MOUTH

This is Tretol House ...

The new London Head Office of the Tretol Organisation, designed by Walter Segal and featured in this journal.

It is an excellent example of the trend towards greater use of calculated brickwork, the use of a mortar plasticiser—Tretol “Morta-Mix”—making possible the stronger, yet more elastic mortar bonding upon which this building technique depends.

The comprehensive range of Tretol building products was used wherever possible in this building. In the solid concrete floor construction, Tretol Cold-Applied Bitumen D.P.C. Solutions were incorporated as the membrane treatment; a waterproof rendering, using Tretol Liquid

Waterproofer, being specified for the walls and floor of the heating chamber, as an inexpensive alternative to asphalt tanking.

The colour schemes adopted are a striking feature of Tretol House. Decorations were carried out in Tretol Hard Gloss and Emulsion Paints and wherever new concrete required painting, such as soffits, etc., Tretolin Paint was specified.

Tretol products were used in many other features of the building and the Company is proud that the use of their own products should have resulted in so attractive and functional a construction.

Teak *in plenty*

For over seventy-five years we have regarded the marketing of teak as our particular province and have obtained supplies direct from one of our subsidiary companies in the teak-growing area. The past thirteen years have proved that there is no adequate substitute for teak; no other wood can compare for resistance to all forms of attack and for long life. Teak is now free from control and we have ample supplies stored in our yards, to meet the requirements of every industry.

GLASS BASE ROOFING

'THERMOGLAS' has a base of glass fibre felted into a strong mat which is first impregnated and then coated on both sides with a high quality asphaltic bitumen.

The production of 'THERMOGLAS' marks an important advance in research in roofing technique and combines the properties indicated on the right, in a flexible form.

The structure of a 'THERMOGLAS' specification provides effective resistance to influences arising from work laid under varying climatic conditions and ensures stable and flat roofing - combining good appearance with permanence.

Lawley

have proved the plastic cistern

Now you can specify the plastic
cistern for those installations
where it is the most suited with
COMPLETE CONFIDENCE.
Lawleys have tested it and proved
beyond doubt that it has a place
in the scheme of things.

Modern, hygienic, rust and corrosion-proof—these and many other advantages make the Lawley plastic cistern ideal for contemporary building. Its cost, too, lends itself to the need for economy when planning estates, office blocks, workshops, etc. The name Lawley is backed by seventy-four years specialised experience in the manufacture of cisterns—cast iron, pressed steel and now plastic. Architects and builders are invited to write for details of this newest addition to the Lawley range.

Our illustrated folder gives details of four Lawley models in plastic, to suit all water regulations. We shall be pleased to forward copies on request.

AN INTRODUCTION TO THE

ARENS TWIN CABLE GEAR

WORLD PATENTS PENDING

*We are presenting this new product
which is now available*

This new design combines low cost with our known high standard of quality.
Neat and inconspicuous — in standard cream finish suitable for painting, if required, to suit particular colour schemes— can be concealed beneath plaster if desired. Very simple to install or modify using plastic-covered twin flexible conduit, and standardised fittings. Ease of operation is remarkable.

* For further details and prices write or 'phone our Contracts Department.

SPRAYED-ON INSULATION

SOLVES MANY PROBLEMS

Main Advantages are . . .

- Combines thermal insulation and sound absorption in one material
- Allows intimate surface contact irrespective of shape or protrusions
- Provides rot and vermin proof asbestos coating which will withstand vibration
- Prevents condensation and consequent corrosion on steel surfaces

SPRAYED 'LIMPET' (Regd.) ASBESTOS was created to provide a form of thermal and sound insulation with many desirable features in one single operation. The process itself consists of the application, by means of a spray gun, of specially prepared forms of asbestos fibre which are discharged from

the main nozzle of the spray gun simultaneously with a spray of water. These thoroughly intermix on leaving the spray gun and firmly adhere to the surface being treated. Irrespective of the shape of the surface, Sprayed 'Limpet' Asbestos completely covers all joints, rivets, or protrusions in one continuous jointless coating, thus eliminating all air spaces with their accompanying disadvantages.

The nature of Sprayed 'Limpet' Asbestos coatings varies with the job in hand, but in all cases it is rot and vermin proof, will not be affected by vibration and for most applications is extremely light in weight. This is the ideal method of combining thermal insulation with sound absorption and admirably suits the needs of various types of auditoria, as well as for the reduction of noise levels in factories, offices and workshops. Full details are contained in our catalogue "Sprayed 'Limpet' Asbestos Insulation", sent on request.

CORROSION TEST

The photograph on the right shows the complete protection offered by Sprayed 'Limpet' Asbestos against corrosion. Both channels were subjected to the same conditions, the test being carried out in a dyeworks.

BIG NOISE REDUCTION

Sprayed 'Limpet' Asbestos has been used in this modern cotton weaving shed to reduce noise and for anti-condensation purposes. Photograph by courtesy of Richard Haworth & Co. Ltd., Hindley Green.

The coil that makes the shower a joy
Some bare facts

A shower is the best bath in the world. The skin glows in the surge and the rush of the pin-point spray. The bather screws up her face and squeaks with delight under the swift attack. But a shower must be under the control of a thermostat or it may turn a little too frisky. A Leonard thermostatic valve will keep the temperature steady. It will iron out the hot or take the kick out of the cold. Leonard thermostatic showers save heat, save water, save piping, and make the shower bath a delight without alloy.

Write for leaflet No. A/2 which gives full particulars.

Skilled Hands

deserve the finest materials

To do a first rate job a craftsman must have confidence in his materials. That is why so many electricians prefer BICC Wiring System Cables. Wiremen know that BICC cables are completely reliable—because they are made with traditional skill from top grade materials. They know, too, that whatever the job, there is a cable in the BICC range to meet every requirement.

THE BALANCED BOARD WITH THE 'BUILT-ON'

DECORATIVE PLASTIC SURFACE

BALANCED
to give
maximum stability

HARDEC is balanced to give maximum stability. Its plastic facing and backing are strongly bonded to the hardboard core by a closely controlled pressing technique, and together they minimise warping and dimensional instability.

HARDEC—made by the manufacturers of Weyroc, the famous man-made timber—is a balanced board with a colourful melamine plastic surface on one side, a hardboard core and a plastic backing. It is sold in sheets 8 ft. x 4 ft. x $\frac{1}{4}$ in. nominal at 3/6d. per sq. ft. Hardec is available in delightful, clear, clean colours—buff, green, pink, blue or grey with an attractive linen-finish pattern. And it is superior to ordinary laminated plastic sheet because it possesses all the same decorative and hard-wearing qualities, plus the strength and dimensional stability found only in a balanced board.

Where to Use HARDEC and How

HARDEC is ideal for partitions, panelling and wall linings. It is eminently suitable for decorative ceilings and flush door facings. And it is finding ever-increasing use for all decorative surfaces in houses, factories, canteens, bars, schools and shops. HARDEC is worked in the same way as ordinary hardboard. It can be sawn and drilled, and is fixed quite simply by nailing, screwing or gluing.

hard **DURABLE** surface
—none better

HARDEC'S hard-wearing plastic surface is abrasion resistant, is not easily marked, scratched or chipped, is resistant to stains from beverages, fruit juices, ink and many chemicals, and is virtually unaffected by heat. Its attractive colours and patterns never fade or lose their freshness, and an occasional wipe with a damp cloth is all that is needed to keep the surface clean and spotless.

SPECIALISTS IN STAIRCASE WORK

PLIMBERITE

in roof construction

at the new Radio Research Station at Datchet.

Designed by the Chief Architect's Division,
Ministry of Works, for the Department
of Scientific and Industrial Research.

