#### At the Royal Doulton Pottery

COLT'S were called in at the planning stage to advise on the ventilation of a new extension to The Whieldon Pottery for Doulton & Company, the world-famous Potters.

The problem was to provide extraction over the area which was to be occupied by Tunnel Kilns to remove the very considerable amount of heat which would be given off. It was also essential that no dust should enter through the Extractor Ventilators. Furthermore, as Fluorine gas was given off during the process, continuous positive extraction at all times was essential for the well-being of the operatives. The COLT SR/2046 Natural High-Duty Roof Extractor Ventilator was the ideal solution to the problem. Its aerofoil curves harness even the lightest roof eddy to assist extraction and prevent downdraught. Forty-nine of these Ventilators were installed to provide from five to six air changes per hour, without the disadvantages of running costs, noise, wear, tear and maintenance. The buildings are now in use and the ventilation system has proved more than satisfactory.

Many years' experience of all types of ventilation problems enables us to bring a supremely practical approach to the science of air induction and extraction. Whether your problem is one of improving existing conditions (with the minimum of interruption to production) or of planning new projects, our experts will be glad to co-operate at the earliest stages.

# P & G BATTERIES

## in the public service

P & G Batteries play an important part in maintaining the efficiency of Britain's giant grid system. In countless substations where the flow of energy is broken down to comply with local needs, there you will find P & G Batteries operating vital switchgear or providing emergency lighting should the mains supply fail. The P & G service extends into many spheres, a natural result of 60 years' experience of battery manufacture and development. In round terms here it is. **1. Technical Advice and Specifications. 2. Complete equipment and installation. 3. Regular inspection and report.** A discussion of your scheme may help. We are always ready to agree that two heads are better than one.

## Don't go into a brown study

No need for stygian deliberation on the subject of finishing. No need to ponder in the dim burning of the midnight oil how best to give your products the look that sells. Just make a mental note to the effect—"there's no better selling combination than a good product and a CELLON FINISH"—then you may snuff out the light, quit your brown study and toddle off contented to bed. Fortunately for everyone, the Cellon back-room boys have already spent many years in the study of finishing problems as is evidenced by the wide variety of paints and finishes produced in the Cellon factories. For Wood Finishing—the superb Cerric range; for Transport and Marine—the renowned Cerrux range; for Industry—specially formulated finishes by Cellon; AND FOR GOOD DECORATORS EVERYWHERE—

# PLIMBERITE

WOOD CHIPBOARD

IN OFFICE  
AND FACTORY

## cuts costs of conversions

Speed up your conversion work with Plimberite and cut partitioning costs. A sheet (8 ft. x 4 ft. in thicknesses of  $\frac{1}{2}$ " and  $\frac{3}{4}$ ") of this versatile resin-bonded wood chipboard cuts readily to fit any angle, thus saving you time, trouble and money. Manufactured under heat and pressure to a density of 50 lbs/ cu. ft., Plimberite is rigid, flameproof, with good sound and thermal insulating qualities. Moisture movement and load tests, carried out on Plimberite by the Department of Scientific and Industrial Research prove its stability and strength. The surface of Plimberite, so ideal for painting, is also suited, because of its pleasing appearance, to staining, waxing and varnishing. To ensure best decorative results, ask for specifications of various finishes. Complete technical data on Plimberite is available from the manufacturers.

PRICES (ex works) 10 boards and over

$\frac{1}{2}$ " — 1/1½ per sq. ft.

$\frac{3}{4}$ " — 1/6 per sq. ft.

*Lower prices for large quantities.*

Offices constructed with  $\frac{3}{4}$ -in. PLIMBERITE and timber framing, by Messrs. Baiger & Co., Confectionery Manufacturers, London, E.I.

# 3 Important factors in the installation of Fluorescent lighting equipment

**DESIGN.** Ediswan engineers have collaborated with some of Britain's leading industrial designers to produce a range of fluorescent lighting fittings planned to reduce to a minimum the difficulties with which the maintenance engineer must contend.

**DURABILITY.** Ediswan Fluorescent lighting equipment is specially cleaned and treated to ensure an anti-corrosive surface before the final finish is applied. Enamel finishes are stoved in Infra-red ovens to ensure hard, wear-resisting qualities and long life even under adverse conditions.

**SIMPLICITY.** Ediswan Fluorescent lighting equipment is as easy to maintain as it is to install. On the fitting illustrated removal of diffusing enclosures is effected by finger pressure on flush push buttons located in the end panels, making cleaning and relamping a simple operation.

*The Ediswan Lighting Advisory Service will show you how to make the best use of this equipment. Write now giving details of your lighting problem. We will suggest a planned lighting scheme giving the correct illumination for your needs.*

## EDISWAN FLUORESCENT LIGHTING EQUIPMENT

Member of the A.E.I. Group of Companies

and Branches

*Classroom and corridor, using units of 24 ft. span (pitched roof) and 6 ft. span (flat roof) respectively.*

## MEDWAY SCHOOL BUILDINGS MARK IV

*Permanent schools of modern design at far less cost*

The Medway Mark IV system will provide permanent schools of any size to suit any site, schools which are attractive and efficient from every point of view. Despite the flexibility of the system the cost of the Mark IV schools is appreciably less than any other building method.

Low cost has been achieved by advanced production methods and by a design which minimises site-work expenditure. Technical staff are available to co-operate freely with Local Education Authorities during planning. Supply and erection of shell buildings can be undertaken anywhere in Britain.

*A 12 ft. span (flat roof) addition to the 6 ft. access corridor. In this case the corridor is provided with curved "Perspex" ventilated roof light.*

*Don't "make do"  
— you can NOW have the BEST*

### TOUGHNESS

SISALKRAFT is very tough and durable, being of 6-ply construction, doubly reinforced by two crossed layers of Sisal fibres. The fibres are totally enclosed by two layers of bitumen, which in turn are faced with tough Kraft paper. The product of this combination is a building paper of exceptional merit.

### VERSATILITY

SISALKRAFT Reinforced Waterproof Building Paper (in appropriate grades) is especially suitable for marking under tiles and slates, as moisture barrier and air-stop in walls, for making floors damp-proof and airtight, for protecting floors and floor coverings, for temporary partitioning, for bond-breaking, and a host of other practical building uses.

### MANAGEABILITY

SISALKRAFT is light in weight, pliable, clean and easy to handle and is free from bitumen on both sides. It can be decorated if desired though for temporary work its pleasing natural appearance (light buff colour) seldom calls for treatment. Furthermore, its resistance to bursting, tearing and cracking during application represents the greatest economy in applied cost.

*Use the BEST—it is essential*

**ONLY**

**MARLITH**

**INSULATING STRUCTURAL ROOF DECK**

*A new pamphlet giving full details of recommended construction will be sent on request.*

***gives all these advantages at low cost***

**High strength to weight ratio**

A roof deck formed of 2" Marlith Units, supported on pressed steel tees, with  $\frac{1}{2}$ " cement sand screed and 2 ply built-up roofing will carry a load of 80 lb. sq. ft. with '05" residual deflection. Weight of deck is 12 lb. sq. ft.

**Thermal Insulation**

No separate insulation required. With 2" Marlith Units the deck has a "U" value of 0.22 B.Th.U./hr./sq. ft./°F.

**Ceiling and Sound Absorption**

No sub-ceiling required. The soffit of the Marlith Units can be decorated with plastic emulsion coating, paint or distemper to give a pleasing textured appearance. The soffit gives a sound absorption co-efficient of 60% over the middle range of frequencies; also excellent resistance to formation of condensation.

**Easy and Speedy Fixing**

The large individual Marlith Units need a minimum of supports and are quickly fixed.

**Fire and Moisture Resistance**

Marlith Units are non-inflammable and are effectively fire resistant. Dampness will not damage the Units.

**Modular Co-ordination in Schools, etc.**

Special sized slabs can be supplied to cater for 6' 8" and 8' 3" Modules.

TRAFFORD PARK

MANCHESTER 17

**"Expensive sound-proofing?  
It really wasn't necessary!"**

*"There's never a lot of noise in here — but footsteps and similar sounds often disturb readers. They put in thinner sound-absorbing tiles than usual, I understand, and so it all cost much less than was expected. A good bargain all round, most ratepayers think!"*

An inexpensive Acousti-Celotex sound-absorbing tile is now available for installations where noise is irritating and distracting rather than loud and sharp. This tile—type C1—is  $\frac{1}{2}$  in. thick and made in two sizes: 12" x 12" and 12" x 24".

These tiles provide the most economical means for permanent sound correction in offices, corridors, libraries, waiting rooms, studios and other places where noise is

tiresome. (Other tiles in the Acousti-Celotex range are more suitable for factories and buildings where sound reverberation is excessive).

If cost is a major consideration, type C1 tiles are the answer to your sound problem and like all Acousti-Celotex tiles, they can be frequently decorated without impairing their sound absorbing efficiency.

# LAYING UP WINTER WARMTH

WITH

## LIGHTWEIGHT EXPANDED CLAY AGGREGATE

Concrete blocks made with LECA save fuel by reducing heat losses to a minimum.

LECA aggregate has a K. value of .9. The K. value of dry LECA concrete of a mix of 9 to 1 and weighing about 50 lbs. per cubic foot is approximately 1.3.

But low thermal conductivity is only one of the many advantages offered by this lightweight aggregate. It produces concrete with high strength for its weight and has a high resistance to fire, frost, damp and shock.

Concrete blocks made with LECA are now being used on many housing schemes. It is also being used as a screed for floors and as loose infill for roofs for insulation purposes.

Information on LECA will be supplied on application to

## The Contribution of Gas

### TO IMPROVED STANDARDS OF SPACE HEATING.

The Gas Industry has no quarrel with the verdict that solid fuel should normally have first consideration for the bulk of continuous space heating. In fact, it makes a big contribution in this field by the production of coke as a complementary part of the gas-producing process, and by research designed to improve the efficiency of coke-burning appliances.

But, where part-time and intermittent space heating is required, whether in large buildings or in the small house, or where fuel storage is a problem, or labour-saving important, Gas itself is now recognised as providing the most efficient means of using available fuel resources. Not only does Gas lend itself readily to a flexible system of control, but Gas appliances are specially designed to suit such conditions.

If Gas is to make its full contribution to improved standards of space heating, it is essential that consideration should be given to the design of the heating system at the earliest stage in planning. Then is the time to make use of the wide knowledge of Gas technicians, which is freely available through local Gas Undertakings.

### Where to go for information about Gas

If you are considering the use of Gas, however tentatively, your first move should be to get in touch with the Gas Undertaking serving the area in which the job is situated. Through it you have access to the combined technical resources of the entire Gas Industry. The following list gives the addresses and telephone numbers of the Area Boards. Where there is any uncertainty as to which Area Board is concerned, The Gas Council will be pleased to give you the correct address.

SCOTTISH GAS BOARD: 26, Drumsheugh Gardens, Edinburgh, 3. Edinburgh 34331/5.

NORTHERN GAS BOARD: 30, Grainger Street, Newcastle-upon-Tyne, 1. Newcastle-upon-Tyne 26101.

NORTH WESTERN GAS BOARD: Bridgewater House, 60, Whitworth Street, Manchester, 1. Manchester Central 8121.

NORTH EASTERN GAS BOARD: Bridge Street, Leeds, 2. Leeds 32571/4.

EAST MIDLANDS GAS BOARD: Beverley House, University Road, Leicester. Leicester 23201/5.

WEST MIDLANDS GAS BOARD: 6, Augustus Road, Edgbaston, Birmingham, 15. Edgbaston 3616.

WALES GAS BOARD: 1 and 2, Windsor Place, Cardiff. Cardiff 28621.

EASTERN GAS BOARD: 2, The Abbey Garden, London, S.W.1. Trafalgar 5373/7.

NORTH THAMES GAS BOARD: 30, Kensington Church Street, London, W.8. Western 8141.

SOUTH EASTERN GAS BOARD: Katharine Street, Croydon, Surrey. Croydon 4466.

SOUTHERN GAS BOARD: 164, Above Bar, Southampton. Southampton 76362.

SOUTH WESTERN GAS BOARD: 9a, Quiet Street, Bath. Bath 60411/5.

## RUBEROID STEEL ROOF DECK

The Ruberoid Company Ltd. realised the possibilities of light-weight steel roofing units 25 years ago and the modern Ruberoid Steel Roof Deck represents a tremendous investment of long-term research and development.

Ruberoid Steel Deck has been used

for some of the most outstanding roofing contracts in the world, including India, the Malay States, Java, South Africa, France, Belgium, and the Argentine. There is not a town or city in the British Isles which does not contain buildings roofed with Ruberoid Steel Deck.

## THE ROOF WITH RECORD PERFORMANCE

### FOR SIZE...

Many of the largest roofs in the world are of Ruberoid Steel Deck as, for instance, the 50-acre roof of a building for the Ministry of Aircraft Production Factories.

### FOR SPEED

Because of its simple construction and the lightness of the individual units, Ruberoid Steel Deck can be erected in record time. A 34,000-sq.-yd. factory roof was completed in 27 working days.

### FOR ADAPTABILITY

Ruberoid Steel Deck lends itself to every type of roof surface, curved, flat or pitched. On the Bristol Brabazon hangar, for instance, it was employed on all the sloping, flat and vertical areas.

R.123

*The Ruberoid Contract Department* places its wide and long experience with all types of roofing problems freely at the disposal of architects: consultations at the design stage can, and often do, result in structural economy. The Department undertakes the supply and fixing of Ruberoid Roofing specifications on any scale from convenient centres throughout the British Isles.

## "The Lady with a Lamp"

Before Florence Nightingale, hospitals were places of dark terror. Medical skill, crude by our standards, was robbed of much of its effectiveness by dirt, ignorance and indifference. In the field hospitals of Crimea comparatively few of the unfortunate patients died from their wounds: the great majority perished from disease borne by germs bred in the dirt and squalor. Miss Nightingale challenged this evil. She defeated blind ignorance, cupidity and the inhumanity of red tape. She set a standard of skilful nursing and devotion to the sick or wounded. This is reflected today in the warm efficiency of our hospital service — a service that is

content with nothing but the best for its patients. To this end Dunlopillo cushioning and mattresses — specially designed for post-operative or convalescent comfort — have already become standard equipment... a humanitarian use of a unique substance that gives daily pleasure to millions who enjoy Dunlopillo comfort in their homes and in cinemas, theatres and public buildings wherever they may be.

#### GOLD MEDAL 1953

As the JOURNAL goes to press the news arrives that the Royal Gold Medal is to be given this year to le Corbusier—one of the few indubitably great men of our day in the world of architecture. His influence has spread over four continents. The medal, which is for the promotion of architecture, could not have a more worthy recipient.

The honour comes at an appropriate moment, when le Corbusier's masterpiece, the Unité d'Habitation at Marseilles, has just been completed. For it he has already been made a Companion of the Legion of Honour by the French. The RIBA is to be congratulated on its well-timed choice.

#### ANOTHER SOCIETY

Good luck to the newly formed Modular Society. Appalled though you may be by the formation of yet another society, you may have high hopes that this one will be really useful. Judging by some of the whispered private battles that took place during the inaugural meeting last week, the coming debates will be lively. "Why do you want a module at all?" hissed a natty pin stripe in the seat behind me, and was all but assaulted by a pair of green corduroys who was working on a four-foot module and found it very convenient thanks very much. "But how," asked a subdued plum waistcoat, "do you decide what is the correct module?" And then a tired-looking tweed suit, who couldn't bear it any longer, stood up and saddened us with the announcement that he very nearly hadn't come. His complaint? He didn't like the Society's name; it implied that there was no doubt that a module was needed. Wouldn't it be better, he asked, if the Society first made up its mind whether or not a module was essential?

With charm and patience Mark Hartland Thomas quoted from the Society's aims ("...collecting and disseminating information concerning a module...") and invited the speaker to join in the coming debates. ASTRAGAL is looking forward to these debates and feels that even if the Society does not bring about the establishment of a fixed module, or group of modules, it will be of great value as a medium for the spreading of information on technical developments and on classification and coding.

