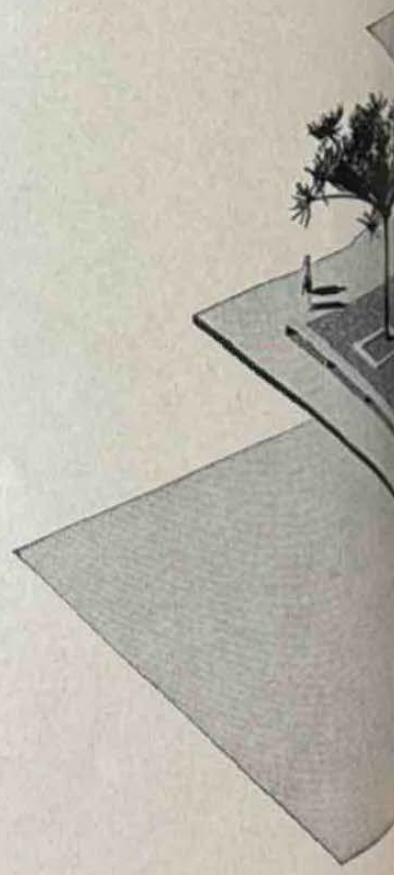
FIR PLYWOOD

ARCHITECT: Robert B. Price, A. I. A., Tacoma, Wash.
Robert C. Wing, Consulting Engineer

IN THIS graceful stressed-skin fir plywood domical roof, Architect Price has developed a simple and precisely engineered unit that combines beams, purlins and roof sheathing.

The first application of this new semi-spherical roof system is in the four-room satellite school shown at right. In its design, Price sought to create "an exciting and stimulating space with a high degree of flexibility and substantial construction economies."

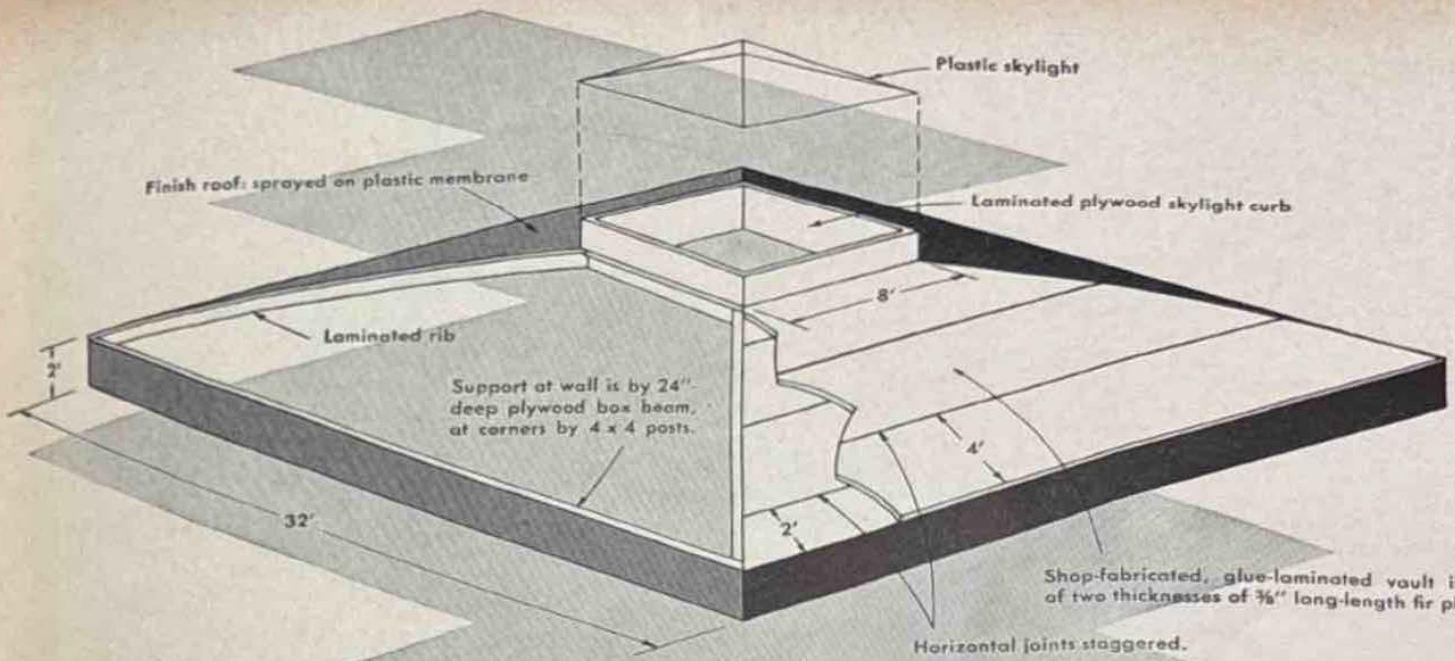
Adaptable to other types of buildings, the Price roof system is a logical design evolution in which lightweight fir plywood replaces heavier and costlier materials. It provides a long, post-free span, pleasing mass and profile, has excellent lighting, insulation and acoustical properties.



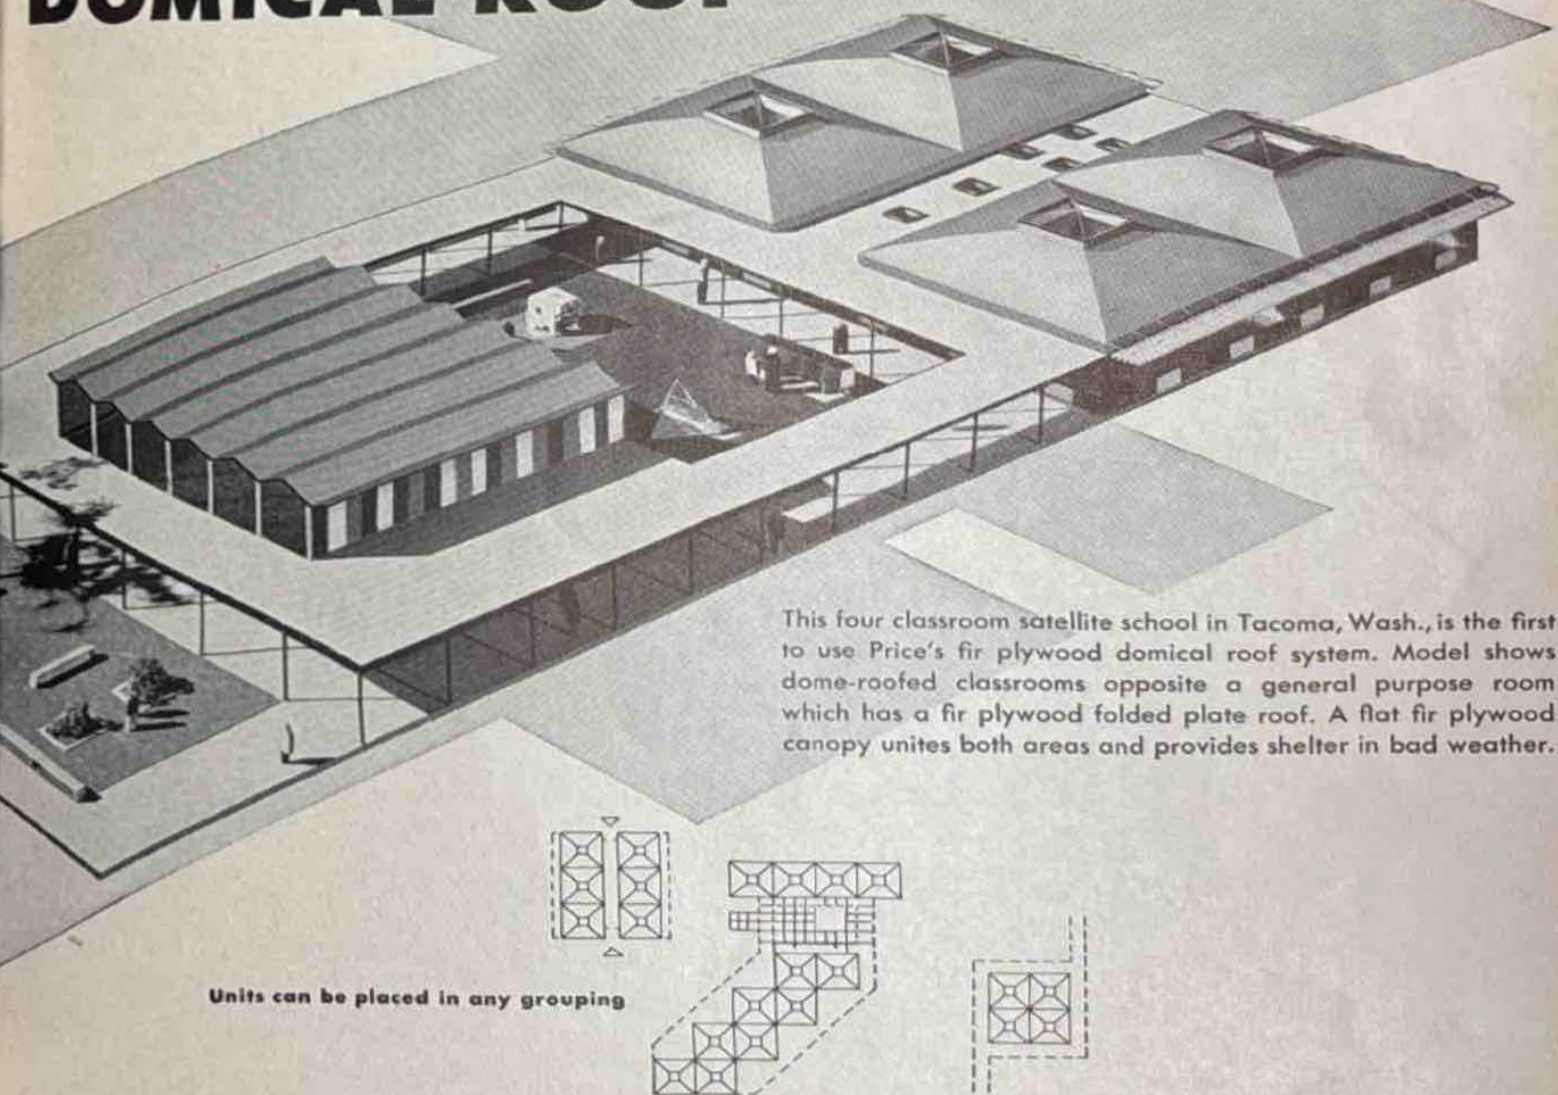
ONE OF A SERIES FROM "SCHOOLS OF THE FUTURE"

. . . a portfolio collection of outstanding designs by six leading architectural firms. Includes details on domical roof shown above. For your free copy, write (USA only) Douglas Fir Plywood Association, Tacoma, Wn.

Also write for information about fir plywood design and engineering consulation services.



DOMICAL ROOF



This four classroom satellite school in Tacoma, Wash., is the first to use Price's fir plywood domical roof system. Model shows dome-roofed classrooms opposite a general purpose room which has a fir plywood folded plate roof. A flat fir plywood canopy unites both areas and provides shelter in bad weather.

Units can be placed in any grouping

PRODUCTS

light fixture

Especially designed to be unbreakable, even when submitted to rough usage, the Ruby Security fluorescent light fixture has many uses in schools, colleges and similar institutions. It fits flush against ceiling or wall and can be opened for relamping only with a special tool. Closed, it is completely dustproof and bugproof and so watertight that it can be cleaned with a hose at full pressure.—Ruby Lighting Corp.

(Item No. 1)

drinking fountain

To satisfy drinking water requirements in heavy traffic locations, Haws has introduced a semirecessed double drinking fountain in stainless steel. Overall front-to-back dimension is 13 in. Model 732 can be used with Haws wall-insert remote cooler units.—Haws Drinking Faucet Co.

(Item No. 2)

modern 'stained glass'

A simple and economical way to make "stained glass" windows of laminated safety glass has been developed by Monsanto, the first commercial installation being made at the University of New Hampshire. There, safety glass seals 240 sq. ft. of abstract painting into a 24-panel window. The artist who created the design applied his paints directly to the surface of the glass. The laminated safety glass then was made by sandwiching three layers of tough plastic sheeting between the painted glass and a sheet of unpainted glass and bonding the five layers with heat and pressure. The artists's work, applied to the inside surface, was sealed protectively into the laminate.—Monsanto Chemical Co.

(Item No. 3)

steel school

Truscon's expandable steel school plan is intended for "outline use" by architects who will adapt this basic pattern to suit individual requirements as to capacity, arrangement, etc. Conceived primarily for a suburban setting, the school can be X-, L-, T- or U-shaped or a modified version. Steel and glass curtain wall panels offered by the manufacturer are bolted together to form one continuous exterior end wall which can be expanded by a simple process of dismantling, repositioning and reassembly. Each unit is about 12 ft. in height and 4½ ft. in width; thickness is about $1\frac{7}{16}$ in.—Republic Steel Corp.

(Item No. 4)

acoustical tiles

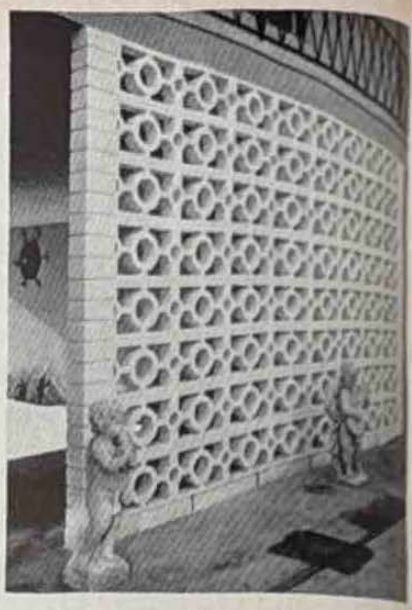
Kaiser has introduced two patterns to round out its Fir-Tex line of fiber acoustical and decorative tiles. These are the regular pattern tile increased to 529 perforations per square foot and the casual pattern of 316 perforations in three different diameters. The complete line has been redesigned with narrower margins, smaller painted bevels and smoother surfaces.—Kaiser Gypsum Co., Inc.

(Item No. 5)

cedar bevel siding

Milled from clear western red cedar, Shado/Edge bevel siding provides a custom material for residential construction at a competitive price. In addition to its dramatic shadow accent, it is factory primed on all surfaces with a transparent water repellent which gives added protection against moisture and lengthens paint life.—Seattle Cedar Lumber Manufacturing Co.

(Item No. 6)



vented block

The Granada vented block, 12 in. wide by 18 in. high, provides a contemporary touch to traditional elements in low cost screening walls for patios, entries, windows and parking areas. It achieves a feeling of privacy, yet admits light and air and the symmetrical openings cast interesting patterns. Gray in color, the block can be easily painted and laid to emphasize either horizontal or vertical lines.—General Concrete Products, Inc.

(Item No. 7)

sliding mirror door

Use of floor-to-ceiling sliding mirror doors for closets and other storage areas adds both new dimensions to the room and extra utility to the closet space. The mirror wall is a packaged product made from Libbey-Owens-Ford Parallel-O-Plate ¼-in. thick glass. It is framed in aluminum and equipped with all hardware for hanging on the overhead heavy duty, double-roller track. National distribution of the Signet Mobile mirror was expected to begin this month through glass and mirror dealers.—Carolina Mirror Corp.

(Item No. 8)

wall-hung toilet

In answer to the many requests received from homemakers, American-Standard has designed a wall-hung toilet styled especially for residential use. The Norwall toilet hangs on a carrier tied directly to wall studs and clears the floor completely. No wall-access panels are needed. To match contemporary decor, the toilet is available in eight colors, as well as white and stands 15 in. high.—Plumbing and Heating Division, American-Standard.

LITERATURE

stone file folder

A file folder of individual sheets for those planning, specifying and installing stone masonry jobs covers such data as preparation of stone, wall section details and setting techniques. Other sheets illustrate popular wall patterns, fireplaces, chimneys, planter walls, flagstone patterns for walks, patios and play areas. Full color reproductions of wall sections show the various tones of the stone.—Briar Hill Stone Co.

(Item No. 10)

redwood index

To assist architects, builders and home planners in the use of redwood products, a revised and categorized index lists 76 data sheets, three booklets and one quarterly magazine which describe numerous phases in production, application and treatment. Range of subject matter on the use of redwood covers such items as interior paneling, walls and siding, garage doors, garden fences and windbreaks, shelters, retaining walls, walkways, patios and garden furniture.—California Redwood Association.

(Item No. 11)

dome skylights

A 20-page guide to aid in design of Plexiglas dome skylight systems is generously illustrated with working drawings and photos showing the various types and accessories which are available from manufacturers. Method of calculating daylighting values is explained, with two actual examples—a school classroom and a warehouse—worked out step by step. —Rohm & Haas Co.

(Item No. 12)

acoustical materials

The 1958 issue of "Sound Absorption Coefficients of Architectural Acoustical Materials" lists products made by AMA members, first in a summary table and then by manufacturer with individual trade names given, along with such data as noise reduction, coefficients and recommended specification range, surface appearance, size, weight, etc. One section covers installation recommendations and information on sound absorption coefficients of general building materials (brick, glass, marble, etc.) and seats and audiences.—Acoustical Materials Association.

(Item No. 13)

school lighting

"What to Look for in School Lighting" is a brief and non-technical outline of the essentials as applied to classrooms and secondary areas. Questions of how much light is needed, what makes for comfortable lighting and the economics of lighting fixture selection are explained.—Garcy Lighting.

(Item No. 14)

family room ideas

"Family Rooms in Beautiful Weldwood" gives 100 illustrated suggestions (most of them in color) for remodeled homes, enclosed wa custom built furniture and cabinets and shelves. The booklet won an award in Ideas for Home Builders con ducted by the Producers' C United States Plywood Corp.

maintenance procedures cover motors, heating elements, fans, castings, traps and check valves and special considerations for forced water and blower type unit heaters. Causes and prevention of system corrosion also is discussed.—Air Moving and Conditioning Association.

(Item No. 16)

CATALOGS

Products for Concrete Construction: 56-page catalog which illustrates and describes Universal's complete line of concrete forms, form ties, accessories and construction specialties makes a handy reference for anyone engaged in the forming of concrete.—Universal Form Clamp Co.

(Item No. 17)

Ornamental Building Stones: architects' file has full color data sheets covering eight stones. Each sheet contains a photo of a stone demonstration panel and gives a detailed description of the blend—height percentages, average length and textures of stone and optional faces available—and a concise specification.—Conco Building Products, Inc.

(Item No. 18)

Olympic Redwood Stain: four-page folder shows four shades of stain currently being marketed and tells how to apply for the best results and to achieve a semigloss effect, if one is desired.—Olympic Stained Products Co.

(Item No. 19)

Tamco Air Forced Air Gas Furnaces: six-page catalog describes each furnace series—Clipper Imperial, Clipper and Clipper Horizontal—with applications, features, ratings and specifications. The line is available in 19 sizes, ranging from 70,000 through 200,000 Btu. input, many in both upflow and counterflow models.—Tamco Corp.

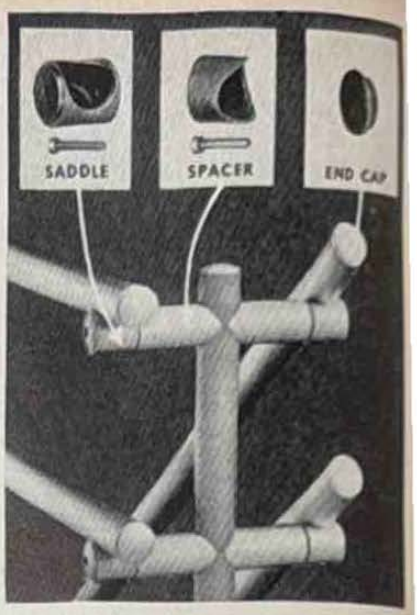
(Item No. 20)

Architectural Aluminum Fabrications: four-page folder discusses one-source service for engineering and fabricating custom designed architectural aluminum products. Photos of current projects illustrate versatility with which aluminum can be fashioned.—Metal Trims, Inc.

(Item No. 21)

Ceramic Veneer: eight-page booklet describes adhesion, anchored, mold pressed, CV Panelwall, screen decorative and sculptured types of the building product; offers a guide to construction details, installation and specifications.—Gladding, McBean & Co.

(Item No. 22)



Universal Handrail System: four-page brochure introduces entirely new handrail system that eliminates need for detail design, templates, prefabrication or welding and automatically adjusts to dimensional variations in floors and stairways. Involved are four basic parts: saddle, spacer, end cap and two $\frac{1}{4}$x1$\frac{1}{2}$-in. screws.—Universal Railing Co.

(Item No. 23)

Sandwich Panel Skylights: four-page folder gives technical and design details of construction employing tensile face materials and compressive cores in a variety of configurations. Drawings show three types of mounting—curb, surface mop-in and flush-deck mop-in.—Architectural Plastics Corp.

(Item No. 24)

Lennox Landmark System: 20-page booklet describes air conditioning system engineered for residential installations which require low power consumption and low noise level, as well as smaller commercial buildings. Heating, cooling coil and blower-filter elements are enclosed in separate cabinets permitting correct selection of air delivery, heating and cooling capacities.—Lennox Industries, Inc.

(Item No. 25)

Owens-Illinois Glass Block: 20-page catalog lists decorative and functional patterns, including the newest designs in solar-selecting glass block; outlines advantages of both solar-selecting and light-directing designs; gives instructions and construction details for large and small size installations in steel, wood and masonry framing; provides convenient dimensional tables as well as data on solar heat control, fuel savings, sound reduction and surface condensation.—Kimble Glass Co.

(Item No. 26)

T-SQUARE TALK

Artists Equity honors Portland architect

Walter Gordon, AIA, is the first to receive an award from the Oregon Chapter of Artists Equity "for outstanding contribution toward the use of painting and sculpture in architecture." The award was made at the opening of a three-week exhibition, "The Artist in Architecture," at the Portland Art Museum. The show was sponsored by Artists Equity and artist members of the museum.

Gordon, who came to Portland in the late '30s as assistant director of the museum, was cited primarily for his crusading for art in architecture. The exhibit included several examples of his own work. A member of the Portland Art Commission, Gordon is now teaching one day a week at the University of Oregon, in addition to maintaining his own architectural practice.

An unusually large number of comments on the exhibit were received by the museum, probably because it showed art put to use in homes, churches, public and commercial buildings. Many of the models shown have not been executed, but gave an idea of what could be accomplished with closer cooperation between artist, architect and client. The 86 entries represented the work of 27 artists and included stained glass windows, glass mosaics, handprinted wallpaper, baptismal fonts, murals, enamel fused on copper and welded, wood and sand sculptures.

Special events in connection with the exhibit included a forum on "Integration of Art in Architecture Today" with Walter Church, AIA; Thomas K. Welch, contractor; Richard T. Turner, chairman of the Portland Art Commission; Manuel Isquierdo, sculptor; and a slide lecture on "Art in Architecture" by Lewis P. Crutcher, AIA.

new offices, partners

✓ Leonard Brooker, AIA-CILA, has established an office for the practice of architecture and landscape architecture at 13543 Ventura Blvd., Sherman Oaks, Calif. (STate 8-3450).

✓ Edward Mahlum, AIA, has opened new offices at 320 Lloyd Building, Seattle (SEneca 7423).

✓ Alex Pierce has opened an architectural office at 1328 S.W. 14th Ave., Portland, where he joins architects William Fletcher, Donald Blair and John Reese; designer Saul Zaik; and interior decorator George M. Schwarz Jr. Each maintains his own office, but the group collaborates on some projects.

✓ The Seattle architectural firm of Wortman & Wilkins is now known as Wortman, Wilkins & Ellison. Principals are C. Noel Wortman, Jess T. Wilkins Jr. and James W. Ellison.

✓ A new partnership of professional engineers, Bouillon, Griffith & Christofferson, has been formed to take over the activities of Bouillon & Griffith at 1411 Fourth Avenue Building, Seattle. Partners are Lincoln Bouillon, L. F. Christofferson, Herbert T. Griffith and Robert H. Schairer.

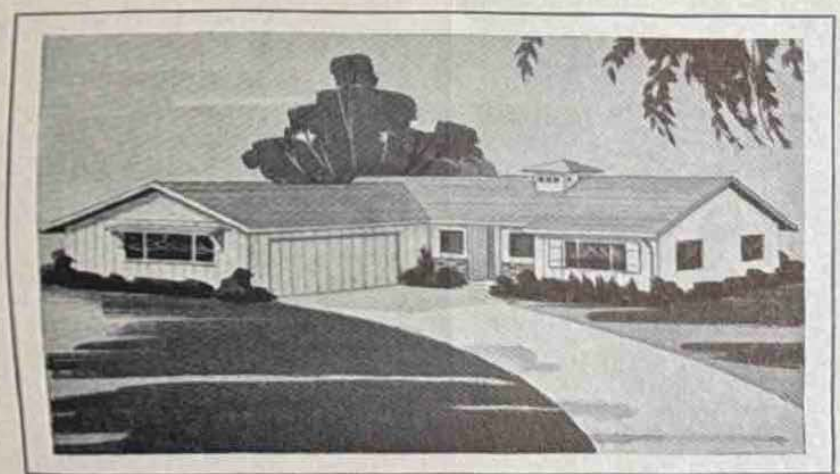
new associations

✓ John C. Bryant, AIA, and Robert Butterfield, associate, of Everett, Wash., announce the association of Norman G. Aehle, architect, with their office.

✓ Arthur E. W. Dodds, AIA and structural engineer, formerly super-

"We build convenience into every home... from dishwashers to telephones!"

...says George Artz, President of Alcan Realty Co., well-known Sacramento and Fresno builders. Their newest development includes color phones in bedroom and kitchen, and a month's free service with each home.



Today's homes are built with the buyer in mind . . . and one thing buyers want is complete telephone planning. That's why leading architects and builders, like Alcan Realty, include plenty of telephone outlets, and concealed wiring, as a matter of course. They know how much Telephone Planning can add to the all-around value of a home . . . that it makes for better-built homes and satisfied buyers.

Pacific Telephone

We'll be glad to help you plan built-in telephone facilities. Just call our business office and ask for our free Architects and Builders Service.

It pays to include Telephone Planning in every home you build!

intendent of the Seattle Building Department, now is associated with the San Francisco architectural firm of Myer & Evers.

elections

✓ New president fo the Consulting Engineers Association of California is Harold P. King, Los Angeles structural engineer. Other officers: John A. Blume, San Francisco, vice president; Arch McDougald, Fresno, secretary; Pecos H. Calahan, Fresno, renamed executive secretary.

appointments

✓ Seattle architect Talbot Wegg has been named the city's urban renewal coordinator to work with a citizen's advisory committee in proposing a program to be submitted to the Housing and Home Finance Agency. He served as Seattle's code research director from 1954-56 and more recently has been with the architectural firm of Bassetti & Morse.

✓ A committee of three practicing architects and two architectural deans has been appointed by the University of Washington Board of Regents to undertake reappraisal of design policy on the campus. They are Lawrence G. Waldron, Seattle; Robert B. Price, Tacoma; Minoru Yamasaki, Birmingham, Mich.; Dean Arthur P. Herrman of the university's College of Architecture and Urban Planning; and Dean Pietro Belluschi of MIT's College of Architecture.

awards

✓ Architect James Stewart of San Pedro, Calif., has won a distinguished community service award from that city's Junior Chamber of Commerce for his work in founding The San Pedro Redevelopment Corp., which plans a survey of the waterfront area in regard to slum clearance and industrial site development.

✓ Earl P. Newberry, AIA, was named Congressman of the Year by the Oregon Building Congress at its 36th annual banquet in January for his long service on the Portland City Building Code Board of Appeals and his general interest in building code problems.

AIA activities

✓ California Council, AIA, will hold its 13th annual convention at Monterey October 15-19, with the Mark Thomas Inn as headquarters and the Monterey County Fairgrounds as site of the professional program. Loy Chamberlain of Oakland will head the advisory committee of six members planning the affair.

✓ Hachiro Yuasa has been named president of the East Bay Chapter, AIA. Other officers are George T. Kern, vice president; William M. Gillis, secretary; and John Austin Zerkle, treasurer. Gerald N. McCue and Francis A. Lockwood are new directors, while the terms of John R. Oyarzo and Harry B. Clausen continue.

✓ The 47th annual banquet of the Oregon Chapter, AIA, will be held at the Columbia-Edgewater Country Club, Portland, February 28, with Mrs. Marjorie Wintermute as chairman. Frank Roehr, a chapter past president, will be toastmaster and John Lyon Reid, FAIA, of San Francisco will be principal speaker.

Newly installed chapter officers are John K. Dukehart, president; Keith R. Maguire, vice president; Robert Douglas, secretary; and Harry K. Stevens, treasurer. Daniel McGoodwin and Earl P. Newberry are new directors; Donald W. Edmundson and E. B. Franks, holdovers; Robert W. Fritsch, past president.

SUPPLIERS

• **Kaiser Aluminum & Chemical Sales, Inc.,** has appointed Fred B. Scobey of Oakland as western regional sales manager.

• **W. P. Fuller & Co.** has promoted C. E. Ide to general manager of its southern district and L. H. Markwood as director of paint trade sales for the entire company.

• **Unit Masonry Association of Seattle** has elected the following officers: C. L. Gerring, president; James R. Stone, vice president; and E. J. Gill, reelected secretary-treasurer.

• **Fluorescent Fixtures of California** has begun an addition to its main plant in South San Francisco, which will bring its manufacturing and storage facilities up to 130,000 sq. ft.

• **Symons Clamp & Mfg. Co.** has appointed Herb L. Priest as sales representative in the Northwest and he has opened a warehouse-office in Portland.

• **Oroply Corp.** is completing construction of a plant near Oroville, Calif., for the manufacture of a complete line of plywood products. The $2 million enterprise when in full operation will have about 350 employees.

• **Bethlehem Pacific Coast Steel Corp.** has promoted secretary-treasurer Sherman L. Crary to vice president. He will continue to serve as treasurer. C. A. Chafey Jr. has been elected secretary and assistant treasurer and will continue to serve as credit manager.

• **Graystone, Inc.,** of Seattle has appointed J. W. Emory as masonry sales manager.

• **WeberWall Division,** Weber Showcase and Fixture Co., Inc., has named Edsel Curry as sales director for the 11 western states, Oklahoma and Texas. The company also has opened new and larger quarters at 2191 Palou Ave., Apparel City, to serve its northern California market.

• **Crane Co.** has promoted its West Coast sales district manager, William O. Brown of Los Angeles, to general manager of sales, with headquarters at the company's Chicago general office.

• **Utility Appliance Corp.** has appointed Gough Industries, Inc., as Los Angeles metropolitan area distributor for its Gaffers & Sattler line of home equipment appliances for heating, cooling and air conditioning.

• **O'Keefe & Merritt** has assigned Western Utilities Suply Co. of Seattle as its gas range distributor for the states of Oregon and Washington.

• **Pioneer Division,** The Flintkote Co., in expanding its activities throughout the West has named Harry D. Taggart as manager of building material sales and Syd M. Lewis as building material division merchandising manager.

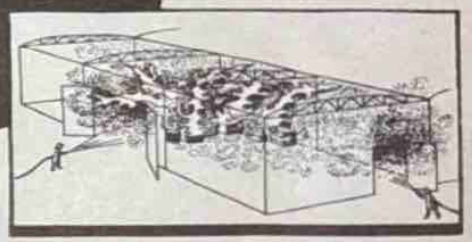
• **Whirlpool Corp.** has appointed Warren Singer as field sales manager and Dave Armbruster as Los Angeles district manager for its air conditioners; and Stephen E. Upton as western regional sales manager for its gas utility division, with headquarters in Los Angeles.

• **American Sisalkraft Corp.** has moved its southern California district representative, Robert D. Wilson, to

Your client gets twice his money's worth... DAY-TO-DAY VENTILATION plus FIRE PROTECTION!

WITH **COLT**

DUAL PURPOSE FIRE VENTILATORS

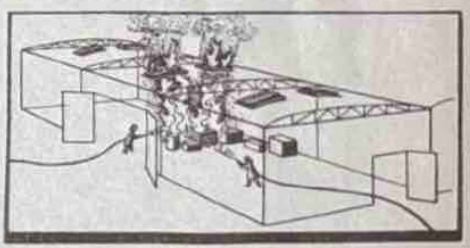


In day-to-day use, the Colt COF/2046 Dual Purpose Fire Ventilator provides efficient, natural ventilation. In the event of fire, a fusible link triggers the ventilator open, providing automatic escape for superheated air and smoke.

Unlike most fire protection equipment which serves no useful purpose until an unwanted emergency arises, Colt's new Dual Purpose Fire Ventilators **work every day** in your client's plant. In addition to functioning as a needed and efficient system of natural ventilation, the Colt COF/2046 Ventilators open automatically in case of fire to serve as a heat and smoke exhaust.

Fire authorities throughout the country agree that superheated air, smoke and explosive gases trapped under a roof with no ventilators or natural openings are the main cause of the horizontal spreading of disastrous industrial fires.

When you specify Colt Dual Purpose Ventilators in your client's building you give him twice as much . . . ventilation **and** fire protection . . . at no more cost than an ordinary ventilator.



Write today for free copy of "A Lecture on Fire Control in Industry" by M. J. Reaney.

ALSO: Free Technical Manual giving full details of the Colt System and equipment used.

the Oregon area, working out of Portland.

• **A. C. Horn Co.** has opened a plant at 2438 N. Nesmith St., Portland, to serve Oregon, Washington, northern Idaho and western Montana. James P. Durcan, formerly West Coast sales manager in San Francisco, will direct the new facility.

• **Kaiser Gypsum Co., Inc.,** has appointed Edward K. (Bus) Denning as insulating products manager for its northern division, with headquarters in Seattle.

• **Trimview Metal Products** of Covina, Calif., has given nine awards in a design competition for aluminum sliding glass door handles conducted among students at the California College of Arts and Crafts in Oakland.

• **Owens-Corning Fiberglas Corp.** has appointed Donald Bradshaw, formerly manager of the Phoenix branch of its engineering and supply division, to a similar post in the San Francisco branch.

• **Orr & Sembower, Inc.,** has added three sales representatives in the West: The Brose Co., Oakland, for northern California; Thermal Engineering and Equipment Co., Los Angeles, for southern California; and L. W. Worthington, Billings, for Montana.

• **Farr Co.** of Los Angeles has a new general sales manager, Gordon F. Thruelsen, formerly general manager of Dust Control, Inc., a Farr subsidiary.

• **Viber Co.** of Burbank, Calif., has named Russell S. Stewart as sales manager.

• **Airtemp Construction Division,** Chrysler Corp., has named Joseph S. Topp as manager of its West Coast zone, with headquarters in Los Angeles.

• **United States Plywood Corp.** has opened a distribution center in Eugene, Ore., at 410 Garfield St., across the street from its associated division mill, with Eugene McDonald as supervisor.

• **Harvey Aluminum** is the new corporate name of Harvey Machine Co., Inc., founded in 1914. Executive offices are in Torrance, Calif., with facilities at The Dalles and Salem, Ore., and Milan, Tenn.

• **M. Greenberg's Sons** of San Francisco has promoted U. A. (Harry) Fabris to manager of sales for both that firm and Josam Pacific Co.

• **Wiley-Bayley, Inc.,** of Seattle, has named Murray M. (Mike) Olwell as sales engineer for the Washington-northern Idaho area.

• **John C. Virden Co.** has appointed Donald S. Gleason of Seattle as sales representative covering Washington and Oregon.

national associations

• **Tile Council of America** has elected Richard B. Alexander of Anderson, Ind., as president.

• **Structural Clay Products Research Foundation** of Washington, D.C., has reelected Roy A. Shipley of Pittsburgh as chairman. Among the 35-member board of management are three Californians: James B. Crawford, Kraftile Co., Niles; C. W. Planje, Gladding, McBean & Co.; and John W. Rice, Union Brick Co., San Diego.

• **Structural Clay Products Institute** of Washington, D.C., has elected Kenneth W. Dunwoody of Macon, Ga., as president. West Coast directors are Alex Corbett of Yakima, Wash., and four Californians: A. E. Barnes, San Francisco; John C. Boggs, Stockton; Norman J. Gatzert, Oakland; and W. C. Reordan, Los Angeles.

• **Weatherstrip Research Institute** of Riverside, Ill., has chosen Charles F. Smith of Memphis as president.

• **Portland Cement Association** of Chicago has elected four new directors, including B. B. Pelly of Olympic Portland Cement Co., Ltd., Seattle.

• **American Institute of Steel Construction** of New York City has reelected N. P. Hayes of Greensboro, N.C. Also reelected was director Paul M. Jacobsen of Pacific Car and Foundry Co., Seattle.

• **Better Heating-Cooling Council** of New York City has elected John H. White of Cranston, R.I., as president for the 1957-58 term. Directors include Alfred Whittell Jr. of Raypak Co., El Monte, Calif.

CHEHALIS BUFF ROMAN BRICK

. . . assures long life and distinctive appearance for Centralia Fire Station.

An outstanding example of the attractive effect that can be created with CHEHALIS BRICK—the Northwest's most distinctive brick—has been achieved in the fine design of this fire station at Centralia where Chehalis Buff Romans in a pleasing range of colors have been harmoniously combined with a rose colored mortar joint. The durability of CHEHALIS BRICK insures enduring and typically Northwest beauty—plus fire safety and low maintenance.

CHURCH— Renton, Wash.

Working drawings are nearing completion by Robert F. Rathjen, architect, 213 Lake St. S., Kirkland, for two-level, 86'x52' (approximately) multi-purpose church building, for Highland Community Church, Wallace R. Wilson, pastor, on a site at 10th and K streets, Renton Highlands, near Renton. This is the first unit of the proposed church and will include a temporary sanctuary, a 200-person capacity Sunday school, a social room and a multipurpose room. The church will provide a construction superintendent.

Wood frame; concrete slab-on-grade; brick veneer, cedar siding, some Welchboard (or equal) exterior; pitched, flat built-up roof, rigid insulation on roof; glued laminated beams; aluminum sash; drywall, plaster partitions; asphalt tile, cork tile flooring; fluorescent, incandescent lighting; gas-fired forced warm air heating. Construction will be underway in the near future. PD 2-8

● HEATING, VENTILATION ALTERATIONS— Richland, Wash.

Bids will be opened March 10 by Atomic Energy Commission, Box 550, Richland, for heating and ventilation alterations in a plant area building at Richland. Specifications with above office. Work consists of insulating, painting and electrical work for 21 heating and ventilating units. SP 2-12

● CHLORINE STORAGE FACILITY— Richland, Wash.

Bids will be opened March 4 by Atomic Energy Commission, Box 550, Richland, for construction of a chlorine storage facility at the Hanford Works, Richland, including construction of a 24'x50' prefabricated steel building with raised concrete floor and loading dock. Specifications with above office.

Equipment to be installed includes an inside monorail system of three ton capacity and an outside loading crane. Miscellaneous electrical work is included. SP 2-8

RESTAURANT EXPANSION—Seattle, Wash.

Preliminary drawings are underway by George W. Stoddard-Huggard & Associates, architects, 1120 Harvard, Seattle, for a new and expanded 6,000 sq. ft. restaurant with a 60' front, at 1120 2nd Ave., in the new National Bank of Commerce annex, on which bids will be called in early February. Expansion will be underway when annex construction permits. PD 2-7

■ OFFICE BUILDING— Seattle, Wash.
(Estimated cost $100,000)

Additional planholders announced for construction of a one-story and partial basement, L-shaped, wood frame office building at 4000 Aurora Ave., Seattle, for Preferred Acceptance Corporation, owners. Bids will be opened 3:30 p.m., February 20 in the office of Jones, Lovegren, Helms & Jones, architects, Republic Bldg., Seattle.

Additional planholders: Strand, Inc., 1801 N. 34th; Jentoft & Forbes, 927 W. 46th. Of Seattle. PD 2-18. Previous report 1-31

● CHURCH BUILDING ADDITION— Seattle, Wash.

Bids will be opened 2 p.m., March 4, in office of John Graham & Co., architects, 1426 Fifth Avenue Bldg., Seattle, by Lake Burien Presbyterian Church, S.W. 151st and 14th S.W., Seattle, for construction of a wood frame two-level 4,600 sq. ft., Sunday School wing addition and a one-level and basement, 5,800 sq. ft. fellowship hall addition to existing church, on the above site. Existing old church building and classroom building are to be removed from the site as part of the contract. Basement space for boiler room only will be included in Sunday School wing. Plans with the architects. $25 deposit each for general, mechanical and electrical contracts. Separate contracts.

Cedar siding, brick veneer exterior; asbestos shingle roofing; metal sash; blanket insulation in ceiling; one-hour construction drywall partitions; vinyl, asphalt tile flooring; oil-fired hot water and boiler heating. PD 2-8. Previous report 2-5

SYNAGOGUE— Seattle, Wash.
(Estimated cost $750,000)

Preliminary sketches are completed and preliminary drawings will soon be started by Detlie & Peck, architects, Securities Bldg., and Marcus B. Pritica, architects, Palomar Bldg., Seattle, for a 1,000-person capacity synagogue at 16th Ave. and E. Pike St., Seattle, for Congregation Temple De Hirsch, 1424 15th Ave., Seattle. A supplemental fund-raising drive is underway. Sol Esfeld is building fund chairman and Frank Newman is building construction chairman. PD 2-8. Previous report 12-11

TRI-PLEX— Seattle, Wash.

Construction is underway by D. B. Strathy, owner-contractor, 4714 E. 178th, on a 4,200 sq. ft., two-level, tri-plex apartment on the corner of 14th N.E. and E. 125th, Seattle. Plans by Lawrence & Hazen, architects, 8626 Roosevelt Way, Seattle.

Wood frame: 1" on 12" pitched built-up roof, asphalt shingles; some brick veneer, cedar siding exterior; aluminum sash, some glass stopped in wood; drywall partitions; hardwood flooring; batt type insulation in ceiling, between floor levels; aluminum insulation in walls; wood cabinets in kitchen; formica counter tops; brick fireplaces with Arizona stone slabs; electric baseboard heating. Brick planter boxes will be at the front of building. A separate three-car garage is included in plans. PD 2-8

● ■ UNITARIAN CHURCH— Seattle, Wash.

Bids will be opened 4 p.m., February 25, in office of Paul Hayden Kirk A.I.A. & Associates, architects, 615 Lakeview Blvd., Seattle, for construction of a two-level, 15,000 sq. ft. chapel and church school building on the southeast corner of 35th N.E. and E. 68th, Seattle, for University Unitarian Church, 4555 16th N.E., Seattle. One general contract. $25 deposit. The church school portion of the building will be connected to the chapel by a covered gallery.

Planholders: O. B. Daniels & Son, 2201 Sunset Highway S.E., Mercer Island; C B I Construction Co., 11115 7th N.W.; Nels Hedin & Co., 2312 Federal; Wick Construction Co., 720 N. 35th; Hainsworth Construction Co., 3028 Western Ave.; B. F. Turnbull, 4201 Leary Way; C & R Builders, 1619 8th Ave. N.; Jentoft & Forbes, 927 W. 46th; Riley Pleas, 522 19th N. All of Seattle, except as noted.

Chapel will have 400-person capacity; wood frame; shingled pitched roof, glued laminated beams, 3" t&g decking; stucco exterior; glass stopped in wood, some operating aluminum windows; acoustical plaster ceilings, some acoustical plaster walls; vertical hemlock 1" t&g on walls; carpeting; gas-fired hot air heating.

The two-story, 51'x70' church school will be wood frame; post and beam; flat built-up roof; 2"x6" t&g decking; 1"x4" bevel lap siding; batt insulation in walls, drywall partitions; glass stopped in wood, some aluminum operating sash; vinyl asbestos flooring, incandescent lighting, some fluorescent lighting; same heating as chapel. A decorative plastic screen will be placed between the chapel and the outer court. Plans include an asphaltic concrete parking area for 50 cars. PD 2-8. Previous report 1-31

SEATTLE PUBLIC LIBRARY—Seattle, Wash.

Bids will be called this spring by City of Seattle, for construction of the five-story and basement, 167,000 sq. ft., reinforced concrete Seattle Public Library (main branch) building to be located at 4th Ave. and Madison in Seattle. Working drawings are nearing completion by Bindon & Wright, architects, Hoge Bldg., Seattle, and Decker, Christenson & Kitchin, associate architects, 1411 Fourth Avenue Bldg., Seattle.

The building is designed with two-level basement for double tier bookstacks. First floor (4th Ave.), second floor and third floor (5th Ave. level) are the public floors, and will have plaster partitions. Fourth floor accommodates the catalog, order and bindery divisions. Fifth floor is administrative and includes in addition to private offices, branch stacks and lunchroom, with small self-service kitchen for staff use. Concrete block partitions will be used in service areas. All floors are laid out on a modular basis to provide flexibility. The two principal entrances, on 4th and 5th avenues, are accessible without steps, and approaches will be surfaced with non-slip terrazzo. Vertical transportation will be handled by means of escalators between the three main floors, supplemented by one passenger and one service elevator, both automatic, which run th full height of the building. Although the two lower floors occupy the major portion of the block, the perimeter walls will set back sufficiently to provide interesting landscape features visible from within as well as from the streets. Certain areas within the building and in landscaping areas will incorporate features of arts such as sculpture and murals, to be coordinated with Seattle Art Commission. The new structure will provide storage for 970,000 volumes. Metal stacks for this purpose may be under separate contract. At the southeast corner of the site, provision is made for limited parking and truck delivery to a loading dock, adjacent to the service elevator. Contract for furniture, including chairs, tables, specialty items, draperies, will be bid separately after general contract is awarded. Elevators and escalators may be included in general contract, or may be bid separately.

Construction will include the following: concrete roof slab, concrete joist construction with steel pans; flat built-up roof with rigid insulation on roof and terrace decking, exterior facing of Mo-Sai veneer supplemented in certain areas with granite or marble; aluminum windows; window glazing with gray heat resistant glass, with drapes and vertical blinds for additional sun control; vinyl tile flooring; suspended acoustical tile ceilings; lighting and ventilating units set on modular grid; mechanical ventilation with provision for installation of air conditioning or cooling at a later date. ▲CATHEDRAL ADDITIONS—Yakima, Wash.

Six bids received by Roman Catholic Diocese of Yakima, Most Rev. Joseph P. Dougherty, bishop, Liberty Bldg., Yakima, for construction of a 2,500 sq. ft. addition to St. Paul's Cathedral, 12th and Chestnut streets, Yakima. Plans by Hargis & Goldsworthy, architects, Miller Bldg., Yakima. Bids opened February 5. TWO LOW BIDS: Jake Leingang, 3804 Summitview Ave., Yakima, $109,991; Al Kokenge, 621 S. 36th Ave., Yakima, $112,258. HI BID: Hugh Templeton, 9th Ave. and Fruitvale Blvd., Yakima, $134,600.
IG 2-7. Previous report 1-30

●DETENTION HOME— Yakima, Wash.

Bids will be opened for the second time at 2 p.m., February 26, by Yakima County Commissioners, Courthouse, Yakima, for construction of the one-story, 8,682 sq. ft., masonry Yakima County Juvenile Detention Home at 18th Ave. and Jerome St. in Yakima. Plans with Cowan & Paddock, architects, Larson Bldg., Yakima. $50 deposit. Separate bids on general, mechanical and electrical contracts.

Bids were previously opened December 18 and subsequently rejected as too high (only $200,000 is provided in the budget for the construction). Several revisions have been made in plans, changes which earlier were considered to affect security and capacity of the detention facility but which have now been accepted. Approximately $18,000 will be saved by the revisions which include the following: structural floors changed to concrete in girls' and boys' wings; acoustical tile ceilings eliminated in dining room and activity room; windows changed; asphaltic concrete instead of concrete sidewalks.

EAST INTERSTATE BRIDGE
BIDS CLOSE 9 A.M., MARCH 27
Portland, Ore. and Vancouver, Wash.
NOTICE TO CONTRACTORS

Time and Place of Receiving Bids: Sealed bids for the work described below will be received by the State Highway Commission of the State of Oregon in The Queen's Room, Imperial Hotel, Portland, Oregon, at 9:00 a.m., Thursday, March 27, 1958.

Type of Project: This is a cooperative project to be financed and built under a tri-party agreement between the States of Oregon and Washington, acting through their respective State Highway Commissions, and the Washington Toll Bridge Authority. By authority of this agreement, all matters pertaining to furnishing plans and specifications to bidders and receipt of proposals are being handled by the State Highway Commission of the State of Oregon, address: State Highway Building, Salem, Oregon.

Description of Work: The work for which bids are to be received consists of the following work on the East Bridge over the Columbia River on the Pacific Highway in the vicinity of Portland, Multnomah County, Oregon, and Vancouver, Clark County, Washington.

Substructure: Reinforce and raise five existing piers, remove entirely one existing pier and raise only one existing pier.

Superstructure: Remove two existing 265-foot steel spans and replace with one new 531-foot steel span, remove one existing 265-foot steel span and replace with concrete viaduct, raise all spans to new grade line corresponding to new West Bridge grade line, redeck completely two existing steel spans, remove existing counterweight cables and place new cables, make other minor revisions to machinery and electrical systems and perform incidental and miscellaneous work as required by the plans and specifications.

Quantities: The work involves the following approximate quantities: Shoring and Cribbing; 6,900 cubic yards structural excavation; 239,000 linear feet timber piling; drive 468 piles, 2,590 cubic yards seal concrete; 7,540 cubic yards Class "A" concrete; 779,000 pounds metal reinforcement; 31,000 pounds tie rods; remove 2,750 cubic yards concrete; remove 1,600 tons structural steel; 1,831,000 pounds structural steel; 25 tons A-C paving; 75,000 pounds counterweight wire rope; 90,000 pounds castings; 540 linear feet metal rail; 200 square yards concrete slab slope protection riprap and 34,000 tons pier protection riprap.

Wage Rates: In accordance with the provisions of Chapter 39.12 of the Revised Washington Statutes, the contracting parties hereto have ascertained the general prevailing rates of wages applicable to the work to be done within the State of Washington to be as follows:

Hourly Minimum Wage Rate—Clark County

$2.92	Adnum, Yeager or Similar Type Spreaders

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., FEBRUARY 18
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, February 18, 1958, until 10 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal Funds have been allocated for item No. 1.

The improvements for which bids will be received follow:

1. Draining, Grading, Surfacing, Paving with Asphaltic Concrete and Cement Concrete, Installing an Illumination System and Constructing a Reinforced Concrete Box Girder and Steel Girder Bridge on 0.870 mile of Primary State Highway No. 1 in King County, ALASKAN WAY VIADUCT IN SEATTLE - HANFORD STREET TO WEST DAKOTA STREET, FAP No. U-001-3(36), involving about 2,400 cubic yards of Common Excavation, 25,200 cubic yards of Sand Borrow, 2,280 cubic yards of Crushed Surfacing and Prime Coat Aggregate, 16 tons of Asphalt Cement, 2,200 tons of Asphaltic Concrete, 7,861 square yards of Cement Concrete Pavement, 6,224 linear feet of Precast Concrete Curb, 2,408 linear feet of Cement Concrete Curb, 3,887 linear feet of Extruded Traffic Curb, 10,185 linear feet of Concrete Pipe, 468 linear feet of Rubber Joint Concrete Pipe, 548 linear feet of Iron Pipe, 273 linear feet of Beam Guard Rail, 22,337 cubic yards of Concrete, 6,082,000 pounds of Steel Reinforcing Bars, 8,240 linear feet of Standard Bridge Railing, 2 lump sum bids for Structural Steel (about 628,700 pounds), 260 MBM of Treated Timber and Lumber, 18,000 linear feet of Treated Timber Piling, 114,700 linear feet of Untreated Timber Piling, 18,416 linear feet of Concrete Piling, a lump sum bid for an Illumination System and other items.
2. Clearing, Draining, Grading, Surfacing, Paving with Asphaltic Concrete and Constructing a Reinforced Concrete Box Girder Bridge on Primary State Highway No. 1 in Clark County, BURNT BRIDGE CREEK UNDERCROSSING, FAP No. I-001-1(37), involvink about 16,370 cubic yards of Common Excavation and Borrow, 5,150 tons of Crushed Surfacing and Ballast, 8 tons of Asphalt Cement, 80 cubic yards of Prime Coat Aggregate, 1,145 tons of Asphaltic Concrete, 1,792 linear feet of Cement Concrete Gutter, 453 linear feet of Cement Concrete Curb, 675 linear feet of Concrete Pipe, 153 linear feet of Metal Pipe, 750 linear feet of Beam Guard Rail, 21 Guide Posts, 694 cubic yards of Concrete, 93,840 pounds of Steel Reinforcing Bars, a lump sum bid for Superstructure (about 1,140 cubic yards of Concrete and 372,000 pounds of Steel Reinforcing Bars), 909 linear feet of Standard Bridge Railing, 10,000 linear feet of Concrete Piling, 700 linear feet of Steel Piling and other items. Minimum Wage Rates for this project have been predeterimned by law and are set forth in the bid proposal.
3. Constructing Two Reinforced Concrete Box Girder Bridges on 0.084 mile of Primary State Highway No. 2 in Chelan County, WENATCHEE RIVER BRIDGE, FAP No. F-028-1(14), involving about 1,065 cubic yards of Concrete, 93,000 pounds of Steel Reinforcing Bars, a lump sum bid for Superstructure (about 2,200 cubic yards of Concrete and 580,000 pounds of Steel Reinforcing Bars), 1,752 linear feet of Standard Bridge Railing, a lump sum bid for Structural Steel and other items.
4. Clearing, Draining, Grading, Surfacing, Constructing Bituminous Surface Treatment, Pacing with Asphaltic Concrete and Constructing a Reinforced Concrete Flat Slab Bridge and a Steel Truss Bridge on 0.606 mile of Secondary State Highway No. 5-A in King County, GREEN RIVER AND OVERFLOW BRIDGES, a State Project, involving about 15 acres of Clearing, 80,540 Cubic yards of Common Excavation and Borrow, 6,550 cubic yards of Selected Roadway Borrow, Crushed Surfacing, Crushed Cover Stone and Prime Coat Aggregate, 33 tons of Asphalt Cement, 1,635 tons of Asphaltic Concrete, 1,680 linear feet of Asphaltic Concrete Curb, 574 linear feet of Metal Pipe, 954 linear feet of Concrete Pipe, 556 linear feet of Beam Guard Rail, 110 Guide Posts, 712 cubic yards of Concrete, 142,640 pounds of Steel Reinforcing Bars, 360 linear feet of Standard Bridge Railing, 2 lump sum bids for Structural Steel (about 438,000 pounds), a lump sum bid for Cast Steel, 4,800 linear feet of Concrete Piling and other items.
5. Draining, Grading, Surfacing and Paving with Asphaltic Concrete on 0.975 mile of Secondary State Highway No. 1-D in Island County, COUPEVILLE VICINITY, a State Project, involving about 15,060 cubic yards of Common Excavation and Borrow, 9,800 cubic yards of Selected Roadway Borrow, Crushed Surfacing and Prime Coat Aggregate, 13 tons of Asphalt Cement, 1,4[illegible] tons of Asphaltic Concrete, 200 linear [illegible] of Metal Pipe, 147 Guide Posts and [illegible] items.
6. Stockpiling Maintenance Rock, Sand, Ba[illegible]last, Crushed Surfacing and Mineral Ag[illegible]gregates on State Highways Numbers 1[illegible]3 and 3-K in Franklin, Garfield, Asot[illegible] Columbia and Walla Walla Counties, No[illegible] ADAMS VICINITY, ET AL, a State Proje[illegible] involving about 84,700 tons of Crush[illegible] Materials.

W. A. BUGGE, Director of Highways,
E. A. COWELL, Chairman.

ELEMENTARY SCHOOL
BIDS CLOSE 2 P.M., FEBRUARY 26
Klamath Falls, Oregon
NOTICE TO CONTRACTORS

Sealed bids will be received on or before two o'clock p.m. Thursday, February 26, 1958, at the office of the Klamath County School District, Veterans' Memorial Bldg., Klamath Falls, Oregon.

This bid will be for the erection of the Elementary School Building, Crest near Laverne, Klamath Falls, Oregon. A general bid will include all items of work. Bids will be publicly opened and read. As a condition precedent to receipt of his proposal, the bidder must have qualified ten (10) days prior to the opening of bids, as prescribed by page 225, Laws of Oregon, 1951.

Plans and Specifications may be obtained at the offices of Morrison and Howard, architects, 203-05 Williams Building, Klamath Falls, Oregon. A deposit of fifty and no/100 dollars ($50.00) will be required for plans and specifications. The deposit will be refunded to the bidder upon return of the plans and specifications, in good condition.

Plans and specifications on file at the Builders Exchange Coops, in Portland and Eugene, Oregon; San Francisco and Sacramento, California.

The successful bidder will be required to furnish a performance bond in the full amount of the contract price, a payment bond of not less than fifty per cent (50%) of the contract price and he shall be required to carry Public Liability Insurance as specified.

A bidders bond or certified check in the amount equal to five per cent (5%) of the lump sum bid, must accompany the bid as a guarantee for the execution of the contract and bonds, in case the contract is awarded to the bidder.

The Directors of the Klamath County School District reserve the right to accept or reject any and all bids and to waive any informalities.

Signed,
J. F. HEYDEN, Clerk

STEEL TOWERS
BIDS CLOSE MARCH 11
Denver, Colorado
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Invitation No. DS-5018) will be received at Denver, Colorado, until March 11, 1958, for furnishing 1,449 steel towers, with tower leg extensions and stub angles, for single-circuit transmission line. Tower body height ranges from 50 feet to 230 feet for Fort Peck-Dawson County-Bismarck 230-kv transmission line, Fort Peck and Missouri River Basin Projects, Montana and North Dakota. Delivery is desired within 730 days. For particulars, address Bureau of Reclamation, Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commissioner.
6034—2-8

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., MARCH 4
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, March 4, 1958, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified

check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal Funds have been allocated for items Nos. 1 to 7 inclusive.

The improvements for which bids will be received follow:

1. Constructing a Steel Truss Bridge and Reinforced Concrete Flat Slab Approach Spans on 0.184 mile of Secondary State Highway No. 1-A in Skagit County, SKAGIT RIVER BRIDGE, FAS No. S-0202 (7), involving about 4,255 cubic yards of Concrete, 170,000 pounds of Steel Reinforcing Bars, a lump sum bid for Concrete Superstructure (about 617 cubic yards of Concrete and 147,500 pounds of Steel Reinforcing Bars), 504 linear feet of Standard Bridge Railing, 2 lump sum bids for Structural Steel (about 1,361,000 pounds), a lump sum bid for Cast Steel, 1,700 linear feet of Concrete Piling, 4,200 linear feet of Untreated Timber Piling, 12,300 tons of Riprap and other items.
2. Surfacing, Constructing a Cement Treated Base, Paving with Asphaltic Concrete, Constructing Bituminous Surface Treatment and Installing Illumination and Fencing on 4.833 miles of Primary State Highway No. 9 in Thurston County, MUD BAY TO TUMWATER, FAP Nos. U-007-5(12) and F-007-5(8), involving about 35 acres of Clearing, 450 cubic yards of Common Excavation, 2,330 tons of Selected Roadway Borrow, 64,475 tons of Gravel Surfacing and Crushed Surfacing, 410 tons of Asphalt Cement, 1,920 cubic yards of Crushed Cover Stone and Prime Coat Aggregate, 28,955 tons of Asphaltic Concrete, 11,800 barrels of Portland Cement, 146,565 square yards of Cement Treated Base, 3,804 linear feet of Cement Concrete Gutter, 1,872 linear feet of Cement Concrete Curb, 8,270 linear feet of Asphaltic Concrete Curb, 1,745 linear feet of Precast Traffic Curb, 387 cubic yards of Concrete, 85,700 pounds of Steel Reinforcing Bars, 1,329 linear feet of Concrete Pipe, 7,752 linear feet of Beam Guard Rail, 2,371 linear feet of Double Beam Guard Rail, 357 Guide Posts, 40,940 linear feet of Wire Fence, 9,360 linear feet of Chain Link Fence, 340 cubic yards of Precast Concrete Slope Protection, 16,020 cubic yards of Top Soil, 5 lump sum bids for Illumination Systems, a lump sum bid for Overhead Destination Sign Supports and other items.
3. Clearing, Draining, Grading and Constructing Two Reinforced Concrete Slab Bridges and One Reinforced Concrete Girder Bridge on 4.226 miles of Primary State Highway No. 11 in Adams County, RITZVILLE TO TOKIO-UNIT 1, FAP No. I-002-5(5), involving about 500,140 cubic yards of Common Excavation, 44,570 cubic yards of Solid Rock Excavation, 56,940 units of Overhaul, 2,575 cubic yards of Crushed Surfacing and Mineral Aggregate, 41 tons of Asphalt Cement, 5,660 linear feet of Concrete Pipe, 616 linear feet of Metal Pipe, 18,685 linear feet of Chain Link Fence, 27,125 linear feet of Wire Fence, 51,490 cubic yards of Top Soil, a lump sum bid for Two Superstructures (about 1,665 cubic yards of Concrete and 444,000 pounds of Steel Reinforcing Bars), 1,342 linear feet of Standard Bridge Railing, 959 cubic yards of Concrete, 147,000 pounds of Steel Reinforcing Bars and other items. Minimum Wage Rates for this project have been predetermined by law and are set forth in the bid proposal.
4. Installing Illumination on Primary State Highway No. 18 in Grant County, MOSES LAKE BRIDGE TO SSH NO. 11-G, FAP No. I-002-4(12), involving 3 lump sum bids for Illumination Systems. Minimum Wage Rates for this project have been predetermined by law and are set forth in the bid proposal.
5. Draining, Grading and Surfacing on 9.145 miles of Franklin County Road, SAGE-HILL ROAD, FAS No. S-1017(3), involving about 101,160 cubic yards of Common Excavation, 720 cubic yards of Solid Rock Excavation, 69,940 tons of Crushed Surfacing and Crushed Cover Stone, 640 linear feet of Metal Pipe, 1,461 linear feet of Concrete Pipe and other items.
6. Surfacing on 5.892 miles of a Grant County Road, WHITE TRAIL ROAD, FAS No. S-1004(4) Unit 2, involving about 24 M gallons of Water and 26,800 tons of Crushed Surfacing and Ballast.
7. Surfacing and Constructing Bituminous Surface Treatment on 3.131 miles of a Columbia County Road, THORN HOLLOW-WHETSTONE ROAD, FAS No. S-1134(2), involving about 10,970 cubic yards of Crushed Surfacing and Crushed Cover Stone, 100 tons of Asphalt Cement and other items.
8. Paving with Asphaltic Concrete on 7.37 miles of Primary State Highway No. 9 in Clallam County, BOGACHIEL RIVER TO LAPUSH ROAD, a State Project, involving about 4,570 tons of Crushed Surfacing, 16,190 tons of Asphaltic Concrete, 33 tons of Asphalt Cement, 270 linear feet of Asphaltic Concrete Curb and other items.

Mr. Architect . . .

you can counteract the high costs of construction

. . . by placing your official advertisements for bids in the construction trade journals of the Northwest—PACIFIC BUILDER & ENGINEER (1st Saturday of each month), PACIFIC ARCHITECT AND BUILDER (3rd Saturday of each month), and CONSTRUCTION NEWS BULLETIN (2d, 4th and 5th Saturdays).

They reach more contractors, subcontractors and suppliers than any twenty newspaper-type publications.

That's why more consulting engineers — and more school districts, cities, counties, state departments, PUDs and federal bureaus — place their advertisements for bids in our columns than in any other publication in the entire Northwest.

IF YOU WISH THE *LOWEST COMPETITIVE BIDS CONSISTENT WITH RESPONSIBLE WORKMANSHIP* we can get them for you, whether your job is located in the Willamette Valley or in the Blue Mountains . . . in Western Washington or the Inland Empire . . . in the Coeur d'Alene or the Snake River Valley . . . on the Flathead or the Feather . . . in the Puget Sound country or in San Francisco.

PACIFIC BUILDER & ENGINEER, Inc.

2418-Third Ave., Seattle 1, Wash.

9. Draining, Grading, Surfacing and Constructing Bituminous Surface Treatment on 0.659 mile of Primary State Highway No. 7 in Lincoln County, TOWN OF ODESSA, a State Project, involving about 7,390 cubic yards of Common Excavation, 70 cubic yards of Top Soil, 18,990 tons of Crushed Surfacing, Ballast and Crushed Cover Stone, 74 tons of Asphalt Cement, 2,460 linear feet of Cement Concrete Curb, 10 cubic yards of Concrete, 411 linear feet of Concrete Pipe, 655 square yards of Cement Concrete Sidewalk and Driveway and other items.
10. Stockpiling Crushed Surfacing, Fine Screenings and Mineral Aggregate on Secondary State Highway No. 5-I in Thurston County, YELM VICINITY, a State Project, involving about 21,000 tons of Crushed Materials and a lump sum bid for Clearing and Grubbing.
11. Draining, Grading, Surfacing, Paving with Asphaltic Concrete and Cement Concrete and Installing Illumination on 0.090 mile of Primary State Highway No. 1 in Clark County, INTERSTATE BRIDGE APPROACHES IN VANCOUVER, a State Project, involving about 3,810 cubic yards of Unclassified Excavation, 2,400 tons of Crushed Surfacing and Ballast, 300 tons of Asphaltic Concrete, 2,980 square yards of Cement Concrete Pavement, 17,680 pounds of Steel Reinforcing Bars, 93 cubic yards of Concrete, 2,515 linear feet of Cement Concrete Curb and Gutter, 204 linear feet of Concrete Pipe, 221 linear feet of Iron Pipe, 270 square yards of Cement Concrete Sidewalk, a lump sum bid for Illumination System and other items.
12. Draining, Grading, Surfacing, Paving with Asphaltic Concrete and Constructing a Reinforced Concrete Slab Bridge on 0.542 mile of Secondary State Highway No. 21-B in Kitsap County, PORT WASHINGTON NARROWS BRIDGE-NORTH APPROACH, a State Project, involving about 21,100 cubic yards of Unclassified Excavation, 89,110 cubic yards of Common Borrow, 10,800 cubic yards of Selected Roadway Borrow, Crushed Surfacing and Prime Coat Aggregate, 35 tons of Asphalt Cement, 4,600 tons of Asphaltic Concrete, 6,790 linear feet of Cement Concrete Gutter, 3,280 linear feet of Cement Concrete Curb and Gutter, 1,930 linear feet of Precast Traffic Curb, 2,744 linear feet of Metal Pipe, 2,836 linear feet of Concrete Pipe, 2,730 linear feet of Beam Guard Rail, 380 square yards of Cement Concrete Sidewalk, 5,180 linear feet of Chain Link Fence, 1,101 cubic yards of Concrete, 131,000 pounds of Steel Reinforcing Bars, 213 linear feet of Standard Bridge Railing and other items.
13. Draining, Grading, Surfacing and Paving with Asphaltic Concrete and Cement Concrete on 0.897 mile of Secondary State Highway No. 21-B in Kitsap County, PORT WASHINGTON NARROWS BRIDGE-SOUTH APPROACH, a State Project, involving about 9,120 cubic yards of Unclassified Excavation, 20,000 cubic yards of Common Borrow, 3,880 cubic yards of Selected Roadway Borrow, Crushed Surfacing and Prime Coat Aggregate, 8 tons of Asphalt Cement, 2,690 tons of Asphaltic Concrete, 15,680 square yards of Cement Concrete Pavement, 11,160 linear feet of Cement Concrete Curb, 950 linear feet of Cement Concrete Curb and Gutter, 500 linear feet of Precast Traffic Curb, 510 cubic yards of Concrete, 45,000 pounds of Steel Reinforcing Bars, 9,400 linear feet of Concrete Pipe, 900 linear feet of Beam Guard Rail, 1,180 linear feet of Chain Link Fence, 7,220 square yards of Cement Concrete Sidewalk and Driveway and other items.

SEWAGE COLLECTION SYSTEM, PUMPING PLANT

LOW'S AND DALY'S ADDITIONS

BIDS CLOSE 7:30 P.M., M.S.T., MARCH 3

Missoula, Montana

NOTICE TO CONTRACTORS

Sealed bids for the construction of a sewage collection system and a sewage pumping plant will be received by the City of Missoula, Missoula County, Montana until 7:30 P.M., MST, on the 3rd day of March, 1958, at which time and place bids will be publicly opened and read aloud.

Proposals shall be addressed to the City Clerk, City Hall, City of Missoula, Montana, and mailed or delivered to that office. The bid opening will be held at the City Fire Hall, West Pine and Stevens Streets, Missoula, Montana.

The proposed work includes the following approximate quantities: 34,795 feet trench excavation and backfill, 5,000 feet 4-inch sewer, 31,757 feet 8-inch sewer, 941 feet 10-inch sewer, 1,436 feet 12-inch sewer, 2,212 feet 15-inch sewer, 91 manholes, 1 pumping plant.

Plans and specifications may be examined at the City Hall of the City of Missoula, Montana; offices of Clark & Groff Engineers, 3240 Triangle Drive, Salem, Oregon and 408 Woody Street, Missoula, Montana; office of Montana Contractors Association, Placer Hotel, Helena, Montana; offices of the Associated General Contractors, 102 South Stevens, Spokane, Washington, 220 West Harrison Street, Seattle 99, Washington, 1210 Grove Street, Boise, Idaho, and 129 Southwest Third Avenue, Portland, Oregon. Licensed Contractors may secure copies of these documents from the Engineer's office either in Missoula, Montana or Salem, Oregon, upon deposit of Thirty-Five Dollars ($35.00). The deposits will be refunded to all bidders and Twenty-Five Dollars ($25.00) of the deposit will be refunded to non-bidders upon return of the documents in good condition within fifteen (15) days after the bid opening.

Each and every bid shall be made upon the regular blank forms found with the specifications and shall be accompanied by a check payable to the City of Missoula, Montana, and certified by a responsible bank for an amount which shall not be less than ten per cent (10%) of the total bid, to be forfeited to the City in the event of failure to contract within ten (10) days after acceptance of bid. A bid bond is not acceptable. A one hundred per cent (100%) corporate surety bond will be required to guarantee faithful performance under any contract awarded.

The City reserves the right to postpone making the award for thirty (30) days or to reject any and all bids, to delete certain items from the bid, and to accept the bid deemed by them to be for the best interests of the City of Missoula, Montana.

By order of the City Commission.

Alan W. Cuthbertson
City Manager

WASCO DAM

BIDS CLOSE 2 P.M., MARCH 18

Culver, Oregon

NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, Bureau of Reclamation. Sealed bids (Specifications No. DC-5022) will be received at Culver, Oregon until 2 p.m. Pacific Time March 18, 1958, for furnishing labor and materials for Wasco Dam, Wapinitia Project, Oregon. Location 35 miles west of Maupin, Oregon, in Wasco County. Principal items are 91,000 cu. yds. excavation; 45,000 cu. yds. dam embankment; 515 cu. yds. concrete; and other work. Completion time 500 days. For particulars, address Bureau of Reclamation, Jerichol Lane, Culver, Oregon; or Building 53, Denver Federal Center, Denver 2, Colorado. W. A. Dexheimer, Commisioner.

6042—2-15

HIGH SCHOOL, ADDITION TO GRADE SCHOOL

BIDS CLOSE 8 P.M., FEBRUARY 25

Deer Park, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Clerk of the Joint Consolidated School District No. 414, at the offices of the School District, in the present High School, Deer Park, Washington, on or before 8:00 P.M., P.S.T., Tuesday, Feb. 25, 1958, for the construction of Deer Park High School and addition to Clayton Elementary School of frame and masonry construction. The bids will then and there be publicly opened and read aloud.

Bids received after the time fixed for opening cannot be considered.

Separate bids will be received for the following contracts:

a. General
b. Mechanical work
c. Electrical work
d. Also a bid on Clayton Multi-Purpose Addition including all three contracts.

Drawings and specifications including contract documents may be examined at the office of the Architect, Victor Louis Wilson, 1526 West Riverside Avenue, Spokane, Washington, and may be obtained there upon the deposit of $40.00 per set for General, and $25.00 each for Mechanical and Electrical.

The sets of plans and specifications will be on file at the following places for the convenience of sub-contractors, etc.: The City Construction Council, 34 Vista Way, Kennewick, Wash.; Construction Council, 321 West 3rd, Spokane, Wash.; AGC Builders' Chapter, N. 1207 Washington, Spokane, Wash.; Builders' Exchange, 317 Builders' Exchange Bldg., Portland, Oregon; AGC Builders' Chapter, 215 West Harrison St., Seattle, Wash.; Plan Bureau, 2413 Western Ave., Seattle, Wash.; Basin Construction Council, 515 W. Broadway, Moses Lake, Wash.; Yakima Valley Master Builders, 702 W. Walnut St., Yakima, Wash.; AGC Builders' Chapter, 452 St. Helens, Tacoma, Wash.

The full amount of the deposit for one set of documents will be refunded to actual bidders upon return of the documents, unmutilated and without marks and annotations, within 10 days after the time set for opening of bids, but to non-bidders only if returned no later than 10 days before the bid opening.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" and on the bid form provided by the Architect and each bid must be accompanied by a certified check, cashier's check or bid bond with State-licensed surety or sureties in an amount of not less than five per cent (5%) of the bid for which security is given, made payable to the Joint Consolidated School District No. 414, Deer Park, Washington.

The right is reserved to accept or reject any or all bids and waive all claims, or any informalities or irregularities in the bids or in the bidding.

The School District reserves the right to award a contract for this project on the basis of the acceptance of any or all of the alternates, whichever course is in the best interests of the School District. No bidder may withdraw his bid after the time set for the opening thereof, unless the award of contract is delayed for a period exceeding 30 days.

By order of Joint Consolidated School District No. 414, Deer Park, Washington.
Mrs. Charlotta Layton, Clerk.

6037—2-8, 15, 22

POULTRY PLANT

BIDS CLOSE 2 P.M., FEBRUARY 19

Pullman, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Board of Regents of the State College of Washington on February 19, 1958, in room 303 of the Administration Building, State College of Washington, at 2:00 P.M., for the construction of a POULTRY PLANT at Pullman, Washington. Bids received after the time for opening will not be considered.

Drawings, specification and forms of contract documents may be examined at the offices of Philip E. Keene, Architect, State College of Washington, Pullman, Washington, or Funk, Murray & Johnson, Architects, W. 524 4th Avenue, Spokane, Washington.

Sets of drawings, specifications and forms may be obtained from Funk, Murray & Johnson, W. 524 4th Ave., Spokane, Washington, on deposit of $30.00 for the General Plans, including the Mechanical and Electrical Plans.

No bidder may withdraw his bid after the hour set for the opening thereof unless said award is delayed for a period exceeding 30 days.

Secretary,
Board of Regents,
State College of Washington.

UNIVERSITY OF OREGON LIBRARY - EUGENE

FRAMEWORK OF THE FUTURE IS GOING UP *Today!*

New "Savarin" Coffee Plant of Slim, Clean Precast Concrete is Functional Beauty

● This bright, light, efficient plant is proof of modern concrete's versatility, speed and economy of erection. The 130 columns, 95 girders and 425 purlins went up in just 7 working weeks.

CHECK THESE CONCRETE FACTS

Here's what architect and owner want in a new building. Here's what precast and prestressed concrete gives them:

- a maintenance-free, corrosion-free structure
- elimination of fire hazard, hence favorable insurance rates
- streamline, smooth surfaces easy to keep clean, new-looking and sanitary
- flexibility for expansion through variety of shapes, sizes and weights made-to-order at no premium cost
- economy through speedy erection in days or weeks, from on-job or off-job casting plants
- immediate availability of units, produced as needed
- quicker starts, earlier finishes by using 'Incor' high early strength cement, in assembly line production through fast stripping and re-use of forms

Dependable 'Incor'*, America's first high early strength cement, is a major reason why precast, prestressed buildings such as this are the Framework of the Future rising everywhere *Today*.

BULLETINS

Contract for design of a $45 million federal office building in San Francisco, one of the largest ever planned outside the Washington, D.C., area, has gone to four architectural firms in that city: Blanchard & Maher; Albert F. Roller; Stone, Mulloy, Marracini & Patterson; and John Carl Warnecke.

Civic Center site in Los Angeles has been selected by the federal government and approved by the City Council for construction of the long-planned $33 million customs house and office building.

Master plan for the future development of the University of Washington campus will be prepared by Seattle architect Paul Thiry.

California Council, AIA, has elected these officers: L. F. Richards, Santa Clara, president; Lee B. Kline, Pasadena, vice president; Edward H. Fickett, Los Angeles, secretary; Allen Y. Lew, Fresno, treasurer; Corwin Booth, San Francisco, member-at-large.

Architectural mosaic muralist Joseph L. Young of Los Angeles has been invited to be artist-in-residence at the Positano (Italy) Art Workshop in June and at the Institute of Industrial Design in Haifa, Israel, later this year. An exhibition of over 30 original mosaics designed for the home and executed by Young's adult classses will be open to the public from March 30 through April 12 at his workshop, 8426 Melrose Ave.

THE CALENDAR

American Wood-Preservers' Association—annual convention, Los Angeles, April 14-16.

National Association of Architectural Metal Manufacturers—annual convention, Shamrock Hilton, Houston, April 27-May 2.

Western Air Conditioning Industries Association — conference and exhibit, Shrine Exposition Hall, Los Angeles, May 7-11.

Stanford Research Institute — annual western area conference, Vancouver, B. C., May 26-27.

THE BUILDING MONTH: TRENDS

Curtain wall panel construction is getting its share of attention this month. An all-day meeting was scheduled to be held in San Francisco at the Sheraton-Palace Hotel March 17, sponsored by the Producers' Council. On the agenda: design and fabrication, erection, types of sealants, joints and flashings, aluminum, masonry, steel, glass, types of panels, specification studies, auxiliary construction. And on the East Coast during a seminar conducted by Bettinger Corp., it was pointed out that over 80% of the cities have thus far adopted one of the major building codes which permit true curtain wall use, but in some of those cases there have been restrictive regulations. Keynoter J. C. Hazen Jr., executive editor of Architectural Forum, jolted his audience when he declared that curtain walls are not new, pretty or doing half the job they should do.

Manufacturers and consulting engineers in an effort aimed at greater cooperation and understanding met in Chicago last month to map plans for the formation of a joint committee to provide continuing liaison between the Producers' Council and the Consulting Engineers Council.

Our dwindling living space will force us to design expandable-shrinkable homes with built-in furnishings and radically miniaturized appliances, industrial designer Henry Dreyfuss told 1,000 businessmen attending February's annual conference of the Reinforced Plastics Division of the Society of the Plastics Industry. "Why not design a house that expands and contracts with our space needs?" the Chicago gathering was asked by Dreyfuss, whose designs include Bell System's color telephones, Hoover vacuum cleaners, Crane plumbing fixtures and Minneapolis-Honeywell thermostats. "Junior arrives and we shop for a cubicle that we buckle onto the side of our existing building. Years later when he has his own house, we cart his room off to the used-room lot."

Study of uses of lead in building construction is now underway by the architectural-engineering firm of Skidmore, Owings & Merrill, which has been retained by the Lead Industries Association. The study will be conducted in its New York, Chicago, Portland and San Francisco offices under the supervision of general partner John B. Rodgers.

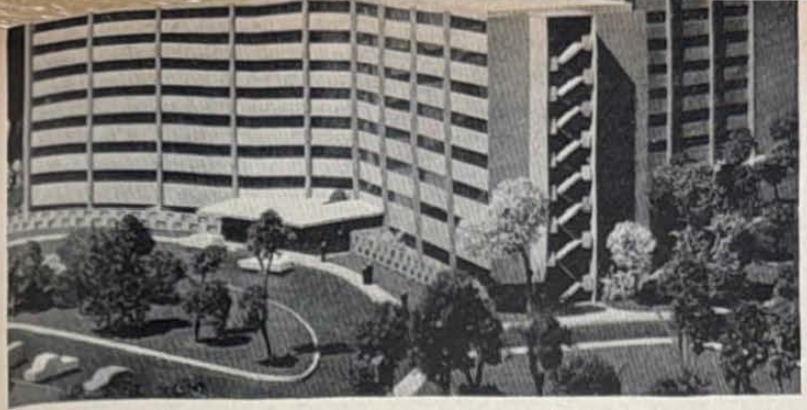
Cost barrier to commercial atomic-electric power appears to have been broken by Pacific Gas and Electric Co., San Francisco, which has reported to a congressional committee that its research has knocked several years off the accepted time when nuclear electricity would become economic for normal public use. The company is prepared to support its findings by building a 60,000-kw. atomic power plant south of Eureka, Calif., for service by the middle of 1962.

A cutback in plywood construction is being noted in the West as plant closures began spreading through the Pacific Northwest into California. Reasons for the closures: growing inventories and falling prices.

Pickup in home construction, accompanied by increased employment in the industry, can be expected this spring as a result of an easing in home loan money by the government. Typical of the optimism expressed is a statement by savings and loan leaders in San Francisco who predict an increase of at least 10% for 1958 over last year in the total of California mortgage finance activities "with plenty of money available for homes for which there will be plenty of buyers."

