Located on a suburban office park site in Enschede, the Netherlands, a new [headquarters building](#) for Sigmax was designed by [Architectenbureau Paul de Ruiter](#). The four-story building features a horizontally uninterrupted glass facade that emphasizes access to daylighting. The building's interior spaces were designed by Ex Interiors.

The 2,500-square-meter (27,000-square-foot) building has been designed in the form of a "stacked pavilion," whose horizontal lines and extensive glass facade with rounded corners emphasize spaciousness and transparency. The glazing comprises large, rectangular floor-to-ceiling panels whose joints align with the building's structural grid. And quarter-circle glass panels form the rounded-corner bridge between adjacent facades.

The thin building floor plates provide minimal interruption of the glass facade and accentuates the building's sense of horizontality. The portions of each floor plate that cantilevers beyond the glazing work to provide shading of the glass and are intended to develop as a vegetal "roof." The architects intended this feature to produce a sense of connection to the landscape, even on the upper floors.

Sigmax is an information technology company which provides innovative mobile solutions for, among other things, the enforcement and monitoring tasks of municipal councils, police forces, and public transport. The company wanted to combine its two departments in a new office, with room for further expansion. Thus, the design of the building is attuned to the work process and organization of Sigmax.

The design of the new Sigmax building is compact. The floors are planned with efficiency in mind, using a flexible layout that combines discrete office "cells" with open office spaces. Each floor is organized around a central atrium. And a prominent white spiral staircase provides the primary vertical circulation path, offering glimpses between floors.

About half of the building's ground floor is devoted to an uninterrupted space that doubles as a lobby and staff dining area. The remaining portion of the ground floor and most of the building's other floors are composed of office space.

According to the architects, the building's placement and orientation on its site are both a direct response to solar access concerns. As part of the climate control strategy, the building's floor-plate cantilever is said to vary on each side of the building. The underside of each cantilevered element is finished with stainless steel panels that help to reflect daylight into center of the building's mass.

In addition, the building's 45-centimeter (18-inch) floor plate also embodies many of the building's HVAC systems, which are kept concealed from view where possible.

The building was completed in January 2012.