#### EVENING STANDARDISATION

Hot on the heels of the JOURNAL'S New Year issue, which contained a description of the difficulties to be met with in designing street decorations, panted the eager hounds of the *Evening Standard*. "Westminster Coronation plans thrown into chaos... Sir Hugh Casson must start again from scratch..." etc. ASTRAGAL, stifling as best he could that disgracefully relieved feeling that always attacks him when Trouble hits somebody else's job, gave tongue in full pursuit to discover from tentative enquiries that the Trouble had been dealt with before Christmas, and that "scratch" had been left, by now, weeks behind, and "chaos" wasn't expected yet awhile. Nevertheless, our commiseration with the designer on the loss of his suspended garlands over Pall Mall and let's hope the more earthbound substitutes strike no further snags, either psychological or the other kind usually coated with Dr. Angus Smith's solution.

How encouraging to note, incidentally, that many London boroughs and provincial cities are, like Westminster, employing architects to design their Coronation decorations. This may not be an entirely new departure—Inigo Jones is only one of many previous architect designers of Royal settings—but it is at least an indication that the modern City Father is beginning to consider such matters a little more seriously.

And now a warm pat on the backs of the *Standard* hounds as they lope

# AVOID CORROSION

back, tongues lolling, to their kennels. No doubt you read of the recent row with the film producers who, I gather, demanded only polite notices or else no advertising—and were told that reviews would continue uncensored and that their advertising was cancelled anyway. So for once a critic or two has had the proper backing: my hearty respects to Lord Beaverbrook or which ever of the high-ups took the decision. Will other dailies please copy?

#### DR. LANCHESTER

By the death, at the age of 89, of Dr. Lanchester, the profession loses not only a distinguished colleague and town-planning pioneer (he was the founder of the TPI) but also one of those links with the great architects whose names are now more often found in history books than in living memories. Indeed in appearance and manner—though not in energy of mind—he always seemed part of the Golden Age of sixty years ago, when jobs were large, and sculpture expected, and collars were as high and stiff as artists were relaxed and jolly and rich.

Indeed, in power of concentration and speed of output Dr. Lanchester could hold his own with the Great Victorian architects, many of whom dealt with their correspondence before breakfast, leaving the day clear for work. And what a day too. The hours in Pugin's office would whiten the hair of a shop-steward. Norman Shaw designed one of his largest country houses while the rest of his week-end party were out shooting. Dr. Lanchester—says his partner—could plan a large building during a week-end, and the more difficult the problem the better he liked it. He was a great competition winner, with a long list of civic and official buildings to his name (one of my favourites being Deptford Town Hall), but he will probably be best remembered for his work at Cardiff and for his Central Hall, Westminster, designed in association with E. A. Rickards—that virile and eccentric character portrayed in Arnold Bennett's "Clayhanger."

Those who knew Rickards best will judge the accuracy of that portrait (did that curious career really begin with

Scrapbook for 1939? Don't be deceived by this sketch of the New Idealism of the 'thirties. Look again at the price, which does not include stone storks and golden window-ledge nudes, and you will deduce correctly that this is a recently published advertisement. And don't say you haven't been warned

a paintbox in an attic bedroom in the Five Towns?). But there is no doubt that Arnold Bennett—with his love of any kind of large project—did, in fact, spend many hours with the architect on the scaffolding of the Central Hall, delighting in the organization of the job, and in such mechanical novelties as concrete mixers. He and Rickards enjoyed finding biblical quotations about the "armour of God," etc., to justify baroque cartouches of arms to Rickards's Wesleyan clients. Bennett delighted too in Rickards's sketching facility—that very odd facility that did not so much make a sketch like a building but made the constructed building look just like a sketch. The Central Hall, which Lanchester and Rickards won in competition in 1904, looks more like a rather fine ink per-

spective than any building one can think of, just, as in contrast, its new neighbour-to-be, the Colonial Office, looks as if it will look like a rendered-up watercolour by a professional perspectivist.

This recent oil painting of the late Dr. Lanchester, of whom Astragal writes above, is by B. Fagan.

### *Guest Editor for 1953*

The JOURNAL, continuing its policy of annually adding a new member to the editorial board to study a current, pertinent, architectural issue, has invited Ian Bowen, above, professor of economics at University College, Hull, to become guest editor for the year 1953. Readers will already be familiar with the series of articles on the statistics and economics of the building industry which Professor Bowen has been contributing regularly to the JOURNAL for many years. For 1953, however, Professor Bowen has accepted the role of guest editor in order to supervise a careful and detailed study of the structure of

the architectural profession and to attempt to foretell its future prospects. Outside the architectural profession, and therefore safe from any accusation of having any professional axe to grind, and with a very high reputation as a building economist and statistician, Professor Bowen will be a guest editor with unique qualifications for undertaking such an analysis of the profession. The reasons for launching such an enquiry, and the scope of it, are given in broad terms in this week's leading article on the facing page. On page 150 are some brief biographical notes on Professor Bowen.

## CHELSEA WIN

The scheme for building a new embankment, carrying a wide motor-road, across the bay formed by the curving foreshore of the upstream stretch of Cheyne Walk, Chelsea, is to be deleted from the County of London Development. This is a resounding victory for the Chelsea Society, the National Trust and all the other people who protested against this threat to the only part of London's waterfront that still retains its old character and charm.

\*

But although protests were made on grounds of amenity, the LCC have withdrawn the proposal on grounds of cost and have reserved the right to examine it again if the national economic situation becomes easier. It is never satisfactory to have the right thing done for the wrong reasons, especially if those reasons may not be permanent. The objectors must persevere and persuade the Chelsea Borough Council and the LCC that the scheme should be condemned not merely for being impracticable but for being undesirable.

## PARISH POLITICS

Mr. Woodbine Parish, the retiring LMBA President, has for years worked very hard for the better training of foremen, operatives and apprentices. Two weeks ago he had some sensible remarks to make on the pressing need for lower costs—low enough for “the man in the street... to feel that he is assured of real value for money.”

This quite obviously makes sense, but one of the present troubles is that the industry (in which architects, remember, are included) is

starting to become a music hall joke. No doubt much of the criticism is “ill-informed” as Mr. Parish said the other day, but it is no good dismissing it as casually as that. The customer isn't always right, but then neither is the producer, and the only thing to do is to take criticism even if it hurts, and try to answer it in terms which the public can understand.

## WHERE DO YOU STAND?

**H**OW little the architect knows about his true status in society today and about the structure of his profession.

From all sides come conflicting rumours and reports. We know, to take the simplest instance, that there are more registered architects in the profession than there have ever been. But is the profession actually doing more work than ever before? One can only guess. It seems as though they are, but does anyone really know if the volume of building work per architect has increased over the pre-war figure? Does anyone know how fast the size of the profession is growing? And is the volume of building work keeping pace with this rate of growth? Nobody seems to know.

We have been told of a very large London office which may have half its staff idle by mid-summer if it does not get some buildings to design at once. And we hear of offices that are still growing in size and have years of work ahead. We hear rumours of unemployment amongst architects, and at the same time, of staff shortages. Might we not try and discover the true position?

Let us take another tack. What does the title “architect” represent in the eyes of society? In a recent article in the *Financial Times* he is described as *starting* as a qualified assistant at £600 a year and rising to £1,000, with “only a minority” of architects in private practice earning “over £2,500 a year” and it is apparently “difficult to find any architect grossing over £20,000 a year with any regularity.” Does the reader find himself fitting easily into this picture?

It may be felt that as a gentleman's profession architects should not be overtly interested in money. The article in the *Financial Times* ends: “On the whole architects do not expect to earn the larger incomes of members of other learned professions. The architect, after all, occupies a half-way house between the artist and the professional man, and for the intense personal satisfaction he derives from his proximity to the former he is content to forgo to some extent the monetary rewards of the latter.” Which is, of course, nonsense. Doctors, dentists, barristers and builders undoubtedly get “intense personal satisfaction” from their work and considerable profit, too. The architect, the universally acknowledged leader of the building team, is responsible for renewing and increasing the bulk of the nation's capital wealth in the form of factories, shops, offices, civic buildings, schools and houses. His services should be valued accordingly as fully the equal of other professional men.

But do, in fact, the architect's services rate as equal to those of other professions in the eyes of the public, when judged by that handy yardstick, their annual incomes? Once again, we don't know. Oughtn't we to try and find out?

A few years ago, in response to a fear of unemployment expressed by members, the RIBA conducted a survey into the future of private practice. The fears were proved needless.

But since then conditions have changed. What people once optimistically called "post-war conditions" are today, to most architects, now normal conditions. The conditions of the nineteen thirties which once helped to shape the profession as it became a *registered* profession are now gone for ever. We have arrived by almost imperceptible degrees into an entirely new world for the architect. A new set of conditions in which to work, a new set of building techniques, and a largely school-trained entry into the profession.

Now, therefore, is the moment to try and discover as much as possible about the profession and its method of working under these new conditions. Now is the moment for a careful analytical study of the structure of the whole profession—an analysis to include the unqualified assistant, the student, the qualified assistant and the principal, *in both public and private office*—so as to discover the profession's true strength and capacity, and the prospects of the individual. Now is the moment for an estimate of the quantity of building work which the profession can expect to handle over the next few years, and for a study of the factors, whether in the form of national financial policies, shortages of materials, defence measures or export drives, which may affect that quantity.

*We are going to endeavour to find out all these facts and to publish them in the JOURNAL during 1953.* Our Guest Editor for the year is Ian Bowen, professor of economics at University College, Hull, and well-known contributor to the JOURNAL. Professor Bowen, with his own team of experts, is going to examine existing facts and figures which, supplemented by polls, questionnaires and personal contacts with various sections of the profession, will build up an accurate picture of the structure, prosperity and prospects of the profession.

Architects will only achieve strength, confidence and influence when they know all that there is to know about *themselves*.

#### PROFESSOR IAN BOWEN

*Professor Bowen, who, as the JOURNAL's Guest Editor for 1953, will be undertaking a detailed study of the size and prosperity of the architectural profession (see page 149), is a Welshman. He was born in Cardiff, and was educated at Westminster School and Christchurch, Oxford. A fellow of All Souls College from 1930 to 1937, and a Lecturer in Economics from 1937 to 1940, Professor Bowen started studying building industry statistics at the Institute of Statistics, Oxford.*

*As a result of the reputation he gained there in this field, he was invited to become Chief Statistical Officer of the MOW in 1940. After the war Professor Bowen became a Research Associate of the National Institute of Economics and Social Research in London, where for two years he continued his study of the building industry. In 1947 he was appointed Professor of Economics at University College, Hull, a position which he still holds and where he now lives with his wife and two children. Although most widely known for his studies of the economics of the building industry, Professor Bowen is specially interested as an economist in problems of capital investment and on the organization of industry in Britain. Unlike the professors of fiction, he is well-travelled and an energetic player of golf, squash and tennis.*

R.I.B.A.*

#### Marignane Hangars

SIR,—I have read with interest your Technical Review of the Year (January 15), especially your reference to the hangars at Marignane, France. There is, however, a point of some importance to which I should like to draw your attention concerning the lifting into position of the 355-ft. clear span concrete shell roofs.

The supporting columns were treated in a special manner so as to make them suitable for playing their part in the lifting operation. U-shaped elements were precast and positioned at the column locations. The entire roof structure was raised 3 ft. 3 in. by means of hydraulic jacks. Concrete was then poured into the U-shaped column elements but the problem arose of obtaining sufficient strength for this concrete to withstand the bearing pressure for the next lift after 24 hours.

It was therefore decided to treat a 6-in. thick "wall" of the filling concrete of the columns by means of the vacuum concrete process, which would give it the required strength without buckling under the load. The concrete was then filled and processed for fifteen minutes, after which the shutter was stripped. Twenty-four hours later the jacks were removed and re-erected in position for the next lift. This fact made it possible in this instance to achieve a rate of lifting of 3 ft. 3 in. per day, the total operation taking only eighteen days instead of the one-and-a-half months which would have been required by normal methods.

Although vacuum concrete was not used for the construction of the roof or the U-shaped column elements, it served to reduce the total time of the work considerably and in its very limited application produced material savings.

I feel that this is an important point and it was a pity that lack of space prevented it from being included.

R. WALT MELLOR.

London.

#### Why Not Vertical Cemeteries?

SIR,—With regard to ASTRAGAL'S notes on cemeteries might not "vertical burial" be the answer.

This would halve space needed by the old method and thus double "production."

DAVID W. HEDWORTH.

Poole, Dorset.

## RIBA

### Gold Medal to Le Corbusier

The RIBA Royal Gold Medal for 1953 has been awarded to le Corbusier. A brief comment by ASTRAGAL can be found on page 145.

## NFBTE

### Tendering Methods

The NFBTE will soon be examining methods of tendering in collaboration with the RIBA and the RICS. This was an-

nounced by the Federation's president, J. Ian Robertson, last week. "Before changes are suggested," he said, "we must be sure that they are real improvements to a system which, by and large, has worked reasonably well in the past. The National Federation is most anxious, particularly at this time of high prices, that there should be the fullest possible competition in all sections of the building industry."

*Le Corbusier, who is to receive this year's RIBA Royal Gold Medal.*

## COMPETITION

### Hospital at Doha

Architects are invited by the Government of Qatar, Persian Gulf, to submit designs for a

100-bed hospital at Doha. Prizes: £1,250; £1,000, and £750. Designs to be submitted by August 15. Last day for questions, March 31.

The assessor will be Alexander S. Gray, of Messrs. W. H. Watkins, Gray and Partners.

Conditions, which will be available after January 30, may be obtained on application (with £3 3s. deposit) to Captain J. E. Stone, C.B.E., M.C., F.S.A.A., Hon. Secretary and Treasurer, International Hospitals Federation, 10, Old Jewry, E.C.2.

## MODULAR SOCIETY

### Inaugural Meeting

After the recent proposal by Mark Hartland Thomas that a Modular Society should be set up (the proposal was made during the first Alfred Bossom lecture to the Royal Society of Arts), the idea received enthusiastic support. At the inaugural public meeting of the Society at the Royal Society of Arts, last Friday, there already existed a nucleus of membership and a provisional committee under the chairmanship of Alfred Bossom. More than a hundred people who attended the meeting filled in membership forms.

There is only one class of membership. It is open, for an annual subscription of £2 2s., to all who are interested in the Society's aims. The Society is designed to bring together for these aims, on an equal footing, the professional, contracting and manufacturing sides of the building industry.

The aims of the Society are as follows:—  
"The promotion of research, experiment,

## WINNING DESIGN FOR 1956 OLYMPIC GAMES SWIMMING POOL

John and Phyllis Murphy, Peter McIntyre, Kevin Borland and William Irwin (Struct.Engineer.) have won the Australia-wide contest for an Olympic games swimming pool in Melbourne. Seventy-two entries were submitted. Prizes of £A400 were awarded to four other finalists. The winners' reward is the commission to build the pool at a cost of £A350,000.

## HOUSE IN CONNAUGHT MEWS, LONDON, W.1. DESIGNED BY

The site of this house designed by F. R. S. Yorke, E. Rosenberg and C. S. Mardall is 24 ft. deep with a 30-ft. frontage, facing south on to the Mews, as seen in the photograph right. The property, which was purchased with a war damage claim on it, consisted of two stables with a straight staircase between them leading to the exposed first floor, were all that remained of the old building. The only wall for windows was the one facing the Mews, although later on a small window was pierced at the back for the kitchen, seen above right. The

First floor plan

[Scale:  $\frac{1}{16}'' = 1' 0''$ ]

living room, seen in the two photographs on this page, is 21 ft. deep and 15 ft. wide. The kitchen and bathroom have domed top lights and open on to a separate ventilated lobby. The large living room window is set back to form a balcony just wide enough to take a deck chair, and is made up of deep frames providing shelves for plants, so that whilst plenty of light comes in, a screen is formed between the room and the rather undistinguished view. A fitting stretching the length of one wall of the living room consists of book shelves, glass fronted cupboards,

## YORKE, ROSENBERG AND MARDALL

gramophone record racks, a roll front cupboard and a built-in gas fire, and is raised up from the floor above a 10-in. high Hornton stone skirting. This fire is set in yellow-green and white patterned tiles designed by Peggy Angus, surrounded by a stainless steel frame. The floor is paved with Hornton stone, which is carried out on to the balcony. The back wall of the living room has a William Morris wallpaper on it. In the kitchen, bathroom and lobby the flooring is in grey flexible plastic tiling. The staircase is of waxed opepe hardwood. The stables on the ground floor are used as garages with doors of V-jointed oiled iroko hardwood. The external paintwork is white, except for the front door, which is a warm grey. The bricks are grey-brown Buckinghamshire facings, similar to those used on the most recently built adjoining house and for houses on the opposite side of the Mews. The quantity surveyors were George Bessant and Partners. The general contractors were Messrs. Simon Johns.

development and discussion (under certain circumstances also the undertaking of research and development) and collecting and disseminating information concerning a module and related dimensions, in the design and construction of buildings and in the manufacture of building materials, components, fittings and equipment in concordance with such a module, in order to provide buildings to the public at lower cost; and the furtherance of related improvements in technical methods."