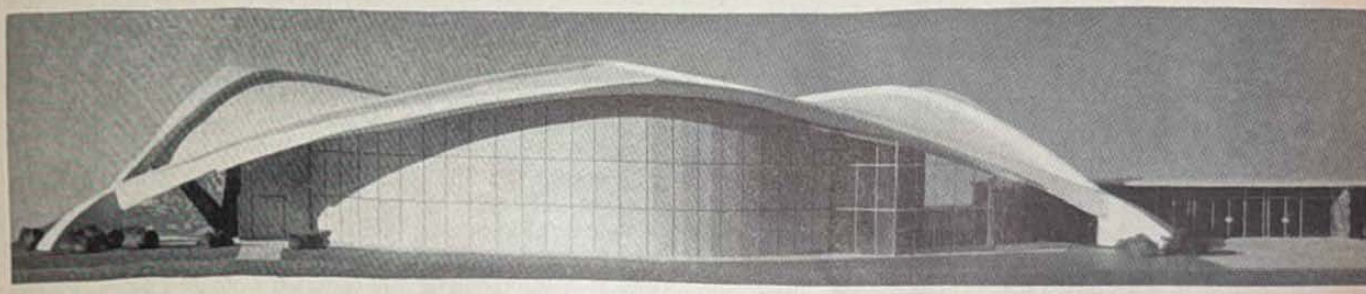
New store construction and modernization is expected to set a record this year, with an estimated $1.3 billion slated to be spent in the U. S.

Home Improvement Council, successor of last year's OHI, has two objectives, "protection of the public from the 'suede shoe' and 'gyppo' type of operation and stimulation of the home improvement and remodeling market, says Kenneth R. Topping Jr., San Francisco contractor and chairman of the council's Greater Bay area.

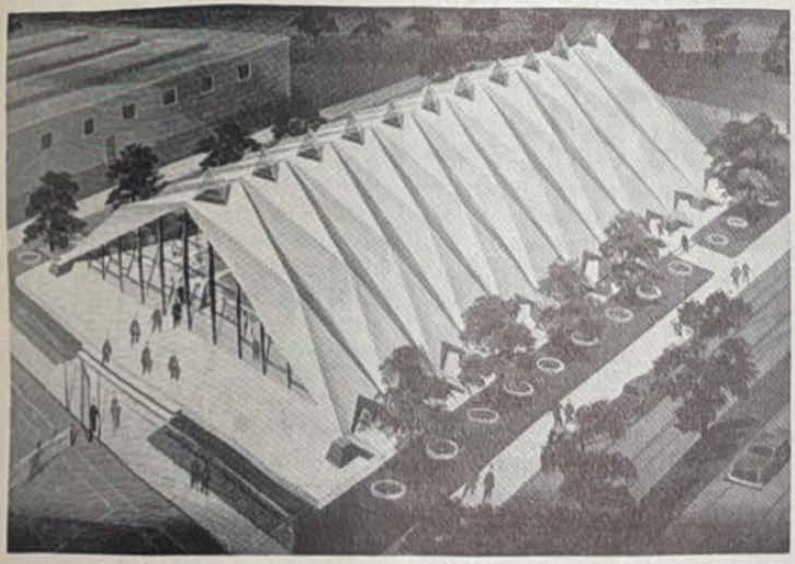


PROTOTYPE for possible future construction at other installations, eight-story officers building to be built at Mather Air Force Base, Sacramento, will accommodate 408 men, with two in each suite. Many of these units will have two bedrooms, living room, bath and kitchenette. Costing about $3 million, facility is designed to stay within limitation of $7,500 per man. Project originally was planned as series of two-story buildings, each housing 40 men, but cost of developing site utilities and roads made it too expensive to construct. Architects-engineers: Daniel, Mann, Johnson & Mendenhall.

AUDITORIUM for North Seattle High School will be combination of three hyperbolic paraboloids, with only three points of support. Roof slab will be structurally exposed, acoustically treated with asbestos-fiber plaster. Walls will be of brick and expanded shale block cavity construction. Architects: Naramore, Bain, Brady & Johanson; Worthington & Skilling, structural engineers.



INDOOR TRAINING POOL (seven-lane, 25-meter and accessory facilities) for U. S. Coast Guard at Alameda, Calif., will be 160x75-ft. building of precast reinforced concrete prismatic panels, 3 in. thick. Box girder construction is designed to float in high-density fluid earth base. (Site is over 14-ft. hydraulic fill.) Construction budget is $230,000. Architect: Office of Ernest J. Kump; engineer: Walter L. Dickey.



OFFICE BUILDING for Bethlehem Pacific Coast Steel Corp. in downtown San Francisco will be first new structure adjacent to 80-acre redevelopment area. Free-standing exterior steel columns and spandrels will be faced with marble; windows will be tinted gray for heat control. Ends of tower will be cantilevered and walls of first two stories set back to form arcade. Architects: Welton Becket & Associates; structural engineers: Hayes & Little and John A. Blume & Associates.

Oregon dean to resign position in July

Sidney W. Little, dean of the School of Architecture and Allied Arts at the University of Oregon, will resign from this position and return to academic status as professor of architecture, effective July 1. The change will be followed by a six-month sabbatical leave for travel in Europe and the United States before returning to the Eugene campus in January 1959.

Dean Little has been in this administrative post for the past 12 years, coming to Oregon from the Alabama Polytechnic Institute, where for the previous eight years he was associate professor of architecture.

Prominent in AIA affairs, several years ago he was a member of a survey commission which contributed to the group of recommendations for strengthing the program of education for the professional practice of architecture. He currently is chairman of the committee of the Association of Collegiate Schools of Architecture for its major program in post-graduate refresher education for the architect in private practice.

While on leave Dean Little will investigate the graduate offerings in architecture at schools similar to Oregon. He plans to continue his work with the Oregon Capitol Planning Commission on his return.

Historians to hear Belluschi in Eugene next month

Among the featured speakers at the spring meeting of the Pacific Coast Section, Society of Architectural Historians, at the University of Oregon April 11-12 will be Dean Pietro Belluschi of the School of Architecture and Planning, MIT. He will give the main address at dinner on the first day.

Also participating in the program will be Mrs. Agnes A. Gilchrist, architectural historian for the National Park Service and the society's former national president. Prof. Marion D. Ross of Oregon's architectural faculty will be chairman of the meeting.

Two other events are scheduled during the historians' stay on the Eugene campus. The Western Division, Association of Collegiate Schools of Architecture, will meet and Lawrence Hall, new architecture and allied arts building, will be dedicated.

AGC prexy decries restrictive practices

• Union head responds with statement

Highlights of the national convention of the Associated General Contractors 38th annual convention in Dallas last month were a statement by outgoing president Lester C. Rogers who asked unions to give a full day's work for a full day's pay; and a 10-point policy outlined by Richard J. Gray, who heads the Building and Construction Trades Department, AFL-CIO.

"The construction employers of the nation demand action from the building and construction trades unions in supporting the principle of giving the public a full day's work in return for a full day's pay," began Rogers, whose group represents more than 7,000 general contractors.

Cites "unreasonable demands"

"The Associated General Contractors of America has sought at the national level and at the local bargaining table to eliminate non-productive wasteful practices and to hold wage increases to reasonable levels in line with productivity and the cost of living. This association supports the appeals of the President of the United States to control unreasonable demands and to reduce inflationary tendencies. 'Make work, featherbedding' and other restrictive practices continue to exist and are increasing despite lip service repeatedly given by labor leaders to the idea of a full day's work for a full day's pay.

"Main prop in economy"

"The public interest is always at stake in the performance of the construction industry and never more than now when construction is one of the main props in the national economy. The time for action is now. The time for talk and promises has passed. This vital matter can no longer remain buried in high level committee discussions, but must be acted on at the bargaining table.

"The association, whose members employ the bulk of construction labor, calls on the Building and Construction Trades Department of the AFL-CIO and each of its international union presidents to act now to eliminate restrictive 'make work' practices in construction, which are beneath the innate dignity of the American workman.

"The association appeals to industry as a whole and to the citizenry in every community to support this campaign to restore full productivity and to give the public full value for its investment in the construction of homes, schools, hospitals, highways, factories, defense facilities and all other structures needed for the progress and security of the nation."

Unions' policy statement

Here is the 10-point declaration of principles, later adopted at a Miami meeting by the 19 national and international unions, with a membership of three million, which make up the department:

1. The selection of craft foremen or craft general foremen, over workmen of their respective crafts, shall be entirely the responsibility of the employer.

2. The welding torch is a tool of the trade having jurisdiction over the work being welded. Craftsmen using the welding torch shall perform any of the work of their trade and shall work under the supervision of the craft foreman.

3. Workmen shall be at their regular place of work at the starting time and shall remain at their place of work until the regular quitting time.

4. There shall be no limit on production of workmen nor restriction of the full use of proper tools or equipment and there shall not be any task or piece work.

5. Payment of excessive daily travel allowances or subsistence shall be discouraged.

6. Jurisdictional disputes shall be settled in accordance with the procedure established by the Building Trades Department of the AFL-CIO or in special cases as agreed and established by two or more international unions, without interruption of work or delay to the job.

7. So-called area practices, not a part of collective bargaining agreements, should not be recognized nor should they be enforced.

"Slowdowns condemned"

8. Slowdowns, forcing of overtime, spread work tactics, standby crews and featherbedding practices have been and are condemned.

9. Stewards shall be qualified workmen performing work of their craft. There shall be no non-working stewards.

10. There shall be no strikes, work stoppages or lockouts during the processing of any grievances or disputes in accordance with the manner prescribed in the local or national agreement.

Women scrutinize kitchens

• New pattern seen at housing congress

Women's growing desire for individuality in their houses to fit their own personal living patterns should be a good omen to the design profession.

The 100 representatives at the Congress on Better Living, sponsored by McCall's magazine, spelled out the framework in which today's family lives and indicated that a new pattern—in some cases a reversal to yesterday's ideas—is evolving throughout the nation.

It was the kitchen that got the most attention—and criticism—and the trend is toward more universal use of this area of the home. Since only three out of the 100 consider the kitchen as "strictly for cooking" alone, one of the biggest problems is that the present kitchen is usually too small and lacks sufficient storage and counter space.

U-shaped kitchen plan preferred

The women prefer a U-shaped kitchen plan with a peninsula sink, or the sink being below a window, because it requires a minimum of movement in preparing meals. The U-plan also reduces traffic and interference by the rest of the family.

The new role of the kitchen calls for a broader architectural conception of women's needs in the home. Among the uses made of this area are laundry washing, drying and ironing; sewing and hobbies; a place for the children to study; storage space. What women want most today is a larger, better integrated kitchen planned to meet a variety of activities.

They also would like something done in every part of the kitchen to make it easier to clean. They want a radical new design in ranges, which are the hardest to maintain; and they recommend elimination of space beneath the refrigerator and between major appliances to ease cleaning problems. Cabinets below knee level annoy women because they are hard to reach.

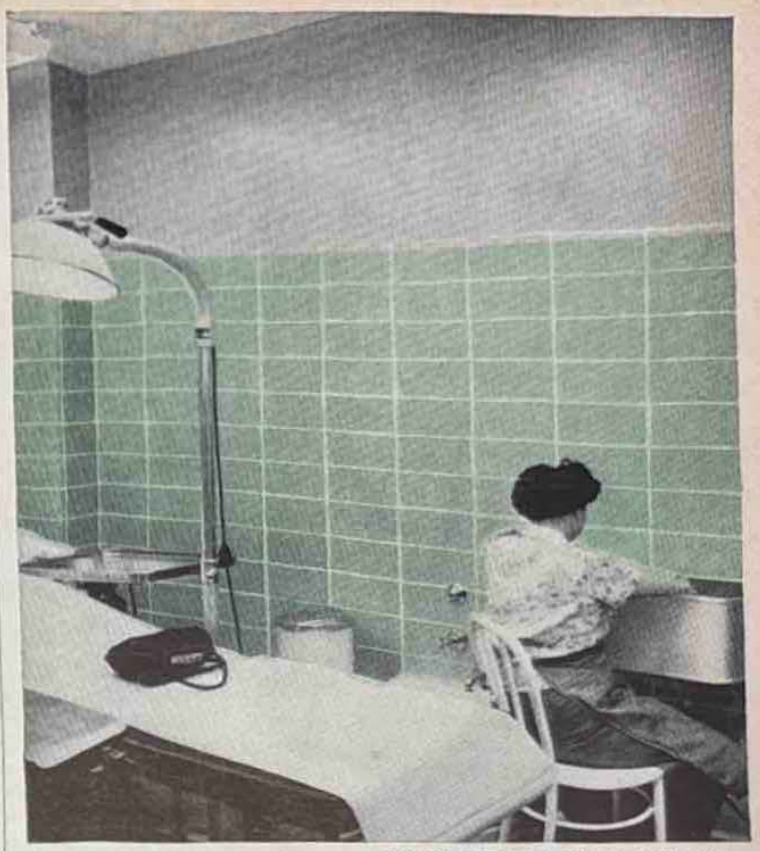
Labor-saving devices may boomerang

Some of the delegates thought that the labor-saving devices require too much labor to keep clean and made these suggestions:

- Disposable oven liners and a removable broiler lining.
- Wall ovens that are more efficiently ventilated.
- Transfer of ice cube compartment from the refrigerator to the sink where glasses and water supply are handy and where they are most used.
- Dishwashers redesigned to accomodate more dishes; many current models also are hard on stemware and silver and barely take care of an average meal. Other ideas: one dishwasher for glasses, one for dishes with its own garbage disposer; a three-speed, three-level unit with adjustable racks for cups and glasses.

Lack of product information

The report shows that some recommendations have in fact been in effect for a time, but that some women lack information about the newest appliances and often do not know that such improvements exist. Many women did not know, for example, of ranges with removable oven linings which make oven cleaning a vastly easier job. It seems that manufacturers must make homemakers—along with architects and home builders—aware of their products as well as meet the requirements of the market.



Ford Motor Company, Milpitas, California
Albert Kahn, Associated Architects & Engineers
Glazed Structural Tile by Kraftile

first aid for ford

What Ford does, Ford does right! Their cheery First Aid Room shown here is only one of many facilities thoughtfully provided in their giant new Milpitas plant. There are first aid rooms, kitchens, cafeterias, shower and locker rooms—all with generous expanses of gleaming, smooth Kraftile glazed structural tile.

In these rooms which do not yield direct profit or production, building and maintenance costs came under extra close scrutiny. Glazed Structural Tile Units are speedily installed as combined wall and finish by only one trade (masonry). A damp cloth cleans it. Glowing, harmonious colors cannot fade. Smooth, marble-hard finish fends off chemicals, acids, grease and steam. Offers no shelter to dirt, vermin, bacteria or rodents. 12 colors plus clear glaze in standardized sizes and shapes. Write for specifications, Graphic Standards and color samples.

KRAFTILE COMPANY • NILES, CALIFORNIA

Northwest boosts wood; Bay, masonry

• School forum, industry dinner promote products

A school design forum arranged by the Tacoma Lumbermen's Club was attended by 240 architects, educational and civic leaders last month, while another 200-plus architects, engineers and city officials gathered in San Francisco for the masonry industry's first promotional dinner in January.

In Tacoma

PRINCIPALS at Tacoma Lumbermen's Club forum on schools are (l. to r.) James Hopkins, assistant superintendent of Tacoma schools; architect Robert Billsbrough Price; Lloyd J. Andrews, Washington state superintendent of public instruction; Corydon Wagner Jr., club president; and Al Ogren, master of ceremonies.

While the forum was titled "Schools Within Reason—the Logic of Wood in Modern School Design," it pointed up generally the problems and potentials of the school building program in Washington State. Said Robert Billsbrough Price of Tacoma: "Today I'm speaking as an architect and my only interest is in obtaining the most for the least for my client," adding that a wood school is also a concrete, masonry and steel school.

Turning to the lumbermen, Price declared, "Gentlemen, you have only yourselves to blame for your untapped markets. It has taken outsiders to make you aware of the potentials of your product." And he went on to commend the Douglas Fir Plywood Association on its research program, "both for the new application as well as its continuing engineering studies which are available to all architects and engineers for the asking."

In San Francisco

At the dinner sponsored by the Masonry Joint Industry Board of Northern Californa Coast Counties, Los Angeles architect Ulysses Floyd Rible bluntly praised and criticized the industry and suggested a program of activity to be followed in creating wider markets for brick.

"I like brick," Rible asserted, "because it has color and texture, is flexible in its adaptation to shapes and surfaces, is low in cost, particularly low in maintenance requirements and its general appearance is desirable.

"I don't like brick because there is not enough variety of colors available in common brick or in grout and because labor in the masonry field has not been too cooperative in efforts to keep costs down."

Rible suggested that the masonry industry "make an effort to develop a far greater range of colors in common brick and a wider range of textures, without increasing costs to the consumers. Common brick still is too soft and too easily damaged both in transit and installation. Perhaps this problem could be overcome by an industrywide effort to produce thin brick preapplied to panels and made competitive in cost to plastics."

John A. Blume, structural engineer and head of John A. Blume & Associates of San Francisco, also spoke.

Two West Coast church designs cited

Lone first award in the 1958 competition sponsored by the Church Architectural Guild of America went to the Cate School Chapel in Caprinteria, Calif., designed by Los Angeles architect George Vernon Russell. Only other West Coast winner was the Hope Lutheran Church in Tacoma, which won an honorable mention for architect Robert Billsbrough Price of that city.

The competition, which was dominated by western winners last year, provides for first, second and third prizes plus honorable mentions in each of six categories, such as churches over 300-seating capacity. In one instance no award was given and in several others, only honorable mentions. In all, 14 projects were premiated.

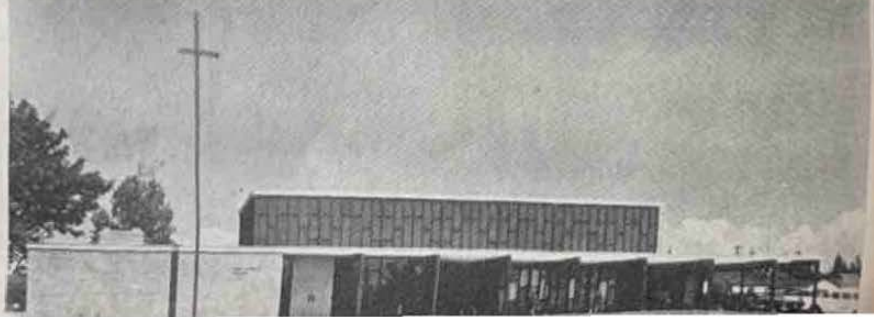
The awards were made as part of a national conference on church architecture in Detroit February 18-20, co-sponsored by the National Council of the Churches of Christ. Among the program participants was Seattle architect Robert L. Durham, who conducted a workshop on "European Churches."

The conference will be held for the first time on the West Coast when it meets in Los Angeles next year; Seattle will host the sessions in 1962.

FIRST AWARD, Class 3, churches of any size unconnected with religious education buildings: Cate School Chapel, Carpinteria, Calif.; George Vernon Russell, architect.

HONORABLE MENTION, Class 2A, churches under 300-seating capacity: Hope Lutheran Church, Tacoma; Robert Billsbrough Price, architect.

Dearborn-Massar



Building volume indicates upturn

PERMITS

Building permit volume continued to rise slightly in February. The total for the five western states was $167,760,393, up $2¾ million over the same period a year ago. Washington chalked up a $5 million increase; Oregon, $1¾ million; and Idaho, $½ million. California dropped $3½ million and Montana was down $1 million.

An exceptionally good February was indicated in San Diego, up $17¾ million over last year; Los Angeles, which had the biggest February on record, up $4 million; Seattle, $2½ million; King County, $1½ million; and Portland, $1¾ million. At the same time a number of individual building permit agencies recording substantial decreases. Los Angeles County dropped $11¾ million from February 1957; San Mateo County, $3 million; Orange County, $2 million; and Spokane, $1½ million.

The usual February slump was marked only in California, where the dollar volume dropped $23½ million below January. Washington picked up a good $6¾ million over the January figure; Oregon was up $1¼ million; Idaho and Montana had slight increases.

While it is still too early to tell whether 1958 will be a considerably better year, the building permit volume for the first two months certainly indicates a somewhat brighter picture. The five-state total is $351,446,113, up $6¾ million over the first two months of 1957.

Following is a breakdown of building permits issued for new buildings and additions by several of the major agencies during February. (Number of permits is followed by total dollar volume.)

ANALYSIS OF TYPICAL AREAS—FEBRUARY

	Dwelling		Commercial & Industrial		Public	
Portland	38	$ 643,900	14	$1,236,000	3	$ 979,970

Industry looks at its broad problems

RESEARCH

• Reduction of building costs is main objective

In an initial effort to define the broad problems facing the building industry today, some 50 leaders gathered in Washington, D. C., February 11-12 for a joint meeting of the Building Research Advisory Board and the Building Research Institute. They heard 11 speakers, each representing the viewpoint of a special industry segment or one of the related professions, and then as a group discussed the opinions expressed.

"Every speaker," said W. H. Scheick, executive director of BRI, "whether architect, engineer, builder, manufacturer or economist, made a major plea for the development of accurate, dependable, scientific building design data through research and for better communication of technical progress between all branches of the industry. With reduction of building costs as the main objective, these industry leaders emphasized the need for strongly stepped-up research programs in building technology itself and in related areas of the natural, human and social sciences."

The assembled BRAB-BRI group approved release of the list of problems developed by the speakers as a challenge to everyone concerned with building design and construction.

Architect sets tone

Indicative of the tone of the meeting was a comment by Chicago architect Norman Schlossman, who said, "We must consider the economic life of our buildings in these times of changing finances and shifting population, on the threshold of an atomic age. Scores of structurally sound buildings are demolished annually due to the workings of economics and obsolescence. What can we do to lengthen their useful life, or at least reduce the present imbalance between the life of the structure and the life of the equipment and the guts?"

An owner speaks

Speaking as a building owner, E. D. Hollinshead of John W. Galbreath Co., Pittsburgh, asked for contracts between building owners and architects or engineers so written that the architects and engineers receive a bonus for every dollar saved under an agreed upon estimated cost. "After the percentage (of the cost) fee is arrived at," he pointed out, "the owner expects the architects and design engineers to spend their time and money to determine the best possible combination of manufactured items for the owner's building and the proper way to combine in the finished structure the building components produced by dozens of manufacturers. Such an arrangement does not work to the best advantage of the owner."

Problems for the creators of buildings

ARCHITECT

1. More study on why buildings leak, particularly in the fields of thin, lightweight walls, masonry walls and windows.
2. Better means of overcoming acoustical difficulties, partitions and suspended ceilings that transmit less sound.
3. More roofing materials that can be used and walked upon, so that wasted roof space can be converted into green areas in the hearts of our cities or used for recreation.
4. An ingredient added to concrete that will make it vapor-proof, watertight and even self-sealing, like a puncture-proof tire.
5. Better, more easily maintained finishes; finishes that are integral with structural materials, that can be sprayed on or in some other way easily applied.
6. More materials and assemblies for our skin type buildings that will stretch, breathe like skin.
7. Research into the causes and effects in buildings, for instance, as to how much infiltration through walls and windows may be due to negative pressure set up by mechanical exhaust systems or the stack effect in tall structures, rather than the walls and windows themselves.
8. More knowledge about the economic life of our buildings and what we can do to lengthen their useful life or reduce the present imbalance between the life of the structure and the life of the equipment.
9. Continuing search to find the ways to put decent housing within financial grasp of all of our people.
10. More data about human reactions to such things as lighting, ventilation, air conditioning, noise, size and location of windows, color, texture and form.
11. Better measures of what buildings do to people, so we can make schools, hospitals, office buildings, homes, greater sources of joy to those within them.
12. More ways to enlarge the possibilities of architectural expression in curtain walls and reduce their sameness.

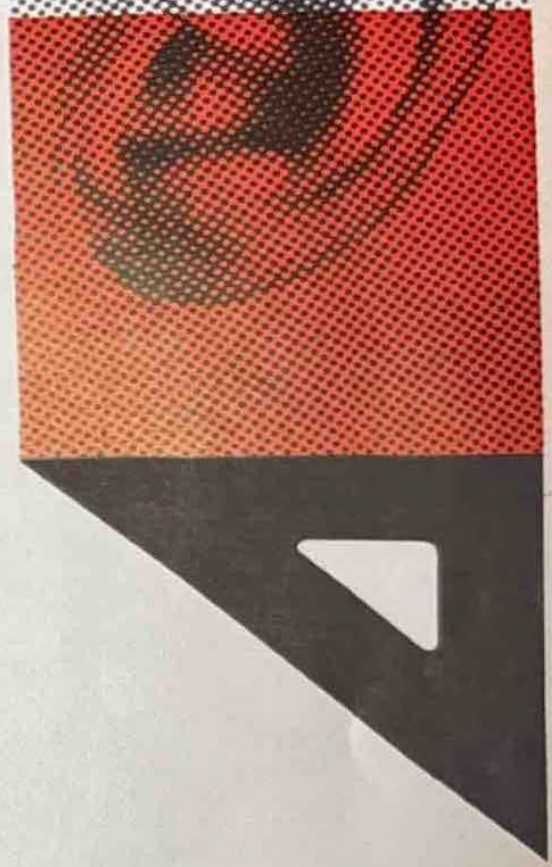
AIR CONDITIONING ENGINEER

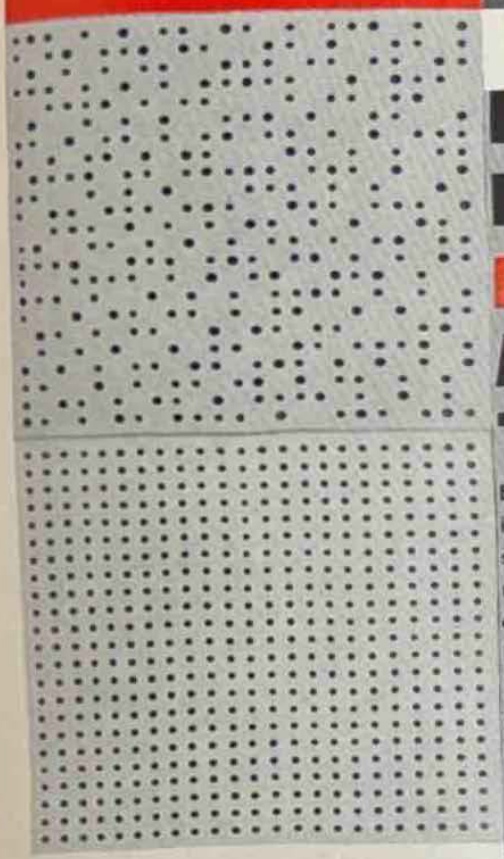
1. Investigation into population densities in buildings of all types, preparation of statistics on them and publication of results. The basic assumption of number of people per square foot in an air conditioned building often proves to be faulty, with the result that either too much or too little air conditioning is provided.
2. More study and creative work should be devoted to shading devices as an integral part of building design to reduce heat gain from the sun and lower the cost of air conditioning.
3. Study of the relative merits of different methods of insulating and vapor sealing, particularly in large roof areas, and the integration of insulation into the design of thin shell structures used in new architectural forms so prominently.
4. More data on the ultimate costs of various systems of construction—costs which include initial construction cost, interest, depreciation, amortization and the annual costs of operation and maintenance—to enable us to choose the best and cheapest method of construction in terms of the life of the building, whether it be 10, 15 or up to 25 years.
5. Research on acoustics as related to lighting, air conditioning and suspended ceilings, so that means may be devised to trap the sound above the ceiling.
6. Study of the effect of wind on the outside of a structure as it affects vents, air intakes, etc., and the deflection of wind by other structures adjacent to the proposed buildings which would influence its design and orientation.

BUILDING CONTRACTOR

1. Biggest problem faced by the contractor in the building industry is how to reduce costs and research on this problem must go on continuously in every branch of the industry.
2. Problem for the industry (not necessarily subject to solution by research) lies in the stage of budgeting, design and estimating. Too frequently

2 SOUND ACHIEVEMENTS





NEW KAISER FIR-TEX ACOUSTICAL TILES

Even the holes are new in Kaiser Fir-Tex acoustical tiles! Our unique new drilling process produces more and cleaner holes per tile, assures high Noise Reduction Coefficients. Two new patterns—Regular (529 holes/sq. foot) and Casual (316 holes/sq. foot—in three diameters)—combine with smaller beveled edges to help you achieve continuous perforated ceiling effects. Available now in ½", ⅝", ¾", and 1" thicknesses, in 12" x 12", 12" x 24" or 24" x 24" tiles. Contact your nearest Kaiser Fir-Tex Representative for data bulletins for your files.

KAISER GYPSUM

KAISER GYPSUM COMPANY, INC. Kaiser Building—1924 Broadway, Oakland, California

the original budget allows no contingency for design decisions which might improve the building, hence the final verision of the design may be stripped down to a point where lowest possible first cost has become the overriding factor.

3. More time should be allowed in the design stages of a building for full consideration of the best that technology has to offer, where study is required.

4. Obstacles to the orderly, timely, efficient delivery to the site of bulk materials, manufactured items and subassemblies should be reduced to the minimum, as should obstacles to the efficient placing of these items in the structure to be built.

5. New components for buildings create new problems of their handling by labor because these bigger building units do not fit the traditional divisions of work by trades. The AGC labor organizations are collaborating to solve these problems and continuing consideration of them is greatly to be desired to keep pace with our changing building technology.

6. More study of temperature and humidity differentials on the several parts of a building, due to varying conditions prevailing on the outside and the inside, both during and after construction.

7. More knowledge about expansion and contraction joints for concrete slab and quarry tile roofs.

Problems for researchers on new products

1. Most urgent basic problem of product research is to define the research project in terms of its objective, instead of the fairly general practice of defining it in terms of specific solution.

2. Once defined, the problem should go through a period of imaginative, creative thinking by the people best qualified to understand it thoroughly or to profit from its solution—the buyer, installer, user.

3. Technical and practical solutions consistent with the end use of the product and the end user's maximum benefit should always be sought.

4. Site construction techniques are a fundamental and basic problem of the masonry industry and often of the rest of the building industry. We need to work with labor in terms of educational programs designed to stimulate the use of new products and labor-saving devices and thereby increase productivity, cut unit costs and enlarge total markets.

5. New product development must be based on coordination of the thinking of many different sciences and technologies and cooperation between all segments of the industry.

6. There is a big void in statistical information on characteristics, trends, etc., of commercial and industrial buildings. Research needs sources of such figures which will make it possible to find out where costs can be cut. Unbiased cost comparison figures are also vitally needed.

7. In working with segmented industry, the problem arises that new development may benefit one group more than another.

8. Problems arise when a material is used as an adjunct with many other building materials and the control of the final product is not in the hands of the original producer.

9. Automation must be more fully introduced into the production of building products in this country.

10. Concrete products must be lighter in weight and new methods of strengthening concrete products must be found.

11. Building materials consumers must be encouraged to bring their problems to the laboratory for solution.

12. With the greatly increased use of precast and prestressed concrete construction, research on these methods must be stepped up, especially in the field of offsite fabrication and delivery of components.

Problems for owners and operators of buildings

GOVERNMENT AS BUILDER AND OWNER

1. Government has problems in practice (not necessarily subject to solution by research) which are the counterpart of private industry's problems in the stages of design and budgeting for buildings. Government's problems stem from the length of time consumed for preparing budgets for buildings to be erected several years hence, for Congress to act on appropriations, and for revisions of designs necessary because of the time lag and changes in costs during this period. As a result, it is very difficult to keep design abreast of technical changes and the final design emphasizes a minimum first cost, to the detriment of design for lowest annual cost.

2. To overcome the problems impo by the requirements for competit bidding, government must carefu check the technical performance a quality of products to be sure th meet minimum requirements, th translate them into performance r quirements in specifications prior award. Evaluating products submitt on a particular project must be ma upon the specifications as advertise The building industry needs to d velop better methods to give gover ment all the technical and scientifi facts about new products and ma terials.

3. The building industry needs to fin more effective ways to help gover ment educate building inspectors, be cause they are such an importa factor in the erection process for go ernment buildings.

4. To get funds for research on build ings as complete entities, means shoul be studied of setting aside a sma portion of each building budget fo building research. Thus, the prob lems of special building types (school hospitals, government building could be subjected to research to im prove their functions.

PRIVATE OWNERS, OPERATORS

1. In the design stage of most build ings, there is always the problem o finding means to coordinate and ap ply the latest in technical research by the manufacturing industry to each design. Each design presents addi tional opportunities for specific re search by the architects and engineer themselves. Only in exceptional case are there allowances of time or money for such professional research. Th historical method of setting profes sional fees allows for no bonus to th designers for research that would sav money on the building itself. A way is needed to do this.

2. Research is done in the design stage—even to the extent of full-scale mockups—by a few outstanding ar chitectural firms working with en lightened owners. A way must be found to report the results of such privately conducted research to the building industry.

3. Every building develops it own par ticular faults such as shortcomings in lighting, acoustics, air conditioning performance of materials, etc. Experi ence of building managers and own ers should be collected and reported anonymously through a general clear ing house like BRI, as the starting point for new research on the physical problems of buildings.

Problems in housing research, urban planning, building economics will be listed next month

Some thoughts about school buildings: what they are, what they are worth, what they should cost

Our problem of ignorance

by LEON CHATELAIN JR.

SOME DOUBTS about our future are being raised today because we seemed to have lagged behind Russia in certain areas. To overcome this lag, there's a good deal of talk going on about how to catch up. Some of this talk involves us—the architect and the builder—and we had better pay heed. We had better pay heed because there's confusion and misunderstanding about public education. A good deal of this confusion involves school buildings: what they are, what they are worth, what they should cost.

The confusion comes from ignorance and this is a sad commentary on American life. The average parent and home owner is affected more by the condition of his schools than nearly anything else in his comunity life. His schools cost him money and affect the welfare of his children; they hit him in the pocketbook and in the family. Yet by and large, the public knows next to nothing about its schools. This ignorance is not confined to the proverbial John Smith of Everytown, USA. It has been disseminated recently by a number of prominent non-educational writers, thus compounding the confusion and, even worse, encouraging school boards to embark upon unwise and wasteful ventures.

In the matter of public education, basically, we are dealing with two kinds of things: those we know and those we do not know.

The architects and general contractors do know about the planning and building of schools, and the fact that many people do not know is our own fault. It is this story which we must tell, not for our own aggrandizement but because, without public understanding and public support, the building of enough good schools that combine quality with economy will not be possible. There are many opinions about school design and construction and also a number of facts. Here are some of the latter.

The cost of school buildings has doubled in the past 20 years, due to advances in the price of land, materials, labor and other expenses. Yet during this same period in which school building costs doubled, the costs of building generally has tripled. In the difference between the two figures lies a real tribute to the dedication and ingenuity of the nation's educators, contractors and architects. The fact is that the school building is still the best bargain, dollar for dollar, on the building market today.

Yet some people claim that schools are overpriced and represent a heavy tax burden upon the homeowner. Are they a tax burden? The simple fact is that if schools were built for nothing at all, it would make very little difference on the average tax bill. Let's say that John Smith receives an annual property tax bill of $200. The chances are his bill will show that about half or $100, will be spent for education. But of that amount, only about 10%, or $10, will be spent on his municipal school building program. In other words, Mr. Smith's share of his comunity's school building costs will cost about the same amount he would spend in one evening by hiring a baby sitter and taking his wife to dinner and a movie.

If school building increased at the same pace for 15 years, Mr. Smith would pay about as much for his new school buildings during that time as he spends on one modest television set. This does not seem unreasonable.

The substantial expense of school buildings is the interest paid on financing and the annual cost of maintenance and repair. For this reason, we have this seeming paradox: only the wealthy community can afford a cheap school. We reject the argument that school buildings should be monuments. We feel that we won this argument many years ago. We can save money by avoiding the trappings and ornaments of the past—the fake columns, the parapet roofs and the gingerbread. Forcing schools into a certain "look" adds nothing to education, creates community eyesores and wastes imagination and money. Contemporary design is simply the freedom to solve a problem without boxing a building into an artificial style.

Recently several writers have stated that schools are being designed as palaces and that they're costing too much; that this is so because educators, architects and contractors want it that way. This is sheer nonsense. In each of these diatribes, the writers have pointed to two or three specific schools as examples which prove their statements. The alleged high cost of one of the schools was cited over and over again. However, no one mentioned that the community in which the school is located has an average annual family income of $21,000. Who are we, or anyone else, to say that the citizens of this rich suburb wasted their money by buying a truly first-class school?

On what should they have spent their money? Has anyone criticized them for buying new cars, new clothes, and new TV sets? Since when is a school less important than incidental, personal luxuries? It seems to me there is a serious question of human values at issue here.

Money can be saved on schools. Of course it can. But it is rare when very much of it can be saved on the jobsite. The real savings to the community accrue through long-range planning of school buildings. A 10-year advance program is not unrealistic. Community studies on population trends, projected location of industry, residential building plans and zoning development can be made at great future savings to the community. Planning targets can be adjusted from year to year. Architects are given time to make thoughtful design studies. Contractors may bid more accurately. Jobs are not dumped together on saturated building markets which deprive the school board of bidding competition. School boards are not stampeded into rash decisions and cut-rate schemes. Communities are not persuaded to accept temporary "package" buildings, fabricated without professional advice and without the needs of the individual site and educational program in mind.

It may seem a new thought to some, but the fact is that it would be hard to find two municipal school systems in our entire nation which teach the same thing in exactly the same way. This is basic to American education. As the architect and contractor know, seemingly minor changes in teaching methods and material can make substantial differences in the school building. Take a science classroom, for example. Will the students be taught mainly at their desks or while standing at the chalkboards? The answer to just this one question will affect the amount of wall space needed, the size of the wall boards, the amount of

Excerpts from an address delivered by the national AIA president before the 39th annual convention of the AGC in Dallas.

storage required, the type and size of seating equipment, and the intensity and location of lighting.

When you add to these questions of curriculum and method the peculiar needs of the local soil, the climate, the degree of natural light available and the availability of materials and labor, you begin to realize why educational facilities cannot be mass-produced on a stock basis.

Besides long-range planning and design tailored to specific community needs, permanence of building is essential to economy. Consider the cost of replacing temporary buildings—not just the construction but the financing. The difference between a 2 and 3% interest rate can be 21% of the cost of the entire building. Today's school should be built of first-class materials and it should be built to last for 40 years. This is not incompatible with flexibility. The good school is situated on enough ground to allow for expansion. It is designed so that additional units can easily be added without tearing down existing walls and laying new utility lines. It is designed, as we like to say, for ultimate use.

I hope I have not given the impression that we know all there is to know about designing for education. One considerable area of uncertainty concerns the psyhcological effects of architecture upon man. There is considerable hope that we will shortly begin to find out many new things about this subject. The National Science Foundation has granted a sum of money for us to hold a conference, which will include psychologists and sociologists, to define needed areas of basic research in architecture. These definitions have not yet been made but I believe it can be predicted fairly that some of them will have to do with finding the answers to questions about human scale and the psychological effects of color.

We know, for example, that lower ceilings cut down the cubic footage of a room and, all things being equal, help reduce the building cost of the unit. However, what effect does this have on the students in a schoolroom? We really do not know. This may seem a rather obscure question. But it is not when you consider that the design of one building can give the occupant a sense of freedom and space while another, containing the same square footage, seems to cramp and constrict. We know this much by observation. We also know that we must find out the why to these questions before we can do as much as we should to design a building which materially encourages the learning process.

Let us examine another part of the educational problem. There is an avalanche of effort today to provide more and better scientists through public education. As architects, the people who plan human environment and whose work must be tailored to the function of the structure in question, we are greatly interested in this subject. Frankly, I had intended to come before you today with recommendations of a specific nature on what we should try to do about improvement of public education. However, the things which we do not know and cannot find out are so vital to a clear understanding of our educational condition that a clear-cut recommendation is ill-advised.

The United States Department of Health, Education and Welfare has proposed a far-ranging scholarship award program to worthy high school students throughout the nation. When we heard this, we immediately thought of the logical connection between the awarding of scholarships—mostly for science students—and the need for physical facilities in the schools. It doesn't make much sense to have one without the other. We've been told by Secretary Folsom that we're in trouble because only one out of three high school students get a year of chemistry, and only one out of four take physics. It seemed to me that someone should speak out about the obvious need for new and better classroom facilities for science. It did, until my staff looked into the subject a little further. The available facts were, to say the least, confusing.

According to the Department of Health, Education and Welfare, 92% of the senior high schools in the country were offering chemistry and physics in 1956. But, at the same time, only 36% of the senior high school students were taking chemistry and only 26% were taking physics. The figures seem to show clearly that the facilities are there, the courses are available, but the students just aren't taking them.

There is another disturbing factor here. The figures themselves don't tell us what kind of facilities our schools have; what sort of programs are being offered. Are they good programs? We couldn't find out. Several educational organizations have told us within the past few days that they're just now planning to find out. The National Science Teachers Association tells us that we don't even know how many science classrooms in the country have gas, electrical outlets, and running water. In this proud nation of pushbuttons, new car styles, color television and the chemise, this is lamentable ignorance.

There is another element which is much harder to measure. This is the imagination and interest of the teacher. The best laboratory in the country won't produce a good science program if the teacher is inadequate. However, it can be argued that an imaginative teacher can conduct a good science program without elaborate classroom facilities. Physics can be taught with a book, a buzzer, a dry cell and a few brain cells. A running stream near a schoolhouse can be used for water-flow experiments and chemical analysis. Another question we must ask concerns the number of science students we want. Is it a bad thing that one out of three high school pupils takes chemistry? Isn't that enough? Will mass scholarships and more facilities produce Einsteins? Would more music schools produce Beethovens? You can encourage geniuses but can you mass produce them? It is relatively easy to raise many serious questions concerning all of the crash programs which have been outlined to us.

Obviously, we need a thorough understanding of our assets and needs before we can draw enough solid conclusions to put us on the proper path. This is of more than passing interest to architects and contractors, because the improvement of teaching methods and curricula will inevitably lead to improvement in the physical facilities of schools. One leads irresistably to another.

From what we now know, I offer several personal observations. They are not original or new yet I think they are valid. We do know that we need more school buildings so that classes do not become too large for effective teaching. We do know that we should pay our teachers more, much more, in order to get and hold the best possible people for the important job of teaching.

I believe we also face a fundamental problem of reassessing our thinking about education. We cannot turn back the clock and say that everything will be much better if we just reconcentrate on the three R's. There are no longer sharply divergent schools of progressive and conservative education. Experimentation is always necessary to progress. In many American cities today, school boards are experimenting with teaching by means of closed circuit TV systems. This can hardly be called a frill or a waste of money.

I do think, however, that we need to place a good deal more emphasis on scholastic excellence, on competition among students within the school-

In this proud nation of pushbuttons, new car styles, color television and the chemise, this is lamentable ignorance.

There is another element which is much harder to measure. This is the imagination and interest of the teacher. The best laboratory in the country won't produce a good science program if the teacher is inadequate. However, it can be argued that an imaginative teacher can conduct a good science program without elaborate classroom facilities. Physics can be taught with a book, a buzzer, a dry cell and a few brain cells. A running stream near a schoolhouse can be used for water-flow experiments and chemical analysis. Another question we must ask concerns the number of science students we want. Is it a bad thing that one out of three high school pupils takes chemistry? Isn't that enough? Will mass scholarships and more facilities produce Einsteins? Would more music schools produce Beethovens? You can encourage geniuses but can you mass produce them? It is relatively easy to raise many serious questions concerning all of the crash programs which have been outlined to us.

Obviously, we need a thorough understanding of our assets and needs before we can draw enough solid conclusions to put us on the proper path. This is of more than passing interest to architects and contractors, because the improvement of teaching methods and curricula will inevitably lead to improvement in the physical facilities of schools. One leads irresistably to another.

From what we now know, I offer several personal observations. They are not original or new yet I think they are valid. We do know that we need more school buildings so that classes do not become too large for effective teaching. We do know that we should pay our teachers more, much more, in order to get and hold the best possible people for the important job of teaching.

I believe we also face a fundamental problem of reassessing our thinking about education. We cannot turn back the clock and say that everything will be much better if we just reconcentrate on the three R's. There are no longer sharply divergent schools of progressive and conservative education. Experimentation is always necessary to progress. In many American cities today, school boards are experimenting with teaching by means of closed circuit TV systems. This can hardly be called a frill or a waste of money.

I do think, however, that we need to place a good deal more emphasis on scholastic excellence, on competition among students within the school-

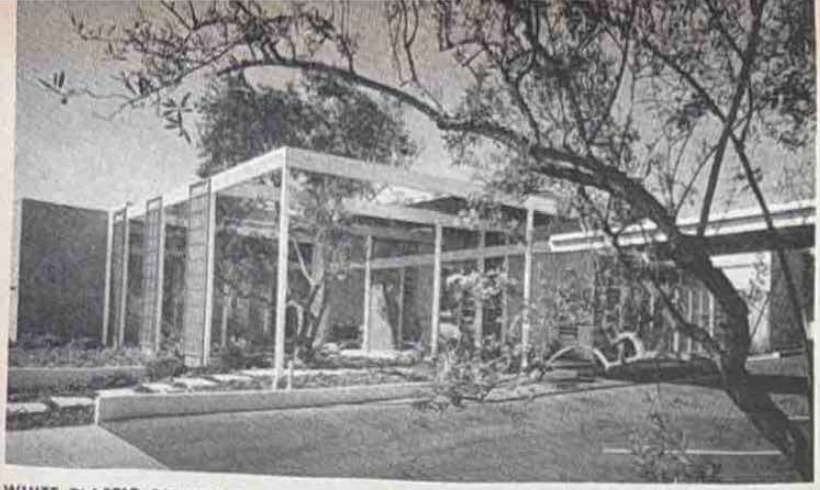
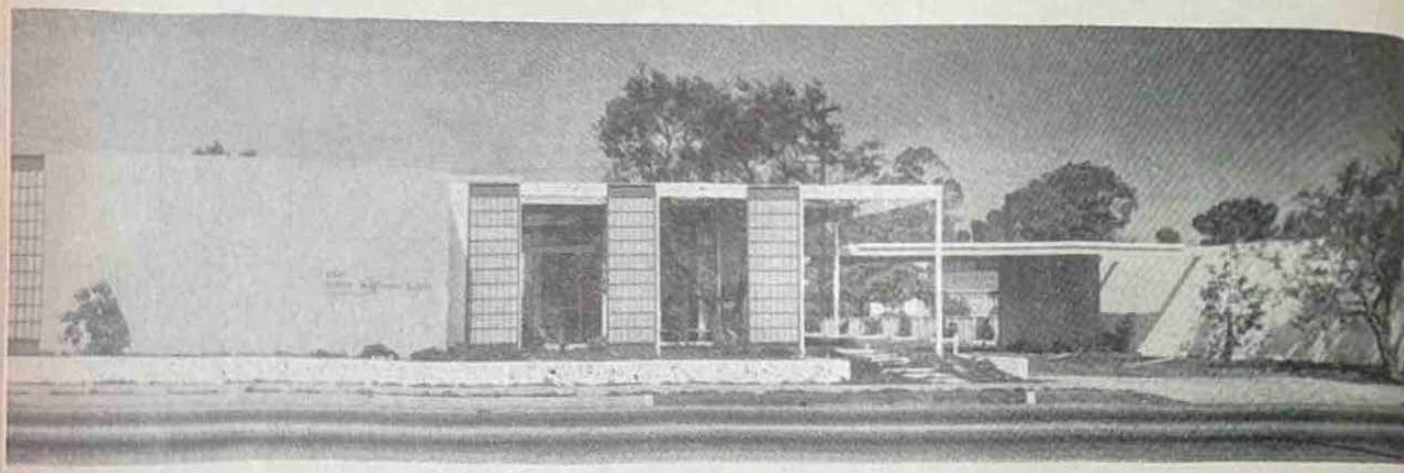
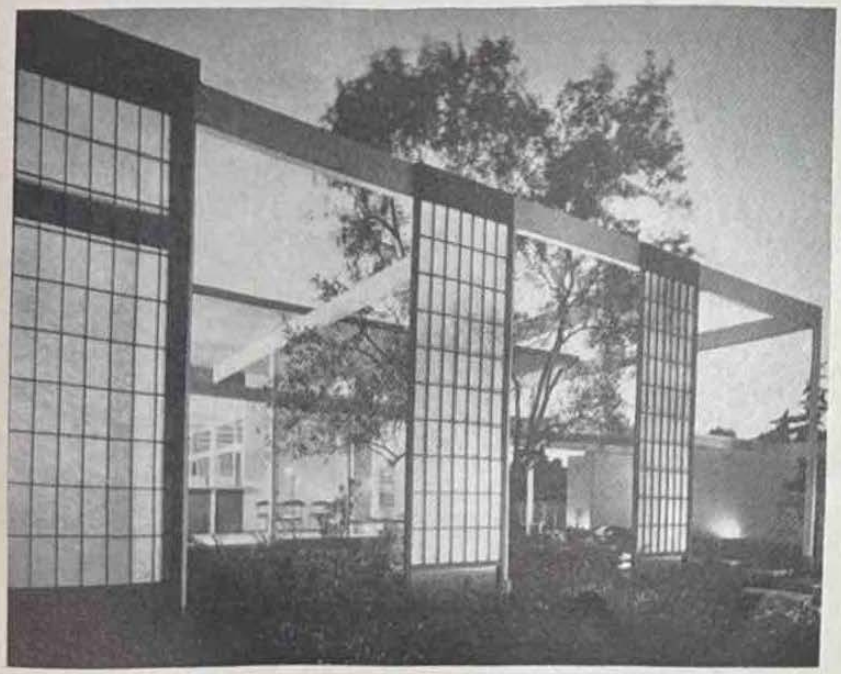
WALLACE WILSON, General Contractor



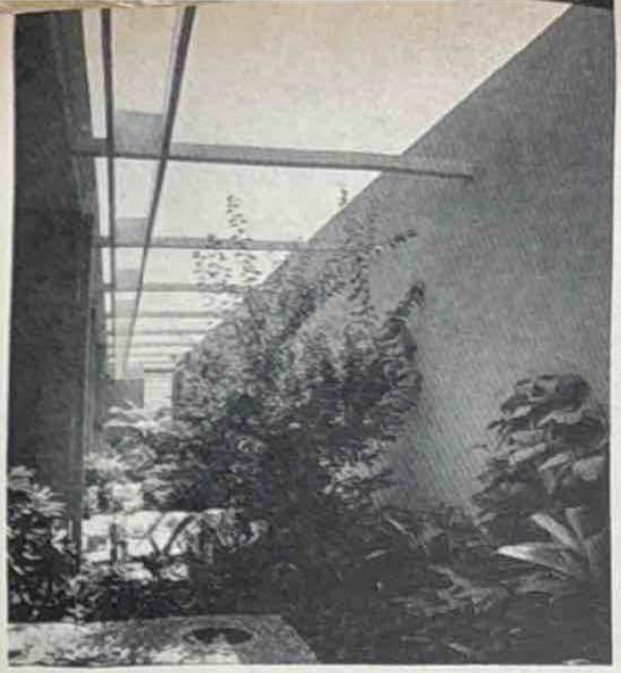
WHITE PLASTIC SCREENS framed with cool brown Douglas fir provide partial shelter for reception room. Building identification is in bronze letters on sand colored, painted concrete block wall. Pale blue also is used for exterior accent.

SITE of the building occupied by a long-established conservative law firm is a 100x130-ft. business lot on a noisy major boulevard. White concrete stepping stones lead through a garden to a reception room with glass walls which are partially sheltered by tall decorative screens at the front of the structure. Six offices for the attorneys extend along the south and west overlooking a 12-ft. wide quiet terrace. Projecting walls separate the offices, each having access to the garden through sliding glass doors. The secretarial pool is developed with individual cubicles to give each employee privacy when seated and a view into another sheltered area. Coffee and lunch room, as well as a lounge, take advantage of this same garden view. The library too has an intimate court which it shares with the rear entrance.



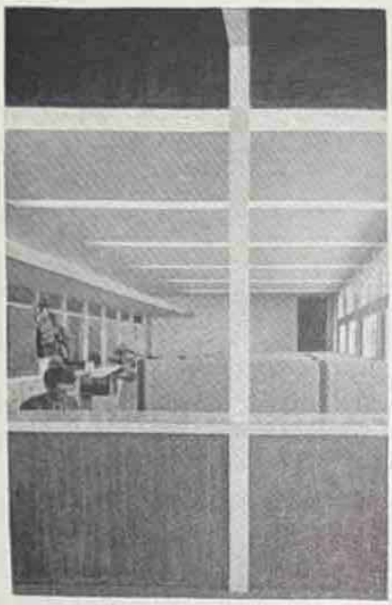


In selecting the project as one of the finest five in a competition sponsored by the Southern California Chapter, AIA, the jury commented: "The small lot is almost completely enclosed; and as a consistent theme, every interior space has its own individually designed court outlook. . . . The quality and dignity of the structure upgrades the whole neighborhood. Every detail has obviously been designed with loving care, yet with great maturity and restraint."



OUTLINE SPECIFICATIONS

Structure: concrete slab floor.
Exterior Walls: plaster; concrete block.
Roof Surfacing: composition with white porcelain granules.
Windows: steel casement.
Doors: sliding glass—Arcadia Metal Products.
Floor Surfacing: vinyl tile—Robbins Floor Products, Inc.; carpeting.
Interior Walls and Partitions: fir studs, plaster.
Ceilings: acoustical tile.
Insulation: rock wool.
Lighting: recessed flourescent.
Heating: built-up air conditioning unit with flexibility for zoning.
Total Area: 4,558 sq. ft.
Date of Completion: January 1957.



COURTYARD AREA (above) as viewed from private office (below). Sun shade is offered by overhead louvers. Secretarial pool is located behind reception desk, which features white plastic covered counter with black walnut facing. Interiors were done by Stan Young of Frank Brothers.

Shoppers Paradise

Experiment in downtown revitalization, headed by an architectural firm in Springfield, Oregon

CONCLUSIONS

TRAFFIC BY-PASS	By-passing of through vehicular traffic around a shopping area is essential—a principal which the shopper accepts but the merchant resists.
PARKING FACILITIES	Shoppers appreciate the conveniences of easily used parking spaces within reasonable walking distance of the shopping area, though merchants object to the idea of eliminating parking at their front doors.
WALKER FREEDOM	Flexibility of shopper movement is provided by a mall organization of shopping areas, but the mall's physical limits are determined by how far shoppers will walk.
SHOPPING ENVIRONMENT	By utilization of a few simple devices, the shopping atmosphere of a downtown area may be made more pleasant and interesting and the buying habits of its patrons completely changed.

SHOPPERS AND MERCHANTS who participated in Springfield's 10-day experiment in planning last August expressed varying opinions on its success, which the project promoters have summarized in a 34-page evaluation.*

Springfield, with a population of 13,500, is just across the Willamette River from Eugene (40,000). Each day more than 10,000 cars and trucks move through the heart of the city on Main Street—State Highway 126. During Shoppers Paradise the highway was by-passed one block to the north of the business area, separating the through and local traffic. Thus Main Street became a pedestrian mall. Parking lost in this area was compensated for by the use of ends of Main Street adjacent to the mall as diagonal lots, in addition to three other adjoining streets.

To help further the experiment, trees and benches were provided, relaxing music replaced traffic noise, art and industrial exhibits were displayed and stores remained open until 9 p.m., with a short entertainment feature presented on each evening.

How did all of this come about? Late in 1956 the Chamber of Commerce and the City Planning Commission recognized symptons of physical deterioration in downtown Springfield —some empty store buildings, lack of maintenance and upkeep of many others, far less retail volume then other Oregon communities of comparable population—and initiated a study to reevaluate its functions. Both the original studies and detail work on the experiment were done by architects-planners Lutes & Amundson (Donald H. Lutes, AIA, is City Planning Commission chairman); consultants were landscape architect Wallace M. Ruff and painter Andrew Vincent; cooperating agencies were the City of Springfield and the Oregon State Highway Commission.

Backed by a fanfare of publicity, the experiment got underway August 15 with these four objectives:

- Relieve traffic congestion by rerouting through traffic.
- Provide easier to use and reasonably convenient parking facilities.
- Permit the shopper to accomplish an entire shopping trip as a pedestrian, without conflict with auto and truck traffic.
- Provide the shopper with facilities not normally found in downtown shopping areas, such as the benches, landscaping, etc.

Upon completion of the 10-day period, the publicity committee polled shoppers with postcards and merchants with questionnaires to determine reactions in four categories, conclusions about which are found at the top of this page. In each case results were tabulated under two headings, those who thought the experiment was a success and those who did not. Reactions from merchants off the mall were included.

While the survey in most instances showed mixed emotions, there seemed to be complete agreement that truck traffic is detrimental to Springfield's downtown area. For so short a period, the changed traffic pattern was confusing to some people and appeared to affect some businesses, but the usual peak hour congestion was eliminated.

The evaluation says that an existing downtown area such as Springfield's must correct two basic problems in order to compete favorably with the integrated shopping center:

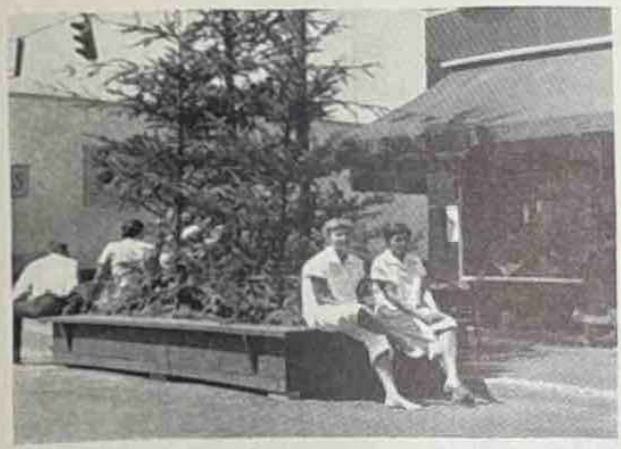
1. It must change its antiquated physical plan, such as was done during Shoppers Paradise. The basic objectives of the plan tested were proved valid; many of these objectives have already been proven in shopping centers and this experiment was only an application of them to an existing downtown area.

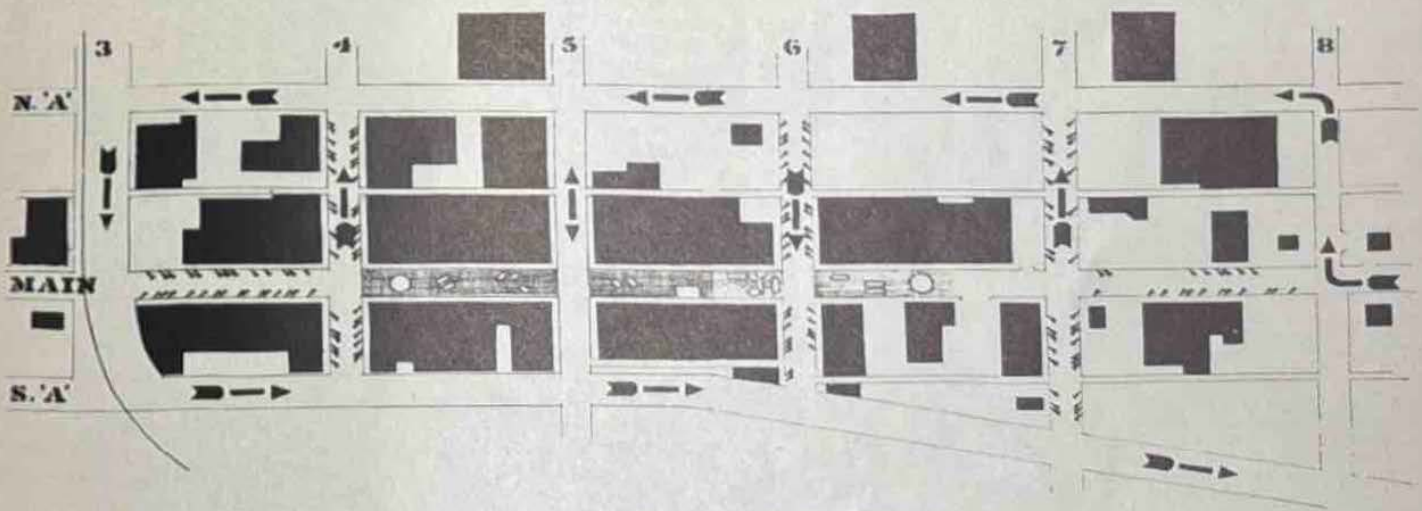
2. Even more difficult to accomplish is a change in downtown attitude. During Shoppers Paradise the downtown merchants worked together as never before, but even this cooperation was limited. A new spirit of understanding by the merchants of Springfield is a prerequisite to their progress in the directions of downtown revitalization suggested by this analysis.

* The evaluation is available in quantity for $1 per copy by writing to Box 155, Springfield, Ore. Thus far requests have come from cities in 33 states, Hawaii and Canada.

A 24-minute sound movie of the event also is available at a rental fee of $5 plus postage and will start on a second tour August 15. The film tentatively has been scheduled for showing in the following California cities during the latter half of March and the first half of April: San Diego, Long Beach, Los Angeles, Whittier, Oakland, Berkeley and Modesto. It has been seen by more than 1,000 viewers in 14 cities of western Oregon and Washington.

SHOPPING ENVIRONMENT during experiment takes on carnival atmosphere, with sidewalk dining, music, exhibts and nightly entertainment. Some reactions: "More incentive to linger and spend money." "Who wants to go to a fair every time he shops?" "It's the music—I haven't had a single angry customer all week."





MAP OF DOWNTOWN SPRINGFELD shows how Main Street traffic was rerouted one block to north, allowing use of area as pedestrian mall. Diagonal lines indicate streets used for parking.

WIRE SCULPTURE designed by architect William C. James, executed by Louis Lovejoy. Chas. R. Pearson

City hall in the Inland Empire

MILLWOOD (WASH.) CITY HALL: Built for $40,000 or $10 per square foot, this pleasant civic structure just out of Spokane serves a number of community functions. A split-level entry provides easy access to the council chamber, reading room, offices and small kitchen on the main floor, while allowing a fire truck to use a level approach to the lower side of the building. Council chamber and reading room are designed so that they can be opened up for larger meetings.

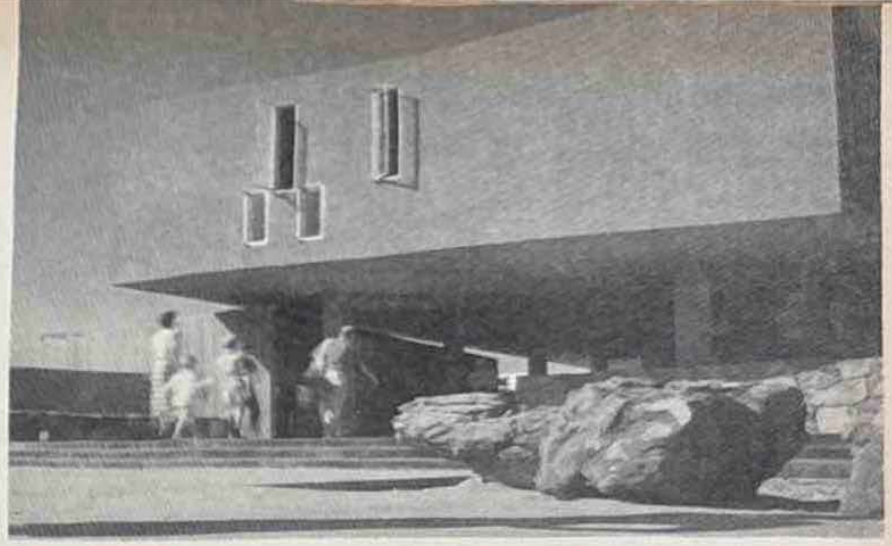
Exterior is of red rustic roman brick and 2-in. grooved plywood; roof is 2x12-in. joists 16 in. o.c., with diagonal sheathing. Main floor has Philippine mahogany plywood paneling and doors, fissured fiber acoustical ceilings and vinyl asbestos tile on thin concrete slab which carries radiant heat coils; lower level has plasterboard walls and ceilings and fir or spruce garage doors of the five-section overhead type. Architects: Eddy, Carlson & James; general contractor: Hefte Construction Co.

Showcase in the desert

J. W. ROBINSON STORE, PALM SPRINGS, CALIF.: Most striking feature of the pavilion type retail structure is the serrated "airfoil" roof which is supported independently of the nonload-bearing exterior walls and floats over column supports, acting as an umbrella for the glass enclosed sales area. Elevated light apertures above the main selling floor provide still more daylight and a view of the mountains to the west of the building. An air conditioning system distributes air through an acoustical ceiling material and with the absence of grilles.

In addition to the large sheets of glass on the street frontages, a special tile of marble and quartz aggregate is used on the exterior. A terraced platform accomodates the land grade and direct access to the store is available from a landscaped parking area. Architects: Pereira & Luckman, with James H. Langenheim in charge of design; general contractors: Robinson & Wilson, Inc.

STORE is oriented to desert sun and vistas by use of glass walls, has serrated "airfoil" roof. Julius Shulman



ENTRANCE CORRIDOR is colonnade of semioval pillars set at oblique angle; above are nine hotel rooms overlooking pool area. Radiant heated pool is surrounded by irregularly shaped patio with grill snack bar at one end.

Glass walls to enjoy the view

MISSION VALLEY COUNTRY CLUB, SAN DIEGO: This club which caters to the middle income bracket has golfing (27 holes and pitch-and-putt) as its primary purpose, but also offers swimming, dining and dancing for a potential 1,000 members. It was planned for a confined site on a major highway, with a driving range on adjacent leased ground.

Of exposed steel frame construction, the main building has extensive areas of glass which provide a view of the greens and clubhouse from almost any point. Principal facilities: main dining room with dance floor, open grill which can be closed off and wall-suspended fireplace; grill room for more informal dining next to the pro shop; garden room overlooking the driving range; and lounge with fireplace and view of the course. Architect: William F. Cody; general contractor, Carl Muehler.

Glass walls to entice customers

AMERICAN AIRLINES TICKET OFFICE, SAN FRANCISCO: In planning an office in Union Square, downtown airline ticket center, the architect was faced with three major problems: 1) space had to be provided within the existing conservative St. Francis Hotel; 2) geographically, the area offered intense competition from other airlines; 3) space available was small, complicated by columns limited in height by a mezzanine floor above, belonging to another tenant. As a further challenge, the floor level was below the sidewalk except at the extreme southeast corner, the least desirable location for the entrance; and the only long wall available had a north orientation, making it a potential "mirror" for a competing airline.

It was decided to provide a corner entrance and use the higher sidewalk elevation to advantage by allowing customers to approach the ticket office from above, giving them a clear view of the entire counter. Exterior walls were developed in glass to produce an impression of openness, accented by a spandrel made up of black marble and quartz chips in a black matrix. A luminous ceiling combined with wall surfaces and floor coverings light in value to a large extent overcame the mirror problem. Architect: Hewitt C. Wells; general contractor: Swinerton & Walberg Co.

LUMINOUS CEILING provides about 75 foot-candles, eliminates spotty fixture lighting, creates illusion of greater space. Wall paneling and ticket counter are of white ash.

Gardens on one side, lagoon on the other

Speculative House
Allen & Rice, Developers
Belvedere, California

•

GEORGE T. ROCKRISE
Architect

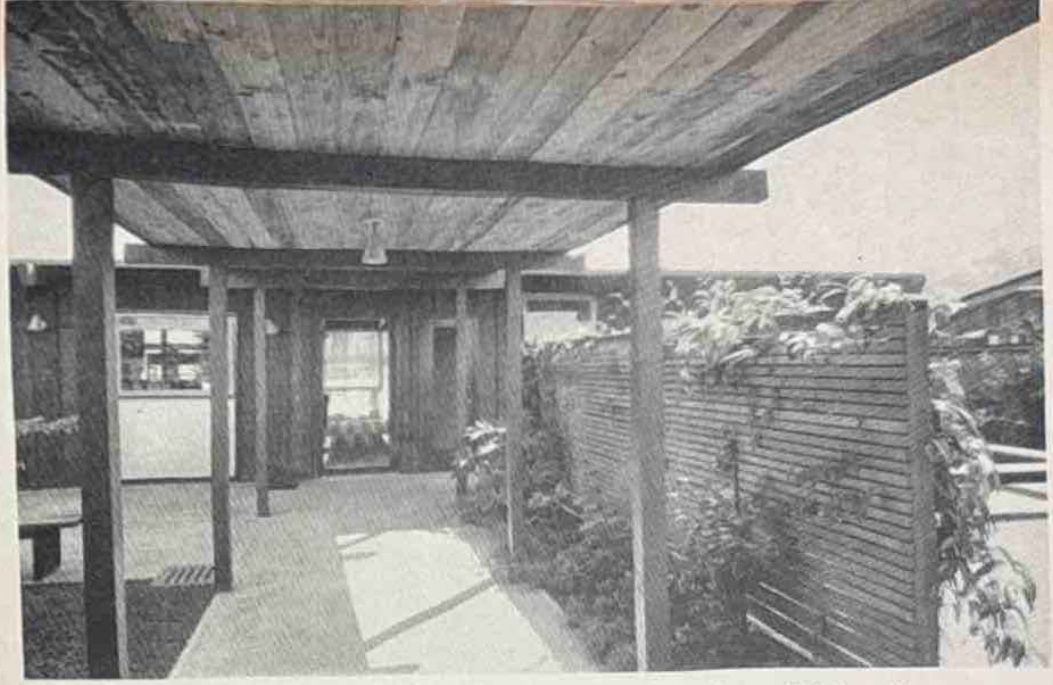
SHARP & ROBINSON
Contractors

THE PROBLEM was to design a three-bedroom, two-bathroom house, with a two-car garage and workshop and to completely develop the waterfront, including beach, wading area, boat facilities, shelter and veranda. The structure itself had to offer utmost privacy, full utilization of the view toward the lagoon and the greatest possible use of land area (65x100-ft. lot), all combined with simple and direct construction; internal planning had to be flexible to create maximum utility and buyer interest.

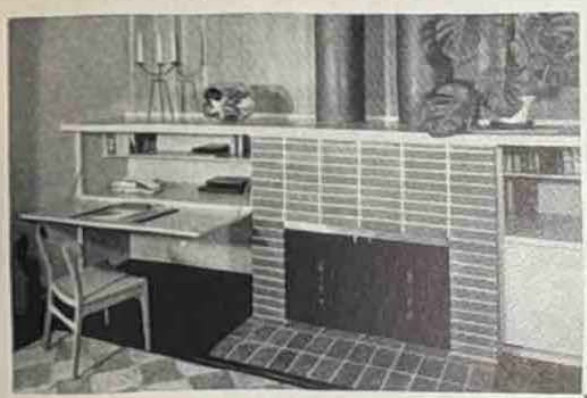
The result is a 1,510-sq. ft. house, a rectangle 28 ft. by 54 ft. 4 in., with a minimum of hallways. The garage is at the front, set back to conserve site space and give light and air around the perimeter of the house, located close to the water's edge to emphasize the marine feeling and to provide sheltered gardens and a play yard on the land side. Living, dining and play areas are planned as one 13½x40-ft. room, partitioned with movable cabinets to permit combinations of use as well as furniture arrangement. The open kitchen, placed in the center of the house, is easily maintained and has a view of both the lagoon and entry garden. An adjacent laundry-work area may be shut off from the play area with the movable cases. The master bedroom is treated as a separate suite with its own private garden.

The house has a board and batten exterior, with 1x4 t&g fir paneling in the living room and entry. Roof beams and floor framing are supported by one central longitudinal wall; ceiling is of exposed beams with 2x6 t&g planking.

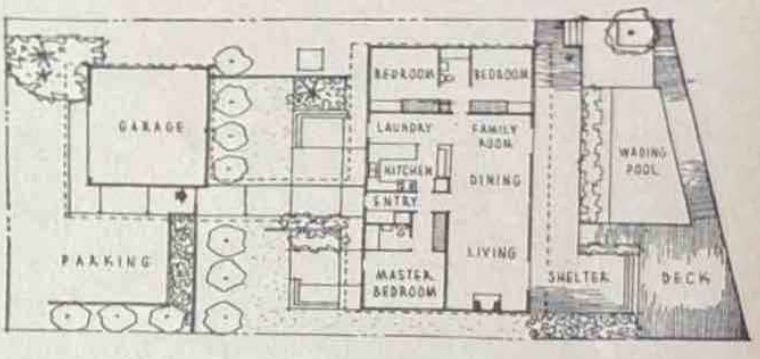
PARTIALLY SHADED DECK encloses wading pool, feasible because lagoon is kept at constant level from spring to fall.



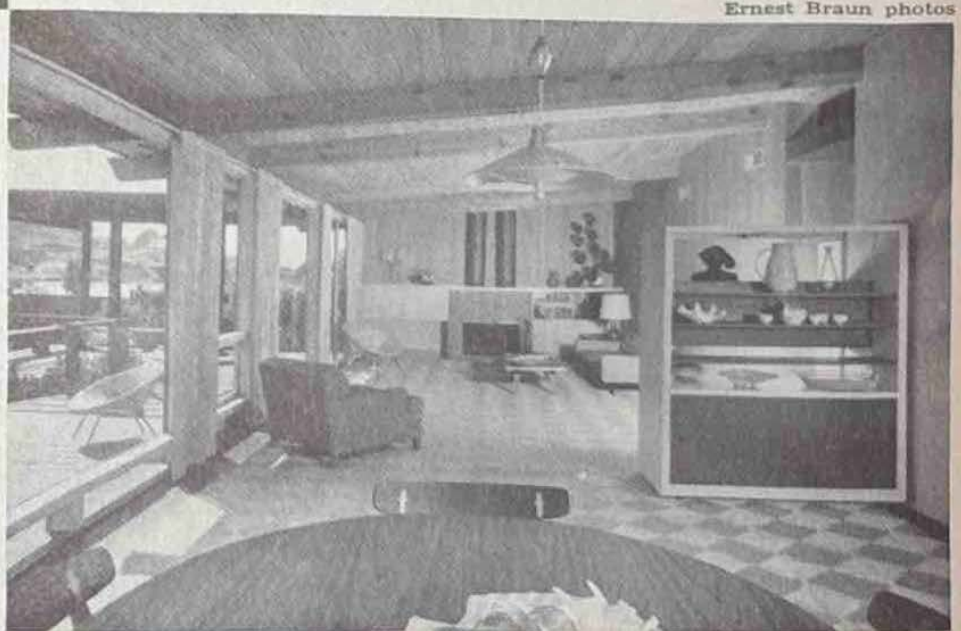
ENTRANCE LOGGIA connects garage to house and bisects garden, which has direct access to kitchen at left and becomes private patio, behind fence, for master bedroom.



LIVING-DINING-PLAY AREA is 40 ft. long, can be converted in various ways by three movable cabinets, on concealed casters, that lock into place. Glass wall on lagoon frontage visually relieves narrow dimensions. Desk, woodbox and shelves at living end are built in.

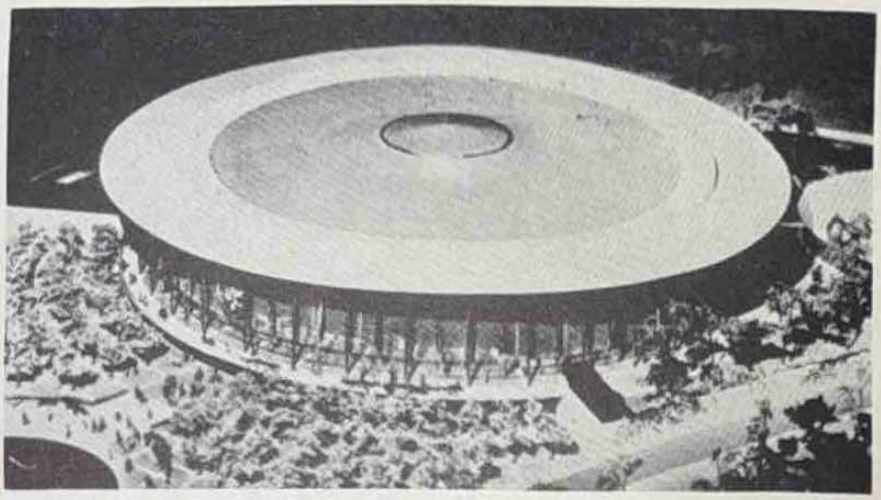


Ernest Braun photos



OUTLINE SPECIFICATIONS

Structure: post and beam 2x6 t&g roof; frame floor.
Exterior Finish: board and batten.
Windows: wood and steel.
Doors: sliding glass—Arcadia Metal Products.
Floor Surfacing: oak.
Partitions: frame.
Interior Finish: 1x4 t&g groove fir paneling; gypsum wallboard (Sheetrock) — United States Gypsum Co.
Ceilings: 2x6 t&g planking between exposed beams.
Insulation: 1-in. rigid in roof.
Heating: hot air, gas fired perimeter type.
Total Area: 1,510 sq. ft.



UNITED STATES PAVILION at Brussels World Fair is topped by plastic roof resembling bicycle wheel 380 ft. in diameter, with outer concrete rim connected to inner metal ring by steel cables.

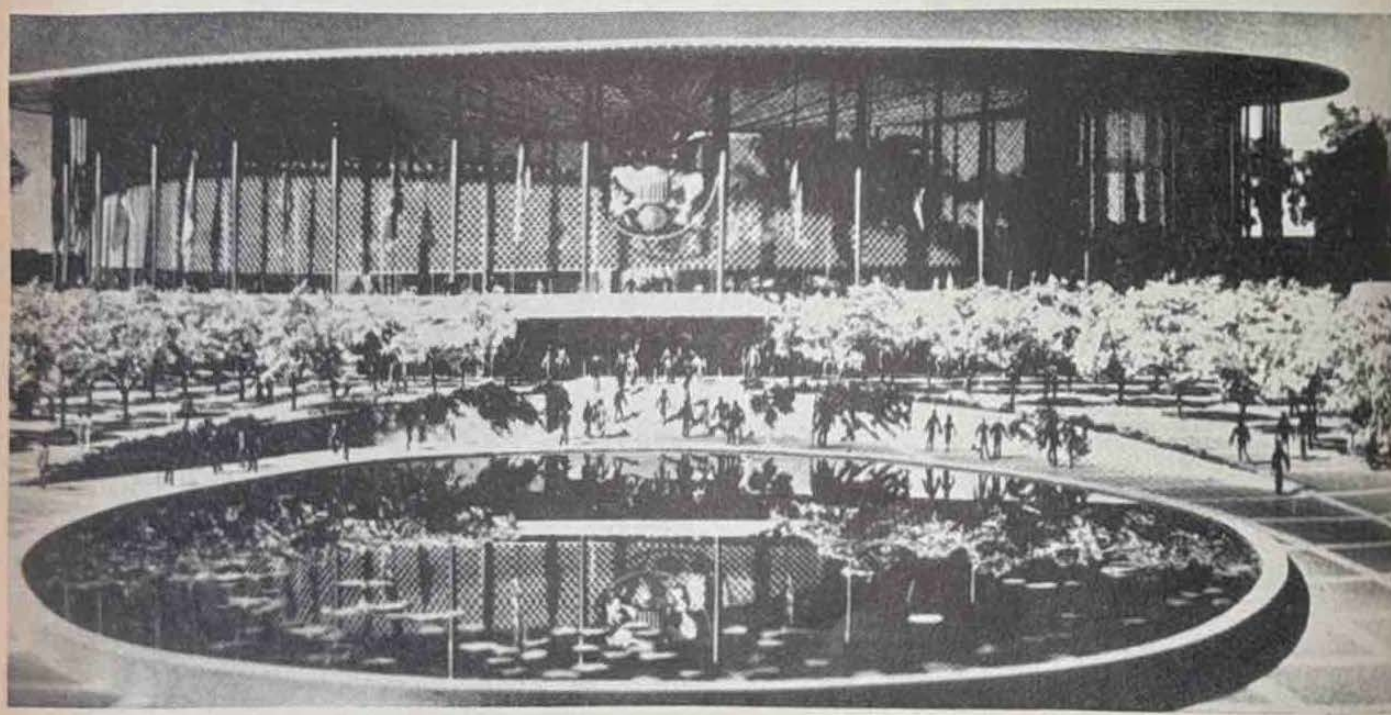
72,000 sq. ft. of plastic roof helps sell America abroad

WORLD'S largest plastic roof, designed like a bicycle wheel and incorporating a number of architectural firsts, encloses the United States Pavilion at the 1958 World's Fair in Brussels and provides extremely flexible exhibition space in an area equal to two football fields.

A modern version of the Roman Colosseum and costing an estimated $5 million, the classically styled circular pavilion is 341 ft. in diameter and 85 ft. high. It is the work of New York architect Edward D. Stone who was commissioned to design the project by the State Department at the suggestion of the American Institute of Architects.

The overhanging roof has an outer rim of reinforced concrete connected to an inner metal ring by two layers of high tension steel cables 2¼ in. thick. The cables, corresponding to the spokes of a wheel, are tightened by turnbuckles. They are then held under tension by the weight of the 66-ft. diameter inner ring which frames a dramatic open air dome.

The cables are topped by a tranlucent plastic roof made up of 2,100



structural panels recently developed by Kalwall Corp. of Manchester, N. H. These panels form a doughnut shaped band 128 ft. around the center ring. Circling the plastic roof is the 54-ft. wide concrete rim which rests upon two concentric rows of gold colored steel columns.