Main Contractors: Messrs. A. Roberts & Co. Ltd.,
79 Eccleston Square, London, S.W.1

$\frac{3}{4}$ " PLIMBERITE Boards in the standard size 8 ft. x 4 ft. were used for decking the flat roof of the new Radio Research Station at Datchet. The photographs show a part of the 45,000 square foot roof under construction, and the drawing gives a detail of the general design of the roof structure.

Covered with three layers of bituminous felt, $\frac{1}{4}$ " PLIMBERITE was also used for covering in the roof heating ducts, over timber stud framework.

$\frac{3}{4}$ " PLIMBERITE Boards can also be used on pitched roofs as a base for the outer roof covering, usually over rafters at 16" centres.

$\frac{1}{4}$ " PLIMBERITE makes an excellent lining to a roof, screwed to the underside of the rafters (together with felt or insulating material if desired).

During roof construction of any kind with PLIMBERITE, it is important that the boards be protected from the rain until the outer roof covering is laid.

The many other uses of PLIMBERITE are dealt with in our Technical Brochure and in the PLIMBERITE REBOND PARTITIONING SYSTEM Booklet.

These publications, also prices and the names of local stockholders, will be supplied on request.

variations on the theme...

Fresh air

Since 1879, "GREENWOOD'S" and "VENTILATION" have become synonymous, and today Greenwood's offer a service ranging from a single unit to a complete ventilation scheme for domestic, professional, municipal and industrial purposes.

GREENWOOD-AIRVAC *Mechavent*

This is a roof ventilator of proved performance available for flat, sloping or ridge fixing. Extraction can be natural or mechanical with built-in fan available in a wide variety of standard ratings.

RECTANGULAR VENTILATOR WITH STANDARD GLASS DOME

Designed for roof-lighting and ventilating interior corridors and rooms, constructed in suitable sizes to carry standard sized glass domes, this unit provides natural ventilation via weatherproof external louvres, with internal hit and miss shutters incorporated if desired.

Extraire EXTRACTION FAN

The silent lightweight fan unit for window mounting that ensures healthy fresh-air conditions in office, restaurant, factory or home. Operated from any 5-amp electric point without special wiring. Constructed from aluminium alloy, enamel finished to resist weather and corrosion. Available in 3 models: standard, closable and lightproof each in 2 sizes, 6" and 9".

Pyrok was used for anti-condensation surfacing of reinforced concrete shell roofs and soffits in the White Swan Laundry, Bromley, Kent. Architects: Mortimer, Burrows, and Partners F/ARIBA

PYROK

in the laundry

Pyrok is a Vermiculite-cement surfacing applied by continuous spray, setting rapidly and adhering strongly to structural steelwork, concrete, stone, brick and fibreboard. Pyrok is used in modern laundry construction as a decorative and protective surfacing resistant to condensation and fire, also for acoustic and insulating purposes.

Pyrok is a process both for interior or exterior use and also a means of carrying out repairs. Contracts are undertaken by Licensees in all parts of the U.K. and in countries abroad. We shall be glad to supply further information on request.

That cry the children never heard - **FIRE!**

When a high degree of thermal insulation is required Insulating Gypsum Plasterboard should be used. If you have not received a copy of National Building Studies No. 22 (Fire Hazard of Internal Linings) write to one of these addresses . . .

The agonised scream; the utter helplessness; the paralysing despair; to say nothing of the sheer material loss that might have been avoided. If only Gypsum Plasterboard had been used for the internal lining of this building, the flames would have been held back and all concerned would have been given that little more time which means the difference between incident and disaster.

Too little is known about CARTER faience

Most of the glazes used with exterior tiles, both glossy and eggshell, can be used with faience and for this reason the materials are often used together. A tendency to crazing is inherent in both though it is more common — or more apparent — in some glazes than in others. This crazing does not in any way affect the soundness of the material which may safely be used under all atmospheric conditions.

Faience is produced in thin slabs for surfacing work and in the form of hollow blocks which, on being filled with concrete, can be used as structural elements. A number of rectangular slabs of various sizes and several sections of cills and copings have been standardized and can therefore be supplied more quickly than purpose made ware. These are known as Unit Faience.

Carter leaflet No. 3/3 gives further details of shapes, sizes and sections.

This recessed lighting scheme of the canteen in the American Embassy was designed by Philips

For Imaginative Lighting

Talk to **PHILIPS**

Philips will be happy to design for you — there is no charge

Some of the more imaginative lighting schemes of recent years have been the result of close co-operation between architects, electrical contractors, and the Philips Lighting Design Service.

The advice and assistance provided by this Philips Service is entirely free, and experienced lighting engineers in each Philips branch area are at your service. In addition, a fully qualified architect with special experience of lighting in its relation to architecture and colour is available to co-operate with you.

2 building problems

with a **RUBEROID** answer

ZYLEX

Slaters' Felt

Fractional differences in the cost of dampcourses and slaters' felts can make a vast difference to the effectiveness and performance of the damp-proofing of a building.

A superior slaters' felt of exceptional insulation value and consistent in quality throughout. Available either reinforced with hessian for laying over open rafters, or "Standard" for use on boarded roofs. Can also be supplied with a surfacing of aluminium for even greater insulation. Complies with B.S.S. No. 747/1952.

To keep out the damp above and below—specify **ZYLEX** and **ASTOS**

These differences, however, may not show up in standard specifications. To remove all doubt and ensure the best possible materials specify Ruberoid products—by name!

ASTOS

Asbestos Dampcourse

For a barrier against rising damp in any building for any climate, specify ASTOS. Made from asbestos fibre and carefully selected bitumens, this material is 100% permanent. It is completely non-absorbent, imperishable, and sufficiently flexible to prevent fracture due to traffic vibration or structural settlement. Available either Standard or Lead Lined. ASTOS Dampcourse exceeds the requirements of B.S.S. 743/1951.

RUBEROID

Roofing Materials & Dampcourses
-there for good

Hessian and Fibre-Based Dampcourses
Details of Pluvex Dampcourse, having a hessian or fibre base, with or without a lead-lining, will be supplied on request. Pluvex Dampcourses also comply with B.S.S. 743/1951.

Further details and samples will be gladly sent on request.

TRUE FLUE Ltd **PATENTED PRECAST EXTERNAL FLUE**

an Outstanding problem solved!

This is an economical and efficient Boiler Flue of pleasing appearance which can be bolted quite simply to an external wall. Each section is easily handled and no elaborate scaffolding is required.

The Flue has a refractory lining and is well insulated to overcome the condensation troubles so often experienced with asbestos or iron flue pipes and can be erected at a fraction of the cost of a brick stack.

Although this is one of our most recent developments we have already supplied approaching 2,000 of these flues to various local Authorities and Contractors.

Write for illustrated booklet and price list to the address at the foot of this page.

For Scientific Flue Construction...

These labour-saving and efficient devices, of which there are several types available, are made of heat-resisting refractory concrete and form a stream-lined connection between the fire and the flue.

The unit illustrated eliminates the labour involved in forming the Gather-Over in brickwork above the fire-place opening. When placed in position it forms a base for TRUE FLUE circular rebated linings or for the 9in. by 9in. parged flue.

The lintol has a removable front portion to enable the Unit to be built in immediately above the appliance, thus enabling a fireplace surround of more pleasing proportions to be used. The front attachment is removed when the appliance is fitted and bedded back in position when any necessary infilling around the back and sides has been carried out. The type of front attachment will vary according to the design of the heating appliance and fireplace surround.

Please apply for illustrated brochure incorporating list of heating appliances with requisite Triple Unit.

A new range of Plateswitches for plaster-depth boxes

*the mark of
leadership*

Following the very successful reception of the first range of MK Plateswitches, we are now introducing new designs for mounting in plaster-depth boxes. These switches will be welcomed by contractors who prefer a box that fits on the face of the brickwork.