The Society will hold regular meetings (at which technical papers will be read), periodical conferences and study groups. It will also publish a bulletin. Members are expected to make technical information—apart from trade secrets—freely available to the Society.

At the inaugural meeting Mark Hartland Thomas pointed out that the Society would not cut across the path of the BSI or the DSIR; rather would it supplement, by direct industrial experience, any studies of modular planning undertaken by those organizations. He said that the Society was not likely to engage directly in industrial research ("except to a limited extent in special cases") but would look mainly to the work of its members for information about experiments.

As soon as possible there will be a meeting, or series of meetings, in which members will debate on the Society's proposal to adopt a module, or a group of related modules (vertical as well as horizontal) for "wet and heavy" construction, as well as for "light and dry." It is hoped that an agreement will be reached on a series of wall and floor finished thicknesses related to the module.

In addition, the Society intends to organize a symposium on tolerances, "so as to begin to build up a body of common experience." It will also sponsor the study of co-ordination of jointing details and will set up a library and information service.

The provisional committee will co-opt others who show interest and will divide itself into two sub-committees; one to consider ways of running the Society, the other to plan its programme of activities.

Applications for membership should be sent to Miss A. F. Annand, 5, Carlton Gardens, S.W.1.

The provisional committee comprises Alfred Bossom (chairman), David Carter, F. W. L. Heathcote, H. Johnson, J. C. Pritchard, James Riley, E. Munro Runtz, K. J. Sommerfeld, M. Hartland Thomas, P. E. Trench and F. R. Yerbury.

*Landscape Projects Connected with Mineral Workings.* Sheila M. Haywood. At Student Planning Group, 28, King Street, W.C.2. 6.30 p.m. JANUARY 29

*President's Address to Students.* At RIBA, 66, Portland Place, W.1. Also criticism of work submitted for studentships and prizes and presentation of prizes by Howard V. Lobb. 6 p.m. FEBRUARY 3

*A New Approach to Town Planning History With Special Reference to the Grid-iron Plan.* Dr. S. Lang. At 66, Portland Place, W.1. (RIBA Library Group Meeting.) 6 p.m. FEBRUARY 9

*Colour in Schools.* David Medd on the MOE Bulletin. At 2, Savoy Hill, W.C.2. Joint Meeting of RIBA and IES. 6 p.m. FEBRUARY 10

*William Allen, of the Building Research Station, Watford, has written the following account of a visit he paid last summer to the United States.*

## AMERICAN VISIT

By William Allen

IN New York everyone goes to see the new Lever Building (above) and I queued with other architects from the American Institute of Architects' Convention then in progress across the street at the Waldorf Astoria. No doubt a great deal will be written about this remarkable building and this is not the place to talk about it in detail. But I would like to say that I think it must surely be one of the most important buildings built in our time, and there are at least two or three technical points which I might say something about.

Its cladding is of course the first thing to catch the eye, for it mirrors the nearby buildings and shimmers in a way only seen before in the UN Building, or in carefully taken photographs of Rockefeller Centre. The vertical lines of stainless steel catch and reflect the sun in a great arc of glinting highlights, while between them the windows of pale green glass give a shape to the whole casing which clear glass would lose—though there is in the effect a slight reminder of an aquarium which some may think significant. One is left with the impression that the line of thought which produced the cladding of the UN Building has here been carried a long way forward, and it seemed to me to have a character which is just right for urban office buildings.

But the shape of the building is really

more important. It will be remembered that towards the end of the war the Ministry of Town and Country Planning, as it then was, and the Building Research Station put forward ideas for building design in central areas to improve daylighting, reduce noise, reduce fire risk, increase land-utilization and give a handful of other advantages. Holford and Holden have pushed these principles ahead in their City of London reports.

Broadly, the idea was to plan the ground level pretty freely, cover the site with one or two storeys, and then carry up a high slab or tower to hold the remainder of the floor area, working to overall maximum plot ratios (i.e., ratios of floor area to site area) of 5 or 6:1. I have no idea whether the architects of the Lever Building studied these proposals of ours or not; probably not, but they have nevertheless hit the nail on the head. Here is the ground floor treated almost wholly as open space, except for a glass cage under the tower, which is the lobby. A big patio lies to one side and the whole is accessible to the public. Then over the whole site, except for a hole to let sunlight reach the patio, comes a single storey layer of offices. This gives shelter to the street level and nicely defines the extent of the site. Finally, there comes the great vertical slab of offices, somewhat to one side of centre, poised lightly above the horizontal matrix, from which it is separated by the restaurant, which is recessed and in shadow. It all seems so clear, and easy. Even the density (the plot ratio is about 6:1—half that of Rockefeller Centre) is right for a site this size, judging by British studies. So here we have a real text-book example of urban building by our own thesis. But it is a little sad to think that it took a British client and an American architect, working in America, to do it.

### AMERICAN OFFICE DESIGN

One other impression of this building is of the way it exemplifies internally the modern American idea of office design. The windows are clear, pale green, plate glass—greenish to reduce heat gain in summer and sky glare at all times. Then they are fitted with louvre blinds, which were mostly in use when I was there, down almost to the bottoms of the windows; and finally, having thus twice cut down the illumination from outside, they turned on the artificial light throughout the building and ran it full steam all day.

Ventilation was, of course, artificial with air forced in through anemostats in the ceiling and extracted down the building near the lift shaft. Artificial ventilation is usual now in American office buildings because it enables them to introduce both heating and cooling without very much trouble. I have no experience of modern Ameri-

can winter heating in these buildings: people tell me it gets very hot and stuffy, but I was very grateful indeed for the cooling when temperatures outdoors were 100° F. or more. In the Lever Building they had gone so far as to fix-glaze all the windows; the only doubt I had about the wisdom of this was what the staff would do when they wanted to contribute telephone directories and other old paper out of the windows for New York's traditional greetings to heroes.

### ARTIFICIAL LIGHT DEFENDED

At first impression it seems silly to reduce daylight and run artificial light all the time, but having seen it I must defend it in some ways. It is very comfortable, and the reduction of illumination near the edge of the building makes it possible for the artificial lighting to give the impression of the whole interior being equally satisfactory for work. This is the important point, for it makes it possible to put clerical and administrative staff in large groups out on the open floor, with only the most senior administrative people off to one side in cages, and this is the way Americans often have things. Definitely in its favour is the very high space utilization which results. The principle could be made inoperative, of course, by noise problems, but these are largely done away with now by the universal use of sound absorbent ceilings. Everything was beautifully finished, but unlike the main design and the cladding, there was nothing new in the principles on which they are based.

### REPRESENTATIVE INTERIORS

These interiors were representative of practically all offices I saw. I cannot recall seeing a single plastered ceiling anywhere, except in very old buildings or in houses, all the time I was in the United States. The use of the suspended absorbent ceiling seems to have virtually superseded plastering. Sometimes the ceilings were of metal trays, perforated and carrying some absorbent, such as glass wool, above, but the most common I saw was a compressed fibrous tile looking rather like travertine. This was popular everywhere. Almost all of the treatments are in 12 in. squares. I formed the impression at first that these travertine-like tiles must be ground off after fixing, because they really were extraordinarily flat; I think it is just good manufacture and fixing, however.

The use of greenish glass is by no means so widespread, yet, as are sound absorbent ceilings, but it is unexpectedly popular and extends now even to motor cars, for almost all the new windscreens have this pale green tinge, darkened to a deep green at the top where the risk of glare is greatest. From the outside, as I said, it makes interiors of buildings look somewhat

like aquariums, but from the inside it has remarkably little effect on the scene except to reduce its brightness.

In Detroit I was able to see Saarinen's new Technical Centre for the General Motors Corporation.\* Again, architects will have seen the recent illustrations of the first buildings of this astounding group, but construction has gone much farther than the published photographs have indicated. The centre is for the design, development and testing of all General Motors' products, and is a very large establishment built up in two or three-storey buildings on three sides of an enormous rectangular artificial lake.

### COLOURED BRICKWORK

It is not reasonable to give any architectural opinions about a scheme like this, which is still quite a long way from completion, though I had some doubt about the architectural or utilitarian value of the lake. But leaving the question of general design on one side, the next thing that springs to my memory is the new range of finishes. The most striking at first glance is of course the coloured brickwork outside, which was featured in the published photos. I was told that this was produced simply by taking second grade bricks and dipping one face in the coloured glaze, which was then fired on. The brick has a rough texture, but the colours are pure and vivid, with the exception of the yellow which has turned somewhat greenish because the dark biscuit of the brick shows through in places. It shows through in all the bricks, but on the red and green it produces a rich effect. The big panels of brickwork are placed strategically in and around the buildings and produce an exciting impression. I wish we could get some of these over here.

### METAL FINISHES

Then the interiors; practically the whole of the linings are sound absorbent in one way or another. Mostly I recall flat sheet metal finishes—truly flat in the way that makes a flat surface so beautiful—sometimes perforated when high sound absorption was wanted in the upper frequencies, and sometimes imperforate when merely the lower frequencies were to be absorbed. The metal finishes were of several kinds, sometimes simple flat colours stoved on, sometimes crackle-black or crackle-grey. I noted an ingenious way of hanging big rock wool quilts on the walls before the sheets were put on over them. A dab of adhesive would be stuck on the wall, and immediately a little square of metal with a nail protruding would be forced against it; these would be put all over the walls so that when the absorbent quilt came on the job, it was simply pushed back on to the nails and was

impaled there. It was incredibly quick.

I came in contact with American architectural education twice. The first time was the result of my original purpose in visiting America—to lecture on acoustics at the Massachusetts Institute of Technology. There they had organized a short course for practising architects and other such interested people, to be given by the three professors who are concerned with acoustics at MIT—one a physicist, one an electrical engineer, and one an architect, who had invited me to join them.

### TEACHING TECHNIQUE

I was interested in the technique they used and found it worked exceptionally well. The "student" body numbered about twenty-five, consisting largely of principals from architectural offices in various parts of the country, and teachers from schools, with a smattering of other people with professional acoustical interests. The technique for giving the course was very simple: we merely took one branch of acoustics each day, with two or three of us always in the room together, taking the lecturing along rather loosely from one to another as we found our own background gave us something to say. Slides and data hand-outs were organized of course. In this way the students were saved from the boredom of a single voice, and the teaching staff were saved from the labours of preparing numerous formal lectures. It was possible, working thus together, to give fifty hours tuition in the one week. We found this just sufficient to cover the subject nicely for this type of student; it included, of course, some demonstrations and "live" exercises such as the testing of intelligibility. These helped to ease the strain. In the middle of the afternoon we would begin a general discussion of the day's subject matter, with breaks morning and afternoon for coca-cola.

### POST-GRADUATE EDUCATION

My other contact with education came in New York, where the Association of Collegiate Schools of Architecture was meeting with the American Institute of Architects. There were several interesting discussions, but the one which most captured my interest was their symposium on post-graduate education for architects. Two or three papers drew together the experience of the last ten or fifteen years in the few schools giving an advanced degree, and it was clear that the extra year was being used, often, not as an additional stretch of studio design, but as a year of training for original research and development. As one would expect, it is these courses which are now producing the scholars and the teachers for American schools of architecture. It seemed to me to be turn-

ing a somewhat doubtful adventure into a very considerable success.

### EXPERIMENTS IN TEXAS

My last few days found me out in Texas, where W. W. Caudill is leading a group of people in some work which is very interesting indeed. Mr. Caudill is an architect, bitten like some of the rest of us with the idea of architectural research, and believing, also like us, that it should be in the hands of good designers. To show that this is right and can be done, he stands as senior partner in a successful firm of architects, he looks after some of the architectural teaching at the Engineering Institution there, and directs also the mixed team of architects, physicists and engineers which embarked two or three years ago upon what they call the Environment Engineering Research Project. They are pre-occupied at present with schools and school problems, especially in the south-west USA, and being in a hot part of the world, they started on natural ventilation; but like others of us who have entered this field they have found it necessary to spread over into lighting and acoustics and treat the group of subjects as one concept; and so this work is extending itself in a way which some people will be familiar with through the activities of the Architectural Physics division at BRS. Caudill's team is getting on with the job and there is very little doubt that we shall hear quite a lot from this group during the next few years. Their publications to date set an extraordinary standard for presentation.

I was not able to give much time to housing and saw only a few schemes where I could fit in a visit merely for the interest of it. Some of Charles Goodman's work in Washington was clearly very interesting, with a rather West Coast use of open planning and glass, sub-divided in a kind of simple modular system. He seemed to be using mostly redwood claddings externally, with areas of clinker blocks—the Americans make exceptionally good ones—which were given a coat or two of special paint. This was the only "modern" housing I saw, though I visited a few good individual homes.

### THE HOUSING RUT

Otherwise I was forcibly reminded of the transient character and general tawdriness of wooden houses. Childhood memories of "individualistic" houses in long straight rows, one after another like mal-formed peas in a pod, rushed back upon me, with verandahs shading dark and airless interiors, and heavy, unhappy roof lines hanging over the upper storey like furrowed brows. Our own heritage is just as bad, and in some ways worse, of course; but my impression is that they are finding it harder to get out of this particular rut than we are.

\* JOURNAL for January 24, 1952, p. 136.

William Allen, who writes of his recent American visit on the previous two pages, spoke last week at the RIBA. Extracts from his talk, which was sponsored by the BRS, are given here.

## MODERN AMERICAN FACTORIES

### Extracts from William Allen's RIBA Talk

**D**ESPITE all the competition between designers and all the diversity of their clients' needs, there has emerged from both sides one conception, and one conception alone, of the type of building needed for the broad mass of industry. This forms the core of American industrial construction today, and designers and clients alike depart from it, on the whole, as little and as seldom as possible. The highest practicable degree of adaptability is their defined aim, and the consequence is a single type of building which houses an increasing variety of industry. The explanation is simple, and seems convincing; adaptability, they say, is in the national interest because it eases the transition from war to peace production and vice versa, thus increasing national strength.

The chief elements in adaptability as practised at present are adequate height, adequate bay size, a roof system capable of taking reasonable hung loads at any point, a clean floor plan, facilities for good artificial ventilation, often up to full conditioning, and a high uniform level of artificial light.

The clear height usual below trusses today is 18 ft. The plan is usually laid out on a 10 ft. grid, with a bay size of 40 x 60 ft., tending to 40 x 80 ft. or 40 x 100 ft. They use flat steel trusses, about 6-8 ft. deep, and an extremely interesting development—a straw in the wind—is the laying in of stocks of these standard trusses by steel fabricators, so that they can be taken "off the peg" as it were. The trusses are classified according to the hung loads they are designed to take, which are generally over a range from 1 to 3 tons per panel point, or three times this amount per bay.

*This building, designed and built by Austins of Cleveland for Lincoln Electric Co., Cleveland, is described by William Allen as one of the latest and probably the best of the entirely windowless factories. A two-storey office block lies inside on the short axis; a tunnel goes through on the long axis, with toilets, lockers, power and cafeteria to either side. (Photo from Architectural Forum.)*

#### THE FACTORY PLAN

The chief elements in the plan are much the same as they are here, but the location of the locker rooms and toilets and restaurant is an interesting problem. One requirement is that none of these should be on the factory floor. Another is that toilets should be within two minutes' walk of all working areas. A third is that they should not be below ground, where supervision becomes more difficult. On the whole, American designers have tried to keep the whole floor area clear for the owner right up to the bottom chord of the trusses, and this has led to a trend to put locker rooms, toilets and transformers into the depth of the trusses, just below the roof. Since this is not always easy to arrange, there have been occasional uses of pent-houses for this purpose. This is simpler for planning, but means a great height to reach a toilet, and the height is of course increasing. A third course is the one that seems most likely to survive, which is to put toilets, lockers and transformers—and often the restaurant—on mezzanines. This leaves the owner his floor space clear, and is a reasonable compromise in other respects.