To attach the panels to the cables, the manufacturers devised a special joining system (see sketch) that may well be a prototype of similar roof systems in the future.

Steel purlins were designed to straddle the cables at 10-ft. intervals, the length of the panels. Placed on the purlins, the panels are joined by slender T-shaped aluminum extrusions, one on each side, supplied by Dixie Corp. of Rome, Ga. They are secured to each other by means of interior bolts. These bolts also connect beneath to steel clips which in turn are bolted to the purlins. A mastic seal makes all connections watertight. The system allows for wind movement, expansion and contraction.

Effect of the translucent roof, says James Ellet, Kalwall's general manager, is to invest the structure with a classical simplicity and an unusual feeling of lightness.

Metal mesh ceiling

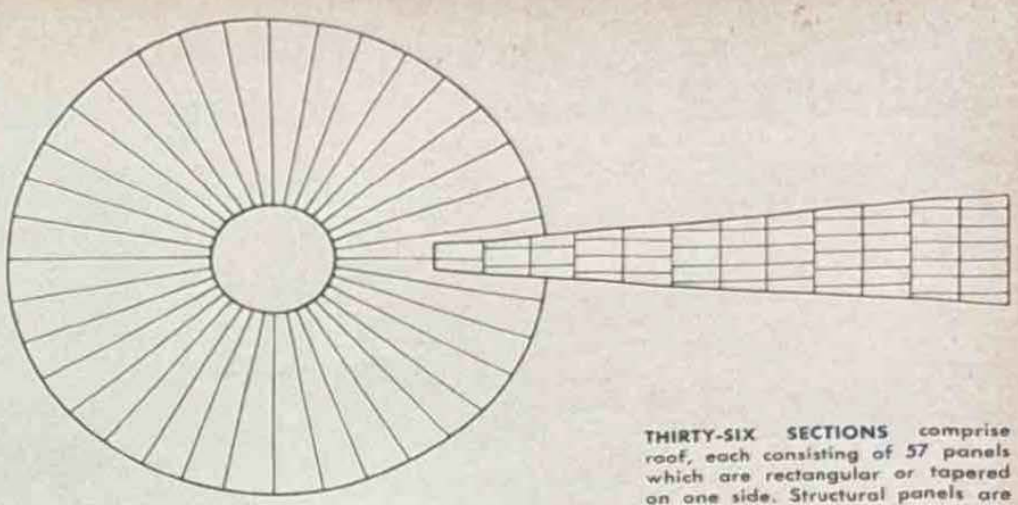
Another feature of the pavilion is its ceiling of metal mesh suspended below the cables of the roof. Diffused light from the plastic panels, supplemented by artificial light from above the mesh, will play on the ceiling, giving it a continuous shimmering effect. White textured paint will be used on the ceiling and gray on wall areas, both produced by Plextone Corporation of America.

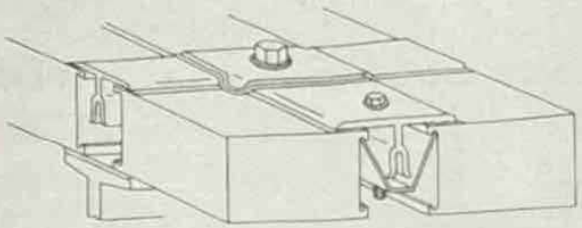
Illumination also will be provided by a circular curtain wall of clear plastic attached to a self-supporting gold colored metal grill.

Adjacent to the pavilion is a theater seating about 1,100 persons. There, Howard S. Cullman, U.S. commissioner general to the fair, will present an extensive program of typically American drama, music, films and other performing arts. Both pavilion and theater are set in a 6½-acre site between the exhibits of the Vatican and the Soviet Union.

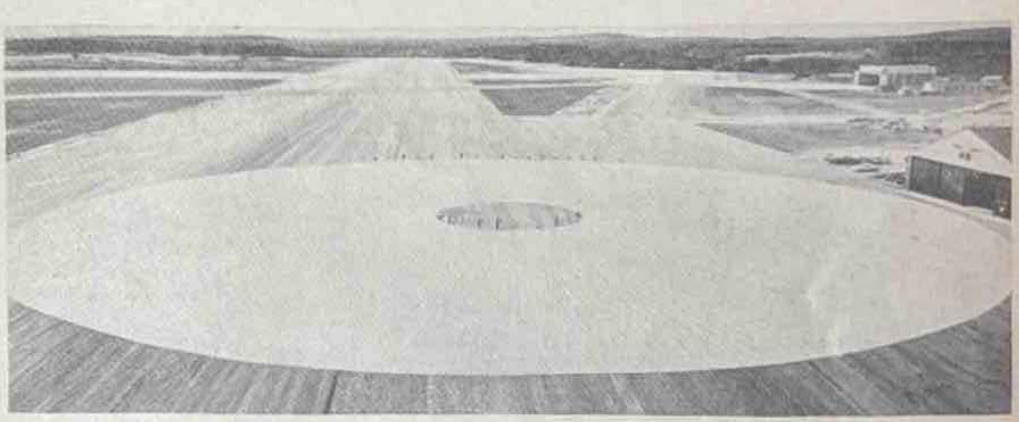
Mid-April opening

The Brussels fair will be the most important international exposition since the New York World's Fair in 1939. Its theme: "New techniques in the service of man for a more human world." Some 50 countries and a number of international organizations will participate in the fair which is scheduled to open mid-April and run until October. Over 35 million visitors are expected to attend.





THIRTY-SIX SECTIONS comprise roof, each consisting of 57 panels which are rectangular or tapered on one side. Structural panels are joined to each other by slender T-shaped aluminum extrusions. Small bolt (right) secures panels to each other and makes mastic seal watertight. Large bolt (center) connects steel clip which in turn is bolted to purlin.



PANELS laid out on Grenier Airfield, Manchester, N. H., give general idea of roof's shape.

General features of Kalwall plastic panel

The Kalwall panel is a self-supporting sandwich of reinforced polyester fiberglass sheets bonded to aluminum I-beam grids, one-seventh the weight of an equivalent metal section. It is completely finished for both interior and exterior wall and roof surfaces, having been tested in institutional, commercial and industrial buildings over the past five years.

The panel reportedly provides nonglare natural illumination, resists weathering and eliminates condensation problems. It is available in four modular sizes: 4x8, 4x10, 4x12 and 4x 20 ft.; in two thicknesses: 1⅞ and 2¾ in.; in six colors: white, crystal, green, blue, rose and yellow.

One man can handle a panel on the job because it weighs only 1.42 to 1.6 lb. per square foot (depending on thickness). The 4x8-ft. panel, for example, weighs 51 lb.

The grid in the panel acts not only as a load-bearing component, but produces solid metal edge banding that accommodates door and window assemblies. The banding can be worked into a flush internal joint system, providing for expansion and contraction and simplifying erection.

The plastic facing has an average tensile strength of 10,000 to 12,000 psi. Bonding used to laminate the face to the aluminum core is a resin type adhesive, designed for external use.

JET AGE HANGAR, shown in architect's model above, will utilize largest welded plate girders ever produced in this country. Each is 365 ft. long and weighs 125 tons. Three-story concrete core will house offices, shops and storerooms.

Largest plate girder beams for San Francisco hangar

HANGAR in which United States Air Lines will handle turn-around maintenance of the fleet of jet transports it will begin using next year at San Francisco's International Airport was designed by architects Skidmore, Owings, & Merrill to eliminate supporting columns in the work area. The 310x363-ft. double-cantilevered structure is now being built by Dinwiddie Construction Co.

A central three-story core of reinforced concrete with dividing masonry walls carries the structural steel frame. Seven 365-ft. beams, each weighing 125 tons, will support the roof.

"These beams," declares W. E. Ottenstein, United's resident engineer on the project, "are the largest plate girder beams ever used anywhere in the construction of a building." They were fabricated and erected by Pacific Iron and Steel Corp. of Los Angeles.

The plate girders cantilever 142 ft. beyond each side of the 81-ft. wide core. They are spaced 51½ ft. o.c. and support a series of inclined trusses which not only support roof purlins but provide lateral bracing for the girders and roof structure as well.

The hangar will have 154,000 sq. ft. of floor space and will be capable of housing four DC-8 jet planes and two DC-7 propeller driven models at the same time, when positioned on each side of and facing toward the central core.

Mechanical heating and ventilation systems and electrical substations will be located in this core. Air, gas and electric power will be provided in each plane position and the core also will house shops, offices, classrooms and storerooms.

Largest pour of concrete in Seattle history: 1,465 cu. yd. in one day

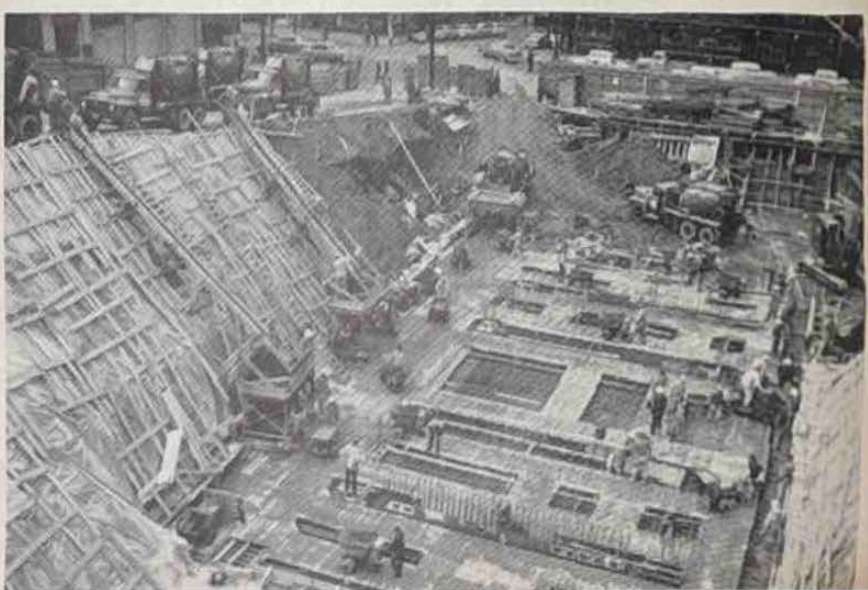
SIDEWALK superintendents in downtown Seattle were treated to a field day last month when they saw a 7-ft. slab placed under the future central core of the 21-story Norton Building in a single shift. Using a fleet of readymix trucks for the hauling chore and 15 gas buggies at the jobsite, contractor Howard S. Wright placed 1,465 cu. yd. of concrete.

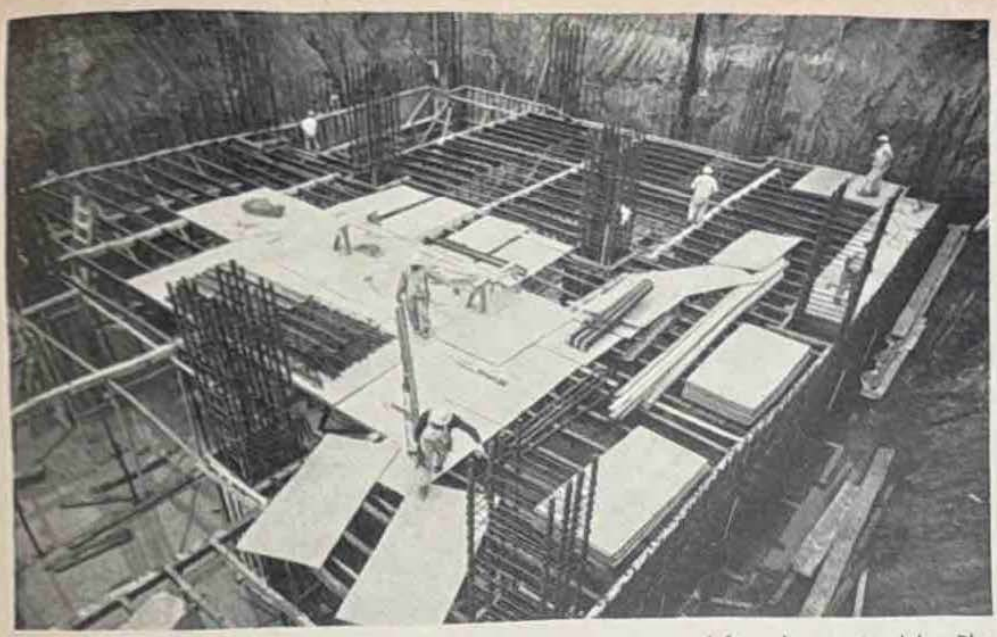
Starting at 8 a.m., Pioneer Sand and Gravel Co. sent a fleet of trucks shuttling back and forth between the jobsite at Second and Columbia streets and Pioneer's two plants at Lake Union and the West Duwamish waterway. The trucks unloaded, four at a time, into hoppers that were placed around two sides of the site. The gas buggies took it from there, establishing patterns over the plank working deck. Mud was then compacted by six vibrators, working in pairs off three gas operated generators.

In the first two hours the contractor placed 225 cu. yd. per hour, with the operation tailing off slightly as it neared the end.

The Norton Building, estimated to cost $12 million, was designed by Bindon & Wright and consultants Skidmore, Owings & Merrill. (For sketch see July 1957 PA&B.)

LARGEST POUR OF CONCRETE ever made in Seattle, nearly 1,500 cu. yd. in one working day, would be equivalent of 2½ football fields at patio depth.





AT KAISER CENTER in Oakland horizontal Spanall beams support reinforced concrete slabs. Plywood sheets already have been laid on top of shoring for about one-third of area. In foreground, two workmen carry section by hand, just before member will be placed in position.

Horizontal shoring cuts costs, speeds progress

A NEW SYSTEM of horizontal shoring to support reinforced concrete slabs is being used increasingly on West Coast jobs to save substantial amounts of construction cost and time. Known as Spanall, the method is basically a system of adjustable telescopic girders that slide inside each other in a manner comparable to a king sized slide rule.

Members come in several different sizes and can be fastened end to end and adjusted to any span desired up to 34 ft. Each member is secured in position with a single bolt and has a built-in camber. A drop-forged protruding lip at each end fits securely on standard bearing surfaces of at least 2 4/5 in. in width. When the concrete slab has set, the supporting members can be removed and used elsewhere on the job. They can be moved easily by hand; no special equipment is required.

Major advantage of using this system is that it eliminates the conventional forest of vertical steel or timber supports. By keeping areas clear, subtrades craftsmen can work with increased speed and efficiency. The shoring is also said to be especially useful where sloping or irregular ground is involved since it eliminates the problem of varying-length supports.

Some of the most notable applications of Spanall have been in California. They include, in addition to the Kaiser Center shown here, the Stanford Medical Center, the Stanford Research Institute and the Carquinez Straits Bridge.

The system is leased by Spanall of the Pacific, Inc., of Oakland through the offices of W. J. Burke & Co. in all major West Coast cities.

Three research conferences on BRI's 1958 program

The Building Research Institute, following an unusually active year, held its first public conference in 1958 at the University of Houston March 5-6, with a conference devoted to "Plastics in Building Illumination." Other events definetely scheduled are:

1. BRI Seventh Annual Meeting. Latest reports on technical developments in many fields of building and construction science will be presented at the Shoreham Hotel, Washington, D.C., April 21-23.

2. Paints and Protective Coatings. A public research correlation conference on the newest developments in this subject is being planned for Washington, D.C., next fall.

3. Floor Systems Construction. A conference now being arranged for next fall in Washington, D.C., to correlate the latest technology in all flooring materials and construction methods.

Looking back on 1957, biggest activity in scope and venture to be gotten underway was the establishment of the BRI committee on coordinated basic building research, created by BRI president Charles H. Topping.

LITERATURE

low cost school construction

"A Citizen's Handbook on Low Cost School Construction" is not a technical manual on techniques nor sales literature on building products, although all of the projects shown incorporate some masonry materials. The designer should find this 28-page booklet of particular interest because of the sensible approach it presents in planning a school building program "aimed at economy rather than cheapness." The material is divided into three major sections—advance planning, site selection and design, the last one being illustrated with a number of school plants across the country.—Allied Masonry Council.

(Item No. 1)

redwood grades

A handy reference on redwood in full color defines the seven major grades and illustrates each in the available dimensions. Recommended uses for each grade also are included.—Georgia Pacific Corp.

(Item No. 2)

aluminum air ducts

First comprehensive work on aluminum air ducts contains 130 pages and more than 350 illustrations in a ring-bound book, with detailed chapters on engineering, drafting, estimating, fabrication and installation. Residential, commercial and industrial applications are considered. One section describes the work carried on by the University of Louisville Institute of Industrial Research in testing various joint constructions and methods of hanging ducts. Controlled heating and cooling cycles were used to determine the cause and cure for noise control and the book furnishes complete data on the recommended methods of controlling joint noises. Reynolds Metals was assisted by such authorities as E. R. Queer of Queer & McLaughlin, State College, Pa.; Dr. Seichi Konzo, professor of mechanical engineering, University of Illinois; and A. B. Algren, professor of mechanical engineering, University of Minnesota, in preparing the work.—Reynolds Metals Co.

(Item No. 3)

hydronic heating

The I-B-R library of installation and calculation guides has been revised and completed with the release of three new publications, providing information on every aspect of hydronic heating as well as cooling. They are: Guide 500—forced circulation hot water heating systems; Piping Guide 700—residential heating systems; Installation Guide 900—chilled water cooling system design.—Institute of Boiler and Radiator Manufacturers.

(Item No. 4)

concrete masonry

"Partners in Fire Safety" is a four-page non-technical leaflet treating the value of concrete masonry for fire safe construction and for low insurance rates. Eight buildings which use this material are shown.—Concrete Products Association of Washington.

(Item No. 5)

light steel framing

Some ideas for light-occupancy structures are found in Bethlehem Pacific's eight-page booklet. Among the projects illustrated and briefly discussed are a library, restaurant, school auditorium, recreation center, plant offices and several homes, all on the West Coast.—Bethlehem Pacific Coast Steel Corp.

(Item No. 6)

CATALOGS

Trane Climate Changers: 56-page catalog provides detailed descriptions and more than 50 photos and engineering drawings of the all-purpose air conditioners for commercial, institutional and industrial comfort and process applications. Gives data on performance and operation, construction, basic application selection and roughing-in dimensions.—The Trane Co.

(Item No. 7)

Rilco Glued Laminated and Solid Wood Products: 24 pages are packed with technical data, connection details and specifications. Illustrations show how laminated wood arches, beams and trusses may be used in church, school, residential, commercial and industrial lighting construction.—Rilco Laminated Products, Inc.

(Item No. 8)

Plaster and Acoustical Systems: eight-page folder treating principal applications of gypsum plaster fireproofing, portland cement for insulating backup of curtain wall construction, acoustical sound conditioning with machine applied vermiculite plastic and a new method of direct-to-steel fireproofing. Contains specifications, fire test and general technical data.—Zonolite Co.

(Item No. 9)

Troffer Lighting: eight-page brochure highlighting Miniature troffers which are just 5 in. wide and 4 in. deep, come in 24-, 36- and 48-in. lengths with a choice of six frame finishes and five light diffusers. Also covered are 8- and 12-in. wide troffers, 6 in. depth.—Alkco Manufacturing Co.

(Item No. 10)

Sika Concrete and Masonry Compounds: eight-page catalog describes concrete admixtures, exposed concrete aggregate, joints and other Sika products; outlines several typical problems; illustrates a number of applications.—Sika Chemical Corp.

(Item No. 11)

The House of Cedar: four-page folder has illustrations and directions for application of shingle roofs and machine grooved shake walls on new homes as well as remodeling. Colors that are available in prestained machine grooved shakes are shown.—Red Cedar Shingle Bureau.

(Item No. 12)

Sunray Cast Iron Baseboard Heating: six-page full color bulletin is designed for use of architects and builders who need literature for their clients, explaining hydronic perimeter heating from the viewpoint of the housewife. Illustrates the decorative advantages of this type of heating, how it makes possible the use of full-length picture windows and can be painted to match any color scheme.—National-U. S. Radiator Corp.

(Item No. 13)

Corbin Originals for Modern Doors: 16-page, full color catalog introduces new doorknob designs by Russwin and Corbin in woods, enamels and ceramics, in squares, ovals and even a "chalice." Four lines for every type and size of building are featured.—Russell & Erwin. **(Item No. 14)**

Don't Gamble with Fire: eight-page brochure is devoted to Lexsuco roof constructions — Koroseal vapor barrier, non-inflammable adhesive and insulation clip; covers specifications for insulated decks of steel, poured or precast and wood; shows typical installations.—Lexsuco, Inc. **(Item No. 15)**

Lightweight Structurals: eight-page booklet covers design properties on J&L 10- and 12-in. joist sections and data on Junior beams, Junior channels and light beams. May be inserted in the American Institute of Steel Construction Manual. — Jones & Laughlin Steel Corp. **(Item No. 16)**

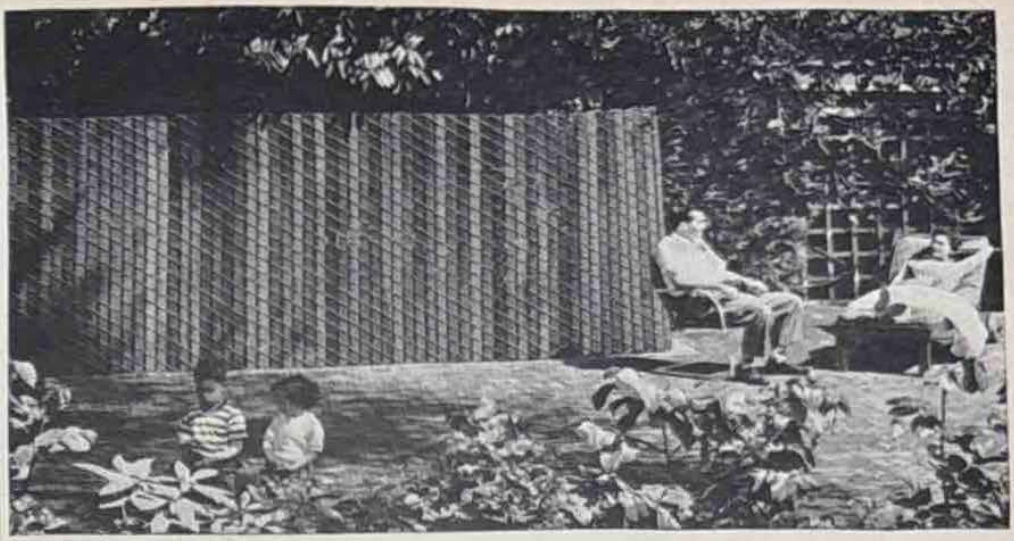
Aetnapak Door-and-Frame Packages: 12-page catalog shows 16 basic door types with the possibility of over 200 type-and-size combinations in swing and sliding hollow metal doors equipped with hardware. Completely flush door type is featured.—Aetna Steel Products Corp. **(Item No. 17)**

Dodge Vinylwood Cork Tile: eight pages with regular and specialty patterns for vinyl cork, SG cork and standard cork tile in full color, along with design data, specifications, installation procedure and maintenance information. Catalog also includes basic data for Dodge cork wall materials—brick, tile and Panelcork.—Dodge Cork Co., Inc. **(Item No. 18)**

Products for Construction: eight-page listing of more than 50 types of adhesives, pressure-sensitive tapes, reflective materials for signs and markings, non-slip surfacing, sealers, insulative and protective coatings, electrical connectors and splice systems. Divided into type of specification and use areas — architectural, electrical, mechanical.—Minnesota Mining and Manfacturing Co. **(Item No. 19)**

Baldwin-Hill Styltone Mineral Tile: four-page brochure describes characteristics and illustrates appearance of the random fissured mineral tile; presents results of laboratory tests, including sound absorption coefficients and flame resistance rating.—Baldwin-Hill Co. **(Item No. 20)**

Architectural Porcelain Panels: 20-page catalog illustrates use of panels



USS Cyclone Rustake

the fence designed
to complement modern architecture
to provide protection and privacy

The great majority of West Coast homeowners are interested in fencing their properties. This provides an excellent opportunity for you to include fence in the specifications of the homes you design. And an especially good fence for you to recommend is Cyclone Rustake Fence.

Rustake Fence is made by inserting slender strips of California Redwood into special wide mesh Cyclone Chain Link Fence. This fence has all the sturdy strength of steel, yet gives the appearance of redwood picket. Rustake Fence keeps out trespassers, establishes boundary lines and preserves privacy. Its attractive design and warm, glowing color make an effective background for shrubbery and blend well with the contemporary designs of Western architecture.

For more information on Cyclone Rustake Fence, send for our free booklet, "Cyclone Rustake Fencing." Then when your clients ask about suitable fencing for their property, you'll be ready with complete information on Cyclone Rustake Fence.

USS and Cyclone are registered trademarks

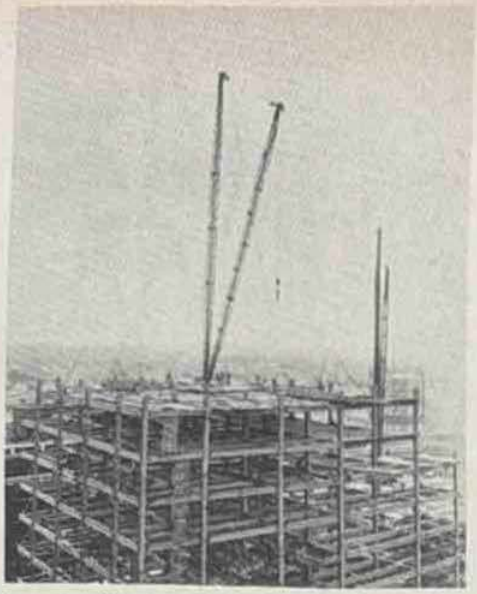
as curtain wall and facing material and shows examples of new and modernization construction for many types of buildings, along with porcelain panel construction details.—Davidson Enamel Products, Inc. **(Item No. 21)**

Thermo-Wall Construction: four-page folder gives advantages, characteristics and erecting details of this method of panel construction employing corrugated asbestos-cement board in combination with a structural insulating unit. A table lists the various coefficients of thermal transmission which vary with the thickness of the insulating unit. —The Philip Carey Mfg. Co. **(Item No. 22)**

Marlite Plastic-Finished Wall and Ceiling Paneling: eight-page folder illustrates and decribes entire line of predecorated hardboard panels, t&g planks and blocks, and Marlite Korelock, a rigid hollow core paneling that is applied directly over framing or furring without backing materials. Shown are 10 companion colors, seven wood grains and six marble patterns. —Marsh Wall Products, Inc. **(Item No. 23)**

How to "Jump" a Guy Derrick: three-page folder for steel erectors seeking the best method of "jumping"—raising the derrick from floor to floor on a building construction project without using other lifting equipment. Three steps in a basic system are illustrated.—American Hoist and Derrick Co. **(Item No. 24)**



Geyser Curtain Walls, Windows: 20-page manual contains detailed drawings, photographs, architects' specifications and recommendations of how to design economically with this grid system. Includes examples of typical installations and explains standard application details that may be applied independently in any combination as to specific planning.—E. K. Geyser Co. **(Item No. 2**

Emergency Lighting: 20 pages devoted to systems for schools, hospitals, public auditoriums, banks, stores, clubs, restaurants and other types of commercial, institutional, civic and public buildings. Contains data on all components, fixtures and exit signs.—The Standard Electric Time Co. **(Item No. 2**

Mono-Seal Protective Coating: 12-page bulletin presents features, properties and characteristics of plastic-type coating, formulated from blends of silicones and epoxies. Gives data on application, drying times, coverage and surface preparation. "Value analysis" section provides guide for economic selection of coating materials.—Mono-Seal Products. **(Item No. 2**

Inductor Air Conditioners: 16-page catalog describes units for perimeter air conditioning of multistoried buildings, covering such supplementary data as installation, adjustments and controls. Section devoted to selection includes a table of basic unit rating, gravity heating capacities, etc.—American Blower. **(Item No. 2**

SUPPLIERS

• **Wasco Products, Inc.**, has purchased Daylite Engineering Co. of Van Nuys, Calif., as another step in its long-range expansion program. Daylite, which now is a division, becomes regional headquarters for the distribution and sales of flashing and bath and shower enclosures and all Wasco products. Present staff and facilities of the purchased firm will remain unchanged.

• **Tecler Aluminum Corp.** of Seattle has appointed Elmo G. Guiles, former sales executive for Soule Steel Co., as district sales manager for California; and D. C. Hall, formerly with Atlas Enameling Co. and Coleman Co., as sales engineer. Hall will cover the 11 western states and Canada, not including California.

• **Pomona Tile Manufacturing Co.** has appointed Donald R. Speaker as assistant to the president, transferring to headquarters in Los Angeles from the company plant in Arkansas City, Kan. Speaker, who joined Pomona in 1948, will continue in the position of vice president.

• **Aluminum Company of America** has established a resident sales office in Boise, located in the offices of Pacific Metals Co., 325 Grove St. Robert W. Roylance of Alcoa's Portland, Ore., sales office has been named resident representative.

• **Pioneer Manufacturing Co.** will expand its 125,000-sq. ft. plant in La Puente, Calif. to accommodate new production requirements.

• **The Pacific Lumber Co. of San Francisco** has announced the retirement of vice president and treasurer Kenneth Smith, who joined the firm in 1948. He is going to resume practice as an economic consultant, a field which he pioneered in the forest products industries in 1931. His career embraced 14 years with Long-Bell Lumber Co.

• **Calaveras Cement Co.** has advanced James White to assistant sales manager in the company's main office in San Francisco. He has been replaced by Kent Vickery as sales representative in Stanislaus, Merced and Mariposa counties.

• **Automatic Sprinkler Corporation of America** has named J. J. Durkin, with the company since 1946 in New York City as contracting engineer, to the post of Seattle district manager.

• **Robbins Floor Products, Inc.**, president Poncet Davis Jr. of Tuscumbia, Ala., in addressing the annual dinner of the San Francisco Floor Covering Club last month, urged the dealers to court the favor of professional decorators and architects. "In 1958, I think the dealer will and should concentrate more on the aesthetic side of our industry," Davis said. "The consumer will be sold not just a product, but the concept of high quality hard sur-

face floor covering as the latest in decorative fashion."

• **Graystone, Inc.,** of Seattle has begun construction of a prestressed concrete manufacturing plant in nearby Redmond. Norman L. Donatt, company engineer for the past six years, will direct the $200,000 installation.

• **Westinghouse Electric Corp.** has opened a new apparatus sales office serving northwest Los Angeles County and all of Ventura, Santa Barbara and Kern counties at 15217 Burbank Blvd., Van Nuys, with Arthur G. Kane Jr. as manager.

• **Pope & Talbot, Inc.,** has appointed Donald W. Pleier as manager of treated lumber sales for its wood preserving division at St. Helens, Ore.

• **General Electric Co.** has named Dean Daniels as western district sales manager for its silicone products with offices in Downey, Calif.

• **McCormick & Baxter Creosoting Co.** has named James A. MacGregor of Portland as vice president, filling the vacancy created by the death of Howard W. Baxter of San Francisco. Other appointments: Doane Hickman as general superintendent and Karl T. Mosher as San Francisco district sales manager.

• **Olympic Stained Products Co.** of Seattle has appointed two representatives: The Harry Malon Sales Co. of Millbrae for northern California and John R. Kruse of Portland for parts of Oregon and Washington.

• **The National Plastic Products Co.** will establish a new warehouse and office facilities in Long Beach, Calif., to serve as headquarters for its western division, covering 11 states, Hawaii and Alaska.

• **Holly-General Co.** of Pasadena has promoted Earl Hefner, formerly sales representative in San Bernardino, Riverside and Imperial counties, to assistant sales manager.

• **Utility Appliance Corp.** and its subsidiary, Mission Appliance Corp., has elected P. L. (Pete) Chabre, who joined the firm in 1936, as vice president, sales and marketing.

• **L.O.F. Glass Fibers Co.** is constructing a manufacturing plant, to cost more than $1 million, in Corona, Calif.,

• **Douglas Fir Plywood Association** has added 11 field promotion representatives, including Ralph McGre formerly with a steel building pr ducts concern in Denver, working o of San Francisco.

• **Seattle Construction Council** h elected the youngest president in i history, 34-year-old Warren C. Brow of Wabco, Inc. Other officers: Pa Jacobsen and Gordon Anderson, vic presidents; Tom Franklin, secretary Fred Frodesen, treasurer.

• **Oregon Building Congress** of Port land has presented its third certifie contractor award to Leonard C. Pa due, mason contractor, and fou guildsmen awards to Lawrence Wink leman, erection superintendent o Timber Structures, Inc.; Arthur L Foster, vice president of Portland Wire & Iron Works and president o Portland Wire & Steel Warehouse Clifford Powell, tile setter; and Fred R. Sanders, brick mason (semiretired).

New officers of the congress are Richard W. Nahstoll, attorney, presi dent; Ernest A. McNabb, First Na tional Bank of Portland, vice presi dent; John R. Murtaugh, AIA, sec retary; and Harold Halvorsen, Shee Metal Workers, treasurer.

"Built-in telephone outlets are a definite selling point"

...says John MacLeod, President of Macco Corporation, Paramount, California developers. "Built-in telephone outlets and underground wiring throughout our latest Newport Beach development have enhanced the value of these homes."

Ask any leading architect or builder —he'll rate Telephone Planning among the basic features of the well-built home. "It's a definite selling point," says Mr. MacLeod, "one that buyers look for." And he's right. Concealed wiring and built-in outlets are features buyers recognize as marks of quality homes. That's why Telephone Planning pays off in increased value, a better-built home and a satisfied buyer.

Pacific Telephone

We'll be glad to help you plan built-in telephone facilities. Just call our business office and ask for our free Architects and Builders Service.

It pays to include Telephone Planning in every home you build!

T-SQUARE TALK

new offices, changes

Gabell Gwathmey, architect, has joined the San Francisco architectural firm of Masten & Hurd as a prinicipal. Recently retired as director of the Department of Licenses and Inspections of the District of Columbia, he served for more than 20 years with the Corps of Engineers in the design and construction of military projects and civil works in the U. S. and overseas.

George W. Heideman, architect, has opened an office at 328 Erie Ave., Seattle (EAst 5-9474), where he has been joined by his wife as color coordinator and interior planner. He is a member of the Montlake Terrace Planning Commission.

Katherine Gibbs, AIA, has opened an office at 1235 S.W. Fifth Ave., Portland (CA 2-7088). A graduate of Smith College Graduate School of Architecture (now Harvard), she formerly was a member of the firm of Weihe & Gibbs in Washington, D.C.

Leed Carmean, architect, has opened an office at 1426 Fifth Avenue Building, Seattle (SEneca 2-3931). A graduate of the University of Oregon, he was employed by the Eugene architectural firm of Wilmsen & Endicott and several Seattle firms.

George Fred Ashley, AIA, partner in the architectural firm of Ashley, Keyser & Runge, has closed his consulting office at 465 California St., San Francisco.

The Portland architectural firm of Sundeleaf, Hagestad & Peace is now known as Sundeleaf & Hagestad.

Glen Morgan, architect, has opened an office at 115 Spokane St., Seattle (MAin 4-8466). Before joining Austin Associates in Seattle in 1956, he was employed by several Los Angeles architectural firms.

deaths

Lance E. Gowen, 63, professor of architecture and planning at the University of Washington and a member of the faculty since 1924, died February 10 following an illness since the first of the year. He studied at the University of California where he received a master's degree in 1922 and also did graduate work in France. Professor Gowen, who practiced in Washington and New York states, served as president of the Washington State Chapter, AIA, from 1936-38.

speakers

Two architects were the principal speakers when the Artists' Equity Association held its annual West Coast conference in Seattle March 7-9. John Detlie, AIA, discussed "Art and the World Fair" and Wendell Lovett, AIA, "Art and Architecture."

Victor Gruen, AIA, of Beverly Hills addressed the Kingsley Art Club in Sacramento February 19 on the subject of "The Architect and Urban Cultures."

Kenneth G. Branch, AIA, architect for the Bremerton Public Schools the past 10 years, represented his profession in a study group on "School Buildings—Now and in the Years Ahead" during the annual conference of the Association for Supervision and Curriculm Development, a department of the National Education Association, in Seattle March 2-6.

appointments

Pereira & Luckman, Los Angeles architects-engineers, have elected Leland W. King, AIA, to the post of vice president and director of architecture and Gin D. Wong, AIA, to vice president in charge of planning and de-

Lifetime Insulation on Masonry Walls

STYROFOAM®

Styrofoam, a Dow plastic foam, bonds directly to masonry walls and serves as a plaster base, providing insulation and moisture vapor barrier. Furring and lathing are entirely eliminated. Once in, Styrofoam stays in for a lifetime.

Styrofoam also excells as perimeter and roof insulation. For further information and recommendations to fit your specific requirements, contact Wiley-Bayley.

® Styrofoam is a registered trademark of The Dow Chemical Company

Wiley-Bayley Inc.

sign. Before joining the firm in 1956, King for 14 years was director and supervising architect for the U. S. Department of State's overseas building activities; Wong has been with the firm for eight years, serving as assistant director of design prior to his promotion.

elections

Eugene Wieczorek, construction supervisor for Daniel, Mann, Johnson & Mendenhall, Los Angeles architects-engineers, has been elected president of the Construction Inspectors Association of Southern California. Charles H. Stimson is new vice president and Louis Waters, secretary-treasurer. The group was founded in 1956.

campus notes

Edward C. Malone, senior student at architecture at the University of Southern California, was awarded the Albert C. Martin grant for advanced study in architecture at a ceremony held in the California Club February 14. The honor was based on Malone's work as an undegraduate in planning as his student project a new resort city near Lake Maracaibo in Venezuela as well as his scholastic standing and his professional attitude. Brothers Albert C. Martin and J. Edward Martin of the architectural-engineering firm sponsoring the grant both are graduates of SC.

RECIPIENT of grant for advanced study in architecture is Edward C. Malone (center). Others are J. Edward Martin, civil engineer and partner in Albert C. Martin & Associates, award sponsor; Dean Arthur B. Gallion of College of Architecture at University of Southern California; Edmund McKanna, member of Los Angeles City Planning Commission and guest speaker; and Albert C. Martin Jr., FAIA.

Competitions for students of architecture at the University of Washington and Washington State College have been announced by the Pacific Northwest Brick and Tile Association. Three cash prizes will be awarded at each institution. A six-week problem, involving design of a student center, will be used at the university and of a light industrial building at the state college.

AMERICAN INDIANS will compete in first national art competition, with design in ceramic tile as object, directed by committee of educators and artists under co-chairmanship of Frederick E. Case (left) of UCLA and actor-artist Vincent Price. Cash prizes of $500 and honor of having $4,000 American Indian fellowship in architecture named after winner are being offered through foundation set up by Royal Tile Mfg. Co. of Fort Worth.

●

AIA activities

The Northwest Regional Council has picked Harrison Hot Springs, B.C., for its annual conference, to be held October 9-11. The program and announcement for the 1957 meeting at Gearhart, Ore., has won a gold ribbon for Arvid Orbeck, Portland commercial artist, presented by the Oregon Advertising Club in the direct mail category.

Miss Marjorie Montgomery, former Dallas newspaperwoman, has been named executive secretary of the East Bay Chapter, AIA, with offices in the Hotel Claremont, Berkeley.

The chapter held a panel discussion on public relations at Spenger's Restaurant, Berkeley, March 13, moderated by Andrew P. Anderson, past president and member of the state AIA committee on public relations. Panelists were James Day, general manager of TV station KQED; Miss Nes Young, San Francisco Chronicle; and Kenneth R. MacDonald, PA&B contributing editor.

Two honorary associate memberships were awarded by the Oregon Chapter at its annual banquet February 28 at Portland's Columbia-Edgewater Country Club. They went to Max W. Sullivan, director of the Portland Art Museum since 1956, for his contribtution to art education and to promotion of the relationship of arts and architecture; and to Lloyd T. Keefe, director of the Portland City Planning Commission since 1951, for speeding the progress of city planning and zoning.

John Lyon Reid, FAIA, of San Francisco was guest speaker at the affair, which also honored the seven fellows of the Oregon Chapter. They are William H. Crowell (fellow emeritus), Pietro Belluschi, Herman Brookman, Walter F. Church, Francis Jacobberger, Irving S. Smith and Glenn Stanton.

Our problem of ignorance (Cont'd from p. 14)

room. I also firmly believe that we all have a big job to do outside the schoolroom. We blame youth for lack of interest in science and explain it on the ground that our youth considers scientists to be "eggheads" and therefore social oddities. Yet in the face of this statement, youthful experimentation in rocketry has become so widespread that there is serious concern over the likelihood of personal injuries. This does not sound as though youth lacks interest in science. One priceless and unique characteristic of youth is its perpetual curiosity. We as adults have the power to direct that curiosity into worthy channels. There seems to be evidence that we have failed to do this; instead, we have forfeited these opportunities through preoccupation with amusing and coddling ourselves with material comforts and innumerable needless luxuries.

Perhaps it is we who really need re-education. Certainly we need re-education which will make us want to put our spare dollars into better schools rather than into more personal gadgets. It is for us to set the examples, else youth, as it always has, will reflect our attitudes and lose sight of those things in life which are worthy of its time.

I am not at all sure that the education our children are getting today is any worse than it was 20 years ago. However, I am sure that today's children need far more and better education than has ever been necessary in the past. As architects and contractors, it is our joint responsibility to build schools which, unlike the prison-like, pompous buildings of yesterday, serve to encourage learning. If such buildings can be combined with imaginative teaching that stimulates student curiosity in the physical sciences—and the arts—it is entirely possible that our young people may come to consider the acquisition of knowledge as something which is not only socially desirable, but pleasurable. If this is done, we as a nation will have nothing to fear from anybody, not even ourselves.

OREGON

★VOR FACILITY CONVERSION— Baker, Ore.

Award to Westchester Electric Co., 6541 W. 90th, Los Angeles, Calif., $24,855, by Civic Aeronautics Administration, Procurement Branch, Box 45007, Airport Station, Los Angeles, Calif., for conversion of an existing VOR facility to a VORTAC facility at Baker, Ore., No. 4-58-965. Eight firms submitted bids. The high bid was $38,190.
DM 3-7. Previous report 2-7

OPERATIONS BUILDING ADDITION— Baker AF Station, Ore.

Bids will be opened on or about April 15 by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for construction of 1,467 sq. ft. concrete block automatic addition to existing Manual Addition of the Operations Bldg. at Baker Air Force Station; ENG-45-108-58-83. Plans with above office.

Addition to have reinforced concrete foundations; frame steel joist roof trusses, metal roof decking; 12" concrete block cavity walls; air conditioning and electrical work.
SP 3-7

▲HOUSING UNITS, SITE DEVELOPMENT— Burns, Ore.

Bids received by U.S. Air Force, Geiger AFB, Wash., for construction of 25 housing units in the vicinity of Burns; IFB-45-614-58-11. Bids were also opened March 6 under the same invitation for construction of 27 units in the vicinity of Cottonwood, Idaho, the results of which appear elsewhere in this issue of PCD.

Six bids received; following are basic bids. LOW BIDS: Harney Homes, Inc., Burns, $345,385; Frank Dunham, Box 214, Kennewick, Wash., $361,635; Allied Construction Co., Box 124, Parkwater Station, Spokane, $367,300. HI BID: Thompson & Georgeson, Inc., 1924 S.E. 6th Ave., Portland, Ore., $417,957.
SP 3-7. Previous report 2-21

● OPERATIONS BUILDING ADDITION— Burns AF Station, Ore.

Bid opening time has been established as 2 p.m., P.S.T., April 2, and will be held by Corps of Engineers at 4735 E. Marginal Way, Seattle, for construction of a 1,490 sq. ft. addition (automatic) to the Operations Bldg. (manual) at Burns Air Force Station; ENG-45-108-58-76. Plans with above office. Reinforced concrete foundations; wood frame, roof and floors; 12" concrete block cavity walls; air conditioning.
DM 3-7. Previous report 3-1

● SCHOOL ADDITIONS— Clackamas, Ore.

Bids will be opened 8 p.m., March 27, by Clackamas County School District No. 64C, Clackamas, for construction of five classrooms with a covered play porch, two toilet rooms and teacher's storage room at the elementary school. Plans with Zenger & Schumaker, architects, Barclay Bldg., Oregon City. Plans call for wood frame on concrete slab; built-up roofing; aluminum sash; acoustical tile ceiling; asphalt tile flooring; convectors attached to present heating system.
DC 3-12. Previous report 12-18

MEN'S DORMITORY— Corvallis, Ore.
(Estimated cost $935,150)

Preliminary plans have been approved by Oregon State Board of Higher Education, Earl M. Pallett, secretary, Johnson Hall, Eugene, for a 314-man, five-story and basement dormitory at Oregon State College, Corvallis. Plans by Burns, Bear, McNeil & Schneider, architcets, 2940 S.E. Belmont St., Portland.

L-shaped structure, with 61,182 sq. ft., will house 58 men on first floor and 64 each on the higher levels; lift-slab construction; concrete block exterior walls exposed on interior; brick veneer exterior. Part of Central Hall, a temporary dormitory, will be demolished to make room for the building.

Bids opened March 6. WB 3-11. Previous report 3-4

INDUSTRIAL AREA— Portland, Ore

(Estimated development cost $7,000,000)

The Port of Portland, John J. Winn, Jr., general manager, 5848 N. Lagoon Ave., P.O. Box 4099, Portland, has been deeded 3[illegible] acres of land in Mocks Bottom from Multnomah County to form the nucleus of a 4[illegible] acre industrial district. The newly-acquired land is being combined with property already owned by the port in Mocks Bottom and on adjacent Swan Island in North Portland. Boundaries of the area are the Union Pacific Railroad's Albina holding yard, the Willamette River and a high bluff.

Preliminary design is by Cornell, Howland, Hayes & Merryfield, consulting engineers, 1600 Western Ave., Corvallis. Land will be leased, rather than sold, for light industry, warehousing and distribution. Landscaping and other practices designed to promote good appearance will be encouraged. Although no immediate need for dock space was foreseen, waterfront areas will be reserved for future ship and barge terminals.

The west end of Swan Island proper and part of the basin side of the island will be reserved for ship repair and dry dock operations. The river side of N. Channel Ave. will be held for ship repair and dry dock operations, and rail trackage will be extended to that area. The greater part of the basin side of Swan Island may be used for berthing shallow-draft vessels, including storage of barges, tugs, floating cranes and similar equipment.

Service centers will be established on Swan Island and Mock's Bottom for motor vehicle service stations, restaurants, branch banking and other public facilities. An extensive road and railroad grade separation at the N. Going St. entrance to the area, and a low level vehicular arterial along the bluff side of Mock's Bottom and extending to the northwest along the easterly bank of the Willamette River to the St. John's area are planned.

Cost estimates include $5,018,500 for realignment of Mocks Bottom, including the fill, streets and railroads; $1,375,000 for Going St. interchange; $611,000 for Swan Island development.

The Port has announced that the first 40-acre section of land on Swan Island is now available for development, and construction will be started this spring on a railroad spur line into the area, Tract A. Shipyard buildings on the island will be removed to make way for new buildings.

A major item in the development will be filling of the former county land with approximately 12,000,000 c.y. of hydraulic fill. This work will be coordinated with normal dredging of the Portland harbor by the port's 30" pipeline dredge, "Clackamas," and may take up to 25 years. WB 3-1

L.D.S. CHURCH— Portland, Ore.

Working drawings are nearly complete by Stewart & Richardson, architects, 219 S.W. Stark St., Portland, for construction of the West Hills Ward, Portland Stake, Latter Day Saints Church, at S.W. McMillan St. between S.W. 99th and 102nd avenues, Portland. Plans are scheduled to be turned over to Bishop Ronald K. Tall on March 21, and it is expected that construction will be under a superintendent.

One-story structure with partial basement; chapel will seat 300; recreation hall will have facilities for feeding 600 persons; kitchen facilities; educational wing; alternate for relief society room. Basically frame structure; glued laminated beams and columns with 4" wood deck over chapel and recreation hall; trussed rafters and wood sheathing over educational wing; rough sawn wood siding and some brick veneer on exterior; built-up roof; aluminum operating sash; large wood window in chapel; stainless steel work in kitchen; asphalt tile flooring, except maple in recreation hall and carpet in choir area; interior partitions of wood studs, gypsum lath and plaster; gypsum lath and plaster ceilings; some acoustically treated ceilings; gas-fired hot water heating system; ventilating units for chapel and recreation hall; incandescent lighting; dimmers on some lights in the chapel and recreation hall. WB 3-5

● RIVERDALE SCHOOL ADDITION— Portland, Ore.

Bids will be opened 8 p.m., March 25, by School District No. 51J, Multnomah County, Leslie W. Buell, clerk, Riverdale Grade School, 11733 S.W. Breyman Ave., Portland, for construction of a reinforced concrete addition to the school. Plans with Annand, Boone & Lei, architects, 1530 S.W. Taylor St., Portland. $25 deposit. Certified check, cashier's check or bid bond 5%.

Addition of five classrooms with individual toilet areas and an open corridor. Concrete slab floor; brick veneer exterior on three sides; corridor will have redwood finish; built-up roofing; frame partitions with lath and plaster; acoustical tile ceilings; asphalt tile floors; hollow metal exterior doors; wood interior doors; fluorescent and incandescent lighting; mechanical ventilating system with finned pipe heating; some asphaltic playground paving. WB 3-8

6 *reasons why architects prefer* COLUMBIA BRICK *for schools...*

1. Low maintenance saves school boards thousands of dollars each year.
2. Enduring beauty.
3. Flexibility of design — choice of many colors, texture and patterns.
4. Sound, fire-safe construction.
5. Creates feeling of pride and security in students and teachers.
6. Stands up to hard usage.

Add these features to Columbia Brick's superior craftsmanship, and unique clays, and you know why Columbia Brick is "specified" so often.

Five bids received by U.S. Forest Service, H. P. Campbell, assistant regional supply officer, P.O. Box 4137, 729 N.E. Oregon St., Portland, for drilling, casing, sealing, developing and testing a water well on a government-owner site at the Klahowya Campground, Clallam County, Olympic National Forest, Wash.; Inv. No. 259. BIDDERS: K. & M. Well Drilling, Box 376, Centralia, $1,019; Glacier Pump & Drilling Co., 10435 N. Sheridan, Tacoma, $1,022; Harold S. Mykol, 4305 Lacey Blvd., Olympia, $1,169; Western Drilling Co., 1545 Bay St., Tacoma, $1,152; Stoican Drilling Co., Route 3, Box 175, Port Orchard, $1,228. Bids opened March 10.
WB 3-12

● CENTRAL HEATING PLANT ADDITION— Fort Lewis, Wash.

Bid opening established as 2 p.m., April 8, by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for construction of a 40'x56' reinforced concrete addition to the central heating plant, Ordnance Facilities, Fort Lewis; ENG-45-108-58-72. Specifications with above office.

Work includes furnishing and installation of two high pressure steam boilers and appurtenances including two 25,000-gal. underground fuel oil tanks. Building to include necessary electrical work and sewer connections to existing heating plant.
SP 3-7. Previous report 3-2

▲GENERATOR INSTALLATION, EQUIPMENT— Geiger AF Station, Wash.

Bids received by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for installation of two 250-kw government-furnished diesel generators and accessories, re-energizing five substations, furnishing and installation of a switchboard and other electrical equipment, and modification of the fuel oil piping system and electrical power wiring at Mica Peak, Geiger Air Force Station; ENG-45-108-58-57. Bids opened March 6.

Five bids, ranging up to $20,545. LOW BIDS: Power City Electric Co., N. 926 Howard, Spokane, $15,790; D. G. Quinton Co., N. 1413 Division, Spokane, $16,953; Kelso Electric Co., N. 416 Helena, Spokane, $19,[illegible]. Government estimate, $20,689.
DM 3-7. Previous report 3-[illegible]

★ELECTRICAL DISTRIBUTION FACILITIES— Geiger AFB, Wash.

Award to Power City Electric Co., N. 926 Howard, Spokane, $115,963, by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for electrical distribution facilities at Geiger AFB; ENG-45-108-58-50.
DM 3-8. Previous report 3-[illegible]

AIRPORT— Gig Harbor, Wash.
(Estimated cost $1,600,000)

On the March 11 ballot will be a resolution authorizing a bond issue to provide $350,000 toward the development of an airport for the city on the Peninsula in Gig Harbor area. The city will furnish $350,000 toward the construction of the airport, the Port of Tacoma $350,000, Weyerhaeuser Timber $100,000 and an individual will contribute $5,000. The city has an application pending to the CAA for $800,000 in federal funds.
DC 3-7. Previous report 1-[illegible]

● DRILL WATER WELLS— Grays Harbor County, Wash.

Bids will be opened 2 p.m., March 24, by Forest Service regional supply officer, 729 N.E. Oregon, Portland, Ore. (Box 4137) for drilling two water wells at Quinault Ranger Station and Ollalie Campground in Grays Harbor County, Olympic National Forest. Plans with above office and with forest supervisor, Post Office Bldg., Olympia. The wells, which will be located about 45 mi. north of Aberdeen on southeast shore of Quinault Lake, will be 40' and 60' deep; will accommodate a 6" I.D. casing. DC 3-[illegible]

★SUBSTATION— Grays River, Wash.

Four bids received by Bonneville Power Administration, 1001 N.E. Lloyd Blvd., Portland, for construction of 3-mva Svenson substation, approximately five mi. west of Grays River, Wahkiakum County, Wash.; Inv. No. 8654. Bids opened March 10. BIDDERS: H. B. Nesheim, 6714 36th Ave. S.W., Seattle, $11,212; The Brandon Co., 6401 Lincoln, Vancouver, $12,259; Harold Moffatt, Troutdale, Ore., $12,770; Tyee Construction Co., 1901 23rd Ave. S., Seattle, $15,494.
WB 3-12. Previous report 3-[illegible]

● IRRIGATION SYSTEM—Kennewick, Wash.

Bids will be opened 7:30 p.m., March 18, by Van E. Nutley, manager of Kennewick Irrigation District, 214 W. 1st Ave., Kennewick, for construction of an irrigation system for LID No. 11. Plans with above office.

Quantities: 5,200' excavation; install 3,200' of 4" and 1,500' of 8" concrete pipelines, gate valves, end valves; install 8 road crossings, 50' each; install one ditch crossing; install 28 service takeouts. DC 3-[illegible]

★RUNWAY EXTENSION— **Larson AFB, Wash.**

Award to N. Fiorito Co., 844 W. 48th, Seattle, $2,336,752, by Corps of Engineers, Walla Walla district, Bldg. 602, City County Airport, Walla Walla, for construction of runway extension and allied facilities at Larson AFB, near Moses Lake; ENG-45-164-58-20.
SP 3-7. Previous report 3-1

▲SEAL COATING— **Larson AFB, Wash.**

Bids which were received February 24 have been rejected by U.S. Air Force, Larson AFB, for 403,338 sq. ft. seal coating taxiways and 60,000 sq. ft. painting taxiways at the base; Inv. No. 58-18.
SP 3-8. Previous report 2-22

APRON, TAXIWAYS, FUELING SYSTEM— **Larson AFB, Wash.**

(Estimated cost $1,000,000 to $5,000,000)

Bids will be opened on or about April 23 by Corps of Engineers, Walla Walla district, Bldg. 602, City County Airport, Walla Walla, for construction of an operational apron, apron access taxiways and hydrant fueling system at Larson AFB; ENG-45-164-58-25. Specifications with above office. $100 deposit. Bids on this project were previously to have been opened about March 6 but the invitation was subsequently cancelled. A pre-bid conference may be held.

Work will include removal of 40,000 sq. yd. asphaltic and portland cement pavement; 84,000 c.y. excavation; 33,000 c.y. sub-base and base course; new paving consisting of 6,250 ton asphaltic concrete; 37,000 c.y. portland cement concrete; 1,100 sq. yd. pavement marking; modification of existing aviation gas pumping and storage plants; construction of masonry jet-fuel transfer pumphouse and two masonry storage pumphouses; designing and construction of 55,000 bbl. steel bulk storage tank; construction of lateral control and dike and enclosure.

Modification of existing aviation gas bulk storage tank; construction of lateral control pits and hydrant outlets; construction of 10" and smaller fuel transfer piping; 8" and smaller water lines; storm sewer; 15" and smaller culverts; ditch and embankment; electrical distribution and modification of existing electrical and area lighting systems; other incidental electrical, mechanical, structural, paving and miscellaneous work. Paving and embedded hydrant to be completed by September 15; remainder by April 15, 1959.
SP 3-12. Previous report 2-5

WELLS HYDROELECTRIC PROJECT— **Wenatchee, Wash.**
(Estimated cost $166,000,000)

Bechtel Corp., 220 Bush St., San Francisco, Calif., has been retained by Douglas County Public Utility District, George Hamilton, president, 20 N. Main, East Wenatchee, to furnish professional engineering services to determine the economic feasibility of the selected site, near Azwell, and to obtain a preliminary estimate of project costs for the Wells hydroelectric project on the Columbia River, 45 mi. about Wenatchee between Rocky Reach and Chief Joseph dams. The utility district has obtained financing for engineering the proposed dam and has consummated an agreement with Puget Sound Power and Light Co., whereby the firm will advance money for engineering expenses on a feasibility basis in return for an option on at least ⅓ of the power output of the 402,000-kw

project. Preliminary engineering was performed by Kaiser Engineers, 1924 Broadway, Oakland, Calif.

Work at the site will include extensive drilling, testing of pump holes, test retrenching borrow and aggregate material exploration and geological investigation and mapping. This stage does not include any investigations of relocations of rail and public roads, any remedial works which may be required from raising the pool, model studies or reservoir regulations studies, nor land acquisition and clearing. Work is directed towards determining the most feasible and economical development for the major structures of dam and spillway, powerhouse and dikes.

Additional planholders: Price-McNemar Construction Co., 13726 Saticoy St., Los Angeles, Calif.; Tullar Power Construction Co., Box 4051, Seattle; Henkels & McCoy Contractors, 610014 N. 20th St., Philadelphia, Pa.; Nager Electric Co., Inc., 420-428 Broadway, Brooklyn, N.Y.; Creamer & Dunlap, Inc., Box 2265, Tulsa, Okla.; Duke's Electric,

Inc., Bldg. 35, Pasco Airport, Pasco; Witzig Construction Co., Box 292, Corvallis, Ore.; Standard Transformer Co., Warren, Ohio; Fischbach & Moore, 1740 Broadway, Denver, Colo.; Gordon Hansen, Box 1485, Missoula, Mont. SP 3-12. Previous report 2-18

▲SEWAGE TREATMENT PLANT— Lewiston, Idaho

Eighteen bids received by City Council, City Hall, Lewiston, for construction of primary sewage treatment plant and pumping station (Contract No. 1), a 36" Clearwater River crossing (Contract No. 2) and interceptor sewers (Contract No. 3) in Lewiston. Plans by Stevens & Thompson, consulting engineers, 2234 S.W. 5th Ave., Portland. Bids opened March 10. LOW BIDS—CONTRACT 1: Henry George & Sons and Durham Contracting Co., Box 42, Moscow, $343,406 (joint venture). CONTRACT 2: M. F. Castle Co., 10503 Division, Spokane, $88,819. CONTRACT 3: M. F. Castle Co., Spokane, $296,575.
DR 3-12. Previous report 3-6

●PIPE, VALVES— Moscow, Idaho

Bids will be opened March 18 by L. C. Warner, purchasing agent, 203 Administration Bldg., University of Idaho, Moscow, for plumbing supplies consisting of 14 types of items including 6" pipe, cast iron flanges and black cast iron valves. Specifications with above office. MH 3-11

RAILROAD TRACKAGE— Mountain Home AFB, Idaho

Bids will be opened on or about April 17 by Corps of Engineers, Walla Walla district, Bldg. 602, City County Airport, Walla Walla, for construction of approximately 1,960' new railroad trackage, removal of 1,720' trackage and miscellaneous work at Mountain Home AFB, Elmore County, Idaho; ENG-45-164-58-41. Specifications with above office. Completion time 210 calendar days.

Work as follows: Construction of 1,960' new trackage, including one turnout, one crossing and one earthfill car bumper; removal of 1,720' existing trackage; construction of one reinforced concrete street crossing; installation of approximately 100' protection sleeves around utility pipes where utilities cross under new trackage; miscellaneous items of work such as hose racks, railroad crossing signs, and modifications to existing utilities. SP 3-7

SEWAGE PLANT, SEWERS— Payette, Idaho

(Estimated cost $416,000)

Voters have approved a proposed sewage disposal plant and sewer system for the city of Payette. Of the estimated $416,000 cost, about $76,000 will be contributed by the federal government.
DC 3-12. Previous report 2-14

SEWAGE DISPOSAL PLANT— Twin Falls, Idaho

Bond election originally scheduled for April for the proposed sewage disposal plant may not be held until May. Selection of a fiscal agent and an outside engineer will delay election. City engineer is Norman Crosley, Box 867, Twin Falls.
DC 3-7. Previous report 1-4

SUBSTATION— Wallace, Idaho

(Estimated cost $1,100,000)

Plans announced by Washington Water Power Co., Virgil Thompson, local representative, Wallace, for construction of a substation at Wallace in connection with the Noxon Rapids Dam in western Montana. Home office of Washington Water Power is at 825 W. Trent in Spokane. IG 3-7

MONTANA

★PATCHING MACHINE—Anaconda, Mont.

Award to Pioneer Equipment and Supply Co., 624 S. Dakota, Butte, $1,650, by City Council, City Hall, Anaconda, for furnishing a heated patching machine for repairing oiled and paved streets. ONLY OTHER BID: Westmont Tractor and Equipment Co., 55 3rd E.N., Kalispell, $2,340. SC 3-12

●BUTTERFLY VALVES— Billings, Mont.

Bids will be opened 5 p.m., March 25, by City Council, City Hall, Billings, for purchase of one 24" and one 30" rubber-seated butterfly valves. Specifications with city clerk. Certified check or bid bond 10%.
EE 3-12

▲SEWAGE LIFT STATION, FORCE MAIN— Great Falls, Mont.

Eight bids received by School District No. 1, Washington School, Great Falls, for construction of a sewage lift station, including two 400-gpm and one 800-gpm pump, at the corner of Central Ave. and 42nd St., and for installation of 3,160' of 10" force main and 8" cement asbestos water main pipe for the East Junior High School in Great Falls. Plans by Wenzel & Co., consulting engineers, 3212 10th Ave. S., Great Falls. Bids opened March 3. TWO LOW BIDS: Robinson & Shepherd, Box 843, Missoula, $21,651; Joe Fagenstrom & Son, Black Eagle, $23,823. HI BID: Utility Builders, Inc., Ford Bldg., Great Falls, $29,995.
SC 3-8. Previous report 2-27

★STREET IMPROVEMENTS— Great Falls, Mont.

Award to City Constructors, 2518 10th Ave. S., Great Falls, $94,219, by City Council, Civic Center, Great Falls, for construction of street improvements in the Morningside Addition, SID No. 939, on 4th and 5th avenues North between 38th and 44th streets in Great Falls. Bids opened February 10. SP 3-8. Previous report 1-25

■ASPHALTIC CONCRETE PAVING, CURB— Great Falls, Mont.

Planholders announced for construction of 2½" asphaltic concrete paving, curb and gutter, and related work, in Sunrise Heights, Sunrise Terrace and portions of Lloyd Land, 4th and 5th Supplements to Sunrise Terrace, SID No. 949, Great Falls. Bids will be opened 8 p.m., March 17, by Fred L. Hill, city clerk, Civic Center, Great Falls.

Planholders: Hilde Construction Co., 3810 7th Ave. N.; Western Utility Co., 815 25th St. N.; Nilson-Smith Construction Co., 800 2nd S.; S. Birch, Inc., Ford Bldg.; Northwestern Engineering Co., Rapid City, S. Dak.; Utility Builders, Inc., 432 Ford Bldg.; Robertson & Cave, Inc., 8th Ave. N.W. and River Drive; McLaughlin, Inc., Ford Bldg. All of Great Falls unless noted.
SP 3-12. Previous report 3-5

■SANITARY SEWER— Great Falls, Mont.

Planholders announced for furnishing and installing 10" sanitary sewer in 14th St. S.W. and 8th Ave. S.W. in Great Falls. Bids will be opened 8 p.m., March 17, by Fred L. Hill, city clerk, Civic Center, Great Falls.

Planholders: Utility Builders, Inc., 432 Ford Bldg.; Robertson & Cave, Inc., 8th Ave. N.W. and River Drive; Western Utility Co., 815 25th St. N.; Joe Fagenstrom & Son, 1701 Smelter Ave., Black Eagle; Falls Construction Co., 25th St. and River Road; Earl Gray, 2600 7th Ave. N.; J. H. Qunell, West of Great Falls. Of Great Falls unless noted.
SP 3-12. Previous report 3-5

●STATE HIGHWAY PROJECTS— Helena, Mont.

Bids will be opened 9 a.m., March 27, by Montana State Highway Commission, State Capitol Bldg., Helena, on 11 highway construction projects. Plans with above office. Certified check, cashier's check or bid bond 5%.

SURFACING—Grade, aggregate surfacing, bituminous surface treatment, draining 4.997 mi. on Idaho-Dillon Road, Beaverhead County; I-ING 82-01(6) Unit 1.

Quantities: 782,446 c.y. excavation; 651 c.y. aggregate backfill; 520,341 mi. yd. overhaul; 180,615 ton crushed aggregate; 15,209 M gal. watering; 2,443 units rolling; 245 ton cutback asphalt; 246 ton emulsified asphalt; 2,052' corrugated metal pipe; 824' structural plate pipe; 4,000' steel beam guard rail; 146.7 sq. yd. concrete pavement; 2,409.2' median concrete curb; 4,199 rods wire fence. Completion time 300 calendar days.

CONCRETE, STEEL OVERPASSES—One 118' prestressed concrete highway overpass and one 450' steel and concrete highway overpass on Idaho Line-Dillon Road, Beaverhead County, I-ING 82-01(6) Unit 2.

Quantities: 241' steel beam bridge rail; 148,060 lb. reinforcing steel; 1,031.5 c.y. concrete; 1,065 c.y. structure excavation; 2,285' precast prestressed concrete beam; 25,488 lb. furnish steel bearing piles; 696' drive steel bearing piles; 899' steel bridge rail. Completion time October 31.

SURFACING—Grade, aggregate surfacing, plantmix surfacing, draining 0.030 mi. on the west of Wolf Point-North Dakota Line Road, Roosevelt County; F. 84(25) Unit 1.

Quantities: 347,168 c.y. excavation; 250 c.y. riprap; 437 c.y. aggregate backfill; 90,334 mi. yd. overhaul; 315,861 ton crushed aggregate; 12,710 M gal. watering; 2,315 units rolling; 229 ton cutback asphalt; 192 ton emulsified asphalt; 2,670' corrugated metal pipe; 83' structural plate pipe; 41,563 c.y. sand surfacing; 1,356 ton asphalt cement; 24,720 ton plantmix. Completion 250 calendar days.

CONCRETE BRIDGE—One 120' concrete bridge over Tule Creek on west of Wolf Point-North Dakota Line Road, Roosevelt County; F 84(25) Unit 2.

Quantities: 1,180 c.y. excavation; 237.5' steel bridge rail; 59,876 lb. reinforcing steel; 290.7 c.y. concrete; 345 c.y. structure excavation; 1,734' drive untreated timber piles; 1,785' furnish untreated timber piles. Completion time August 31.

SURFACING, BRIDGE—Grade, aggregate surfacing, plantmix surfacing, drain and construct 118' concrete bridge over Mission Creek on 7.756 mi. on Livingston-Bit Timber Road, Park County; I-117(10) Unit 1.

Quantities: 583,814 mi. excavation; 1,512 c.y. aggregated backfill; 340,814 mi. yd. overhaul; 183,069 ton crushed aggregate; 61,870 ton uncrushed aggregate; 13,502 M gal. watering; 2,290 units rolling; 277.18 units cutback asphalt; 230.79 tons emulsified asphalt; 346' corrugated metal pipe; 764' structural plate pipe; 2,738' reinforced concrete pipe; 1,978 ton asphalt cement; 35,964 tons plantmix; 5,487 rods wire fence; 241.46' steel beam bridge rail; 49,383 lb. reinforced steel; 380 c.y. concrete; 625 c.y. structure excavation; 805' precast prestressed concrete beams. Completion 250 calendar days.

SURFACING—Grade, aggregate surfacing, plantmix surfacing, drain 7.578 mi. on Upper Nine Mile Road, Silver Bow County; S-US-USG 213(3) Unit 2.

Quantities: 286,862 c.y. excavation; 228 c.y. aggregate backfill; 214,925 mi. yd. overhaul; 27,605 ton crushed aggregate; 42,492 c.y. uncrushed aggregate; 5,525 M gal. watering; 1,047 units rolling; 205 ton cutback asphalt; 168 tons emulsified asphalt; 146' corrugated metal pipe; 184' structural plate pipe; 3,512' reinforced concrete pipe; 1,151 ton asphalt cement; 20,954 ton plantmix surfacing; 3,725' steel beam guard rail. Completion 250 calendar days.

SURFACING—Grade, aggregate surfacing, bituminous surface treatment, drain 8.801 mi. Townsend-Canyon Ferry-Clasoil Road, Lewis and Clark, and Jefferson counties; S 6(3).

Quantities: 416,246 c.y. excavation; 561 c.y. aggregate backfill; 26,166 mi. yd. overhaul; 107,209 ton crushed aggregate; 8,288 M gal. watering; 1,388 units rolling; 207 ton cutback asphalt; 212 ton emulsified asphalt; 164' structural plate pipe; 2,160' reinforced concrete pipe; 572' relay pipe culverts. Completion time 250 calendar days.

SURFACING—Grade, aggregate surfacing, bituminous surface treatment, drain 12.665 mi. on Armells Creek-Hays-Harlem Road, Blaine County; S 187(1) Unit.

Quantities: 669,036 c.y. excavation; 263 c.y. aggregate backfill; 74,197 mi. yd. overhaul; 204,753 ton crushed aggregate; 34,802 ton uncrushed aggregate; 14,692 M gal. watering; 2,406 units rolling; 320 ton cutback asphalt; 323 ton emulsified asphalt; 2,874' corrugated metal pipe; 294' structural plate pipe. Completion time 250 calendar days.

TIMBER BRIDGES—One 75' treated timber pile bridge and one 100' treated timber pile bridge on Armells Creek-Hays-Harlem Road, Blaine County; S 187(1) Unit 2.

Quantities: 1,030 c.y. excavation; 85,801 MBM treated timber; 2,618 MBM untreated timber; 3,160' treated timber piles; 3,965 lb. structural steel. Completion time August 13.

CONCRETE BRIDGE—One 120' concrete bridge over Canyon Creek on Adobe Road

(Laurel), Yellowstone County; S 192(2) Unit 1

Quantities: 180 c.y. excavation; 243,950' steel beam bridge rail; 50,753 lb. reinforcing steel; 268.7 c.y. concrete; 355 c.y. structure excavation; 1,230' drive untreated timber piles; 1,320' furnish untreated timber pile. Completion time August 31.

SURFACING—Grade, aggregate surfacing, bituminous surface treatment, drain 3.986 mi. on East Helena-North Road, Lewis and Clark counties: S 232(1).

Quantities: 56,148 c.y. excavation; 147 c.y. aggregate backfill; 46,636 mi. yd. overhaul; 54,315 ton crushed aggregate; 1,892 M gal. watering; 389 units rolling; 95 ton cutback asphalt; 95 ton emulsified asphalt; 106' corrugated metal pipe; 798' reinforced concrete pipe; 100' steel beam guard rail. Completion 130 calendar days. DM 3-11

▲WELL DRILLING— Jordan, Mont.

A low bid of $12,810 was submitted to Town Council, Town Hall, Jordan, by Dodd Drilling Co. of Wolf Point, for drilling of a well for city water. Three bids were received. SC 3-8

★WATER WELL— Kalispell, Mont.

Award to Western Drilling and Equipment Co., 1545 E. Bay, Tacoma, $8,940, by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for drilling and casing water well No. 2-TM-179 to a depth of approximately 400', including developing and testing, at Kalispell Air Force Station; ENG-45-108-58-54. SP 3-12. Previous report 2-28

★PATCHING MACHINE, GRADER— Kalispell, Mont.

Awards announced by Flathead County Commissioners, Courthouse, Kalispell, for furnishing an asphalt patching machine for use on oiled roads in the county, and for furnishing 500 grader blades to the county. AWARDS — PATCHING MACHINE: Hall-Perry Machinery Co., 1116 15th Ave. N., Great Falls, $4,845. BLADES: Westmont Tractor and Equipment Co., 55 3rd E.N., Kalispell, $7.06 per blade. SC 3-12

■ PAVING, LIGHTING, RUNWAY BARRIERS— Malmstrom AFB, Mont.

Planholders announced for taxiway-runway, access shoulder paving, lighting, marking and seeding, and runway arresting barriers at Malmstrom AFB; ENG-45-164-58-31. Bids will be opened 2 p.m., March 20, by Corps of Engineers, Walla Walla office, Bldg. 602, City County Airport, Walla Walla.

Planholders: Peter Kiewit Sons' Co., Box 1854, Billings; Holland Construction Co., 1121 S. 3rd, Bozeman; S. Birch & Sons Construction Co., Box 1926, Great Falls; Lewis Construction Co., Box 2092, Great Falls; McLaughlin, Inc., Box 1924, Great Falls; Nilson-Smith Construction Co., Box 1147, Great Falls; Lou Richardson, Box 335, Miles City; Northwestern Engineering, Box 1392, Rapid City, S. Dak.; Rainbow Electric Co., 2220 River Drive, Great Falls; E. F. Pugsley, 805 E. Northlake, Seattle, Wash.; Olson Electric Co., 710 W. 8th, Vancouver; Townsco Contracting Co., 1115 Cravens Bldg., Oklahoma City, Okla.; Paul Kovack, 706 7th N., Great Falls tDM 3-7. Previous report 2-19

★AIRCRAFT FUELING SYSTEM— Malmstrom AFB, Mont.

Award to Paul W. Larsen Contractor, Inc., and The P. L. Larsen Co., 361 W. 4th South, Salt Lake City, Utah, $1,110,321 (joint venture), by Corps of Engineers, Walla Walla district, Bldg. 602, City County Airport, Walla Walla, for aircraft hydrant fueling system at Malmstrom AFB; ENG-45-164-58-21. SP 3-8. Previous report 2-26

★GENERATOR INSTALLATION, EQUIPMENT— Malmstrom AFB, Mont.

Award to Goggans & Pennie, 1106 Central Ave., Great Falls, $18,366, by Corps of Engineers, Walla Walla district, Bldg. 602, City County Airport, Walla Walls, for installation of two 250-kw government furnished diesel generators and accessories, re-energizing four substations, furnishing and installation of a switchboard and other electrical equipment, and modification of the fuel oil piping system and electrical power wiring; ENG-45-08-58-56. SP 3-11. Previous report 3-5

★FUEL STORAGE TANK, UTILITIES— Malmstrom AFB, Mont.

Award to P.S. Lord Mechanical Contractors, 4507 S.E. Milwaukie Ave., Portland, $75,423, by Corps of Engineers, Walla Walla office, Bldg. 602, City County Airport, Walla Walla, for base aviation fuel storage at Malmstrom AFB; ENG-45-164-58-22. SP 3-8. Previous report 2-26

▲SEWAGE COLLECTION SYSTEM, PUMPING PLANT— Missoula, Mont.

Five bids received by City Council, in the City Fire Hall, W. Pine and Stevens streets, Missoula, for construction of a sewage collection system and sewage pumping plant in Low's and Daly's Additions in Missoula. Plans by Clark & Groff, consulting engineers, 3240 Triangle Drive, Salem, Ore., and 408 Woody St., Missoula. Bids opened March 3. TWO LOW BIDS: Browning & Randolph, 520 Ben Vista Drive S., Salem, $225,148 (sewers, clay pipe), $212,816 (sewers, concrete pipe), $16,000 (pumping plant) $4,000 (power plant); Intermountain Co., 1322 Grove, Boise, Idaho, $231,072, $221,335, $16,518, $3,380. HI BID: Bud King Construction Co., 1203 Wyoming, Missoula, $280,094, $269,075, $14,500, $3,100. RB 3-7. Previous report 2-12

★EXCAVATING, PAVING— Sidney, Mont.

Award to Albert Lalonde Co., S. Roosevelt Ave., Sidney, $26,500, by City Council, City Hall, Sidney, for excavating, laying gravel base, paving with asphaltic mix, installing concrete curb and gutter in city streets in the area of SID No. 43. Specifications by L. W. Burdick, consulting engineer, c/o Willard Webster, Box 1134, Williston, N. Dak. EE 3-12. Previous report 2-11

● SEWAGE DISPOSAL PLANT— Twin Bridges, Mont.

Bids will be opened 10 a.m., March 27 by State Board of Examiners, G. L. Bryant, executive secretary, State Capitol Bldg., Helena, for construction of a lagoon-type sewage disposal plant at the Montana Orphans Home in Twin Bridges. Plans with Martin Kelly, state engineer, 231 Capitol Bldg., or with Walter C. Moyle, engineer, 307 Allen St., Helena. $25 deposit.

Project consists of two ponds each about 240'x150'; 1,370' sewer line leading to lift station; outfall sewer to river. LS 3-8. Previous report 6-21

ALASKA

★SURVEY SERVICES— Anchorage, Alaska

Award to Tuttle Engineering Co., Arcadia, Calif., $411,875, by Corps of Engineers, Alaska District, D-E Bldg., Anchorage, for providing survey services for the district; ENG-95-507-58-27. AL 3-7

PAVING— Anchorage, Alaska

(Approximate cost $150,000 to $200,000)

Plans will be completed late in March by Rutledge-Johnson-Tryck, consulting engineers, Glover Bldg., Anchorage, for about 9/10 of a mile of paving along portions of Railroad Ave., Co-op Ave., Colony St. in Palmer. Bids will be called later by City Council, City Hall, Palmer. Work will involve excavation, backfill, culvert installation, asphalt surfacing. AL 3-8

● UTILITY LINE SUPPORT— Anchorage, Alaska

Bids will be opened 10 a.m., March 24, in the procurement office at Elmendorf AFB, for construction of a steel and timber structure to support steam and water utility lines crossing Ship Creek at Anchorage; Inv. No. 58-108. Specifications with above office. SC 3-8

● DISTRIBUTION LINE, TRANSFORMER— Fort Richardson, Alaska

Bids will be opened 2 p.m., April 2, by Corps of Engineers, Alaska District, D-E Bldg., Anchorage, for Alaska Tactical Facilities, Support Facilities, Explosive Component Storage, consisting of constructing 2.3-kv overhead electrical distribution line, installation of one 25-kva transformer, underground service to three ammunition storage buildings (igloos), and installation of electric panels and heaters in each building, at Fort Richardson; ENG-95-507-58-21. Specifications with above office. Bid bond 20%. SP 3-

● DOCK APPROACH, PILING— Valdez, Alaska

Bids will be opened 2 p.m., March 26, by Department of Finance of the Territory of Alaska, Purchasing Division, 519 Alaska Bldg., Box 2420, Juneau, for construction of harbor facilities including construction of 380 sq. ft. new dock approach, pulling 24 creosote piling, redriving 24 creosote piling at new location, removal of 200' of float and 57' ramp from north end of harbor and installation in the south end of harbor at Valdez; Proj. No. 249653-10. Plans with above purchasing office, with Commissioner of Highways and Public Works, Alaska Office Bldg., Juneau, and with Alaska Highway and Public Works Field Office, 1228 E. 7th, Anchorage. AL 3-

NORTHERN CALIFORNIA

● APPROACH LIGHTING— Hamilton AFB, Calif.

Bid will be opened 2 p.m., March 27, by Corps of Engineers, 180 New Montgomery St., San Francisco, for constructing approach lighting including piling, earthwork, gravel walkway, new manholes and duct lines, removal of existing facilities, modifications at vault and tower and restoration of surfaces, Hamilton Air Force Base, Marin County, Calif. Ser. No. ENG-04-203-58-3[illegible]. Plans and specifications available at above address. Bid bond 20%. Completion time 150 days. RM 3-

● WATER DISTRIBUTION SYSTEM, DINING HALL— Hamilton AFB, Calif.

Bid opening extended from March 12 to 1 p.m., March 17, by Corps of Engineers, 180 New Montgomery St., San Francisco, for construction of a water distribution system and Airmen's Dining Hall at Hamilton Air Force Base, Marin County, Calif.; Ser. No. ENG-04-203-58-314.

RM 3-15. Previous report 3-

● WATER MAIN— Hayward, Calif.

Bids will be opened 8 p.m., March 25, by City Council, City Hall, Hayward, for installation of water main for Hayward Municipal Airport; Proj. No. 1038. Specifications with Edward E. Phillips, Director of Public Works, City Hall Annex, Hayward. $25 deposit. Bid bond 10%.

Quantities: 3,981' asbestos cement pipe, 6" to 12"; 76' cast iron pipe, 6"; 14 cast iron tee; 20 gate valve, 6" to 12"; 14 cast iron plug; 8 steamer hydrants; 14 hydrant guard posts; 1,800 sq. ft. replace existing pavement. RM 3-

● PAVING, UTILITIES, SHOP ADDITION— Mather AFB, Calif.