The new range, which includes a three-gang pattern, has many outstanding features. They are described in detail in Leaflet 233.

Write today for your copy.

Efficient Office Planning

The Anderson Type 'F' System of partitioning is designed to make the best possible use of floor space. Segregation of departments into quiet, orderly units improves working conditions and simplifies direction and control.

This modern system of unit construction, utilising extruded aluminium supporting members, embodies special features including rubber glazing beads and rubber inserts in architraves, reducing noise and vibration to a minimum. Choice of panelling may be made from a wide variety of attractive sheet materials. Speedy dismantling and re-erection to a new layout is made possible by simplified floor and wall fixing.

Enquiries are invited. Please ask for literature.

THE ROOM THERMOSTAT

IMPROVED DESIGN ... BETTER PERFORMANCE

Model T86. 2-wire low voltage. Closes circuit on temperature fall

Electrical Rating. Low voltage AC only 0.8 amperes at 25 volts AC.

Setting range 55-85°F.

Thermometer range 42-90°F.

Differential Approx. 1½°F.

Dimensions Dia. 3½" Depth 1½"

The new round thermostat with its high sensitivity provides closer control of temperature. The incorporation of a mercury switch eliminates all switch maintenance . . . there is no arcing and no dust or dirt accumulation. The combination dial facilitates easy temperature setting and indication. The dial carries a bimetal thermometer element and thermometer pointer and is set — by the simple knurled rim adjustment — against a fixed pointer . . . in normal operation the two pointers remain in line. Its clean modern lines enable this thermostat to be blended with any decorative scheme and the hemispherical ring can be painted to match any surroundings. idea
(No 1)

UNDULITE, the translucent building material, cuts costs because it's lighter

A fresh-air annexe to the living room is a luxury idea — but UNDULITE cuts the cost to a practical level! UNDULITE is a translucent corrugated plastic sheeting, reinforced with fibreglass. It's so light and easy to handle that man-hours are cut to a minimum and the simplest framework gives adequate support.

UNDULITE and a little imagination will provide an effective answer to hundreds of building problems. It's tremendously strong, rigid, durable and shatterproof. Use it for roofing, skylights, wall lights, panels and partitions.

Use it to let the daylight into farm buildings, factories, shops and office buildings.

light, strong and easy to handle—

UNDULITE

made by **Ashdowns**

UNDULITE is made in standard sized sheets to nest with standard pitches of other materials, and it can be cut, sawn, drilled, clipped or even nailed with ordinary tools to suit your particular requirements. For further details, please write for a copy of our illustrated folder.

Delivery of standard profiles ex. stock.

THEATRE DESIGN

In connection with the current International Theatre Congress, the RIBA have rifled their library files for architect's drawings for, of, and about theatres, and put the results on exhibition. Hardly an Aladdin's cave, the exhibition nevertheless sports some minor treasures and a few real jewels. There are a handful of Bibiena drawings—the full Baroque theatrical fantasy, unrestrained either in the use of decoration or the consumption of illusionistic space—which would be worth the journey to Portland Place any day. An interesting series of sheets traces the development of Drury Lane from Wren, through Adam to Wyatt, and plays a dirty trick on Adam *en*

passant, by showing a revised version of his interior perspective with the figures drawn true-scale, about a third larger, so that the auditorium shrinks and the ceilings come down on the gallery-ites' heads. The indefatigable contemporary research into Georgian theatres by Messrs. Southern and Leacroft is well represented with drawings and a model, and there is the project for the new Questors Theatre designed by W. S. Hattrell and Partners—which appears to have everything, including a—wait for it—"space stage"—semi-circular, the full width of the theatre, for *Dramorama*, presumably.

MORE BIRDS OF PASSAGE

ASTRAGAL's tally of distinguished visitors, started last week, has been lengthened by a flying visit to the National Trust's annual summer school on country houses. Clearly in view at one moment were two Deans of Art Departments from the US—Charles H. Sawyer from Yale and Marion Ross from Oregon—Guthorm Kavli from the *Kunst Industrie* museum in Oslo, Dr. Wittgenstein from the *Denkmalamt* (Ancient Monuments Office to you) in Munich and Minor Thomas from Colonial Williamsburg.

*

Not to mention the rest of the "student body," assembled on a hot stuffy July evening in the red-and-white dining room at Attingham Park to hear Ellis Waterhouse dissertate upon the English country house collections—a witty little discourse in which ASTRAGAL managed to catch quite two or three of the subtler jokes, and what with that and the distinguished company, came away with considerably boosted morale.

There is also, of course, the Russian delegation (see photo on page 109) who have been touring the New Towns, Pimlico and the LCC housing estates.

SUBUTOPIA

The campaign against "subtopia" has caught the imagination of Royalty, Ministers, the BBC, and the weekly and daily press. Of the last category I will have more to say in a future issue. The opportunity must not be lost, however, of saying straightaway how encouraging it was to hear no less than the Minister of Housing and Local Government, Duncan Sandys, supporting *The Architectural Review's* campaign in a speech he gave at the RIBA last week before presenting monthly medals and diplomas for private enterprise housing. "In the name of progress and convenience," said the Minister, referring to the country's architectural and landscape inheritance, "these irreplaceable treasures are everywhere being mutilated or obscured. Every fresh intrusion, whether it be a ferro-concrete lamp post, an advertisement hoarding, a public convenience, a bus shelter or a traffic sign, must be critically scrutinized with the object of seeing that it is designed and located in a way which will not needlessly intrude upon or clutter up its surroundings. In fact, the aim should be . . . to see that every new addition . . . makes a positive contribution to the character and interest of the scene."

*

That is the kind of language we have been waiting for from someone who is in fact, if not in name, the Minister of Planning. One can only hope that he has not arrived too late.

HENRY HOPE & SONS LTD.

SMETHWICK, BIRMINGHAM
LONDON: 17 BERNERS STREET, W.1

MEMBER OF THE METAL  WINDOW ASSOCIATION

Some of the designs on view at the AA exhibition of students' work. Top left: a proposal for the development around St. Paul's in the form of 75-ft. high office blocks arranged in courts around City churches in the vicinity. 48 ft. above ground level is a pedestrian deck with a further two floors of offices over. Some shops and restaurants are also provided. The design is by 4th year students, Messrs. Burder, Cons, Moore and Pickering. Top right: the winning design for the Le Corbusier prize by David Burder. The building consists of two dormitories accommodating a total of 13 with a warden's house, a common room and a kitchen for the members' use. Centre right: part of a design by an American 5th year student, John L. Davies, for housing at Acton Ponds, Boston, Mass. The model shows high density 3-bedroom houses on a terraced slope, each house having a private court which is not overlooked by any neighbour. Above: a project from the AA's Tropical Department. R. A. Diss has designed a development board headquarters on the Ogun River, Nigeria. On the left is African housing; in the centre foreground is a clinic, the headquarters, a social club and, on the right, European housing.

AA PRIZE GIVING

Last week space did not permit ASTRAGAL to finish his comments on recent AA events. The Association must be congratulated on its farsightedness in asking Sir John Maude to give away the prizes this year. Architects will know him best as former Permanent Secretary to the MOE during the years of the expanding schools programme and the implementation of the Butler Act. Sir John has not only a wide knowledge of architectural problems but sympathy and understanding for architecture—a very different thing. Now, as the new Permanent Secretary

to the Ministry of Fuel & Power he is again concerned with an even more formidable building programme—power stations and refineries—in an era when not only is the need for power growing but the nature of power is radically and unpredictably changing. Sir John Maude (yet another who has clearly read his "Outrage" number of *The Architectural Review*) is very well aware of the problems facing his Ministry in the coming years.