#### LUXURY LOBBIES

I became increasingly aware that entrance lobbies were given a lot of attention and that they shared certain characteristics. They were much of a size, about 25 or 30 ft. square and 15 to 20 ft. high. They had good, and often magnificent floors, good modern carpets and furniture, attractive indoor planting and splendid curtains. At a strategic point there would be an efficient looking control desk with an efficient and very presentable receptionist in control. As you probably know, it is quite a common practice in America to have one entrance only for management, personnel and visitors alike, and where this is the case it has been noticed that a good entrance has a very good effect on factory housekeeping. Apparently the men cannot cross a well-designed room of this size, especially over a fine floor, and pass the receptionist as well, without feeling that dirty shoes, dirty clothing, and bad behaviour generally is out of place.

#### ARTIFICIAL LIGHTING

Natural lighting from the roof is attempted less and less. North lighting was abandoned 25 or 30 years ago because it was difficult to ventilate and the directionality of the lighting created serious working difficulties, as we, too, sometimes find. They went over to the monitor, which reduced the directional effect but gave uneven and inefficient lighting the way they did it. Then wartime experience of black-out factories without roof lighting showed that the artificial lighting was acceptable by itself, and that if the money saved on capital and maintenance costs of monitors (some 10 per cent. of total factory cos.s) were put into good artificial ventilation, the nett result was much better working conditions.

The vision strip, about 6 ft. from sill to lintel, can have what are loosely called psychological effects of relief even in the middle of a factory 500 ft. square, and I believe this to be the policy that will survive and become standard.

It was surprising to find, with this tendency to rely on artificial light, that the quality of artificial lighting was poor. Its quantity, at uniform levels of 35 ft. candles or so, was very satisfying, of course, but not once did I see in a working area any direct light allowed to reach the ceiling, though an upward proportion of  $\frac{1}{10}$  to  $\frac{1}{4}$  has been a common recommendation both here and in America in recent years. The lighting people deplore this, but clients have been curiously impregnable to advice in the fear that they were losing something. Fortunately it has now been found that if fittings are perforated to allow a proportion of upward light, the better ventilation of the units keeps them so much cleaner, and lets the lamps operate so much cooler that there is usually no appreciable loss of operating efficiency as compared with conventional direct fittings, and the visual benefits are thus obtained more-or-less for nothing.

The really interesting thing to see was the uniform and relatively strong illumination, which is taking the place of the various levels of illumination related to the visual difficulty of the task. If the poor quality of the artificial lighting was a surprise in factories with an artificial climate, an even greater surprise was the almost total absence of colour.

#### ARTIFICIAL VENTILATION

Artificial ventilation is of course the established practice; it is not always done, but those who do not do it usually regret it in the summer. Common practice is to design for 4 to 7 summer air changes, or about 2 cfm/sq. ft., and to reduce this to about 1 to 1½ fresh air changes per hour in winter, with re-circulation of up to 75 per cent. of the total air, thus utilizing the remainder of the capacity of the fans.

Since they have the artificial ventilation plant, heating is naturally done by warming the circulated air; no radiant heating was seen. Cooling is said to be becoming common, but humidifying and filtering are still unusual, though filtering is perhaps fairly widely accepted.

May I ask you finally to consider what new direction, if any, we should now take? My own feeling runs somewhat thus: that we should press for the standardization and stocking of clean, economic, adaptable and attractive steelwork; that we should ask for adaptable ventilation plant along the American lines I described, co-ordinated with the steelwork. No doubt we should have monitors available to us when needed. And we should standardize in a way that facilitates the supply and fixing of good standardized lighting and power gear. I should like to see an effort made to devise reinforced concrete designs to give adaptability, for they can have the merits of cleaner design and lowered maintenance costs. And then I think we should aim to increase in every way studies of industrial technology.

## FLATS

in BEEHIVE LANE, ILFORD, ESSEX  
for the ILFORD BOROUGH COUNCIL

designed by L. E. J. REYNOLDS

senior assistant architect, H. B. N. NIXON

assistant architect-in-charge, R. C. EDLESTON

quantity surveyors, WALTER W. GREEN and PARTNER

Beehive Court, consisting of a block of 11 old peoples' flats (completed in 1951) and a 7-storey block of 38 flats for the middle income group, occupies a 2-acre site, on which originally stood semi-derelict industrial buildings. The area in which the site lies is to the south of Eastern Avenue, near Gants Hill station, and mainly contains semi-detached houses (a few can be seen in the photograph, left). The density of the Beehive Court development is 90 persons to the acre.

*The 7-storey block with the old people's flats on the left.*

**SITE.**—In making its decision to purchase this site the Council was influenced by the following considerations. To restore the original, war-damaged buildings would have perpetuated an industrial use of the site, which was inconsistent with the residential character of the area. The site is within a few minutes' walk of an underground station, bus routes and shops. The existence of all necessary services and two flanking roads meant the minimum expenditure on these normally expensive items. In view of these facilities and the nearness of the site to a fine public park, it was considered suitable

*Left, the covered way between the main entrances, from the north.*

Typical upper floor plan

Ground floor plan [Scale:  $\frac{1}{8}'' = 1' 0''$ ]

for high density development. The two sections of the community, old persons and members of the middle income group, accommodated in Beehive Court, had not been previously served by the Council's post-war housing programme. The shape of the site, its orientation, area and the position of existing trees, determined the layout adopted. All flats overlook a spacious green and the existing trees include elm, apple, pear, cherry, laburnum, plane, poplar and shumac. The service road at the rear of

Site plan

the main block gives access to garages and to the boiler house at the north-east corner of the site. It is also used for refuse removal.

**PLAN.**—The main block has an overall length of 223 ft., a width of 25 ft., and a height from ground floor to top of roof parapet of 64 ft. 9 in. There are fourteen 3-bedroom flats, twenty-four 2-bedroom flats, a laundry, workroom, games room, stores for prams, and garages.

**CONSTRUCTION.**—A reinforced-concrete frame was chosen mainly for economy in steel and is designed on a 12-ft. square grid on plan, 10 ft. where staircases occur. The staircase walls, which are 6-in. solid RC, are designed as vertical cantilevers to resist wind pressure on the whole wall face, in

conjunction with the north and south walls of the block. External panel walls are of 9-in. cavity construction, consisting of a 4½-in. outer skin of facing bricks, a 2½-in. cavity and a 2-in. inner-skin of keyed hollow blocks. The two skins are tied with copper wire butterfly wall ties at 3-ft. by 1-ft. 6-in. centres. Internal partitions are constructed of 2-in. or 3-in. breeze blocks. Party walls between adjoining flats are constructed of two breeze block skins, one 3 in. the other 2 in., divided by a 4-in. cavity for sound insulation. The different thicknesses of these skins adds to the insulation value of the walls. Expansion joints pass through the entire building at these points. The RC beams in the floors are split with ½-in. thick fibre board sandwiched in the gap. The vertical expansion

joints through the external faces of the block consist of  $\frac{3}{8}$ -in. thick by 2-in. deep cork strip inserted in the  $\frac{3}{8}$ -in. joint, covered on the face by an aluminium section fixed to a hardwood strip, secured to lugs built into the brickwork. Where the expansion joints meet windows on the west elevation there are special plate mullions. Through the projecting RC canopy a fibre board strip is inserted; the roof slab is similarly treated but with a V-shaped groove left on the top face of the slab to accommodate the 2-layer mineral-faced felt roofing laid on  $\frac{1}{2}$ -in. fibre board. All floors are 5-in. solid RC slabs. The lift shafts are enclosed in 5-in. RC walls and are carried up fully isolated from the surrounding

designed by L. E. J. REYNOLDS

external painting of metal casement windows is carried out. Floors are insulated against air-borne sound by a 1-in. layer of glass silk quilt, compressed down to  $\frac{1}{2}$  in. thickness, covered with building paper and chicken wire on which is laid a 2-in. thick cement sand screed, the floor finish being chequer pattern cork tiles, 12 in. square and  $\frac{3}{16}$  in. thick in living rooms, bedrooms and corridors. In halls, kitchens, bathrooms and W.C.s the finish is 9-in. square thermoplastic tiles. All internal walls are plastered and distempered, except in tank rooms and the laundry. Windows on the east elevation are standard, but on the west elevation they are purpose-made steel casements. All windows delivered to the site were rust proofed by the electro-galvanizing process. Behind lift shafts are landings, accessible from the kitchens of two adjoining flats. These landings are screened on the rear elevation by RC grilles similar to staircase windows on the front elevation, but fitted with framed timber louvres in place of glazing.

**SERVICES.**—There is a combined heating system for the main block and the old people's flats by low pressure hot water, with radiators in all living rooms, bedrooms, work room, games rooms and kitchens. The heating chamber is under the north end of the main block.

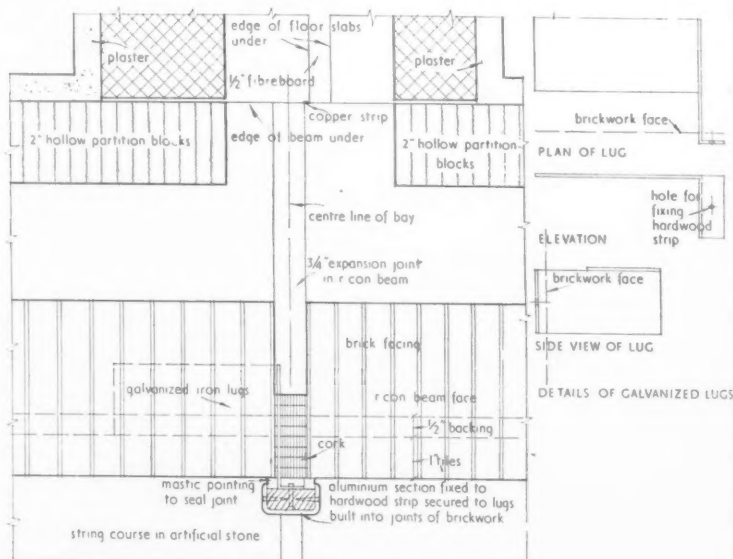

The period for construction of the main block was 18 months and the contract price £98,123. The cost per ft. cube was 5s. and per ft., super 69s. 3d. The

ancillary buildings cost £2,590; landscaping cost, £720. Rents, including central heating, use of laundry, games room and workshop, are £3 1s. 8d. for a 2-bedroom flat and £3 8s. 9d. for a 3-bedroom flat per week.

The general contractors were Gee, Walker & Slater, Ltd. For sub-contractors, see page 174.

## BUS GARAGE

for the LONDON TRANSPORT EXECUTIVE

in WHITEHALL ROAD, THORNTON HEATH, SURREY

designed by ADIE, BUTTON and PARTNERS

under the direction of P. CROOM-JOHNSON, chief engineer to the LTE and T. BILBOW, architect to the LTE

consulting engineer, A. E. BEER; electrical engineers, RONALD EDGAR and PARTNERS

quantity surveyors, HARRIS and PORTER

This garage forms part of the LTE South London tramways conversion scheme and occupies the site of the former tram depot and three houses facing the London Road. The building was planned to accommodate 107 buses, together with five running shift and rota pits, workshops, stores, etc., for engineering staff. The block which faces Whitehall Road contains the traffic offices with staff canteen and recreation room on the first floor.

*The administrative block, from the east.*

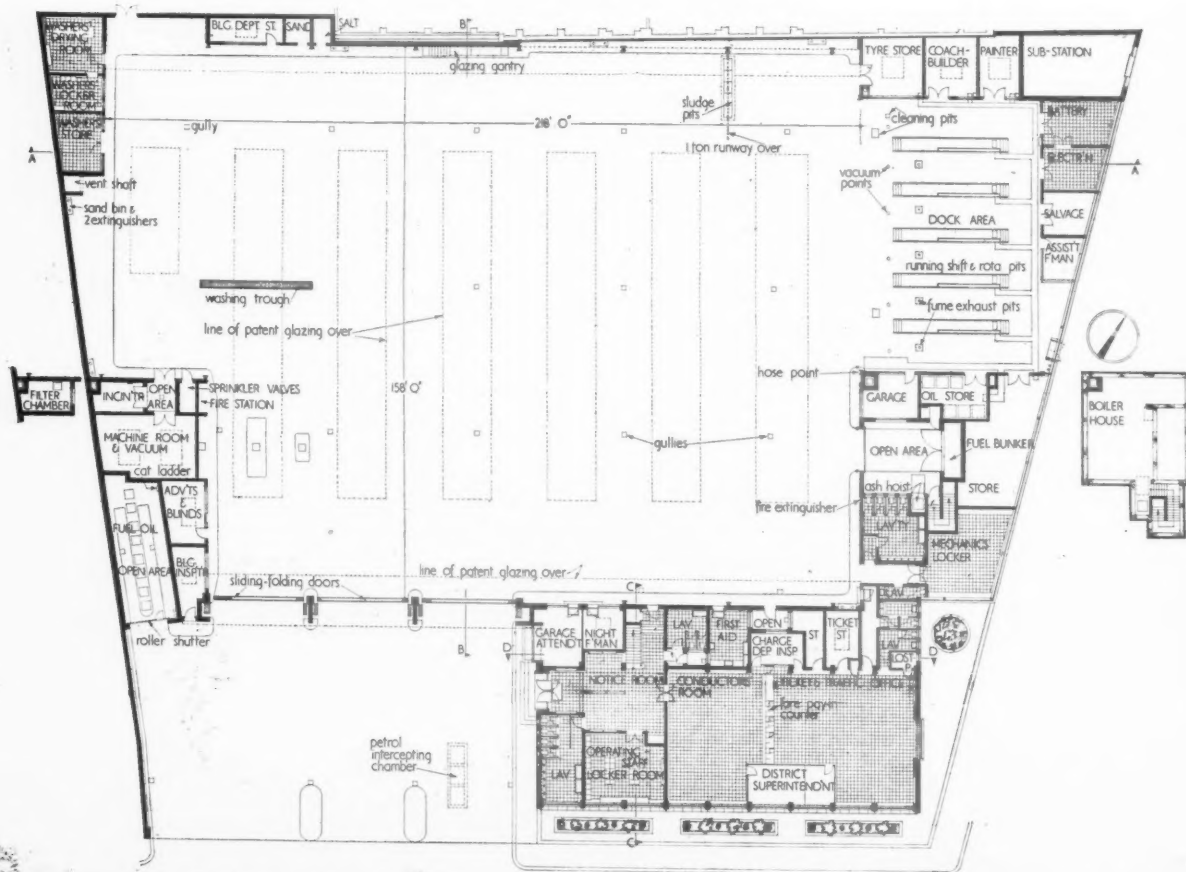

View from the south-east, with glazing to the dock area in the background.

## BUS GARAGE

at THORNTON HEATH, SURREY  
designed by ADIE, BUTTON and  
PARTNERS

First floor plan

Ground floor and basement plans [Scale: 1/4" = 1' 0"]

**SITE.**—All the existing buildings on the site, including the three houses, were demolished before building began, with the exception of the sub-station on the south-west side, which could not be demolished until a later date when trams on all routes had ceased to run. The garage has been set back from the old building line on London Road to allow for future road widening and this portion of the site has been made into a fenced garden.

**PLAN.**—The main entrance and exit was planned as far as possible from the main road to allow buses to queue, before entering the garage, without disturbing traffic. The main entrance to the operating and welfare block is off the bus entrance to

allow conductors easy access when paying in fares. There is also access from the parking area for mechanics and drivers.

**CONSTRUCTION.**—The main parking area has a flat roof carried on lattice girders, supported on stanchions and the external walls are solid 18-in. brickwork. Some of the walls formed part of the original tram depot and have been refaced on the inside. The welfare block is completely steel framed; the external walls are of 13½-in. brickwork. Partitions are of 13½-in., 9-in. and 4½-in. brickwork and of 3-in. breeze blocks. All suspended floors and the low level roof slab are of precast reinforced concrete with *in situ* filling.

**FINISHES.** The roof over the parking area is of asbestos-cement decking covered with

three-ply felt and 1-in. macadam intersected with 14-ft. wide skylights. All r.c. flat roofs are covered with 2-in. cork, screeded to falls in sand and cement and covered with three-ply bituminous felt with 1-in. macadam. The main parking and pit area walls are of sand lime bricks, with a 5-ft. cement rendered dado, painted grey. The floors are of hardened granolithic, and the ceiling is distempered cream. The main elevation of the welfare block is faced with 2-in. Portland stone and other elevations are faced with brown rustic facing bricks. All windows are steel, rust-proofed and painted. All workshops have walls of fair-faced brickwork, painted grey to a height of 7 ft. and ivory above. Ceilings are plastered and distempered cream. Lavatories and locker room walls are finished with 6-in. sq. sepia or mushroom

Sections A-A and B-B [Scale: 1/8" = 1' 0"]

PARTNERS

coloured tiles to 7-ft. height and peach distemper above. The canteen is tiled with 6-in. sq. mottled yellow tiles up to 7 ft. and has a floor of heather brown tiles. Window sills are cantilevered over the radiators and covered with laminated plastic.