Bid opening extended from March 11 to 2 p.m., March 26, by Corps of Engineers, Room 305, Wright Bldg., 1209 Eighth St., Sacramento, for addition to field maintenance special purpose shop; concrete sidewalks, curbs and gutters; paved areas; water service, sanitary sewer and gas service lines at Mather Air Force Base, Mather Field, Calif. Spec. No. 2352; Ser. No. ENG-04-[illegible]-58-18. Plans and specifications with district engineer, above address. Bid bond 20%. Completion time—240 days. RM 3-15. Previous report 3-

▲ SITE PREPARATION, DORMITORIES— Mather AFB, Calif.

SCHOOL ADDITIONS
BIDS CLOSE 8 P.M., MARCH 26
Burton, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Board of Education of Vashon Island Public Schools at the School District Office, Vashon High School, Burton, Washington, until Wednesday, March 26, 1958, at 8:00 P.M., for (a) **General Contract, (B) Mechanical Contract,** and (c) **Electrical Contract,** separately or combined for the construction of **additions to the Burton Elementary School,** at Burton, Washington, and the said bids will then and there be publicly opened and read aloud. Bidders and others properly interested are invited to be present at the bid opening. Bids received after the time fixed for opening cannot be considered.

Bid Documents: Specifications, including bid and contract documents, and drawings, may be examined at the office of the architect, Branch & Branch, 2616 East 11th Street, Bremerton, Washington, and at the School District Office at Vashon High School.

Bonafide bidders may obtain a set at the architect's office upon deposit of a check payable to the architect in the amount of $25.00. Should a bidder wish additional sets or parts of sets, he may obtain them by paying the cost of reproduction.

Refunds of Deposits: The full amount of deposit for one set of documents will be refunded to bonafide bidders upon return of the documents in good condition to the architect's office at or before the time set for opening bids. There will be no refund for additional sets or parts of sets. Plan holders who do not submit a bonafide bid and do not return the documents at least four days before the time set for opening bids will forfeit the full amount of their deposit.

Right To Reject Bids: The owner reserves the right to reject any and all bids and to waive informalities.

By order of: VASHON ISLAND SCHOOL DISTRICT NO. 402,
By Hal D. Barton, Superintendent.

MEDICAL OFFICE BUILDING
BIDS CLOSE 4 P.M., MARCH 19
Seattle, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by Bassetti & Morse, Architects, at their offices, 1602 Tower Bldg., Seventh Ave. and Olive St., Seattle 1, Wash., until 4:00 p.m., Wednesday, March 19, 1958, for the construction of a Medical Office Building for the Minor and James Medical Bldg., Inc., and will then and there be opened and publicly read aloud. Bids received after the time set for opening cannot be considered.

Separate bids should be submitted for General, Mechanical, and Electrical Work respectively.

Plans, specifications and form of contract documents may be examined at the offices of the Architects, Bassetti & Morse, at the office of the Associated General Contractors of America, 215 West Harrison St., and at the Plan Bureau, 2413 Western Ave., Seattle.

Bona fide bidders may obtain one set of plans, specifications and documents upon deposit of a check payable to Bassetti & Morse in the amount of $25.00 each for General, Mechanical, or Electric Work. Additional sets of plans may be obtained upon payment of the actual cost of blueprinting. The deposit will be refunded to actual bidders upon return of the documents in good condition within ten (10) days after the time set for the opening of bids.

Each bid must be accompanied by a certified check, cashier's check or bid bond with a state-licensed surety or sureties in an amount of not less than five per cent (5%) of the base bid payable to Minor & James Medical Bldg., Inc., Seattle, Wash.

The right is reserved to accept or reject any or all bids and to waive all claims. The Owner reserves the right to select other than the low bidder.

No bidder may withdraw his bid after the time set for the opening thereof, unless the award of contract is delayed for a period exceeding thirty (30) days from time of bid opening.

Owner: Minor & James Medical Bldg., Inc., Architects: Bassett & Morse, A.I.A.

SCHOOL ADDITION
BIDS CLOSE 8 P.M., MARCH 20
Federal Way, Washington
NOTICE TO CONTRACTORS

Sealed bids are invited by Federal Way School District No. 210, King County, Washington, for construction of an Addition to Federal Way High School.

Bids will be received at the Administration Office of the Federal Way School District until 8:00 P.M., on Thursday, March 20, 1958, and will be publicly opened and read aloud. Bids received after the time fixed for opening cannot be considered.

Bids will be received for the General Contract, which includes the General Construction, Mechanical and Electrical Work.

Drawings and specifications, including contract documents, may be examined at the office of Lea, Pearson & Richards, Architects, 240 Stadium Way, Tacoma, Washington, and may be obtained there upon deposit of $25.00 for each set of blueprints and specifications.

The full amount of the deposit for one set of documents will be refunded to actual bidders upon return of the documents, not mutilated and without marks or annotations, within ten (10) days after the time set for opening bids. Other deposits will be refunded, with deduction for the actual cost of reproducing the drawings, under the same conditions. Plans must be returned to the Architect within five days after issuance if no bid is to be submitted. Failure to comply with any of these conditions will cause forfeiture of deposit.

Each bid must be accompanied by a certified check, cashier's check or bid bond, in an amount not less than 5% of the largest bid made payable to Federal Way School District No. 210.

The right is reserved to reject any or all bids and to waive informalities.

No bidder may withdraw his bid after the time set for the opening thereof, unless the award of contract is delayed for a period exceeding thirty (30) days.

By order of:
FEDERAL WAY SCHOOL DISTRICT No. 210
KING COUNTY, WASHINGTON
KENNETH C. JONES, Superintendent

SCHOOL FACILITIES
BIDS CLOSE 2:30 P.M., P.S.T., MARCH 27
McCloud, California
NOTICE TO CONTRACTORS

Sealed bids are requested for the construction of new school facilities for McCloud High School to be erected at McCloud, California. The buildings will be one story in height, wood frame and concrete construction, wood siding, concrete floors, built-up roofing and hot water heating. Base Bid covers a ground area of approximately 29,542 square feet, and includes 3 regular classrooms, 3 special classrooms, administration, gymnasium, locker and shower rooms, toilet rooms, music and practice rooms, and boiler room.

Bids are to be delivered to the Board of Trustees of the Siskiyou Union High School District at their office in the Warrens Building, Yreka, California, on or before 2:30 p.m., Pacific Standard Time, Thursday, March 27, 1958. The Board of Trustees reserves the right to open all bids at any one time during the meeting.

Contract documents, which include plans and specifications, may be obtained at the office of Howard R. Perrin, Architect, 1121 Main Street, Klamath Falls, Oregon, for a deposit of $50.00 per set, which deposit will be returned to the bidder upon receipt of the documents by the Architect.

Contract documents are on file at the San Francisco Builders Exchange, 850 S. Van Ness Avenue, San Francisco, California; Daily Pacific Builder, Plan Room, 465 10th Street, San Francisco; Sacramento Builders Exchange, 1331 T Street, Sacramento; Valley Contractors Exchange, 325 West 4th Street, Chico; Builders Exchange Co-operative, 317 Builders Exchange Building, Portland, Oregon; Eugene Builders Exchange, 145 East 29th Street, Eugene, Oregon; Cal-Ore Builders Exchange, 246 S. Central, Medford, Oregon; and at the office of Dr. J. E. Hurley, Superintendent, Siskiyou Union High School District, Warrens Building, Yreka, California.

Bidders are hereby notified that pursuant to the Statutes of the State of California, or local law thereto applicable, the Trustees of the Siskiyou Union High School District have ascertained the general prevailing rate of per diem wages in the locality in which this work is to be performed for each craft or type of workmen or mechanic needed to execute the contract. The prevailing rates so determined are as follows:

Brick Layers	$3.50
Brick Layers Tender	2.75
Carpenters	3.22½
Cement Finishers	2.99½
Cement Mixer, under 1 yd.	2.705
Cement Mixer, over 1 yd.	3.035
Concrete Vibrator Operator	2.575
Electricians	3.35
Iron workers, structural	3.40
Iron workers, reinforcing	3.15
Laborers, Building and concrete	2.325 to 3.375
Lathers	3.4375
Plasterers	3.375
Painters	3.00 to 3.70
Plumbers	3.45
Roofers	3.10
Sheet metal work	3.25
Steam fitters	3.45
Tile setters	3.50
Tile setters helpers	2.75

Overtime not less than one and one-half (1½) times the above rates; Sundays and holidays, not less than one and one-half (1½) times the above rates. Bidders shall check with the Building Trades Council having jurisdiction, for any rates not covered, for health, welfare, and other funds and benefits for changes in rates or benefits, which have been established by craft agreement.

Bids are to be accompanied by 5% bid bond or certified check and the successful bidder will be required to furnish a surety company 50% performance and 50% Labor and Material Bond, and he shall be required to carry Public Liability Insurance to cover all phases of the work.

The Board of Trustees of the Siskiyou Union High School District reserves the right to reject any and all bids and to waive any informalities.

Signed: James D. Herbert
Clerk

DORMITORY, PHYSICAL EDUCATION BUILDINGS

BIDS CLOSE 2 P.M., P.S.T., APRIL 3

Portland, Oregon

NOTICE TO CONTRACTORS

Sealed bids will be received by the Oregon State Board of Higher Education at Room 20, General Extension Division Building, 1633 S.W. Park Avenue, Portland 1, Oregon, until 2 P.M., Pacific Standard Time, on Thursday, April 3, 1958, for the construction of the Men's Dormitory No. 3 and the Men's Physical Education Building Addition, University of Oregon, Eugene, Oregon.

Briefly the work is described as follows:

The Men's Dormitory No. 3 consists of five separate units, three and four stories in height, reinforced concrete with brick veneer and metal panels; approximately 79,587 square feet; capacity of 329 students.

The Men's Physical Education Building Addition includes a standard type swimming pool, 42 ft. x 75 ft. The Building is approximately 104 ft. x 134 ft.

For the Men's Dormitory No. 3, separate bids will be received for General Work, Mechanical Work, Electrical Work, and Built-In Furniture.

For the Men's Physical Education Building Addition separate bids will be received for the General Work and the Mechanical Work.

Separate bids may be submitted for any type of work on either project, or both, on forms provided by the architects.

All bidders must comply with Chapter 279, Oregon Revised Statutes, relating to the qualification of bidders.

One set of drawings, specifications, and contract documents for each contract relating to the Men's Dormitory No. 3 may be obtained by **prime bidders only** from Church, Newberry, Roehr & Schuette, Architects, 619 Builders Exchange Building, Portland, Oregon, upon the deposit of $50.00.

One set of drawings, specifications, and forms of contract documents for each contract relating to the Men's Physical Education Building Addition may be obtained by **prime bidders only** from Wick & Hilgers, Architects, 909 Portland Trust Building, Portland 4, Oregon, upon the deposit of $50.00.

Additional sets may be obtained from the architects for the cost of reproduction.

The deposit made upon the procurement of drawings, specifications, and forms of contract documents will be refunded upon the return thereof in good condition by actual bidders within two weeks after the opening of bids, but to non-bidders only if returned no later than two weeks prior to the bid opening.

The drawings, specifications, and forms of contract documents for each project may be examined at the Builders' Exchange in Portland, Eugene, and Salem, Oregon, and at the offices of the architects.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid forms provided by the architects and accompanied by a certified check or a bid bond executed in favor of the State of Oregon and the Oregon State Board of Higher Education in an amount not less than ten per cent (10%) of the total amount of the bid to be forfeited as fixed and liquidated damages should the bidder neglect or refuse to enter into a contract and provide suitable bond for the satisfactory performance of the work in the event the contract is awarded to him.

The Oregon State Board of Higher Education reserves the right to reject any or all bids and to waive all informalities.

No bidder may withdraw his bid after the hour set for the opening thereof until after the elapse of 30 days from the bid opening.

OREGON STATE BOARD OF HIGHER EDUCATION,
Earl M. Pallett, Secretary
Eugene, Oregon

6065—3-12

STATE HIGHWAY PROJECTS

BIDS CLOSE 10 A.M., MARCH 18

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, March 18, 1958, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal funds have been allocated for items Nos. 1 to 6 inclusive.

The improvements for which bids will be received follow:

1. Clearing, Draining, Grading, Surfacing and Paving with Cement Concrete on 3.626 miles of Primary State Highway No. 3 in Spokane County, WASHINGTON ROAD TO HATCH ROAD, FAP No. F-037-2(5), involving about 91 acres of Clearing, 437,270 cubic yards of Common Excavation, 438,560 cubic yards of Solid Rock Excavation, 65,250 units of Overhaul, 9,330 cubic yards of Top Soil, 65,710 tons of Selected Roadway Borrow, 27,190 tons of Crushed Surfacing and Crushed Cover Stone, 192 tons of Asphalt Cement, 800 tons of Asphaltic Concrete, 51,050 square yards of Cement Concrete Pavement, 28,080 pounds of Steel Reinforcing Bars, 140 linear feet of Metal Pipe, 3,876 linear feet of Concrete Pipe, 9,574 linear feet of Beam Guard Rail, 14 Guide Posts, 1,000 tons of Loose Riprap and other items.
2. Surfacing, Constructing Bituminous Surface Treatment, Constructing Cement Treated Base, Paving with Asphaltic Concrete and Installing Illumination on 3.759 miles of Primary State Highway No. 1 in Snohomish County, STIMSON ROAD TO PORTAGE CREEK, FAP No. I-001-4(19), involving about 11,310 cubic yards of Common Excavation, 4,520 cubic yards of Top Soil, 52,370 tons of Selected Roadway Borrow, 16,870 tons of Crushed Surfacing and Crushed Cover Stone, 389 tons of Asphalt Cement, 7,800 barrels of Portland Cement, 105,760 square yards of Cement Treated Base, 45 cubic yards of Prime Coat Aggregate, 25,930 of Asphaltic Concrete, 2,130 linear feet of Asphaltic Concrete Curb, 775 linear feet of Asphalt Lined Spillway and Roadway Ditch, 710 linear feet of Extruded Traffic Curb, 14 linear feet of Metal Pipe, 124 linear feet of Concrete Pipe, 1,227 linear feet of Beam Guard Rail, 188 Guide Posts, 540 tons of Loose Riprap, 140 linear feet of Wire Fence, a lump sum bid for Illumination System and other items. Minimum Wage Rates for this project have been predetermined by law and are set forth in the bid proposal.
3. Surfacing, Constructing Bituminous Surface Treatment and Paving with Asphaltic Concrete on 1.172 miles of Primary State Highway No. 12 in Pacific County, WILLAPA RIVER BRIDGE APPROACHES, FAP No. F-006-2(4) Unit 2, involving about 200 cubic yards of Common Excavation, 42,260 tons of Ballast, Crushed Cover Stone, Maintenance Rock and Crushed Screenings, 60 tons of Asphalt Cement, 210 cubic yards of Prime Coat Aggregate, 3,300 tons of Asphaltic Concrete, 360 linear feet of Precast Traffic Curb, 46 cubic yards of Concrete, 10,320 pounds of Steel Reinforcing Bars, 89 Guide Posts, 500 cubic yards of Riprap and other items.
4. Clearing, Draining, Grading, Surfacing, Paving with Bituminous Plant Mix and Constructing Two Reinforced Concrete Slab Bridges on 0.341 mile of Primary State Highway No. 9 in Grays Har-

Your Inquiry Will Get Special Attention

Pacific Standard Time, Wednesday, March 26, 1958, for the CONSTRUCTION OF TWO RESIDENCES, ROADWAYS AND PIPELINES, at the Oak Springs Hatchery near Maupin, Oregon, and will then and there be opened and publicly read aloud. Bids received after the time fixed for opening the same will not be considered.

Plans, Specifications and Forms of Contract documents may be obtained at the office of the Oregon State Game Commission at 1634 S.W. Alder Street, Portland 8, Oregon.

All contractors shall comply with all state laws pertaining to the qualification of bidders, and particularly Oregon Revised Statutes 279.008 to 279.342, inclusive.

Each proposal shall be made out on a Bid Form contained in the contract documents and shall be accompanied by a certified check or Bid Bond made payable to the Oregon State Game Commission of the State of Oregon in an amount not less than ten per cent (10%) of the total amount of the proposal.

The Oregon State Game Commission reserves the right to reject any or all bids.

No bidder may withdraw his bid after the hour set for the opening unless said award is delayed for a period exceeding 30 days.

AUDITORIUM, CAFETERIA BUILDING
BIDS CLOSE 1 P.M., MARCH 18
Balboa Heights, Canal Zone
NOTICE TO CONTRACTORS

Sealed bids will be received in the office of the Engineering and Construction Director, Panama Canal Company, Balboa Heights, Canal Zone, until 1:00 P.M. March 26, 1958 and at that time publicly opened, for the work and material required in the construction of R.O.T.C. activities facilities at Balboa, Canal Zone. The work consists of building one new masonry auditorium seating 600, complete with stage, and band, choir, rehearsal, recording rooms. Also, one new R.O.T.C. masonry building with cafeteria and appurtenant facilities. Data are available for examination in the office of Chief, Procurement Division, Panama Canal Company, 21 West Street, New York 6, N. Y. Complete sets of data may be obtained upon payment of $50.00 deposit which will be refunded if data are returned within 40 calendar days after bid opening. Telephone Bowling Green 9-5300, extension 130.

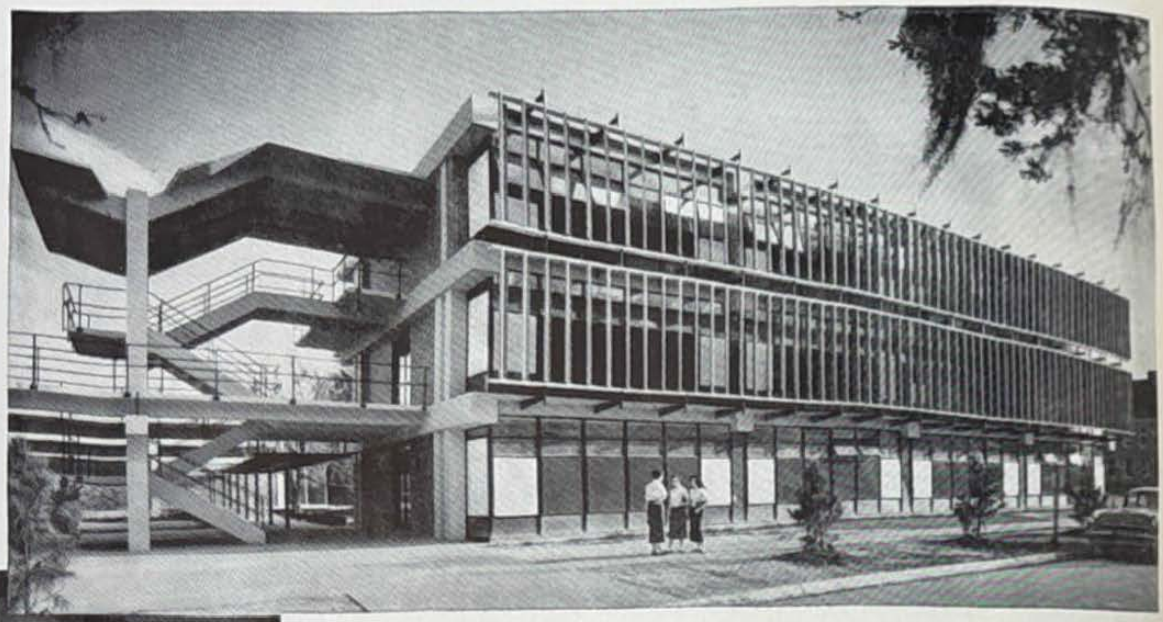
BOLD NEW DESIGN

for a Fine Old Tradition



MEMORIAL STUDENT UNION
SOUTHWESTERN LOUISIANA INSTITUTE,
Lafayette, Louisiana

General Contractor:
BARKSDALE & LeBLANC,
Baton Rouge, Louisiana

Architect and Engineer:
BURK, LEBRETON & LAMANTIA,
New Orleans

Lone Star Concrete supplied by
LAFAYETTE LUMBER COMPANY,
Lafayette, Louisiana

The Spirit of Southern Hospitality Finds Dramatic Expression in These Modern New College Campus Buildings

• Memorial Student Union strikes a note of pleasing contrast amidst academic surroundings and architecture of by-gone days.

Set beside a small pond, overhung with magnolia and Spanish moss, the impressive structures dominate the social life of the students on the campus of Southwestern Louisiana Institute, in Lafayette, Louisiana.

Three interconnected buildings comprise the student union, housing the college bookstore, post-office, snack bar, ballroom and other recreational facilities.

Significantly, the structures are built with reinforced concrete to meet today's needs and the challenge posed by the generations of tomorrow.

Concrete combines great strength, economy, fire-safety and beauty in one versatile material, providing the widest possible latitude for the designer's creative skill backed up by sound construction know-how.

In these fine structures, there were 4000 barrels of Lone Star Portland Cement used. For complete dependability and assured uniform quality, use Lone Star Portland Cement.

BULLETINS

The Portland firm of Stewart & Richardson early this month was named architect for the Oregon Centennial Exposition and International Trade Fair by the Centennial Commission, which has been under constant fire the past several months for its handling of the design development. Among those who pressed hard for the appointment of an architect was John K. Dukehart, newly elected president of the Oregon Chapter, AIA, who, in referring to the centennial celebration, said: "The architect has been relegated to the position of decorator or embellisher and to date all planning has been dominated by an entertainment organization."

California architects have been invited to attend the convention of the Central California Chapter, AGC, in Monterey April 24-26. Main session on the final day will be devoted to the relationship of architect to builder—and vice versa—and of both to owner. Among the speakers: architects John S. Bolles and Nathaniel Owings and contractors L. D. Weirick and Frank F. Burrows.

Washington State Regional Laboratory (see PA&B for April '57) will be dedicated on the WSC campus at Pullman April 25. Principal speaker at the banquet, to be held in conjunction with the annual meeting of the students and the Spokane Chapter, AIA, will be Charles W. Attwood, representing the Building Research Institute and Unistrut Corp., the firm which donated the structural steel framework for the two-classroom building.

Correction: The news article on page 10 concerning the dedication of Lawrence Hall at the University of Oregon inadvertently failed to credit Annand, Boone & Lei as architects, working with Dean Little and his staff.

THE CALENDAR

National Association of Architectural Metal Manufacturers—annual convention, Shamrock Hilton, Houston, April 27-May 2.

Western Air Conditioning Industries Association — conference and exhibit, Shrine Exposition Hall, Los Angeles, May 7-11.

Stanford Research Institute — annual western area conference, Vancouver, B. C., May 26-27.

THE BUILDING MONTH: TRENDS

Seattle's metropolitan government proposal—the Metro Plan—which would have set up a municipal corporation to handle sewage, public transit and planning lost at the polls in March when it failed to win a majority of the votes in the suburbs. But unabashed, a group of citizens, with East Side suburbanites this time taking the initiative, are drafting another proposal which will deal only with sewage disposal and pollution, eliminating the transportation and area planning functions of the original plan. Their aim: to submit the measure at the September primaries.

San Francisco's problems too can only be handled effectively on an areawide basis. So declared Reginald H. Biggs, retiring chairman of the San Francisco Bay Area Council at the annual meeting March 26; and his successor, Edgar F. Kaiser, said that the group would press for a comprehensive study of these problems—the need for land use planning, for a unified highway and transportation system, for an adequate future water supply, for air and water pollution control, for recreational facilities.

Real estate magnate William Zeckendorf came to Los Angeles to address the Southern California Chapter, AIA, last month and before he left he disclosed plans ("just in the talking stages") for a $550 million housing development in the Santa Monica Mountains. The head of New York's Webb & Knapp Co. said there would be only one giant apartment house for each 100-acre tract and all but the building site itself would be preserved in its natural state except for parks, tennis courts, etc.

A contractors' licensing law designed to police the industry has been drafted by the Home Builders Association of Washington State and will be submitted to the next session of the legislature. The proposal would protect the public from unethical operators and would impose restrictions on violators.

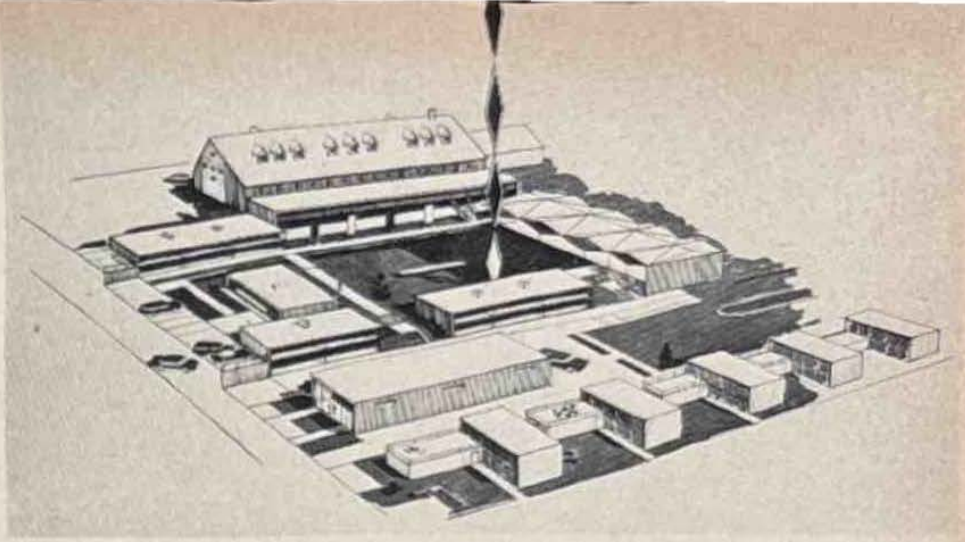
A tractor-trenching device that digs for subsurface drainage systems, forms pipe from a plastic sheet and backfills the hole was among recent developments to be introduced to members of the Building Research Institute at their seventh annual meeting in Washington, D.C., this month. Executive director William H. Scheick reports that pipe can be laid by this system at a quarter of the cost of current methods. Developed by the U. S. Department of Agriculture, it also makes possible the reclaiming of swampy, marginal land for development purposes.

Formation of National Cement-Asbestos Erectors Association "heralds the recognition of the importance of this industry which has for many years performed a noteworthy and illustrious service in its part of the building industry," says executive director C. C. Figge, who headquarters at 189 W. Madison St., Chicago.

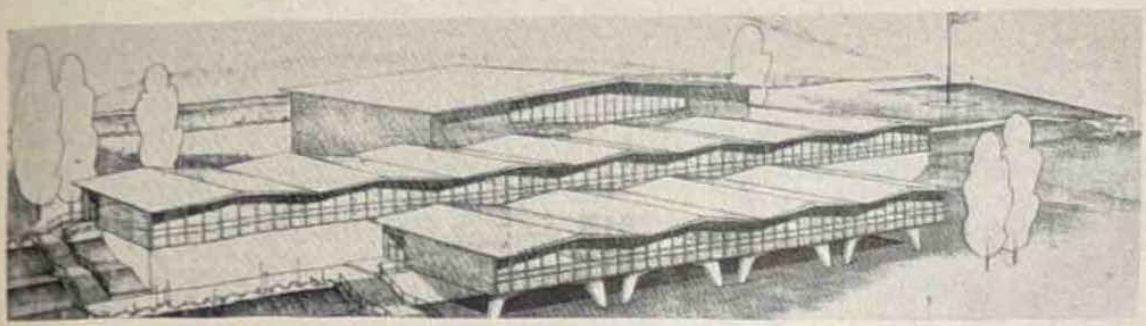
Total engineering enrollment in the U.S. and its outlying parts in institutions accredited by the Engineers' Council for Professional Development reached an all-time high of 257,777 students in the fall of 1957, a 5.5% over the previous peak reported in 1947. A year-to-year increase has been shown since 1951.

A full-scale sun heated home has been built by the Massachusetts Institute of Technology, practical in every way except the initial cost of its hand-made heating system. This could make it too expensive for the average home owner "in the near future," explains a professor of MIT's School of Architecture and Planning. South side of the glass roof lets the sun heat in, but keeps the long heat waves from getting back out again. Copper tubes are attached to the back of a black-painted aluminum sheet, just under the glass, and water circulates through the tubes. Hot water is pumped through a heat exchanger upward through ducts and registers to all rooms of the house. (For an article on a solar house which has been opened near Phoenix, see p. 8.)

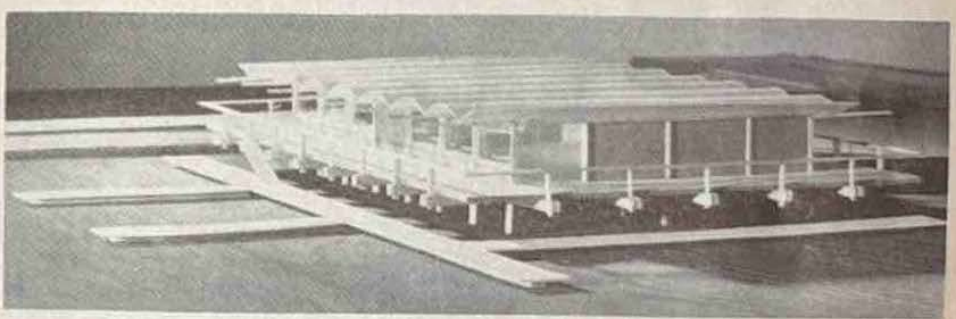
PROJECT PREVIEW



COASTAL RESORT on U. S. Highway 101 near Oceanlake, Ore., will be expanded in $250,000 development, to include renovation of existing Dorchester House. Identifying sculptured tower of light will rise from central gardens, around which will face full-length extension to main structure, four cabanas with view decks and swimming pool building (note faceted roof). Community activity building for indoor sports and additional cabanas will be located further west on seaward side. Oregon cedar and fieldstone will be principal materials. Designer: Robert K. Grubb.



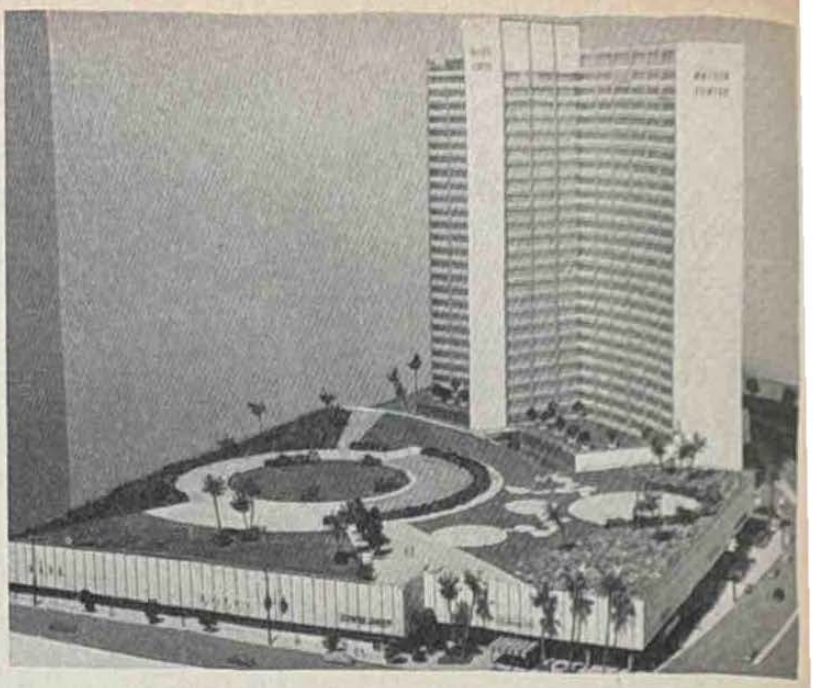
ELEMENTARY SCHOOL to be built of steel frame, brick and aluminum curtain walls and laminated wood roof in Butte, Mont., takes advantage of rolling site to provide three levels and reduce construction costs. Front portion, with covered play area underneath, will contain four classrooms; center section will have four classrooms, administrative offices, nurses' room, faculty lounge; rear portion will house all-purpose room equipped with stage, storage and locker rooms, electric kitchen. Architects-engineers: J. G. Link & Co.



YACHT CLUB in Sausalito, Calif., will be shared by owners of two types of craft—sailboats and power cruisers—who decided to pool limited funds but insisted upon retaining their respective identities. Flexible plan provides for common main entrance and toilet facilities; two separate lounge areas; and main hall adjacent to either lounge, which can be closed off. Because most of hillside residences will look over building, special consideration was given to roof, of lightweight, plywood barrel vaults. Architect: Theodore T. Boutmy; consultant: George Kasmak; structural engineer: John Brown.

OFFICE BUILDING for midtown Honolulu, near Waikiki Beach, will feature roof garden restaurant with ocean view on three sides through glass window walls and revolving lounge, making one complete turn an hour. Vertical sunshades, rotated by electric eye, will afford sun protection for entire 17-story structure, to adjoin regional shopping center now in advanced planning stages. Architects-engineers: John Graham & Co.

JOB OF THE MONTH



COMPLETE SHOPPING CENTER, five-level parking structure and four-acre roof garden all will be part of $45 million project, which will house more than 3,000 Kaiser employees.

Oakland's Kaiser Center: city within a city

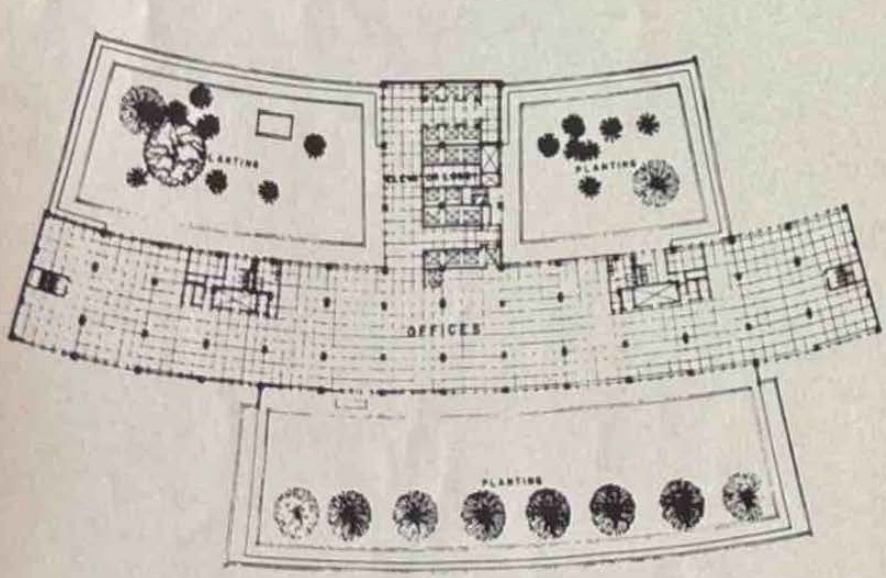
Letting of final major contracts clears the way for all-out construction of the $45 million Kaiser Center, which will dominate a seven-acre site overlooking Lake Merritt in downtown Oakland when completed in late 1959.

Robert E. McKee, Inc., of Los Angeles has been awarded a contract for general construction of the office building and another for the five-level garage and shopping center structure.

Designed by Welton Becket & Associates, the center's 1,650,000 sq. ft. of space will include a gross area of 976,000 sq. ft. in the office building—making it the largest west of the Rocky Mountains—and 674,000 sq. ft. in the shops and parking structure. Murray Erick Associates are structural engineers; Dudley Deane & Associates, mechanical-electrical engineers.

Rising 390 ft. above street level, the office building will be floated on a 5-ft. thick concrete slab foundation, 62 ft. wide by 420 ft. long. Subsurface work, performed by MacDonald, Young & Nelson, Inc., of Oakland, has been underway since late 1957 and should be completed this month.

The building will provide executive and general staff offices for Kaiser Industries Corp. and its some 50 affiliated companies. More than 3,000 employees will be housed in the office structure, whose capacity will be 4,500.



TYPICAL OFFICE FLOOR

Exterior: Sheathed front and back in anodized gold and gray aluminum and glass, the 28-story building will form a curved arc following the shoreline. End panels of the office structure will consist of 5x13-ft. sections of precast white dolomite aggregate stone. Special window glass will eliminate heat and glare. About 150,000 sq. ft., or 3½ acres, of glass will be employed throughout the building.

All roof decks of the entire center will be landscaped, as will perimeter streets adjacent to shop fronts.

Interior: The office structure will include 20,000 sq. ft. of space for shops on the first floor, an auditorium, cafeteria, electronic computer section and a medical clinic for employees. Main entrance will be from the Lake Merritt side. A two-story open well will connect ground floor and second floor lobbies, with an escalator threading through the well to the upper lobby.

Both lobby areas will be given special decorative treatment, incorporated with interior planting. A mosaic mural is planned for the wall near the main entrance. Lobby walls will feature precast polished panels fashioned from Kaiser materials.

Seventeen high speed automatic elevators will carry traffic from the lobby to three zones.

Main auditorium on the second floor will seat 400 persons. It will contain specially designed king-size seats, a projection booth, light coves in a recessing pattern of vertical troughs along the sides and a large glass-en-

PROJECT SITE, as indicated by model superimposed on Oakland skyline, is western shore of Lake Merritt.

CAFETERIA-DINING ROOM, overlooking lake on second floor, will accommodate 800 persons, can be converted into 1,200-seat banquet room by closing off serving area.

closed foyer fronting the lake.

Walls of the dining room will be precast polished dolomite stone panels, while one end will be decorated with a low 60-ft. long planter complemented by individual plants bracketed to the wall. Featuring blue, yellow and white, the room will have certain areas of the ceiling lowered to form geometric designs.

Private dining rooms, the medical clinic and general office areas will complete the second floor facilities. Additional offices and the electronic data processing section will be on the third, while executive and general offices will occupy the rest of the building through the 27th floor.

An executive dining room on the 28th floor will seat 175 persons.

Special Features: The radiant ceiling air conditioning will consist of perforated squares of aluminum, behind which is assembled a system of pipes carrying hot or cold water. Interior air will be circulated through ducts, also located in the ceiling.

A push-button control mailing system will deliver mail to any floor of the building by the simple pressure of a finger. Pneumatic tubes will be used for the transmittal of wire messages.

Reduction of building costs is main objective of industry research group

When the Building Research Advisory Board and the Building Research Institute met in Washington, D.C., for a joint meeting in February, they heard 11 speakers develop a list of problems as a challenge to everyone concerned with building design and construction. Problems for 1) creators of buildings, 2) researchers on new products, 3) owners and operators of buildings were presented in PA&B last month. Here is the conclusion of that list.

Problems in housing research

1. Among the basic problems affecting housing research is the diversification of the industry consisting as it does of consumers, code and government regulatory bodies, mortgage bankers, designers, manufacturers, appraisers, builders, subcontractors and labor. All need to be educated to today's concept of housing research.

2. Another obstacle to progress in housing research is the fact that housing has become a political, social and economic issue in today's society.

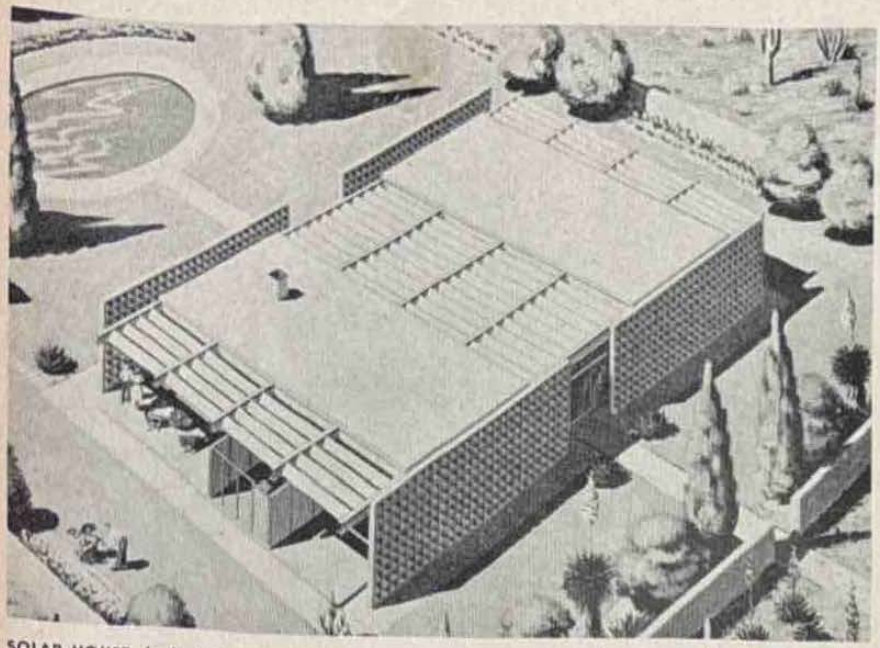
3. The basic long range problems of the industry to be solved by research include:

a) Provision of community facilities.
b) New sources for mortgage financing.
c) Improved marketing and distribution of materials.
d) More scientific facts on the subject of obsolescence and decay.
e) Improved trade-in systems.
f) More facts about skilled labor sources and on site productivity.

4. In the field of costs, research must provide information leading to better houses at lower cost, or our very political system is in jeopardy.

5. Specific objectives of housing research should:

Continued on p. 25



SOLAR HOUSE, built from prize-winning design by Peter R. Lee of Minneapolis, consists of two distinct sections, separated by central court and connected by glass-enclosed walkway. Concrete masonry screen walls along east and west sides shade actual walls of house from sun's direct rays. Insulation in inner walls and ceilings of house, combined with built-up wooden roofs, offer protection from summer sun.

Solar house makes debut in Arizona

America's first house designed to receive all of its heat requirements from the sun was opened to the public April 13 in Paradise Valley, seven miles from Phoenix.

The structure will utilize only mechanical equipment now generally available through commercial sources. The system as used in this house can be employed effectively in two-thirds of the U. S., reports John I. Yellott, executive vice president of the Association for Applied Solar Energy, project sponsor.

Though a dozen other structures across the nation use solar energy in various ways, this is the first to rely on the sun completely for its year-round heat requirements. Solar energy will provide winter heat for the house and swimming pool and will heat the domestic water supply throughout the year. Heat is stored during sunny periods to use in cloudy spells.

The house incorporates a unique solution to the related problem of minimizing the cooling load during the summer. Solar collectors are utilized as shade-producing louvers. Integrating the swimming pool with the air conditioning circuit allows the heat pump to operate with maximum economy in both winter and summer.

The Arizona house gathers solar energy by means of a series of collector panels which are turned to face the sun each day. At night and during the summer, they are rotated so that their aluminum-clad backs face the sky. Water circulated through copper tubes in the collectors is heated and stored in an underground tank, providing a reserve of heat for use at night and during cloudy weather. This heat is transferred into the house as needed by coils mounted on the intake faces of two standard air-to-air heat pumps.

A double-floor system is used in which conditioned air circulates under each room before entering the house through perimeter grilles. This combination of radiant and convection heating and cooling will result in comfortable conditions throughout, with minimum heat loss in winter and heat gain in summer.

The solar heating system transfers heat to the swimming pool during the winter by means of a grid of copper pipe buried in the bottom of the pool. During the summer, the pool is used to cool the water from the storage tank, after this water has been used to precool the air passing over the heat pump condenser. This integrated system enables the swimming pool to be used as a reserve for heat pump use during the winter and to minimize the cooling bill during the summer.

An improtant feature of the house will be a complete set of instruments by which every aspect of its performance can be measured, including the amount of solar energy which falls on the house, the amount of heat picked up by the collectors and the temperatures at significant locations on, in and under the house. Power used by the heat pumps, water circulators and fans also will be recorded.

"We are definitely past the experimental stage in solar heating," Yellott declares. "The combination of 1958 model solar energy collectors with standard heat pumps makes possible the utilization of the sun's energy to provide comfort in both winter and summer."

Use of solar energy in heating is important not only to reduce heating bills but also because fossil fuels—gas, oil and coal—already are approaching exhaustion in areas of the world such as England and are scarce in other nations such as Greece and Turkey, Yellott points out.

Actual construction of the house, which cost $30,000 exclusive of the solar heating system, was supervised by the solar energy committee of the Phoenix Association of Home Builders, headed by Bernard Young of Scottsdale. Interior decoration was handled by Houston Barton of Phoenix.

Western architects cited for religious buildings

Five of the 15 awards in the annual institutional architectural competition sponsored by Catholic Property Administration magazine have gone to West Coast architects.

Comeau & Brooks of Encino, Calif., won two citations for their design of St. Lawrence Martyr School and Rectory, Redondo Beach: a first place for an elementary school accommodating 400 or more and a distinctive design award for a small rectory.

A first place also went to Gene Verge and R. N. Clatworthy of Los Angeles for Providence High School (accommodating no more then 750), Burbank. Distinctive design award winners: Vincent G. Raney of San Francisco for St. Hilary Church (seating no more than 400), Tiburon; and Lea, Pearson & Richards of Tacoma for Aquinas Academy (high school accommodating no more than 750), Tacoma.

The four-man jury based its selections on how well the designs offered solved any particular problem or filled a specific need.

Public vs. private openings

. . . A tale of two letters

A "strong protest" lodged by a contractors' association concerning secretive bidding procedures of a supermarket chain has resulted in a reply by a company vice president who intends to recommend adoption of public openings. (Carbon copies of both letters were sent to PA&B.)

Colton Harper, manager of the Seattle Chapter, AGC, in a letter to the Oakland headquarters of Safeway Stores, Inc., referring to the firm's bid letting on a distribution center in Bellevue, pointed out "that 10 days' time elapsed from the time of the opening until the announcement of the award. Throughout this 10-day period a large segment of the construction industry of this area could not schedule its bidding on other projects since it did not know if it were to do Safeway's work or not."

Harper's letter continued: "It has been our policy to support public bid openings in all cases. We believe that if all bidders are aware of their position in the bidding at a given time when all bids are opened at once, then goodwill toward the owners will far outweigh any benefits that might be derived by your present policies."

The Answer: Vice president G. T. Burroughs' reply read in part: "While I still prefer public openings, I recognize there are certain advantages to private openings and that private openings are not uncommon throughout the country. One of the problems, as you well know, of public openings is the fact that usually on most major jobs several alternates are called for and at times the alternates selected would determine the bidder. Frequently, one of the bidders will submit an alternate which was not in the plans and specifications but which is acceptable to us. With private openings, we can request the other contractor to submit a revised bid including the alternate without putting the low bidder at a disadvantage by disclosing his bid. With public openings the other bidders would have an opportunity to 'sharpshoot' at the low bidder. This, of course, would be to our advantage rather than the contractor's.* Where alternates are involved, it is frequently impossible to determine the low bidder until the alternates have been determined. Due to this fact, it is seldom possible, at the time of the opening, to advise any particular contractor that he is the low bidder.**

"You criticized the 10 days' time that elapsed from the opening until the announcement of the award. I do not feel that this is an unduly long time. In this particular case, a public opening would have determined the low bidder immediately as the successful bidder was low regardless of any combination of alternates. However, this is the first big job we have had for some time where this was the case . . .

". . . in spite of some obvious objections to public openings, I still prefer them and intend to take the matter up again at our next executive meeting and recommend the adoption of such a policy."

Editors' note

*We feel that the contractor who submits an unspecified alternate which is acceptable to the owner should be given the advantage of his ingenuity without further bidding.

**Far more complicated jobs than stores are subject to public openings. Schools and other institutional projects are opened publicly, have many alternates and the field usually is narrowed to two or three contractors right at the time of opening.

PA&B wishes to lodge its own protest against a few private enterprises such as Safeway Stores which fail to cooperate with news sources in releasing information on construction projects.

Oregon dedicates new architectural hall

RESEARCH LIBRARY (left), consisting of 3,000 sq. ft., is connector between remaining portion of old building and new architectural unit (below) on Eugene campus.

The School of Architecture and Allied Arts at the University of Oregon has been occupying its new home since last summer, but the building was dedicated in a formal ceremony April 12. And the night before Dean Pietro Belluschi of Massachusetts Institute of Technology spoke at a banquet to honor the occasion (too late to be reported in this month's PA&B).

Known as Lawrence Hall after the late Dean Ellis F. Lawrence, who organized the school in 1916 and served as its first head until 1945, the structure consists of more than 70,000 sq. ft. of floor space, divided almost equally into new building and a rehabilitated portion. The former houses the architectural division of the school; the latter is used for the studio needs of painting, drawing, art education and applied design.

The new portion is a concrete frame with aluminum skin exterior. In the buildings are facilities for exhibition space, public review rooms, large drafting rooms and studios. Outdoor studio space also is provided.

Original design and preliminary sketches for the project, as was the final landscape plan, were developed by a committee of the school faculty, headed by Dean Sidney W. Little.

Dean explains plan to revamp U.C. architectural college

Proposed creation of a College of Environment Design at the University of California would make the College of Architecture a department, along with city and regional planning and landscape architecture.

Dean William F. Wurster, appearing at a meeting of the directors of the California Council, AIA, in Berkeley, emphasized that formation of the new college would not affect the architectural curriculum or degree. Aside from internal administrative advantages, principal benefit would be a closer relationship and understanding between students of the three professions involved, he explained.

Wurster's appearance was prompted by a letter from the council to U. C. President Robert Gordon Sproul requesting information and asking that the architects have an opportunity to express their opinions before the reorganization takes place. It was noted at the meeting that the proposal has been under discussion for eight years without officially coming to the council's attention.

The board voted to establish a liaison committee whose first task will be evaluation of the reorganization plan.

First CSI chapter in N.W. elects officers

Newly formed Construction Specifications Institute, Puget Sound Chapter (only one in the Northwest), elected officers March 18 at a meeting attended by some 40 members in Seattle.

President Wallace W. Macdonald, architect with the office of John W. Maloney, Seattle, will be assisted by vice president Donald E. Paine, architect with Wohleb & Wohleb & Associates, Olympia, and secretary-treasurer Ralph E. Yoder, regional director of the SCPI Pacific Northwest Brick & Tile Association, Seattle. Directors are Clarence H. Irwin, architect with the Maloney firm (three years); A. Dallas Hagan, U. S. Gypsum Co., Seattle (two); Kenneth C. Helms, architect with Jones, Lovegren, Helms & Jones, Seattle, and James W. Mosman, architectural engineer with the 13th Naval District, Public Works Design Division, Seattle (one).

CSI serves the specification writers whether they be architect, engineer, contractor, building materials manufacturer or student, says Macdonald. Main objective, he adds, is to provide common ground for discussion and thought on ways and means of improving the form and content of specifications as applied to the construction and allied industries.

The national organization has headquarters in Washington, D.C.

OFFICERS of Puget Sound Chapter, Construction Specifications Institute, are Ralph E. Yoder, secretary-treasurer; Wallace W. Macdonald, president; Donald E. Paine, vice president.

ESCO HELPS YOU OPEN NEW DESIGN FRONTIERS

WITH SPECIAL STAINLESS STEEL SHAPES AND FINISHES

Design opportunities with stainless steel in a wide variety of stock shapes and finishes are limited only by the imagination. For example, skins for office buildings, railings, ductwork and trim in stainless steel can accomplish striking, as well as lasting decorative or structural design achievements.

Stainless sheet and plate are available in a complete range of surface finishes. Stainless pipe and tubing are available in many unusual shapes as well as standard shapes in all sizes. Stainless bar, wire, fittings and fastenings further expand the designer's freedom. Plastic extrusions are also available.

Increase your freedom of design. Ask your nearest ESCO representative for available literature, specifications and samples.

BUILDING PERMITS

First quarter shows $36.5 million gain

Building permit volume for the first quarter in the five western states totaled $601,062,420, a good $36½ million increase over the same period last year. Most of the gain was in California where the dollar volume rose $34 million over 1957. Washington chalked up a $5 million increase and Idaho was just $37,219 higher. Oregon dropped $1 million and Montana, $2¼ million.

First quarter tabulations by states:

	Jan.-Mar. 1958	Jan.-Mar. 1957
Calif.	$497,548,885	$462,843,815
Oregon	26,625,422	27,602,749
Wash.	69,127,486	63,934,569
Mont.	3,142,764	5,700,687
Idaho	4,617,863	4,580,644

For the month of March, the five-state total climbed to $249,616,307, highest monthly total since July 1956 and $29¾ million more than last March. California picked up $31¼ million; Oregon, $1½ million; and Idaho, $118,108. Washington and Montana each dropped $1½ million.

The big increase in California was due mainly to exceptionally large totals for several permit agencies.

ANALYSIS OF TYPICAL AREAS — MARCH

(Number of permits is followed by total dollar volume)

	Dwelling		Commercial & Industrial		Public	
Portland	71	$ 1,403,890	16	$2,533,725	2	$ 59,000

NEW BEAUTYWARE BRASS FITTINGS
—a new and different concept in plumbingware fittings with smooth sculptured lines in gleaming chrome-plate. If desired, interchangeable color inserts can be matched to any of the Briggs colors.

A complete line of plumbing fixtures for residential, commercial, and industrial buildings.

Briggs ideas that help sell more homes

An Early American bathroom achieved with contemporary materials

Imaginative use of modern materials can make your home a "stand-out"! This Briggs Beautyware bathroom, for instance, combines modern wall paneling, tiles and flooring to create an eye-catching Early American effect. And, of course, the key to this design is Briggs Beautyware—as contemporary as the materials used. Smoothly contoured lines, newly-designed brass fittings and six compatible colors—Sky Blue, Sea Green, Coral, Sandstone, Pearl Gray and new Autumn Yellow—allow full freedom of expression. Give your homes added appeal, added distinction. Build with Briggs Beautyware.

Highway program: unguided missiles, unbridled building

Scores of speakers shared the rostrum when the National Association of Home Builders met in Chicago for its annual convention earlier this year. Here is a roundup of some of the papers that may have got lost in the shuffle, but are worthy of at least brief mention.

Morals and Money: Carl Feiss, planning and urban renewal consultant to a number of cities and firms in the East, pulled no punches in analyzing the important question of the relationship between our national highway program and housing.

"I am talking to you about this problem because all of these people who are writing on the subject of urban sprawl and unplanned metropolitan growth and the slums of the future are really afraid of you," he explained. "They are afraid of what you are going to do as home builders to make the complex American cities and suburbs even more complex. There is no confidence that you have formulated by yourselves adequate standards of development and sufficient public responsibility to make it possible to count on you, under your own steam, to build the kind of community and the kind of nation that we believe in, and want, and that we know can and should be built.

"What you are seeing happen is that specialists in the field of community development and management are beginning to prepare safeguards, protective devices, plans and programs directed toward some kind of logical order. They know that without such devices further chaos is inevitable, followed by deterioration and ultimately slums and all of the familiar problems."

Feiss explained that he was not on the platform to predict dire results, but rather to point out the fact that "we face a shameful situation where the government which we elect in our free society finds it is necessary to protect its citizenry from the license of free enterprise. I use the word 'license' in terms of free-wheeling and irresponsible enterprise as against that type which is mature and responsible and free as well."

The planning consultant made it clear that the new highway program will open up new land for development, adding: "I don't question for one moment that the program is going to be a money-maker for the home builder. I don't question that smart operators are going to keep their eye out for every interchange along all the major routes and will begin to buy up land as soon as the cloverleafs have been staked out. This is going to be a quick business for the farmer and it's going to be a good quick business for the home builder. The great question is: Is it going to be good business for anyone else, and in particular, is it going to be good business for the United States of America?"

Highways and Byways: Edward H. Holmes, assistant commissioner for research, Bureau of Public Roads, in discussing the need for coordination of highway plans with city and regional programs, asked the home builders to support the American Assocation of State Highway Officials and the American Municipal Association which have created a joint committee to work in this field.

"Two other committees are important in this area and also deserve wide support," he added. "One is the National Committee on Urban Transportation which is just now releasing a guide entitled 'Better Transportation for Your City'—an excellent reference supported by a series of procedural manuals prepared by the committee with the aid of over 100 experts in this field. The other is the Urban Research Committee of the Highway Research Board which seeks to encourage fundamental research in the role of the city in our future.

HOUSING PRODUCTION FIGURES
(for the U. S. since 1940)

Year	Total Private Starts
1940	529,600
1941	619,500
1942	301,200
1943	183,700

1954	1,201,700
1955	1,309,500
1956	1,093,900
1957	989,100

Highways and Houses. Harry A. Bowell Jr., builder and developer of Washington, D. C., emphasized that what is needed immediately in this mushrooming America is a "marriage" of land planners, highway planners, home builders and city officials to coordinate orderly growth of the United States.

"The highway program is important to every element of our society," he commented. "Builders, therefore, are provided with unique opportunities for responsible leadership. But our responsible builders must point out that both builders and officials concerned with community planning are going to suffer if the present lack of coordination among all persons with a vital stake in community growth is allowed to continue.

"Land planners have to understand builders' reasons for their suspicions. First, present disagreements between land planners, highway planners and other departments of city government are almost amounting to a public scandal in many sections of the nation. Second, everyone knows that community plans and zoning requirements too often are not developed for the best functional use, but instead are designed to restrict development."

"Strip Trees" Acts. Edward R. Carr of Washington, D. C., past president of NAHB, criticized builders who engage in "strip trees" acts, stating that trees are a greatly overlooked asset by many of his colleagues.

"You can make more money and improve your public relations tremendously by saving trees in your new housing developments," he continued. "For years I have been preaching this doctrine up and down the entire country and practicing it as well. I cannot understand why more builders do not realize that trees are an economic asset. People like trees. Paste that simple statement in your hats."

Carr also gave a tip to the builder on a method for getting the most out of wooded lots for the smallest investment. He suggested that they leave standing all the trees in the rear of each lot. In that way, two back-to-back lots can provide a goodly strip of wooded land and in a development of 50 to 100 houses this could form a continuous "panel" of trees that would enhance every home in the subdivision.

Privacy, good taste for tired travelers

Dinah's Motor Hotel
Palo Alto, California

CAMPBELL & WONG
Architects

ECKO, ROYSTON & WILLIAMS
Landscape Architects

ROY GIORGI
General Contractor

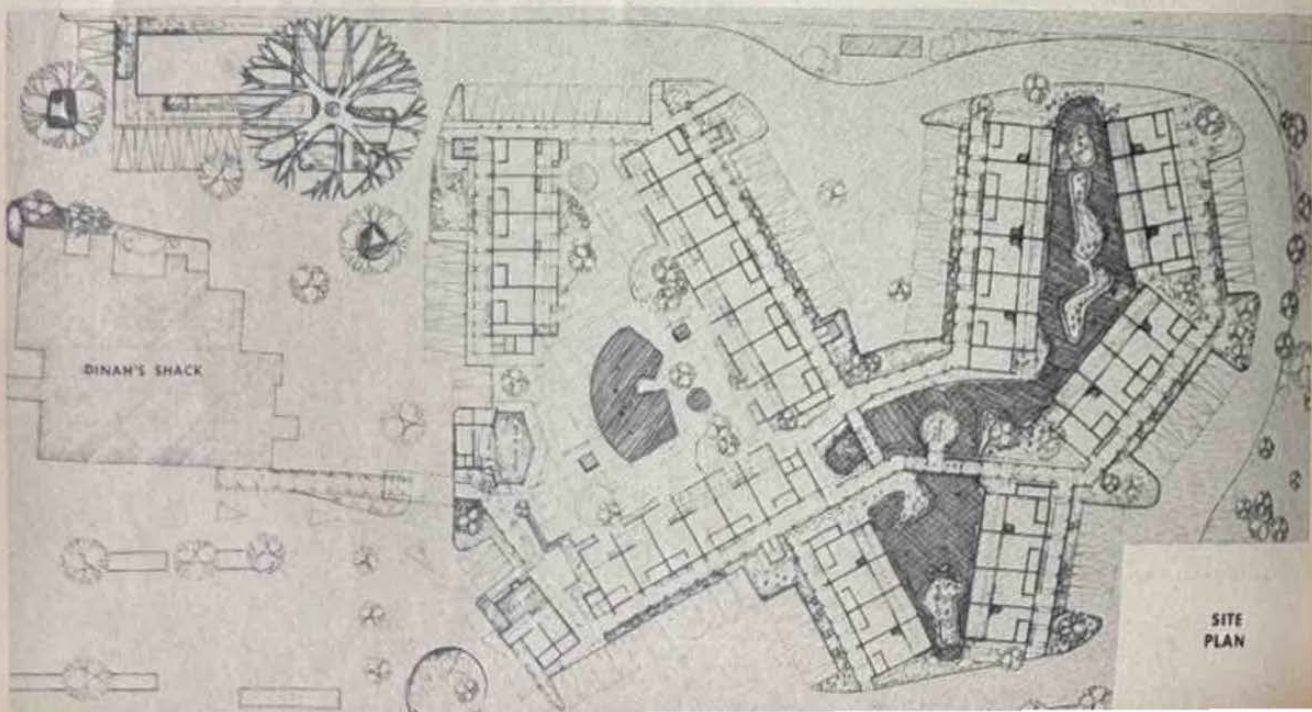
REDWOOD SLATS provide shadow and light effects as well as privacy for individual units. Overhangs protect entrances.

DINAH'S MOTOR HOTEL

FORTUNATE indeed is the motorist who hits upon Dinah's, for its architectural concept is based on the premise that the overnight guest should have as much privacy as is feasible, a pleasant environment and a maximum of service facilities. The site adjoins Dinah's Shack, two miles south of Stanford University on the San Francisco's Peninsula.

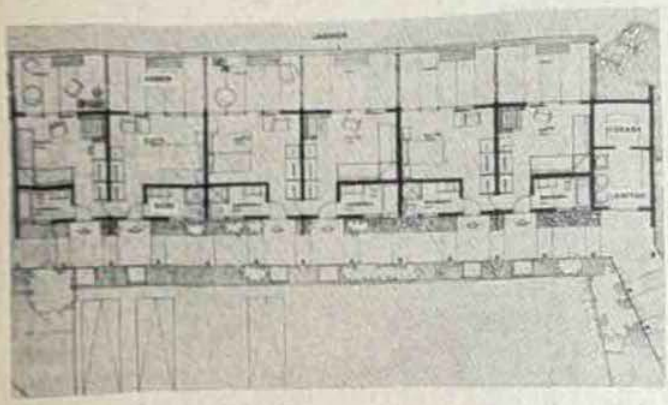
On this site, 300 ft. back from the noisy El Camino Real, the architects proceeded to translate the wishes of their clients—Ray Handley and Ray Renault—who sought to produce a motel that would be the equivalent of a fine, luxury type hotel and who were willing to sacrifice the sales and advertising potentials of being located directly on the highway. Specifically, they wanted to utilize the space adjacent to the restuarant to provide small, private gardens as well as public grounds that would be completely free of automobile traffic.

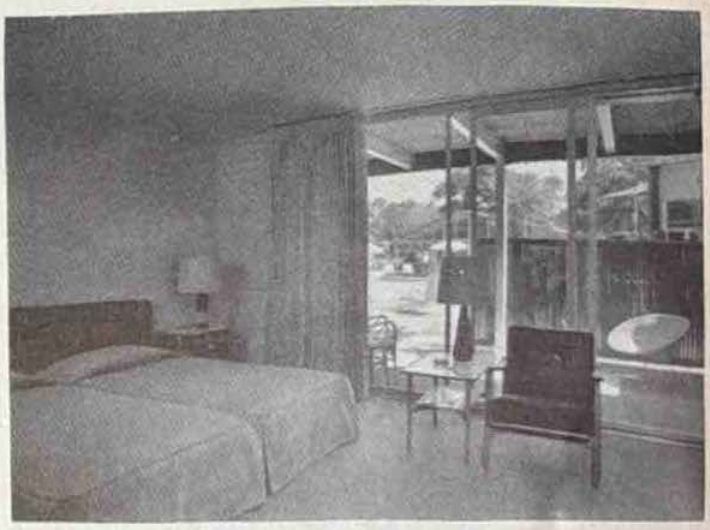
The result is an interesting combination of California redwood and concrete, with skillfully integrated landscaping everywhere one looks. Majority of the rooms ($8-12 for singles, $10-14 for doubles, $12-16 for twins, $22-32 for two-room, fireplace suites) overlook a series of lagoons, while the others have a view of a heated swimming pool. Entry side of individual units opens to a parking area but is separated from the patio side to help insure freedom from noise and traffic. Double walls and doors and concrete upper decks provide soundproofing; covered walks lead to the restaurant and poolside coffee shop.



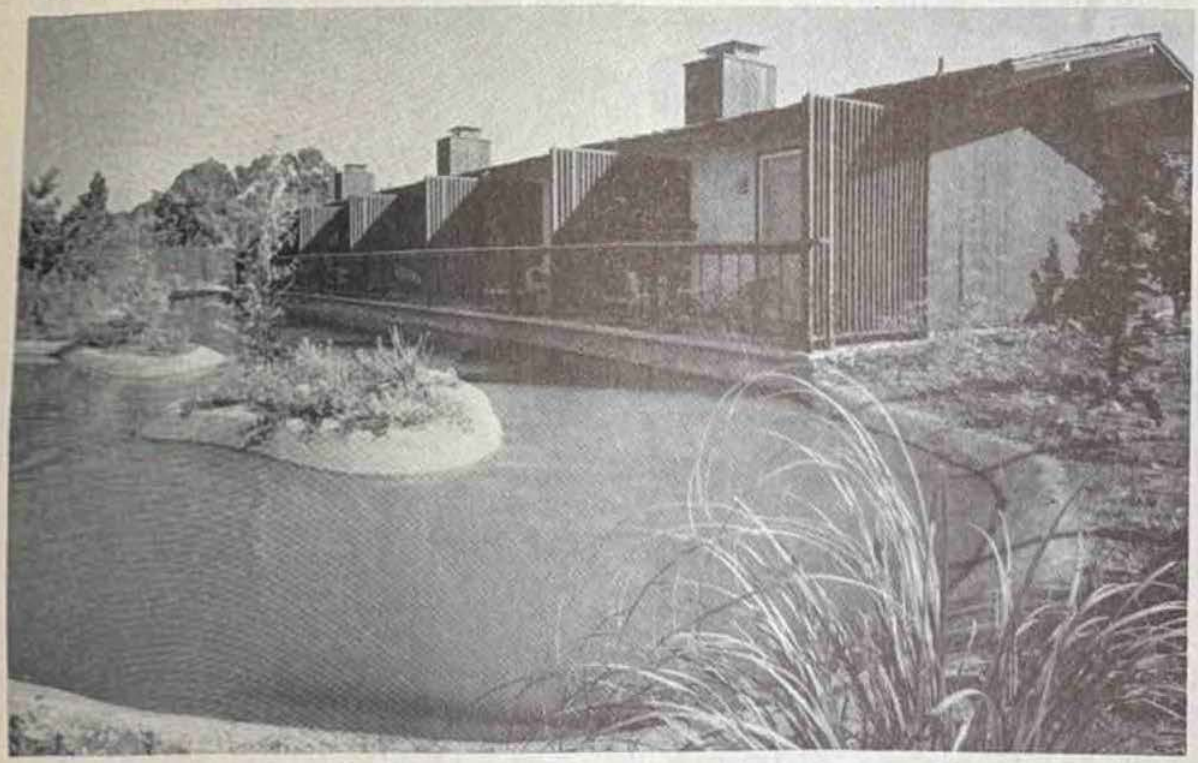
SITE PLAN

SECOND FLOOR UNITS have balconies overlooking 65-ft. free-form swimming pool, serviced by coffee shop. Typical room has sliding glass doors, wall-to-wall carpeting, Belgian linen draperies, Danish imported furniture, including specially designed desk-drawer.





MAJORITY OF ROOMS are surrounded by series of lagoons and extensive typical California plantings.



ALTERNATING PATTERN of wide and narrow spandrels, columns expresses seismic design.

400 beds in Alaska

Two noteworth

5040th Hospital
Elmendorf Air Force Base, Alaska

•

SKIDMORE, OWINGS & MERRILL
Architects

J. C. BOESPFLUG CONSTRUCTION CO.
General Contractor

IN A SETTING of spruce and birch, with a view of the nearby Chugach Mountains, this $10 million hospital at an air force base adjoining Fort Richardson, near Anchorage, ranks with the finest in the states. (There's even a helicopter port for patients brought in from outlying sections of the Territory.) The project was built under the supervision of the Alaska District, Corps of Engineers, as a 400-bed facility, its core areas having been planned for eventual expansion to 1,000.

The eight-story building is constructed over a steel framework with concrete and concrete block walls, employing "crumbleproof joints" between the three wings as a guard against earthquakes. The alternating pattern of wide and narrow spandrels and columns is an expression of the seismic design of the structural frame, lateral resistance being provided by the larger members. Exterior walls are insulated with cork which is carried back 4 ft. on each floor slab to prevent freezing of the slabs.

The hospital can accommodate just about every need—surgeries; medical departments; eye, ear, nose and throat clinics; obstetrical, pediatrics and orthopedic wards; laboratories; X-ray rooms; library; diet kitchens—and one entire floor is devoted to neuropsychiatric treatment. There are extensive outpatient facilities as well as a recreation and rehabilitation center on the lower floor (a modified daylight basement). The latter is especially important because of the lack of other recreational opportunities in the area and because patients stay longer than they ordinarily would, since many come from remote regions. The spacious, colorful dining area, on the sloping side of the site, opens onto an outdoor plaza. Post exchange and barber shop also are on this level.

Exterior columns, spandrels and exposed concrete are a light gray; infilling panels of concrete block are a darker blue-gray. The basic neutral interior scheme is accented with bright, primary colors. Materials include rubber, vinyl and asphalt tile flooring; metal stud partitions with gypsum lath and plaster; wood paneling and other more refined wall coverings in certain public areas.

HUB-AND-WHEEL DESIGN creates stir in medical circles, saves nursing time.

hospital projects

63 beds in California

Valley Presbyterian Hospital
Van Nuys, California

•

PEREIRA & LUCKMAN
Architect-Engineers

STEED BROS.
General Contractors

CONCEPT for the hub-and-wheel design of this 63-bed hospital was derived from efforts to reduce walking distance of nurses. Circular nursing units, which occupy the top two of four floors, avoid conventional dead ends found in line corridor arrangements and permit attendants to pass directly through nurse stations to the patients' rooms. The result: a 36% saving in nurse time and walking distance, say the architects, who also explain that the circular plan of the building is probably the best shape for resistance to bomb blast effect in a horizontal plane.

Arrangement of beds within patients' rooms allows each to have equal window area and light from the outside. Through use of adjustable cubicle curtains and external vertical louvers, each patient may control the amount of sunlight he desires without affecting his neighbor in the two-bed room. Every room has a television set mounted on the wall directly in front of the beds; remote pushbutton TV controls and separate bedside speakers also are provided.

The reinforced concrete structure was built for $1,523,690, or $16,636 per bed. Provision has been made for 52 medical and surgical and 11 obstetrical beds, along with 14 bassinets, in Phase 1 of a plan that will see eventual construction, again in the hub-and-wheel design (see sketch next page), and incorporation of 250 additional beds.

The hospital's lower level is devoted to kitchen area, storage space, electrical equipment room and the elevator lobby. First floor is laid out for general offices, records, central supply, two major operation and other specialized rooms, laboratories, pharmacy, mechanical equipment room and boiler room. Second and third floors are the nursing units, with a wing appended to the former and containing delivery, two labor, doctor and nurse rooms.

Floors are terrazzo in main public areas, oxichloride terrazzo in the surgical and delivery suites, asphalt tile in remaining areas; wainscot is glazed plaster coating; non-load bearing walls are metal lath and plaster. Gin D. Wong was in charge of planning and design; James S. Moore, project manager.

PHASE 2, repeating circular theme, will add 250 beds to hospital plant.

OUTLINE SPECIFICATIONS

Structure: reinforced concrete (Type 1); four stories; 82 beds.

Floor Finish: terrazzo in main public areas; oxichloride terrazzo in surgical and delivery suites; asphalt tile in remaining areas.

Ceilings: plaster.

Interior Walls and Partitions: lath and plaster (non-load bearing); glazed plaster coating (wainscot).

Total Cost: $1,523,690.

Cost per Bed: $16,636.

Date of Completion: January 1958.

SECOND FLOOR PLAN

MALONE COLLEGE
CANTON, OHIO
Arnold A. Peterson, Architect & Engineer • Cleveland, Ohio

MACOMBER V-BEAM and STEEL DECK in classrooms illustrate structurally sound, yet attractive appearance. Macomber V-GIRDERS were used for longer spans.

In addition to V-BEAMS, MACOMBER "nailable" LOAD-BEARING PARTITIONS were supplied for use in corridors of offices, classrooms and dormitories.

MACOMBER V-BEAMS

gave Malone College a stronger structure at lower cost!

6 new buildings completed in 240 working days

Macomber V-BEAMS and V-GIRDERS meant substantial benefits to Malone College and to the builder. The exclusive Macomber cold-formed chords and webs, besides providing extra structural strength, contributed an appearance factor that saved ceiling finishing costs and made lower ceiling heights possible without detracting from the pleasing architectural effect.

Macomber V-BEAMS are available for spans to 48 feet, V-GIRDERS to 96 feet. Quality control? — It's *continuous* at Macomber — by Pittsburgh Testing Laboratory resident inspectors.

Write for this Macomber V-BEAM Catalog containing loading tables, chord dimensions and designs, anchoring and bridging information. A new catalog on V-GIRDERS is also available.

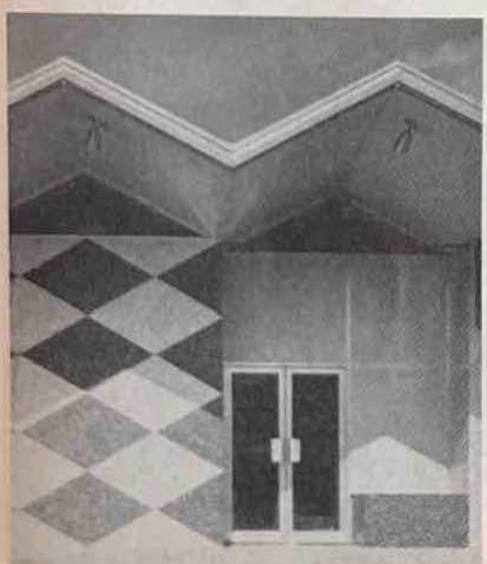
ZIGZAG PLYWOOD ROOF is visual key to store building, which has three concrete block masonry walls and front of plate glass and aluminum, with precast terrazzo panel adding color at restaurant entrance (closeup below). Underside of 10-ft. overhang is sheathed with plastic coated plywood and painted; interior is sheathed with plasterboard.

Wood folded plates roof 14,000 sq. ft. in nine hours

A ROOF developed with flat prebuilt lumber-framed plywood components functioning as a series of self-supporting inclined diaphragms is believed to be the largest application to date of the folded plate principle in wood. Although previously executed in concrete, this is the first time any architect has tried wood and plywood as a medium for the folded plate in series, free of any supporting element except at theoretical corner points.

Architect Jack N. Bryant, working with structural engineer Harvey H. Johnson, turned to plywood for economy and strength in an effort to develop a store building for a suburban shopping center in Burien, Wash., with more visual appeal than joist and beam construction.

Peaks and Valleys: Roof structure consists of 23 inclined planes, or diaphragms, 5 ft. 7½ in. wide, sloping in opposite directions and tied to each other to form a series of peaks and valleys 120 ft. 8 in. long from the front to the back of the building. The planes were built in sections on the ground, enabling the contractor, Powell Construction Co., to cover 14,040 sq. ft. in nine hours. In-place cost of the roof surfaces including materials, labor and erection time was 80 cents per square foot.



Structurally, these planes work in pairs as a series of 11 folded plates spanning 10 ft. each across the front and 26 ft. from beam to beam through the building. They serve as deep beams in collecting and transferring roof loads to the supports.

Plywood plates are supported on four conventional glued laminated beams running the width of the building, generally on 26-ft. centers. Beams are supported at the side walls by block piers and at intermediate points by 4-in pipe columns except at one corner where the roof rests on 6x6 wood posts used in conjunction with conventional wood floor framing to provide for a partial basement. Remainder of the foundation is concrete slab.

Diaphragms were prebuilt on the ground and lifted into position as paired panels by a crane. Bolted together at valleys and ridges, they form a continuous folded plate. Each tilted plane was made up of one plate 23½ ft. long, three plates 26 ft. long and one plate 18½ ft. long. The heaviest diaphragm plate weighed about 500 lb.

Plates were fabricated on the jobsite in jigs, using ⅝-in. fir plywood cut by the mill to a uniform length of 5½ ft.; the standard 4-in. width was utilized generally with some necessary variation.

Longitudinal framing with plywood consisted of a 4x4 at the top of the frame and a 3x4 at the bottom, or valley edge. The ridge cord was ripped at an angle so that it would butt squarely against the neighboring chord when the two plates were in position. Rippings were saved and placed in the valleys for a walk, or cast strip. Vertical members were 3x4s on 4-ft. centers, to which edges of the plywood were nailed, while a 2x4 in the center of each sheet served as a stiffener. Casein glue was applied to the framing members by roller prior to placing the plywood in position.

No Trick for Crane: A pair of panels, butted at the top and held temporarily by four double-head nails, was lifted by the crane and eased into position. Their corners concided with posts in the bays that stood 10 ft. apart, which meant that each half of a plate, 5½ ft. wide, was a 6/12 angle when in position. With ends bolted together, plates were joined in the valleys by a support bracket consisting of two ⅜-in. angle irons, 1½ ft. long, welded together. Corners of the four panels occupied such a bracket, held by lag bolt to beam, varying somewhat in design to meet the requirements of its position. For drainage purposes in the valleys, the roof was given a 1-ft. pitch from front to rear.

Only 105 minutes were required to roof the first bay, which was done early to provide shelter for fabrication work. Remaining four bays were roofed in seven hours.

A built-up roof consisting of three plies of fiberglass with a mineral surface cap was applied to the folded plate. The interior underside was sheathed with ⅝-in. plasterboard on 1x4 furring strips which also served as vent strips. The 10-ft. overhang at the front of the building was finished

Vern Green photos

3

1. Panels cut to uniform length of 5½ ft. are placed on framing members. Nailing is done with air gun using 6d nails on two rows. Frequency is heaviest on end plates in diaphragms and lightest in center. Where cross members butt against purlins, triple-grip galvanized iron type C-anchor clip is nailed by hand.

2. Custom made support bracket in which four corners of four panels rest is fashioned from two ⅜-in. angle irons, welded together. Bolted to beam or plate, screws hold panel corners.

3. Panels are lifted in pairs, held together temporarily by four double-headed nails. Heaviest lift approximates 500 lb. Each panel is made up of five plates—one, 23½ ft.; three, 26 ft.; one 18½ ft.—and roofs one bay.

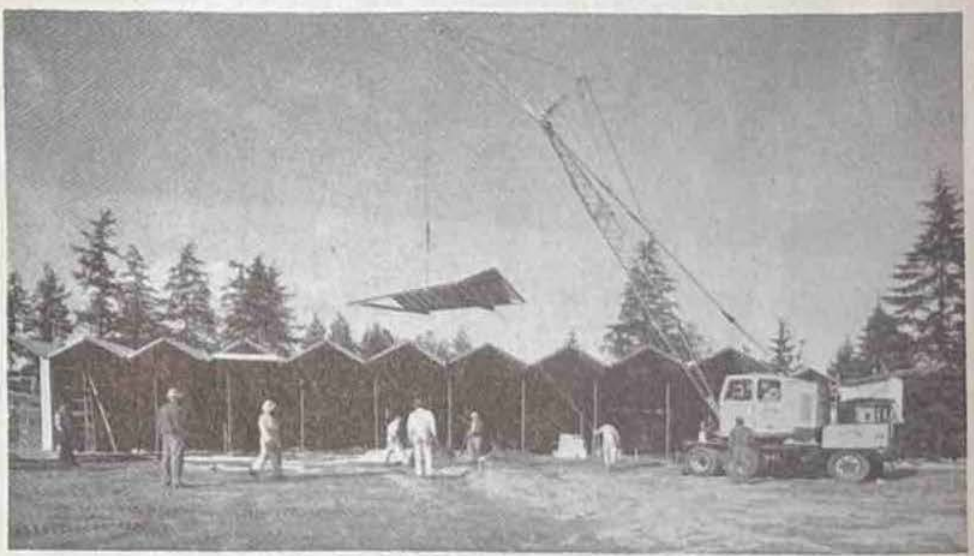
4. Building begins to take shape as folded plate roofing system progresses. Structure was built by resident contractor employing ordinary carpenters. Material costs amounted to 35.4 cents per square foot for ground coverage.

4

on the underside with resin overlaid ⅜-in. plywood and painted white.

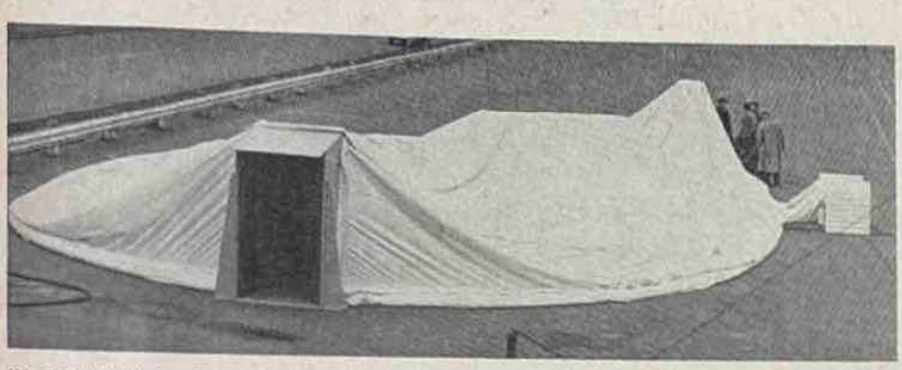
Just a Start: "Costs were comparable to the least expensive roof system necessary to accomplish the same thing structurally," the architect says, pointing out that materials for the folded plates amounted to 35.4 cents per square foot of ground coverage, ie., the area roofed over. "However, aesthetically we feel we achieved more than we could have with standard joist construction."