AA principal Michael Patrick made an excellent and thoughtful speech at the prize giving which ASTRAGAL

understands is reported in this issue. It should be read by all concerned with the future of architectural education, especially those at the RIBA, as it contained many very practical suggestions to overcome the great difficulties resulting from military service.

As a principal, Patrick has grown in stature. His job has been far from easy. It is good to hear from him that at least the financial situation at the AA which has so overshadowed things in the last few years has improved. The principal, for all his modesty, must be given much of the credit for this.

Ground floor plan

First floor plan

Winning Design for the Rome Scholarship, 1955

For the first time since the Rome Scholarship was founded in 1913 it has been awarded to a student from one of the minor schools of art. The winner is J. C. Haskell, a student at the Department of Architecture (Principal: Eric Brown) of the Kingston School of Art, and part of his winning design is shown above. The subject for the competition was "A British Embassy in a European capital," and the site plan which accompanied the competition programme showed a "flat site" on an "important corner" with a rectangle depicting a 40-ft. high museum on the south side and another representing a 50-ft. high French embassy on the east. The jury has chosen as the winning entry a design which can be described as the most contemporary in feeling of the five designs submitted. In this the jury is maintaining a welcome policy of support for contemporary architecture, the last award for a design of a markedly traditional character being made in 1950. Nevertheless, as we stated when we published the winning design for the Victory

Scholarship, in the issue of January 13, we are not convinced that this kind of design programme calling for plans and elevation and little or no construction does not encourage a "*beaux arts* approach to design carried out in contemporary clichés." When mature architects are struggling to master the new techniques evolving in contemporary architecture and to assemble them in a contemporary style, it seems a trifle hard to condemn mere students for an inability to produce "dignity or quality of permanence to be expected in an embassy building." These are attributes which, even if desirable, would tax the design sense of one of our greatest modern architects, and if accomplished would not necessarily be immediately recognised as such by his fellows. While not decrying the achievement of Mr. Haskell and the school he represents, we suggest that it is high time that the Prizes and Scholarships Committee of the RIBA reconsiders the competition programmes as a whole, and the purpose of them. The jury's report is published on page 108.

COST PLANNING

IF a client said to you, "I want a factory (school, office block, weaving shed, etc.)—a good one—and it must cost no more than (say) £110,000," could you guarantee to fulfil his budget? No, you couldn't; until the tenders came in it would be a gamble. Defined results for heating, lighting, stability, with specialist help these can be achieved with certainty, but a defined price? No.

But this week the Guest Editors present a method, "Cost Planning" (page 110), which enables the architect to remove, or at least reduce to harmless proportions, the element of gamble in designing to a set price. By reference to the cost analysis of past buildings a target price can be set for each element (external walls, internal partitions, upper floors, etc.). The price of the constructional method chosen for each element is checked against the target. For instance, the moment you get Messrs. Blogg's quotation for roof finishes you know for certain, by comparing Blogg's price with the target figure, whether your client can afford it.

Cost Analysis and Cost Planning offer the architect a new assurance in his relations with the client where they most often break down, namely, on the subject of costs.

FOR THE NEW HOSPITAL PROGRAMME

The Nuffield Provincial Hospitals Trust's new publication* marks a stage in the slow unfolding of tested functionalism in architecture. It is not in any sense a definitive volume: it does no more than broach half a dozen or so of the numberless problems of hospital design: but it treats them in a spirit of exactness which is all too new. A proportion of the volume does not deal with architecture in the traditional sense of the word, but with what we might call "pre-architecture," with matters which have to do with the client's brief. There is, for instance, a chapter on "the outpatient service," which deals with the question "why do outpatients have to wait so long?" and another on "planning to meet demand," which means determining how many people a group of hospitals will have to serve and what will be their wants. It is not, of course, always necessary for the architect himself to undertake enquiries of this kind. But it is certainly his business, as the man responsible for the usefulness of a building, to see that they are done. Inadequate briefing is as likely a cause for a building's failure as any defect of structure or of planning in the narrow sense. It is the most intractable of all sources of

A comparatively new feature of AA prize giving is the Le Corbusier prize. ASTRAGAL, being rather mystified by this new jewel (£100 cash with no strings attached) in the AA diadem has discovered the following: apparently Corb. gave his name to this annual prize two years ago when he visited the AA. The subject is set by an AA jury and three selected designs are sent to Le Corbusier for final choice. Last year the jury made no award and the money was added to this year's prize—it is double the usual amount. The jury this year consisted of Peter Shephard, Max Lock and Arthur Korn.

*

The winning design by David Burder, 4th year (on page 105, with other designs from the exhibition) though not very exciting and surprisingly un-Corb-like, has avoided many of the pitfalls which this type of building—neither domestic or monumental—is heir to. It certainly is worthy of praise and prize. However, ASTRAGAL has a feeling that the particular *câchet* which surrounds most important prizes has not yet done so in this case. Such a name and such a school should produce important results.

IUA CONGRESS

The IUA Congress at The Hague would appear to have been a great success. So great, in fact, that the JOURNAL's representatives have disappeared without trace. All ASTRAGAL has been able to learn is that 700 architects from 42 countries (on both sides of the iron curtain) attended, that the '57 congress will be held in Moscow and that the Dutch organisers handled all arrangements—from tours and exhibitions to discussions translated into four languages—quite superbly. The British contingent was about 30 strong, and included Patrick Abercrombie, Robert Matthew, Percy Johnson Marshall, Gontran Goulden, Robert Gardner-Medwin and C. H. Aslin—a very eminent and worthy bunch of representatives. It is quite obvious that the IUA is going to have a very important part to play in international relationships and in the development of architectural standards if it can continue the good work it has now so ably started.

architectural weakness: for unless the architect has irrefutable facts at his elbow, he cannot contest the client's opinion on the requirements. The Nuffield Foundation does not show architects how to build hospitals. The ward blocks designed by the Foundation at Greenock and Belfast and the Diagnostic Centre at Corby are only to test certain ideas: they are not exemplars. The purpose of the Foundation is rather to build up a body of hospital building doctrine to which everyone may refer with confidence. It is hardly possible to overestimate the value of such a service. Though the findings of this report are so limited in their scope they at least come to us at the right time, for we are at the beginning of a spell of hospital building. The mistakes they will save us, if they were converted into money, must surely dwarf the outlay. The Nuffield Foundation is already extending its investigations to laboratories and farm buildings. If only we were on the way to discovering as much about the many other classes of design which are still shrouded in mystery the architect could feel more confident about his usefulness.

Hardwood Tests

SIR.—The recently published Report of the Director of Building Research for 1954 contains, as usual, much of general interest, but a point in particular which is deserving of the notice of architects is a virtual admission that laboratory tests to determine the wear resistance of flooring materials are a failure, even if such admission is cloaked in the official wording "reliable methods of test have yet to be devised".

Although this Association has always co-operated fully with both the Building Research Station and the Forest Products Research Laboratories in the exchange of information, we have often had to disagree with their findings as a result of wear-resistance tests which have not been confirmed by practical experience.

We have always maintained that the suitability of a particular flooring timber for a particular use can only really be tested under site conditions and year after year individual members have carried out their own practical tests in this way to enable them to advise users of hardwood flooring with the utmost confidence. This has been increasingly necessary during the years since the war when the embargo on the import of traditional flooring timbers made necessary the trial and use of many new species.

That a number of these have become so widely used and given complete satisfaction, often under difficult conditions, is proof that reputable manufacturers are competent to assess the qualities of a hardwood more accurately than any laboratory and can be trusted to recommend a species suitable for a particular use.

Moreover, they consider this to be an essential part of their service, with which they try to meet the requirements of the architectural profession and the building industry.