**SERVICES.**—The welfare block, offices, workshops, stores and pits are centrally heated from a boiler room in the basement. Boilers are fitted with underfeed stokers, gravity fed from a fuel bunker which is accessible from the parking area. A central vacuum system is installed for cleaning buses. Oil fuel tanks are below ground adjoining the entrance. There are two vertical

extract shafts on the north-west side of the garage to assist in the ventilation of the parking area.

The general contractors were M. J. Gleeson (Contractors), Ltd. For sub-contractors, see page 174.

*Above, the welfare block, from the south-west. Below, left, folding-sliding entrance doors. Below, bus being repaired over one of the rota pits.*

## TECHNICAL SECTION

Recently arrived in this country is a publication of the American Federal Civil Defence Administration entitled : *An Interim Guide for the Design of Building Exposed to Atomic Blast*. This is an interesting, if somewhat depressing, document ; architects, one would have thought, had enough problems getting their buildings up, without having to consider what will happen when someone tries to knock them down.

However, the first question that the architect in this country will ask is : " May I use more steel and other materials in order to strengthen my building against the effects of atom bombing ? " To this MOW reply that it depends what the building is for and where it is to be built. In the case of a building in the heart of the country, no ! In the case of a building of national importance in the heart of a city, yes—the Minister *will* take into account the building's resistance to bombing when considering the application for steel.

One particularly interesting point emerges from the American publication—that buildings with continuous frames or with rigid connections have the greatest resistance to bombing ; these are, in fact, forms of construction that are essentially economical in materials.

### 26 SERVICES AND EQUIPMENT standard lifts

This week's  
special article

The number preceding the week's special article or survey indicates the appropriate subject heading of the Information Centre to which the article or survey belongs. The complete list of these headings is printed from time-to-time. To each survey is appended a list of recently-published and relevant Information Centre items. Further and earlier information can be found by referring to the index published free each year

*In a short article below, A. Dixie puts the case for "standard" lifts. Recommended in Post War Building Study No. 9\*, abandoned in the BS C of P, the standardization of lift speeds, dimensions and loading is now under consideration again by a BSI committee. Mr. Dixie claims that the specification of standard lifts by architects, whenever possible, would mean cheaper lifts, better lifts and a reduction in the time spent at the drawing board in the architect's office.*

Part 2 of Post War Building Study No. 9 (*Mechanical Installations*) was devoted to lifts, hoists and escalators. In addition to many pages of recommendations for lifts in various buildings, outline diagrams of many types of lift were given, together with main dimensions for lifts with various loads and

\* *Mechanical Installations*. MOW. (HMSO, 1944, 2s.)

speeds. The committee that prepared this publication represented both users and makers, and its work was the first official effort towards standardizing electric lifts. The value of this work was appreciated by many architects, engineers and manufacturers. One manufacturer, who before the war only made lifts "to order," has installed,

Left, a standard general-purpose lift for 20 persons, exported from Great Britain and installed in Singapore, at the Chartered Bank of India, Australia and China. (Architects, Messrs. Palmer and Turner.) The more standard lifts exported, the cheaper lifts at home will become. Right, standard components need not look dull. These ordinary telescopic gates at Thos. Cook and Son, Ltd. Berkeley Street, have been painted so that as they open and close the patterns change. (Architect, Dennis Lennon.)

since 1945, hundreds of standard lifts, which he claims, with some logic, can be produced far more economically than "tailor-made" lifts.

#### A RETROGRESSIVE STEP

In 1951 the Council for Codes of Practice for Buildings issued BS C of P 407.101 (1951), which covers very similar ground to that covered by Part 2 of *Mechanical Installations*, but there was one vital difference between the two publications: in the C of P, loads, speeds and dimensions were omitted from the diagrams of the lifts. Hence, the basis on which a range of standard lifts could have been built up was destroyed, and architects were left to seek the information they required on space requirements from individual firms, or simply to ask firms to make the best use of a given space.

The following reason for the omission was given in the C of P:

"Owing to the different types of components, e.g., door-operating devices, that are available, and differences in site conditions, it is not practicable to prepare dimensioned layouts to cover the many possible combinations of conditions with electric lifts. Moreover, changes in space requirements occur at not infrequent intervals as improvements in the equipment are made."

This excuse overlooked the fact that what was claimed to be "not practicable" had already been done, both here and in the USA. Fifty per cent. of the output of passenger lifts of one

American firm alone consists of standardized products. It has been suggested that the lift-maker cannot be expected to standardize more than the details of his equipment, and that he should be prepared to assemble his equipment on the site in an infinite number of combinations. But, unless a certain degree of standardization of layout is accepted, the chances of achieving any worthwhile standardization of equipment are severely reduced. All too often, site variations necessitate unexpected changes in equipment. The standardization of components without the standardization of assembly means that the manufacturer is obliged to stock too great a range of components.

#### THE ADVANTAGES OF STANDARDIZATION

Standardization, and the increasing degree of mass-production of components that it makes possible, brings down the cost of a lift, in just the same way as it brings down the cost of any other commodity. Moreover, a cheaper product would enable us to compete more successfully with the USA for foreign markets. Compared with the United States' annual output of lifts, there are in America less firms of lift-makers than there are in this country. Hence, it will be appreciated, American competition is keen. The reader may well ask why, as an architect, he should be concerned with our lift exports. The answer to his question is simply that, if our exports increase, the cost of lifts would fall—to the benefit of his client.

Clearly, too, if the output of lifts was

increased, the firms that make them could devote more money to development work—which, in turn, would mean cheaper lifts and better lifts.

The saving of drawing-office time, both for the manufacturer and for the architect, is another important consideration. In the case of the former, it helps to further reduce costs; in the case of the latter, it means that standard details can be used, and that working drawings are not held up whilst awaiting the arrival of details from the manufacturer.

#### LOADINGS

Standardization means that the architect, instead of choosing any size and loading for a lift, must choose the size and loading nearest to his requirements from the schedule that the industry adopts. The standard loadings for passenger lifts suggested in the Post War Building Study were based on the industry's past practice. They were 600, 900, 1,200, 1,500, 2,250 and 3,000 lb.—for 4, 6, 8, 10, 15 and 20 persons respectively—i.e., based approximately on cwt., rather than, as in the USA, on the unit of 1,000 lb. (Standard loadings for American passenger lifts are 1,000, 2,000, 2,500, 3,000, 3,500, 4,000 and 5,000 lb.) Similarly, standard goods lifts in America start from the relatively large load of 2,500 lb., in contrast to our first size of 10 cwt.

These loads, and the standards for speeds and dimensions, have been criticized. They may, in fact, not be the best figures to adopt. But this does not affect the argument that standardization is in itself a good thing. It is not impossible to change the figures. For example, immediately after the war, the 4-person lift was widely adopted for local authority flats. This was not suitable for carrying a pram, and the use of an 8-person lift, specially-shaped to carry a pram, was adopted instead.

An architect, or his client, can seldom justify the necessity for an intermediate size of passenger lift, and, even then, if the more widespread use of standard lifts brings their price down further, the difference in price between these and a "special" might well make a client change his mind.

#### GOODS LIFTS AND LIFTS IN EXISTING WELLS

Goods lifts do not lend themselves to standardization as readily as passenger lifts. Nevertheless, architects often find that a standard lift will serve just as well as a "special," unless there are very unusual requirements. The replacement of lifts in existing wells can, of course, seldom be done with standard lifts. But, if the practice of using the standard product increases, this will, in time, become possible, and it will mean that the replacement of a lift by a more up-to-date type will cease to be such an extravagance as it often is today.

# BISON PRESTRESSED

## *Notice of Longer Spans*

Our extensive experience in this work, and assured supplies of High Tensile steel wire have enabled us to offer BISON PRESTRESSED UNITS for longer spans than in our published Span Table.

The Span Table published in the Bison Information Book, Volume II, and Prestressed Booklet, is therefore modified as follows :—

**Table of Maximum Spans of Bison Prestressed Floors  
and Roofs for various Loads and Thicknesses**

Depth of BISON SLAB	Dead Weight of BISON SLAB lbs. per sq. ft.	Safe Distributed Superimposed Load (lbs. per square foot)				
		30	60	100	150	200
4½"	30	18' 0"	16' 0"	14' 0"	12' 0"	11' 0"
5"	38	22' 0"	19' 0"	16' 0"	13' 9"	12' 0"
6"	43	25' 0"	21' 0"	18' 0"	15' 6"	14' 0"
7"	48	29' 0"	25' 0"	22' 0"	19' 3"	17' 0"
8"	53	33' 0"	29' 0"	25' 0"	22' 0"	20' 0"

WHEN THE STRUCTURAL STEEL IS BY

**BOULTON  
AND PAUL**

**IT'S A FIRST CLASS JOB**

We have over half a century's experience in designing, fabricating and erecting steel structures in Britain and other parts of the world. One of our many jobs during the past year was steelwork for the Boiler House Building at the Morwell Briquetting Works, Victoria, Australia, to the order of Mitchell Engineering Ltd., in which 4,500 tons of steel were used.

● NORWICH • LONDON • BIRMINGHAM

CRC1958

## ALUMINIUM FLIGHT HANGAR FOR THE COMET AIRLINER

The new flight hangar for the "Comet" has a clear span of 200 ft. (overall width, 217 ft.) and is 330 ft. long. The main structure, consisting of 12 aluminium portal frames, covers, therefore, an area of approximately 66,000 sq. ft., as compared with 107,000 sq. ft. for the Dome of Discovery (span 342 ft.) and  $3 \times 16,500$  sq. ft. for the three-bay aluminium hangar at London Airport (spans 150 ft.). The principal advantages of using aluminium were, firstly, that for a span as great as this the weight of the structure is only about one-seventh that of an equivalent steel structure. Thus, large factory-fabricated elements can be more easily transported and more of the work done in the factory. So that, secondly, site erection is very rapid—the main structure was erected by 18 men in 13 weeks, using only two 5-ton hand-operated cranes, practically without scaffolding. Below, a recent photograph showing completion to date. On the left can be seen the framework for the office annexe. The photograph above is of a model, made by the architects; in the foreground are the offices; and on the right, the control tower. The portal frames (each frame weighs only 6 ton 7 cwt.) have pinned bases of welded steel (see photo on page 170).

The legs of the portals are 8 ft. wide, and the horizontal portions have a constant depth of 10 ft., except at the knee positions, where they are slightly deeper in order to counteract the heavy fixing couples that are induced. The clear height to the underside of the beams is 45 ft. 4½ in. Spanning between the portals are aluminium north-light trusses—23 to each bay, making 253 in all. Each truss weighs only 175 lb. Wind girders have been introduced between the last 3 portals at each end of the structure. The problem of expansion along the 330-ft. length of the hangar has been solved by the introduction of expansion joints at all structural connections on one side of the 6th portal frame from the north end. All sheeting rails and ties on the east side of this portal have slotted holes, the rail stays being formed so as to allow freedom of movement yet still to function as stabilisers for the leg of the frame. Expansion in the width of the building is absorbed by strain in the portal frame members. The north-light glazing is 9 ft. 3 in. deep, with aluminium-alloy glazing bars at 2-ft. centres and ¼-in. wired cast glass. The south slopes of the roof are covered with aluminium roof decking, over which there is ½-in. insulation board and two

The photographs depict the placing of the waterproofed concrete to the floor ducts and also at ground level.

A large quantity of 'PUDLO' Brand Waterproofer was employed for this work and was quickly and accurately proportioned to the cement by measure.

## STRETFORD GIRLS' GRAMMAR SCHOOL

*near Manchester*

Nothing can be more simple than adding a powder to a powder, thus eliminating wastage and loss which often happens with a liquid or paste.

Write for the latest edition of our Book of Directions which gives comprehensive specifications for the waterproofing of most types of structural dampness, both new and old work. This will gladly be sent, post free, upon request.

### CEMENT WATERPROOFER

*The word 'PUDLO' is the registered Trade Brand of Kerner-Greenwood & Co. Ltd. by whom all articles bearing that Brand are manufactured.*

**THE MOST RELIABLE FIRE CEMENT IS 'FEUSOL'**  
—have you tried it?

*Sole Proprietors and Manufacturers :—*

**KERNER - GREENWOOD & CO. LTD. · KING'S LYNN · NORFOLK**

## THE COMET HANGAR — A 200-FT. CLEAR SPAN IN ALUMINIUM (continued)

layers of bituminous roof felt with a mineral finish. The 2-ft. wide boundary gutters, widened out at each corner to form 10-ft. by 12-ft. platforms, are fitted with aluminium handrails so that they may be used as walkways. They are drained by six  $4\frac{1}{2}$ -in. dia. aluminium-alloy down pipes. The east wall, and the west wall above the roof level of the brick-clad annexe, is clad with corrugated aluminium-alloy sheeting, and lined with  $\frac{3}{8}$ -in. asbestos-wood board fixed with T-section aluminium extrusions. Aluminium-foil insulation has been used. The main sliding/folding doors give a clear opening 200 ft. wide and 44 ft. 9 in. high. Two sliding/folding doors, 12 ft. wide and 15 ft. high, are incorporated in the east wall. The photograph below shows one of the beams, having been assembled on the ground, being hoisted on to the legs of the portal. Top right, one of the welded steel pin joints. Top left, one of the frames being riveted in the factory. Cold-squeezed rivets were used. They fill the entire hole, as there is no contraction after cooling, and are driven with 25-ton pressure. The yoke (seen in the photo) used to rivet against weighs  $\frac{1}{2}$  ton; it is suspended from the roof. The loading conditions are in accordance with those stipulated in BS 449: 1948. In addition to dead loads from the structure and covering, a load of 10 lb./sq. ft. to allow for snow, and a load of 2 lb./sq. ft. to allow for lights, sprinkler system, etc., were taken into account. (Architects, James M. Monro & Son; consulting engineer for foundations, J. Bak; consultants for materials, Fulmer Research Institute; contractors, page 174.)

## INFORMATION CENTRE

*A digest of current information prepared by independent specialists; printed so that readers may cut out items for filing and paste them up in classified order.*

### 8.33 surveying and specification SURVEYING

*Surveying and Field Work.* J. Williamson. (Constable & Co. Ltd. 1952. 40s.)

3rd edition of well-known work on surveying; now contains 20 chapters, 551 pp. and 337 figs.

The main revision of this book consists of the addition of a chapter on hydrographic and hydro-electric surveying, which not only describes methods of making soundings for river beds, harbours, etc., but includes methods of measuring and recording water flow in rivers and channels by making use of weirs and current meters.

The various types of survey—chain, compass, theodolite, plane-table and tachometric—are adequately described, as are the necessary instruments and their adjustment; the practice of levelling; the various types of level and the preparation of sections. The setting-out of works is dealt with in detail and there is a chapter on the measurement of earthworks. The book is well illustrated, easy to read and gives throughout the practical aspects of surveyors' problems.

### 9.32 design: general BRS

*Building Research.* 1951. DSIR. (HMSO. 1952. 4s. 6d.)

Annual report of BRS. To keep even remotely up to date with new developments one must read this. A 60-pp. report with something of interest, and often something new, on almost every page. An infuriating document because it cannot go far enough on any subject to do more than whet the appetite. The list of 1951 publications is, at first sight, impressive but, when compared with the number of subjects covered by the report, it emphasizes once again the time lag between research done, or in progress, and the results getting across to the industry. The increasing amount of work being done on productivity, and especially on building plant, is reflected in part of the report.