Bryant explains that this system was not used to its fullest extent in the store building where the longest span was 26 ft. He believes that spans of 40 ft. and more could be covered with increased economies.



INFLATED AIRHOUSE looks like giant elongated dome, has strength enough to support weight of several workmen on roof. Radiating from top center are stitch lines where tapered pieces of white vinyl impregnated fabric have been sewn together to round end. Material is waterproof and translucent to extent that no interior lighting is needed. This photo was taken with available light during heavy rain.

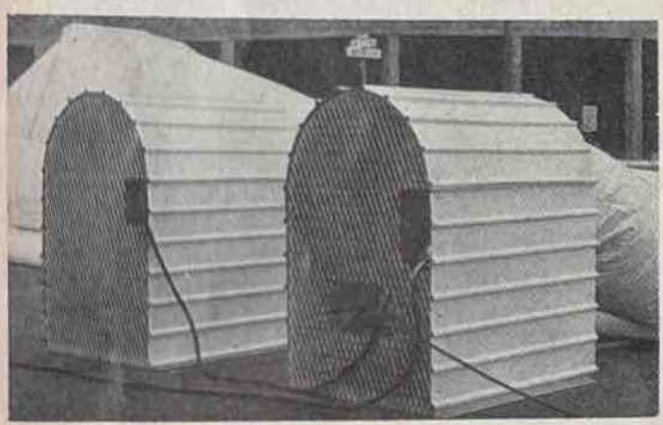
How to erect a 40x80-ft. 'house' in 12 minutes



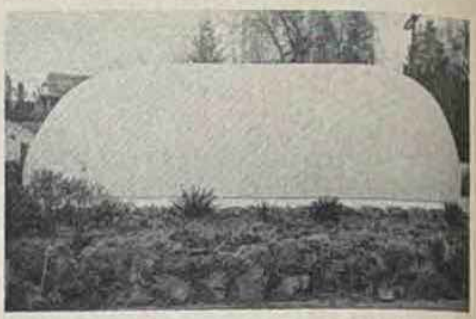
IN FEW MINUTES vinyl fabric will rise to dome about 25 ft. high, covering 40x80-ft. area. This model has small conventional doorways (airlock construction) at both ends so station wagon to be shown inside when house is erected has to be "inside" before structure is blown up, accounting for bump in material.

JOINING the parade of shelters being produced in this scientific age is the airhouse, which is finding its way across country to the West Coast. A 40x80-ft. model erected last month by Seattle Tent and Awning Co. in Seattle's Civic Center area demonstrated its potentialities to architects, builders, industrialists and homeowners.

As the photos on this page indicate, an airhouse starts with a limp, specially treated fabric (DuPont and United States Rubber are the chief suppliers) spread out on the ground and grows to a full-sized house when inflated with air. The pumping-up operation of this particular structure took less than 12 minutes.



TWO ILG FANS, each powered by 1/3-hp. electric motors, start air rushing into house, are capable of raising it completely in less than 12 minutes. They are controlled automatically by pressure-sensitive gauges and operate only when interior pressure drops sufficiently to start motors. Actually only one fan, operating at 38% capacity, is required to keep house at full pressure. Except for faster inflation time, there is no advantage in having two fans.



Air-supported structures may be built large enough to cover half a city block. For example, they may cover an entire building site during construction of a home, allowing workmen to go about their business regardless of the weather. Western swimming pool owners are covering their pools (see photo above) to enable them to swim all-year round. The houses may be taken down and stored for long periods.

Airhouses are not affected by severe cold. The vinyl impregnated nylon will withstand temperatures down to 60 deg. below zero. It was for this reason that type of structure was selected for radomes used in our Arctic early warning system (DEW Line).

PARTIALLY INFLATED HOUSE begins to look like big balloon. It is stabilized by water-filled ballast tube, noticeable around perimeter, but it may be ballasted by sand or earth or staked down for semi-permanent use. Airhouses do not have floors.

Reduction of building costs is research aid (Cont'd from p. 7)

a) Reduce on site labor.
b) Reduce total construction time.
c) Reduce total weight.
d) Reduce the number of layers of materials in the building shell.
e) Provide more comfort.
f) Combine functions of materials and equipment.
g) Integrate labor functions.
h) Increase the use of modular dimensioning and construction.
i) Increase the use of component construction.
j) Develop interdependent structural systems.
k) Improve methods of materials handling.
l) Improve methods of gluing or adhesion of parts to give continuous joints.
m) Continue to develop new materials and the use of more materials in combination.

6. To achieve these objectives, research must provide more scientific facts, more technical facts, more economic facts, more human and sociological facts, and more facts about the entire building process and its characteristics.
7. An effective aid to progress in housing research would be closer communication between the designer, manufacturer, researcher and builder.

Problems in building economics

The building economist must advise the prospective owner or builder when and where it is worthwhile to build. In order to do this, economists need:

1. National data on social and economic trends affecting demands for building, such as household formation by age and type.
2. Local data on factors influencing the demand for building.
3. Greater accuracy in the data supplied, whether it be presented by the federal government, by local governments or by industry.
4. More data on additions and alterations to existing structures, both residential and commercial.
5. Better data on financing which will include financing of apartments, trailers, etc.
6. Improvement in the data supplied on expenditures on existing non-residential structures.
7. Coordination of commercial research data on materials for non-residential construction.
8. Data on construction costs to the buyer.
9. Policies to help decide the areas of governmental and private responsibility for providing these data.

Problems in urban planning

1. The major problem in urban planning is the failure of planners to identify their decisions with the economic and financial, as well as the social, aspects of land use and development.
2. Most pressing problems in urban planning are:

a) Limitations on the supply of land available for our expanding urban areas, which surveys indicate is being used up at a rate of over one million acres per year of land suitable for urban development.
b) Recognition by government at all levels of the necessity for efficient renewal and redevelopment of existing urban areas, from the standpoint of industrial and commercial uses as well as housing, to raise every piece of land to its optimum use value.
c) Closer coordination between planners of highways and planners of urban land areas to prevent the forcing of highways into locations which would have serious impact on existing urban areas and on future development potentials.
d) Need to reduce the variations in codes, specifications, standards and requirements presented by various small, local jurisdictions within a metropolitan area.
e) Provision for an integrated city with all the requirements for living: homes, industry, education, recreation, etc.
f) Study of land use and land scarcity in terms of building life and a technique developed for disposing of obsolete buildings.
g) Flexible and progressive principles to guide urban planners both in new development and in rebuilding existing urban areas.
h) Information on the effect of neighborhood development on the economy, and the effect of the economy on neighborhood development.

FOR **SWIVEL LIGHTS**

PRESCOLITE IS PREFERRED

HERE'S WHY...

EXCLUSIVE "DieLux" DIECAST CONSTRUCTION

Heavy duty swivels hold tension indefinitely

A-14

9 beautiful finishes to choose from

Choice of metal cones; or Fabriglas cones, with embedded maple leaves, ferns, or rattan. (Also available in white.)

These are just a few of the features that make Prescolite Swivel Lights the finest available.

PRODUCTS

improved wrought iron

Production of 4-D wrought iron with 25% increased corrosion resistance has been heralded as a significant advancement in that product's metallurgical history, particularly on the Pacific Coast where salt water corrosion losses are severe. Results have been achieved by increasing the purity of the iron and its phosphorous content and in using a more siliceous iron silicate. Physical and mechanical properties of 4-D wrought iron also have been improved. It is widely used in the West for water supply and steam condensate lines, radiant heating systems, waste and drainage piping in buildings, as well as in underground water, air and gas lines. — A. M. Byers Co. **(Item No. 1)**

surfacing technique

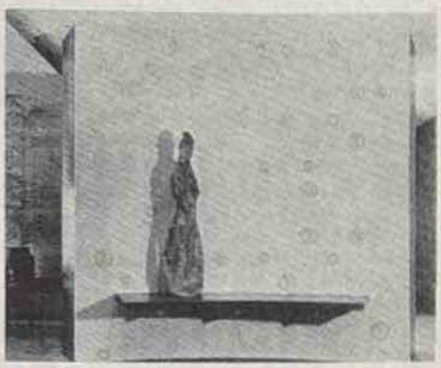
A surfacing technique called the Zolmat process permits complete renovation and modernization of wall areas, almost regardless of their condition. It allows surfaces which have been previously decorated with various materials such as wallpaper, canvas, wood and fibreboard to be uniformly finished without showing evidence of prior treatment. Even walls damaged by fire, smoke or water reportedly can be made to look like new with no visible defects.—Zolatone Process, Inc. **(Item No. 2)**

AC-TV wall unit

A self-contained wall unit has the AC and TV antenna outlet mounted on the same box assembly and on the same mounting plate. It is available in ivory or brown for single, duplex and triple receptacles as well as the Sierraplex models. (The manufacturer does not furnish the receptacle because of building code variations.) Electric box has been modified by deleting the knockouts from the side opposite the bracket to eliminate the possibility of bringing the AC into the unit too close to the TV line, which might be both a hazard and source of picture interference. — The Tele-Jac Co. **(Item No. 3)**

tile-wallpaper combo

Hermosa's latest series of decorative tile with correlating wallpaper includes seven oriental designs on three



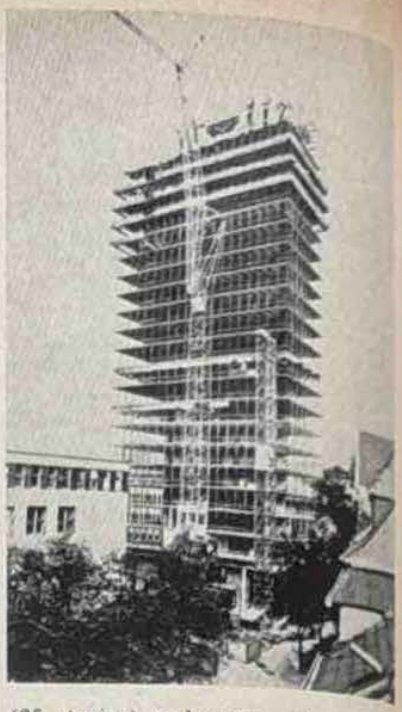
distinctive backgrounds. Orange or burnished gold may be combined with either a white or oatmeal background; gray can be used on graphite. Each is also available on hand screened wallpaper by Albert Van Luit & Co., designer of the new patterns.—Gladding, McBean & Co. **(Item No. 4)**

water heater

Described as the "first completely new water heater in a generation," the 5-Star General has a streamlined cabinet with all controls enclosed, can be built in with other cabinets or installed anywhere in the house. A temperature selector is located at eye level. Recovery rates are 77 gph. for the 40-gal. size, 63 gph. for the 30-gal. size.—The Holly-General Co. **(Item No. 5)**

giant crane

Expressing the distributor's "conviction that we are witnessing only the beginning of a colossal era of construction in the West," a slewing tower crane with a jib length of 100 ft. that can lift a 1½-ton load 332 ft.



(25 stories) and move under load is being introduced in this area. Developed by Peine in West Germany where it has been used for eight years, the crane is available in seven sizes, each allowing all motions—lifting, lowering, slewing, luffing and traveling—to be carried out simultaneously or independently, and all but the smallest type have three driving positions. One of the largest and the first to be used in this country is now at work on the Binghamton-Sheraton Hotel, New York (see photo), with a pully height of 161 ft., a jib length of 82 ft. and a lifting capacity of 7,200 lb.—Beatty Scaffolds, Inc. **(Item No. 6)**

versatile nailer

The Fox Nailer has been introduced as a pneumatic hammer attachment that greatly reduces fatigue and expenses in many nailing operations. Operator just places the nail in the nozzle; the nailer starts and finishes the job. The nailer weighs less than 1 lb., is only 6 in. long. Of the four parts, only two move and no lubrication is required.—Fox Nailer Corp. **(Item No. 7)**

air filter

The Far-Air Microloc offers the benefits of two-stage filtration in one unit with the installation and maintenance economies of a single bank of filters. A dry type, renewable media model, it is recommended for application requiring efficiencies which equal or exceed those of electrostatic air cleaners. Panel filter holding frame and locking device are an integral part of the unit.—Farr Co. **(Item No. 8)**

sprayed concrete

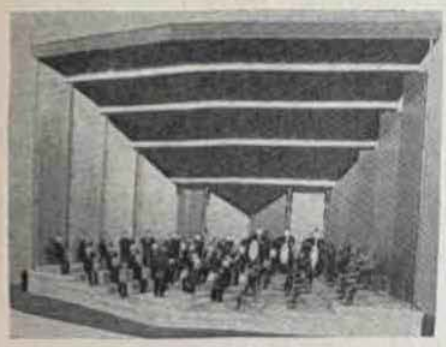
A concrete finish called Vitricon is sprayed on to produce a glazed surface with tilelike charecteristics. Recommended for hard wear areas, Vitricon is especially useful for remodeling projects since it fills and bridges hairline settlement cracks. The product can be sprayed on all types of masonry surfaces either inside or outside. Any color combination is possible by adding pigments to the mixture. The glazed surface sheds dirt and is cleaned with soap and water.—Vitricon, Inc. **(Item No. 9)**

sliding glass door

Tailored for large residential patios, hotels, motels and other commercial uses, panels of Trimview's multiple track aluminum sliding glass door can be stacked at either end, regardless of the number. They can be of standard or custom width. Multiple track can be installed with a raised or recessed sill by the use of adjustable rollers.—Trimview Metal Products. **(Item No. 10)**

aluminum band shell

What is described as the greatest advance in acoustical engineering ever devised for this type of structure, an all-aluminum band shell employs baffles in the sides and ceiling which diffuse rebounding echoes rather than concentrating them in any one spot in the audience. Design of the Overly hi-fi shell, which is suspended from the rear by three cantilevers, bans from the interior any structural supports which might tend to interfere with the acoustics. Made by sandwiching a 2-in. plastic core between sheets of aluminum, the side panels will be available in practically any finish or color. The shell, developed by the manufacturer in cooperation with the Aluminum Company of America and Pittsburgh architects Schell & Deeter, will accommodate from 40 to 120 musicians. A variety of lighting installations may be specified without necessitating changes in the basic design.—Overly Manufacturing Co. **(Item No. 11)**



When protection alone is not enough . . .

USS Cyclone Rustake Fence

This attractive swimming club needed protection. Good, strong fence was required to exclude trespassers and gate-crashers, to prevent unguarded after-hours swimming parties.

But this fence had another job to do, too—it had to preserve privacy. And that's why USS Cyclone Rustake Fence was selected. Sturdy Cyclone Fence, with its heavy steel framework and barbed wire, will discourage the most intrepid intruder. And those slender strips of glowing California Redwood, inserted in the special wide mesh of Cyclone Chain Link fabric, keep out prying eyes, let the bathers swim in privacy, add to the pool's good looks.

USS Cyclone Rustake Fence is ideal for use on every type of installation where protection, plus privacy, is essential. Cyclone Rustake Fence has all the strength of steel, and at the same time it gives the over-all appearance of redwood picket fence.

LITERATURE

electric heating systems

A faster, easier method of computing heat losses for rooms or complete homes and buildings is found in a "Manual for Planning Electric Heating Systems." Necessary time for calculating the heat loss for an entire house is reduced more than 50%. The newly developed method considers all the factors of other systems (multiplying heat loss coefficient by the square feet of area by the design temperature difference), but eliminates all arithmetic by transforming factors into one clear, easy-to-use graph. The manual also covers types of electric heating equipment available and their applications, insulation, selection and location and related topics.—Markel Electric Products, Inc. **(Item No. 12)**

home wiring calculator

A handy calculator to determine home electrical requirements consists of a check list by means of which the architect or builder can total room by room, the amount of wattage required. From this, comparisons can be made with national electric code recommendations to ascertain if service entrance equipment, number of branch circuits and size of wire used are adequate.—Federal Pacific Electric Co. **(Item No. 13)**

kitchen layouts

Although a brochure covering seven basic kitchen layouts is being offered to homemakers, architects and builders too may find some useful ideas in the 16 pages. Each of the layouts consists of a sketch, floor plan and brief description. The booklet features Ben-Hur built-in freezers and refrigerators but is not confined to the promotion of that company's products and has general data on lighting, ventilation, equipment and appliances and wiring. —Ben-Hur Mfg. Co. **(Item No. 14)**

walnut in architecture

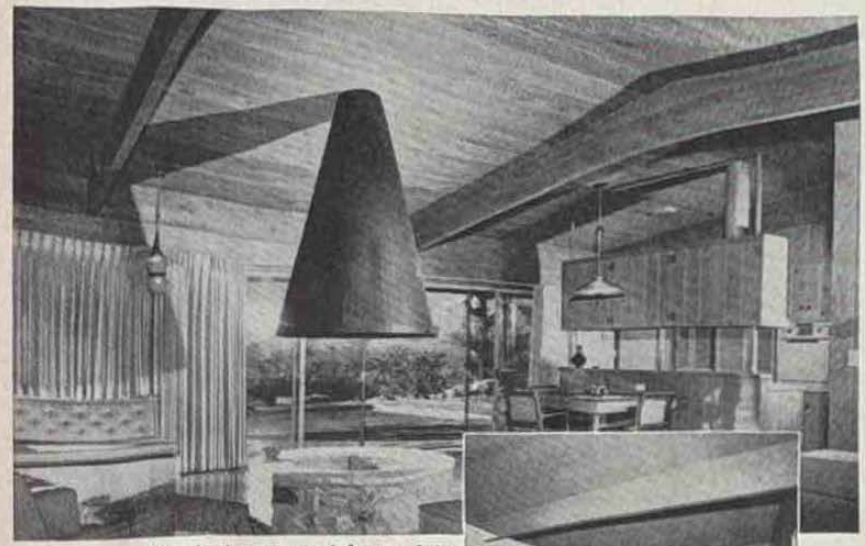
"An architectural Study of Walnut for Commercial, Institutional and Residential Interiors" presents 16 pages, some in color, of fresh treatments, ranging from traditional to contemporary decor. Companion piece is a walnut source list, intended as an aid in finding local supplies of walnut plywood paneling and solid walnut paneling and trim.—American Walnut Manufacturers Association. **(Item No. 15)**

pictorial design roundup

A 32-page brochure which illustrates construction and remodeling projects using Kohler installations completed since late 1954 actually is a fairly good cross section of architectural design from coast to coast and in the territories. Structures range from single-family residences to huge luxury apartments; and from a football stadium to an airport terminal building. In each case the architect, general contractor, plumbing contractor and distributor are credited.—Kohler Co. **(Item No. 16)**

industrial lighting specs

A reference guide for those concerned with the purchasing, specifying or selling of industrial lighting units, the 1958 "RLM Specifications Book" has new data covering 1) two- and three-lamp special service fluorescent units; 2) three types of units utilizing 800-ma. fluorescent lamps; 3) new incandescent reflector sizes; 4) new mounting specifications for fluorescent units. Specifications pertinent to all fixtures have been incorporated into a new, single standard; and as an added convenience feature, each individual specification is contained on the front



Rilco laminated wood beams from 30 ft. to 42 ft. long were used. "They all worked PERFECTLY" said the builder.

"I Can't Say Enough for the Rilco Beams!"

Writes Mr. J. F. Salyers. "They all fit perfectly with no twists or crowns. No sanding or filling was required. The Rilco beams have all the advantages, plus strength, of wood and none of the disadvantages. The finished appearance is so much better that there is just no comparison.

Residence, Tucson, Arizona
J. F. Salyers, designer
Casa Mesa Homes, builder

"We have had plenty of comments about these beams and they are mostly the same: 'They are beautiful.' 'Can you work them in our plan?' "

Striking Rilco laminated members blend well with any architectural style — allow wide latitude of expression with complete design freedom. And Rilco members retain their beauty, require little if any maintenance, increase their warmth with age — resist warping, splitting, cracking.

Laminated members are available in sizes difficult or impossible to obtain in solid construction. And now Rilco stocks standard-size flat beams, assuring prompt delivery with the low price of volume production.

RILCO
works wonders with wood

Rilco members and Rilco Deck may be able to help you solve a design problem. For complete information contact your nearest Rilco office.

RILCO LAMINATED PRODUCTS
236 Tacoma Building, Tacoma, Washington

and back side of a single page. Pages may be easily detached from the book and placed with a lighting quotation or specification.—RLM Standards Institute. **(Item No. 17)**

masonry in Northwest

"Reinforced Masonry as Developed in the Northwest" is a four-page brochure based on a paper presented at the American Concrete Institute regional meeting last fall by Verne Frese, president of Layrite Concrete Products of Seattle, Inc. One page is devoted to design details.—Concrete Products Association of Washington. **(Item No. 18)**

laminated timbers

The story of glued laminated timber construction is told in a 12-page booklet, made up of reprints of seven articles of interest to architects, builders and engineers. One piece gives a brief background of the history and development of laminated timbers; another is a picture article of how laminated beams are designed. Also included are the names and addresses of the members of the American Institute of Timber Construction.—Koppers Co., Inc., Chemical Division. **(Item No. 19)**

CATALOGS

Readers are requested to write directly to the manufacturers for copies of catalogs.

High Velocity Duct Design: contains 11 pp. of performance tables; explains step-by-step computations on two work sheets for 10-story office building; shows schematic layouts; 24 pp.—Anemostat Corporation of America, 10 E. 39th St., New York 16, N. Y.

Press Molded Building Panels, Flat Panes (AIA 26-A-9): details on mechanical and physical properties, chemical resistance, colors, finishes; gives installation instructions; has technical data table for thicknesses, standard lengths, finishes, coverage, lappage, spans; 8 pp.—Structoglas Division, International Molded Plastics, Inc., 4387 W. 35th St., Cleveland 9, Ohio.

Prescon System (AIA 4-E-12): briefly covers history and development of prestressed concrete; explains post-tensioning system; includes application examples, technical data, guide specifications, detail drawings; 14 pp.—The Prescon Corp., P. O. Box 4186, Corpus Christi, Texas.

New Distribution Switchboard: lists features, application data, protective device information, system applications and selection, dimensions, guide-form specifications; 32 pp.—General Electric Co., Plainville, Conn.

Pittsburgh Glass-Clad Buildings (AIA 17-A): handsome folder showing colors, sketches and actual installations of 82-X curtain wall system; plus pocket with specifications and details; 14 pp.—Pittsburgh Plate Glass Co., 1 Gateway Center, Pittsburgh 22, Pa.

Angle-Rite, the Means to Plastering with Crack-Free Corners: describes improved and faster method of locking gypsum lath in corners and ceiling angles; contains installation data; 4 pp.—Butcher & Hart Mfg. Co., 4601 Cortland Ave., Altoona, Pa.

Nevamar Carefree Kitchens Specifications File (AIA 35-C-12): data on wall and base cabinets, hardware, accessories; 4 pp.—Nevamar Carefree Kitchens, Odenton, Md.

Cafco for Fireproofing: contains description of product, fire-retardant rating tables, specification guide: 4 pp. Columbia Acoustics and Fireproofing Co., Stanhope, N. J.

SUPPLIERS

• **Fabricon Products** has named Western Plywood Co. of Seattle as distributor in the state of Washington for its Lamin-Art plastics.

• **Utility Appliance Corp.** and its subsidiary, Mission Appliance Corp., of Los Angeles have promoted John K. Elfstrom to advertising manager of both firms. He formerly directed this operation for Utility only.

• **Products Research Co.** has completed an addition to its West Coast manufacturing facility at Glendale, Calif., to provide storage and handling room for its synthetic rubber caulking and sealing compounds.

• **Consoweld Corp.** has appointed Ed Smedberg to cover several Northwest states out of Portland.

• **Kaiser Manufacturing, Inc.,** has opened a warehouse and factory at 683 S. Clarence St., Los Angeles, and appointed Ben F. Dingman as West Coast division manager. The firm's principal product is Crest Tile-Set, a portland cement material with chemical additives.

• **Unit Masonry Association** of Portland has elected these officers: L. C. Pardue, mason contractor, president; Howard Jacobs, mason contractor, vice president; Ralph Holm, Bricklayers Local 1, secretary; Alan Green, Pacific Building Materials, treasurer.

• **Pacific Lumber Co.** of San Francisco has elected Carl W. Bahr as vice president in charge of lumber sales; Norman B. Livermore Jr. treasurer; Merle L. Walker, assistant secretary (reelected) and controller; Harold Bendorf, assistant sales manager and sales production coordinator.

• **Reynolds Metals Co.** has named Donald W. Johnson as plant manager at Longview, Wash.

• **Goodyear Tire and Rubber Co.** has appointed Murray B. Marsh Co. of Los Angeles as distributor of its vinyl and rubber flooring products in eight western states.

• **Redondo Tile Co.** has opened a warehouse at 13904 Saticoy St., Van Nuys, Calif.

• **California Metal Enameling Co.** of Los Angeles has erected a new building to accommodate an especially engineered system for laminating architectural panels.

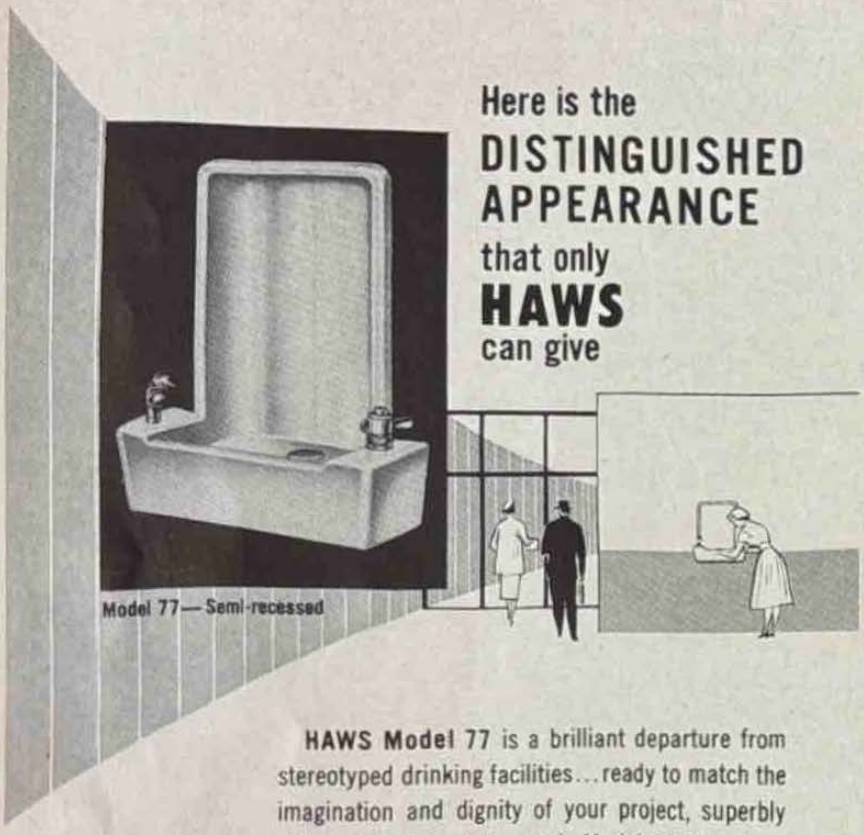
• **Eagle Metals Co.** of Seattle has elected C. B. Holder, who has been with the firm since 1937, to the office of vice president and sales manager.

• **The Payne Co.** of La Puente, Calif., has appointed William F. Steiner as assistant national sales manager, supervising the field sales force except southern California; and Kenneth E. Hill as factory sales engineer for southern California, serving the San Fernando Valley and West Los Angeles.

• **Gladding, McBean & Co.** has begun operations at its new $5 million pipe plant at Corona, Calif., regarded as the world's most modern and highly automatic.

• **Chase Brass and Copper Co., Inc.,** has opened a new warehouse and sales office at 230 Shaw Road, South San Francisco.

• **Trueforms, Inc.,** of Seattle, which is introducing a new fastening device



HAWS Model 77 is a brilliant departure from stereotyped drinking facilities...ready to match the imagination and dignity of your project, superbly styled, precision-engineered. Model 77 is a semi-recessed wall fountain—in durable vitreous china, available in striking colors, with automatic volume and pressure controls. And the same design is available in stainless steel (Model 73); or in remarkably tough, lightweight fiberglass (Model 69, in choice of colors at no extra cost).

WRITE FOR DETAILS
Ask for HAWS complete new catalog, too!

For nearly 50 years, HAWS has provided finer drinking facilities to match forward-looking architectural design. Here's a design in vitreous china, stainless steel and fiberglass worthy of your attention.

HAWS DRINKING FAUCET COMPANY
1441 FOURTH STREET (Since 1909) BERKELEY 10, CALIFORNIA

for concrete forming on the West Coast, has opened a warehouse at 1550 Doolittle Drive, San Leandro, Calif.

• **A. C. Horn Co., Inc.,** has moved its western division to larger quarters at 550 Third St., San Francisco, where an all-concrete structure houses three times the former space to serve the 11 western states.

• **Sliding Glass Door and Window Institute** at its annual meeting in Los Angeles recently elected Donald Foss of Van Nuys, Calif., as president. He heads Slide View Door and Window Co. and Malibu Manufacturing Corp. Other officers, all Californians, are: Murrell Spence, North Hollywood; first vice president; George Radford, Santa Maria, second vice president; William Watkins, Gardena, honorary vice president; and Charles Walker, Burbank, treasurer.

NATIONAL ASSOCIATIONS

• **American Concrete Institute** at its 54th annual convention in Chicago named as president, Douglas McHenry of Chicago, director of development, research and development division, Portland Cement Association.

• **Perlite Institute** elected D. Loring Marlett of Los Angeles, vice president of the mining and mineral products division, Great Lakes Carbon Corp., as president during its ninth annual meeting in Fort Lauderdale, Fla.

• **International Drywall Contractors Association,** which headquarters at 608 S. Hill St., Los Angeles, has begun publication of a monthly newsletter.

• **Metal Lath Manufacturers Association** reelected its president, L. C. Hollerbach of Wheeling, W. Va., manager of building material sales, Wheeling Corrugating Co., at the group's annual meeting in Cleveland.

• **Building Stone Institute** at its 39th annual convention in San Francisco elected August P. Petrillo of Mount Vernon, N.Y., as president.

• **Expansion Joint Institute** has elected Wallace C. Fischer of Chicago, head of Servicised Products Corp., as president.

• **Lumber Dealers Research Council,** sponsor of the Lu-Re-Co system, has opened its membership to manufacturers whose products are distributed through retail lumber and building supply dealers.

CONTRACTORS

• **Seattle Chapter, AGC,** has named John F. Boespflug of J. C. Boespflug Construction Co. as president for 1958. Other officers: Andrew P. Wick, Wick Construction Co., and Fred C. Ness, Ness Construction Co., vice presidents; Larry Baugh, Baugh Construction Co., secretary; John Frodesen, Farwest Construction Co., treasurer.

• **Twaits-Wittenberg Co.** partner and general manager, Carl H. Wittenberg of Los Angeles, cited the importance of the carpenter to the construction industry when he spoke at the Apprentice Completion Ceremonies at the Biltmore Hotel last month.

• **Fruin-Colnon Contracting Co.,** engineers and constructors, have expanded their personnel and facilities by moving from 260 Kearny St., San Francisco, to 48 Park Road, Burlingame, Calif.

• **John Cisero,** 66, building contractor at Los Gatos, Calif., for the past 10 years, died last month.

• McDonald, Young & Nelson, Inc., have moved to a new office building at 8907 Railroad Ave., Oakland.

bond plastic foam insulation to smooth walls better with

FOAM FAST*

ADHESIVE

*Trademark Registered

FOAM FAST provides a superior bond between plastic foam insulation and smooth surfaces of concrete, masonry, metal or wood. Just follow simple mixing instructions combining FOAM FAST Latex and FOAM FAST Powder. There's nothing else to add. FOAM FAST is easily applied with push box or trowel. Write or call for specifications and prices.

new offices, changes

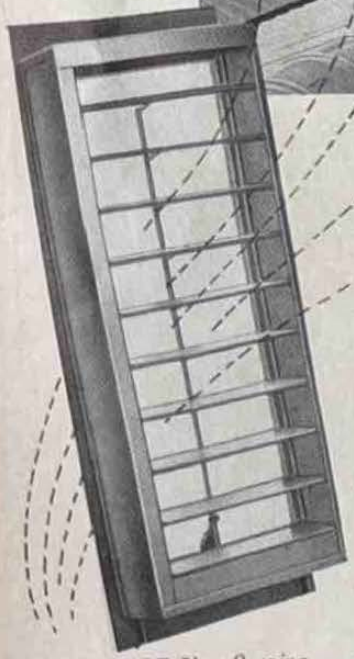
Warren B. Heid, AIA, who has been associated with the architectural firm of Binder & Curtis in San Jose since 1947, has established his own office in the Professional Building, 14400 Park Plaza, Saratoga, Calif. The office will also serve as a branch office for Norton S. Curtis, AIA, of the firm with whom Heid will continue to be affiliated.

Frederick L. Rudat, architect, has opened his office in the Terminal Sales Building, 1220 S.W. Morrison St., Portland. Rudat had been in the Portland office of Skidmore, Owings & Merrill and previously with Stanton, Boles, Maguire & Church.

Albert A. Erkel & Associates, consulting structural engineers, have opened new offices at 3515 Cahuenga Blvd., Los Angeles. Prior to starting his own practice early last year, Erkel was in charge of structural engineering for Pereira & Luckman. He has degrees from Caltech and University of Southern California.

Another Southern California Firm Selects
VENTILATION BY
COLT

ELECTRA MOTORS, Inc., Anaheim



CO/2046 COLT Clear Opening Adjustable Louver Ventilators.

And when you're selecting a ventilation system for your clients, you'll want to specify **COLT.** Here's why:

Efficiency and economy—COLT ventilators perform double duty, space ventilation with properly circulated air within the building and, in addition, provide fire protection. (Fire authorities everywhere agree that fire control in industry must include modern and efficient fire venting.)

No operating costs—no machinery or gears, nothing to repair or run up power bills.

Complete selection—COLT manufactures a wide variety of clear-opening, weatherproof ventilators for roof or wall.

Lightweight—with built-in controls, endless control cord. Heavy gauge anti-corrosive hardened aluminum.

Extra fire protection—Louvers open down automatically in event of fire. Wide, unrestricted free area allows immediate escape of heat and smoke . . . and many other features fully described in free pamphlet, *"Some Aspects of Fire Prevention in Industrial Buildings," by M. J. Reaney, and a free technical manual giving full details of the COLT system.*

ANOTHER FINE PRODUCT BY

COLT VENTILATION OF AMERICA, INC.

4652 Hollywood Boulevard, Los Angeles 27, California • NOrmandy 2-1181

Howard R. Lane has reorganized his architectural practice to include AIA members Samuel E. Hart and E. Ray Schlick as partners and has moved to new offices which the firm (now known as Lane, Hart & Schlick) designed at 16042 Ventura Blvd., Encino, Calif. Hart joins the partnership after six years with Welton Becket & Associates; Schlick, an associate in the firm for four years, is now in charge of production and field supervision.

Donald H. Lutes, AIA, and John M. Amundson have formed a partnership for the practice of architecture and community planning in the United States National Bank Building, Springfield, Ore.

Philip H. Hauck, AIA, has replaced James B. Pannell in the architectural firm of Bordeleau-Pannell & Amundson, now known as Bordeleau-Amundson & Hauck and occupying its present offices at 309 First Ave. N., Great Falls, Mont. A graduate of Montana State College, Hauck comes from Butte where he has been associated with Norman J. Hammill & Associates. Pannell is temporarily withdrawing from the practice of architecture because of business interests, but he will be retained by the new firm on a part-time consulting basis.

Charles E. Morgan, formerly associate architect with Blaine McCool & Associates, now is a partner in the firm, known as McCool, Morgan & Associates, which has moved to 11 Eastlake Ave., Seattle.

James S. Moore, AIA, and Donald E. Wilcox have been named vice presidents of Pereira & Luckman, Los Angeles architectural-engineering firm. A graduate of the University of Southern California, Moore has been with the firm for six years; Wilcox, with degrees from Washington State College and Yale University, has been with P&L since 1947.

new addresses

Philip S. Buckingham, AIA, to 5 Security Bank Building, Fresno.

Eckbo, Royston & Williams, landscape architects and planning consultants, to 1136 Clement St., San Francisco.

elections

Architects and Engineers Conference Committee of California has elected architect Henry L. Wright of Los Angeles as chairman and engine

Wesley T. Hayes of San Francisco as vice chairman. Melton Ferris, executive director of the California Council, AIA, was appointed to a second term as executive secretary of the committee, which is made up of four statewide organizations: the AIA, Structural Engineers Association, Consulting Engineers Association and Civil Engineers and Land Surveyors.

appointments

Malcolm Reynolds of Oakland has been named president of the California State Board of Architectural Examiners, succeeded by Kenneth S. Wing of Long Beach as secretary. Frank B. Cronin, the board's investigator in the San Francisco area for the past five years, has been appointed executive secretary to replace Richard A. Patrick, who recently resigned to enter a Los Angeles architectural firm.

Albert Harvey Funk of Spokane has been appointed to the Washington State Architectural Examining Board.

John Aguirre, formerly senior architect at North American Aviation, has been appointed architect in the Los Angeles office of the Portland Cement Association.

Richard Neutra, Los Angeles architect, has been named to the five-man R. S. Reynolds Memorial Award jury.

awards

Victor Gruen Associates, nationwide architectural firm with headquarters in Beverly Hills, Calif., has become the second recipient of a gold medal awarded by the Memphis Chapter, AIA, for "outstanding achievement in architecture and city planning."

exhibitions

An exhibit of hospitals designed by West Coast architects is being shown at the convention of the Association of Western Hospitals April 21-24 at the Civic Auditorium, San Francisco.

Special exhibition now hanging in the Architectural Gallery of the Building Center, Los Angeles, and continuing through April 30 features the work of Thornton Ladd & Associates, Pasadena architects. The show was preceded earlier this month by an exhibition of the work of Austin, Field & Fry, Los Angeles architectural-engineering firm.

CALIFORNIA COUNCIL, AIA, OFFICERS for 1958 are Corwin Booth, San Francisco, member-at-large; Allen Y. Lew, Fresno, treasurer; Lee B. Kline, Pasadena, vice president; L. F. Richards, Santa Clara, president. Secretary Edward H. Fickett of Los Angeles is not shown.

AIA activities

California Council, AIA, again has proposed that the national institute make the state a region in itself. The council, which first took this stand at its 1953 convention, declares that Nevada and Hawaii, now linked with California in the regional organization, could be better served by affiliation with the Western Mountain and Northwest regions respectively. It points out that California accounts for more than 93% of the AIA members in the region and that architects in the state operate under "code, conditions and practices" greatly different from those in the other two areas.

Idaho Chapter at an all-day meeting in Boise March 15 discussed "Arts and Crafts and Their Relationship with Architecture." Principal speaker was Elisabeth Kendall Thompson, western editor of Architectural Record, who said: "The glass wall, the pierced concrete grille, the plane surface have an apparent self-sufficiency which poses a problem for the arts in architecture that is perhaps more acute today than at any other time." Other speakers: Paul Roseland, Palo Alto, Calif., furniture design consultant; Lloyd M. Bond, landscape architect, and James Bartell, plastics and glass designer, both of Eugene, Ore.; Mrs.

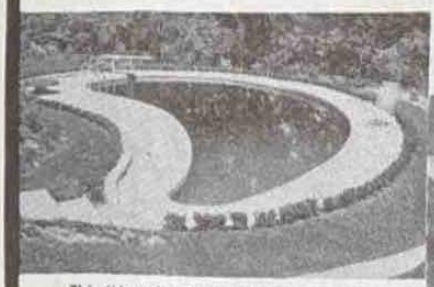
FREE POOL-FORMING PLAN SERVICE

Gates & Sons are offering a special forming plan service designed to show you how to build better pools faster with poured concrete . . . at no increase in costs!

THIS IS WHAT THE SERVICE INCLUDES:

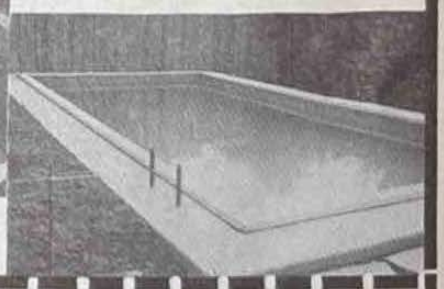
- **Form layouts from YOUR specifications** *Just send a detailed description of the pool you are now building.*
- **Pool cost estimates**
- **Gates Forming Booklet**

Virtually every type of pool can be formed with Gates



This "Aqua" pool had footings, walls and a continuous 2' sidewalk on all sides *monolithically* poured in one operation.

Using a Gates System, this complex, free-form pool was formed with a minimum of bracing, walering and ribbing.



SEND COUPON TODAY NO OBLIGATION OF COURSE

Gates & Sons, Inc. PAB 4/58

80 South Galapago Street, Denver 23, Colorado

Please rush me the following information from your new planning service. I understand there is no cost or obligation.

☐ Form layouts from my specifications (enclosed)

☐ Form layouts of TYPICAL Gates pools PLUS, pool cost estimates and the Gates Forming Booklet

Aldrich Bowler, Hagerman, Idaho, potter; and L. A. Douglas, Boise, muralist.

Washington State Chapter, joined by members of the Artists Equity Association at a dinner meeting in Seattle April 3, presented seven certificates for superior design, execution and craftsmanship. Awards went to Erik H. Erikson, Mercer Island, for general contracting and carpentry; Mignonne Keller, Seattle, sculpture and painting; Frank Melang, Marysville, masonry; Andrew V. Wetterauer and Carl N. Nelson, both of Seattle, and George Whelan, Bothell, execution of construction; and Bert Willemese, Portland, design and execution of stained glass.

Northern California Chapter, as part of its public relations program, is co-sponsoring a weekly column devoted to answering questions from the general public about architects and home construction problems in the San Francisco Examiner's "Modern Living" section.

Fifth annual Tour of Homes of the Women's Architectural League of Oregon will be held in Portland on Saturday, May 3, according to Mrs. Clark Austen, chairman.

BOOKS

Problems of Design. By George Nelson. Whitney Publications, Inc., 18 E. 50th St., New York 22, N.Y. 1957. 295 pp. $10.

A collection of 26 of the best and most interesting articles written by George Nelson ("an industrial designer with a sense of humor") during the past 10 years. Topics covered range from art to architecture, housing to town planning, modern decoration to the new subscape.

Shops and Stores. By Morris Ketchum Jr. Reinhold Publishing Corp., 430 Park Ave., New York 22, N.Y. 1957. 263 pp. $15.

A revised edition of a book which was published almost 10 years ago, developing the subject of store design in the same way—from the inside out. The chapter on "The Department Store" and those in the section entitled "Shopping Environment" have been completely rewritten. Brand new is the chapter on color.

Buildings for Industry. F. W. Dodge Corp., 119 W. 40th St., New York 18, N.Y. 1957. 309 pp. $9.75.

A selection of new industrial buildings, together with a series of studies on trends and factors in present-day industrial building design. Illustrated with more than 500 photographs and 200 line drawings are 74 projects from all over the U.S. and several other countries as well. There are six categories: warehouses, light industry, consumer goods, manufacturing laboratories, utilities and service industries and heavy industry.

High Schools: Today and Tomorrow. By Charles W. Bursch and John Lyon Reid. Reinhold Publishing Corp., 430 Park Ave., New York 22, N.Y. 1957. 127 pp. $7.95.

This volume which treats the development of a sound, workable high school program and the design of a building to house it should be of particular interest on the West Coast because of its authors. Charles W. Bursch headed the school plant service administration on the California State Department of Education for years and San Francisco architect John Lyon Reid is well known for his design of school buildings and also teaches at the University of California. Illustrations consist of plans and drawings of the proposed school plant; there are no photographs because there are no schools now in existence that incorporate these new ideas. Both program and plant are flexible enough to be adapted to special conditions.

"More and more buyers are demanding built-in telephone outlets."

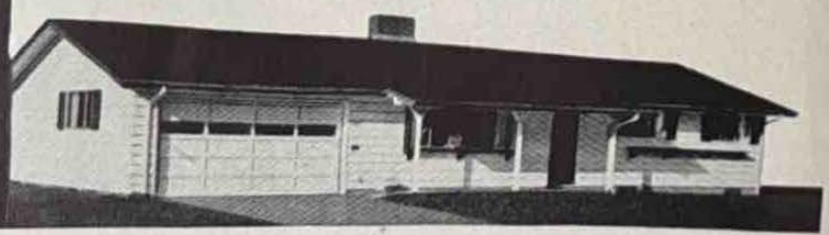
says Jack McLeod, President of the Portland Home Builders Association, Portland, Oregon.

"Our clients want a home that will meet their telephone needs today—and tomorrow. So we install telephone outlets and concealed wiring in all the busiest rooms. Telephone planning increases the long-range value of a home—and is a real plus in making a sale!"

To successful builders like Jack McLeod, who are meeting the modern living standards of the Pacific West, complete telephone planning is as basic as adequate electrical wiring.

We'll be glad to help you plan built-in telephone facilities. Just call our business office, and ask for our free Architects and Builders Service.

Pacific Telephone



It pays to include Telephone Planning in every home you build!

▲METHODIST CHURCH— Gresham, Ore.

Five bids received by Gresham Methodist Church, 200 E. Powell Blvd., Gresham, in the City Hall at Gresham for construction of the reinforced concrete and frame Gresham Methodist Church on a four-acre site at Norman Ave. and N.W. 8th St., near Multnomah County Fairgrounds, in Gresham. Plans by Stuart B. Mockford, architect, 723 Washington St., Oregon City. Bids opened April 11. TWO LOW BIDS: Mason & Robinson, 2004 N.E. 127th Ave., Portland, $208,500; Anfelt B. Hansen, 2115 S.E. Ogden St., Portland, $213,723. HI BID: Robertson, Hay & Wallace, 1801 S.E. Grand Ave., Portland, $228,500. WB 4-15. Previous report 4-1

GARAGE RELOCATION— Kingsley Field, Ore.

Bid opening cancelled by U.S. Air Force, Kingsley Field, Klamath Falls, for relocation of 18 garages at Kingsley Field; Inv. No. 58-15. Bids were to have been opened April 10.
ZZ 4-12. Previous report 3-25

●THEATER, PARACHUTE SHOP— Kingsley Field, Ore.

Bids will be opened 2 p.m., May 2, by 13th Naval District, room 107B, Bldg. 250, U.S. Naval Station, Seattle, for construction of a 43'x126'x22' high reinforced concrete and concrete block base theater building and a base parachute shop consisting of a 20'x26'x62' high reinforced concrete drying tower and an attached 62'x40'x11' high concrete block building, at Kingsley Field, Klamath Falls, Ore.; Spec. No. 12351/58. Plans with above office.

Following description applies to both buildings: structural steel joist; steel roof deck; extensions, alterations and connections to existing utility service; paving; sidewalks. Work involves earthwork, concrete, masonry, steel work, carpentry and joinery, roofing, metal windows and doors, asphaltic concrete, flooring, acoustical unit work, sprinkler system, electrical work, plumbing, heating and ventilating and field painting.
SP 4-11

★FIRE ESCAPE MODIFICATION— Kingsley Field, Ore.

Award to only bidder A. E. Fitzgerald, 329 Rogers St., Klamath Falls, $4,968, by U.S. Air Force, Kingsley Field, Klamath Falls, for modifying fire escapes serving four buildings at the base; Inv. No. 58-16. Bid opening April 9.
ZZ 4-15. Previous report 3-25

COLLEGE PLANT IMPROVEMENTS— Klamath Falls, Ore.

The Oregon State Board of Education, Capitol Bldg., Salem, has authorized W. D. Purvine, director, Oregon Technical Institute, Klamath Falls, to negotiate with Stevens & Thompson, consulting engineers, 2234 S.W. 5th Ave., Portland, to prepare alternate drawings for improving the institute plant at its present location or for a new institute at another location. A preliminary estimate prepared by the consulting engineering firm

slated $6,000,000 for replacing the campus at its present location and more than $7,000,000 for moving the plant to a new site. Modernization plans for the present site are expected to include a central building to house administrative offices and classrooms, a building for allied arts courses, a science building and housing quarters for more than 700 married students.
ZZ 4-5

RESIDENCE— Klamath Falls, Ore.

Plans are nearing completion by Stan Miller, architect with Howard R. Perrin, 1121 Main St., Klamath Falls, for a one-story and no basement, 1,640 sq. ft. residence on Moyina Heights in Klamath Falls, for James E. Misfeldt, 2205 Eberlein Ave., Klamath Falls. Included will be 22'x26' attached connecting garage. Contract will probably be negotiated.
ZZ 4-12

FIELD HOUSE— Klamath Falls, Ore.
(Estimated cost $110,000)

Plans will be complete about July 1 by Morrison & Howard, architects, 203 Williams Bldg., Klamath Falls, on a one-story, 8,500 sq. ft., wood with pumice brick exterior field house to be constructed as an addition to the high school natatorium on Modoc Athletic Field in Klamath Falls. Bids will be invited soon after completion of plans by Klamath Union High School District No. 2, Klamath High School, Klamath Falls.

Reinforced concrete footings and foundation; concrete slab floors with ceramic tile in shower and toilet rooms; steel or aluminum sash; general wood construction with pumice brick exterior; built-up roofing. Plans include additional filter facilities to bring the natatorium pool up to class A standards and contract will include removing present frame field house.
ZZ 4-15. Previous report 3-25

●HIGH SCHOOL ADDITIONS— Milwaukie, Ore.

Bids will be opened 8 p.m., May 8, by Union High School District No. 5, Clackamas County, Ferd Paulson, clerk, Milwaukie, for (A) Clackamas High School addition; (B) Clackamas High grandstand, and (C) Milwaukie High remodeling and addition. Plans with Hayslip, Tuft, Hewlett & Jamison, architects, 2040 S.W. 3rd Ave., Portland. $25 deposit. Certified check, cashier's check or bid bond 5%.

CLACKAMAS HIGH ADDITION — One wing to contain agriculture shop, classroom and vocal room; another wing will have arts and crafts space. Frame construction with brick veneer exterior; concrete slab floor with asphalt and rubber tile; aluminum sash; hollow metal exterior doors; glued laminated beams with solid decking and graveled built-up roof; hemlock wall paneling and plaster wall finishes; acoustical tile ceilings in classrooms; fir and birch cabinets; extension of existing heating with space heaters and ventilation units; fluorescent lighting. GRANDSTAND—Risers and treads will be concrete placed on an existing embankment; built-up steel brackets and wood seat boards (seating for 1,400); concrete block toilet and concession areas; roof (deductive alternate) will have glued laminated beams with wood purlins and plywood deck under built-up roofing. MILWAUKIE HIGH—Replacing of concrete slab on ground floor; remodeling rooms on first and second floors with vinyl tile and linoleum floor finishes; plaster on new wiring and some patchwork; asphalt tile on new floor slab. Alternates for additional work: (1) Remodel present shop building for arts and crafts, photography, general work area and ceramics area; considerable built-up cabinet work; (2) Remodel frame agricultural shop into bank building with frame interior partitions, floor covering and acoustical treatment; (3) Addition of reinforced concrete vocal wing to existing stage; wood floor with cork flooring; plastered walls; acoustical ceilings; plastic skylights; wood joist roof; built-up roofing.
WB 4-12

▲CHURCH COMPLETION—Milwaukie, Ore.

Three bids received by Oak Grove Methodist Church, O. L. Covault, pastor, 14700 S.E. Rupert Drive, Milwaukie, for completion of the 114'x44' church. Plans by Stuart B. Mockford, architect, 723 Washington St., Oregon City. Bids opened April 10. BIDS: Norman Builders, 2803 S.W. 3rd Ave., $53,982; St. Pierre & Vermilyea, 10505 N.E. Beech St., $55,630; Bickford Construction Co., 823 S.E. 28th Ave., $55,800. All of Portland.
WB 4-15. Previous report 4-2

RESORT EXPANSION— Oceanlake, Ore.
(Estimated cost $250,000)

Construction is expected to start this summer on expansion of the Dorchester House restaurant on 400'x420' site west of the existing structure at Oceanlake. Plans by Robert K. Grubb, designer, 2787 N.W. Raleigh St., Portland. Al Jaroff, Oceanlake, is owner of the resort.

The existing structure will be renovated; a new extension will be added the full length of the main building with new kitchen, dining, broiler and cocktail facilities; viewing deck. The garden area will feature reflecting pool, teenage coke bar (enclosed for winter use), pool building with faceted roof structure housing central heating plant. Living cabanas with individual interior designs and art forms will surround the gardens. Community activity building will provide indoors sports such as shuffleboard, squash, tennis, etc., and portable seating for banquets and meetings. Additional housing units will have sun decks. Sculptured tower of light and rich night lighting. Construction materials will include Oregon cedar, field stone, thermopane, copper and art glass; cinder, cement and pebble walks; terra cotta tile in landscape and garden areas.
WB 4-5

■GRADE SCHOOL— Pendleton, Ore.

Planholders announced for construction of a 18,360 sq. ft. seven-classroom starter grade school on the old golf course site just north of the high school now under construction in Pendleton. Bids will be opened 2 p.m., April 29, by Pendleton School District No. 16C, Wallace McCrae, superintendent, 229 S.W. 1st, Pendleton. Plans with Warren Weber, architect, 610 Fenton Bldg., Portland. $35 deposit.

Planholders: McCormack Construction Co., S.E. 3rd and Goodwin Sts., Pendleton; Bechtel Bros., Box 792, La Grande; Timber Co., 2150 N. 1st St., Hermiston; Paul B. Emerick Co., 4540 S.E. 174th Ave., Portland; Beebe Construction Co., 2134 N. Flint, Portland; Mason & Robinson, 2004 N.E. 137th Ave., Portland.
WB 4-16. Previous report 4-5

★COMMUNICATIONS BUILDING, TOWER, TANK— Placer AFS, Ore.

Award to Ausland Construction Co., Manchel Bldg., Grants Pass, $40,465, by Corps of Engineers, Seattle office, 4735 E. Marginal Way, Seattle, for Gap Filler Facility, including a 1,282 sq. ft. concrete block communications building, tower erection, oil storage tank and grading and road surfacing, at Placer Air Force Station; ENG-45-108-58-79.
SP 4-11. Previous report 4-4

GRADE SCHOOL ADDITION— Portland, Ore.

Bond issue for $48,000 approved by Rockwood School District No. 27, Multnomah County, 740 S.E. 182nd Ave., Portland, for partial financing of an addition to the North Rockwood Elementary School at 330 N.E. 172nd Ave. It will include five classrooms, toilet facilities and an additional boiler. Bid call will be issued about May 1. Plans are by Logan & Murtaugh, architects, 1940 S.W. 4th Ave., Portland.
WB 4-12

REHABILITATE EXPOSITION— BUILDING— Portland, Ore.
(Estimated cost $484,380)

Stewart & Richardson, architects, 219 S.W. Stark St., Portland, retained by Oregon Centennial Commission, Anthony Brandenthaler, chairman, Jackson Tower, Portland, to prepare plans for renovation of the Pacific International Livestock Exposition building in north Portland for the Oregon Centennial Exposition and International Trade Fair in 1959. The architects will also do the architectural layout and design of the 65-acre site.

Preliminary estimates on the cost of the work have been made by Moffatt, Nichol & Taylor, structural engineers, 1845 N.E. Couch St. Work would include: (1) Structural repair, $31,840, including reposting columns and repair of balcony floor; (2) Fire protection, $72,210, including roof and window vents, repair of fire doors, placement of new hydrants, sprinkler system under stage seat decks and standby water system; (3) Sewage disposal, $39,950, including primary treatment plant and lavatory facilities; (4) Electrical additions, $132,150; (5) Building renovation, $101,800, including new asphalt siding on arena walls, remodeling of interior lavatory facilities, two new ramps, repair of damaged seating, refinishing all seats, replacement of sideboards with pipe railing and painting; (6) Site development, $196,630, including road at east end of building, new paving 12' strip at south side, new parking lot, bumper logs, filling and paving area for amusements, and walks.

PILING, DOLPHIN— Coquille, Ore.

The Coquille Valley Boat Club, Box 606, Coquille, has applied to the Corps of Engineers, Portland district, 628 Pittock Block, Portland, for a permit to drive piling and a 3-pile dolphin in the Coquille River at Coquille. Site of the proposed work is on the south side and upstream from the U.S. Highway 101 bridge crossing the river.

A sheer boom with four single piles and one 3-pile dolphin will be attached to the upstream end of the swing span pier and continue upstream for 230', thence shoreward on a 60-degree angle to a piling 30' landward of the mean lower low water line. The upstream end of the sheer boom will be 40' channelward from the mean lower low water line. Piling will be driven landward of the sheer boom for a floating dock, which will consist of two rows of four single piles about 40' apart and about 40' and 5' channelward of the mean lower low water line respectively. One single pile will be driven 20' upstream from the outer row and two piles will be driven 10' and 20' respectively upstream from the inner row. A floating walk will be provided at the upstream end of the dock and will consist of two single piling being driven 10' apart and 20' landward of the mean lower low water line.

Colonel Jackson Graham, Portland district engineer, will receive letters in his office until April 24 concerning effect of the work on navigation.

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., APRIL 29
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, April 29, 1958, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal Funds have been allocated for items nos. 1 to 4 inclusive.

The improvements for which bids will be received follow:

1. Constructing Two Reinforced Concrete Box Girder Bridges on 0.046 mile of Primary State Highway No. 1 in Clark County, SALMON CREEK INTERCHANGE-A-LINE OVERCROSSING, FAP No. I-5-1(15)7, involving about 377 cubic yards of Concrete, 52,000 pounds of Steel Reinforcing Bars, a lump sum bid for Superstructure (about 1,150 cubic yards of Concrete and 328,000 pounds of Steel Reinforcing Bars), 942 linear feet of Standard Bridge Railing, 11,000 linear feet of Treated Timber Piling and other items. Minimum Wage Rates for this project have been predetermined by law and are set forth in the bid proposal.
2. Clearing, Draining, Grading and Surfacing on 5.250 miles of a Jefferson County Foad, CHIMACUM-CENTER ROAD, FAS No. S-0496(1) and State and County Projects, involving about 60,150 cubic yards of Unclassified Excavation, 45,280 cubic yards of Selected Roadway Borrow, 6,960 cubic yards of Screened Gravel Surfacing, 1,533 linear feet of Concrete Pipe, 117 linear feet of Metal Pipe, 60 linear feet of Iron Pipe, 25 cubic yards of Riprap and other items.
3. Constructing Bituminous Surface Treatment and Bituminous Road Mix on 13.745 miles of Walla Walla County Roads, MOJONNIER ROAD, ET AL, FAS Nos. S-0636 (4), S-1140(1) and S-0638(1), involving about 629 tons of Asphalt Cement, 6,695 cubic yards of Crushed Cover Stone and Mineral Aggregate, 4,531 linear feet of Beam Guard Rail and other items.
4. Clearing, Draining, Grading and Surfacing on 1.017 miles of County Road No. 10 in Clark County, VENERSBORG VICINITY, FAS No. S-0594(2), involving about 13,180 cubic yards of Common Excavation, 9,650 cubic yards of Solid Rock Excavation, 9,580 tons of Ballast and Crushed Surfacing, 459 linear feet of Concrete Pipe, 84 linear feet of Metal Pipe and other items.
5. Surfacing, Constructing Bituminous Surface Treatment and Stockpiling Crushed Surfacing, Ballast, Maintenance Rock and Mineral Aggregates on 2.724 miles of Secondary State Highway No. 3-L in Columbia County, TURNER TO KINGS RANCH, a State Project, involving about 29,475 tons of Crushed Surfacing, Mineral Aggregates, Crushed Cover Stone, Ballast and Maintenance Rock, 84 tons of Asphalt Cement and other items.
6. Paving with Asphaltic Concrete on 1.936 miles of Primary State Highway No. 15 in Snohomish County, SNOHOMISH TO HALFORD, a State Project, involving about 560 cubic yards of Crushed Surfacing, 11 tons of Asphalt Cement, 2,250 tons of Asphaltic Concrete and other items.
7. Stockpiling Crushed Surfacing, Maintenance Rock and Mineral Aggregates on State Highways Nos. 4, 4-C and 11-B in Lincoln and Whitman Counties, PSH NO. 2 TO LAKE ROOSEVELT, ET AL, a State Proqject, involving about 3,500 cubic yards of Stripping Quarries and Pits and 66,900 tons of Crushed Materials.
8. Stockpiling Crushed Surfacing and Mineral Aggregates on Secondary State Highway No. 9-A in Clallam County, TWIN VICINITY—STOCKPILING, a State Project, involving about 13,600 tons of Crushed Surfacing and Mineral Aggregates.

STRESSING
A STRUCTURAL TRIUMPH

Prestressed 'Incor' Structural Members Frame 72,000 Sq. Ft. of New Sanitary Food Plant

• Sanitation and cleanliness are of paramount importance in food processing. How better can these essentials be obtained than with precast, prestressed concrete!

Versatile concrete provides wide-open floor space and streamlined smooth surfaces that keep that new look, and are easy to clean.

Other important advantages inherent in prestressed concrete are low-cost maintenance, economy of erection, and flexibility for expansion through a variety of shapes, sizes, and weights made to order at no premium cost. The bright, light, functionally attractive structures of prestressed concrete are also corrosion-proof, fire-safe and durable—designed for today's needs, yet built for the years ahead.

Noteworthy is this large modern structure which houses the multiple food processing facilities of Charles Dennery, Inc. in Jefferson Parish, Louisiana. Covering 72,000 square feet, the well-designed building contains the plant's varied operations—converting raw materials into packaged food products.

Beams, girders, purlins, and columns were supplied and erected by Belden Concrete Products, Inc. of New Orleans. A quick start and early completion were obtained using 'Incor'*, making possible assembly-line production, fast stripping and re-use of forms—advantages always assured with America's FIRST high early strength portland cement.

BUILDING PERMITS

April's $222 million is slight drop

Building permit volume for the five western states in April slid back to $222,258,347, a drop of $10¼ million from the same period last year. However, only California showed a decrease, $38 million. Oregon picked up $23¾ million, due primarily to a single $21.3 million permit for the Lloyd Center in Portland. Washington was up $2¼ million; Idaho, $1½ million; and Montana, $75,000.

Compared to the previous month, the dollar volume for the five states dropped $27¼ million. Here again California was responsible, with a $55¼ million loss. All other states showed good increases over March.

The dollar volume for the first four months of 1958 stands at $823,320,787, an increase of $26¼ million over the corresponding period in 1957. Biggest increase is in Oregon, up $22¾ million. Four-month tabulation by states:

	Jan.-Apr. 1958	Jan.-Apr. 1957
Calif.	$653,477,234	$656,562,543
Ore.	60,671,150	37,823,965
Wash.	94,731,013	87,329,972
Mont.	6,370,048	8,859,394
Idaho	8,071,342	6,464,175

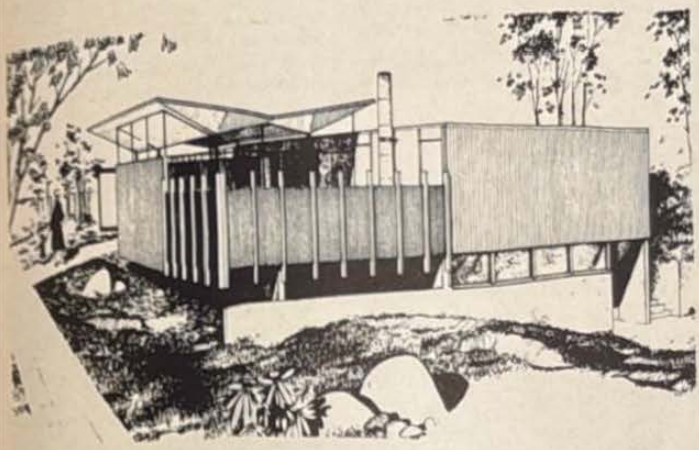
PROJECT PREVIEW

COOPERATIVE APARTMENT

project, believed to be largest ever undertaken in southern California, will provide 256 units in 16 separate buildings on landscaped site overlooking Pacific Ocean and La Jolla Beach and Tennis Club. Of lift slab construction, each structure will be six stories, have three penthouses. Total cost: $8 million. Architects: John C. Lindsay & Associates.

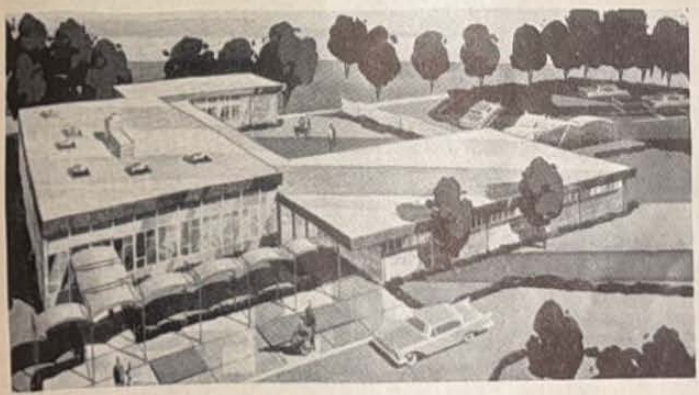


MEDICAL CENTER

to be shared by general practitioner, surgeon, dentist and pharmacist in Seattle will be frame building with stained cedar siding, translucent plastic panels and glass, have some 2,000 sq. ft. Self-supporting roof structure will dramatize reception area. Architect: Gene Zema; engineers: Stern & Towne.

CHURCH PLANT

for Unitarians in Sacramento has been designed outward rather than upward (main auditorium will be only 28 ft. high), reflecting principle of universal relationship with nature. Perforated pattern within walls will be obtained by using concrete block in hexagonal form—same basic shape of each building in master plan. Social hall and two religious education departments will be first units built. Architect: John Harvey Carter; structural engineer: Walter Constant.



REHABILITATION CENTER

in Great Falls, under sponsorship of Montana Society for Crippled Children and Adults, will be separated into three main areas: administration, medical-dental evaluation, speech and hearing, and dining; physical therapy and special education; occupational therapy and prevocational training. Building, to cost $320,000 when equipped, will feature ceramic tile facia, aluminum windows with marble chips on panels. Architects: Page & Werner.

JOB OF THE MONTH

LLOYD CENTER MODEL superimposed on Portland's central east side. Retail shops will form T, with Meier & Frank's at intersection of two malls. Structure in left corner is proposed medical-dental building; across Halladay Park (city owned) is now-being-built Sheraton Hotel and at its left, completed Interior Building. Boundry at right is Northeast Broadway. Exposition-Recreation Center will be located between Broadway Bridge (extreme right) and Steel Bridge (next to Broadway), this side of highway. Banfield Expressway goes through Sullivan's Gulch at left of Lloyd property.

56-block shopping center six minutes from down town

After eight years of planning, Portland's in-town Lloyd Shopping Center, which will be as large as any in the nation, is now set for construction, with contracts awarded thus far totaling $21.4 million. This figure does not include store fronts and outside finishes, which are expected to raise the total to $30 million, exclusive of land, tenant fixtures and stocks. The Sheraton Hotel, although on the center site, is being built as a separate project (for sketch, see PA&B, Jan. '58).

Designed by John Graham & Co., architects-engineers, the center will consist principally of four units, to be constructed by the following: Donald M. Drake Co., No. 1 (Meier & Frank department store and two multi-tenant buildings on the north mall), $7.7 million, and No. 3 (three-level J. J. Newberry Building and adjacent three-level buildings on the north mall plus one three-level and two two-level buildings on the west mall); $7.6 million; Max J. Kuney, No. 2 (three-level building for J. C. Penny and F. W. Woolworth plus two two-level adjacent multi-tenant buildings on the east mall), $5.3 million; and Henry M. Mason Co., No. 4 (Safeway Store on mall level with full basement), $700,000. Figures include subcontracts.

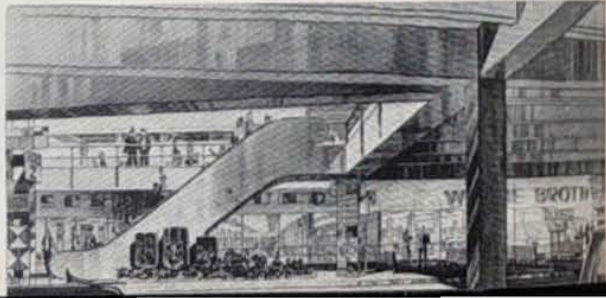
In addition to its sheer size, Lloyd Center will be noteworthy in a number of respects. Most significant perhaps is the fact that such a large site—56 square surface blocks and 34 square blocks of covered parking—is located so close to the heart of a city under a single ownership. Within six minutes' driving time of the west side downtown business area, it will be situated on the east side of the Willamette River, where 82% of the population lives.

The center is designed on the mall plan which the architects first developed for Seattle's Northgate Shopping City in 1950. The Portland project will have two rectangular groupings, each split by a mall, set in the shape of a huge T. Covered walks and balconies will protect shoppers from the weather. All structures will be of concrete, but faced with a variety of materials and colors. Exposed neon signs will be prohibited.

Parking for 8,500 cars will be provided on three levels: lower (entered from Multnomah Street), intermediate and mall deck. The first two levels will offer covered garage parking. Assisting in the planning have been Larry Smith & Co., real estate consultants, and Harland Bartholomew & Associates, traffic consultants.

LARGEST STRUCTURE in center will be Meier & Frank department store, occupying five full levels, with 300,000 sq. ft. of floor space, and designed to accommodate additional floors for expansion.

TWO LEVEL SHOPPING MALLS will be connected by escalators, will feature rest areas and planters. Lower level will be one of three providing parking for 8,500 cars. Divided into seven zones, each area will have its own basic color for shoppers' convenience.



THE BUILDING MONTH: BRIEFS

New York hotel architect William B. Tabler has received one of the 1958 Horatio Alger awards, based on a vote of college campus leaders across the country. Among his designs: the Statler Hilton in Los Angeles, the San Francisco Airport Inn (first of Hilton's horizontal hotels) and the proposed 1,000-room Hilton Hotel in the heart of the Bay city.

A proposed monorail installation for Seattle, which probably would link the business district with the Civic Center-World's Fair site, is being studied by transit and city officials. Meanwhile, in New Orleans the City Council has voted a conditional franchise for a 15-mile installation from Moisant International Airport to the Union Passenger Terminal.

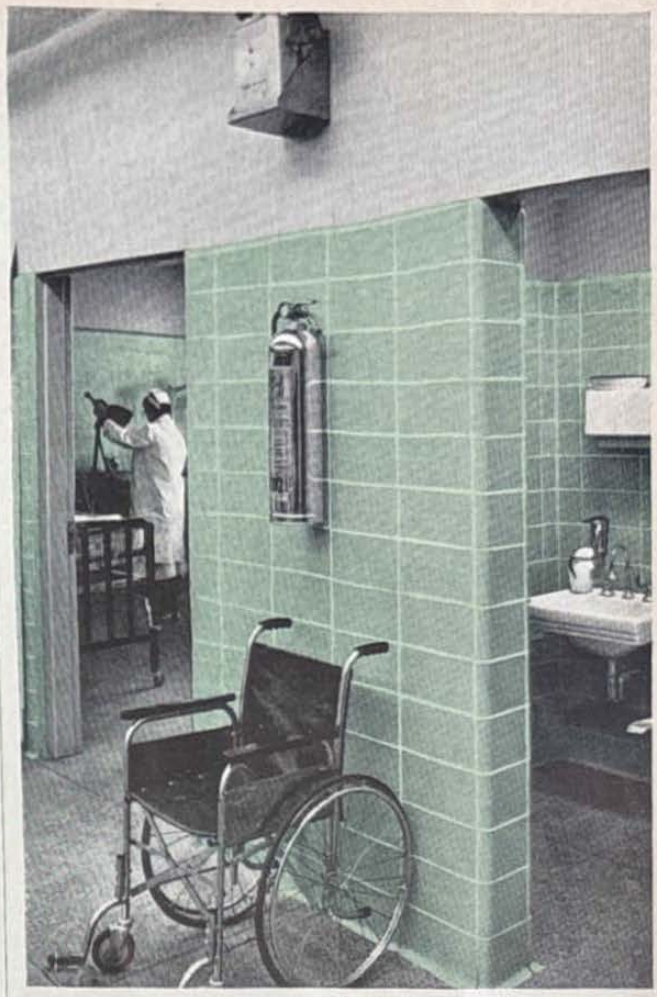
Ex-Portland architect Pietro Belluschi, principal speaker during weekend dedication activities for the new building of the University of Oregon's School of Architecture and Allied Arts on the Eugene campus, declared: "The seed of creativeness is in all of us and the proper environment will bring it out." The dean of the School of Architecture and Planning at Massachusetts Institute of Technology, went on to say that education is a process of using knowledge as much as gaining it and that "our job is to teach students to think."

The Hawaiian Islands comprised one of the brightest spots in the construction industry in the first quarter of 1958, with projects let for bid totaling $60,134,000, compared with $25,421,000 in the same period of 1957. The Bank of Hawaii reports: "Because of rain and stormy weather, construction put in place during the winter months was slightly below previous year levels. Hence, during the remainder of 1958 there will be increasing pressure on the industry for a speedup in construction."

Fourth Western Area Development Conference to be held in Vancouver, B.C., May 26-27, will bring together leaders from western Canada, the western states, Alaska and Hawaii to discuss "New Products and New Industries Through Research." Among the speakers: Dr. Robert J. Seidl, director of research, Simpson Timber Co., Seattle, discussing new wood products. Stanford Research Institute is the sponsor.

Portland will host the national convention of the American Society of Civil Engineers, June 23-27, whose program will include 16 papers on design and fabrication of timber construction for buildings and bridges and tours of lumber industry processing plants in Longview, Wash.

One of the nation's first jet age hangars is now in operation at Metropolitan Oakland International Airport. The $1,250,000 project has one of the world's largest cantilever spans providing 43,000 sq. ft. of unobstructed space to a height of 50 ft., which will clear the largest propeller aircraft now in service as well as jet transports. Designed by O'Neil & Long Associated, consulting engineers, the hangar was built by the Port of Oakland for lease to Aircraft Engineering and Maintenance Co. The port currently is undergoing a $17.5 million expansion at the airport to prepare for the jet age on recently completed fill extending a mile into the Bay.



Ford Motor Company, Milpitas, California
Architect: Albert Kahn, Associated Architects & Engineers
Glazed structural tile by Kraftile

CHEER FOR THE ILL & INJURED

A sense of cleanliness brings a feeling of comfort and security to the ill or injured. Color gives them optimism and quiets their fears. In this First Aid Room, cheerful attractiveness and hospital cleanliness will go hand in hand for the life of the building. Walls are colorful, gleaming Kraftile, chosen because of its low annual cost. Harsh, heavy-duty soaps and detergents, cleansing powders, bleaches and antiseptics cannot dull the sheen of Kraftile surfaces. Repeated scrubbings throughout the day, year in and year out, cannot wear it out. Chemicals and bleaches cannot change or fade its glowing colors. Construction with Kraftile goes with astonishing speed. When you specify Kraftile glazed *structural* tile, costs are competitive. Kraftile construction requires no carpentry, plastering or finishing. Standard sizes and shapes for every need, in 12 architect-selected colors and clear glaze. Write for specifications, graphic standards, and color samples.

AIA names keynoter for Cleveland

• Five Californians elected to fellowship

With the selection of Secretary of the Treasury Robert B. Anderson as keynoter, the program for the annual convention of the American Institute of Architects in Cleveland, July 7-11, is whipping into shape. Another headliner will be Dr. Margaret Mead, associate curator of ethnology at the American Museum of National History, who will discuss "The Anthropologist Looks at Architecture."

Secretary Anderson's opening address on Tuesday morning, July 8, will be followed by the architectural keynote speech of Philadelphia architect Vincent G. Kling. At luncheon that day Harland Hatcher, president of the University of Michigan, will speak on "The Western Reserve—Part of Our Heritage."

The convention program this year is geared toward providing a deeper understanding of the economic forces of the nation that are influencing environmental patterns, but panelists will also treat such practical matters as how to make better cost estimates, where to find construction money, developing today's building program and working with the home builder. Other seminars: urban planning, office organization, chapter affairs and professional status.

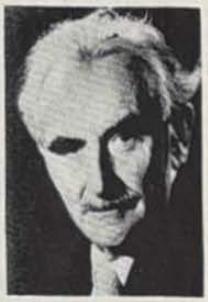
The Gold Medal will be awarded at the annual banquet July 10.

Fellows: Five of 20 members who have been elected to fellowship are from California. They are William Clement Ambrose, San Francisco, service to the institute; William L. Pereira, Los Angeles, design; John L. Rex, Los Angeles, design; Malcolm D. Reynolds, Oakland, service to the institute; and George Vernon Russell, Los Angeles, design. The six-man jury included Winchton L. Risley of Los Angeles.

Nominations: Among the nominees for the top five AIA posts (there are at least two for each position) is Henry L. Wright of Los Angeles, for second vice president, running against Austin W. Mather of Bridgeport, Conn., and Herbert C. Millkey of Atlanta. Other candidates: for president —John N. Richards of Toledo and Alexander C. Robinson 3rd of Cleveland for first vice president—Albert S. Golemon of Houston and Philip Will Jr. of Chicago; for secretary—Louie L. Scribner of Charlottesville, Va., and Edward L. Wilson of Fort Worth; for treasurer — Gerson T. Hirsch of Pleasantville, N.Y., and Raymond S. Kastendieck of Gary, Ind.

Citations for Neutra in Venice, Vienna

More laurels, this time citations from Venice and Vienna, have been bestowed upon Richard J. Neutra, who is celebrating his two-thirds of a century anniversary in 1958.



NEUTRA

The College of the Academicians of Venice, founded in 1750 and just recently reinstituted, has named the Los Angeles architect an honorary member. In notifying him of the selection, Bruno Zevi, rector of the college's architectural class, wrote: "I know that your creative genius does not need any formal recognition, as it is universally admired and respected. I am sure, however, that you will be so kind to accept this nomination as a sign of the devotion of humanistic Italy, as represented by one of the oldest and most glorious cultural institutions."

In Vienna the annual award for achievement in architecture has gone to Neutra, who was invited by the Academy of Fine Arts to personally receive the prize from the mayor during a May 17 presentation. In addition, the architect has been nominated as director of planning for the European cultural center.

Back home, the firm of Neutra & Alexander has been commissioned by the National Park Service to design the Shrine of the Nation, the Lincoln Memorial Building, on the grounds of the Battlefield of Gettysburg.

National honor for Warnecke

John Carl Warnecke of San Francisco is one of five architects elected to associate membership in the National Academy of Design. Others are Gordon Bunshaft and Francis B. Hoffman, both of New York; Richard Koch, New Orleans; and Roy F. Larson, Radnor, Pa.

FLLW has friends, foes in civic center feud

A contract for Frank Lloyd Wright to design a Marin County civic center in northern California has become the center of a community uproar.

Alvin Schultz, Greenbrae builder and president of the Marin County Taxpayers Association, has opened a drive to cancel the Wright contract and has announced that his association will "fight any expenditure of public funds for a civic center design" regardless of whom the architect might be.

William Fusselman, a member of the Marin County Board of Supervisors, has been an articulate and highly vocal critic of Wright, basing much of his criticism on the architect's background.

Initial sketches and plans prepared by Wright have been presented to the board and have been widely shown throughout the county at various public exhibits.

In the meantime, two temporary co-chairmen have organized a citizens' group to support the architect's plans for a center that would eventually cost as much as $10 million. They are Harold Stockstad and William A. Steward, both of Mill Valley, and their organization will be known as the Citizens' Committee for the County Center.

Architects to play big role at Aspen design conference

The International Design Conference to be held in Aspen, Colo., June 22-28, will feature papers of several architects and members of related professions, including three from the West Coast. Program theme, "Design and Human Problems — How Are They Meshing?" will be divided into three cycles.

Among the participants will be architect Henry Hill of San Francisco, "Architecture in the Landscape"; landscape architect Ed Williams of San Francisco, "House in the Garden"; and engineer-planner Edgardo Contini of Los Angeles, "Structures of Cities." Walter Packard, economist-conservationist of Berkeley, Calif., will summarize one of the sessions.

Other architect speakers: Alberto T. Arai, Mexico City; Romaldo Guirgola, University of Pennsylvania; Gordon Stephenson, head of the School of Architecture, University of Toronto; and Christopher Tunnard, School of Architecture and Design, Yale University.

Keynoter will be Dr. E. A. Gutkind, Institute of Urban Studies, University of Pennsylvania.

Housing code trips on a stairway

• San Francisco proposal runs into a snag

A new housing code which had promised to be the "bright hope" of San Francisco's slum clearance plans has, figuratively speaking, tripped on a stairway and banged its head against a board.

The accident took place during a surprise battle before the health committee of the San Francisco Board of Supervisors.

City leaders had hoped to have the code enacted by July at which time new inspection teams would be created to crack down on slum housing. To speed hearings, the final draft had been cleared with architects, builders and other interested groups, all of whom had supposedly endorsed the new code.