Houses That Didn't Win Medals

SIR.—Re your frontispiece (Houses That Didn't Win Medals) AJ, June 30. Could it be that other architects too were confused at the meaning of "private enterprise housing"—ugly term? To me this has always meant houses built speculatively for sale.

In any case this architect at least failed to notice the existence of the MOHLG Competition, and he reads your columns fairly regularly, even as you will see by the address, while on holiday.

BRIAN PEAKE.

Speyside.

SIR.—Your editorial comment on the MOHLG awards (AJ, June 30) states that entries of a similar high standard to the houses illustrated were not submitted in Greater London.

I understand that the Parkleys flats at Ham (architect Eric Lyons) were submitted, in which case it seems incredible that they received no award.

They are surely the best example of small-scale housing development in England. The layout of blocks around linked courtyards and the individual planning of flats is extraordinarily good and I say this in spite of personal reservations regarding architectural treatment and detail.

In view of the architectural standard of the awards in other regions and particularly as no award was made in Greater London, I should be interested to learn the criteria by which entries are judged.

DAVID ALLFORD.

Ham Common, Surrey

RIBA

Rome Scholarship Award

The Faculty of Architecture of the British School at Rome announce the award of the Rome Scholarship in architecture for 1955 to John Christopher Haskell of the Kingston School of Art. Mr. Haskell is 23 years of age and took his final examination of the RIBA in June 1954. The Rome Scholarship in Architecture is provided for by an annual grant (of £400) made to the British School at Rome by the Council of the RIBA and is normally tenable for two years but may be prolonged in exceptional cases for a third year.

The Faculty of Architecture in announcing the award state that they have to record their disappointment with the general quality of the work submitted in the final stage of this year's competition, the subject of which was "A British Embassy in a European capital." It seems evident that insufficient consideration was given by competitors to the broad solution of the problem as a whole with the result that site planning and general massing were poor—none of the schemes submitted genuinely met the requirements of the programme nor gave an adequate answer to the planning problem, and all the designs contained a number of obvious mistakes. The architectural expression adopted by most of the candidates showed little of the dignity or quality of permanence to be expected in an embassy building, characteristics which should be attainable however "modern" the "idiom" or the constructional system that is used. The Faculty, nevertheless, considered it desirable that an award should be made, and since no outstanding scheme was presented to them they have chosen that which, in their opinion, showed the nearest approach to all-round competence and the candidate who held out the greatest promise of being able to benefit by the opportunity for post-graduate research and foreign travel which the Rome scholarship gives.

The complete list of Rome scholars and the schools they attended is given below. Twenty-seven awards have been made, of which nine have gone to students of the Liverpool school, five to the Edinburgh school, three to the AA school, two to the Manchester school, two to the Durham school and one each to the remainder.

- 1913 H. C. Bradshaw, Liverpool University School of Architecture
- 1914 P. D. Hepworth, A.A. School of Architecture
- 1920 F. O. Lawrence, Liverpool University School of Architecture
- 1921 S. R. Pierce, A.A. School of Architecture
- 1922 S. Welsh, Glasgow School of Architecture
- 1923 R. A. Cordingley, University of Manchester

- 1925 G. A. Butling, Liverpool University
 1926 A. D. Connell, New Zealand, London University
 Atelier
 1927 R. P. Cummings, A.A. School of Architecture
 1929 J. B. Wride, Welsh School of Architecture, Cardiff
 1930 W. G. Holford, Liverpool University
 1931 C. St. C. R. Oakes, Northern Polytechnic, R.A.
 Schools
 1932 R. P. S. Hubbard, Liverpool University
 1933 A. G. S. Fidler, Liverpool University
 1934 F. A. C. Maunder, Armstrong College, Durham
 University
 1936 P. E. D. Hirst, Liverpool University
 1937 W. T. C. Walker, Edinburgh School of Architecture
 1938 A. B. Wylie, Edinburgh School of Architecture
 1939 R. Cowan, Edinburgh School of Architecture
 1947 R. Fraser, Edinburgh School of Architecture
 1949 I. S. Melville, University of Liverpool
 1950 E. Carter, Durham University School of Architecture
 1952 D. I. Black, Edinburgh School of Architecture
 1953 J. A. Graham (Special Grant), Manchester University
 1954 G. I. Lacey, Liverpool University
 P. S. Staughton (Special Rome Scholarship), Melbourne University School of Architecture
 1955 J. C. Haskell, Kingston School of Art

The competition entries are on view at the RIBA until July 29.

AA

New Teaching Policy

In his speech at the annual prize giving, Michael Patrick, Principal of the AA, listed the changes and ideas which had been put into operation in the past session. First was the department for the study of Tropical Architecture. This had double the expected number of students for the first session, and there is a waiting list for the second session.

Second was the reintroduction of a modified form of the unit system. Each year is broken down into small units of about 15 students each under the charge of a unit master who stays with the unit for about a term and a half. The staff time on administration has been cut down and shared. The small classes allow a much more intimate and informal type of instruction, said Mr. Patrick, which is often preferable to formal lecturing. Units of different years are placed in the same studio in order to encourage interest in each others' work. A third idea started was collaboration with the Brixton and Hammersmith Schools of Building. Their plant and equipment has proved very suitable for practical training, and the AA are most grateful for the help these schools have given.

Michael Patrick then referred to the AA school's recent financial troubles. A good response had been received to the AA's request to members and commercial firms for scholarships. As a result, although the fees have had to be raised, no student has had to leave on that account, and applications to enter the school had gone up.

Mr. Patrick continued:—

"We often hear complaints that the prestige and status of architects abroad is much higher than at home. If this is true, and I think it is, we have no one but ourselves to blame. The whole conduct of the profession is controlled by architects; we are not hampered by outdated legislation; nor are we tied to any moribund academy, but we have really done very little ourselves in the last twenty years to improve the standard of training. Perhaps the present exceptional demand to get assistants has made us less critical of quality, but it is not generally known that the majority of those qualifying do so without any form of full-time school training at all.

"The Board of Education at the RIBA has naturally been rather concerned about the lack of progress in training, but there has been too much insistence on their role as an examining body and one would like them to play a much more positive part in education. We shall not achieve better design by unifying tests on history or building construction. The improvement can only come when it is possible for all students to spend part of their training at full-time study in a school.

At the invitation of the Government a Russian housing delegation has visited this country for the first time since the war. They have been shown BRS, Harlow, West Ham and LCC and Westminster housing estates. Last week they were given a dinner at the RIBA. Above they are shown at the Building Centre, in which they were so interested that they altered their programme in order to be able to make a second visit. From left to right: Raisa Bobrova, an attaché from the Russian Embassy; F. R. Yerbury, Director of the BC and consulting editor of the JOURNAL; Pyotr Novozhilov, head of the Russian Ministry of Construction Materials; Vladimir Promyslov, the leader of the delegation and first deputy chairman of the Moscow City Soviet and Chief of the Moscow Building Trust; Nicolai Smirnov, head of the Department of Dwellings and Civic Buildings of the State Building Committee of the Council of Ministers of the USSR.

"It has recently been decided that after 1962 there must be an additional year of post-graduate office practice before qualifying for Associateship. I quite agree that if the younger architect is to carry the full responsibilities that are implied in this qualification, he must be given adequate time to get the necessary experience. But if two years of practice are to be tacked on to five years of school, plus two more of national service, the whole business is becoming exceedingly long. Certainly if this is to be the general pattern, the timing and sequence of the different parts must be much more carefully regulated than at present.

"I believe strongly that national service should be done first. Parents need not look on it as a waste of time. For most boys it is a useful interim period for growing up. It allows adjustment from the strict control of school life to a much harder self-discipline which is needed if the best is to be got out of a more adult form of education. Of course at 19 or 20 the applicant is much surer than he was at 17 about what he really wants to do himself, and we find him more discriminating and generally far easier to teach.