### 9.33 design: general REFERENCE BOOK

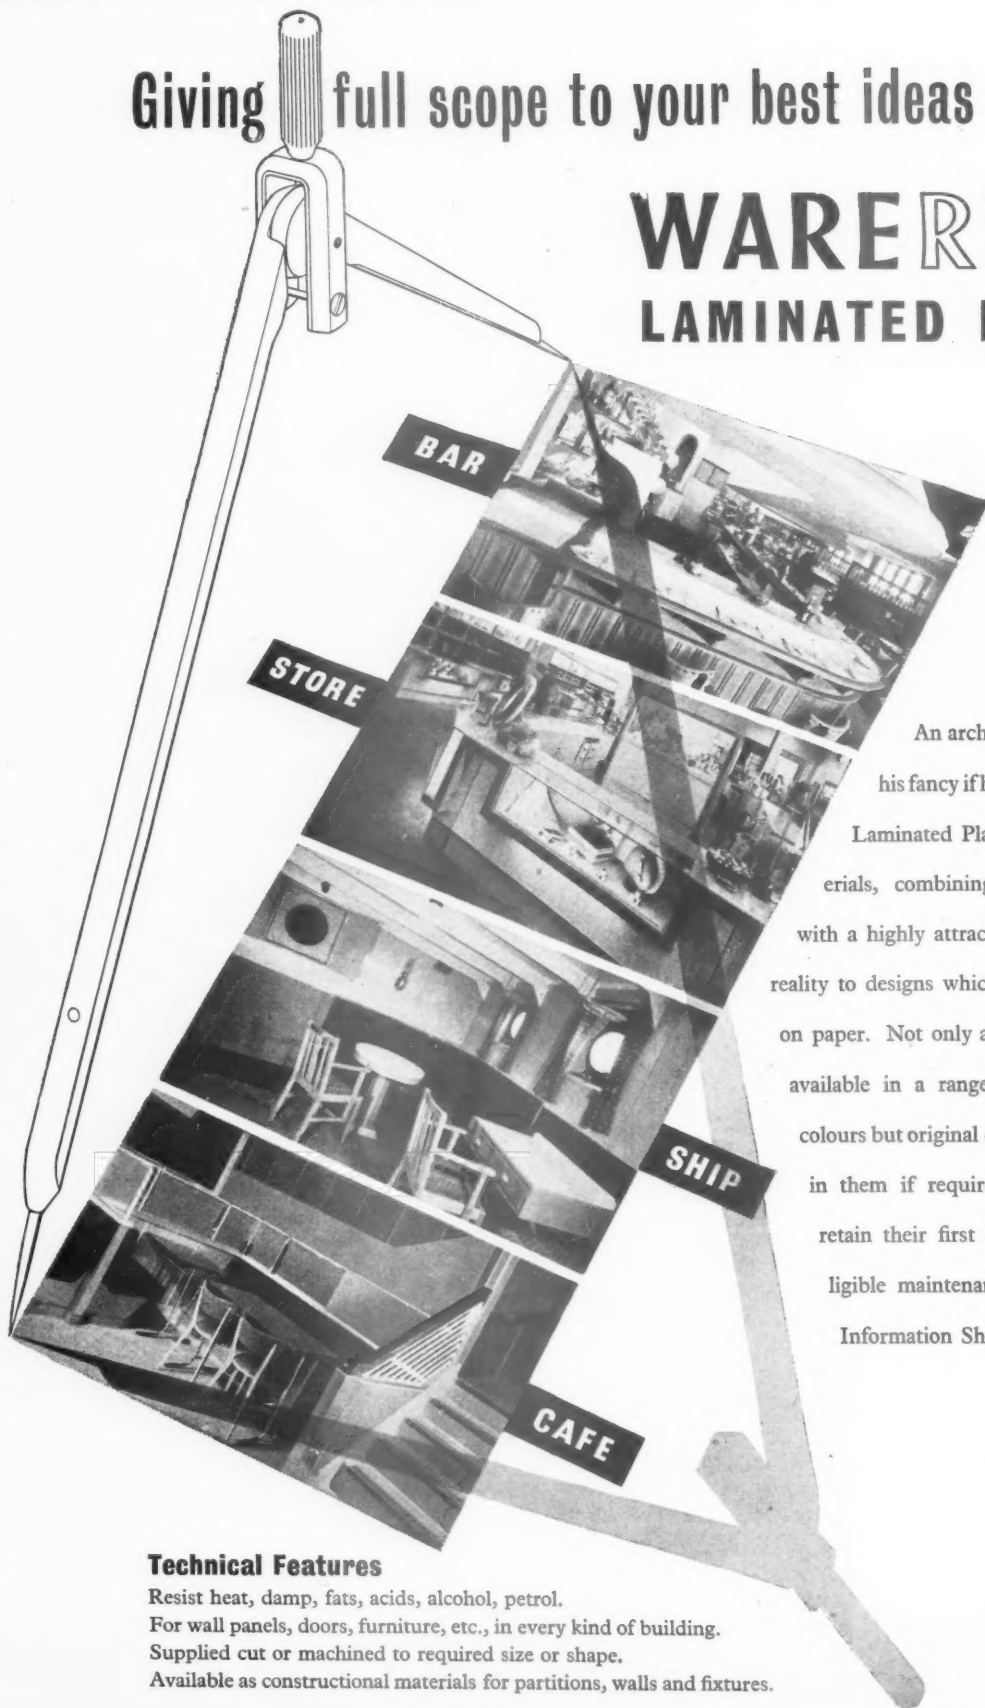

*Architects', Builders' and Civil and Highway Engineers' Reference Book.* (4th edition.) (Geo. Newnes Ltd. 1952. 5 gns.)

Having reached its fourth edition, this encyclopædia is presumably now sufficiently well known to need little description. It contains several special articles, including one on schools.

The various sections dealing with materials, finishes and fittings each contain an article

Giving full scope to your best ideas

# WARERITE<sup>REGD. TRADE MARK</sup> LAMINATED PLASTICS

An architect may give free flight to his fancy if he remembers WARERITE Laminated Plastics. These unique materials, combining hard wearing qualities with a highly attractive appearance, can bring reality to designs which might otherwise remain on paper. Not only are WARERITE Materials available in a range of patterns and delicate colours but original designs can be incorporated in them if required. When installed, they retain their first finish for years at a negligible maintenance cost. Please write for Information Sheet . . .

## Technical Features

Resist heat, damp, fats, acids, alcohol, petrol.  
For wall panels, doors, furniture, etc., in every kind of building.  
Supplied cut or machined to required size or shape.  
Available as constructional materials for partitions, walls and fixtures.

WARERITE LIMITED (UNIT OF BAKELITE LIMITED) • WARE • HERTS • Telegrams: WARERITE WARE • Telephone: WARE 502

of a rather general nature; in most of these some reference is made to recent developments. At the end of each section is a list of manufacturers and suppliers, together with the names of the materials they supply. Unfortunately, these lists do not seem to be comprehensive. The sections are interspersed with pages of advertisements. About 70 pp. are devoted to a section called "Progress and Development," which consists of very brief descriptions of new products, mostly in a form easily recognized as resembling manufacturers' "hand-outs."

In this book's 1,000 pages there is a great deal of information, but whether this type of book is the best way to provide architects with it, is open to question.

### 10.101 design: building types CHURCH ROOFS

*Church Roof Coverings. Committee Report. (The Builder Limited. 1952. 2s. 3d.)*

This report by a committee appointed by the Central Council for the Care of Churches commences with a one-page summary in which it is made clear that the Committee is rigidly opposed to the use of any non-traditional coverings.

It seems curiously illogical for the committee to insist that "substitute materials" should not be used, because they are of doubtful durability, yet to accept the use of thatch. It might be argued that thatch must be used sometimes to retain the character of a building—indeed, the Committee seems to regard changing the character of a building as the eighth deadly sin—yet it seems prepared to consider the substitution of copper for lead, in some cases. Aluminium is given a very grudging welcome. Zinc, asphalt, bituminous materials, and asbestos-cement are rejected, except for very limited uses.

In 28 pages, each type of roof covering is dealt with in detail, under the headings: History, Aesthetics, Suitability, Durability and Technical Notes. These sections are illustrated and form, in effect, a code of practice for church roofing. They contain useful information which would be difficult to find in any other single publication.

### 15.108 materials: applied finishes and treatments PAINTING ASBESTOS CEMENT

*Painting Asbestos Cement. MOW Advisory Leaflet No. 28. (HMSO, 1952. 3d.)*

Difficulties in painting asbestos cement are due to the absorbent surface and the presence of alkalis. A completely dry sheet, which will be maintained in dry condition, is not likely to be difficult—but such conditions rarely occur. The leaflet describes clearly various types of treatment suitable for external, damp internal and dry internal conditions. It deprecates treatment with hydrochloric acid or zinc sulphate as an attempt to neutralize alkalis. Areas of unequal suction need equalizing and back painting is recommended when the back of sheets are exposed to moisture, especially if the front is to be decorated with an impervious paint. The painting of rainwater pipes is useless unless the insides of the pipes have been factory treated with a bitumen coating. A clear and useful guide.

### 18.113 construction: theory PLASTIC THEORY

*The Collapse Method of Design. (British Constructional Steelwork Association. Publication No. 5, 1952.)*

Second publication in the series explaining the plastic theory of design for steel members. 52 pp., 71 diagrams.

The BCSA Publication No. 3 (the subject of Information Centre Item 18.94:14.2.52) was a brief introduction to the plastic theory; it foreshadowed the release of further publications demonstrating the method of design in greater detail. Publication No. 5 is the first of these.

It covers the design of fixed and continuous beams and pinned-base portals under static forms of loading. Design is confined to simple joist and welded compound joist construction as built-up plate web sections have not yet been explored fully.

The theoretical cases considered are well explained and easily followed by anyone with a moderate knowledge of structures. A practical example is given of a ridge portal mill building with a travelling crane, which shows the slightly more complicated conditions arising from a variety of loading. Two points must be appreciated, though they are not by any means a cause for alarm: first, that with the lighter members used there will be greater deflections and, second, that in certain cases a slight permanent strain may develop under working load.

This booklet, along with others which are to follow, will do much to further the cause of plastic theory by bringing information which has hitherto been restricted to papers at professional institutions within easy reach of the designer.

### 18.118 construction: theory WELDED DESIGN

*Welding and Cutting of Metals. BS 499. (British Standards Institution. 1952. 21s.)*

Revised BS giving glossary of terms and symbols relating to the welding and cutting of metals.

Since the 1939 edition of this standard there has been a considerable increase in the application of welding—partly as a result of the war, partly as a result of consequent development in technique. The Standard includes the publication known previously as BS 499, Part 2, which deals with terms relating to imperfections in welds which are appropriate for radiographic examinations. To enable related terms to be associated and to simplify reference, the glossary has been divided into a number of sections dealing with:

- (a) Terms common to most types of welding;
- (b) Welding with pressure;
- (c) Fusion welding (welding without pressure);
- (d) Brazing and bronze welding;
- (e) Testing;
- (f) Weld imperfections;
- (g) Scheme of symbols;
- (h) Cutting.

The publication is fully illustrated with sketches and line drawings; the section on radiographic examination includes reproductions of radiographs; and the scheme of symbols is profusely illustrated with examples showing its application. An interesting item is a chart showing the derivation of various welding and cutting processes. There is a fully cross-referenced index of all the terms dealt with in the Standard.

### 20.215 construction: complete structures SHELL ROOFED STRUCTURES

*Factory at Brynmawr. (Cement and Concrete Association. 1952.)*

22-pp. booklet describing the Brynmawr factory, with emphasis on construction and the use of concrete.

The Brynmawr project has received sufficient publicity to make a detailed description here superfluous. The main features are the shell roofs of the main building, the drug and mill room roofs, and the south block. The nine domes of the main building each cover an area 82 ft. x 63 ft. and rise approximately 8 ft. from springing to crown. They are thin two-way curving slabs, for the main part 3 in. thick, reinforced by two layers of 6-in. square mesh, weighing about 3 lb./sq. yd. The drug and mill room roofs consist of multiple barrels; those over the former having a chord width of 12 ft. 9 in.; those over the latter, a chord width of 30 ft.

The entrance hall in the south block is of unusual design—a single vault spanning 57 ft. between the supporting solid wall end frames and cantilevering nearly 6 ft. beyond them. The chord width is 37 ft. 7 in.; the total rise, 7 ft. 2 in.

The booklet has over 40 illustrations and provides a convenient summary of the job for office reference.

### 25.89 water supply and sanitation WATER SUPPLY

*Water Supply. BS C of P 310 (1952). (British Standards Institution. 6s.)*

Long list of relevant BS, with some notes on supply from sources other than company main. On the whole this section is disappointing as almost all difficult points are covered by mentioning "the need to get expert advice."

This BS contains useful information on water storage and piping in building and there are some useful tables of water requirements, weights of pipes, fixings, etc. Some of the limited information on hot water and heating is largely a repetition of parts of fuller descriptions given in other Codes.

Where somewhat involved descriptions are given about good or bad arrangement of piping, it is an effort to follow the text, and it would have been helpful to have included some diagrams.

## ENQUIRY FORM

I am interested in the following advertisements appearing in this issue of "The Architects' Journal." (BLOCK LETTERS, and list in alphabetical order of manufacturers' names please).

## THORNTON HEATH BUS GARAGE

# ANOTHER **COLEMANOID** FLOOR

### THE LIQUID WATERPROOFER & HARDENER

This is the interior of the new Thornton Heath Bus Depot where the concrete floors have been made dustless and exceptionally resistant to the wear and tear of heavy vehicles by the use of Colemanoid as have two other new garages in the London area. Incidentally, Colemanoid has been used for public transport garages since 1921.

Colemanoid not only adds to the strength of concrete and makes floors oil, grease and

waterproof, but avoids the long delays waiting for frosty weather to disappear. **Make it an integral part of the concrete to avoid the ill effects of frost.**

For further details write to me for Bulletin No. 3.

*Cecil Kahn*

THE ADAMITE COMPANY LTD., Manfield House, Strand, W.C.2.

Temple Bar 6233/6

## THE INDUSTRY

*From the Industry this week, Brian Grant reports on a form of thermostat now available for the control of all electrical devices up to 3-kW. loading, two new refrigerators, and an Australian sliding window now being produced in this country too.*

### CONTROLLED HEAT

Before the war, all but the very cheapest of gas cookers had an adjustable thermostat, and the makers of electric cookers rather lagged behind. Now practically all electric cookers have their oven temperature (and perhaps one or more hotplates as well) controlled by "Simmerstat" switches. These are not true thermostats, but are, in effect, the equivalent of the infinitely variable gas taps and, therefore, an enormous improvement over the older type of three-heat switch. The control ranges from off to full heat, and the "Simmerstat" switches on and off so as to give an even heat at the dial setting.

These "Simmerstat" controls are now being produced in switched-socket form, both in 15-amp. 3-pin form, to BS546, and to 13-amp. (3-kW.) rectangular pin form, to BS1363; both types being produced for flush- and surface-mounting. They can be used to replace the normal switched socket for many purposes. In the house, for instance, they can be used to control any heating device not fitted with a thermostat—fires, convector heaters, irons or hotplates; while in factories, they can also be used for controlling the temperature of such things as electric glue pots or soldering irons. They can, in fact, be used with any device not rated at more than 3 kW.

Prices vary from 54s. 8d. to 63s. 4d. each, according to the type and the finish. (J. H. Tucker & Co. Ltd., Kings Road, Tyseley, Birmingham 11.)

### TWO NEW REFRIGERATORS

Two new domestic refrigerators, both of 7-cu. ft. capacity, have been produced by G.E.C. One, the "DMM 71," includes all the essential features at a minimum price, the other, the "DMJ 71," is a more expensive type. The latter includes a full-width freezer, to cater for the growing number of people who make a practice of using quick-frozen foods.

Care has been taken in the design of the new models to save floor space and both types occupy no more than the company's 5.3-cu. ft. model. The height of the cabinets has, however, been increased by 2 in. Both have sealed refrigerator units which require no attention and cause no radio interference. Like the smaller model, they have welded steel cabinets, with interiors finished in white acid-resistant vitreous enamel. The exteriors are stove enamelled, and no screws or bolts are visible whether the cabinets are open or shut.

Shelf area of the "DMJ 71" is 13.4 sq. ft. and of the "DMM 71" 12.5 sq. ft. External dimensions of both refrigerators are: height, 4 ft. 7½ in.; width, 2 ft. 3½ in.; depth, 2 ft. 0½ in. Internal dimensions are:

height, 3 ft. 1½ in.; width, 1 ft. 9¾ in.; depth, 1 ft. 2½ in.

Standard voltage is 200/250 at 50 cycles, but motors wound for any voltage and any frequency from 40-60 can be supplied at no extra cost. Price of the "DMJ 71," including purchase tax, is £147 7s. 7d., and of the "DMM 71," £137 10s. There is a five-year guarantee against faulty material and workmanship in the sealed refrigerator system. (The General Electric Co. Ltd., Magnet House, Kingsway, London, W.C.2.)