The health committee hearing, however, turned into a battle royal when the Chamber of Commerce, the San Francisco Planning and Housing Association, Associated Home Builders and the public health director took issue with parts of the proposed new code.

The code, as drafted, sets minimum standards for everything from the size of rooms in a house to the amount of heat the furnace should produce and it would apply to every home built in San Francisco since August 17, 1923. Approximately half of the city's homes were built prior to that date and thus would be exempt from the new code standards.

The fight arose over a section that would require two stairways leading to the ground from any floor more than 14 ft. from the ground. Carl Gellert of Standard Builders immediately protested that the requirement would add $750 to $1,000 to the cost of each new home with more than one floor above the garage.

Chief Albert Hayes of the Fire Department Bureau of Fire Prevention then accused Gellert of "trying to confuse the committee" and added, "People are entitled to two ways out. The second floor is where most people die in a fire!"

The second section to come in for trouble related to a board of appeals to which home owners could turn for redress against the code. Dr. Ellis Sox, public health director, attacked this provision with the declaration that "an appeals board would destroy the effectiveness of the law."

Architect Leonard Tivol, representing the AIA, said the chapter "is supporting the code primarily because it would make federal redevelopment money available. But the code must have an appeal section."

So San Francisco's new housing code remains still a subject for heated discussion, with approval by the health committee put over to later sessions.

More money for vet housing

New California state legislation provides for a $300 million bond issue, raised from $200 million through efforts of the Home Builders Council of California, to provide additional home financing for California veterans.

The new bill sets a price ceiling of $25,000 on the amount a veteran can pay for a home; retains the loan limitation of $15,000; continues the acceptance of sales contracts with veterans pending completion of negotiations with the Cal-Vet Board; and continues a policy of no refinancing until all applications for new home purchases are processed.

MASTER PLAN calls for business block improvement and street conversion to shopping mall in two stages.

REAR OF BLOCK as it looks today and proposed realignment of street to provide larger parking area contiguous to stores, with removal of Union Pacific Depot.

Revitalization at work: shopping mall for Pomona

DOWNTOWN REVITALIZATION is becoming a reality in Pomona, Calif., where property owners are sponsoring a plan to beautify and unite all buildings in the entire 100 block on both the First and Second street sides.

Back in October 1954 the Pomona Central Business District, Inc., was organized for the purpose of maintaining a dynamic downtown shopping center. Already several steps have been taken to achieve this objective, among them greatly improved accessibility through a master plan for streets and highways and expanded off-street parking facilities.

"The battle is being fought on many fronts, but requires considerable coordination," admits executive director Earl H. Kieselhorst. He adds, however, that Pomona has arrived at a point where it needs a master plan for store modernization, which would be achieved in the same way the other plans are being completed, on a step-by-step basis.

A blockwide project of cooperating property owners is now in process of development, with Carlo Fontaine & Associates, industrial design firm whose staff is made up of architects and city planners, having been commissioned to prepare precise plans on which bids will be made and costs distributed to each owner on a front foot basis. "Advantages of such a blockwide project," explains Kieselhorst, "is that it gives the group of small stores and property owners the dominance and prestige of large capital investment for relatively small individual outlay."

Here is the program as he sees it: "Every effort is being made to expand parking immediately contiguous to the rear of stores fronting our major shopping street to eliminate parking there altogether, as the first stage in the development of a shopping mall. Next, the sidewalks will be widened and a landscaped planter center strip with trees will be installed, leaving one lane in each direction for movement of traffic. After property owners have seen the advantages of such beautification, it is felt they will agree to the conversion of the street to a complete mall closed to traffic without having to go into costly litigation in street abandonment proceedings."

Pomona has purchased off-street parking facilities from funds supplied by owner assessments (about $500,000), parking meter revenues and the sale of unnecessary streets and alleys. The master plan calls for closing every other cross street and two alleys entering the main shopping street to provide longer, more unified blocks. Property owners involved are deeding their rights to the city on the condition that it agrees to acquire additional off-street parking from the proceeds of such sales. As Kieselhorst points out: "The owners benefit from the increased parking and the city puts unproductive streets back on the tax rolls."

Thus far one alley has been closed and sold; deeds have been obtained for three streets and another alley; and hearings are being held by the City Council preparatory to their closing and sale.

YOU SPECIFY THE THERMAL VALUE

KAISER FIR-TEX
TAILORS THE ROOF INSULATION

Kaiser is the West's specialist in rigid roof insulation, whatever the job requirements. Kaiser Fir-Tex can deliver a complete line of standard or special boards to meet the thermal value architects specify. Call or write for technical bulletins incorporating latest thermal values. And remember, always look to Kaiser Fir-Tex for exciting new quality, performance and economy achievements in roof insulation, acoustical and other insulating products.

POINTS OF VIEW

City planning: a challenge

Edmund P. McKanna, long-time member of the Los Angeles Planning Commission, spoke at a dinner honoring the fifth year design class at the University of Southern California School of Architecture

CITY PLANNING offers the greatest unexplored challenge to young designers today. Imagination rules the world and it should be the purpose of young men starting out in the planning professions to solve the overriding domestic problems facing the next generation. Eighty percent of our people inhabit the great metropolitan areas of America, creating problems of city living and city functions unprecedented in previous ages. It is the duty and the unique challenge of the architect-engineer-planner to solve these complex problems and provide greater and more rational living vehicles for the metropolitan city areas of the next decades.

Southern California and more specifically the urban complex that is centered on Los Angeles is the goal of the greatest voluntary mass migration in the history of man. Every two minutes there is a net gain of one in the population of this Los Angeles urban complex. Seven hundred a day, more than a quarter million a year, are confronting the officials of this area with tremendous problems of growth. This cyclonic expansion is not only a matter of new homes. There are needs for parks, for playgrounds, for street and sewer improvements, for all the attributes of a healthy city.

Just as no rational person would think of building a beautiful home or an effective factory without an architect, so no community can hope to efficiently solve its growth problems without a competent, qualified planner who has both the stature and the authority to do his job.

Planners are community architects but like architects, they must thoroughly know their client. What kind of a city do we want? But first, what do we have now?

Every community should make an inventory of what their resources are. Just as a close perusal of a young man's physical and mental resources will enable a qualified expert to determine the goal for which he is best suited to train and strive, so a similar analysis guides the planner in setting up a master plan of development. Now in this matter of a master plan, there has been a great deal of confused thinking and talking. A master plan is not something as immutable as the tablets that Moses brought down from Sinai. No human has a pipeline to omniscience. A master plan is a pattern. When changes are proposed, they are checked against this master plan. The burden of proof is upon the change proposed and thus the master plan avoids a city growing by decisions of expedience and political pressure.

I often feel that we should have a new synonym for planning. We need a word or a phrase which can suggest the dynamite that is wrapped up in planning. Everyone has hopes and dreams and aspirations. Planning—good planning—is the way that hopes can be realized. But the name connotes something else to the average person. Maybe the planning department should be known as the Department of the Future, the Department of Growth or the Department of Tomorrow.

What could be more exciting than planning a great city—actually playing a part in its growth. We have our legends of winning the West and building a great country. Young people have always yearned for adventure. The brave new world is not to be reached by rocket ship but by planning for it and building it now. It would be naive to expect that the young of the land would develop the same enthusiasm for a career in planning that they do for one in the sports world or aviation, but a great deal can be done that is not being done now. In Florence during the Renaissance, the young men of the city vied in verse and architectural competitions, just as our young men do in sports. They were just as virile then, but the environmental influences conditioned them just as our young men of today are moulded by their environment.

School design: obligations

Tacoma architect Robert Billsbrough Price addressed a forum on "Schools Within Reason—the logic of Wood in Modern School Design," sponsored by the Tacoma Lumbermen's Club

ONE CANNOT precisely and carefully isolate any one segment of the design process. Each in its own way forms a definite and vital part of the design; each, however, is contingent upon the other. Structural, mechanical, electrical, acoustical, landscape, art—each to have meaning must be examined in its relationship to the others and to the whole. Each depends to a part on the others for the desired result. All should be natural and logical solutions stemming fundamentally from the building program.

I believe the architect, the educator and the board member and all others charged with the responsibility of programming, designing and building shelters for the education of our students have assumed four very definite obligations.

Our first obligation is to do a good school; good for the students it will serve. It should provide an atmosphere that is appealing to the student, its very environment conducive to learning and instilling in all a desire to be a part of the school. The planning should allow the utmost in individuality and at the same time make possible group expression. It should be designed so as to provide freedom of movement with a minimum of regulations and controls. In all, it should be an easy, natural, workable expression of the needs: one that will meet today's program and yet with a very real realization that today's program will change, and that this change in program will not make obsolete but rather allow a continuing workable pleasant environment for tomorrow. This shelter that we provide should express the truth in a manner as simple, as pleasing and as straightforward as we as architects and you as educators and technicians are capable of conceiving.

Our second obligation is that which we owe to those who must use these facilities as an aid to teaching. As the students must be enriched by their surroundings, so too must those who provide the leadership be enriched. Again, every effort should be made to provide an environment that will help rather than hinder the teaching and learning process for those it was designed to serve.

Our third obligation is to our client. True, the student, the teachers, the administrators are all our client, but in this case I refer to those who must pay the bill: the taxpayer. To them we owe a definite and very real responsibility. We must conceive shelters that are workable, pleasant and inexpensive and as maintenance free as it is in our ability to produce. In other words, we should build the most for the least.

And lastly I believe that as architects, we have a definite obligation to ourselves to do our very best. Not simply to solve the problem, or to assemble the parts as they are handed to us, but rather to challenge and evaluate all facets of the building program.

AN ARCHITECT'S CASE STUDY OF A CHURCH

by ROBERT L. DURHAM, AIA

IF THERE is any one major requirement for an architect designing churches, it is the virtue of patience. St. Elizabeth's is an indication: initial conversations were held in February 1950 and the job was completed in January, seven years later. In addition, there was a change in ministers, a change in sites and, as usual, a good many changes in plans.

To make this case study helpful, we outline below the week-by-week records of the progress. Italicized paragraphs emphasize the basic policy of our firm in dealing with church clients.

We were first called to St. Elizabeth's by the vicar, Rev. Edward Slater, who had seen our other work, with the request that we look at the property, a 100x190-ft. corner lot. It contained a small chapel with a one-room social hall tacked on the back. The congregation at that time planned to build a parish hall adjacent to the chapel for a budget of $20,000. The members wished to know our ideas on "modern" architecture in general and on church architecture in particular and were interviewing three architects.

In our interview we emphasized one of the firm's basic philosophies: the master plan for a 25-year program. We pointed out that the typical congregation builds one addition after the other without knowing exactly where it is going. Many times new space is constructed, bringing new growth, which makes the previous structures inadequate, with no possible solution for keeping all parts of the building in proper balance.

MEMO: March 6. We submitted a standard form of contract based on an 8% fee and asked the owners to put down their requirements in writing and to furnish a topographical survey. The client is trying to secure an adjacent lot to take care of the county's recently adopted parking ordinance.

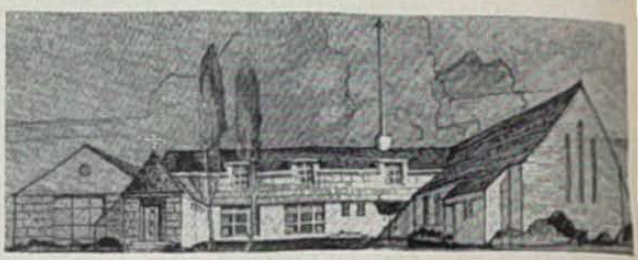
"ENGLISH COUNTRYSIDE CHAPEL using Pacific Northwest materials."

MEMO: March 14. The vicar dropped into the office to leave a sketch of a possible solution. There seems to be fear among many in the church that our design will be too untraditional to be acceptable. ("What the people want is an English countryside chapel using Pacific Northwest materials.") At the same time there is an unrealistic attitude among the building committee members as to the amount of building they can expect for their budget. We wrote: "You should not expect a construction cost of less than $25,000 for 3,200 sq. ft. of floor area. This may cover the roof and rough construction of the second floor, but will not cover the finish of the second floor. Diligent use of volunteer labor may reduce this amount to $20,000. We would be delinquent in our duty to let you assume that this can be done for a lower cost than this amount."

MEMO: March 22. A bishop's committee meeting was held and the general requirements reviewed, which are as follows:

1. A future nave to seat 200.
2. A choir space for 20.
3. A narthex with adjacent lavatories.
4. Sacristies with additional space for acolytes.
5. A clergy vesting room which would be used for an office.
6. A social room to seat 300. This room was programmed to be used for temporary worship and to include a stage and two dressing rooms which would be used by the choir in the meantime.
7. A nursery for 25 to 50.
8. A kindergarten room for 150.
9. A primary room for 250.
10. A kitchen, choir vestry, storage, heating plant, etc.

MEMO: March 30. A solution was discussed with a proposal for a two-story parish house as the central wing, including a guild hall on the first floor, with the future nave to be constructed adjacent to the side street. The congregation has made overtures about buying adjacent property, but are skeptical because of the $15,000 price. It intends to start a campaign May 1 for $35,000.

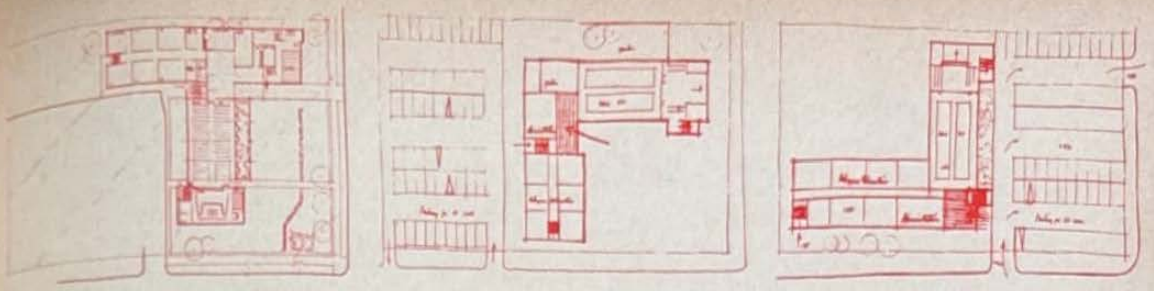


EARLY PROPOSAL features two-story parish house as central wing.

MEMO: June 2. A meeting was held to review the plans and results of a financial campaign. Members have raised $14,000 and do not believe it possible to get more than $20,000. With volunteer labor, they feel that they can get the amount of parish house necessary. There was considerable discussion about the drainage line which runs diagonally across the lot, taking water from adjacent lots to a street inlet. With no record of this line at the county, the idea of running it underneath the building seemed to be not only expensive but somewhat hazardous. The architects proposed that because of the small size of this site in view of expected growth, because of county parking requirements and because of the drainage line, the congregation consider other properties in the neighborhood with the intent of selling the present building and using the money to start over again. This proposal was made in the face of fixed opinion that the congregation would, however, build on its present site.

During the next several months there were discussions with the vicar regarding other sites, particularly one close to the Burien shopping center. It was determined that the lot, sloping gently toward the south and bordered by fine trees on both streets, would be available for $7,500. The vicar presented a sketch done by a Philadelphia architect who has performed work over a period of years for the Methodist headquarters, showing a solution with a social hall allowing the nave to expand into it. We encouraged the committee to let us start preparation of a new master plan without consideration of the amount of building which it could construct with immediate funds. There was a hope by this time that the diocese might make $25,000 available for the first unit.

MEMO: November 1. The vicar came to discuss plans for approaching the congregation about the acquisition of the new site. We suggested that we be given 25 minutes to



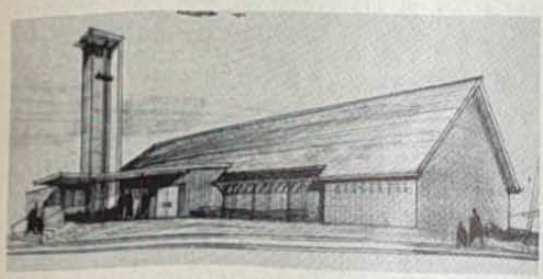
SCHEME A SCHEME B SCHEME C

present some slides of other structures illustrating present-day concepts of church architecture and the basic features involved. This gave us a chance to point out the good features of the new site such as size, lack of drainage problems, space for parking and a strategic location in relation to neighborhood shopping. ●

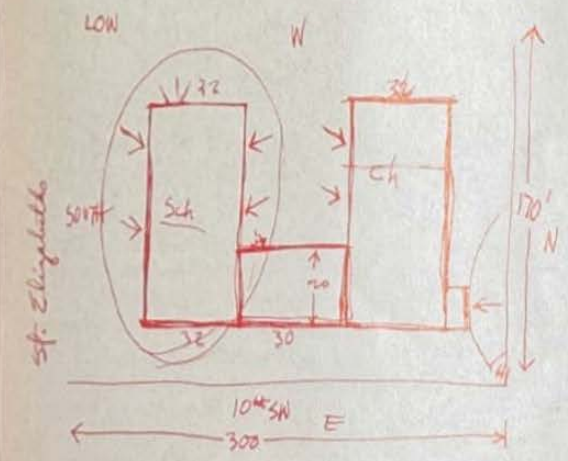
MEMO: December 6. A conference was held with Bishop Stephen F. Bayne Jr. at the Diocese of Olympia, who felt that the initial expenditure should be at least $40,000 and indicated his intention to help the congregation. He did not seem as enthusiastic over the new proprety as we had hoped and repeated the phrase, "if we move," a number of times. He stated that all work should be of a permanent nature in the new construction. ●

After the new property was obtained, three alternate schemes were produced and discussed with the bishop's committee, which in each Episcopalian church is normally charged with building committee responsibilities. One scheme was selected and exterior sketches made for presentation to the church members. Then followed a period of inactivity.

MEMO: March 27, 1952. The vicar came to the office and asked that we do more work on the preliminary plan. He said that there are those in the congregation who feel that the present design is a "combination between a barn and a silo." At this time he brought another sketch of his own, indicating a desire to have the building in three wings. The one on the south would be a meeting room with a higher ceiling and church school space below. ●



"COMBINATION between a barn and a silo"; vicar's own sektch below.



Permit us to make the observation that the architect must always contend with the minister who dabbles in architecture. It is well to suggest in the early stages that the architect should stick to architecture without attempting to interpret theology and the clergy should stick to the ministry. Full credit, however, must be given the vicar in this case for his persistent and continuing leadership of the congregation toward a new building. By this time he was thinking in terms of $200,000 for the ultimate plan, with the expectation that the smaller half of this amount would be spent on the first unit.

MEMO: March 11, 1953. A new vicar has been obtained for the parish, his predecessor having had the responsibility of two parishes.

In any church the change of ministers is usually a catastrophe for the architect so far as the use of the work which has gone before. The architect needs to spend considerable time with the new man in order to orient him as to the reasons for the previous work and to determine as accurately as possible the ideas of the new leadership.

Father H. A. Berngen, whose background was originally Chicago, was for some years at Trinity Church in New York, serving one of the mission parishes on the lower East Side. We found that he had very definite ideas from the liturgical standpoint. After reviewing the work which had been done and the reason for changing to the new lot location, we discussed in detail the building program. The new vicar felt that there should be considerable space given to the chancel, with the choir so sublimated as to definitely take its members out of the class of performers. He was interested in having generous space for all features of the "setting of worship," suggesting that the altar should be moved out from the wall in order to allow the priest to be back of it and that even the pulpit should be out of the chancel area. He stated that he thought 300 seats in the nave was the absolute minimum to support a parish and appeared to be receptive to contemporary design, recommending that we review the pamphlet put out by the Commission on Architecture of the Episcopalian Church entitled "Architecture in the Church." Father Berngen added that he did not want a "cute" church.

Perhaps it should be pointed out that in the change of leadership, there was a change in direction of thought. Where the first vicar had put considerable emphasis on religious education space and by nature tended to be involved in trying to produce a solution, the new vicar seemed to put most emphasis on the worship area and by nature tended to analyze the requirements of the setting for worship. This subtle change had a major part in changing the direction of the design.

The vicar outlined his thought that the religious education program should develop two or three services to

which people would come as a family so that children in the grades worship with the family for half of the program and go to the education space for the remainder. This concept reduces the Sunday school requirement to 200. The vicar feels that a church cannot compete with day school and provide the same quality of space which is used only a half hour each week.

The congregation has been offered $17,500 for its present land and building. With $2,000 or so in the building fund, members hope to raise a total of $25,000, which will be matched with an equal amount from the diocese. We suggested that it would be actually necessary to have $100,000 to build the first unit as it should be done. However, we encouraged the members to continue to think in terms of the master plan rather than get involved in determining which unit is to be built first. •

In our opinion, this is a cardinal point which should not be lost. Unless the master plan as a solution for the client's long-term needs becomes dominant, there is always a tendency to compromise in such a way as to make it easy to build the first unit which may lead to an unsound solution.

At this time we asked Father Berngen to write a new church program outlining the needs in detail. He pointed out that the unusual side aisle requirements in an Episcopal church demand that they be almost as wide as the center aisles to allow for full processionals. The vicar explained his feeling of the chancel as a "God set apart" rather than a "God of fellowship." This was the beginning of a continuing exchange of philosophy between the minister and the architect.

MEMO: April 22. A new building program was crystallized as follows:

1. Nave to seat 350, with a chapel in relation to the church proper. (The bishop later increased the size to 400.)
2. Sanctuary to have ample space for movement of the clergy, to have a clear view for the congregation, to have a full width communion rail with consideration for the procession and recession of communicants.
3. Sacristy to be provided with space enough for vestments and closet space.
4. Working sacristy with sink and closet space for acolytes' vestments.
5. Choir to accommodate 20 persons and to be located off center enough so that there will be no distraction from the focus of the altar.
6. Narthex to accommodate a coat room, tract stand and table or desk.
7. Aisles to be sufficient in width for processions.
8. Doors to be sufficient in width for funerals.
9. Chapel to provide for 50 people.
10. Pastor's study to be large enough to be used as a conference room.
11. Storage space for various departments of the church.
12. Printing room.
13. Sunday school for 400 children, with divisions into four different departments and a library and clubroom.
14. Parish hall to accommodate 250 persons, with adjacent kitchen.
15. Parking area with space for one car for each six persons.
16. Miscellaneous: heating plants, lavatories, cloak rooms, tower, etc. •

One of the most important items is a good analysis of requirements. Preferably, it should include a statement on the philosophy of worship and education of the particular church. In our practice we furnish a questionnaire to help the committee crystalize its ideas. The program is referred to continuously as the solution proceeds from plan to interior to exterior.

MEMO: May 13. A trip was taken with the new minister to various Episcopalian churches around Seattle. As we went from one to another, Father Berngen explained his interpretation of the functional requirements; the amount of space required for the minister to kneel in front of the altar; the philosophy of the baptistry as a symbol of one's entering into the church in a philosophical as well as a realistic way; and the functional facilities for the storage of various symbols used in connection with baptisms. He outlined in detail the activity of the working sacristy and the care of vestments there. He spoke almost bitterly against the present trend of deep-pile carpets, padded pews, etc., in protest against the expression, "Gracious living in the House of God." •

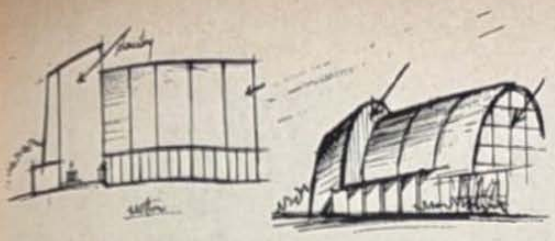
MEMO: July 20. A meeting was held with the bishop's committee for a review of the building program, including preliminary master plan sketches. The scheme with parking out toward the street was rejected. The T-shaped plan seemed to allow more space for expansion than the L-shaped one. At this time we were able to convince the members of having a chapel which would not be expanded from the nave. It was generally decided that we would take the summer to get the preliminary design agreed upon and would expect to meet again as soon as Father Berngen returned from a trip to Europe. The congregation is thinking in terms of collecting $40,000 and obtaining another $40,000 from the diocese. •

MEMO: August 14. A meeting was held with Father Berngen to review Plans A and B. Consideration was given to placing the choir back of the altar in such a way that it would not be seen by the congregation. Because of the nature of the lot, it was agreed there will be no basement under the nave and consequently there will be no way for the minister to get from the narthex to the sacristy without going outside the building or down the side aisle. •

At about this point the plan began to be fixed and recognized as a logical solution. Because of the slope of the contours away from the corner and the location of the entrance to the narthex to be on grade, without steps, the chancel end of the building would be slightly sunk in the existing grade. The architects proposed a circular wall to surround the sacristies and choir robing room which would act as a retaining wall, but at the same time serve as a garden wall from the exterior. This would overcome the appearance of a building partly sunk in the ground. The main building would rise back of this wall. From the narthex a stairway would lead directly to a large parking lot on the back side of the building and then on down to the other religious education spaces. The choir was set off to one side of the congregation to be part of it and have the same relationship philosophically to the altar. The organ chamber was to speak directly to the congregation and be above the sacristy area.

It is a basic philosophy of our firm to insist that the plan be recognized as an accepted solution by the client before going on to the development of the concept of interior design and, of course, exterior design. We believe this discipline mandatory. Considerable patience must be exercised by the architect in developing an appreciation for this inside-outside approach. The history of the eclectic "outside first" approach is still too strong in people's minds to make this easy to overcome.

The architect has previously admitted that the design concept for the structure of the building came about as he sat in his own church sketching on the back of the printed "Order of Worship." This should not reflect on the quality of the sermons of his own minister, but perhaps indicates the fact that church is one of the few places in which today's architect is undisturbed by telephone, dictaphone, contractors and salesmen.



DESIGN CONCEPT emerges: two parabolic shaped arches, one inside other, at juncture of chancel and nave.

The design concept involved the use of parabolic shaped laminated arches but with two, one inside the other, at the juncture of the chancel and nave. The outside arch would serve to support the raised roof over the chancel and allow the space between the two arches to be filled in with plastic running completely around the perimeter of the inside arch. Side aisles would break out with a flat roof and the roof covering of the nave would follow the parabolic shape of the arch.

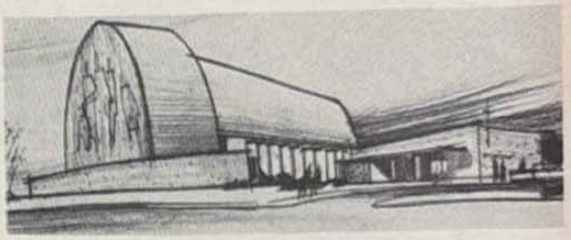
MEMO: June 9, 1954. We reviewed preliminary plans at a meeting with Father Berngen. The chapel was made slightly larger. Discussing the chancel, we agreed to study the possibility of placing the baptistry where the lectern is usually located. The baptistry would be up one step and perhaps have a credence table on an adjacent arch. A symbolic wrought iron symbol of the Holy Spirit might be suspended from the ceiling. The pulpit is to be little more than an open platform surrounded with a wrought iron railing to allow the congregation to see the total form of the minister's body as well as his hands. He feels that this adds to the expressiveness of the minister's gestures during the sermon. At the same time when the pulpit is empty, it will not act as a competitive mass to the altar itself. The choir is to be moved toward the congregation to be less a part of the chancel. The minister expressed concern about contractors on the project, especially as to the determination of which ones in the local community might be acceptable. He was encouraged to place this responsibility in the hands of the architects. ●

It is our practice to recommend competitive bids from selected contractors. Care is always needed to prevent a house builder in the church from thinking this an opportunity to get a commercial job. The architect who gets a definite commitment from the building committee that the work will be awarded to the low bidder, regardless of the difference in bids, will save himself trouble at a later date.

MEMO: June 12. Preliminary plans were given enthusiastic approval at a meeting with Father Berngen and Bishop Bayne. The latter emphasized seating for 400 and the possibility of future expansion and stated that an ambulatory is mandatory. He liked the idea of the design concept of the lighting and was not at all concerned that the shape of the building might appear somewhat like a hangar, an armadillo or a quonset hut. He suggested a huge mosaic or painting in place of the screen on the front of the building. He mentioned Emiel Frei in St. Louis in passing and encouraged us in the thought of incorporating art at this point in the design. He felt that $90,000 was a reasonable budget and that construction should start as soon as possible. ●

MEMO: July 27. A meeting was held with about 20 people at the church. This was an expanded committee and we started out by again reviewing the building program. Members agreed that the program was still valid. We reviewed the potentials of the lot and its characteristics, taking into account traffic, noise, view and shape of the building. Plans were given general approval. It was decided that the choir space would be moved on the opposite side of the nave and the space made a little larger to allow people to see the choir when singing. ●

MEMO: August 19. A meeting was held with about eight persons present to review revised plans, interior sketch and exteriors. There were those in the group who were somewhat shocked by the design and recalled that our original instructions had been to move toward a simple English countryside type of concept. One man, an aircraft engineer undoubtedly working on the design of space ships, was asked on what basis a tail surface of a bomber was determined: preconceived ideas of shape or mathematics? He answered: "Mathematics, of course." We attempted to lead the group into the feeling that we are living in a new age which requires new shapes and that it is just as valid for a church to have a new shape as it is for an airplane. We proposed native textured materials such as wood shakes on the roof and stone on the walls. We pointed out the advantage of the existing trees which would serve to help soften the unorthodox lines of the structural concept.



"NEW AGE requires new shapes just as valid for church as for airplane."

We have found it essential to have very good presentation sketches; slides are made of plans, interiors and exterior views before any presentation to a congregation.

At this time there was considerable work done by the architects in determining the raised collar around the roof: should it raise in the most simple fashion from the face of the facade or break back as in the final design. The cross was added and made a part of the raised collar after considerable discussion with everyone involved.

Plans were reviewed by the architectural commission of laymen and clergy serving for the bishop. They were approved but with some skepticism.

Final plans were completed during the summer and bids called, with a low basic figure of $99,919. Financing was arranged through the diocese and construction started February 15, 1955. During construction minor modifications were made, especially in the placing of the handsplit shakes, since it was found that as they followed the parabolic arch to the peak, they came up to a flat surface. Roof furring was added to bring the shakes up to a peak, not violating the required minimum slope for shakes nor changing the shape of the parabolic structure.

For the architects, the job resulted in a net loss of $1,991.46 (see cost breakdown on next page). Net profit or loss, of course, is not necessarily an indication of "net satisfaction." Our personal friends who at one time had said, "Aren't you slipping a little?" now came back to say, "You know I was inside that church the other day and I begin to see what you are driving at."

The building still lacks many things. Now, eight years after the start, conversations are being held concerning a permanent altar design, landscaping and future additions. Bert Willemse, stained glass artist in Portland, is

working on sketches for the side windows. The mural on the main facade to be done in band-sawn handsplit cedar representing the "Tree of Jesse" is still to be started by the architect and volunteer labor crew.

The design was entered in the 1957 meeting of the National Conference of Church Architecture in St. Louis where the jury gave it the highest award. Jurors reported that they used the following questions in their judgment.

1. Was the architecture conceived from an idea?
2. Was it a strong idea?
3. How did the architect deal with the purpose, use and structure in creating a space with religious character?
4. Was the development consistent enough to permeate the entire work?

Religious character? Evidently this is a matter of some differing interpretation, as these quotations indicate.

BUREAU OF CHURCH BUILDING: As a final word, we sum up by saying that the exterior design, in our humble estimation, lacks religious refinement and inspiration.

JOINT COMMISSION ON CHURCH ARCHITECTURE OF THE (EPISCOPAL CHURCH) CONVENTION: When I think of some of the unimaginative trash that we have sponsored, I cannot allow myself to take too serious objection to this honest effort which may turn out to be creative in the extreme.

CHRISTIAN CENTURY MAGAZINE: Durham, Anderson & Freed's heavy shingled little gem under a parabolic roof, St. Elizabeth's in Burien, Wash., deserved the Church Architectural Guild's award.

If credits are due, perhaps they should go most to Father Slater who kindled the dream of a new church, to Father Berngen who crystallized the philosophy, to Bishop Bayne for his encouragement of contemporary architecture and to the building committee which was willing to set aside its preconceived ideas in the hope of something better. Associated with the architects, structural engineer and general contractor on the project were Stern & Towne, mechanical engineers; Beverly A. Travis, electrical engineer; and Gladwyn Morrison, color consultant.

Building Costs:

Basic bid	$ 99,919.00	
Parking area	3,000.00	
Chancel furniture (temporary)	1,300.00	
Interior painting	1,400.00	
Shakes in lieu of shingles	1,700.00	
Change orders	2,672.69	
Total	$109,991.69	

Architects' Production Costs:

Preliminaries 406 hours	$ 1,151.72	
Working drawings 787 hours	2,127.51	
Supervision 244 hours	787.66	
		$ 4,066.89
Overhead		4,066.89
Mechanical Engineer	$ 850.15	
Structural Engineer	1,282.71	
Electrical Engineer	179.15

OFFICE of ERNEST J. KUMP
Architects

BARRETT CONSTRUCTION CO.
General Contractor

TRELLIS-SCREENED CORRIDORS (above) provide access at windowless rear; pool side has lounging balconies. Exposed concrete, cast with batten-lined forms, are painted redwood color. Redwood sunbreaks add drama to exterior. Note twin hydraulic elevator with metal and clear plastic cabs in center of building. There are two other exterior models in world—one at El Cortez Hotel in San Diego, another in Japan.

OUTLINE SPECIFICATIONS

Structure: reinforced concrete columns, slabs, walls.

Exterior Finish: redwood vertical boards and battens on corridor side and in elevator lobby; exposed concrete ends painted redwood.

Roof Surfacing: tar and gravel.

Doors: painted wood; sliding glass in steel frames.

Floor Finish: concrete on outside corridors; decorated tile in lobby; tile on balconies and lanais, in baths; carpeting in suites.

Interior Walls: tinted plaster over concrete.

Ceilings: plaster with integral color.

Special Equipment: twin free-standing hydraulic elevators—Otis.

Heating: electrically heated tile ovens—Kachelofens.

Total Area: 39,000 sq. ft.

Total Cost: $850,000, including elevators, furnishings, landscaping.

Date of Completion: December 1957.

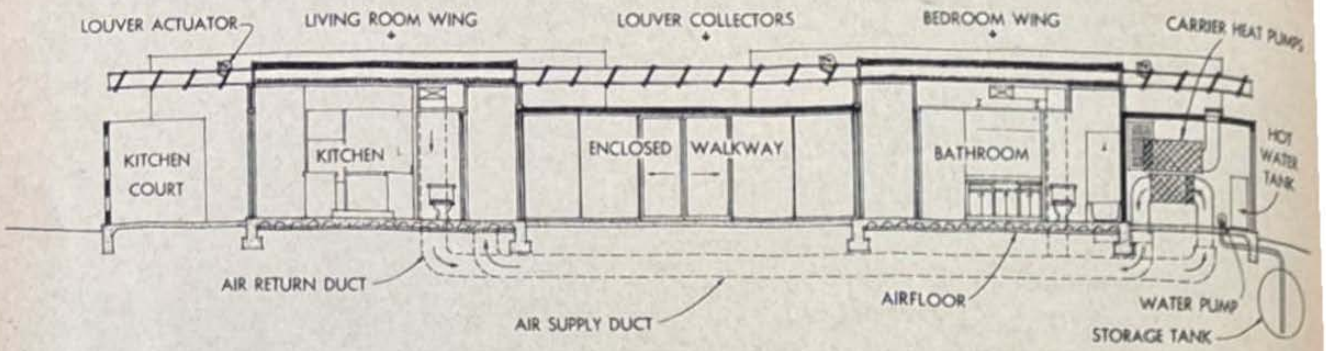
Structure sits in a sunken landscaped pool

IN DEVELOPING an addition to his existing Studio Inn (designed by the same architectural firm), the client desired six floors with 64 luxury suites. To meet a height-limit regulation, it was necessary to lower the structure 3 ft., the drainage problem being solved by placing the building in a landscaped pool. A 14-ft. cantilevered concrete slab extends the first floor several feet out over the depressed water garden area which flows underneath. Access to the entrance lobby is via a curved bridge.

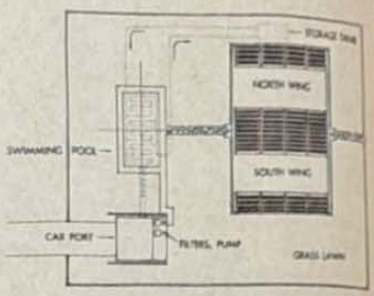
The suites—nine on the first floor and 11 on each of the upper five—are entered from a balcony corridor which extends along the rear at each level. Units consist of a spacious living-bedroom area, dressing room-bath combination and lanai with tile floor, wood jalousies, sliding glass doors and Vienna-imported ornamental iron railings. Art objects from Europe and the Orient decorate the hotel.

Twin outdoor hydraulic elevators have metal and clear plastic cabs affording guests a diverting ride and a fine view both day and night. The elevators, whose 50-ft. plungers rest on solid concrete beams, require no tower projecting above the roof to house the lifting mechanism as in the case of the cable type.

Associated with the Kump office on this project were Douglas Baylis, landscape architect; Hall, Pregnoff & Matheu, structural engineers; Clarence Rinne, project engineer; Smith & Garthorne, mechanical-electrical engineers; and Kosta Belotelkin, mechanical engineer.



CROSS SECTION through solar house (above). By integrating swimming pool with air conditioning circuit (below), heat pump is allowed to operate with maximum economy in both winter and summer.



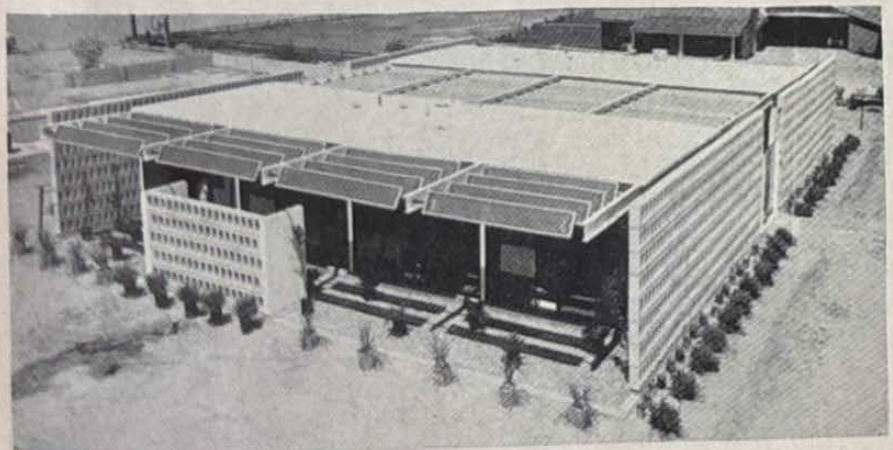
Solar heating: costs and operation

SOLAR HEATING SYSTEM of the type which can now be used in American homes in two-thirds of the nation will pay for itself in less than 10 years. Basis for this estimate is the solar house which was opened to the public near Phoenix last month (see PA&B for April), designed by architectural student Peter R. Lee and constructed by the Phoenix Association of Home Builders.

The system as employed in this house cost about $4,000 more to install than a conventional heating and cooling system, explains John I. Yellot, executive vice president of the Association for Applied Solar Energy, project sponsor. But the utility bills will be reduced $550 annually, he added. It is estimated that heating and cooling the house through conventional methods would cost $1,000 a year, whereas with the solar system the figure will be $450, including maintenance.

All mechanical equipment being used in the house is now available through commercial sources and is economically feasible for new construction in all but the eastern one-third of the nation, Yellott declares. Though this particular house is in the $50,000 bracket, similar equipment could be installed in virtually any new home costing more than $10,000.

Heating System: Solar energy will provide winter heat for the house and swimming pool and will heat the domestic water supply throughout the year. Energy is gathered by a series of collector panels which are rotated by a clock-operated motor to face south during daylight hours in the heating season. Their aluminum-clad backs are covered with Dacron batting for insulation, over which are blackened copper tubes set in a copper sheet. Plastic sheets placed over the copper allow the sun's energy to get through, but prevent long heat waves from radiating back. Water circulated through the tubes is heated and stored in an underground tank, providing a reserve for use at night and during cloudy weather. Heat is transferred as needed by coils mounted on the intake faces of two standard air-to-air heat pumps, which will extract heat from the outside air when necessary. These pumps rely on the system's heat storage for part of the heat they get.



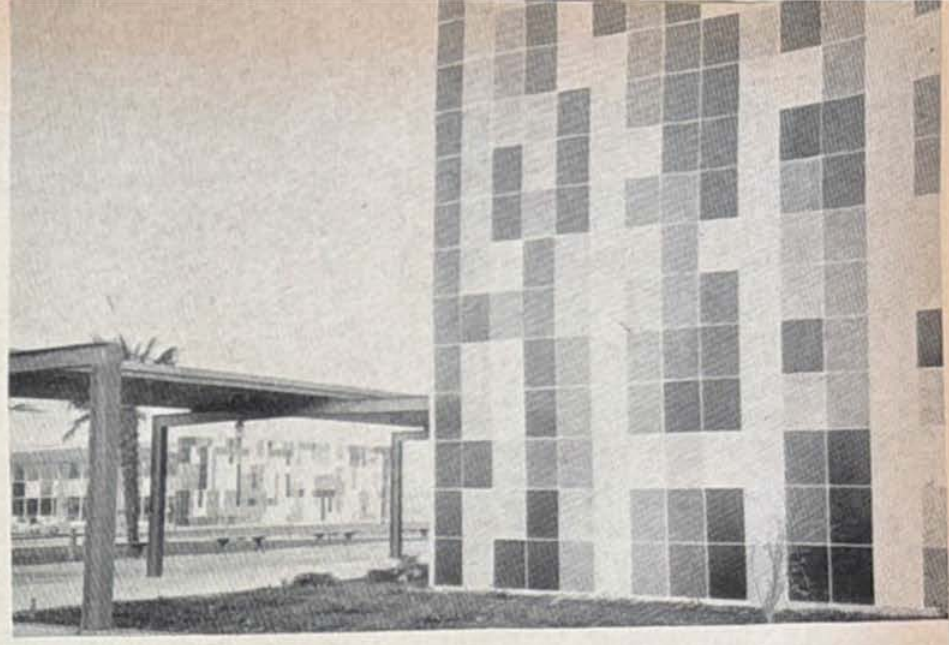
SOUTH-FACING VIEW of solar house, with kitchen court in foreground. Heat is trapped by louver-collectors over central court and north and south patios. Concrete masonry screen walls along east and west sides help cool structure.

Donors: Majority of the materials used for the heating system were donated. Among the companies: duPont (Mylar plastic and Dacron); Revere Copper and Brass (copper tubing and sheeting); Reynolds Metals (aluminum); Farboil Paint (black paint for collectors); Carrier (heat pumps). A graduate physics student and his wife will live in the house for about a year, keeping complete records of its performance, based on a set of instruments bought through a grant of the John B. Pierce Foundation.

Morocco Too: Opening of the solar house near Phoenix was followed shortly by completion of a similar project in Morocco, for which Yellott designed the heating system. It was unveiled for the first time at the Casablanca Trade Fair as a part of the U.S. Department of Commerce exhibit. Use of solar energy is important not only to reduce heating bills, but because fossil fuels already are approaching exhaustion in some areas and are scarce in most sunny nations.

IBM PLANT

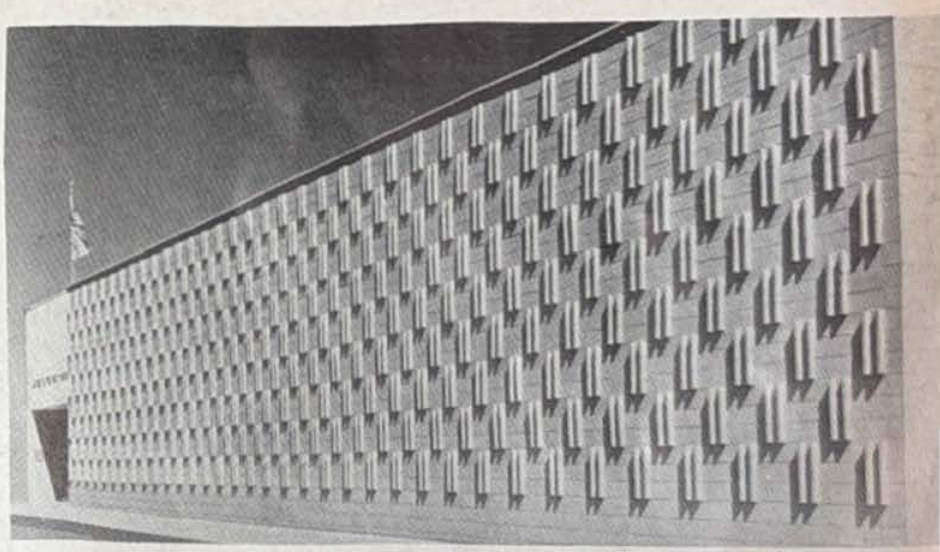
in San Jose illustrates use of ceramic veneer (Gladding, McBean) as facing material which doubles as art form. About 50,000 sq. ft. has been employed in creation of murals, executed in vivid colors by Bay region artists. Architect: John S. Bolles; color coordinator: Robert L. Haldeman.



Putting on a front--three California projects

U. S. POST OFFICE

in La Mirada with its textured wall typifies design and construction versatility of lightweight concrete masonry units (Rocklite). Architects: Victor Gruen & Associates; mason contractor: San Abrams; general contractor: Devon Construction Co.



OFFICE BUILDING

in Beverly Hills features exterior of Italian glass mosaic tile in abstract pattern of blue, white, red, green and yellow, braced with metal grid. Careful detailing enabled installation to be completed at $2 per square foot. Since all patterns were rectangular and all spandrel sections same size, tile work could be set on paper at factory, with no hand setting required on site. Architects: Welton Becket & Associates; structural engineer: Richard E. Bradshaw; general contractor: Ryan Construction Co.

PRODUCTS

water-repellant coating

An answer to the effects of water, wear and weather on wooden doors, sills and stoops is found in Doorcote, a water-repellent liquid epoxy coating. In wet climates it seals water and dampness out; in dry climates it retards drying out, cracking, splitting. Tests indicate Doorcote outlasts paint and varnish as much as 10 to 1 under the most extreme conditions and is impervious to grease, acids, etc. It may be brushed or sprayed over raw wood, old varnish or painted surfaces.—Carl H. Briggs Co. **(Item No. 1)**

outdoor lighting

A shatter-resistant outdoor lighting fixture is designed to eliminate the losses resulting from vandalistic breakage of glass outdoor diffusers. Silvray features a plexiglass diffusing globe, topped by an aluminum reflector. All joints in the units are sealed by neoprene gaskets to keep out insects, dirt and rain; all metal parts are natural finished aluminum, requiring no maintenance.—Silvray Lighting, Inc. **(Item No. 2)**

plywood fastener

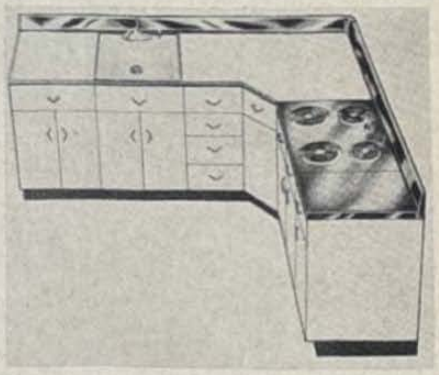
An H-shaped aluminum alloy clip stiffens panel edges in a plywood roof deck at a fraction of the cost of conventional 2x4 blocking. Marketed under the name PlyClip, it looks like a section out of an I-beam with exagerated flanges. The clip stiffens the joint between two adjacent panels by transferring a concentrated load from one panel edge to another. It is a fully adequate substitute, with one exception: in plywood roof deck engineered as a horizontal diaphragm to transmit maximum allowable shear.—Douglas Fir Plywood Association. **(Item No. 3)**

built-in scale

A built-in-the-wall health scale is ideal not only for the bath but for the dressing room and bedroom as well in new or existing homes. Box is made of heavy gauge steel and the platform rests on a rubber covered steel handle. Scale is securely fastened to lid and slightly turned for easy reading. Finishes: chrome, white and prime coated, ready for matching color.—Davis Steel Products Co. **(Item No. 4)**

kitchen cabinet tops

Youngstown has entered the custom cabinet top field with introduction of its Lustre-Trim tops and drop-in sink



bowls of porcelain and stainless steel. They are made on a strictly custom basis, with any variations required to fit a kitchen installation. Tops provide continuous work surface with no metal sealers and are covered with plastic laminate in a wide range of patterns and colors, including an exclusive pattern called Circlet. Backsplash can be adjusted to meet the contour of out-of-square walls, solving one of the most vexing installation problems.—American Standard, Youngstown Kitchens Division.

(Item No. 5)

scored ceramic tile

A newly developed process for cutting grout lines in 6x6-in. standard ceramic tile produces a scored tile which, when installed, results in a wall covering 1 in. square. Tile is applied in the normal manner, then seams and

scored lines are grouted. Major advantages: faster application and less chance of breakage. Scored tile is available in all colors.—Pomona Tile Manufacturing Co. **(Item No. 6)**

open-top lighting diffuser

Open-top construction of the module type Spacelighter, consisting of a rigid frame forming the periphery, makes possible its use as a direct-indirect suspended fixture. Diffusers rest on a flange around the inside bottom edge, similar to the previous model. Only 3 in. in depth, the fixure is finished in baked white enamel; vinyl diffusers are available in a number of patterns —Leadlight Fixture Co. **(Item No. 7)**

decorative expanded metals

Three patterns of decorative expanded metals—Armorweave (top photo) and Festoon in large, 1½-in. wide openings, and Cathedral (bottom), a new type—may be curved, formed, welded and cut without raveling. A variety of finishes may be applied by anodizing, porcelain-enameling and painting to add color and further corrosion-resistance. Among numerous uses for the metals: grilles, protective enclosures, ventilator panels, filter screens —United States Gypsum Co.

(Item No. 8)

LITERATURE

classroom acoustics

A new concept in classroom acoustical design is explained in a 16-page booklet entitled "Classrooms for Easy Listening." Use of sound reflective ceilings is covered in easy-to-read text and explanatory drawings, making the material helpful to school officials as well as architects.—The Flexicore Co. **(Item No. 9)**

home sewage disposal

A 40-page primer on sewage pumping and treatment covers a variety of situations encountered by builders in the collection, disposition and treatment of sewage. The non-technical case history presentation runs the gamut from single dwellings up to 1,500-home developments.—Yeomans Brothers Co. **(Item No. 10)**

fire, hazard losses

Written particularly with the architect in mind, "Building Loss Possibilities from Fire and Natural Hazards" discusses these factors: type of construction, enclosures of stairways, elevators and other floor openings, subdivision of large areas, protection against fires in adjoining property, fire-resistant roof coverings and safe chimney construction. Earthquakes, floods, lightning, termites and windstorms also are covered.—National Board of Fire Underwriters. **(Item No. 11)**

lumber directory

More than 200 mills in Washington, Oregon and northern California producing Douglas fir, West Coast hemlock, Western red cedar and Sitka spruce lumber are listed in the 1958 edition of "Where to Buy." The 40-page directory lists key personnel, capacity and facilities of WCLA member mills and the items or timber products in which they specialize.—West Coast Lumbermen's Association. **(Item No. 12)**

asbestos-cement sheets

A manual on the application of flat asbestos-cement sheets covers every aspect from a general discussion of available types and designs through required accessory materials, special tools, care of material, job planning and preparation. Detailed drawings illustrate the text of the 12-page guide. — Asbestos-Cement Products Association. **(Item No. 13)**

stainless steel curtain walls

"Data on Stainless Steel Curtain Walls" summarizes a study at Princeton University's School of Architecture, part of a research project commissioned by the American Iron and Steel Institute, supplementing a series recently released. A comprehensive chart tabulates technical specifications for all buildings that use a significant quantity of stainless steel for which information could be obtained. Photos and architectural drawings illustrate curtain wall panel details, methods of attachments, insulation and weatherseal systems for several important structures such as the recently completed Steel Building in Chicago.—American Iron and Steel Institute. **(Item No. 14)**

home lighting standards

Lighting requirements for small, average and large home living areas are included in the revised one-sheet 1958 edition of "Minimum Light for Living Standards." They specify for living areas under 125 sq. ft., for between 125 and 225 sq. ft. and for over 225 sq. ft., covering both ceiling fixtures and built-in lighting. — American Home Lighting Institute. **(Item No. 15)**

warm, dry floors,
lower fuel bills,
LIFETIME PERIMETER INSULATION

STYROFOAM®

Styrofoam, a Dow plastic foam, is ideal for horizontal or vertical perimeter insulation and for insulation under slabs. Its non-interconnecting cells block out heat, cold and moisture. Easy-to-handle Styrofoam resists rot, mold and deterioration.

Styrofoam also excells as roof insulation and for insulation-plaster base against masonry walls. Contact Wiley-Bayley for complete information on Pacific Northwest Styrofoam installations and recommendations to fit your special requirements.

® Styrofoam is a registered trademark of The Dow Chemical Company

Warehouses in Seattle, Portland, Spokane

SUPPLIERS

• **United States Ceramic Tile Co.** has opened a new showroom and warehouse at 6460 Corvette St., Los Angeles, and a similar facility in Millbrae to serve the Bay region.

• **Kaiser Aluminum and Chemical Sales, Inc.,** has awarded a franchise to Fraser-Edwards Co., structural division of Malott & Peterson-Grundy, San Francisco, to fabricate and erect stressed skin aluminum dome buildings.

• **Browne Window Manufacturing Co.** has appointed DePartee Co., Inc., of Seattle as distributor.

• **Royal Tile Manufacturing Co.** has opened a warehouse and factory outlet in Phoenix for seven western states: California, Washington, Oregon, Idaho, Utah, Nevada and Arizona.

• **John A. Roebling's Sons Corp.** has named Lloyd F. Stansbury as West Coast supervisor of its construction materials division, replacing the late Robert J. Cole, at the firm's San Francisco district offices.

• **Builders Brick** has appointed Columbia Brick of Portland as exclusive distributor for Clay City brick in northwestern Oregon and southwestern Washington.

• **Schlage Lock Co.** of San Francisco has named its director of research, Ernest L. Schlage, to the post of vice president.

• **Leadlight Fixture Co.** of Oakland has awarded a distributorship to Bruce Emmett Co. of Portland.

• **The Radiant Heating and Cooling Institute** has elected these officers, all Californians: Don Smith, Pasadena, president; Dave Longerot, South Gate, vice president; Harry Taylor, Costa Mesa, secretary; Al Ottum, Los Angeles, treasurer.

• **Nevamar Carefree Kitchens** will add the West Coast to its distribution setup and is planning a representative kitchen installation display to be located at its permanent sales and showroom at 1150 DeForest Ave., Long Beach, Calif.

• **Chase Brass and Copper Co.** has promoted Charles W. Baker, western regional manager since 1952, to assistant general sales manager. He will continue to make his headquarters in Los Angeles, devoting his time to the western and midwestern sales regions. Baker is succeeded by A. R. Armstrong, with offices in San Francisco.

ANNUAL SCHOLARSHIP

Is presented to Thomas B. Mathis (second left) of Edmonds, Wash., by Dean Arthur Herrman, of College of Architecture and Urban Planning at University of Washington on behalf of Seattle Unit Masonry Association. Looking on are UMA president C. L. Gr... and Dean Pietro Belluschi of School of Architecture and Planning of Massachusetts Institute of Technology, who was principal speaker at April 16 awards banquet.

• **American Fire Alarm Co.** has appointed A. Greenburg of Seattle distributor for the state of Washington.

"I put built-in telephone outlets in all my homes"

says Larry Rear, President of Lawrence A. Rear, Builder, Chico, California.

"We've found our customers look for the important 'extras' when buying a home—just as they do when buying a car. So we include telephone outlets and concealed wiring in all the busiest rooms. Telephone planning increases the value of every home—and is a persuasive 'plus' when making a sale."

To successful builders like Larry Rear, who are growing with the Pacific West, complete telephone planning is as basic as adequate electrical wiring.

We'll be glad to help you plan built-in telephone facilities. Just call our business office and ask for our free Architects and Builders Service.

Pacific Telephone

It pays to include Telephone Planning in every home you build!

T-SQUARE TALK

new partners, associates

Ernest J. Kump, FAIA, Palo Alto, Calif., has formed a partnership with Stanley M. Smith, AIA, and Arthur B. Sweetser, the firm continuing to practice architecture under the name of the Office of Ernest J. Kump. A 1939 graduate of the University of California, Smith joined the organization last fall upon his return from six years in Europe and the Near East; Sweetser, who became associated with the Kump office in 1955, studied at Stanford University and the Harvard Graduate School.

Rodney T. Robinson, AIA, and Raymond Ziegler, AIA, have been advanced from associate to partner status in the Los Angeles architectural firm of Allison & Rible.

William R. Hawley has joined Palo Alto architects Albert Sigal Jr. and Milton F. Johnson as a partner and the firm is now known as Sigal, Johnson & Hawley. Hawley has worked for a number of Bay area architectural firms and more recently conducted his own practice in Palo Alto.

Ward W. Deems, AIA, Chancy M. Lott, AIA, and Fred DeNisco have been named associates in the firm of Albert C. Martin & Associates, Los Angeles architects-engineers. Karl Klokke has been appointed chief designer.

Richard V. Peterson has been named an associate in the Seattle architectural firm of Durham, Anderson & Freed.

new offices

Edgar B. Jensen has opened an architectural office at 714½ N. Orchard St., Boise. A graduate of the University of Idaho, he has been associated with several Boise architects.

new addresses

Worthen, Wing, Seifert & Forbes, architects-engineers, to 925 Tacoma Ave. S., Tacoma.

deaths

William H. Schuchardt, 83, Los Angeles architect who served as chairman of the City Planning Commission for five years and of the County Museum Board for three, died April 17. A native of Milwaukee, he was architectural commission chairman of the Associated Colleges at Claremont for the last 19 years.

appointments

Jack L. Campbell, project manager specializing in air base, airport and missile facilities development, has been selected a vice president of Pereira & Luckman, Los Angeles architects-engineers.

D. Stewart Kerr, Los Angeles architect, has been elected to the governing board of the School Facilities Council, nationwide organization whose purpose is to improve school design, sites, facilities and equipment.

Elizabeth Ayer, architect, has been appointed to Seattle's Board of Adjustment.

Frank E. Smith has been named business manager of Richard George Wheeler & Associates, San Diego architectural-engineering firm.

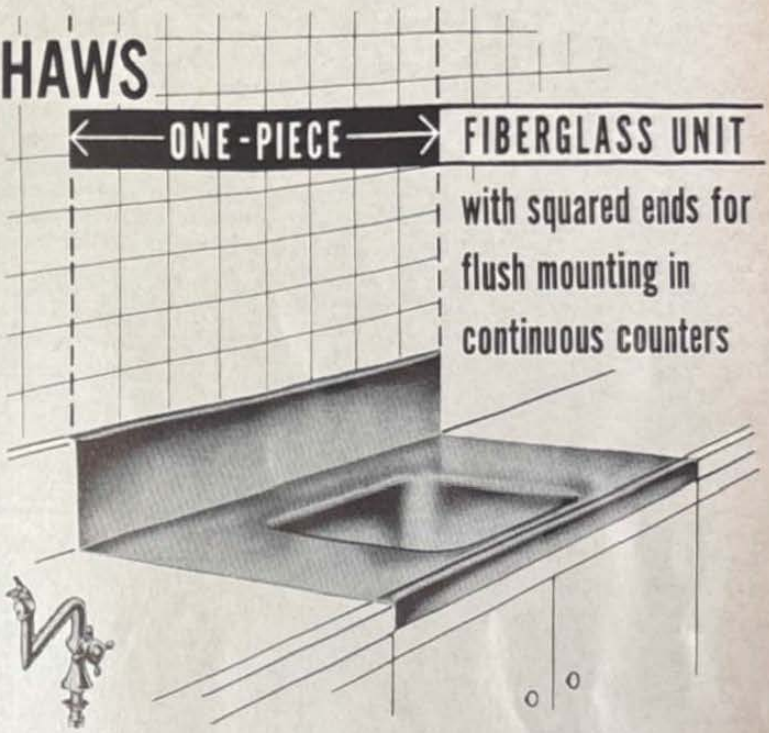
proposed commissions

The Design Standards Advisory Board has recommended the following architects for Seattle's Civic Center: James J. Chiarelli and B. Marcus Priteca, to prepare plans for converting the Civic Auditorium into a 3,000-

HAWS

ONE-PIECE FIBERGLASS UNIT

with squared ends for flush mounting in continuous counters



DRINKING FOUNTAINS

PANTRY FAUCETS

LABORATORY FAUCETS

For commercial, school, industrial and residential use... HAWS Series 2800 is a one-piece fiberglass molded unit with integral receptor and deck-top. No cracks or joints for water accumulation. It's specifically designed for simple installation in continuous counters; squared ends butt snugly against adjacent counters. Decks slope to receptor for complete, unhindered drainage.

Fiberglass finish is colorful and durable! You can choose from five decorator colors at no extra cost! Choose your pantry faucet and fountain fixtures, too, from HAWS complete line of facilities for every purpose.

ARCHITECTS, BUILDERS, SCHOOL OFFICIALS... here's an idea worthy of your attention. Write for illustrated literature, today.

HAWS DRINKING FAUCET COMPANY

seat concert hall; Paul Hayden Kirk, to be site planner for both the center and adjoining World Fair development; and the firm of Bassetti & Morse, to remodel the Civic Ice Arena to make it available for basketball, boxing and other sports. The board, made up of architects Perry B. Johansen, Paul Thiry, John Detlie and Robert H. Dietz, ruled themselves and their firms out of contention for any of the projects.

speakers

Griswold Raetze, San Francisco architect, addressed engineering students at City College of San Francisco last month on "The Architect as Part of a Team."

campus notes

The architectural department of Montana State College, Bozeman, next fall will become the School of Architecture in the newly named Division of Architecture and Applied Arts.

"Education for Architecture and Industrial Design," first comprehensive exhibition of all phases of student work at the University of Southern California School of Architecture, will remain on display through June 1 at the California Museum of Science and Industry.

Hospital corridor design wins rubber floor prize

Winning entry in the rubber floor design awards competition sponsored by the Rubber Manufacturers Association is a multicolored scheme installed in a new wing of McKennan Hospital, Sioux Falls, S. D.

Leonard Payne, designer for Harold Spitznagel & Associates, Sioux Falls architects, used 9-in. crosswise stripes of alternating gray and off-white rubber tile to minimize the tunnel effect of the long corridors.

BROAD STRIP in variegated colors down corridor center helps guide traffic.

School design: obligations (Cont'd from p. 12)

We must invent new solutions to old problems and to originate new solutions to new requests stemming from today's and tommorrow's program; to present in a straightforward manner, what we in our hearts honestly believe to be the right solution and then we must stand and defend it.

As educators, many of you have the responsibility of programming or writing the educational specifications. All too often this program is not one which offers challenge and stimuli to your architect. Rather it presents frustrations in trying to assemble a series of preconceived or preused elements into a workable homogeneous unit. Here your consultant should question your requests, looking behind the mere request and seeking the reasoning that prompted it. Too often this gap, this lack of real communication between designer and client, results in the hackneyed, the trite, the unimaginative solution. For from your educational specifications the first breath of life is instilled in a project. The entire success of the project for those it must serve—the student, the teacher, the administrator, the taxpayer—is established or lost at this point. For without this approach and the constant reminder of our four basic obligations, we are not fulfilling the trust we have been asked to share.

This forum is on the subject of wood schools. Just what is a wood school? A wood school is also a concrete school; a wood school is also a masonry school; a wood school is also a steel school; in summary, a wood school is concrete, masonry, steel, aluminum, glass, plastic, fiber, synthetic material, paint, ceramic and wood.

On any school a rough rule-of-thumb is that the general contract will consume approximately 70% of the construction budget; the mechanical, 20%; and the electrical, 10%. These percentages will vary but rarely over 2-3%. Therefore, it behooves us in all of our thinking to be consistent. All parts must be studied with equal care if we are to reduce cost. There is no all-swiveling magic answer to lowering building costs. Each and every part or process of the erection of the building from site work to finish hardware must be carefully scrutinized for possible savings. Every item from the design of footings to the necessity of a project sign must be studied in the light of the most for the least.

In our office we have endeavored to analyze, taking into consideration all factors, the most economical framing system it is possible to do toda Studies have been made in concrete, steel, in wood. All are within penni of each other. A simple decision change the grade of floor coveri one grade more than offsets the di ference in square foot cost of one sy tem over another. However, there a a number of factors that on paper d not immediately become evident in pure cost analysis. As we all know our jobs are bid competitively. It our desire to have competitive biddi on all of the three major contracts. addition, it is our desire to have competitive bidding situation on a phases of the work through the small est subcontract—bidding on the same or equal material, rigidly specified a to quality, grade and workmanship.

In addition to competitive biddi one should consider the availabilit of local labor, either skilled labo performing in different manufacturin plants on preassembled units or skil ed labor fabricating in the field. Bot of these two mentioned factors if ex ploited can, I believe, make for sizab savings.

On every project we have a budge It is our collective job to endeavo in every way to meet the budget. behooves us to analyze every step the building process; to continual ask, "Is this the simplest possible a proach consistent with the desir end result?" Will one member of o operation replace several members several operations? Or is the numb or operation even necessary at al Have we used our material to the u most? Have we designed using th most economical system and proce ures? Have we used the most advan ed engineering techniques to explo the maximum potentials of the pro erties of the medium we plan to bui with? Have we conceived a structu that makes for easy coordination mechanical, electrical and other fiel of construction that must be provide to complete the project? And in tur does the medium we are working wi allow us imagination to easily solv either in the shop or the field the and countless other problems?

What of design? Design that ex plores new forms to do a better job new forms that require thorough en gineering know-how, less material new forms that through the results engineering become sculpture and thing of beauty. It is my belief th creative designer's hands are not tied but rather this medium is as challeng ing as any we know today. Every job that is brilliantly conceived raises th position of the entire profession as well as the architect.

OREGON

★GLEN VISTA MOTEL— Bend, Ore.

Contract being negotiated with Maurice Olson, Bend, by Glen Vista Motel, Bend, for construction of 5,000 sq. ft. motel at Bend. Plans by Kendall & West, architects, 1132 S.W. 12th Ave., Portland. Negotiated price somewhat less than $43,000. Stefani Lumber Co., Canby, was low bidder at $43,325, when bids were opened May 3. (Figure of $42,325 in previous report was in error).
WB 5-9. Previous report 5-7

▲PAINT, IMPROVE BUILDINGS— Bonneville Dam, Ore.

Four bids received by Corps of Engineers, Portland district, 628 Pittock Block, Portland, for reconditioning sheathing, re-shingling, cleaning and painting various buildings at Bonneville Dam; CIVENG-35-026-58-161. Bids opened May 7. PART A—LOW BIDS: J. & K. Roofing, 237 E. Washington, Hillsboro, $11,335; Pioneer Roofing Co., 16916 S.E. Main St., Portland, $16,076. HI BID: R. W. O'Neil, Stevenson, Wash., $18,992. Government estimate, $18,478.
WB 5-9. Previous report 4-9

▲CHURCH— Coos Bay, Ore.

Four bids opened May 5 by Presbyterian Church, Union and Washington, Coos Bay, for constructing 4,500 sq. ft. one-story, frame school building. BIDS: Harold H. Grappe, Box 656, Coos Bay, $35,746; Fred Jensen, Route 2, Box 639, $42,810; S. S. and Tom E. Drake, Box 104, Coquille, $43,219; R. O. Gallia, 1776 Union, North Bend, $49,111. Architect: Robert F. Fisher, 422 Hall Bldg., Coos Bay. DM 5-9. Previous report 4-16

●SCHOOL ADDITION— Coos Bay, Ore.

Bids to be opened 8 p.m., May 28 by School District 9C, 7th and Hall, Coos Bay for constructing seven-classroom addition and remodeling existing Englewood School. Plans with Roy H. Erichsen, consulting engineer, 409 N. Fourth Court, Coos Bay. $35 deposit. Central portion to measure 112'x77½' with 24'x40' wing. Concrete and frame; stucco and cement asbestos board and batten exterior finish; built-up plywood roofing; wood sash with aluminum alternate; vinyl and asphalt tile flooring; gypsum board walls; acoustical tile ceiling; showers. DC 5-9

MECHANICAL ENGINEERING BUILDING— Corvallis, Ore.
(Estimated cost $1,242,000)

Wilmsen & Endicott, architects, 863 13th E., Eugene, have been retained by Oregon State Board of Higher Education, Dr. John Richards, chancellor, Johnson Hall, Eugene, to draw preliminary plans for a mechanical engineering building at Oregon State College. Funds will be requested from the 1959 Oregon Legislature.
WB 5-7. Previous report 3-22

■PHYSICS-CHEMISTRY BUILDING— Corvallis, Ore.

Additional planholders announced for construction of 98,199 sq. ft., five-story with partial sixth floor, reinforced concrete and window wall physics-chemistry building at Oregon State College, Corvallis. Bids will be opened 2 p.m., May 20, by Oregon State Board of Higher Education, Earl M. Pallett, secretary, (Eugene), at room 20, General Extension Division Bldg., 1633 S.W. Park Ave., Portland. Plans with Burns, Bear, McNeil & Schneider, architects, 2940 S.E. Belmont St., Portland. $50 deposit for general plans; $35, mechanical or electrical.

Additional planholders — MECHANICAL: A. G. Rushlight Co., 3900 N.W. St. Helens Road, Portland; Den Herder, Inc., Box 307, Lebanon. ELECTRICAL: Emery & Bohm, 516 N.W. 14th Ave., Portland; Lord Electric, 1034 S.E. Water Ave., Portland.
WB 5-14. Previous report 5-8

●ELEMENTARY SCHOOL ADDITIONS— Eugene, Ore.

Bids to be opened 2 p.m., May 23, by Eugene School District No. 4, 275 E. 7th Ave., Eugene, for constructing additions to Adams, Laurel Hill and Harris schools (Group 1) and Willagillespie and Washington schools (Group 2) in Eugene. Plans with Hamlin & Martin, architects, 159 W. 12th Ave., Eugene.

Frame construction with concrete floors; built-up roofing; plaster interior walls; acoustical tile ceilings; asphalt tile flooring; t&g cedar siding. DB 5-13

●FRATERNITY HOUSE ADDITIONS, ALTERATIONS— Eugene, Ore.

Bids to be opened 3 p.m., May 23, at the Phi Kappa Psi Chapter House, 729 E. 11th Ave., Eugene, for constructing new wing addition, extensive remodeling and alteration work on all three floors and in basement of the fraternity chapter house. Plans with Donald B. Parks and Frank E. Kelly, architects, 408 S.W. 2nd Ave., Portland.

Included in work are: asphalt shingles, built-up roofing; thermal insulation; new slate tile; stainless steel counter, sink; lath and plaster; millwork; weatherstripping; ceramic tile; linoleum; hardwood floors; plumbing, electrical work, fixtures. Heating calls for conversion of present sawdust-fired low pressure steam heating boiler to diesel oil firing system with new oil burner and controls, oil storage tank, additional radiation, baseboards and convectors, supply and return risers with necessary extensions, addition of two steam controls for two-zone heating for existing wing and new wing.

consider the "hidden" values of

BRICK CONSTRUCTION

There are so many sound reasons why brick construction is popular these days . . . but how about the "unseen" values? Brick creates a feeling of pride and security . . . a safe, secure feeling . . . a pride in "belonging" to a brick building . . . a brick school or church or office building.

And brick goes so well with other materials . . . it is flexible, easy for designers to work with. Next time you're designing a building . . . consider the "hidden" values of Columbia Brick.

CATHEDRAL HOUSE ADDITION—
Seattle, Wash.

(Estimated cost $385,000)

Bids will be called in late summer by St. Mark's Episcopal Cathedral, Dean Leffler, vicar, for constructing two-story, semi-circular cathedral house addition to west end of existing cathedral, 1531 10th N., Seattle. Working drawings underway by Young, Richardson & Carleton, architects, Central Bldg., Seattle. PD 5-14. Previous report 2-6

●■APARTMENT— Seattle, Wash.

(Estimated cost $750,000)

Four contractors have been asked to submit bids for construction of a two-building (39 units each) apartment on Eastlake and Shelby, Seattle, just south of new apartment on this site. Award will be made later in May.

Planholders: E. F. Shuck Construction Co., 535 Pontius; Baugh Construction Co., 922 Poplar Place; Hebb & Narodick Construction Co., Inc., 4225 23rd W.; Puget Construction Co., Inc., 1811 Bush Place. Of Seattle. Architect: George Bolotin, 915 E. Pine St., Seattle.

Reinforced concrete, concrete block; concrete slab-on-grade; flat built-up roof, rigid insulation in roof; painted pumice block exterior; aluminum sash; asphalt tile, ceramic tile, some asbestos vinyl flooring; electric baseboard heat. A 48-55 car asphaltic concrete parking area is planned.

●VAULT VENTILATION— Seattle, Wash.

Bids will be opened 2 p.m., June 5, by 13th Naval District, room 107B, Bldg. 250, U.S. Naval Station, Seattle, for installation of government-furnished ventilation unit, provision of steam and condensate piping, electrical supply and opening in walls and duct work in Bldg. 250, U.S. Naval Station, Seattle; Spec. No. 18313/58. Plans with above office. Work also includes relocation of existing unit heater, relocation of lighting fixture and provision of new lighting fixture.

RG 5-14

●SEATTLE PUBLIC LIBRARY—
Seattle, Wash.

Bids will be opened 2 p.m., June 3, by City of Seattle, in librarian's office, 1631 7th Ave., Seattle, for construction of five-story and basement, 167,000 sq. ft., reinforced concrete Seattle Public Library (main branch) building to be located at 4th Ave. and Madison in Seattle. Plans with Bindon & Wright, architects, Hoge Bldg., Seattle. One contract for general, mechanical and electrical. Separate contract for vertical transportation (elevators, escalators). $100 deposit for two sets of general plans and specifications, $10 deposit for vertical transportation. Associate architects: Decker, Christenson & Kitchin, 1411 Fourth Avenue Bldg., Seattle. Structural engineers, Andersen, Bjornstad-Kane, Hoge Bldg.; electrical engineer, Beverly A. Travis, Medical Arts Bldg.; mechanical engineers, May & Triol, Medical Arts Bldg.

The building is designed with two-level basement for double tier bookstacks. First floor (4th Ave.), second floor and third floor (5th Ave. level) are the public floors, and will have some plaster partitions. Fourth floor accommodates the catalog, order and bindery divisions. Fifth floor is administrative and includes in addition to private offices, branch stacks and lunchroom, with small self-service kitchen for staff use. Concrete block partitions will be used in service areas. All floors are laid out on a modular basis to provide flexibility. The two principal entrances, on 4th and 5th avenues, are accessible without steps, and approaches will be surfaced with non-slip terrazzo. Vertical transportation will be handled by means of escalators between the three main floors, supplemented by one passenger and one service elevator, both automatic, which run the full height of the building. Although the two lower floors occupy the major portion of the block, the perimeter walls will set back sufficiently to provide interesting landscape features visible from within as well as from the streets. Certain areas within the building and in landscaping areas will incorporate features of arts such as sculpture and murals, to be coordinated with Seattle Art Commission. The new structure will provide storage for 970,000 volumes. Metal stacks for this purpose will be bid under separate contract, with bid call about mid-May. At the southeast corner of the site, provision is made for limited parking and truck delivery to a loading dock, adjacent to the service elevator. Contract for furniture, including chairs, tables, specialty items, draperies, will be bid separately after general contract is awarded. Landscaping contract will be bid separately at a later date.

Construction will include the following: concrete roof slab, concrete joist construction with steel spans; flat built-up roof with rigid insulation on roof and terrace decking; exterior facing of Mo-Sai veneer supplemented in certain areas with granite; alumi-

num windows; window glazing with gray heat resistant glass, with drapes and vertical blinds for additional sun control; vinyl tile flooring; suspended acoustical tile ceilings; lighting and ventilating units set on modular grid; mechanical ventilation with provision for installation of air conditioning or cooling at a later date. The building will be constructed so that three additional stories can be built after twenty years if necessary.

●STATE HIGHWAY PROJECTS—
Olympia, Wash.

Bids to be opened 10 a.m., May 27, by Washington State Highway Commission, Transportation Bldg., Olympia, for 14 highway construction projects.

PAVING, Davenport to Reardan—Clearing, draining, grading, constructing cement treated base, bituminous surfacing, asphaltic concrete paving, stockpiling on 11.943 mi.

f No. 2, Lincoln County; FAP No. F-
4(4).
uantities: 65,470 c.y. common excavation,
2,040 c.y. foundation excavation;
345 ton crushed surfacing, cover stone,
ral aggregate, ballast; 80 c.y. prime coat
regate; 535 c.y. riprap; 666 ton asphalt
ent; 30,950 ton asphaltic concrete; 10,750
portland cement; 55,860 ton cement
ted base; 8,828' asphaltic concrete curb;
c.y. concrete; 22,940 lb. steel reinforcing
s; 348' concrete pipe; 1,456' metal pipe;
ss' beam guard rail; 133 guide post.

AVING, Schneiders Prairie to Mason
unty Line—Clearing, draining, grading,
structing cement treated base, asphaltic
crete paving, illumination system, 2.514
PSH No. 9, Thurston County; FAP No.
-0(11).
Quantities: 67 acre clearing; 375,690 c.y.
mon excavation; 19,100 c.y. solid rock
avation; 3,860 c.y. unsuitable foundation
avation; 48,310 ton select road borrow;
300 c.y. top soil; 9,450 ton crushed surfac-
F; 1,330 c.y. crushed cover stone, mineral
regate; 228 ton asphalt cement; 14,140 ton
phaltic concrete; 5,490 bbl. portland ce-
ent; 20,200 ton cement treated base; 2,100'
phaltic concrete curb; 880' precast traffic
rb; 77 c.y. concrete; 3,840' concrete pipe;
" metal pipe; 3,932' beam guard rail;
guide posts; 23,780' wire fence; illumina-
n system.

BRIDGES, Bean Creek to Naselle—Clear-
g, draining, grading, constructing two re-
forced concrete slab bridges, 4.710 mi. SSH
o. 13-B, Pacific County; FAP No. F-
3-1(7).
Quantities: 55 acre clearing; 164,000 c.y.
nclassified excavation; 28,400 c.y. common
cavation; 730 c.y. crushed surfacing, bal-
st; 6 c.y. concrete; 5,494' concrete pipe;
" metal pipe; 305' iron pipe; 5 guide
sts; 495 c.y. riprap; 4,300' wire fence; two
perstructures involving about 350 c.y. con-
rete; 81,000 lb. steel reinforcing bars; 182'
eam guard rail; 195' standard bridge rail;
250' concrete piling.

PAVING, Jct. SSH 1-D to Anacortes—Sur-
cing, constructing cement treated base,
ituminous surfacing, asphaltic concrete
aving, installing illumination 2.725 mi. PSH
o. 1, Skagit County; FAS Nos. S-0964(5),
S-0964(6).
Quantities: 12,130 c.y. common excavation,
orrow, 28,000 ton select road borrow; 7,300
on crushed surfacing; 790 c.y. crushed cover
tone, prime coat aggregate; 138 ton asphalt
ement; 9,600 ton asphaltic concrete; 2,920
bl. portland cement; 13,700 ton cement
reated base; 3,830' cement concrete gutter;
30' cement concrete curb; 4,250' asphaltic
oncrete curb, spillway; 2,190' extruded
raffic curb; 234' concrete pipe; 641' metal
ipe; 6,198' beam guard rail; 401 guide posts;
lumination system.

CLEARING, GRUBBING, Lyre River
Bridge vicinity—Clearing, grubbing 0.795 mi.
SH No. 9-A, Clallam County; FAS No. DS-
217(2). Involves 14 acre clearing, 11 acre
rubbing.

GRADING, BRIDGE, Silver Creek-Mossy-
ock Road-Tilton River Bridge—Clearing,
raining, grading, constructing reinforced
oncrete box girder bridge, surfacing 0.284
i. on Lewis County road; FAS No. S-
820(1).
Quantities: 17,000 c.y. common excavation;
,200 c.y. crushed surfacing, ballast; 114'
oncrete pipe; 205 c.y. concrete; 19,400 lb.
teel reinforcing bars; 570' steel bridge rail;
uperstructure involving 536 c.y. concrete
nd 154,650 lb. steel reinforcing bars.

GRADING, BRIDGE, Klaber Road—Clear-
ng, draining, grading, surfacing, construct-
ng reinforced concrete girder bridge 0.294
i. Lewis County road; FAS No. S-0338(5).
Quantities: 11,000 c.y. common borrow;
,700 c.y. select road borrow; 374 c.y. con-
rete; 85,000 lb. steel reinforcing bars; 422'
teel bridge rail.

SURFACING, Whitehall, Mudsprings and
McNiel Canyon Roads—Bituminous surfac-
ng 10.203 mi. Douglas County roads; FAS
Nos. S-1124(1) and S-1120(1); a County
Project.
Quantities: 30,980 c.y. crushed surfacing,
over stone; 427 ton asphalt cement.