"For these ex-service students I believe that four years at an architectural school might prove to be better than five, and when they leave, they can go straight into the profession and stay there. The present arrangement for deferment selected by the majority, entails a few months in an office after taking the five year diploma course and then two years with services. This seems to give them the worst of all worlds.

"It might seem strange at a time when building is becoming more complex, to advocate a condensed or shortened course, even for a few, but in architecture aesthetic maturity does not come after four, five or even seven years, and if one expected the poor student to be word-perfect in all the technical subjects, then he would never leave school at all. The length and timing of the course must be arranged so as to retain a continuing enthusiasm, for this is the only real spur to creative ability. Rates of development vary, but for nearly all students, it is very slow after the fourth year and it is common knowledge in every school of architecture that the thesis in the fifth

year is for quite a number, nothing more than just another long design subject.

"It might improve things if those of real ability were allowed to pass to office training at the end of their fourth year and then come back to do their thesis when they had had a few years' experience. If this were done, we could then expect the thesis to be nearer the true meaning of that word—something, in fact, which might prove to be a real contribution to knowledge and which was not only valuable to the student, but a help to those who followed, for after all the spirit of our teaching should be collaborative rather than competitive.

"There should in any case be many more opportunities for post-graduate research. Much of the work which has to be done requires men of mature outlook who should be given an opportunity to leave practice for a period and assist with education. On the technical side there is a deplorable lack of good text-books which are really up to date. A group of post-graduate students working in the School could be most beneficial. The A.A. has always prided itself on using young practising architects, but it must be remembered that present-day practice brings with it too much rush and far too much worry. The only worry that the teaching architect should have is the progress of his pupils.

"To stick to teaching for too long has led to staleness, but every school should have a few instructors whose total commitment was to the school and whose work was a mixture of research and instruction; for these ought to go hand in hand. In my view these posts should be the most highly paid, the most trusted, and the most sought after. They should be given only to those who had that rare gift of acquiring knowledge and also the ability to impart it.

"There is room for more fundamental work in architectural education itself. What, for instance, are the best and scientific ways to make a student's mind think in three dimensions? How can one impart a sense of structure to those who do not have it naturally? At the moment too much time is taken up in trying to perfect systems which in essence are still based on the beaux arts. Although we feel rather

(continued on page 116.)

This, the eighth article in the series by our Guest Editors, is written by James Nisbet, the quantity surveyor member of the team, who was responsible for working out the method of cost planning. Nowadays, cost exercises such a decisive influence in the choice of technical expedience, and is therefore so vital a thread in the relationship between consumer and supplier that it seems wrong to view it as a momentary but irritating hurdle in the path of creative activity. In admiring and striving for order and regularity in our buildings, economy is too rarely acknowledged as an integral part of our motive, which we prefer to think of as aesthetic. Cost planning is a method by which the architect can plan, at an early stage in the sketch design, the distribution of money among the parts of a building. It enables cost to join with all the other factors, such as space and circulation, weather resistance and stability, and the exigencies of construction that, collectively, determine the design.

THE COST OF BUILDING

COST PLANNING

The Guest Editors here present the method as a practical device for the use of architects and quantity surveyors. They will be glad to receive information and comment that testing of the method in practice may reveal.

To demonstrate cost planning a hypothetical example is worked out stage by stage. This involves certain assumptions due to gaps in our cost knowledge—gaps which further testing of the method on a variety of buildings will fill.

The Need for Cost Planning

Cost planning is always desirable: (a) where the client has stated a maximum limit of cost for a project, or where it would be uneconomic to exceed a certain sum; (b) where it is wished to adopt new or unusual methods or materials without incurring additional or excessive expense.

With the present wide range of materials, services, structures, and appliances and the variety of possible planning arrangements it is becoming more difficult to meet a cost limit without detailed guidance at all stages of design.

Early cost investigation of a projected building has mostly been by the use of a rate per cubic foot, to discover the probable *total cost*. The accuracy of this method depends almost entirely on having available the cost figures of buildings which are practically identical in quality, constructional method and size. But with building technique now so complex and varied such a contingency would be a matter of luck. In any case it is impossible to assess the effect of changes of constructional detail on the cube figure. In other words, it would be impossible to predict the effect on the cube figure of a change from clinker block to plaster slab partitions since it is not known how much was allowed for partitions in the original figure.

While it is probably fair to assume that the "cube" method worked very well when building was much more localized, prices stable, services few and simple, and buildings in each category very similar in design and planning, it has been proving unsatisfactory, particularly since the war. The reasons are not hard to find.

In addition to the many new materials, appliances, methods of construction, etc., new types of building and concepts of

design and planning have been introduced. These developments have accompanied considerable social changes, and changes in the financial position of clients. The building industry is faced with a demand which it cannot meet for some considerable time and building work has required guidance and direction at a national level. Local authorities and government departments have become the major clients, and have demanded the best value for money. The cost of building has forced the private client to require the architect to build within narrow limits of cost. As clients state these limits when commissioning architects the approximate estimate has been used to satisfy the architect and client that they can build for the sum of money allowed.

Many architects are of the opinion that the "cube" method does not give them this assurance and have therefore been faced with the task of preparing an estimate based on approximate quantities. To do this, they have to consider the project in sufficient detail to specify the constituent parts of the building. When the estimate has exceeded the cost limit much work has been in vain. To avoid this a more positive method of designing to a stated cost is now being demanded.

Cost planning is such a method. It provides the architect with detailed yardsticks of cost for each constituent part of a proposed building at the beginning of the design stage, so that as each part is considered a choice may be made which will satisfy not only the functional and aesthetic requirements but also the cost requirements. Limits of cost for each part have to be calculated so that any alteration to the design can be readily evaluated and its effect shown on total cost. This calculation requires the method of analysis which was described in article 4 (AJ February 24). Information obtained in this manner can be used to work out the cost plan.

Accommodation and cost

Apart from the few cases where cost is of no material importance to the client, the architect finds himself in either of two situations: (i) *where the limit of cost is fixed*. This

may be in the form of a fixed total sum or a fixed sum per unit of accommodation. In the first case the architect must strike a balance between the area of accommodation and the standard of construction/equipment which can be provided, but in the second case he has no such discretion since the standards are determined by the fixed sum per unit of accommodation. The speculative office building is an example of the second case, where the anticipated rental is the dominant factor and the area might be determined by the site or the capital available. (ii) *where the function of the building is defined without reference to total cost.* In this instance area and equipment must be provided as economically as possible since the client is unlikely to have unlimited resources and the architect should discipline himself within his own cost limits. In both cases, in the early stages, the architect and his client should determine an acceptable balance between accommodation and cost. For this purpose a number of cost analyses (such as those published by the AJ) are of great value, for they show what accommodation, finishes and equipment were bought for the money spent.

With a preliminary decision on total cost and area of accommodation the architect can proceed with his outline plan (Fig. 1). At this stage he need make no decisions as to structure, materials or finishes that might later prove abortive.