### CATALOGUES NOT RECEIVED

One so often finds leaflets badly set-out or un-informative that it is a refreshing change when a manufacturer sends out a prototype catalogue and asks whether it is what one wants or whether it could be improved. The only trouble, of course, is that it's very much easier to say a catalogue is bad than to prepare a sensible list of improvements. Fortunately, perhaps, the provisional effort submitted by "Econa" hasn't anything much wrong with it. The firm, as most readers will know, are pretty deft manipulators of copper tube, and make traps, bent flush and waste pipes and lavatory basin ranges for hospitals and schools, not to mention pre-formed soil and waste disposal pipework for individual jobs.

In general, the data are clearly presented with dimensions, type numbers and brief comments. The only criticism I would make is that the brief contents should stay at the front and the much longer index might go to the back, where most people would expect to find it. I would also omit the large pale blue "Econa" across each page; it can only be of use if a page gets torn out, and the same thing could be done less stridently—and supersede hasn't got a "c" in it. (Econa Modern Products Ltd., Aqua Works, Warwick Road, Tyseley, Birmingham 11.)

### ANTI-STARLING

There has been quite a lot of general discussion recently on how to keep starlings and pigeons off all-too-convenient cornices and other roosting places. Various methods have been suggested, including stuffed snakes and/or owls at strategic points, but a leaflet from a Scottish firm with the odd but perhaps logical name of De-Birding Ltd. suggests a modified version of the electric fence which has been in use for some years to keep cattle where they are wanted. A single wire on small insulators is run along any ledges where birds normally perch and a control box automatically transmits an electric impulse every second or so. The shock does no harm to the birds, but is enough to scare them, and current consumption is very small. (De-Birding Ltd., 8, Drumlanrig Square, Hawick, Roxburghshire.)

### SLIDING WINDOWS

A sliding window which has been in production for some time in Australia is now being produced in this country. The panes are held in a double channel at the top, and at the bottom there is a further pair of channels, each of which contains a groove for ball bearings, these grooves having a further slot below for the removal of dust and water. The track shown in the diagram is suitable for plate glass windows up to 7 ft. high and should be splay cut at each end to allow rain water to drain away. The glass panels, which should be overlapped at least 3 inches at the centre to ensure that they are weatherproof, are locked by end wall fittings entering the finger slots of the glass panels. These locks also prevent the complete panels from being removed bodily from the grooves.

For smaller windows, up to 3 ft. high, there are simple channels without the ball bearing groove. (P. G. Allday & Co. Ltd., Northwood Street, Birmingham 3.)

BRIAN GRANT.

*The "De-Birding" device—a single wire on insulators, transmitting electric impulses to scare birds off ledges, etc.*

*A new sliding window, in production for some time in Australia, now being produced in this country too.*

*GEC's new 7-cu. ft. capacity domestic refrigerator. Above, the "de luxe" model.*

# ARCHITECTS!

**Job/Control Progress Record**  
**— From Enquiry to Completion —**  
**VISIBLY CONTROLLED**  
**ON ONE RECORD**

Here is a completely new record for Architects—  
 designed in conjunction *with* Architects.

It is a simple visible record which controls every  
 undertaking, small or large, from start to finish.

It shows at sight progress on each job: drawings  
 and plans submitted, licences obtained, approvals  
 from Public Health, Town and Country Planning and  
 Central Land authorities.

Details of contractors involved, their estimates or  
 tenders, final costs, etc., are all controlled. Water,  
 gas and other services available—drawing office costs,  
 fees, etc.—are all provided for. In short, one small  
 record gives the visual history of every single under-  
 taking.

This and similar records are available in panels  
 holding just a few jobs or in books and cabinets  
 housing thousands. The cost involved is little. More  
 important, perhaps, the clerical work involved is very  
 little, certainly far less than normally entailed.

Where preferred such records can be slotted into  
 files which house correspondence, plans, etc., such files  
 having flat tops extending the full width of the file for  
 instant vision and colour signalling, thus providing  
 visibility PLUS filing.

Full details will be sent if you will just jot "Architects  
 Records" on your letterheading and send to address  
 below.

## ONE OF THE BEST NAMES IN JOINERY

### THE MIDLAND JOINERY WORKS LTD BURTON-ON-TRENT

Architects and builders know that the proof of good joinery is found in the quality of timber, its condition, moisture contents and the accurate and intelligent interpretation of specifications by recognised craftsmen. That is why so many specify Midland Joinery woodwork for they know beyond doubt that they are assured of complete satisfaction.

We invite your enquiries.

**THE MIDLAND JOINERY WORKS LTD., BURTON-ON-TRENT**

## OLD INTO NEW

### FABRIGUARD

#### at the ATCO 'C' Depot Birmingham

Renovation of old property for new uses is one of the Architects' important and interesting tasks. The nature and condition of the surfaces to be dealt with call for careful choice of paint materials.

The photograph shows the interior of the ATCO C. Depot at Birmingham. When taken over by Messrs. Charles H. Pugh Ltd., this was a much used and dilapidated building dirty and begrimed. Due to their enterprise, however, it is now spick and span throughout the Fitting Shop, Showrooms and Offices.

**Materials used—Walls and Roofing :** 'FLORALAC' Hard Gloss Enamel Paint in Cream and Eau-de-Nil. **Floors :** Hangers Floor Paint in Leaf Green and Red.

The EXTERIOR presented a problem often encountered by the Architect—how to cover successfully a combination of old and renewed surfaces—and get it done quickly. The answer was FABRIGUARD Emulso-Plastic Paint in Porcelain Gloss (Cream and Permanent Green) which provided a smart attractive exterior without risk of reaction from new plaster patches.

For Technical Bulletin on FABRIGUARD and details of FABRIGUARD Contracts, write to :—

The Technical Director HANGERS PAINTS LTD., HULL

#### FABRIGUARD can be used upon :

- New Plaster
- Old Plaster
- Hardboard
- Softboard
- Wood
- Creosoted Wood
- New Cement
- Old Cement
- Asbestos Cement
- Brickwork
- Roofing Felt
- Non-ferrous metals
- Limewash
- Previously Painted Surfaces
- Previously Distempered Surfaces
- Bitumen-coated Corrugated Iron

BIRMINGHAM, GLASGOW

## Warm or cool as the day demands

Whatever the weather's like outside, there's no need to worry, if the house is warmed by the Radiation system of ducted air. Today, hundreds of families all over the country are enjoying the benefits of Radiation Whole-House Warming—its comfort, convenience and economy. Here is the Radiation research team's effective answer to the problem of space and water-heating—health-giving warmth, regulated to meet the needs of the day and hour and carried to every room and passage in the house.

The Radiation system provides warmth all over the house as well as a generous supply of hot water from either a gas installation or a compact solid fuel unit. The solid fuel model incorporates a down-draught furnace and burns any fuel virtually smokelessly. The thermostatically controlled system is so flexible in operation that bedroom temperatures may be raised or lowered 10° in as many minutes. Fuel consumption throughout the year averages about 1½ cwt. a week

and unrationed fuels give excellent results.

Architects, housing authorities and others—especially those interested in smoke abatement—should write for literature or visit the demonstration houses at Stanmore where both solid fuel and gas installations may be seen. But please apply first for an appointment to Radiation Group Sales Limited, Lancelot Works, Wembley, Middlesex. Telephone : Wembley 6221.

Include **Whole-house Warming**  
by **Radiation** ducted air in *your* plan

ISSUED BY RADIATION LIMITED, ASTON, BIRMINGHAM 6, AND 7/8 STRATFORD PLACE, LONDON, W.1

## Domestic heater fitted in L.C.C. new hatted classroom

Photograph by courtesy  
of the L.C.C. Education  
Authority.

—one of the many situations for which the Sugg Assisted-convection gas-fired space heater is particularly suited.

Developed by SUGG of Westminster, the principle of fan-assisted convection is embodied in several different types of heater and heater-ventilator for both industrial and domestic installation.

This new development in space-heating gives remarkably even temperature from floor to ceiling.

Available for flued and flueless operation Economical in installation, very efficient in use of fuel.

See our permanent exhibit at the Building Centre, Store Street, W.C.1.

## Use **BULLDOG'** TIMBER CONNECTORS

'Bulldog' Connectors have solved the basic problem of Timber Construction. They enable simple joints to be made, in which the load is spread over almost the entire cross section of the wood.

In the past much larger sections of timber were needed in order to make the joints strong enough to carry the load.

Now, Timber Construction can be placed on a sound engineering basis, the consequent increase in efficiency bringing outstanding advantages.

*and Save*  
**TIMBER  
TIME  
and  
MONEY**

1 While the members are held temporarily in place by nails, a bolt hole is bored through the assembly.

2 The members are lifted apart and the toothed connectors are placed between the adjacent faces of the members to be connected.

3 The members are then drawn together by means of the bolt until the projecting teeth of the metal plates are completely embedded in each contacting timber surface.

The 'Bulldog' Timber Connector consists of a steel plate with the edges turned off at right angles to form sharp triangular teeth projecting evenly from both sides of the plate.

'Bulldog' Timber Connectors are also made with teeth on one side only for timber to steel joints, or for portable and demountable timber buildings.

## Finish the job in a day!

**This odourless  
interior paint  
dries in 2 HOURS!**

Tretolux provides a LUXURY finish at very low cost. Labour charges are cut, too, and decorating can be completed in *less than 12 hours*, since Tretolux is exceptionally easy to apply by brush or spray. There are no unpleasant odours and the completed job is attractive, grease-proof, mould-resistant, really washable and lasts for years.

► Can be applied direct to NEW PLASTER, CEMENT RENDERINGS and ASBESTOS CEMENT.

► Supplied in White, Off-White and 15 Pastel Shades.

Please write for descriptive leaflet. LA (1)

# BALANCE

High above the streets the "spider man" may be seen at work, passing to and fro along the iron girders with a sure-footedness that has been acquired through a perfect sense of balance.

In the manufacture of paints, a fine sense of balance is equally as important, for the slightest discrepancy in the proportions of the many ingredients makes all the difference to the quality. For over 150 years, Joseph Mason's experts have paid careful and particular attention to this question of perfect balance and the results of their efforts may be seen in the outstanding quality of Lynomas and the many other

# AT LAST! A PERFECT FILLER FOR CHIPBOARDS

"Temprima" was formulated at the request of the chipboard manufacturers for a suitable compound to fill the natural surface irregularities peculiar to all chipboards and to seal the surface to prevent excessive paint absorption. Moreover, it had to be cheap, easy to apply and require the minimum of rubbing down. *Temprima is the first filler to meet all these requirements.*

- Temprima is an oil-bound paste, ready for use.
- Applied only with a broad knife it forms a thin, tough film which dries in 15 to 24 hours, when it will take paint, synthetic enamel, cellulose, French polish, varnish, wax polish or oil-bound distemper.
- Fully tested, approved and recommended for these purposes by the makers of **weygoc** man-made Timber and of **PLIMBERITE** wood chipboard.
- Packed in 1-lb. tins at 3/4d. each or 5-lb. tins at 13/4d. each.

## A new technique in LOCK-UP GARAGES

at half the cost of brick buildings

two

three

or more

With the present-day high cost of building materials and labour, BATLEY Multiple Concrete Garages offer tremendous economies. Employing the well-known Batley principle of tongued and grooved concrete units which are simply bolted together on a firm level foundation, these Garages can be erected by unskilled labour in hours instead of days. In addition to the big saving in initial cost, Batley Garages require no maintenance—they last a lifetime without attention. They are completely fireproof, weatherproof, rotproof and vermin proof. Wherever lock-up Garages are required—for Municipal Housing Estates, Hotels, Flats, Armed Services Camps, etc.—it will pay you to investigate.

### at these low prices

No. of Garages	Size	Clear Height	Total Cost
2	16ft. 3in. x 16ft. 4in.	6ft. 3in.	£125-0-0
3	24ft. 3in. x 16ft. 4in.	6ft. 3in.	£180-0-0
6	48ft. 3in. x 16ft. 4in.	6ft. 3in.	£345-0-0
9	72ft. 3in. x 16ft. 4in.	6ft. 3in.	£510-0-0
12	96ft. 3in. x 16ft. 4in.	6ft. 3in.	£675-0-0

Plus £55 per additional garage to any number required in one block. Also available with a clear height of 7ft. 9in.

## TESTING...

*to Peglers standards*

A Peglers tap lasts for years, because it begins its working life only after many rigorous tests. Peglers laboratory staff first pass the raw metal for tensile strength. Precision instruments measuring to 1/10,000 inch are used for checking tools, jigs and dies. Equally severe are the inspections of component parts made in the machine shops. Finally, before the finished, gleaming chrome tap is wrapped in protective tissue paper, it is scrutinised by a practised fault finder. A Peglers tap is 'made to standard' and to Peglers higher standards, too — *it satisfies everyone.*

## WHY

*it pays to specify*

## EXTRUSIONS

M K B extrusions are extremely handsome in appearance, faultless in finish and minutely close to size. This reduces or entirely eliminates further machining. Time, tools and labour are saved, leading to increased output and reduced costs.

There is virtually no limit to the applications of McKechnie extrusions in brass, bronze and nickel silver.

★ See our exhibit at The London Building Centre, Store Street, London, W.1

# THE MODERN FACTORY

by **EDWARD D. MILLS** F.R.I.B.A., R.I.B.A. Alfred Bossom Research Fellow, 1953

THIS IS A BOOK for architects and industrialists. Its purpose is to help solve the many present-day problems of factory layout, planning, design and construction. It contains chapters dealing with siting and layout; the factory estate; the design and structural techniques employed for modern factory buildings; technical considerations; storage and warehouse accommodation; administration buildings; industrial laboratories; industrial welfare buildings. There are numerous line-diagrams, tables and working check-lists in the text, and the book illustrates, with photographs and drawings, a selection of the more interesting factories recently built in this country and abroad, factories which are not only efficient production units but also outstanding examples of contemporary architecture. It ends with a comprehensive bibliography.

The author, in addition to practising privately since 1936 with notable success over a wide field (including factories, laboratories, canteens) has held several lecturing and examining appointments, has served on a number of advisory panels and is at present a member of the MARS Group executive. He was the zone architect responsible for the Administration Building at the South Bank Festival Exhibition; and he has just been awarded an R.I.B.A. Alfred Bossom Research Fellowship.

Bound in full cloth boards. Size 9½ ins. × 7½ ins. 192 pages including frontispiece and 42 pages of plates; many line drawings, a bibliography and an index.

Price 30s. net. Postage 8d.

### CITY OF PLYMOUTH.

#### CITY ARCHITECT'S DEPARTMENT.

Applications are invited for the following appointments on the established staff. The appointments are subject to the Conditions of Service of the National Joint Council for Local Authorities Administrative, Professional, Technical and Clerical Services; the Local Government Superannuation Act, 1937; a satisfactory medical examination and one month's notice on either side for termination:—

- (a) SENIOR ASSISTANT ARCHITECT. Grade A.P.T., VI (£670 to £735).
- (b) ASSISTANT QUANTITY SURVEYOR. Grade A.P.T., V (£595 to £645).
- (c) ASSISTANT QUANTITY SURVEYOR. Grade A.P.T., II (£495 to £540).
- (d) ASSISTANT QUANTITY SURVEYOR. Grade A.P.T., I (£465 to £510).

Candidates for appointment (a) should be experienced in the design and construction of schools, municipal housing or general work, must be Registered Architects, and preference will be given to members of the R.I.B.A.

Candidates for appointment (b) should be Members of the Royal Institution of Chartered Surveyors (Sub-division III Quantities).

Candidates for appointment (c) should have had experience in the measurement of works on site, and preference will be given to persons who have passed the Intermediate Examination (Quantities Sub-division) of the Royal Institution of Chartered Surveyors.

Candidates for appointment (d) must be capable of squaring and abstracting dimensions, and will be expected to give general assistance in the preparation of Bills of Quantities and the settlement of accounts. Preference will be given to those who have passed the First Examination of the Royal Institution of Chartered Surveyors.

Applicants must not be over 40 years of age, but this condition may be released in the case of a person up to 45 years of age employed by another Local Authority.

Applications on forms obtainable from the undersigned, accompanied by copies of not more than three recent testimonials and/or names of persons to whom reference may be made, should be received at my office not later than the 9th February 1953.