SURFACING, Toroda Creek Road—Clear-
ng, draining, grading, surfacing with select
oad borrow 4.801 mi. Okanogan County
oad; FAS No. S-1143(1).
Quantities: 85,490 c.y. unclassified exca-
vation; 15,840 c.y. select road borrow; 1,000', metal pipe; 56' structural plate pipe arch; 200 c.y. riprap; 27,475' wire fence.

CLEARING, SURFACING, GRADING, Coal Creek Road—Clearing, draining, grading, surfacing 1.566 mi. Cowlitz County road; FAS No. S-0710(1).

Quantities: 7 acre clearing; 20,135 c.y. common excavation; 5,690 c.y. solid rock excavation; 19,590 ton crushed surfacing, ballast; 21 c.y. concrete; 725' concrete pipe; 270' metal pipe; 263' beam guard rail.

PLANTMIX SURFACING, Poulsbo to Port Gamble and Suquamish Jct. Vicinity—Grading, bituminous plantmix surfacing 6.236 mi. State Highways 21 and 21-A, Kitsap County; a State Project.

Quantities: 3,480 c.y. common excavation; 6,460 ton crushed surfacing; 45 c.y. prime coat aggregate; 37 ton asphalt cement; 15,735 ton bituminous plantmix.

BITUMINOUS SURFACING, National Ave. to Salzer Creek, et al—Bituminous surfacing 31.1 mi. State Highways, 1, 5, 8, 12, 1-Q and 1-S, Clark, Cowlitz, Lewis, Pacific and Klickitat counties; a State Project.

Quantities: 720 ton asphalt cement; 260 c.y. crushed cover stone; 5,985 c.y. mineral aggregate.

STOCKPILING, Kamilche and Graham Vicinities—Stockpiling about 38,000 ton crushed material SSH Nos. 9-D and 5-N, Mason and Pierce counties; a State Project.

BANK PROTECTION, Dosewallips River Revetment—Bank protection on PSH No. 9, Jefferson County; a State Project. Involving about 5,440 c.y. loose riprap. DM 5-9

★STEEL PIPE— Port Townsend, Wash.

Award to Hydraulic Manufacturing Co., 7500 8th Ave. S., Seattle, $267,301, by City Council, City Hall, Port Townsend, for furnishing and delivering at trench site about 20,000' of 30" electrically welded and coated-and-wrapped steel pipe. Six bids received for May 6 opening. HI BID: American Pipe and Construction Co., Portland, Ore., $285,-616. SP 5-14. Previous report 4-22

●PAVING, CURBS, DRAINS— Puyallup, Wash.

(Estimated cost $300,000)

Bids to be opened 8 p.m., May 19, by C. S. Seabrook, city engineer, City Hall, Puyallup, for about 26,000' of asphaltic concrete paving, concrete curbs and gutters, sidewalks, storm drains, necessary appurtenances on residential streets in area south of Pioneer W., all in LID 58-1. Advertisements reaching us not later than Wednesday noon will appear the same week.

THE RATE for Advertisements for Bids is 35 cents per line for the first insertion; 25 cents per line for each insertion thereafter.

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., JUNE 3
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington, on Tuesday, June 3, 1958, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

Bid proposals delivered in person will be received only at the Reception Desk located on the first floor of the Transportation Building.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal Funds have been allocated for items Nos. 1 to 7 inclusive.

The improvements for which bids will be received follow:

1. Grading. Constructing Two Reinforced Concrete Box Girder Bridges and a Precast Prestressed Concrete Bridge on 0.087 mile of Primary State Highway No. 2 in Kittitas County. YAKIMA RIVER BRIDGE AND EASTON UNDERCROSSING, FAP No. I-90-2(13)68, involving about 38,050 cubic yards of Common Borrow, 9,480 tons of Riprap, 1,566 cubic yards of Concrete, 1,735 linear feet of Standard Bridge Railing, 168,000 pounds of Steel Reinforcing Bars, 1,460 linear feet of Prestressed Concrete Girders, a lump sum bid for Superstructure (about 1,447 cubic yards of Concrete and 436,900 pounds of Steel Reinforcing Bars) and other items. Minimum Wage Rates for this project have been predetermined by law and are set forth in the bid proposal.
2. Paving with Asphaltic Concrete and Reconstructing Shoulders on 4.75 miles of Primary State Highway No. 3 in Walla Walla County, LOWDEN TO TOUCHET, FAP No. DF-018-4(8), involving about 16 ton of Asphalt Cement, 9,820 tons of Asphaltic Concrete, 3,500 tons of Crushed Surfacing and other items.
3. Grading, Draining and Surfacing on 2.551 miles of a Whitman County Road, HUME ROAD, FAS No. S-0662(2), involving about 94,710 cubic yards of Common Excavation, 955 cubic yards of Solid Rock Excavation, 65,090 tons of Crushed Surfacing and Crushed Cover Stone, 1,122 linear feet of Metal Pipe, 128 linear feet of Metal Pipe-Arch and other items.
4. Draining, Grading, Surfacing and Constructing Bituminous Surface Treatment on 4.782 miles of a Lincoln County Road, CRESTON-MILES ROAD, FAS No. S-0952(4), involving about 40,500 cubic yards of Common Excavation and Borrow, 24,870 cubic yards of Solid Rock Excavation, 53,830 tons of Crushed Surfacing and Crushed Cover Stone, 1,560 cubic yards of Mineral Aggregate, 12 linear feet of Concrete Pipe, 632 linear feet of Metal Pipe, 229 tons of Asphalt Cement and other items.
5. Clearing, Draining and Grading on 0.634 mile of a Kitsap County Road, EAGLEDALE-CREOSOTE ROAD, FAS No. S-1266(1), involving about 75,720 cubic yards of Unclassified Excavation, 1,523 linear feet of Concrete Pipe, 150 linear feet of Metal Pipe, 810 linear feet of Beam Guard Rail and other items.
6. Clearing, Draining, Grading, Surfacing, Constructing Bituminous Surface Treatment and Paving with Bituminous Plant Mix on 1.580 miles of Benton County Roads, WASHINGTON STREET-OLYMPIA STREET-33RD PLACE, FAS No. S-0655(1) and County Project, involving about 10,550 cubic yards of Common Excavation, 17,485 tons of Crushed Surfacing, Crushed Cover Stone and Ballast, 450 cubic yards of Mineral Aggregate, 3[illegible] tons of Asphalt Cement, 400 tons of Bituminous Plant Mix, 674 linear feet of Precast Traffic Curb, 1,262 linear feet of Concrete Pipe, 102 linear feet of Metal Pipe and other items.
7. Clearing, Draining, Grading, Constructing Bituminous Surface Treatment and Paving with Asphaltic Concrete on 0.9[illegible] mile of Redmond City Streets in King County, 166TH AVENUE AND N.E. 10[illegible] STREET IN REDMOND, No. A-AD-2[illegible], involving about 7,060 cubic yards of Common Excavation, 4,670 cubic yards of Selected Roadway Borrow, Crushed Cover Stone and Prime Coat Aggregate, 2[illegible] tons of Crushed Surfacing, 31 tons of Asphalt Cement, 1,650 tons of Asphaltic Concrete, 1,560 linear feet of Asphaltic Concrete Ditch, 3 cubic yards of Concrete, 60 pounds of Steel Reinforcing Bars, 539 linear feet of Concrete Pipe and other items.

STATE HIGHWAY PROJECTS
BIDS CLOSE 10 A.M., MAY 29
Salem, Oregon
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received and opened by the State Highway Commission in Room 418, State Highway Building in Salem, Oregon, at 10:0[illegible] a.m., on Thursday, May 29, 1958. No award of contracts will be made on May 29 but all bids will be referred to the Highway Commission for award at its next meeting in Portland on June 19, 1958.

BIDS TO BE OPENED AT 10:00 A.M. ON THURSDAY, MAY 29, 1958

COLUMBIA COUNTY: Nehalem River Bridge (M.P. 58.16) Section of the Nehalem Highway, near Vernonia. FAS Project DS-21,3(20). 182-foot, reinf. conc. struct ove

Nehalem River, 0.18 mi. highway roadbed and stone base. Requires approx. 1,300 cu. yds. general excavation; 220 lin. ft. metal guardrail; 2,200 cu. yds. rock base; 280 lin. ft. steel piling; drive 8 piles, 395 cu. yds. Class "A" concrete; 90,000 lbs. metal reinf.; 30 lin. feet. metal drain pipe.

COOS COUNTY: Isthmus Slough Bridge on Coos River Highway. State project. Repair pier fenders. Requires approx. 4,500 lin. ft. treated timber piling; drive 64 piles; 5,000 FBM treated lumber.

CURRY COUNTY: Hooskanaden Creek-Thomas Creek Section of the Oregon Coast Highway, about 8 mi. north of Brookings. Federal Aid Project No. BF-124(14). 3.21 mi. of grading. Requires approx. 4,115,000 cu. yds. roadbed excavation; 141,000 cu. yds. embankment foundation excavation; 1,000 cu. yds. Class "A" concrete; 84,000 lbs. metal reinf.; 2,383 lin. ft. struc. plate pipe; 46,690 lin. ft. corrugated metal culvert and drain pipe; and 1,300 rods Type 2 fence.

GRANT COUNTY: Middle Unit, Hamilton-Long Creek Section of the Kimberly-Long Creek Highway, about 1.5 mi. west of Long Creek. Federal Aid Project No. DS-260(5). 5.83 mi. grading and oiling. Requires approx. 102,500 cu. yds. roadbed excavation; 104,540 tons crushed material in base and oiling; 120 tons MC-2 asphalt; 270 tons 120-150 asphalt; and 80 tons RS-1 asphalt.

JACKSON COUNTY: Third St. - Green Springs Jct. Section of the Pacific Highway in the City of Ashland. Federal Aid Project No. DU-190(9). 1.11 mi. grading and paving. Requires approx. 5,500 cu. yds. roadbed excavation; 520 cu. yds. Class "A" concrete; 3,330 cu. yds. crushed material in base and binder; 26 tons RC-3 asphalt; 4 tons RS-1 asphalt; and 6,000 tons Class "B" asphaltic concrete.

JACKSON COUNTY: Trail Creek Bridge Section of the Crater Lake Highway, about 22 mi. north of Medford. Federal Aid Project No. S-47(7). 0.77 mi. grading, paving and structure; also crushed material in stock piles. Requires approx. 67,900 cu. yds. roadbed excavation; 11,000 cu. yds. toe excavation; 1,600 lin. ft. metal guardrail; 30 metal sight posts; 30 rods Type 3 fence; 21,000 cu. yds. crushed materials in base and in stock piles; 22 tons RC-3 asphalt; 3,000 tons asphaltic concrete mixture; 180 tons 85-100 asphalt; 385 cu. yds. Class "A" concrete in structure and box culvert; 81,600 lbs. metal reinf. in struct. and box culvert; and 210 lin. ft. steel piling.

JACKSON AND KLAMATH COUNTIES: Prospect - Park Boundary Section of the Crater Lake Highway, north and east from Prospect. State project. Requires furnishing approx. 9,000 cu. yds. crushed material in stock piles.

KLAMATH COUNTY: Middle Unit, Crescent Lake Jct.-The Dalles-California Jct. Section of the Willamette Highway, about 40 mi. southeast of Oakridge. Federal Aid Project No. DF-184(4). 3.28 mi. grading and paving. Requires approx. 67,900 cu. yds. roadbed excavation; 2,250 lin. ft. metal guardrail; 59,455 tons crushed material in base and shoulder oiling; 80 tons RC-3 asphalt; 56 tons 120-150 asphalt; 16 tons RS-1 asphalt; 10,800 tons asphaltic concrete mixture; and 650 tons 85-100 asphalt in mixture.

KLAMATH COUNTY: Chiloquin (Second Avenue) Section on Second Avenue in the City of Chiloquin. City project. 0.32 mi. stone base and paving. Requires approx. 20 hours blade-grader time; 30 cu. yds. State-furnished aggregates; and 730 tons Class "B" asphaltic concrete pavement.

LANE COUNTY: Santa Clara-Eugene Section of the Junction City-Eugene Highway extending north from Eugene. Federal Aid Project No. DS-373(1). 2.90 mi. paving. Requires approx. 100 hours blade-grader time; 80 hours front end loader; 240 hours dump trucks; 24,400 lin. ft. sewer pipe; 4,370 cu. yds. crushed material in base and shoulder oiling; 6,800 tons Class "B" asphaltic concrete; 54 tons 120-150 asphalt; and 40 tons RS-1 asphalt.

LANE COUNTY: Knowles Creek Tunnel Section of the Mapleton-Richardson Road, about 5.2 mi. east of Mapleton. State project. Curb construction. Requires approx. 96 cu. yds. Class "A" concrete; and 306 cu. yds. State-furnished base materials.

MALHEUR COUNTY: Jonesboro - Tunnel Section of the Central Oregon Highway, about 12.2 mi. east of Juntura. Federal Aid Project No. F-326(4). 8.19 mi. grading and paving and 3 concrete slab span structures. Requires approx. 129,200 cu. yds. roadbed excavation; 3,600 lin. ft. metal guardrail; 100 rods Type 1 fence; 57,800 tons crushed material in base; 24 tons MC-2 asphalt; 29,000 tons asphaltic concrete mixture; 1,740 tons 85-100 asphalt; 16 tons RS-1 asphalt; 395 cu. yds. Class "A" concrete; and 77,950 lbs. metal reinf.

MALHEUR COUNTY: Ontario (W. Idaho Ave.) Section on West Idaho Ave. in the City of Ontario. City project. 0.47 mi. stone base and paving. Requires approx. 1,060 cu. yds. crushed material in base; 22 tons MC-2 asphalt; and 2,250 tons Class "B" asphaltic concrete.

MARION COUNTY: Lancaster Drive-Sublimity Gun Club Section of the North Santiam Highway, extending easterly from Salem. Federal Aid Project Nos. S-220(12) and S-265(6). 9.78 mi. grading. Requires approx. 16,000 cu. yds. embankment foundation excavation; 973,200 cu. yds. roadbed excavation; 20,000 cu. yds. special stone fill; 320 cu. yds. Class "A" concrete; 44,300 lbs. metal reinf.; 7,600 rods Type 2 fence; 31,250 tons crushed material in base and oiling; 50 tons RC-3 asphalt; and 150 tons 150-200 asphalt.

MARION COUNTY: 12th St.-E. City Limits (Salem) Section of the Silver Creek Falls Highway in Salem. Federal Aid project No. DUS-265(5). 0.95 mi. grading and paving and reconstruction of one bridge. Requires approx. 5,500 cu. yds. roadbed excavation; 718 cu. yds. Class "A" concrete in curbs, walks, driveways and bridge reconstruction; 2,100 lbs. metal reinf.; 3,900 tons Class "B" asphaltic concrete; and 4 tons RS-1 asphalt.

MULTNOMAH COUNTY: Airport-Alberta St. Section of 82nd Ave. and the Cascade Highway, southerly from the International Airport at Portland. FAP Nos. S-364(3) and US-364(2). 1.64 mil. grading and paving; also construction of three structures. Requires approx. 225,000 cu. ds. excavation; 9,200 cu. yds. top-soil; 145 cu. yds. conc. in curbs and islands; 1970 lin. ft. guardrail; 7,200 lin. ft. median barrier; 71,000 tons stone base materials; 125 tons RC-3 asphalt; 16 tons 120-150 asphalt; 5 tons RS-1 asphalt; 17,400 tons asphaltic conc. pavement; 2,625 cu. yds. struct. excavation; 1,120 lin. ft. steel piling; 3,176 cu. yds. conc. in struct.; 526,500 lbs. metal reinf.; struct. steel (approx. 530,000 lbs.); 2,520 lin. ft. timber piling; and 46 M-FBM lumber and timber.

MULTNOMAH COUNTY: 19th Ave. and Multnomah Blvd. Undercrossings on Harbor Drive-Washington County Line Section of the Pacific Highway (R. H. Baldock Freeway) in Portland. Federal Aid Project No. I-5-6(3)296. 387.5' reinf. conc. bridge to carry 19th Ave. traffic over Pacific Highway, and 405' reinf. concrete and struct. steel bridge to carry Multnomah Blvd. traffic over Pacific Highway. Requires approx. 1,200 cu. yds. struct. excavation; 3,300 lin. ft. steel piling; 4,800 lin. ft. treated timber piling; drive 220 piles; 1,750 cu. yds. Class "A" Concrete; 386,000 lbs. metal reinf.; 800 lin. ft. metal rail; 375,000 lbs. struct. steel; 810 lin. ft. pipe parapet rail; 350 lin. ft. 8" metal drain pipe; and 530 sq. yds. conc. slab riprap.

POLK COUNTY: Church St. and East St.-E. City Limits (Monmouth) Sections of Church St. and the Monmouth-Independence Highway in Monmouth. State project. 0.52 mi. grading and paving. Requires approx. 1,960 cu. yds. roadbed excavation; 3,840 cu. yds. crushed material in base; and 1,840 tons Class "B" asphaltic concrete.

UMATILLA COUNTY: Pendleton Maint. Shed Addition. State project. Construct 36'x54'-8" masonry block addition to existing maintenance shed.

WASHINGTON COUNTY: McFee Bridge (Bonner Bridge over McFee Creek), about 9.68 mi. south of Hillsboro on the Hillsboro-Silverton Highway. State project. Remove existing timber deck and precast conc. deck. Requires approx. 117 cu. yds. Class "A" concrete; 40,000 lbs. metal reinf.; 3.5 tons asphaltic concrete.

THE MINIMUM HOURLY WAGE RATES TO BE PAID TO LABOR EMPLOYED ON THE ABOVE ADVERTISED FEDERAL INTERSTATE PROJECTS HAVE BEEN PREDETERMINED BY THE SECRETARY OF LABOR AND ARE AS SET FORTH IN THE SPECIAL PROVISIONS APPLICABLE TO THOSE RESPECTIVE PROJECTS. THE MINIMUM HOURLY WAGE PAID TO LABOR EMPLOYED ON OTHER FEDERAL-AID PROJECTS SHALL BE AS FOLLOWS: SKILLED LABOR, $2.25 PER HOUR; INTERMEDIATE LABOR, $2.00 PER HOUR; UNSKILLED LABOR, $1.75 PER HOUR.

Prequalification of bidders will be required in accordance with the provisions of ORS 279.010 to 279.024, inclusive. Full information for bidders may be obtained at the office of the Oregon State Highway Commission, State Highway Building, Salem, Oregon. Plans and specifications may be inspected at the same place and may be obtained by eligible bidders upon payment of $2.00 for each set.

Plans and specifications may also be inspected at the office of the Associated General Contractors in Portland, Seattle, Spokane, and Boise; and at the Builders Exchange Cooperative, Portland.

The right is reserved to reject any and all proposals or to accept the proposal deemed best for the State of Oregon.

OREGON STATE HIGHWAY COMMISSION
H. B. Glaisyer, Secretary.

WATER DISTRIBUTION SYSTEM
BIDS CLOSE 10 A.M., P.S.T., JULY 2
Anchorage, Alaska
NOTICE TO CONTRACTORS

INVITATION FOR BIDS (Construction Contract). Project Aaa. 50-A-245, Water System, Mt. View, Anchorage, Alaska. DATE: April 30, 1958. NAME AND LOCATION OF PROJECT: MOUNTAIN VIEW WATER DISTRIBUTION SYSTEM, Project Aaa 50-A-245, Anchorage, Alaska. DEPARTMENT OR AGENCY: Alaska Public Works, Office of Territories, Department of the Interior. **By (Issuing Office)** Thomas G. Mooney, Director, Alaska Public Works, Office of Territories, Department of the Interior, Post Office Box 1181, Juneau, Alaska. **Sealed bids** in single copy for furnishing all labor, equipment, and materials and performing all work for the project described herein will be received until 10:00 A.M. Pacific Standard Time July 2, 1958 in the mailroom of the office of the Director, Alaska Public Works, Office of Territories, Department of the Interior, 123 West Third Street, Post Office Box 1181, Juneau, Alaska and then **publicly** opened and read aloud. Information regarding bidding material, bid guarantee, and bonds follows: Plans and specifications and other proposed contract documents are open for public inspection at the Director's office, Juneau, Alaska; at Room 5621 Interior Bldg., Washington 25, D. C.; at the Area Engineer's office, Alaska Public Works, Reliable Service Bldg., Anchorage, Alaska; and Associated General Contractor's of America offices as follows: Seattle Chapter, Construction Center, 215 West Harrison St., Seattle, Wash.; Mountain Chapter, 220 West Harrison St., Seattle, Wash.; Tacoma Chapter, 1605 Center Street, Tacoma, Wash.; Portland Chapter, Suite 112, Multnomah Hotel, Portland, Ore.; The Alaska Chapter, 306 Central Bldg., Anchorage, Alaska, and the Plan Bureau, 2413 Western Ave., Seattle, Wash.; and the Builders Exchange Cooperative, 317 Builders Exchange Bldg., Portland, Oregon. A set of such documents may be procured from the office of the Director at Juneau, Alaska upon deposit of $25.00, all of which will be refunded upon the return of the plans and specifications in good condition within twenty (20) days from date of bid opening. Each bid must be accompanied by a satisfactory bid security (certified check or bid bond) in an amount not less than 5 per cent of the total bid in dollars and cents. No bid will be withdrawn until thirty days after the scheduled closing date for the receipt of bids. The successful bidder will be required to furnish a performance bond and payment bond, each in the amount of 100 per cent of the contract price. The Government reserves the right to award a contract for the project on the basis of the acceptance of any or all of the alternates, whichever course is in the best interest of the Government. Funds for the award of this project are not currently available. The conractor will place his bid subject to allotment of funds. It is presently anticipated that these funds will be allotted prior to July 31, 1958, and

the project will be awarded on or before that date, provided that the funds are allotted and a satisfactory bid is received.

WATER WORKS CONSTRUCTION
BIDS CLOSE 8 A.M., P.S.T., JUNE 11
Olympia, Washington
NOTICE TO CONTRACTORS

Sealed proposals will be received by the undersigned at the Public Utility District Office, 208 First National Bank Building, Olympia, Washington, until 08:00 A.M. Pacific Standard Time, June 11, 1958, for furnishing and installing the following:

Schedule A—Well Pump Installation together with necessary appurtenances.

Schedule B—2,400 linear feet of 4" and 8", Class 150, asbestos cement pipe, together with valves, hydrants and other necessary appurtenances.

Schedule C—1,500 linear feet of 6", Class 150, asbestos cement pipe, together with valves, hydrants and other necessary appurtenances.

Plans and Specifications are on file at the Public Utility District Office and the offices of Howard T. Harstad & Associates, Consulting Engineers, 1000 Lenora Street, Seattle 1, Washington. Plans and Specifications may be obtained from the Engineers by depositing $15.00 per set.

Each bid shall be accompanied by a certified check, cashier's check or bid bond payable to Thurston County Public Utility District No. 1, for a sum not less than five percent (5%) of the amount of the bid, and no bid will be considered unless accompanied by such check or bid bond.

At the time and place named, the bids will be publicly opened and read. The Board reserves the right to reject any or all proposals or to waive informalities in the bidding.

Harvey Thompson, Secretary
Board of Commissioners
Public Utility District No. 1
Thurston County, Washington

LIBRARY
BIDS CLOSE 2 P.M., P.S.T., MAY 27
Portland, Oregon
NOTICE TO CONTRACTORS

Sealed bids will be opened by the Oregon State Board of Higher Education at Room 20, General Extension Division Building, 1633 S.W. Park Avenue, Portland 1, Oregon, at 2:00 P.M., Pacific Standard Time, on Tuesday, May 27, 1958, for the construction of the Portland State College Library Building.

Bids for the Mechanical Work and for the Electrical Work, separately, must be received at the address indicated above prior to 2:00 P.M., Pacific Standard Time, on the preceding day, Monday, May 26, 1958, but will be retained unopened for a 24-hour period. Bids for the General Work only, and/or for a combination of the General, Mechanical and Electrical Work, must be received by 2:00 P.M., Pacific Standard Time, Tuesday, May 27, 1958, when all bids received for the project will be opened and read.

Briefly, the proposed work consists of a four-story building, plus basement; concrete and steel construction; window wall and masonry exterior; total area approximately 50,000 square feet; bridge connection with classroom building, southwest Montgomery Street and Broadway, Portland, Oregon.

Two sets of drawings, specifications and forms of contract documents may be obtained by prime bidders only from Lawrence, Tucker and Wallmann, Architects, 912 Failing Building, Portland 4, Oregon, upon a deposit of $100 for the General Work, $25 for the Mechanical Work and $25 for Electrical Work. Additional sets may be obtained from the Architects for the cost of reproduction.

Deposits made upon the procurement of drawings, specifications and forms of contract documents will be refunded upon the return thereof in good condition by actual bidders within two weeks after the opening of bids, but to non-bidders only if returned no later than two weeks prior to the bid opening.

The drawings, specifications and forms of contract documents may be examined at the Builders Exchange in Portland or at the office of the Architects.

All bidders must be prequalified in accordance with Chapter 279, Oregon Revised Statutes.

No bid will be considered unless fully completed in the manner provided in the "Instructions to Bidders" upon the bid form provided by the Architects and accompanied by a certified check or bid bond, executed in favor of the State of Oregon and the Oregon State Board of Higher Education in an amount not less than ten percent of the total amount of the bid, to be forfeited as fixed and liquidated damages should the bidder neglect or refuse to enter into a contract and provide suitable bond for the faithful performance of the work in the event the contract is awarded to him.

The Oregon State Board of Higher Education reserves the right to reject any or all bids and to waive all informalities.

No bidder may withdraw his bid after the latest hour set for the receipt thereof until after the elapse of 30 days from the bid opening.

OREGON STATE BOARD OF HIGHER EDUCATION,
Earl M. Pallett, Secretary, Eugene, Oregon

PUBLIC LIBRARY
BIDS CLOSE 2 P.M., JUNE 3
Seattle, Washington
NOTICE TO CONTRACTORS

Sealed proposals will be received by the Seattle Public Library, at the office of the Librarian, 1631 Seventh Avenue, Seattle 1, Washington until 2:00 P.M., June 3, 1958, for separate General Contract (including Mechanical and Electrical) and Vertical Transportation contracts for construction of a new Central Library Building. Proposals will be publicly opened and read aloud immediately thereafter. Proposals received after the time set for opening cannot be considered.

Specifications and drawings may be examined at the office of Bindon & Wright, 715 Hoge Building and may be obtained at the above office.

A deposit of $100.00 for two sets of General Contract drawings and specifications and $10.00 for Vertical Transportation Contract sets will be required.

The deposit for the two sets of documents will be refunded to actual prime contract bidders upon return of the documents in good condition. Prime contract bidders requiring more than two sets of documents and subcontract bidders desiring prints of drawings for their own use may obtain same by paying the actual cost of printing, which amount will not be refunded.

The Board of Trustees reserves the right to reject any or all bids, and to waive informalities.

EXCAVATION, GRADING, PAVING SIDEWALK, CURB, GUTTER

BIDS CLOSE 11 A.M., P.S.T., June 10

Juneau, Alaska

NOTICE TO CONTRACTORS

DEPARTMENT OF COMMERCE, Bureau of Public Roads, Region 10. Sealed bids, in single copy, for furnishing all labor, equipment, and materials and performing all work for Project No. DF-031-1(2), Seward-Anchorage Highway (Third Avenue, Seward, Alaska), described herein will be received until 11:00 a.m., PST, June 10, 1958, in Room 119, Federal Building, Juneau, Alaska. Principal items of work included in the project are unclassified excavation, 11,500 cubic yards; excavation for structures, 1,720 cubic yards; crushed aggregate base, grading D-1, 4,89 tons; hot bituminous concrete pavement, 2,800 tons; 4" concrete sidewalk, 2,061 square yards; 6" curb and gutter, 3,276 lineal feet. Plans and specifications may be obtained free of charge by all who have a bonafide need for them for bidding purposes at Room 311, Federal Building, Juneau, Alaska. It is requested that plans be returned to the Division Engineer, Bureau of Public Roads, Anchorage, Alaska. A bid guaranty in a minimum amount of 5% of the bid amount and conforming to the requirements of Standard Form 22 shall be required with each bid. If the bidder fails to accompany his bid with the required bid guaranty, his bid will not be read or otherwise considered. Telegraphic notification of execution of a Bid Bond does not meet the above requirement of a bid bond accompanying a bid. E. H. Swick, Regional Engineer.

STATE HIGHWAY PROJECTS

BIDS CLOSE 10 A.M., MAY 27

Olympia, Washington

NOTICE TO CONTRACTORS

Sealed bids will be received by the Washington State Highway Commission at Olympia, Washington on Tuesday, May 27, 1958, until 10:00 A.M. and will then and there be opened and publicly read for the construction of the improvements listed below.

Bid proposals delivered in person will be received only at the Reception Desk located on the first floor of the Transportation Building.

All bid proposals shall be accompanied by a bid proposal deposit in cash, certified check, cashier's check or surety bond in an amount equal to five per cent (5%) of the amount of such bid proposal. Should the successful bidder fail to enter into such contract and furnish satisfactory performance bond within the time stated in the specifications, the bid proposal deposit shall be forfeited to the State of Washington.

Prequalification of bidders is required. Maps, plans and specifications may be obtained from this office upon written request therefor and payment to the Director of Highways by cash, certified check, cashier's check or money order in the sum of two dollars ($2.00) for each copy of such maps, plans and specifications as a rental for the use of them. Plans will be forwarded by First Class Mail.

Informational copies of maps, plans and specifications are on file in the office of the County Engineer of the County in which the work is situated, the Chapter offices of the Associated General Contractors of America in Seattle, Spokane, Tacoma and Portland and the offices of the District Engineers of the Department of Highways where they may be inspected.

Federal Funds have been allocated for items Nos. 1 to 10 inclusive.

The improvements for which bids will be received follow:

1. Clearing, Draining, Grading, Surfacing, Constructing Cement Treated Base and Bituminous Surface Treatment, Paving with Asphaltic Concrete and Stockpiling Crushed Surfacing and Mineral Aggregates on 11.943 miles of Primary State Highway No. 2 in Lincoln County, DAVENPORT TO REARDAN, FAP No. F-028-4(4), involving about 65,470 cubic yards of Common Excavation and Borrow, 2,040 cubic yards of Unsuitable Foundation Excavation, 355,345 tons of Crushed Surfacing, Crushed Cover Stone, Mineral Aggregate and Ballast, 80 cubic yards of Prime Coat Aggregate, 835 cubic yards of Riprap, 666 tons of Asphalt Cement, 30,950 tons of Asphaltic Concrete, 10,750 barrels of Portland Cement, 55,860 tons of Cement Treated Base, 8,828 linear feet of Asphaltic Concrete Curb, 102 cubic yards of Concrete, 22,940 pounds of Steel Reinforcing Bars, 348 linear feet of Concrete Pipe, 1,456 linear feet of Metal Pipe, 10,225 linear feet of Beam Guard Rail, 133 Guide Posts and other items.

2. Clearing, Draining, Grading, Surfacing, Constructing Cement Treated Base, Paving with Asphaltic Concrete and Installing Illumination on 2.514 miles of Primary State Highway No. 9 in Thurston County, SCHNEIDERS PRAIRIE TO MASON COUNTY LINE, FAP No. DF-007-5(11), involving about 67 acres of Clearing, 375,690 cubic yards of Common Excavation, 19,100 cubic yards of Solid Rock Excavation, 3,860 cubic yards of Unsuitable Foundation Excavation, 48,310 tons of Selected Roadway Borrow, 10,500 cubic yards of Top Soil, 9,450 tons of Crushed Surfacing, 1,350 cubic yards of Crushed Cover Stone and Mineral Aggregate, 228 tons of Asphalt Cement, 14,140 tons of Asphaltic Concrete, 5,490 barrels of Portland Cement, 20,300 tons of Cement Treated Base, 2,100 linear feet of Asphaltic Concrete Curb, 880 linear feet of Precast Traffic Curb, 77 cubic yards of Concrete, 3,840 linear feet of Concrete Pipe, 392 linear feet of Metal Pipe, 3,932 linear feet of Beam Guard Rail, 190 Guide Posts, 23,780 linear feet of Wire Fence, a lump sum bid for Illumination Systems and other items.

3. Clearing, Draining, Grading and Constructing Two Reinforced Concrete Slab Bridges on 4.710 miles of Secondary State Highway No. 12-B in Pacific County, BEAN CREEK TO NASELLE, FAP No. F-003-1(7), involving about 55 acres of Clearing, 164,000 cubic yards of Unclassified Excavation, 28,400 cubic yards of Common Excavation, 750 cubic yards of Crushed Surfacing and Ballast, 6 cubic yards of Concrete, 5,494 linear feet of Concrete Pipe, 276 linear feet of Metal Pipe, 305 linear feet of Iron Pipe, 5 Guide Posts, 495 cubic yards of Riprap, 4,300 linear feet of Wire Fence, a lump sum bid for Two Super-structures (about 350 cubic yards of Concrete and 81,000 pounds of Steel Reinforcing Bars) 182 linear feet of Beam Guard Rail, 195 linear feet of Standard Bridge Railing, 1,350 linear feet of Concrete Piling and other items.

4. Surfacing, Constructing Cement Treated Base and Bituminous Surface Treatment, Paving with Asphaltic Concrete and Installing Illumination on 2.725 miles of Primary State Highway No. 1 in Skagit County JCT. SSH 1-D TO ANACORTES, FAS Nos. S-0964(5) and US-0964(6), involving about 12,130 cubic yards of Common Excavation and Borrow, 28,000 tons of Selected Roadway Borrow, 7,300 tons of Crushed Surfacing, 790 cubic yards of Crushed Cover Stone and Prime Coat Aggregate, 138 tons of Asphalt Cement, 9,600 tons of Asphaltic Concrete, 2,920 barrels of Portland Cement, 13,700 tons of Cement Treated Base, 3,830 linear feet of Cement Concrete Gutter, 530 linear feet of Cement Concrete Curb, 4,250 linear feet of Asphaltic Concrete Curb and Spillway, 2,190 linear feet of Extruded Traffic Curb, 234 linear feet of Concrete Pipe, 641 linear feet of Metal Pipe, 6,198 linear feet of Beam Guard Rail, 401 Guide Posts, 4 lump sum bids for Illumination Systems and other items.

5. Clearing and Grubbing on 0.795 mile of Secondary State Highway No. 9-A in Clallam County, LYRE RIVER BRIDGE VICINITY, FAS No. DS-0217(2), involving about 14 acres of Clearing and 11 acres of Grubbing.

6. Clearing, Draining, Grading, Surfacing and Constructing a Reinforced Concrete Box Girder Bridge on 0.284 mile of a Lewis County Road, SILVER CREEK-MOSSYROCK ROAD-TILTON RIVER BRIDGE, FAS No. S-0630(1), involving about 17,000 cubic yards of Common Excavation, 2,200 cubic yards of Crushed Surfacing and Ballast, 114 linear feet of Concrete Pipe, 205 cubic yards of Concrete, 19,400 pounds of Steel Reinforcing Bars, 570 linear feet of Steel Bridge Railing, a lump sum bid for Superstructure (about 536 cubic yards of Concrete and 154,650 pounds of Steel Reinforcing Bars) and other items.

7. Clearing, Draining, Grading, Surfacing and Constructing a Reinforced Concrete Girder Bridge on 0.294 mile of a Lewis County Road, KLABER ROAD, FAS No. S-0338(5), involving about 11,000 cubic yards of Common Borrow, 1,700 cubic yards of Selected Roadway Borrow, 374 cubic yards of Concrete, 85,000 pounds of Steel Reinforcing Bars, 422 linear feet of Steel Railing and other items.

8. Surfacing and Constructing Bituminous Surface Treatment on 10.203 miles of Douglas County Roads, WHITEHALL, MUDSPRINGS AND McNIEL CANYON ROADS, FAS Nos. S-1124(1) and S-1120(1) and County Project, involving about 30,980 cubic yards of Crushed Surfacing and Crushed Cover Stone, 427 tons of Asphalt Cement and other items.

9. Clearing, Draining, Grading and Surfacing with Selected Roadway Borrow on 4.801 miles of an Okanogan County Road, TORODA CREEK ROAD, FAS No. S-1143(1), involving about 85,490 cubic yards of Unclassified Excavation, 15,840 cubic yards of Selected Roadway Borrow, 1,090 linear feet of Metal Pipe, 56 linear feet of Structural Plate Pipe-Arch, 200 cubic yards of Riprap, 27,475 linear feet of Wire Fence and other items.

10. Clearing, Draining, Grading and Surfacing on 1.566 miles of a Cowlitz County Road, COAL CREEK ROAD, FAS No. S-0710(1), involving about 7 acres of Clearing, 20,135

cubic yards of Common Excavation, 5,690 cubic yards of Solid Rock Excavation, 19,590 tone of Crushed Surfacing and Ballast, 21 cubic yards of Concrete, 725 linear feet of Concrete Pipe, 270 linear feet of Metal Pipe, 263 linear feet of Beam Guard Rail and other items.

11. Grading, Surfacing and Constructing Bituminous Plant Mix on 6.236 miles of State Highways Nos. 21 and 21-A in Kitsap County, POULSBO TO PORT GAMBLE AND SUQUAMISH JCT. VICINITY, a State Project, involving about 3,480 cubic yards of Common Excavation, 6.460 tons of Crushed Surfacing, 45 cubic yards of Prime Coat Aggregate, 37 tons of Asphalt Cement, 15,735 tons of Bituminous Plant Mix and other items.

12. Constructing Bituminous Surface Treatment on 31.100 miles of State Highways Nos. 1, 5, 8, 12, 1-Q and 1-S in Clark, Cowlitz, Lewis, Pacific and Klickitat Counties, NATIONAL AVENUE TO SALZER CREEK, ET AL, a State Project, involving about 720 tons of Asphalt Cement, 260 cubic yards of Crushed Cover Stone, 5,985 cubic yards of Mineral Aggregate and other items.

13. Stockpiling Crushed Stone Surfacing and Mineral Aggregates on Secondary State Highways Nos. 9-D and 5-N in Mason and Pierce Counties, KAMILCHE AND GRAHAM VICINITIES, a State Project, involving about 38,000 tons of Crushed Materials and other items.

14. Constructing Bank Protection on Primary State Highway No. 9 in Jefferson County, DOSEWALLIPS RIVER REVETMENT, a State Project, involving about 5,440 cubic yards of Loose Riprap and other items.

BITUMINOUS PAVING
BIDS CLOSE 10 A.M., JUNE 3
Portland, Oregon
NOTICE TO CONTRACTORS

DEPARTMENT OF THE INTERIOR, NATIONAL PARK SERVICE, May 16, 1958. SEALED BIDS will be received at the office of the Bureau of Public Roads, 760 Morgan Building, Portland, Oregon, mail address P.O. Box 3900, Portland, Oregon, until 10 a.m. on June 3, 1958, for furnishing the material and performing the work for constructing 13.689 miles bituminous paving and other improvements, Mt. Rainier National Park Project 5-A5, B3, C3, D6, East Side Road, Pierce and Lewis Counties, Washington, involving 10 acres Clearing and grubbing; 21,687 cu. yds. Excavation; 4,470 tons Special subbase; 46,473 tons Crushed aggregate base; 348 tons Asphalt; 2,223 tons Asphalt cement; 324 lin. ft. Culvert pipe; 31,170 tons Plant mixture; 530 lin. ft. Concrete Curb and gutters; 1,200 sq. yds. Bituminous sidewalk, and other small items of work. The attention of prospective bidders is directed to the special clause "United States-Flag Vessel Provisions" included in the Special Provisions for this project. Plans, specifications and proposals may be obtained at the office of the Bureau of Public Roads, 760 Morgan Building, Portland, Oregon. B. M. FRENCH, Regional Engineer.
6146—5-17, 24

STATE HIGHWAY PROJECTS
BIDS CLOSE 9 A.M., MAY 22
Helena, Montana
NOTICE TO CONTRACTORS

Sealed bids on the following projects will be received by the Montana Highway Commission at the offices of said Commission in the City of Helena until 9:00 a.m. on May 22, 1958. The proposals will be publicly opened and read immediately thereafter. **YOUR ATTENTION IS DIRECTED TO THE 9:00 A.M. HOUR SET FOR THE OPENING OF BIDS IN ROOM 151 OF THE STATE HIGHWAY DEPARTMENT BUILDING.**

1. IN 90-9(5)498 U2 & IN 90-9(7)508 U2—Construction of one 209.5' concrete overpass, two 118.0' concrete overpasses, two 133.0' concrete overpasses, one 164.5' concrete bridge and one 153.0' concrete bridge on the Crow Agency-Hardin Road in Big Horn County, involving about 653 cu. yds. excavation; 1,051 lin. ft. steel bridge rail; all lump sum maintaining traffic on IN 90-9(7)508; 9,017 lin. ft. treated timber piles; 1,022.92 lin. ft. steel beam bridge rail; 276,885 lbs. reinforcing steel; 2,193 cu. yds. concrete; 1,400 cu. yds. structure excavation; 638 lin. ft. driving steel bearing piles; 23,760 lbs. furnishing steel bearing piles; 5,605 lin. ft. precast prestressed concrete beam; all lump sum treated timber test piles and 8,283 lin. ft. drive treated timber piles. Project to be completed by July 31, 1959.

2. IN 90-9(6)510—Plant-mix surfacing and seal-coat oiling 6.557 miles on the Wyoming Line-Crow Agency Road in Big Horn County, involving about 1,951 tons crushed aggregate; 34,404 tons plant mix; all lump sum furnish and maintain water plant; 78 units rolling; 1,892.37 tons asphalt cement; 265.79 tons cutback asphalt and 59 hours watering. Project to be completed in 100 calendar days.

3. DF 191(18)—Plant-mix surfacing and seal-coat oiling 7.488 miles on the Pablo-Kalispell Road in Lake County, involving about 1,874 tons crushed aggregate; 6 units rolling; 45 tons cutback asphalt; 178.58 tons emulsified asphalt; 1,304.96 tons penetration asphalt cement; 23,771 tons plant mix; 28 hours watering; 2,800 lin. ft. beam guard rail; and other items. Project to be completed in 130 calendar days.

4. F 238(7)—Grade, aggregate surfacing, plant-mix surfacing, seal-coat oiling, and drain 10.454 miles on the Wolf Creek-Augusta Road in Lewis and Clark County, involving about 803,642 cu. yds. excavation; 861 cu. yds. aggregate backfill; 76,816 mi. yds. overhaul; 214,875 tons crushed aggregate; 28,777 tons plant mix; 16,253 M gals. watering; 2,587 units rolling; 1,581.78 tons asphalt cement; 270.07 tons cutback asphalt; 224.62 tons emulsified asphalt; 278 lin. ft. corrugated metal pipe; 312 lin. ft. structural plate pipe; 2,898 lin. ft. reinforced concrete pipe; 392 lin. ft. relay pipe culverts; all lump sum clearing and grubbing; 70 hours watering; all lump sum remove existing structure; and other items. Project to be completed in 300 calendar days.

5. DF-DFG 384(4)—Grade, aggregate surfacing, bituminous surface treatment, and drain 1.244 miles on the Forsyth-Northwest Road in Rosebud County, involving about 222,345 cu. yds. excavation; 1,740 cu. yds. riprap; 40,357 mi. yds. overhaul; 16,789 tons crushed aggregate; 25,574 tons uncrushed aggregate; 4,161 M gals. watering; 652 units rolling; 117.8 tons cutback asphalt; 1,066 lin. ft. reinforced concrete pipe; 29 hours watering; 1,862.5 lin. ft. steel beam guard rail; and other items. Project to be completed in 150 calendar days.

6. DS 35(8)—Grade, aggregate surface and drain 3.302 miles and surfacing an additional 7.500 miles on the Jackson-Dillon Road in Beaverhead County, involving about 74,480 cu. yds. excavation; 100 cu. yds. aggregate backfill; 1,974 mi. yds. overhaul; 69,387 tons crushed aggregate; 2,484 M gals. watering; 423 units rolling; 18 lin. ft. corrugated metal pipe; 792 lin. ft. reinforced concrete pipe; 33 lin. ft. relay pipe culverts; and other items. Project to be completed in 120 calendar days.

7. DS 91(4)—Grade, aggregate surfacing, bituminous surface treatment, and drain 3.443 miles on the Eden-Great Falls Road in Cascade County, involving about 188,498 cu. yds. excavation; 189 cu. yds. aggregate backfill; 4,787 mi. yds. overhaul; 40,970 tons crushed aggregate; 3,610 M gals. watering; 594 units rolling; 82.56 tons cutback asphalt; 82.56 tons emulsified asphalt; 60 lin. ft. corrugated metal pipe; 68 lin. ft. structural plate pipe; 1,338 lin. ft. reinforced concrete pipe; 36 lin. ft. relay pipe culverts; 42 hours watering; and other items. Project to be completed in 90 calendar days.

8. S 128(3)—Grade, aggregate surfacing, and drain 7.415 miles on the Wibaux-Sidney Road in Richland County, involving about 709,573 cu. yds. excavation; 141 cu. yds. aggregate backfill; 11,669 mi. yds. overhaul; 59,084 tons crushed aggregate; 11,590 M gals. watering; 234 units rolling; 2,436 lin. ft. corrugated metal pipe; 100 lin. ft. relay pipe culverts; all lump sum remove existing structure; and other items. Project to be completed in 200 calendar days.

9. S-253(1)—Grade, aggregate surfacing, bituminous surface treatment, and drain 3.567 miles on the Southeast of Toston-Northerly Road in Broadwater County, involving about 26,134 cu. yds. excavation; 100 cu. yds. aggregate backfill; 22,358 mi. yds. overhaul; 33,942 tons crushed aggregate; 27,393 tons uncrushed aggregate; 1,578 M gals. watering; 356 units rolling; 88.69 tons cutback asphalt; 88.69 tons emulsified asphalt; 1,152 lin. ft. corrugated metal pipe; 345 lin. ft. relay pipe culverts; 45 hours watering; and other items. Project to be completed in 90 calendar days.

10. DS 356(6)—Plant-mix surfacing and seal-coat oiling 11.69 miles on the Winnett-Arrow Road in Musselshell and Petroleum Counties, involving about 1,907 tons crushed aggregate; 22,614 tons plant mix; 778 units rolling; [illegible] tons emulsified asphalt; 1,243.81 tons asphalt cement; 57 hours watering; and other items. Project to be completed in 90 calendar days.

The above-listed quantities are approximate only.

All bid proposals shall be accompanied by a certified or cashier's check, cash, postal money order, bank money order, or bid bond in the amount of at least 5% of the bid. Should the successful bidder fail to enter into his contract and furnish a satisfactory performance bond within the time stated in this proposal, the bid deposit shall be forfeited to the State Highway Commission of Montana.

Prequalification of bidders at least 72 hours prior to the opening of the bids is required.

Plans, specifications, forms of contract and bond, proposal blanks, and full instructions are on file for examination and may be obtained at the offices of the State Highway Commission, Helena, Montana. Plans and specifications for all Federal-aid projects are also on file and may be examined in the offices of the Bureau of Public Roads, Missoula.

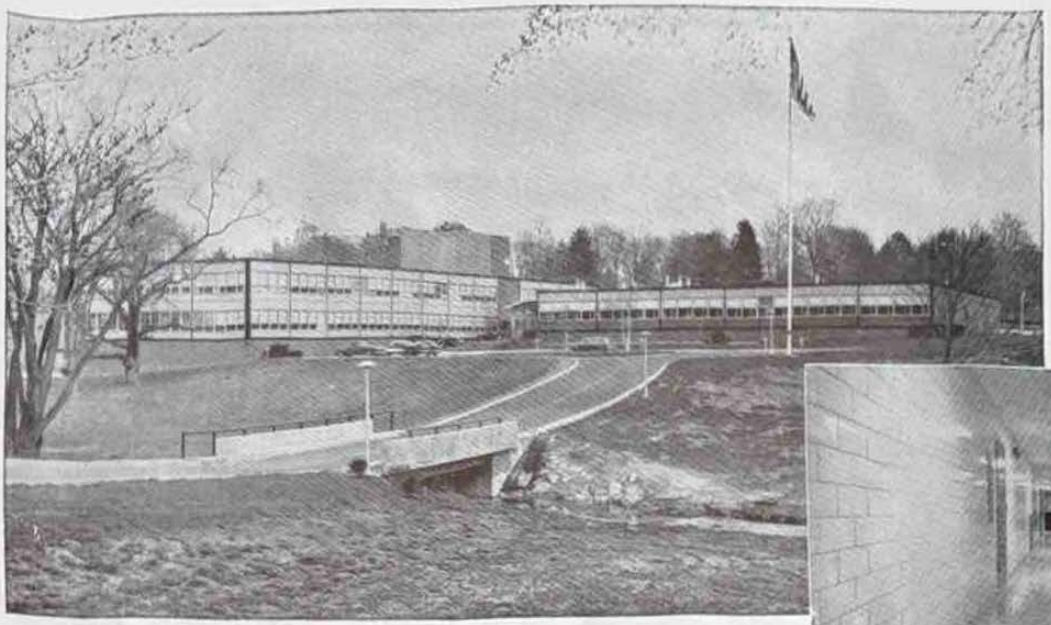
Works of Wonder

Wonder Bread Builds For Tomorrow With Erection of Distinctive Office-Research Laboratories



WONDER-LAND of Continental Baking Company is situated on 25-acre tract near New York City. Note below the gleaming walls which add clean, efficient look to product development laboratories.

● Continental Baking Company's leadership finds new expression in the streamlined construction of its million dollar headquarters and research laboratories in Rye, New York.

This nerve center of the nation's leading baker is as fresh in appearance and wholesomely-modern as the products it sends to market.

Essential to the attractiveness, economy, and quality of the structures was Lone Star Masonry Cement, used throughout all of the masonry work. It combines all the properties needed to make outstanding performance a certainty, and to satisfy Owner, Architect, and Mason:

1. High water retention, assuring excellent workability, plasticity, bond.
2. Adequate strength.
3. A ready-to-use masonry cement that means one less material to handle on the job.
4. Low shrinkage.

For the highest standards of dependable performance . . . for wonderful quality masonry construction that lasts and lasts . . . use Lone Star Masonry Cement—every time!

The inherent water repellency and low absorption of Lone Star Masonry Cement make the addition of any waterproofing material unnecessary.

BUILDING PERMITS

May chalks up $27 million gain

Building permit volume in the five western states for May picked up a good $27 million over April, thanks to substantial increases in California and Washington. Oregon, Montana and Idaho, reported decreases.

ANALYSIS OF TYPICAL AREAS – MAY
(Number of permits is followed by total dollar volume)

	Dwelling		Commercial & Industrial		Public	
Portland	66	$ 4,268,850	26	$1,415,895	3	$ 284,165
King County	644	6,750,910	48	332,950	9	1,948,000
Seattle	601	4,183,237	259	2,701,110	5	1,761,000
Tacoma	144	660,710	35	386,920	1	35,000
Los Angeles County	1776	13,947,611	268	2,863,083	22	729,850
Orange County	221	3,042,088	45	192,125	1	216,495
Sacramento County	730	6,585,197	102	718,952	5	83,182

Compared to a year ago the five-state volume was $7½ million higher. Again the areawide picture varied, with Oregon, Washington and Montana recording increases and California and Idaho below May 1957. Although the California figure was high, aided by the best May on record for Los Angeles ($64,256,539), it was still $1¾ million below last year.

The dollar volume for the first five months has climbed to $1,072,777,100, an increase of $33¾ million over the same period in 1957. Oregon, Washington and Idaho are running ahead of last year; California and Montana are slightly behind. Five-month tabulation by states:

	Jan.-May 1958	Jan.-May 1957
Calif.	$850,114,453	$855,073,588
Ore.	76,295,117	49,726,082
Wash.	126,646,200	113,963,424
Mont.	9,565,872	11,027,662
Idaho	10,155,458	9,161,315

Building Permit Totals for 116 Western Agencies for May

CALIFORNIA	May 1958	Apr. 1958	May 1957
Alameda County	$ 1,480,350	$ 1,401,750	$ 3,232,000
Anaheim	3,399,211	5,132,236	2,597,407
Bakersfield	556,085	786,488	309,571
Burbank	760,927	1,231,742	1,575,262
Contra Costa County	3,422,102	2,536,542	3,567,798
Fresno	2,594,941	2,469,561	5,872,435
Fullerton	3,522,441	730,737	848,289
Glendale	2,252,490	1,902,669	3,148,692
Inglewood	1,820,256	756,127	931,292
Long Beach	6,021,350	5,854,520	3,509,875

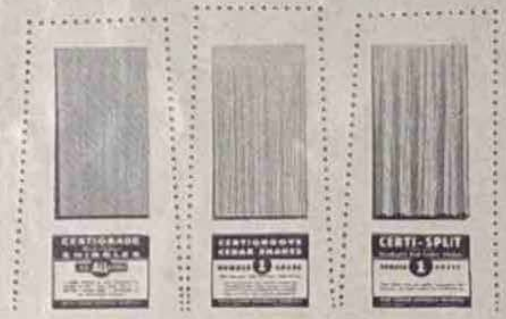
The qualities of cedar shingle roofing transcend passing fancy. Custom home designs—*of any period*—are characterized by expansive roof areas, distinctive roof textures, important roof pitches. The versatility and integrity of natural materials—notably cedar shingles for exteriors—afford the designer limitless scope, infinite expression.

Shingles of Western Red Cedar have that vital *third dimension* . . . the thick butt-lines that catch the sun and create shadow accents of dramatic depth. Only cedar shingles offer the natural graining and rich texture of the genuine. Because only cedar *is* the genuine.

When you think of roof design . . . think *big* . . . think *bold* . . . *and you will think of cedar!*

RED CEDAR SHINGLE BUREAU

5510 White Building, Seattle 1, Washington
550 Burrard Street, Vancouver 1, B. C.



THE BUILDING MONTH: BRIEFS

• Plans for a U. S. consular building in Japan will be completed by San Francisco architects George T. Rockrise, Harvey Parke Clark and John G. Beuttler. The structure will "express sympathy with traditional Japanese architecture" and will be located in Fukuoka in southern Japan. Typhoon- and earthquake-proof, the building will use local materials and Japanese artisans, with gardens designed by San Francisco landscape architect Lawrence Halprin.

• On-campus construction of a neuro-psychiatric hospital at UCLA has won the approval of the board of regents. The proposed $9 million project, scheduled to begin in August, has been referred to as a "dangerous experiment" by those who oppose its location on the campus.

• Copies of a report entitled "Disposal of Waste Materials Incidental to the Clearance and Development of Land for Subdivision or Building Purposes" may be obtained by writing to the Bay Area Pollution Control District, 1480 Mission St., San Francisco 1, Calif. It was prepared as a means of assisting the community in transition problems following enactment of a regulation controlling (and largely eliminating) open burning in the six counties of the district.

• A three-day celebration in Seattle last month commemorated the establishment of the College of Architecture and Urban Planning at the University of Washington (July 1957). Los Angeles architect Welton Becket, an alumnus, was principal speaker at the student awards banquet.

• A pilgrimage and exhibits of the work of Bernard Ralph Maybeck were held May 24-25 in San Francisco, Berkeley and Marin County in the memory of an architect "who inspired the architectural developments of an entire region." Maybeck died in October 1957 at the age of 95.

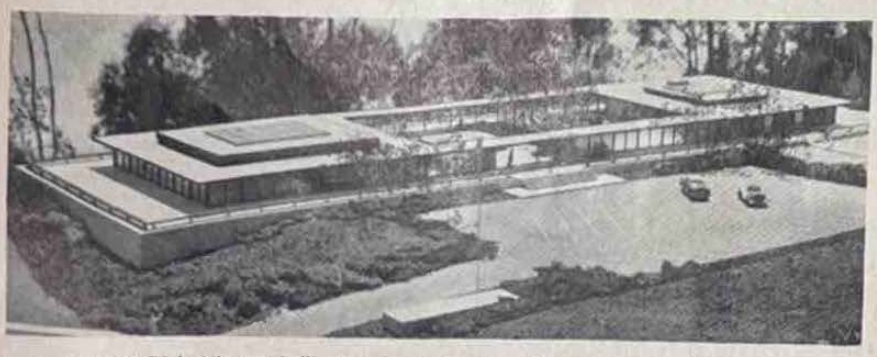
• General Electric is introducing its company's "Operation Upturn" program in the West to key managers in Los Angeles, San Francisco, Portland and Seattle. The program, says C. C. Walker, western region vice president, "is to create jobs and build sales in 1958 by bringing extra values and renewed confidences to customers."

California firm designs Canadian Consulate

The Canadian Consulate, latest to be sponsored by the State Department's Office of Foreign Buildings, has been designed by Thornton Ladd & Associates of Pasadena as a pavilion-like office building and residence. The project is linked together by a series of landscaped gardens and raised above the level of the site on an elevated "podium" of off-white pebbled concrete.

The buildings themselves, rectangular in form, alternate steel columns with panels of clear and translucent glass. Both structures and the gardens are surmounted by a single roofed portico. White, black and burnt apricot are the prevailing colors and the buildings have been oriented to take advantage of the view of the American Falls on one side and Queen Victoria Park on the other.

Ladd, who at 34 is the youngest architect selected by the State Department to design a foreign building, says the consulate represents an attempt "to infuse the spirit of California hospitality into the monumental architecture of our government. Without compromising the dignity of a great power we have tried to convey the warmth of a good neighbor."



U. S. CONSULATE in Niagara Falls, Canada, designed by Thornton Ladd & Associates.

• Three Los Angeles city school bond proposals totaling $158 million and covering elementary, high school and junior college facilities won approval by voters earlier this month. The jail bond issue amounting to $30.3 million went down to defeat, while another, authorizing $12.4 million for new police stations throughout the city, was barely under the needed two-thirds majority as PA&B went to press.

• Portland voters in the May primary election approved spending more than $9 million for urban renewal, fire system improvements and school construction. Defeated was a measure to move the strife-torn Exposition-Recreation Center from the Broadway Steel Bridge site to the Delta Park site. Considerable money has already been spent on preliminary work and bids will be called soon on construction of the center.

• In a special report the Seattle-King County Municipal League has urged that an outside planning consultant be employed to review the organization, structure, practices and procedures of the King County Planning Commission and its staff. League chairman John D. Ehrlichman says that an investigation uncovered "a veritable rat's nest" in the planning agency. The report was triggered by the resignation of John J. Swan as county planning director. The Washington State Chapter, AIA, has suggested that the 12 commissioners do likewise.

• The Association of Women in Architecture will hold its national convention June 30-July 2 in Los Angeles at the Town House Hotel, with industrial designer Greta Grossman of Beverly Hills as chairman. National officers assisting her include architects Jean Driskel, Olive Chadeayne, Lucille Raport and Dorothy Harrison from the Los Angeles area.

• Steel production probably will get back on the upgrade in the latter part of this year and gain increased momentum during 1959, Max D. Howell, executive vice president of the American Iron and Steel Institute, predicted at the National Junior Achievement banquet last month.

• The U. S. nuclear reactor safety exhibit at the Second International Conference on Peaceful Uses of Atomic Energy in Geneva September 1-13 will be designed and operated by Holmes & Narver, Inc., Los Angeles engineering and construction firm.

ESCO HELPS YOU OPEN NEW DESIGN FRONTIERS

WITH SPECIAL STAINLESS STEEL SHAPES AND FINISHES

Design opportunities with stainless steel in a wide variety of stock shapes and finishes are limited only by the imagination. For example, skins for office buildings, railings, ductwork and trim in stainless steel can accomplish striking, as well as lasting decorative or structural design achievements.

Stainless sheet and plate are available in a complete range of surface finishes. Stainless pipe and tubing are available in many unusual shapes as well as standard shapes in all sizes. Stainless bar, wire, fittings and fastenings further expand the designer's freedom. Plastic extrusions are also available.

Increase your freedom of design. Ask your nearest ESCO representative for available literature, specifications and samples.

First Honor Awards

1. Elementary School, Sonoma, Calif.: Mario J. Ciampi, architect.
2. Westmoor High School, Daly City, Calif.: Mario J. Ciampi, architect.
3. Robinson's Specialty Shop, Palm Spring, Calif. (PA&S, March '58): Pereira & Luckman, architects.
4. Pharmaceutical Plant Headquarters for The Stuart Co., Pasadena, Calif.: Edward D. Stone, architect.
5. Home Office Building for Connecticut General Life Insurance Co., Bloomfield, Conn.: Skidmore, Owings & Merrill, architects.

In presenting four First Honor Awards and five Awards of Merit to West Coast buildings out of a total of 14 winners in the American Institute of Architects' 1958 competition for outstanding architecture, the jury reported that it regretted the uneven representation from the different sections of the country. Eight of the projects are located in California and one in Washington. Remaining five are found in Louisiana (two), Florida, New York and Brussels.

San Francisco architect Mario J. Ciampi heads this year's list, winning two top honors with schools in the Bay area. Los Angeles architects Pereira & Luckman have also received two citations—a First Honor Award and an Award of Merit.

Prof. Jean Labatut, director of graduate studies at Princeton University's School of Architecture, was chairman of the all-architect jury: Welton Becket, Los Angeles; Igor B. Polevitzky, Miami; Frederick James MacKie, Houston; and John Gaw Meem, Santa Fe. The jurors showed concern because there were not more examples of buildings, parking areas and landscape treatment expressed as an integral part of architecture in the 312 submissions. To be eligible, work must have been completed since January 1, 1953, by an registered architect practicing professionally in the U.S.

Certificates will be presented to the architects and owners during the AIA's annual convention to be held July 7-11 in Cleveland and an exhibition of the winning buildings will be shown at the Cleveland Museum of Art during that month.

The jury explained that the five First Honor Awards were given for these reasons:

- For rare and great quality of unity in the entire work from exterior space to interior space and from the ensemble to the smallest details—for unity achieved without monotony or extravagance.
- For achieving an expression of strength without heaviness and lightness without weakness, resulting in definite elegance and refinement.
- For well-controlled physical and psychological scale leading to meaning and character corresponding to the particular program.
- For achieving aesthetic quality by means of the structural elements becoming pleasing and decorative.
- For exploring further the inexhaustible field of architectural composition by showing originality and inventiveness.

cited in AIA design competition

Awards of Merit

1. Neil Lakenan Residence, Beverly Hills, Calif.: Richard Dorman & Associates, architects, and Dan Morganelli, associate architect.
2. Architect's Studio, Pasadena, Calif.: Thornton Ladd, architect.
3. Bellevue Office, Washington State Bank, Bellevue, Wash. (PA&B, Aug. '57): Mithun & Nesland, architects, and Ridenour & Cochran, associate architects.
4. Beckman/Helipot Corp. Plant, Newport Beach, Calif.: Pereira & Luckman, architects.
5. Union Service Center, Los Angeles: Smith & Williams, architects.
6. United States Pavilion, Universal and International Exposition, Brussels (PA&B, March '58): Edward D. Stone, architect.
7. Warm Mineral Springs Inn, Venice, Fla.: Victor A. Lundy, architect.
8. Cafeteria Building, Southeastern Louisiana College, Hammond, La.: Desmond & Davis, architects.
9. Immaculate Conception Church, Marrero, La.: Curtis & Davis and Associates, architects.

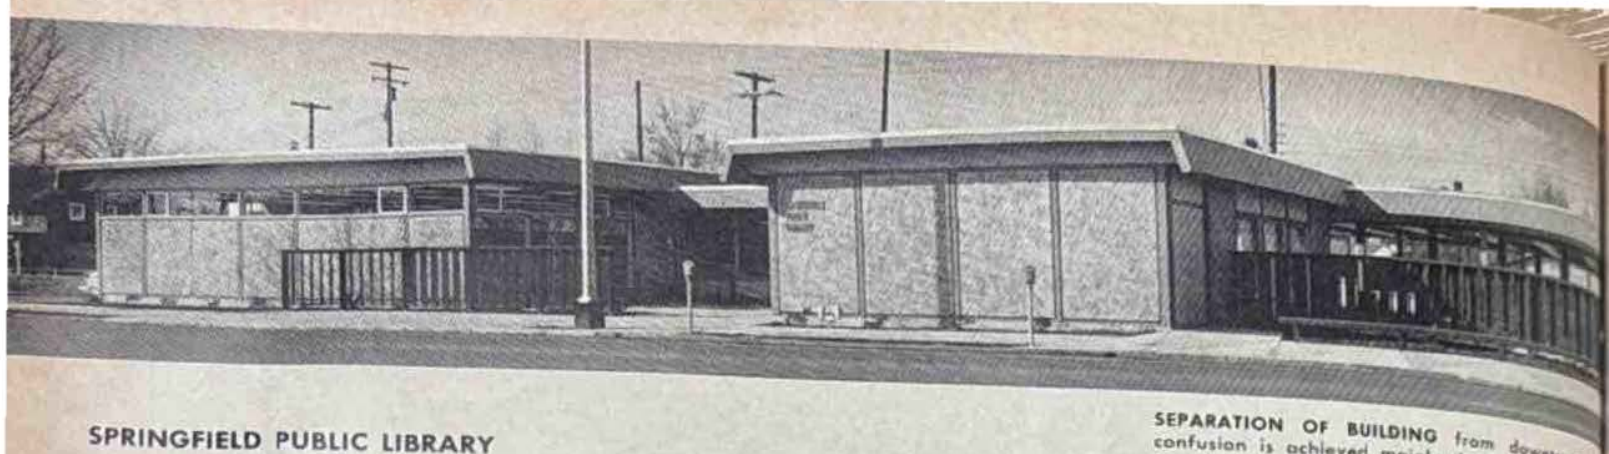
YOUEL & HUFFMAN
General Contractors



SEPARATION OF BUILDING from downtown confusion is achieved mainly through enclosed courtyards and extensive landscaping.

SPRINGFIELD PUBLIC LIBRARY

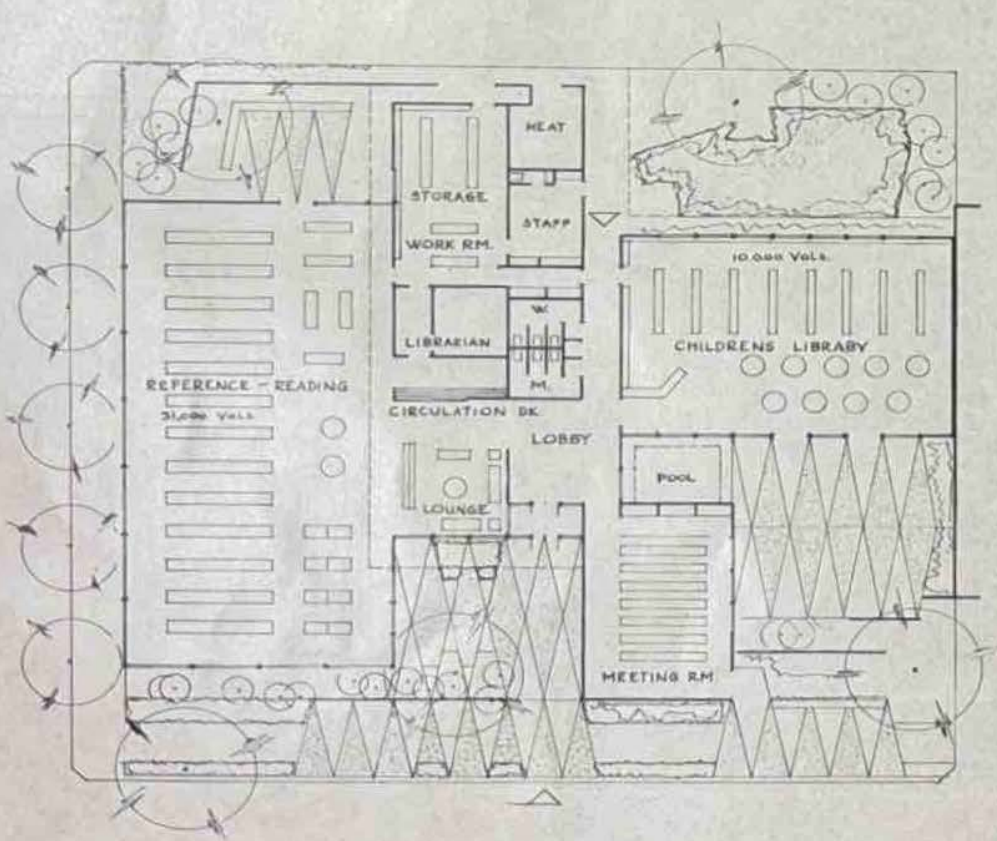
THE PROGRAM called for a site adjacent to the retail center of the city, since most of the patrons will drive to the library as part of a shopping trip. To separate the structure as much as possible from the downtown environment, the architects made extensive use of courtyards and glass, except in those elements which face the street. Another site problem, that of masking a 30x80-ft. wall of the neighboring fire station, was solved by designing a long overhang in front of the children's library, which also cuts the sun out of that room.

From the central lobby one can easily orient himself to the various segments of the library. It houses 49,310 volumes and has an initial 10,000 sq. ft., with space for expansion to 12,000 sq. ft. (This is less than the American Library Association standard, considered excessive in view of the character of the community, the size of the present book stock and the proximity of the University of Oregon library.) Seating capacity is 175: main library, 60; children's library, 40; lounge, 15; meeting room, 60.

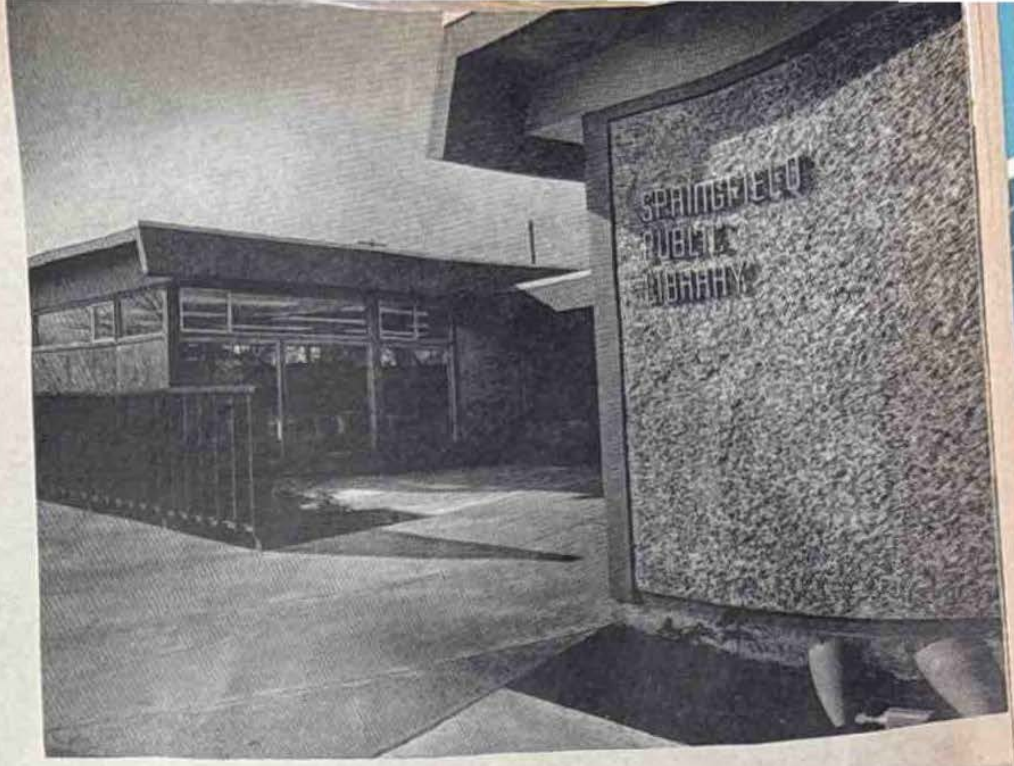
A visual highlight is the "Mother and Child" sculpture executed in Deschutes River stone by Mark Sponenburgh. The piece, which can be viewed from almost any point in the building, sits in a 4-in. pool of water into which falls one of the principal roof drains. The pleasantness of the sound of falling water—even in rainy Oregon—draws frequent comments from library users.

Constructed of exposed aggregate concrete with steel trim, the structure has steel columns supporting glued-laminated roof framing and decking, aluminum windows and doors. Interior finish for the most part is plaster. Cabinet work is either Douglas fir with birch trim or solid birch.

In commenting that circulation this spring increased more than 50% over last year, the architects explain: "A large share of credit for the project, in sound programming and in a clear explanation to the citizens, can be attributed to the progressive city administration. The mayor, city manager, city council, library board and staff consistently collaborated in the decisions which have made this building a community success—a true symbol of the Springfield spirit."



SCREEN FENCE for courtyard has battens spaced at far end for use as bicycle rack. High windows in main reading and reference room are heat-absorbing plate glass to reduce glare; lower windows provide different courtyard vista from each room.



OUTLINE SPECIFICATIONS

Structure: steel fire-protected columns supporting Douglas fir glued-laminated roof framing and decking.

Exterior Walls: exposed aggregate concrete; steel trim.

Fascia Surfacing: cement-asbestos board (Transite) sealed with metal angles and battens and enameled.

Windows: aluminum sash (Soule') with heat-absorbing glass in main reading and reference room.

Doors: aluminum (Acme).

Floor Surfacing: vinyl (Robbins); ceramic tile in toilet rooms.

Interior Finish: plaster.

Ceilings: incombustible tile (Armstrong) set in metal grid.

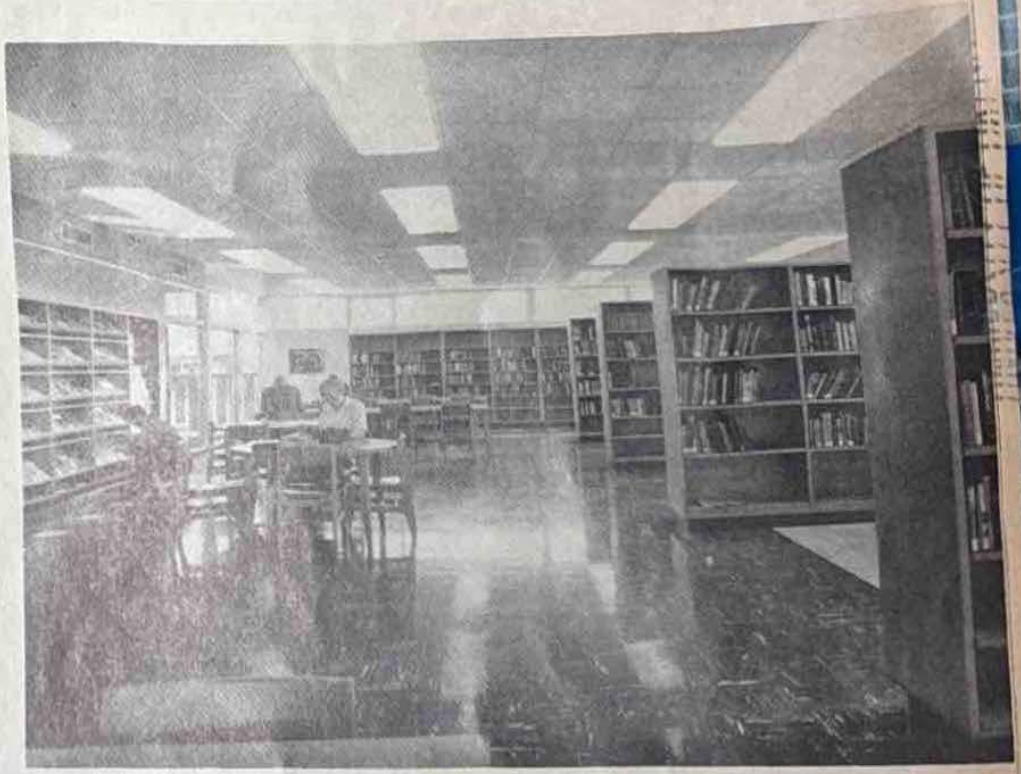
Cabinet Work: Douglas fir with birch trim; solid birch.

Heating: electrically heated hot water pumped through floor slabs and volume heater; separate heating and ventilation system for meeting room.

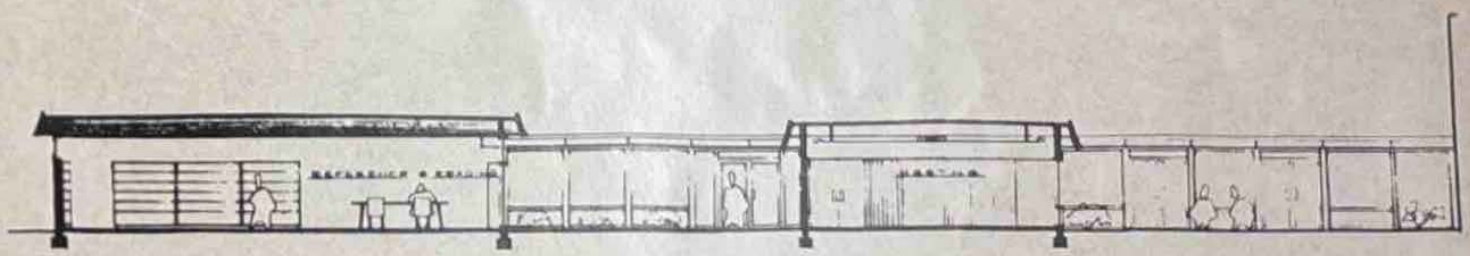
Total Area: 10,000 sq. ft.

Total Cost: $150,000, including site, landscaping, furnishings and fees.

Date of Completion: January 1958.



DRAMATIZATION of book displays is key element both in floor plan organization and in interior color work. Free-standing cabinets are now 12 ft. o.c., will be moved to 6 ft. o.c. as library expands.

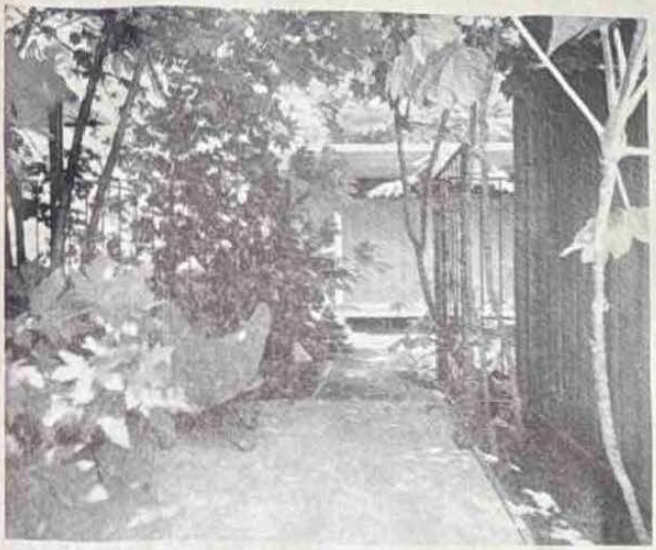


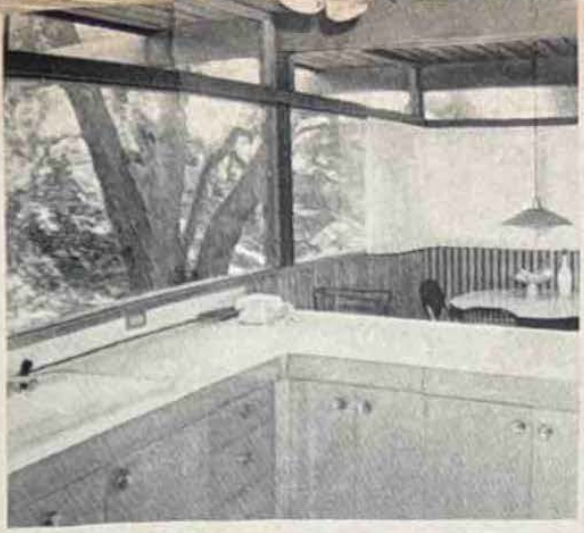
Richard Leitch Residence
Altadena, California

RICHARD LEITCH
Architect-Builder

"SUN-TRAP" PATIO (below) is sheltered from prevailing breeze, unshaded by oaks. Central courtyard (right) opens off entry via raised deck and off lanai at right. Shoji screens permit garden room to become part of terrace for summer entertaining. Boulder near center of site serves as focal point.

Margaret Stovall photos



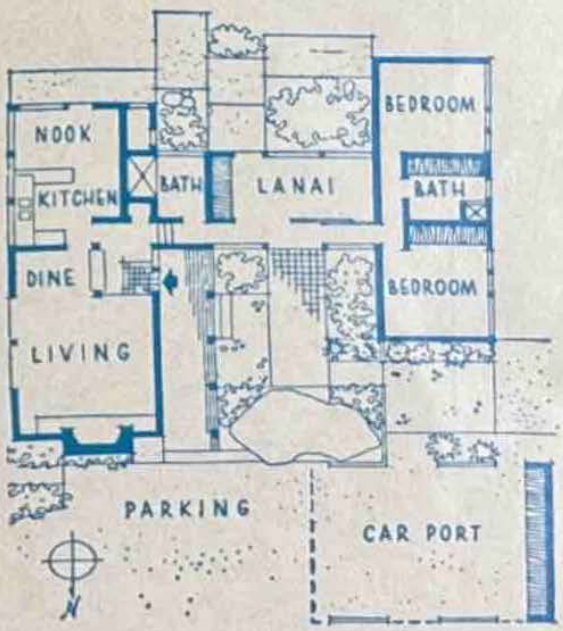


KITCHEN-BREAKFAST ROOM has white plastic surfaced countertops, natural woods, turquoise and white color accents. China cabinet in dining room acts as visual break from entry; quarry tile helps reduce maintenance.