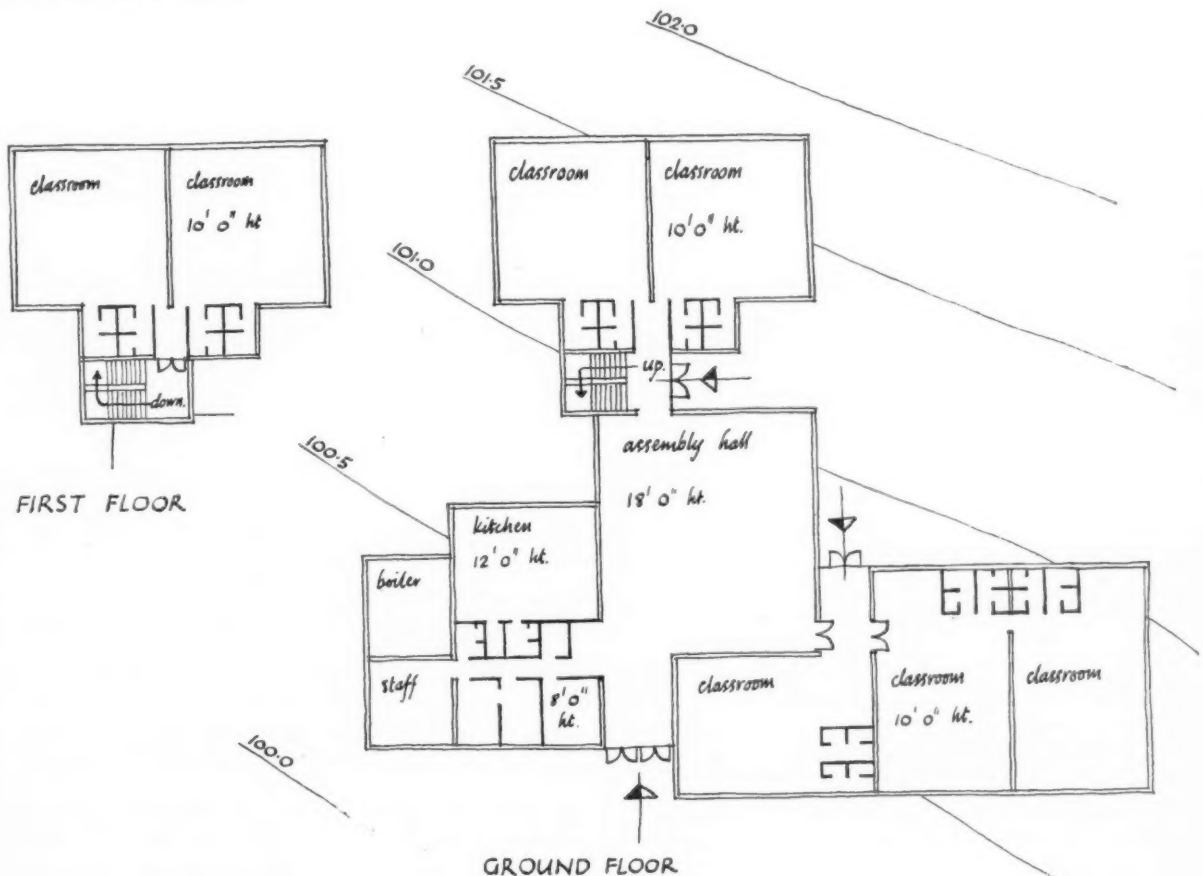

To work out a cost plan, the following information is needed: (a) The outline plan as shown below (Fig. 1).

Fig. 1. Sketch plans of school, scale 32 ft. to 1 in. A cost plan can be prepared when a reasonable arrangement of accommodation has been evolved, and before constructional methods are considered.

(b) Certain ratios calculated from the outline plan (Fig. 2). (c) An indication of the standard of construction, finishes, fittings and services required. (d) A few cost analyses of other buildings with a detailed specification for each element, and certain critical ratios (Fig. 3). (e) Information as to site and functional requirements, e.g., soil bearing pressure, criteria temperatures, etc. This information should be available from the brief. (See article 6, the Architect's Contribution, AJ June 30.)

Assuming that the building at Fig. 1 represents a primary school for which the cost limit is £146 per place, a decision to provide 44 square feet per place would result in a cost per square foot of 66/4d. Before apportioning this sum among the elements, it should be reduced to allow for uncertainties which affect the price before the tender is received, such as: (a) Fluctuations in the price of materials and labour before tender date. (b) Market fluctuations and variations of price level between different builders. (c) Constructional details which cannot be defined at the design stage.

This reduction will help to absorb increased cost if all the above factors turn out to be unfavourable, and represents a determined effort to avoid the "inevitable extra." For the example demonstrated here, 5% reduction is allowed, giving a total target cost of $(66/4 \text{ less } 3/4) = 63/-$ per sq. ft. of floor area. From this point the detailed selection of element target costs can proceed, as demonstrated on page 113.

DATA FOR COST PLAN OF PROPOSED PRIMARY SCHOOL

Total floor area	12,000 sq. ft.	Upper floor area	2,500 sq. ft.	Roof area	10,000 sq. ft.
Floor area in 1 storey (normal span)	5,200 sq. ft.	Ratio : $\frac{\text{Wall}}{\text{Total floor area}}$	0.450	WC compartments	24
Floor area in 1 storey (large span)	1,800 sq. ft.	Ratio : $\frac{\text{Window and door}}{\text{Total floor area}}$	0.300	Single internal doors	44
Floor area in 2 storeys	5,000 sq. ft.	Ratio : $\frac{\text{Enclosing walls}}{\text{Total floor area}}$	0.750	Double internal doors	8
Floor area in 3 storeys	—	Roof lights	250 sq. ft.	Number of staircases	1
				Storey height	10 ft. 0 in.
				Staircase width	3 ft. 3 in.

Fig. 2. Information based on the sketch plan (Fig. 1) and used in interpreting figures in the cost analysis (Fig. 3) to decide element targets. See for example "Staircases" (p. 113).

Gaps in knowledge

There is one important point to be made in the working out of element targets. In some cases, the factors affecting the element in the proposed building will not be the same as those in the cost analysis being used. For example, in foundations the bearing pressure may be different, in upper floor construction the spans and loadings may not be the same. While the effects of such differences on the cost are not easy to calculate, a more reliable estimate can be made than by present methods, since this system of cost planning requires the architect and quantity surveyor to make a systematic examination of the factors affecting the cost of a project, at an early stage. Furthermore, in many cases guidance can be obtained by referring to the analysis of another building where the factors and conditions correspond more closely. This emphasizes the need for systematic analysis of such elements in a number of buildings to show, for example, how foundation cost varies with bearing pressure, or how upper floor cost varies with span and with loading. A number of cost analyses with the relative constructional and design information, as shown in Fig. 3, can allow this kind of investigation to take place, but there are many elements which should be the subject of a special inquiry. The longer cost analysis and cost planning are practised the fewer will be those occasions when the architect relies on a "hunch" in deciding a particular element target. The cost analyses being published by the AJ should form useful material for investigation of cost relationships of this kind.

When the cost plan is completed the total target (Fig. 4) indicates that there is $0/4\frac{1}{2}$ per sq. ft. undistributed ($63/-$ less $62/7\frac{1}{2}$). The architect may either work to a total of $62/7\frac{1}{2}$ and maintain a larger reserve than he had originally intended, or he may distribute the $0/4\frac{1}{2}$ among other elements to enhance the quality of the building. If the total exceeds the target figure, reductions may have to be made; for example, it may be necessary to do without the improved wall finishes that were allowed for in the wall finishes target—or a cheaper method of providing the roof construction may have to be found.

The cost plan, however, may show that it will be impossible to achieve the target cost without seriously impairing the quality of the building. To know this at such an early stage, and to be able to present to the client a reasoned case, based on cost planning would, of course, be invaluable.

In this example, no consideration has been given to fluctuations in the cost of the materials and labour between the date of the cost analyses used and the date of the cost plan. But the figures can be adjusted in accordance with the movement of building prices. Where the architect is satisfied that the total target cost is reasonable, a cost analysis, irrespective of its tender date, may be used to indicate the appropriate distribution to the elements of the money available.