THE CORPORATION MAY MAKE HOUSING ACCOMMODATION AVAILABLE TO THE SUCCESSFUL MARRIED CANDIDATES IF REQUIRED.

H. J. W. STIRLING, A.R.I.B.A.

City Architect.

Seymour Road, Plymouth. 80063

- (d) MEASURING SURVEYOR. Salary Grade: £625 to £830 to £700.
- (e) SENIOR CLERK. Salary Grade: £475 to £540.
- (f) MODEL MAKER. Salary Grade: £470 to £515.
- (g) SHORTHAND TYPIST. Salary: £177 to £363.

Applicants should have qualifications as follows:—

- (a) Be fully qualified Architects, with experience of large building contracts.
- (b) Have completed a degree or diploma course at a recognised School of Architecture or have passed the Final Examination of the R.I.B.A.
- (c) At least Intermediate L.L.A. standard, with experience of tree and shrub planting and preparation of ornamental grass.
- (d) Some taking off experience necessary.
- (e) and (g). Some experience in an Architect's office desirable.
- (f) Must be able to construct models from drawings.

Housing accommodation will be available in due course in appropriate cases.

Applications, stating post applied for, and giving details of experience and names of two referees, to be sent to the Chief Administrative Officer, Stevenage Development Corporation, Aston House, near Stevenage, Herts., not later than Monday, 9th February, 1953. 80062

### MIDDLESEX COUNTY COUNCIL—COUNTY PLANNING DEPT.

PLANNING ASSISTANTS required, A.P.T. IV (£585, rising to £630 p.a. if 26 years or over). Capable of undertaking statistical and territorial analysis. Pref. given if possessing qualifications, in Town Planning, Geography, Economics, or Commerce, but other appropriate qualifications considered. Prescribed conditions. Application forms from County Planning Officer, 10, Gt. George Street, Westminster, S.W.1, returnable to the undersigned by 12th February (quoting L.616 A3). Canvassing disqualifies.

C. W. RADCLIFFE.

Clerk of the County Council. 8070

### HAYES AND HARLINGTON URBAN DISTRICT COUNCIL.

#### ARCHITECTURAL ASSISTANT.

Applications are invited for the above-mentioned permanent appointment in the Department of the Engineer and Surveyor, at a salary in accordance with A.P.T. Division, Grade IV, of the Scales of Salaries, i.e., commencing at £555 per annum and rising to a maximum of £600 per annum, plus London "weighting," amounting to £20 p.a. at 21-25 years and £30 p.a. at 26 years and over.

Preference will be given to applicants who have had experience of housing work and have passed the Intermediate Examination of the R.I.B.A.

Forms of application may be obtained, upon receipt of a stamped addressed envelope, from the Engineer and Surveyor, Town Hall, Hayes, Middx., to whom completed applications must be returned by 16th February, 1953. The envelope containing a request for a form of application should not be endorsed.

A. E. HIGGINS.

Clerk of the Council. 8076

### LONDON COUNTY COUNCIL.

#### ARCHITECT'S DEPARTMENT—DISTRICT SURVEYORS SERVICE.

Vacancies for TECHNICAL ASSISTANTS (salaries up to £696), A.M.I.Struc.E., A.R.I.B.A., or A.R.I.C.S. Structural knowledge essential. Particulars and applications forms, for return by 15th February, from Architect, AR/EK/DS/4, County Hall, S.E.1. (58) 8079

### BUCKS COUNTY COUNCIL.

#### ARCHITECT'S DEPARTMENT.

#### APPOINTMENT OF CHIEF MAINTENANCE SURVEYOR.

Applications are invited for the post of Chief Maintenance Surveyor in the County Architect's Department, at a salary in accordance with Grade X (£895 to £1,025 p.a.).

The duties of the post comprise the administration and supervision of the Section responsible for the repair and maintenance of County Buildings.

Applicants should possess a sound knowledge of all building trades, should have had considerable experience in a similar capacity with a local authority, and should preferably possess some recognised professional qualification.

The successful applicant will be required to report to and attend at appropriate Committees. The appointment is superannuable and subject to medical examination.

A weekly allowance of 25s. 6d. and return fare home once every two months may be paid for six months to newly appointed married officers of the Council unable to find accommodation.

Further particulars and form of application may be obtained from the County Architect, County Offices, Aylesbury, to whom applications must be delivered by 9th February, 1953. 80069

### WEST MIDLANDS GAS BOARD.

#### APPOINTMENT OF ARCHITECT.

Applications are invited from Associates or Fellows of the Royal Institute of British Architects for appointment as Architect to the Board. Candidates must have high ability in design and be capable of preparing and supervising schemes of construction connected with the erection of industrial and commercial buildings.

The post is pensionable and will carry a commencing salary of £2,000 per annum.

Applications, giving details of age, qualifications and experience, and accompanied by the names of two referees, should reach the Industrial Relations Officer, West Midlands Gas Board, 6, Augustus Road, Edgbaston, Birmingham, 15, within fifteen days of the appearance of this advertisement.

F. H. CURETON.

Secretary to the Board. 8069

### SEDGEFIELD RURAL DISTRICT COUNCIL.

#### HOUSING ARCHITECT'S DEPARTMENT.

The Council invite applications for the following posts:—

- (1) DEPUTY ARCHITECT. Applicants must have passed the Final Examination of the Royal Institute of British Architects. They should have experience in the Housing Department of a Local Authority, and be able to take charge in the absence of the Head of the Department.
- (2) JUNIOR TECHNICAL ASSISTANT. Applicants should have served their Articles with a Registered Architect and be able to carry out general technical work in the Housing Architect's Department.

The salary will be in accordance with Grade A.P.T., VI, commencing at £670 per annum, and rising in accordance with scale to £735 per annum.

The Terms and Conditions of appointment in both cases will be in accordance with the National Scheme for Local Government Officers; will be subject to the Council's Superannuation Scheme, and to one month's notice on either side.

Applications for either of the posts must be on forms obtainable from my office, and should be completed and in my hands by Wednesday, the 11th February 1953, at 10 a.m. at the latest. F. J. DAVISON.

Clerk to the Council. 8075

### SEDGEFIELD, STOCKTON-ON-TEES.

#### CANNOCK RURAL DISTRICT COUNCIL.

#### APPOINTMENT QUANTITY SURVEYING ASSISTANT, GRADE A.P.T., VI-VII (£670-£785).

Applications are invited for the above appointment on the permanent staff of the Engineer and Surveyor of the Cannock Rural District Council.

Applicants for the post should be fully capable of taking off and preparing Bills of Quantities for housing schemes, measuring builders' works, and checking and agreeing interim and final accounts, and should preferably have passed the Final Examination of the R.I.C.S. (Quantities Sub-Division).

The appointment will be subject to one month's notice on either side, to the provisions of National Joint Council Conditions of Service and the Local Government Superannuation Act, 1937, and to the passing of a medical examination.

A travelling allowance in accordance with the National Joint Council Scale for casual users will be paid to the successful applicant for the post, who will be required to provide a car or motorcycle.

Applications, giving full particulars of age, qualifications, experience, etc., together with copies of two recent testimonials, should reach the undersigned not later than Tuesday, 3rd February, 1953.

JOHN P. ROBERTS.

Clerk of the Council. 8082

Council Offices, Penkridge, Stafford.

19th January, 1953.

### COUNTY BOROUGH OF BOURNEMOUTH.

#### BOROUGH ARCHITECT'S DEPARTMENT.

Applications are invited for the following appointment:—

- ASSISTANT ARCHITECT—Established Post—Salary Grade A.P.T.V.(a), £625 to £685 per annum. Applicants must be Registered Architects and have had some experience in Local Authority Housing Schemes.

The successful candidate will be appointed at his present salary if such salary is within the incremental scale of the advertised post.

The above appointment will be terminable by one month's notice, in writing, on either side, and subject to the provisions of the Local Government Superannuation Act, 1937, also to the conditions of service in accordance with the National Scheme.

The successful candidate will be required to pass a medical examination.

No assistance can be offered regarding housing accommodation.

Applications, on forms to be obtained from the Borough Architect, Town Hall, Bournemouth, accompanied by copies of three recent testimonials, to be returned to the undersigned in envelopes endorsed "Staff Architectural," not later than 10 a.m. Saturday, 14th February, 1953.

A. LINDSAY CLEGG.

Town Clerk. 8091

**SOLIHULL URBAN DISTRICT COUNCIL.**

**APPOINTMENT OF ARCHITECTURAL STAFF.**  
Applications are invited for appointments as ASSISTANT ARCHITECT and ARCHITECTURAL ASSISTANT in the Engineer and Surveyor's Department. The salary payable in respect of the first appointment is in accordance with A.P.T., Grade VIa (£625-£220-£655), and in respect of the position as Architectural Assistant, is in accordance with A.P.T., Grade IV (£555-£415-£600).

The Engineer and Surveyor is responsible for the erection of houses, schools, libraries and other public buildings in this rapidly developing district, and brief particulars as to the work of the Architect's Section of the Department may be obtained on application to the Engineer and Surveyor, 90, Station Road, Solihull.

The appointment will be subject to the provisions of the Local Government Superannuation Act, 1937, to the terms of the National Scheme of Conditions of Service, and to one month's notice on either side. It may be possible to offer housing accommodation to the successful applicant.

Applications, giving full details as to age, present position and salary, qualifications and experience, together with the names and addresses of two referees, should be delivered, in envelopes appropriately endorsed, to the Engineer and Surveyor at the above address not later than the 9th February, 1953.

W. MAURICE MELL,  
Clerk of the Council. 8083

**NORTHAMPTON RURAL DISTRICT COUNCIL.****GENERAL ARCHITECTURAL ASSISTANT (UNESTABLISHED).**

Applications are invited for the post of General Architectural Assistant at a salary within the range of £465 to £540, per annum, according to qualifications and experience.

Candidates must be experienced in general building work, be neat draughtsmen, have had a good architectural training and with Planning and Byelaw experience.

The appointment which is unestablished will be for a period of three years at least and will be subject to one calendar month's notice, in writing, on either side.

Applications, in candidate's own handwriting, stating age, whether married or single, qualifications and experience, accompanied by copies of two recent testimonials, are to reach the undersigned not later than Saturday, the 21st February, 1953.

Candidates must disclose whether they are related to any Member or senior Officer of the Council. Canvassing, either directly or indirectly, will disqualify.

CLIFFORD E. JONES,  
Clerk of the Council. 8090

**CITY OF SHEFFIELD.****CITY ARCHITECT'S DEPARTMENT.**

Applications are invited for the following appointments on the staff of the City Architect (Mr. J. L. Womersley, A.R.I.B.A., A.M.T.P.I.):—

(a) SENIOR ASSISTANT ARCHITECT (HOUSING), Grade IX. Salary: £815 to £935 per annum. The person appointed will be required to design, prepare working drawings, and supervise to completion Multi-storey Flats and the more complex buildings on housing estates.

Preference will be given to applicants with considerable experience of this type of work.

(b) SENIOR ASSISTANT ARCHITECT (HOUSING), Grade VIII. Salary: £760 to £835 per annum. The person appointed will be required to prepare initial designs for housing layouts and to work them up in detail. Preference will be given to those having a planning qualification or with a particular interest in town planning, the grouping of buildings and landscaping.

Candidates for each post must be Associate Members of the R.I.B.A.

The City's Housing Programme consists of (i) estates in outer areas comprising mixed development of houses and flats, (ii) estates in inner areas containing a substantial proportion of high flats, and (iii) the redevelopment of outworn central areas. The appointments offer considerable scope to progressive architects possessing the requisite qualifications, design ability and experience.

Superannuable posts: N.Y.C. Conditions of Service; medical examination.

Applications, stating age, education and training, qualifications, present and past appointments (with dates and salaries), experience, and the names of two referees, should reach me by the 2nd February, 1953.

JOHN HEYS,  
Town Clerk. 8084

**COUNTY BOROUGH OF BARNLEY.****BOROUGH ENGINEER AND SURVEYOR'S PLANNING OFFICER'S DEPARTMENT.****APPOINTMENT OF SENIOR PLANNING ASSISTANT.**

Applications are invited for the appointment of Senior Planning Assistant at a salary in accordance with A.P.T. Grade VII (£710-£785 per annum). A car allowance will be paid in accordance with the prevailing scheme for essential users.

The appointment will be subject to the Scheme of Conditions of Service for A.P.T.C. Services, to the General Conditions of Service within the Corporation as varied from time to time, and to the provisions of the Local Government Superannuation Acts.

Candidates must have had extensive experience in Town Planning and be Corporate Members of the Town Planning Institute or hold an equivalent qualification. The person appointed will be in charge of the Town Planning Section of the Department and directly responsible to the Borough Engineer for all planning matters.

The successful applicant will be required to pass a medical examination, and the appointment will be subject to one month's notice on either side.

Applications, stating age, present and previous appointments, experience, qualifications, etc., together with the names of three referees, should be addressed to the Borough Engineer and Surveyor and Planning Officer, Town Hall, Barnsley, to reach him not later than Wednesday, 18th February, 1953.

Canvassing will disqualify, and applicants should disclose in their applications whether to their knowledge they are related to any member or senior officer of the Council.

A. E. GILFILLAN,  
Town Clerk. 8078

Town Hall, Barnsley.  
January, 1953.

**FIFE COUNTY COUNCIL.****COUNTY ARCHITECT'S DEPARTMENT.**

Applications are invited for appointments as:—

(a) CHIEF QUANTITY SURVEYOR, on salary Grade £750, rising by £50 to £1,000 per annum.

(b) ASSISTANT ARCHITECTS, on salary Grade £730, rising to £840 per annum.

(c) ARCHITECTURAL ASSISTANTS, on salary Grade £530-£650 per annum.

(d) ARCHITECTURAL DRAUGHTSMAN on salary Grade £480-£600.

Candidates for appointment (a) must be Corporate Members of the R.I.C.S. (Quantities Division), and thoroughly experienced in the preparation of Bills of Materials, Specifications, Estimates and Final Accounts in connection with schools and housing (traditional and non-traditional), and other architectural work undertaken by the County Council.

Candidates for post (b) should be Associate Members of the R.I.B.A. or hold equivalent qualifications, and have considerable experience in design and construction of Schools and Local Authority Housing and Contract administration.

Applicants for (c) should have passed the Intermediate Examination of the R.I.B.A. and should be able to prepare Surveys, Working Drawings and Details, etc., with a minimum of supervision.

Applicants for (d) should have had several years' experience in the preparation of Working Drawings, Details and Lay-outs for Schools, Housing Schemes and General Architectural work.

Successful candidates under 45 years of age will be considered for admission to the Council's superannuation scheme, subject to satisfactory medical reports being received. Consideration may be given to meeting housing requirements.

Applications, stating age, experience, qualifications, etc., and accompanied by copies of recent testimonials, to be lodged with the undersigned not later than 7th February, 1953.

MATTHEW POLLOCK,  
County Clerk. 8099

County Buildings, Cupar, Fife.

# LARGE TIMBER BUILDINGS

Superbly built at lowest prices

Hall's, the largest manufacturers, fulfil the biggest orders without interruption. Contracts can proceed from start to finish without stop. Single spans from 10 ft. to 30 ft. with no limit on length. Only specially selected and seasoned timber is used. Hall's quote lowest prices—with quality now better than pre-war best. All buildings are creosoted inside and out, with priming paint on doors and windows. They arrive complete with fittings, ironmongery, putty, ready-cut glass and roofing felt.

Send for clearly illustrated, fully detailed Catalogue.

Robert H. Hall & Co. (KENT) Ltd, 30-46 PADDOCK WOOD, TONBRIDGE, KENT.

A rafter in the roof of Chichester Cathedral showing damage by the Death Watch Beetle.

## Expert treatment of timber decay

The insidious workings of the Death Watch Beetle are often not apparent until serious damage has been done. Only the scientific use of a penetrating and persistent insecticide will eradicate these borers. "WYKAMOL" polychlorophthalene can be confidently recommended and the experience and technical skill of our staff is at your disposal.

Send for free Technical Brochure: "The Control of INSECT and FUNGAL DESTROYERS OF TIMBER."

## STEAM RAISING

—the easy way

The easy way of raising steam is without the labour, dirt and fuel difficulties which are normally associated with boiler houses. The Autolec Electrode Steam Raiser produces steam in any quantity automatically and silently and is readily installed. That is why it is being specified by many of the leading industries throughout the country.