THE ARCHITECT has translated a steeply sloping site into an award-winning garden house for his family of three. Profusely covered with large oak trees and studded with river-washed boulders, the 90x144-ft. lot drops 15 ft. below the street to the living room terrace level, then slopes another 3 ft. to the rear patio level. Living-dining room and kitchen-breakfast room are on the upper level relating to the east patio. Lanai-den, stepped down 20 in., opens north to the sunny entrance courtyard and to the south to a shaded patio. Master bedroom and the son's room open to the west to the pool. Rear bath, which is also off the pool, doubles as a dressing room.

The house bespeaks informality and is simply constructed entirely of wood—redwood exterior, redwood and plywood interior—on a 6-ft. module laminated post and beam system with bolted connections, t&g roof decking and perimeter-heated slab floors. Wood siding is stained gray-green; beams, posts and trim are a darker value of the same color.

Total integration of house and garden



OUTLINE SPECIFICATIONS

Structure: 6-ft. module laminated post and beam with bolted connections; t&g roof decking.
Exterior Finish: stained redwood.
Roof Surfacing: composition with fiberglass insulation.
Windows: stopped in wood.
Doors: wood french.
Floor Surfacing: asphalt tile and quarry tile (Gladding, McBean); carpeting.
Interior Finish: redwood; Douglas fir plywood.
Ceilings: exposed t&g decking.
Heating: perimeter (Payne furnace) in slab floors.
Total Area: 1,400 sq. ft.
Cost per Square foot: $12.
Date of Completion: 1956.

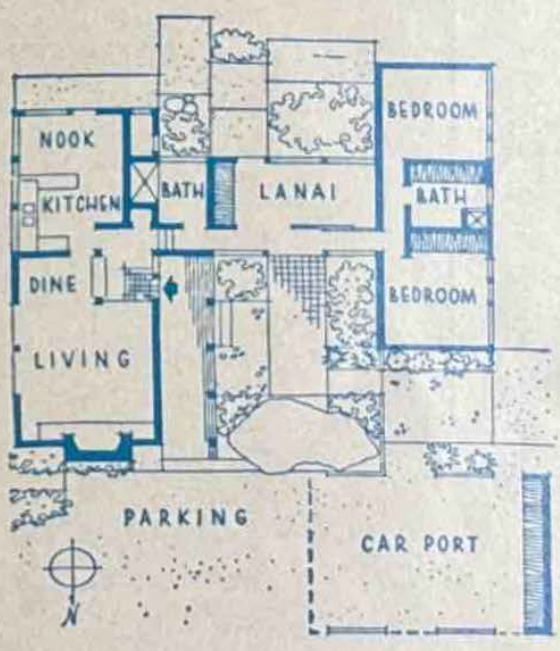
Lanai-den, stepped down 20 in., opens north to the sunny entrance courtyard and to the south to a shaded patio. Master bedroom and the son's room open to the west to the pool. Rear bath, which is also off the pool, doubles as a dressing room.

The house bespeaks informality and is simply constructed entirely of wood—redwood exterior, redwood and plywood interior—on a 6-ft. module laminated post and beam system with bolted connections, t&g roof decking and perimeter-heated slab floors. Wood siding is stained gray-green; beams, posts and trim are a darker value of the same color.

Total integration of house and garden



OUTLINE SPECIFICATIONS

Structure: 6-ft. module laminated post and beam with bolted connections; t&g roof decking.
Exterior Finish: stained redwood.
Roof Surfacing: composition with fiberglass insulation.
Windows: stopped in wood.
Doors: wood french.
Floor Surfacing: asphalt tile and quarry tile (Gladding, McBean); carpeting.
Interior Finish: redwood; Douglas fir plywood.
Ceilings: exposed t&g decking.
Heating: perimeter (Payne furnace) in slab floors.
Total Area: 1,400 sq. ft.
Cost per Square foot: $12.
Date of Completion: 1956.

LANDSCAPING will help to screen surrounding industrial yard; plum trees will provide shade.

Low-cost office structure built in 45 days

Contractors' Building
Oakland, California

•

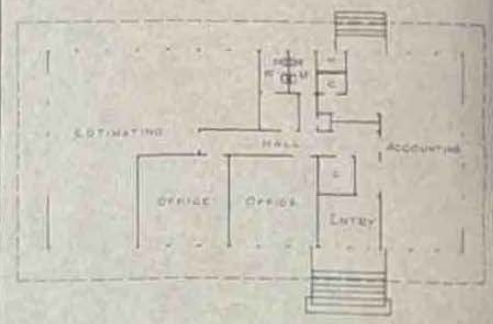
WURSTER, BERNARDI & EMMONS
Architects

MacDONALD, YOUNG & NELSON, INC.
General Contractors

WHEN THE CLIENT decided to move its headquarters from downtown San Francisco into an easy-to-park area, the location was an obvious choice: the five-acre site of the corporation yard which the firm has maintained for some time in the industrial section of Oakland. The building was designed to be expandable and was completed in less than two months.

The contractor-owner had on hand large timbers and plywood panels which allowed the structure to be built on 12x12 girders above concrete piers, facilitating easy future moving. Exterior is covered with panels of plywood or glass, all set in frames made up of one uniform shape, with redwood stops. Ceiling joists extend out to form overhangs and are fanned at the corners, contributing to the pavilion-like appearance of the building. Panels and soffits are tan; all trim is a dark green-black; doors are a bright red. Finished with gypsum wallboard and acoustical tile ceilings, the interior is arranged to provide maximum flexibility of space, with hallway areas virtually eliminated.

AMPLE PARKING SPACE is provided for all personnel of firm.



OUTLINE SPECIFICATIONS

Structure: frame, built on 12x12 girders above concrete piers; plywood roof.
Exterior Walls: plywood or glass panels, set in frames with redwood stops.
Roof Surfacing: tar and gravel.
Doors: wood slab.
Interior Finish: gypsum wallboard (Sheetrock)—United States Gypsum Co.
Ceilings: acoustical tile.
Floor Surfacing: asphalt tile.
Heating: gas fired, warm air.
Total Area: 2,300 sq. ft.
Date of Completion: February 1958.

OUTLINE SPECIFICATIONS

Structure: steel posts on reinforced concrete footings supporting glued-laminated beams 16 ft. o.c.; stressed-skin plywood panel roof acting as ceiling.

Exterior Walls: aluminum-framed panels of asbestos board or glass; concrete block; norman brick.

Roof Surfacing: built-up.

Windows: aluminum (Tecler).

Doors: **exterior:** aluminum (Tecler); **interior:** birch and walnut.

Floor Finish: vinyl asbestos over concrete slab in offices, display rooms.

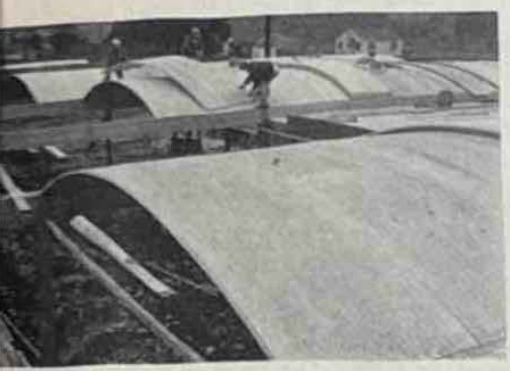
Interior Walls: removable, drywall partitions; walnut plywood paneling.

Heating: gas fired, forced warm air ducts under slab in display and office areas; unit heaters in warehouse.

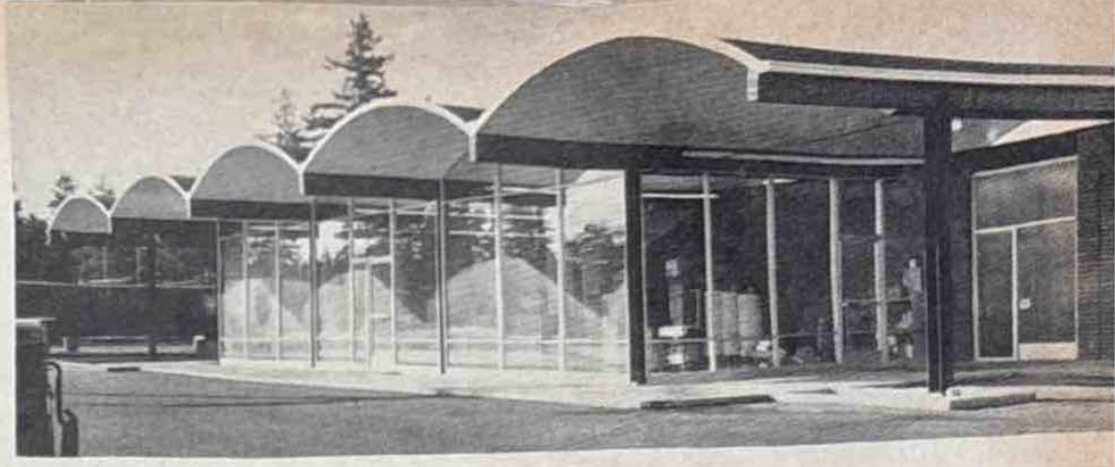
Total Area: 7,870 sq. ft.

Cost per Square Foot: $8.10.

Date of Completion: January 1958.



ARCHED SECTION is made up of 55 stressed-skin panels, each spanning 16 ft., supported on glued-laminated beams and wide flange steel posts, on reinforced concrete footings.



FIVE-BAY VAULTED ROOF and glass are used for entrance and display area; curtain walls of aluminum-framed panels of asbestos board or glass for office portions; concrete block and norman brick for rest of building.

Redi-Gas Co. Building
Tacoma, Washington

•

SWEDBERG & ANDERSON
Architects

PURVIS CONSTRUCTION CO.
General Contractor

Arched panels dramatize small structure

REQUIREMENTS for a headquarters building to house a client who markets gas, appliances and equipment and has subsidiaries throughout southwestern Washington were these: an attractive display room and retail sales area, warehouse space for wholesale operations, general office space, purchasing and dispatcher's offices with truck loading and service facilities—within a tight budget and building schedule. The architect held costs to about $8 per square foot by specifying a simplified post and beam construction method and dual-purpose stressed-skin roof panels to provide both ceiling and decking in one component; and he gave distinction to the entrance and display area by employing a multiple-arch roof section.

Each flat panel (Panelbilt Systems, Inc., is fabricator) consists of 2x4 lumber framing around the perimeter, with sheets of exterior fir plywood glued to it to form top and bottom skins. Two-by-four stiffeners within the panel are 16 in. o.c. Top skins act as roof decking; the sanded surface of the bottom skins as the finished ceiling. Fiberglass insulation is built into the panel, whose edges are formed for t&g joining. Each vaulted section is composed of 11 4-ft. wide arched panels, similar in construction to the flat ones, but not as thick. Less than three days' labor was required for the entire installation, resulting in a finished deck ready for application of built-up roofing.

Interior walls are removable, drywall partitions with walnut plywood paneling in the reception and conference rooms and manager's office. Troweled-in dye and scoring add interest to the vinyl asbestos tile which covers the concrete slab floors.

FISHERMAN'S WHARF is site for this 1,420-sq. ft. restaurant. Steel beams spanning 40 ft. open space permit unlimited view for 185 customers in three-tiered dining area and in lower

On the waterfront

FRANCISCAN RESTAURANT, SAN FRANCISCO: To take full advantage of a sweeping view of the Bay, bridge and fishing boats, the architect specified huge angled expanses of glass and raised the floor level to second floor height. Thus the brunt of stress was placed on two relatively narrow side walls, which, like the roof and floors, are covered with fir plywood. Designed with most of its steelwork exposed, the structure rests on an 8-in. concrete mat which is seated above the water on new piling. A floating stairway, fabricated by welding channels and plate, connects the glass-enclosed entrance on the ground flo to the upper level. Redwood plankin accents both interior and exterior. Th restaurant cost $250,000, comple with fixtures and equipment. Arch tect: Hewitt C. Wells; structural en gineers: Gould & Degenkolb; gener contractor: Charles O. Jones Co.

In a tract development

BUILDER HOUSE, ANAHEIM, CALIF.: As a starting place for a 400-home development (Sherwood Forest), it was decided that three basic plans would meet the needs of prospective buyers, but that such an arrangement would be acceptabl only if every possible advantage wer taken of variety to avoid the usua "tract look." To achieve this end, a number of variations were used:

- One-half of the houses have con crete slab floors; the other half, wood
- All plans have alternate garage locations, many extending the visual size of the house.
- Different roof pitches and roof materials were applied to the basic plans.
- Both flat and sloping ceilings were used.
- Three types of masonry units were used in fireplaces.
- Careful site planning was com bined with variation in front setbacks.

A large family room combined with breakfast bar is separated from the living room by the kitchen, which works equally well with either area. A two-terrace living room—one with shade, one with sun—doubles the out door living possibilities. Architects: Smith & Williams; builder: George D. Buccola.

Julius Shulman

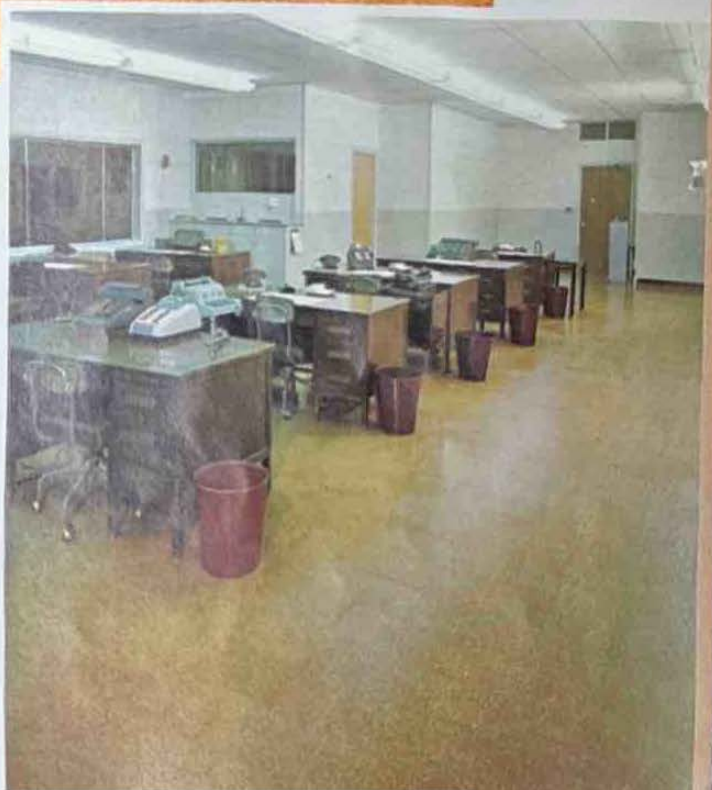
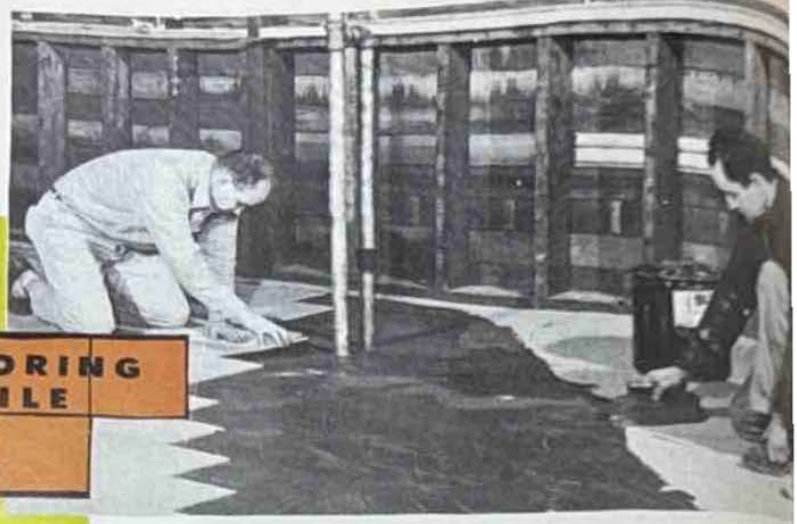
Luxurious . . . conforms to all decor . . . Par-TILE's rich color and texture compliment any decor. Now being used in homes, hospitals, churches, schools, hotels, stores, offices, institutions and commercial buildings of many types where long wear, comfort under foot and ease of maintenance are important.



Par-TILE FLOORING TILE OF DILLARD, OREGON



It took four men only two days to lay over 9,000 square feet of Par-TILE in this modern dental clinic.

EASY TO INSTALL

Nothing new to learn . . . Par-TILE flooring tile is installed in the same easy manner as any other tile . . . You simply lay Par-TILE over a prescribed mastic. Easy to work with average tools. Can be installed over on grade or suspended concrete or wood sub-floors as well as other normal floors.

Par-TILE is guaranteed to be free from defect in material and workmanship. Scientifically manufactured to meet our specifications.

Par-TILE is available in varied thicknesses, from one-quarter inch to one inch. Other thicknesses available for special industrial uses, engineered to specifications.

EASY TO MAINTAIN

Par-TILE, a miracle of modern science, gives both luxurious beauty and lifetime durability to any floor . . . whether in your party-room, living room, kitchen or commercial building. Satisfaction guaranteed. Easy to cleanse and keep clean with ordinary waxing and polishing and occasional damp mopping.

The tough surface of Par-TILE resists denting, marring or scratching . . . takes a high gloss wax finish.

Par-TILE is available in handsome pre-finished lustre or can be obtained unfinished upon order.

Par-TILE's exclusive Flexo GRID SCORING

Flexo-grid scoring gives Par-TILE the flexibility to take in uneven sub-flooring. Recommended for concrete with some evenness. Exclusive Flexo-grid scoring available only with Par-TILE (application for patent being presented).

Another plus: Flexo-grid scoring creates multiple bonding surfaces, affording superior adhesive charcteristics. Par-TILE available with plain back for work on level surfaces.

How to plan for operatorless elevator service

by CHARLES W. LERCH*

THE OPERATORLESS ELEVATOR —a wonderful device for those who push the button and ride—offers new excitement and new challenges to vertical transportation problems facing the architect. Electronic and other improvements in elevators can contribute mightily to building prestige and earning power, in addition to providing safe, fast travel for passengers.

The elevator can also do a lot for the architect if he will permit it to become a part of his early planning.

Operatorless service is more costly to buy and to install. It is more complex in operation. Mistakes in planning are more serious. These may come under the general headings of too many or too few elevators, incorrect arrangement of elevators; an elevator plant unsuited to the needs of its building.

Operatorless service alone does not guarantee perfect vertical transportation, any more than the automatic transmission on a car will end crowded traffic conditions. Operatorless elevator service is winning success in almost all types of multistory buildings; even in large hotels and hospitals, where it was long believed to be "out of the question."

The reasons are improved service and operational savings. The greater cost of the installation is more than offset by reduced (or eliminated) operators' wages and related costs. These savings range from $4,000 to $7,000 per year per car and they are enough to pay for the cost of new elevators in periods ranging from 10 to 20 years. In addition, operatorless elevator service gives your building essential advantages in prestige and profit potential.

To my knowledge, all new multistory office buildings now planned or under construction are specifying operatorless service. The early fears that passengers would be unwilling to ride alone or that balky passengers would delay service have proved groundless. Continuing research and development in supervisory control systems provides electronic equipment which is very nearly foolproof and certainly safe. The average yearly accident rate on operatorless service is estimated to be 34% less than on manually controlled cars.

The operatorless elevator will call for special attention in building design and construction: hoistway width, pit depth and overhead clearance.

The number of elevators, the type of control, location, shape size and speed are all important factors in building design. They are primary factors. The arrangement of elevators affects column locations, size and location of the lobby and its relation to exits and garages attached to the building.

The supervisory control features of operatorless elevators make it almost mandatory to keep your elevators together, although this has always seemed good basic practice to me. The higher speeds generally asked for now, as well as new code requirements, make necessary the extra space overhead and in the pit.

The use of power operated, center opening doors emphasizes the need for attention to car size, hoistway width and depth. I know of one installation—this was a modernization job—where car size was decreased to permit new type doors and speed was reduced in connection with conversion to operatorless service. The result was actually worse service than the former plant had provided. The investment yielded no dividends. Most installations provide happier stories.

Early planning is essential. The sooner you can visualize the elevator plant, the more freedom you will gain for your basic design concept. This is a truism but I am amazed at how frequently it is overlooked. In most cases it is the architect himself who will then pay a heavy cost in time required for the job.

Unlike other fields in which consultants operate, there are few sources for impartial information in vertical transportation. It is a subject rarely argued in architectural journals. Perhaps this is why elevators are often taken for granted by the architect.

Planning ahead avoids taking expensive chances, saves time for the architect and his client and helps to provide a vertical transportation system which will be a valued life line to both building and reputation for years to come.

My firm serves as consultants to either the architect or owner. We work from basic design of the elevator system all the way through specifications, bids and supervision of installation to test and code approval. A sample of our approach to some of the problems and an indication of the many considerations modern elevators demand is shown in the case history (next page). Some of the questions most often asked us on operatorless service are answered below.

Q. How many manufacturers make operatorless elevators?

A. There are about 50 elevator manufacturers in the U. S. Almost all will supply operatorless service.

Q. What can we tell the client about maintenance of operatorless elevators? Won't it cost more?

A. Yes, but not to an alarming degree. Perhaps 5% more.

Q. How much supervisory or electronic control ought to be provided?

A. If your building is over 12 stories, you may need four to six patterns or arrangements to meet varying traffic conditions. If it is less than 12 stories, you can simplify. It is difficult to generalize; each building has specific needs.

Q. What about speed?

A. Speed is an important factor. It can affect the quality of service; it is certain to affect initial cost. In high-rise buildings where express and tower service elevators are to be used, speeds up to 1,000 fpm. may be desirable. Where elevators may have to make frequent stops, speed can be reduced with consequent savings and without decreasing service efficiency. If you have a building 230 ft. high, travel time from bottom to top, non-stop at 1,000 fpm. will be 14.7 seconds. If you reduce this speed to 700 fpm., you will save about $7,000 per car in cost. Your travel time will be increased to 19.6 seconds. How much are the 4.9 seconds worth to your client and his tenants?

Q. Can operatorless elevators be converted to manual operation?

A. Easily.

Q. How can an architect sell the merits and extra cost of operatorless service to a hard-to-convince client?

A. There are two basic arguments. One is presentation of costs for operators' wages, uniforms, locker space, benefits, etc. The other is simply the fact that each building

---

* President, Charles W. Lerch & Associates, consulting engineers, with offices in Chicago, Denver and San Francisco.

BUILDING need not reach skyscraper height to make use of operatorless elevators. Casper National Bank Building, Casper, Wyo., is using three to serve its eight stories and two basements. Each has 2,500-lb. capacity and 300-fpm. speed. Two escalators are also employed to handle bank traffic from ground to second floor only.

must compete with others of its type in the same area. The building without modern elevator service has an extra obstacle to overcome—an obstacle which will loom larger as operatorless elevator service becomes more universal.

Q. Aren't elevator prices of major manufacturers competitive?

A. Yes. The savings and better elevator service which can be achieved will come largely through unbiased specification and knowledge of the plant which will suit your building's present and future needs. Specification writing is a key factor in obtaining truly competitive bidding.

TENANTS in Oakland's new 18-story First Western Building will be served by six fully automatic, operatorless elevators with 3,500-lb. capacity (one car designated for service use will carry 4,500 lb.) and speed of 500 fpm. Another elevator with 3,000-lb. capacity and speed of 300 fpm. will handle needs of bank located on second and third floors of building.

Case study report

PROBLEM: To determine the quality and quantity of elevator service to be required in 24-story, western city office building.

Step 1: Quality of Service

This office building will have a diversified type of tenancy. It is a prestige building. The quality of service is measured by the average interval in seconds between elevators passing any floor and by the average time to destination. The latter is the total time required to get from the landing on one floor to the landing on another floor. This time includes door opening, car loading, door closing, travel, door opening, car unloading, door closing.

Our experience shows us that quality of elevator service in this city during heavy traffic periods such as the noon hour may be judged against these standards:

	Departure Interval (Seconds)	Time to Destination (Seconds)
Excellent	30	45
Good	35	50
Fair	40	60

Thus, our goal for this building in quality of service becomes a 30-second departure interval and a time to destination of 45 seconds, both being averages.

Step 2: Quantity of Service

This is the time required for the elevator system to handle a fixed percentage of the building population within a five-minute period during peak traffic conditions. National averages on this show basic requirements as follows:

	Average
Morning peak	11%
Noon peak	13%
Evening peak	15%

We match our national averages against figures taken in from competitive buildings in the area where our client's building is to be located. By comparison we can estimate that our building will need elevators to handle a noon peak ranging from 12 to 19% and an evening peak ranging from 13 to 21%. The average at noon is 16% (of building population) and that at evening is 17%. If we expect to provide modern elevator service we must meet these predetermined needs.

The estimate of our building population is based on density figures for this city and this type of building and the intention of the owner regarding future tenancy. We will show probable elevator handling capacity for the proposed building with occupancy ranging from 100 to 150 sq. ft. per person. We will show three possible plans for the elevators. From all this information we can make the table shown in Figure 1.

THE RECOMMENDATION: **Plan 1:** Our recommendation in this case called for using two banks of four elevators. This will meet the building needs in quality of service and in quantity. It will cost substantially less than **Plan 3,** using seven elevators to all floors, and somewhat more than **Plan 2,** using six elevators. One of our two banks will service floors 1 to 14 only. Thus this plan will increase our client's rental income possibilities because floors above 14 will need space for four elevators only.

It is important to note that this recommendation achieves initial and future savings without lessening service efficiency now or in the years to come. The case study excerpted above is of course but a small step in the complete elevator plan prepared for this building. We cite it here simply to demonstrate the many factors which must have full and early consideration of the ideal goal if truly modern vertical transportation is to be achieved.

THREE POSSIBLE ELEVATOR PLANS FOR 24-STORY BUILDING

Showing building density in relation to handling capacity of each plan

Bldg. Density Sq. Ft. Per Person	PLAN 1: 4 Local Elevators (B-1 to 14) 3,000-lb. cap. 600 fpm.	PLAN 1: 4 Express Elevators (1-14-24) 3,000-lb. cap. 800 fpm.	PLAN 2: 6 Elevators (All stops)	PLAN 3: 7 Elevators (All stops)
100	14.4	12.6	9.25	11.2
110	16.3	12.2	10.0	12.35
125	19.1	16.0	11.2	14.0
150	22.9	19.2	13.5	16.8

Costs of operatorless elevator modernization

Excerpts from an address given by LeRoy A. Petersen, president, Otis Elevator Co., before the Building Owners and Managers Association in Washington, D.C.

BECAUSE of a great variety in type, age and condition of existing elevators, a statement of approximate cost to modernize can be made in general terms only as there is no common denominator as a starting point. I shall quote cost ranges which may be applied to various classes of existing elevators and with the assumption that the resulting operatorless installation will be of a nature consistent with my definition of the term "operatorless control"* and that existing cabs and hatchway doors may be retained. Price ranges apply to existing gearless elevator installations in the average office building.

CLASS 1: If an existing installation of gearless elevators was installed within the past 5 to 10 years, including a manually controlled supervisory dispatching system which was being sold just prior to the introduction of the modern operatorless control elevator, the cost of modernization to operatorless control will probably fall within the price range of $15,000-$20,000 per elevator.

CLASS 2: If the existing elevator installation is of the type described in Class 1 but not including a manually controlled supervisory dispatching system, a changeover to modern operatorless control will probably fall within a price range of $25,000-$35,000 per elevator.

CLASS 3: If the existing elevators are of the gearless, variable voltage, car switch control type, they will require new controllers, selectors, a supervisory dispatching system and all other new electrical equipment associated with the modern operatorless elevator, reusing the existing machines and motor generator sets. This class of operatorless changeover will probably fall within a price classification of $55,000-$70,000 per elevator.

CLASS 4: If the existing elevators are of the car switch resistance control type, they will require completely new electrical equipment and control devices, with the result that a modern operatorless changeover will fall within a price range of $65,000-$80,000 per elevator.

A word of caution: The name "operatorless elevator" and the term "operatorless control" are now being used by many elevator companies and building owners and managers as definitive of any type of unattended elevator—hence not comparable to the comprehensive definition which I have previously given. For example, we have heard of instances in which it has been proposed that a simple electrical change be made to use the signal light circuit as an automatic starting impulse and install some form of door protective device, thus obtaining a form of unattended elevator.

Unattended elevators of one form or another have been available for 50 years or more but those developments which have made it possible to automatically operate groups of high speed passenger elevators under the definitely controlled conditions required to realize maximum efficiency from the group are of relatively recent vintage.

*Reference to the control and coordination of a group of such intensive service, unattended elevators by a specially adapted automatic supervisory system, including automatic traffic program selection.

"Telephone planning boosts our sales — and our reputation!"

says Robert Vient, President, Robert Vient Corp., Glendale, Calif.

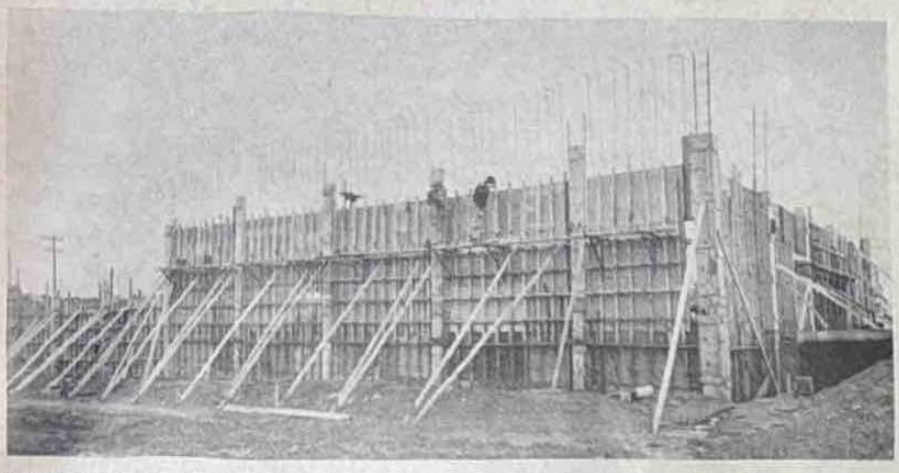
"Discriminating buyers today look for those important 'extras' that spell the difference between a quality home — and 'just another house.' That's why we include built-in telephone outlets with concealed wiring in all the busiest rooms. This complete telephone planning insures a home that will grow in value over the years — along with our reputation!"

In today's competitive market, Bob Vient, like many other trend-minded builders, recognizes concealed telephone wiring as an indispensable modern sales feature.

We'll be glad to help you plan built-in telephone facilities. Just call our business office and ask for our free Architects and Builders Service.

Pacific Telephone

It pays to include Telephone Planning in every home you build!



CONCRETE FORMING SYSTEM used at Seattle's Roxbury School speeded forming time by at least 20%, says Dohlgren Construction Co. Contractor adds that finished wall had excellent architectural concrete finish and alignment was "straight as a die."

Unusual fastener speeds forming

A FASTENING DEVICE for plywood concrete forms which holds both the form tie and waler in place is reported by contractors to make forming 20 to 40% faster than conventional systems. Developed by a Seattle firm, Trueforms, Inc., it has been used on a number of jobs in the Northwest and now is being introduced in northern California.

The device is a bracket called a Ply-Tie holder, designed for use with conventional fir plywood panels. One arm of the bracket has a teardrop slot which fits over the head of a special form tie; the other arm of the bracket holds the waler.

With this system, the tie holes are predrilled in the plywood, using a standardized pattern. Then the contractor tacks 2x4 studs to the plywood with one of the studs backing the joint. Holder secures the form tie and holds the waler in place.

Since the waler drops into a procession of holders along the entire length of the wall, a minimum of nailing is necessary. Formwork can be quickly stripped by springing the walers loose and releasing the tie holder with the tap of a hammer. The same holder can be used for light, medium or heavy construction by varying the spacing and thickness of studs and walers.

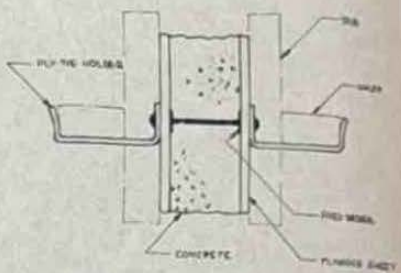
The Trueform concept was developed by the late Homer Allen, firm president, who had been in the prefabricated form business for several years. He consulted with engineers and contractors to formulate a system which would achieve an architectural concrete finish at an economical cost. The fastening system capitalizes on the relatively high cost of prefabricated forms, since contractors can use standard size panels which are widely available and select their own stud spacing according to the nature of the job.

Initial cost for the forming is not high. Trueform ties are the same as conventional ties (and comparable in price) except for the space between the washer to the head, which is equal to the thickness of the plywood plus the holder, or less than an inch using ¾-in. plywood.

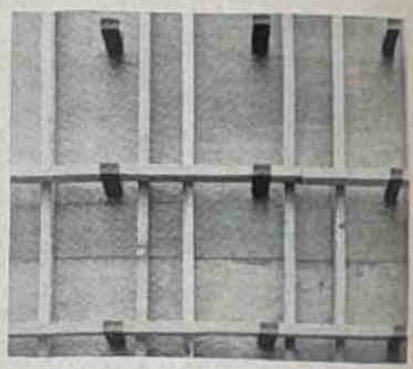
The system is applicable for most forming requirements, including walls, columns, pilasters and beams, on all kinds of industrial, commercial and residential jobs.

Walls 14 to 16 ft. high for a new Army Reserve Training Center at Seattle's Fort Lawton (see photo at right), which employed more than 40,000 sq. ft. of plywood, were formed 20% faster by using the Trueform system, according to Kuney-Johnson Construction Co. Project engineer Bud Collins states that the forms were easy to strip and "as accurate as anything I've ever seen."

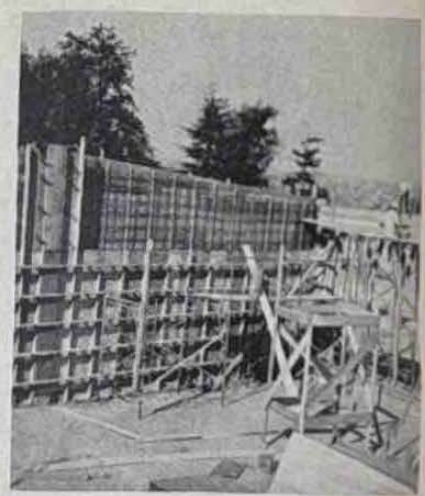
PLY-TIE HOLDER secures both form tie and waler in place. Form work can be stripped quickly by lifting waler out of holder and tapping latter loose with hammer.



BASIC DETAILS of Trueform system. Holder has teardrop slot which fits over end of special form tie.



FEWER WALERS, STUDS are required. Studs need only to be tacked into place, with one stud backing up each joint.



ERECTION OF FORMS for new Army Reserve Training Center at Fort Lawton. Holder shown here was of earlier type and has three slots; later model has one (note drawing above).

Determining lighting needs

AN OPTICAL SYSTEM for determining the lighting requirements of any seeing task was introduced recently to lighting engineers, designers, architects and ophthalmologists at the first of a series of regional conferences conducted by the Illuminating Engineering Society.

The new technique, which indicates the need for moderate to sharp increases in the recommended lighting levels for a broad variety of standardized lighting classifications, is the result of an eight-year study conducted at the Vision Research Laboratories of the University of Michigan and supported by the Illuminating Engineering Research Institute, an independent body of the IES.

Representative of the range of necessary lighting modifications indicated by the new measuring technique are the following recommended footcandle increases:

- For desk-level illumination for an accountant, from 50 to 150.
- In school tasks involving writing with soft lead pencils, from 30 to 60.
- For the work area of a draftsman, a fourfold increase from 50 to 200.

In many instances, initial tests have indicated that no modifications are necessary.

"Most Scientifically Accurate": The evaluation system, developed by Dr. H. Richard Blackwell, director of the Michigan laboratories, and a team of University of Michigan research specialists in optics and psychology, is considered to be the most scientifically accurate and most comprehensive technique for determining the lighting needs of specific tasks thus far devised, according to C. L. Crouch, technical director of the society.

Dr. Blackwell began developing his new system in 1950 with a series of studies to establish how accurately a variety of subjects could determine the presence of circular targets of diverse sizes exposed to view for varying periods. The targets were designed to simulate various degrees of "difficulty" in seeing specific objects under varying conditions. Scores of thousands of readings were recorded and carefully catalogued. These data became the cornerstone of the system which is based on the scientific fact that an identical amount of light is required to perform any visual task of total equal difficulty.

Thus, Dr. Blackwell explained at the symposium, "if the lighting engineer knows the amount of light required to perform a given visual task, he can accurately specify the amount of light required by another task equally difficult to see."

To relate his accumulated basic data to any given seeing task, Dr. Blackwell developed a complex optical instrument called the Visual Task Evaluator or VTE. With this device he can view a seeing task of unknown lighting requirements at threshold, or just bare visibility, match it to a test object of known lighting requirements and quickly determine the lighting requirements from the collected statistical data. The indicated lighting requirement thereafter needs only simple mathematical adjustment to compensate for the differences between the standard data, collected under optimum laboratory conditions and actual conditions in the field.

Eye "Assimilates" by Bits: While conducting his eight-year study, Dr. Blackwell recognized that the average eye sees or "assimilates" visual information by bits and that the level of illumination determines the number of assimilations the eye can make in a one-second interval. At the Dearborn meeting he indicated that the average eye "is easily capable of making 10 such assimilations a second if the light level is sufficiently high."

Pacific Gas & Electric Co. Marina Sub-Station, San Francisco
Kraftile Veneer gives acceptability to industrial buildings adjacent to residential sections.

LOW-COST DISTINCTION FOR INDUSTRIAL BUILDINGS

Whether you're planning an industrial, commercial or public service building, you'll find that Kraftile Veneer offers lasting beauty, cleanliness and lower-cost installation for exterior or interior application. Especially adaptable to the enhancement of non-residential structures located in residential areas, Kraftile Veneer is easily installed over wood, steel or concrete, on new construction or modernization projects.

KRAFTILE VENEER SAVES 60% ON SPACE AND WEIGHT

Kraftile glazed ceramic veneer panels of 3/8" thickness weigh only 4 lbs. per square foot, require less structural support than heavier facings, can be cut on the job for faster handling. exterior house paint

After testing a new formula over the past seven years on hundreds of homes throughout the West, Fuller chemists report that they have come up with an answer to the problem of longer color and gloss retention. The paint was exposed to the rains of the Northwest, the winters of Montana, the heat of Arizona and California and the salt-laden fog of the coast. Result: the paint behaved extremely well under all conditions. It is easier to apply than traditional oil type paints; does not need thinning; and the initial drying, sufficient to give it a protective surface against dust, takes only two to three hours. The white house paint will not stain with rust from nails, screens and outside drains.—W. P. Fuller & Co. (Item No. 1)

low-profile cooling towers

Through its low profile and uniform exterior treatment, a series of Lo-Line cooling towers with capacities ranging upward from 75 tons is intended to compliment architectural design. Companion to the redwood framed model, the series features all-steel structural members and louvers, casing, distribution system and fan deck of asbestos cement. Redwood is used in the deck fill.—J. F. Pritchard & Co. (Item No. 2)

drum lighting unit

Prescolite has introduced what it calls the only drum lighting unit with pan integral mechanical parts constructed from weather-resisting die cast aluminum. Trigger Lok cam-locking principle and simplified hinging allow fast, easy maintenance. Glass is hand blown, satin finished Thermopal.—Prescolite Manufacturing Co. (Item No. 3)

heating-cooling unit

Smart styling characterizes the Regulaire gas- or oil-fired combination furnace-air conditioner which can be

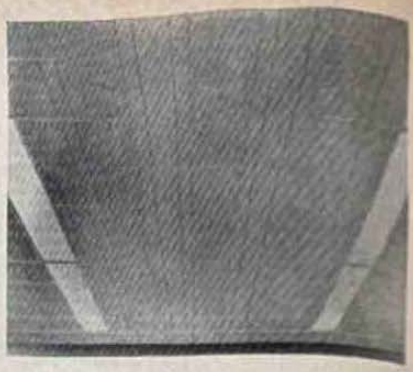
built in anywhere in the home—basement, utility room or even in the family room, kitchen or foyer. All duct connections can be made from the top, permitting an "island" installation dividing living and dining areas as shown in the photo. Because the unit needs no clearance areas on the sides or back, dust-collecting crevices are eliminated.—Perfection Industries, Division of Hupp Corp. (Item No. 4)

bronze finish awning

Architects in the past have hesitated to recommend aluminum awnings for commercial and industrial buildings because bare aluminum was out of the question and colored ones out of place. Now Arrow Metal has launched a full-scale program to develop a practical production method for anodizing and finishing bare aluminum strip. The bronze finish is reported to stand up under all weather conditions and to give the same results as the company's Pressurecoat finish.—Arrow Metal Products Corp. (Item No. 5)

radiant-acoustical ceiling

A ceiling system of 12x24-in. aluminum panels which offers radiant heating and cooling can be used in conjunction with standard acoustical tile. Back of panels are thermal heat bridges which contact water pipes, connected to special square shape headers. Suspended at any height, the



panels are supported by standard acoustical T-bars, save duct space on each floor and are available in more than 400 colors or can be matched to meet any special specifications.—Airtex Corp. (Item No. 6)

nerve center for schools

A central nerve center which incorporates communication, alarm and television systems into one can mean cost savings for schools. Instead of installing separate systems, a single network can function as public address, internal telephone, fire alarm and panic control, time signals and audio-visual instruction. Provision can be made for future expansion or for addition of new electronic services operating over the same basic set of wires and conduits.—Dukane Corp. (Item No. 7)

handy hoist

Portability is a big advantage claimed for the Tusky hoist because it can be towed by car or pickup as fast as the contractor wants to tow it and upon reaching the job, it can be moved into position and put to work within minutes by one man. Hydraulically controlled, the hoist can be operated from the ground or at any point along the length of its mast, which may extend as high as 100 ft. Its capacity is 1,500 lb. but regardless of load, the speed of the platform in either direction is governed at 100 fpm.—Tublar Structures Corporation of America. (Item No. 8)

sliding mirror doors

Aluminum framed MirroGlide doors "open up" bedroom wardrobe walls, dressing rooms, dens, hallways, etc., by the illusion of increased space. Available in both bypass and pocket types and in various heights and widths, the doors come in clear, gold and black Alumilite finish. Sliding sections move on top mounted, dual tandem nylon rollers with ball bearing axles. Bypass models have a single extruded dual track head section for easier installation. Masonite backing is installed without drilling.—Frank B. Miller Mfg. Co. (Item No. 9)

aluminum lighting louver

To give architects and engineers a wide range of decorator effects, the ½x½x½-in. Koldbonded louver is offered in a variety of colors which can be mixed or matched. Fabricated from .025 aluminum, it is assembled as one unit and can be specified in lengths up to 48 in. and in widths up to 24 in. Louver can be easily cut to varying sizes and shapes on the job.—Columbia Electric and Manufacturing Co. **(Item No. 10)**

plumbing fixture supports

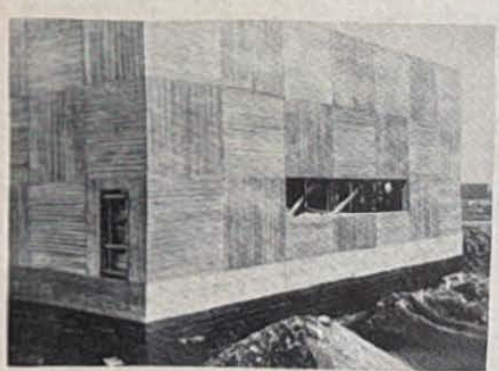
Restroom planners and designers can gain additional floor space by choosing from a line of Zurn Thinline systems of wall closet supports. Reduced dimensions between center line of flow and front of face plate make it possible to install, for example, the single horizontal adjustable system in pipe case space as little as 6½ in. Systems accommodate any manufacturer's wall type plumbing fixtures.—Plumbing Products Division, Zurn Industries, Inc. **(Item No. 11)**

reroofing process

A cold process built-up roofing method is reported to cut reroofing application costs by as much as 55%. The Vulca-Dek system literally "vulcanizes" a new roof right over and to the old roof surface, thus eliminating the time, labor and expense of old roof removal. It is totally bonded to roof surfaces and does not require skilled labor for speedy application. — The Monroe Co., Inc. **(Item No. 12)**

textured concrete form

Weldwood Formtex, newest face in a line of concrete forms, features an unusual texture of deep, irregularly spaced, full-length grooves which produce decorative patterns for exteriors of all types of structures. It eliminates the need for sack and rub treatment, making it only necessary to patch and tie rod holes and occasional honeycomb spots. The result: savings of about 10c per square foot in finishing costs. Formtex gives up to 13 reuses.—United States Plywood Corp. **(Item No. 13)**



ceiling fixture

What may be considered a new fixture shape for commercial and residential installation, the Ellipse radiates light from the entire surface of satin finished opal glass with its greatest intensity downward. The one-light rigid stem ceiling fixture is wired for either a 200- or 300-watt bulb.—EJS Lighting Corp. **(Item No. 14)**

framing anchor

Because of its full symmetrical design, a framing anchor called Strong-Tie can be used for rights or lefts for practically all framing needs. It offers six combinations for all two- and three-way ties. The two full symmetrical surfaces improve load distribution, reduce inventory problems. Other items in the Strong-Tie line: joist hangars for applications of 2x4s up to 2x16s; support angles for all-purpose use; and special welded joist hangars produced to customer specification.—Simpson Co. **(Item No. 15)**

Lifetime Insulation on Masonry Walls

STYROFOAM®

Styrofoam, a Dow plastic foam, bonds directly to masonry walls and serves as a plaster base, providing insulation and moisture vapor barrier. Furring and lathing are entirely eliminated. Once in, Styrofoam stays in for a lifetime.

Styrofoam also excells as perimeter and roof insulation. For further information and recommendations to fit your specific requirements, contact Wiley-Bayley.

* Styrofoam is a registered trademark of The Dow Chemical Company

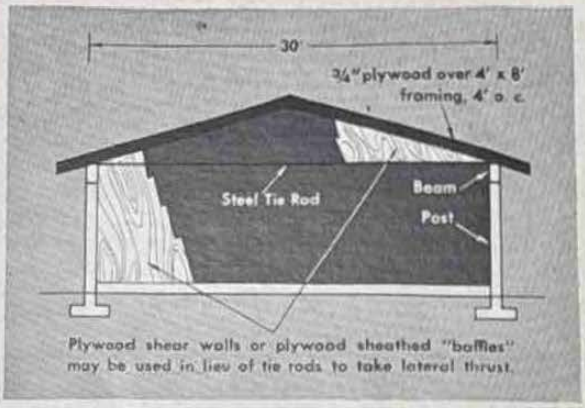
Warehouses in Seattle, Portland, Spokane

new approaches to structural design with fir plywood



Tilted roof planes (each a rigid plywood diaphragm) provide mutual support at ridge, permit long, clear spans. Diaphragm action transfers horizontal thrust to steel ties or fir plywood end walls.

FIR PLYWOOD

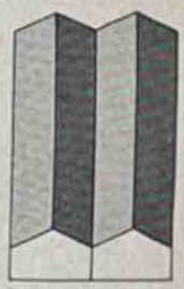
TENT-SHAPED ROOF UNI

ARCHITECTS AND ENGINEERS:
John Lyon Reid & Partners, San Francisco, Calif.
Partners in Charge: William A. Gillis, A. I. A., and Dr. Alexander Tarics, Structural Engineer

THIS folded plate plywood roof system developed for an expandable community school offers a straightforward solution to the problem of obtaining a high degree of design flexibility at low cost.

The basic tent-shaped canopy units may be placed separately or combined in series or rows to cover any given area. With supports needed only at wide intervals, walls and partitions may be arranged or re-arranged as needed.

Structurally, the system relies on the outstanding diaphragm strength of the plywood sheathing. The roof planes—each a rigid plywood diaphragm—are inclined to form a giant inverted "V" beam, eliminating posts or trusses normally required for support under the ridge. Because the roof is self-supporting at the center, rafter spans can be nearly doubled, e.g., up to 50 feet with 4 x 14's on four foot centers. Diaphragm action also permits ties and supporting columns to be placed at wide intervals.

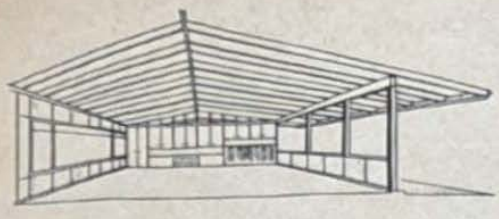


Basic units can be arranged in series or rows as needed

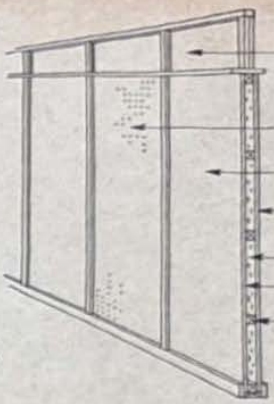
ONE OF A SERIES FROM "SCHOOLS OF THE FUTURE"

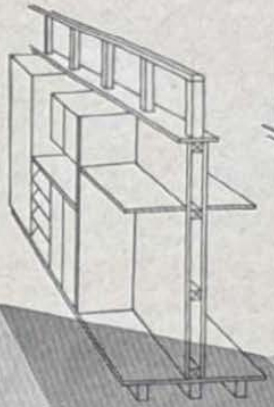
. . . a portfolio collection of outstanding designs by six leading architectural firms. Material includes details on folded plate roof system shown above. For free copy, write (USA only) Douglas Fir Plywood Association, Tacoma, Wash.

Also write for information about design and engineering consultation services.



The interior may be left open for classroom uses
. . . or divided into smaller areas by movable partitions

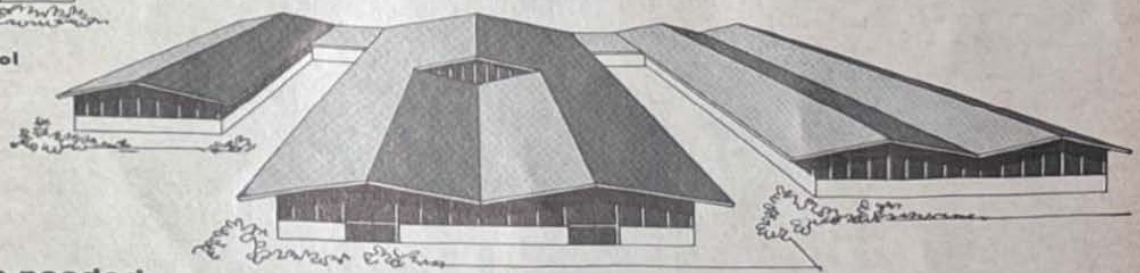




FOLDED PLATE ROOF

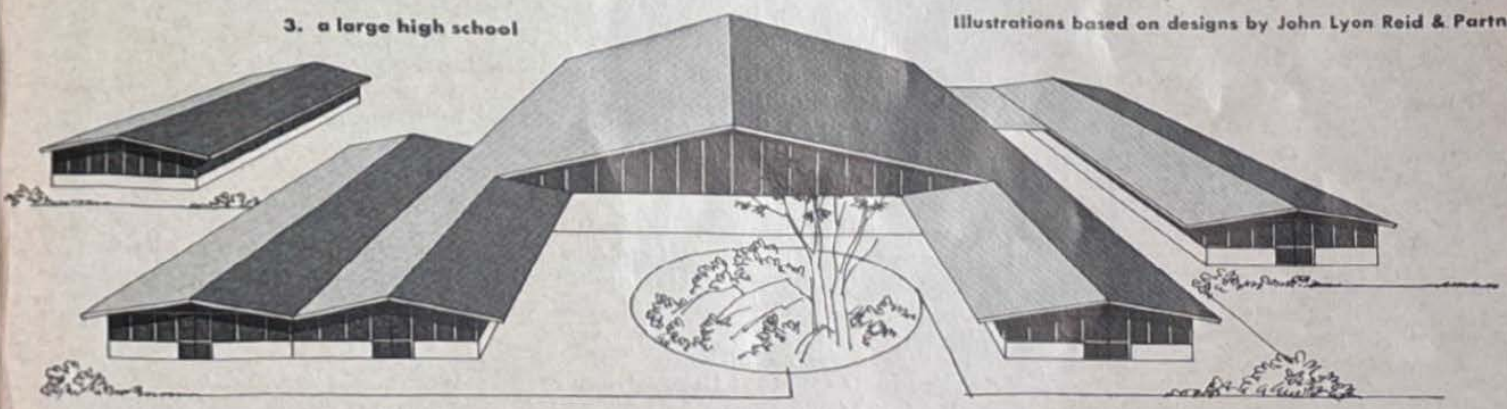
PROVIDE MAXIMUM FLEXIBILITY FOR AN EXPANDABLE SCHOOL

1. a small elementary school

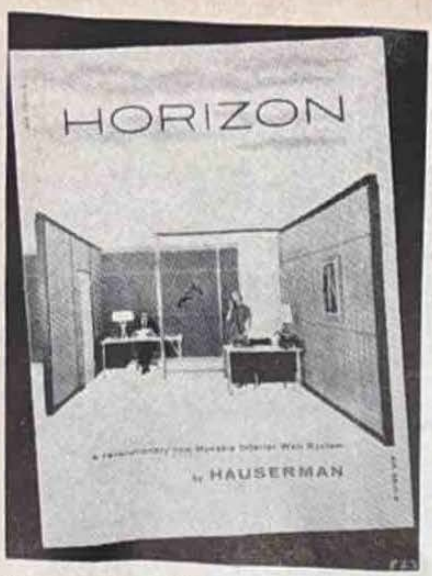


Units can be added as needed

3. a large high school



Illustrations based on designs by John Lyon Reid & Partners



Horizon Movable Wall System: illustrates system's complete movability and custom selection of panel materials, feature inserts, modules, post shapes, glass patterns, panel colors; 6 pp.—E. F. Hauserman Co., 7516 Grant Ave., Cleveland 5, Ohio.

Util-A-Vent Ventilating Units (AIA 30-D-1): covers complete line of belt driven units, performance tables, engineering data, selection, installation; 26 pp.—General Blower Co., Morton Grove, Ill.

Spanall Horizontal Shoring: describes plates and lattice members; illustrates how plate slides inside lattice member and can be adjusted and set at desired length; provides charts which show suitable spacings and members needed for wide range of loads and spans; 8 pp.—Spanall of the Pacific, 600 California St., San Francisco 8, Calif.

Modular Lighting for Modular Measure: (AIA 31-F-2): covers Mobilex and Troffer line of recessed fluorescent fixtures; how these units fit within building cube; 16 pp.—Day-Brite Lighting, Inc., 6260 N. Broadway, St. Louis 15, Mo.

Jamison Package-Passing Doors: designed to help architects, contractors and refrigeration engineers select and specify cold storage package-passing doors and tunnels for all standard operating conditions, with data on temperature ranges, door styles, etc.—Jamison Cold Storage Door Co., Hargerstown, Md.

Edwards Airvec Freon Condenser: describes "radically new type of air condenser" for air conditioning industry; 4 pp.—Edwards Engineering Corp., 101 Alexander Ave., Pompton Plains, N.J.

CATALOGS

Readers are requested to write directly to the manufacturers for copies of catalogs.

Finned Radiation and Enclosures: describes new Type Q finned radiation, different types of enclosures, finned tube heating elements, accessories equipment; has tables, charts, diagrams related to capacities, dimensions, specifications, selections; 16 pp.—American Air Filter Co., Inc., 215 Central Ave., Louisville 8, Ky.

Design Criteria for Stacks and Breechings: features tables and charts to help determine best methods of conducting flue gases to atmosphere for most satisfactory burner operation; discusses supplemental fixed and barometric damper applications in detail; 23 pp.—Orr & Sembower, Inc., Reading, Pa.

High Intensity, Low Brightness Controlled Illumination: gives data on Directo-Lens for use in fixtures for offices, schools, churches, plants, homes, which are available in two types of clear crystal glass in five square and three round sizes; 4 pp. plus series of six photometric data pages.—The Phoenix Glass Co., Monaca, Pa.

Ariston Hand Rail Brackets: covers shell-molded bracket which conceals the anchorage; illustrates principle which allows adjustment of bracket in any direction on wall surface; gives installation details for concrete or masonry, plaster wall and wood construction; 4 pp.—Michel & Pfeffer Iron Works, Inc., 212 Shaw Road, South San Francisco, Calif.

'58 Wadsworth Guide (AIA 31-D): has technical data, cabinet sizes, knockout arrangements, etc., for safety switch line, wiring diagrams and simplified index; 162 pp.—Wadsworth Electric Mfg. Co., Covington, Ky.

Kwik-Fit Door Pattern: describes what it calls "something new" in door fitting at one-third the time; 4 pp.—Kwik-Fit Door Pattern, P. O. Box 126, Blackstone, Va.

Sanymetal Toilet Compartments: illustrates shower stalls, hospital cubicles and dressing room compartments as well as toilet compartments; contains a complete set of color samples and simple diagrams; 28 pp.—The Sanymetal Products Co., 1664 Urbana Road, Cleveland 12, Ohio.

Spanjer Metal Letters (AIA 15-R-1): describes complete line of traditional and modern styles; has on-location photos; explains methods for specifying and ordering special design lettering and for mounting on masonry and other building materials; 22 pp.—Spanjer Brothers, Inc., 1160 N. Howe St., Chicago 10, Ill.

Prescolite Preslok Series: highlights new conception in hinged frames for recessed fixtures; 4 pp.—Prescolite Manufacturing Corp., 2229 Fourth St., Berkeley, Calif.

Robertson Versatile Wall: (AIA 17-A) file folder with individual sheets covering construction details, progress photos of this window wall construction.—H. H. Robertson Co., 2400 Farmers Bank Bldg., Pittsburgh, Pa.

Simpson Redwood Grades: detailed description of each grade along with full color photos; lists stock sizes available; 12 pp.—Simpson Redwood Co., Room 601, Arcata, Calif.

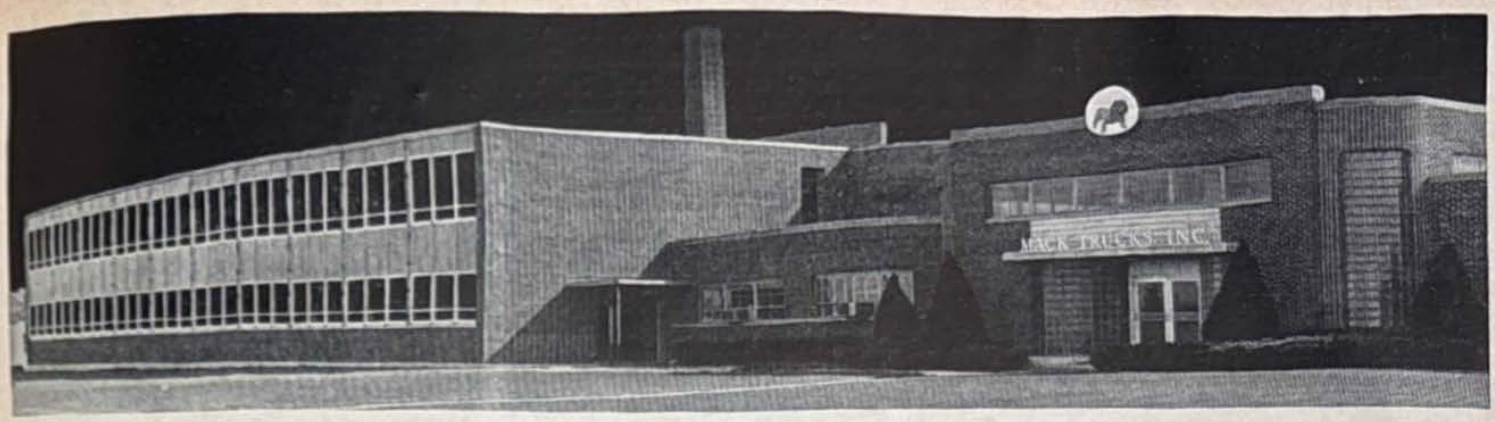
Questions and Answers on Master Mix: pocket-size folder covers product description, mixing procedure, application, protection and miscellaneous; 8 pp.—L & M Tile Products, Inc., Box 35472, Dallas 35, Texas.

Marco Skylights: consolidates data of all previously issued literature on aluminum and fiberglass skylight products; describes models and designs as well as major installations; 12 pp. —The Marco Co., 45 Greenwood Ave., East Orange, N.J.

Crest Tile-Set (AIA 23-P): describes thin-bed portland cement material for dry installation of real clay tile, ceramic mosaics, marble, precast terrazzo and similar materials; includes installation drawings; 16 pp.—Kaiser Manufacturing, Inc., 2000 Harrington St., Houston, Texas.

Imagineering in Steel: outlines three steps in planning, cutting and joining new Bild-A-Flex steel framework; has tables for calculating maximum loads for horizontal and upright framework; 20 pp.—Berger Division, Republic Steel Corp., 1038 Belden Ave., N.E., Canton 5, Ohio.

Uni-Crest Expanded Polystyrene: lists qualities such as low K-factor, slab and block sizes; contains specification sheets for applications to a variety of perimeter, foundation and concrete slab insulation problems; file folder. — Uni-Crest Division, United Cork Companies, Kearney, N.J.



164,500 square foot addition to Mack Truck plant

Steel Erection — V-LOK is an exclusive Macomber interlocking framing system that requires no on-the-job bolting, riveting or welding.

Under Roof — V-LOK steel framing provides the ideal support for Macomber steel deck roofing. Workers were able to proceed with interior construction without delay.

Completed Building — Macomber V-LOK construction with V-LOK Girders and Purlins, provides large unobstructed bays for final truck assembly department.

...ALL V-LOK TRADE MARK REGISTERED CONSTRUCTION

The addition to the Mack Truck building in Sidney, Ohio, is another example of sound construction where Macomber V-LOK framing meant substantial savings in cost and time.

V-LOK framing was used exclusively on the new two-story engineering building with curtain wall construction and on other plant additions, totaling 164,500 square feet.

Contact your nearest Macomber representative or write us direct.

V-LOK Design Manual is available.

firm changes, additions

Associates J. Everett Hoerner and Allen W. Young are now principals in the firm of Kaestner, Hoerner & Young, Inc., architects-engineers of Visalia, Calif., formerly known as Kaestner Associates.

Albert Arthur Hoover, AIA, formerly partner of Perkins & Will in the firm's White Plans, N. Y. office, has joined the staff of John Carl Warnecke, AIA, San Francisco. Hoover was designer of the Heathcote Elementary School in Scarsdale, N. Y., which won the Silver Medal from the Architectural League of New York in 1953.

William Phipps has joined the architectural firm of Doudna & Williams, Yakima, Wash., now known as Doudna, Williams & Phipps. A graduate of the University of Washington, the new member was formerly employed by the Yakima firm of Gowan & Paddock.

new offices

Roger J. Gotteland, AIA, and Jan Koczarski have formed an architectural firm known as Gotteland Koczarski in the Second and Ch Building, Seattle.

Harold Keeney Jr. has opened architectural office at 13251 Ave. N.E., Kirkland, Wash. He returned to his home state aft 10-year absence, most recently w ing in the offices of Henry Hill John Lyon Reid in San Francisc

Donald Grier Hannum and Will Whifler have opened offices for practice of architecture at 153 versity Ave., Palo Alto, Calif.

new addresses

Bolton White, AIA; Jack Herma AIA; and Allan Steinau, AIA, to Beach St., San Francisco.

Samuel G. Morrison, architect, the Jones Building, Third and Un Seattle.

deaths

Norman Hunter, AIA, of Los A geles and national president of Construction Specifications Institu died May 23. Born in Auckland, New Zealand, and a graduate of Auckland University, he came to the U. S. in 1927, practicing architecture in New York and New Jersey until 1945. For the past several years Hunter had devoted much of his time to the CSI and a dressed the Conference on Standar in San Francisco early this year.

HUNT

Joseph H. Wohleb, AIA who found ed the architectural firm of Wohle & Wohleb of Olympia, Wash., die June 11 at age of 71. A number buildings on the state capitol ground are among the projects designed b the firm.

awards

Donald Arthur Winkelman, an employee in the Seattle architectural firm of Bittman & Sanders, has received one of three special mentions in the LeBrun Fellowship competition sponsored by the New York Chapter, AIA.

SPECIFY HAWS FROM A COMPLETE LINEUP OF...

ELECTRIC WATER COOLERS!

You can specify water coolers for any specific requirement from the **complete** lineup of HAWS ELECTRIC WATER COOLERS! Pressure bubbler types, bottle-types, freezing compartment models, hot and colds, restaurant and cafeteria models of all sizes, remotes, wall inserts . . . they're ALL in the HAWS lineup with custom styling and advanced designs that guarantee client satisfaction.

Specify HAWS! Get Complete Water Cooler specification data from one dependable source . . . write today, for the new 1958 HAWS Catalog!

DURHAM'S CHURCH ANALYSIS

Because of the interest evoked in Robert L. Durham's article, "An Architect's Case Study of a Church," which appeared in PA&B for May, reprints are being made available at cost. Send requests to: Reader Service, Pacific Architect and Builder, 2418 Third Ave., Seattle 1, Wash.

retirements

Ernest R. Boyd, chief of the architectural section of the engineering control branch for the U. S. Army Engineer District, Alaska, has retired after 14 years of service, coming to Anchorage when the Corps of Engineers began its rush military construction program. He and his twin brother, Richard R. Boyd, structural and architectural chief, have been with the district from before the time it was formally established.

speakers

Edgardo Contini, engineer of Beverly Hills, Calif., was guest lecturer at the University of Minnesota School of Architecture last month, discussing the basic structural systems available to the designer.

campus notes

A University of Washington Architectural Foundation has been established to provide scholarships and awards for students in the College of Architecture and Urban Planning. Initial funds will be set up with contributions of charter sponsors, in the amount of $100 each made on or before December 31, 1958. Alumni and friends interested in participating in the foundation may contact Dean Arthur P. Herrman in Seattle.

AIA activities

Northern California Chapter has elected these officers: Donald Powers Smith, president; Corwin Booth, vice president; Joseph Esherick, secretary; Richard Banwell, treasurer; and John Lord King, Alexander Yuill-Thornton and Andrew T. Hass, directors.

Montana Chapter has named Kenneth K. Knight, Great Falls, president; Richard Taylor, Kalispell, vice president; H. C. Cheever, Bozeman, reelected secretary-treasurer; and Calvin Hoiland, Great Falls, and Oswald Berg Jr., Bozeman (retiring president), directors.

Southwest Washington Chapter at its annual banquet in Tacoma May 23 presented craftsmanship awards, with Harry Berry as chairman, to: Virgil Cliff for "outstanding cooperation and superior execution of sign and commercial advertising"; Robert Coleman for "outstanding execution of sheet metal work on the Stadium High School roof"; Frank Faley for "outstanding supervision of a superior manner for work on the Tyee-Park Elementary School"; Victor Nash for "outstanding electrical work on the Woodrow Wilson High School"; and Oliver Tudemann for "unusual execution of a mural."

NEW OFFICERS of the Southwest Washington Chapter are Robert Olson, first vice president; Charles T. Pearson, director and immediate past president; Robert B. Price, president; Percy Ball, secretary; and Donald Burr, second vice president. All are from Tacoma except Olson, who is from Olympia. Installation took place at the annual meeting last month.

VENTILATION BY COLT

saves your client's money . . . reduces employee fatigue . . . increases production!

When warm weather combines with inadequate air circulation the air "hangs"—employees lose energy, slow down on their jobs. *That means a big loss in production!*

You can make sure your clients avoid this costly situation—as so many firms throughout the world have—by specifying COLT Ventilation Systems. Low cost, highly efficient system that *keeps air moving freely!*

- Unique in design and application
- Of rugged anti-corrosive hardened aluminum
- Full clear opening permits maximum possible passage of air
- Adjustable louvers 100% rainproof when closed
- No operating costs
- Lightweight

—can be installed in any type of factory roof,

- Dual Purpose Utility

—day-to-day ventilation plus extra fire protection
—louvers fall open automatically in event of fire.

Installation of CO/2016 COLT Clear Opening Adjustable Louver Ventilators in the roof at Electra Motors, Inc., Anaheim

COLT Another Fine Product By **VENTILATION OF AMERICA, INC.**

4652 Hollywood Boulevard, Los Angeles 27, California • NOrmandy 2-1181.

SUPPLIERS

• **Pacific Tile and Porcelain Co.,** on the eve of its 25th anniversary, has announced expansion plans for 1958. The company recently opened a warehouse in Seattle and intends to establish similar facilities in Phoenix this month.

• **EKCO Products Co.** has diversified its line of special products for the building industry with the purchase and introduction of Lighting Dynamics, formerly known as Ruby Lighting Corp. This addition provides the manufacturer of steel lockers, hardware, sliding doors, bathroom fixtures and stainless steel sinks with a full line of fluorescent fixture designs.

• **United Vinyl Products, Inc.,** president Frederick W. Krieger of Seattle has been named superintendent of buildings and grounds at Montana State University, Missoula. A former MSU track star, he transferred to the University of Colorado, where he took a BS degree in architectural engineering.

• **Standard Tank and Seat Co.** has named these new distributors in the West: Wuesthoff-Hofmann-Jones, Inc., Los Angeles, for southern California and Arizona; Davids-Steinbach Co., Oakland, for northern California and northern Nevada; Lou Falkenhagen Co., Portland and Seattle, for Oregon, Washington and the panhandle of Idaho.

•

STATE CHARTER

of Affiliation No. 6 is received by President James B. Lundberg of Concrete Products Association of Washington from executive director Walter Underwood of National Concrete Masonry Association. Says Lundberg: "Architects, engineers, builders and buyers will benefit from the increased design and technical research that will be available to our area; we will be able to provide a much finer service to the trade with this affiliation."

• **Crane Co.** has named Charles A. Warden as special trade relations representative for the Pacific Coast and is being succeeded as manager of the company's San Francisco branch office by Frank R. Perry.

• **Pabco Building Materials Division** of Fibreboard Paper Products Corp. has appointed R. R. Galloway as vice president and general manager, with headquarters in San Francisco.

• **West Coast Lumbermen's Association** has chosen Jack Fairhurst of San Rafael, Calif., as president.

• **American-Marietta Co.** will construct a $1 million synthetic resin research center on Seattle's Harbor Island for the evaluation and testing of wood products manufactured in the Northwest.

• **Northwest Plaster Bureau** has named Richard Cronn of Portland as president. Other officers: David Kissack, Vancouver, B.C., vice president; W. S. Wilson, Seattle, reelected recording secretary.

• **Westinghouse Electric Corp.** has appointed Roy F. Carter as sales engineer for its air conditioning division, with headquarters in Fresno, Calif.

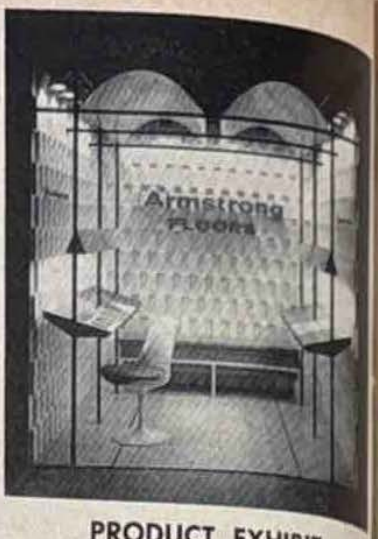
• **Washington State Chapter, Producers' Council,** has awarded a plaque for outstanding service to the building materials and equipment industry to Ralph E. Yoder of Seattle, regional director of the Structural Clay Products Institute.

• **Continental Materials Corp.** has acquired Williams Furnace Co. of Los Angeles and will operate it as a subsidiary, with L. P. MacHarg, former general manager of Williams, as president. Other management personnel will remain with the firm.

• **The Fyr-Fyter Co.** has established a Pacific Coast regional office at 132 Hawthorne St., San Francisco, under the direction of Donald Mathewson.

• **Certain-teed Products Corp.** has received plaques at five of its accident-free plants, including Tacoma, Wash., from the National Safety Council for 1957.

• **Tile Council of America** is now supporting architectural scholarships, each valued at $500, at 12 institutions, including the University of Southern California and the University of Washington.



PRODUCT EXHIBIT

to be shown during annual convention of AIA in Cleveland July 7-11 will have such attractive displays as that of Armstrong Cork Co., with its imaginative foamed plastic backdrop.

Product literature awards total 53

Top honors for this year's most outstanding building product literature and space advertising directed to architect-readers have gone to Kawneer Co., Perlite Institute, Armstrong Cork Co., U. S. Steel Corp., Fenestra, Inc., and Aluminum Company of America.

A record 297 entries were received this year and judging required two full days. The annual competition is co-sponsored by Producers' Council and the AIA.

CLASS 1: Literature concerned primarily with basic technical information.

EXCEPTIONAL MERIT

Kawneer Reference Book, Kawneer Co.

CERTIFICATE OF MERIT

Sound Absorption Coefficients, Acoustical Materials Association.

Manual of Control for Commercial Air Conditioning, Minneapolis-Honeywell Regulator Co.

Alcoa Aluminum in Architecture, Aluminum Company of America.

Concrete Masonry Foundation Walls, National Concrete Masonry Association.

Structural Facing Tile, Facing Tile Institute.

Architectural Woodword (2), Architectural Woodwork Institute.

HONORABLE MENTION

Porcelain Enamel in Architecture, Architectural Division, Porcelain Enamel Institute.

CLASS 2: Literature offering technical information confined to particular products of a single manufacturer.

EXCEPTIONAL MERIT

Armstrong Floors — Technical Data, Armstrong Cork Co.

CERTIFICATE OF MERIT

Anemostat Selection Manual, Anemostat Corporation of America.

Sloan Flush Valves, Sloan Valve Co.

Blumcraft Aluminum Railing Catalog, Blumcraft of Pittsburgh.

Barrett Architects' and Engineers' Reference Manual, Barrett Division, Allied Chemical Corp.

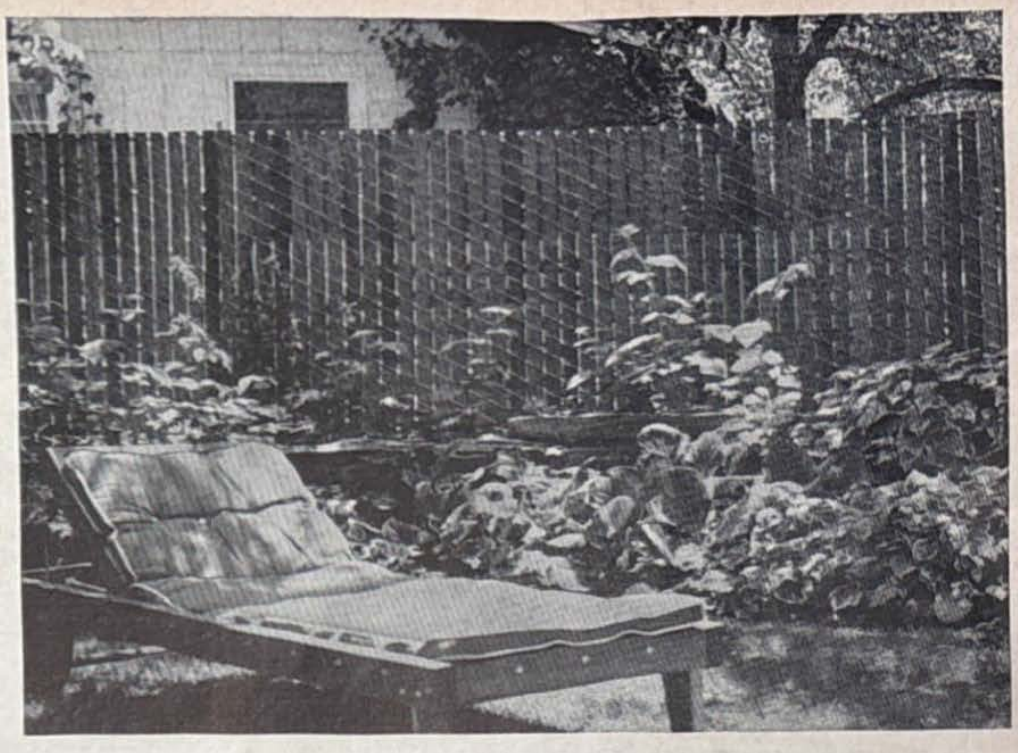
Shading the Sun the Beautiful Way, Mo-Sai Associates, Inc.



Designing a new home for a client?
Plan for the outdoor living area with

USS **Cyclone Rustake Fence**

Thanks to Cyclone Rustake Fence you can give your clients the outdoor privacy they want. Cyclone Rustake Fence consists of slender strips of native redwood inserted into wide mesh Cyclone Chain Link Fence. It's strong, sturdy. All parts which come into contact with corrosive ground conditions are rust-resistant steel. But it has the general appearance of redwood picket.

USS Cyclone Rustake Fence gives a finished look to undeveloped yards. It protects and makes an attractive background for young plants and trees. Cyclone Rustake Fence is an economical buy for your clients. It assures years of service with a minimum of maintenance, never needs painting or refinishing.

Be in a position to supply your clients with complete information on this attractive Cyclone Rustake Fencing by sending today for our free literature—use the convenient coupon below.

Report: Fourth Plastics Study Group. Building Research Institute, 2101 Constitution Ave., Washington 25, D.C., 1957. 125 pp. $3.

Covers a two-day meeting at Washington University, St. Louis, last September. Sessions were devoted to "Plastics for Roof Construction" and "A Case Study—Plastics in a New Building," detailing applications in the new Inorganic Chemicals Laboratory of Monsanto Chemical Co.

Modern School Shop Planning. Prakken Publications, 330 Thompson St., Ann Arbor, Mich. 1957. 184 pp. $3.85.

Revised and enlarged edition (plastic bound) of the only work available on the subject features the addition of extensive checklists of standards for evaluating shop plans and facilities and has over 200 illustrations.

TECHNICAL PUBLICATIONS

Aluminum in Modern Architecture—1958. Edited by John Peter. Reynolds Metals Co., 2500 S. Third St., Louisville, Ky., 1958. 118 pp. No charge.

A supplement to "Aluminum in Modern Architecture" issued in two volumes in 1956, this edition features the first detailed report published in the U. S. of the conference on aluminum in international architecture held in West Berlin. It also presents studies of 25 recently completed buildings which make extensive use of aluminum and has new photos of the Spanish project which won the first R. S. Reynolds Memorial Award.

Development Guide for Domestic Airport Terminal Passenger Facilities. Air Transport Association, 1000 Connecticut Ave., N.W., Washington 6, D.C., 1958. $1.

Designed to aid airport planners, builders, operators and tenants, this guide deals with passenger and baggage flow; handling of ground transportation, taxicabs, auto traffic and parking; physical arrangement for ticketing and baggage checking areas; special passenger service rooms and facilities for safety, comfort and convenience; and airplane boarding plans.

How to Design Pole Type Buildings. American Wood Preservers Institute, 111 W. Washington St., Chicago 2, Ill., 1957. 62 pp.

A manual of engineering and design data on the uses of pressure treated round and sawn timbers in commercial and industrial warehouses, service buildings and other structures. Seventeen line drawings show how to compute live, dead, wind loads and stresses for every structural member of a proposed pole type building.

Housing Almanac. National Association of Home Builders, 1625 L St., N.W., Washington, D.C., 1957. 144 pp. $2.

Called "a fact file of the home building industry," the new edition includes sections devoted to economics, specific housing programs, the federal government and functions of its agencies relating to housing, home building statistics, a chronology of federal housing legislation and a list of industry directories.

Windows and Glass in the Exterior of Buildings. Building Research Institute, 2101 Constitution Ave., Washington 25, D.C., 1958. 176 pp. $5.

Report on a research correlation conference covering 1) functions of the building environment; 2) product engineering; 3) controls; 4) design applications.

Carstensen Co., designers, Alaska Bldg., Seattle, on a 41'x250' concrete block or tilt-up concrete structure to house five businesses, to be located on land now occupied by Keeney Lumber Co. in Bothell. Mike Phillips, c/o Carstensen Co., is one of co-owners. Also planned is a 41'x256' asphaltic concrete parking lot. MH 6-3

Announcing the NEW

Gates PlastiCone

Canadian and U.S. pat. pending

FORM TIES

with full 1" or 1½" break-back for the finest architectural finish concrete.

- Provide positive break-back
- Practically eliminate spalling
- Prevent bleed at tie-slot
- Never need oiling

HERE'S HOW THEY WORK:

As the concrete is poured, pressure forces the molded, polyethylene cones against the panels, forming a void around the ends of the ties, and at the same time, covering the slots and preventing bleed.

Since concrete cannot adhere to their glass-smooth surface, the cones can be removed and ties broken back immediately after stripping the forms. This means that all grouting and filling is accomplished on "green" concrete for the finest architectural finish possible... without costly delay.

For detailed information on the new Gates PlastiCone Ties see your nearby Gates Dealer, or write to:

Gates & Sons, Inc.