Use of the cost plan

With the cost plan prepared, the architect has a cost target for each element. For example, in the case of roof construction, which was allotted $7/10\frac{1}{2}$, this multiplied by the floor area gives a total sum of £4,712. This could be shown as 855 sq. yds. of roof decking and waterproof finish at £3 per sq. yd. and 200 sq. yds. at £4 per sq. yd., and a 3,000 ft. run of eaves at 9/- per foot run. With this information, the architect can make a choice fully aware of the effect of his choice upon the cost of the job. In the case of construction not provided by sub-contractors or suppliers the architect would have approximate quantities prepared by his q.s. of the method or alternative methods of construction being considered, to see whether they achieve the cost target. Periodic checks will be necessary to make sure that costs are within the limits set.

As the design proceeds it may appear desirable that some elements should receive a greater proportion of the cost than the cost target allows. In this case, corresponding reductions should be made in other elements. Similarly, if an element cost is less than the target, the spare money may be used on other elements.

At the conclusion of the design stage, the element costs should have been decided with some assurance that the ultimate cost will be within the budget. It will be prudent, however, to check the costs of the building as a whole before starting working drawings. At this stage the major portion of the specification should be settled and an estimate based on approximate quantities, preferably by elements, should be prepared. A favourable outcome of this estimate will be the best assurance that working drawings and quantities can be prepared and tenders received without the haunting fear that distasteful reductions or unpleasant explanations will have to be made before the job can start.

PROPOSED PRIMARY SCHOOL CALCULATION OF ELEMENT COSTS

GENERAL ELEMENTS

N.B. All element costs are expressed in shillings and pence per sq. ft. of floor area. The net total cost target is 63s.

Preliminaries and Insurances. 3s. 4d.

Some builders price the site overheads in Preliminaries, others distribute them among the pricing rates: there is no universal practice. Thus cost analyses are not always very helpful in deciding how much to allow for this element. By making it a separate element, abnormal preliminaries, such as temporary roads, gantries, and so forth, can be allowed for, and in checking the other element prices against targets there is no need to add in each case for preliminaries. In this case 5 per cent. of the total is assumed, making the element target 3s. 4d.

Contingencies. 1s. 8d.

This is the easiest element to budget for, 2½ per cent. for new works will be considered reasonable, 1s. 8d.

STRUCTURAL ELEMENTS

Works below ground floor level. 3s. 6½d.

Single storey area (7,000 sq. ft.).

The cost analysis at Fig. 3 indicates this element at 5s. 3d. for single-storey building in load-bearing brickwork, specification as shown, where the bearing pressure was 1½ tons/ft. super and the soil conditions were clayey-silt with a water table of 4 ft. 6 in.

If the assumed bearing pressure for the proposed building were three tons per sq. ft. and the sub-soil gravel, and the water table could be neglected, the cost of the works below ground floor level should be cheaper. It is assumed that a saving of about one-third can be made on the concrete foundation to walls. A further economy could probably be effected on foundation walls, and if these were reduced in height by 1 ft. a saving of about one-third could be made. If, therefore, the foundation walls and the foundations accounted for about 2s. 3d. per sq. ft. of the element total, a saving of one third would amount to 9d. per sq. ft.

For this example it will be assumed that a reasonable target for the single-storey area could be 5s. 3d. less 9d. = 4s. 6d.

Two storey area (5,000 sq. ft.).

Foundations for two-storey and single-storey building in load-bearing construction are often the same because of empirical methods of foundation design. If this is true (and here, further investigation would be worth-while) the target for the two-storey area would be half the single-storey target

$$\frac{4s. 6d.}{2} = 2s. 3d.$$

The element target would then be:

7,000 sq. ft. at 4s. 6d.	= 31,500 shillings
5,000 sq. ft. at 2s. 3d.	= 11,250 shillings
12,000 sq. ft.	42,750 shillings
42,750s.	= 3s. 6½d.
12,000	

External walls and facings. 4s. 0d.

The cost of this element in Fig. 3 is 4s. 3d. and the ratio $\frac{\text{wall}}{\text{floor}}$ is 0.480. In the proposed

school the ratio is 0.450. If the same standard of construction and finish is required, this element would be $\frac{4s. 3d. \times 0.450}{0.480} = 4s. 0d.$

It is assumed that first and second floor walls cost the same, and that any additional cost, such as the provision of a hoist will be included in Preliminaries and Insurance.

The addition $\frac{\text{wall}}{\text{floor}} + \frac{\text{windows and doors}}{\text{floor}}$ indicates the economy of the design. A high ratio indicating too great an area of enclosing walls to clothe the building. The target, therefore, can also be adjusted by reducing the area of the enclosing walls.

Frame.

It is assumed that the architect wishes to provide a hall without steel column supports. Thus a target cost for frame is not required, but the element Roof Construction will probably require a larger proportion of cost. If the building were to be framed, one would need a number of analyses of different types of frames with a description of their performances and design characteristics; e.g., the spacing and spans of the frame; the floor, roof and wind loads, the number and height of storeys. A target cost then would be decided as follows:

Single-storey (generally 10 ft. high, 25 ft. span)	5,200 sq. ft. at 6s. 6d. = 33,800 shillings.
Single-storey (generally 18 ft. high, 40 ft. span)	1,800 sq. ft. at 7s. 3d. = 13,050 shillings.
Two-storey (generally 10 ft. high, 25 ft. span)	5,000 sq. ft. at 7s. 6d. = 37,500 shillings.
	12,000 sq. ft. 84,350 shillings.

The target, if needed, would be:

$$\frac{84,350s.}{12,000 f.s.} = 7s. 0½d.$$

Upper floor construction. 0s. 9½d.

The cost analysis generally most suitable for cost planning may not contain all the elements required. Reference must then be made to other cost analyses, and this would be necessary for the upper floor construction target in this example. Assuming that another cost analysis gives 1s. 3½d., with a total floor area of 15,000 sq. ft. and an upper floor area of 5,000 sq. ft. and that the span, loading, etc., are the same, the target for the proposed school would be:

$$\frac{1s. 3½d. \times 15,000 \times 2,500}{5,000 \times 12,000} = 0s. 9½d.$$

1s. 3½d. × 15,000 gives the total cost of the element and this divided by 5,000 (area of the upper floor) equals the cost per sq. ft. of the upper floors in the cost analysis referred to. If this is multiplied by 2,500 (upper floor area in Fig. 1) it gives the total cost of the element. The target cost is then this figure divided by 12,000 (total floor area of Fig. 1).

Variations in span, loading, sound insulation value, etc. between the analysis being used, and the proposed building would influence the

target cost chosen. The more cost planning is used, the more cost information will accumulate to provide guidance for adjustments of this kind.

Staircases. 0s. 4d.

Once again reference must be made to another cost analysis, which gives 1s. 1d., the total floor area being 15,000 sq. ft.; there were 2 two-storey staircases 3 ft. 3 in. wide, the storey height being 10 ft. 0 in. The staircases thus rise through a total height of 40 ft. If, in the proposed building, the staircase width is 3 ft. 3 in. and the storey height 10 ft. 0 in., the element cost could be calculated as follows:

$$\frac{1s. 1d. \times 15,000 \times 10}{40 \times 12,000} = 0s. 4d.$$

Element cost per sq. ft. (Fig. 3) × total floor area (Fig. 3) × storey height (Fig. 2)

Total rise of staircases × total floor area (Fig. 2)

If the requirements should be different from those in the assumed cost analysis, e.g., if fire protection required a wider staircase, the element cost would have to be increased. Here conditions are assumed to be the same.

Roof construction. 7s. 10½d.

It is assumed that the roofs are similar in both the analysis and the project to be cost planned, except for the assembly hall where provision has to be made for supporting the roof over a larger span.

In the cost analysis at Fig. 3 the assembly hall was metal decking over an area of 1,800 sq. ft., probably with a span of about 4 ft. and supported by a frame at a cost of 1s. 3d. In the proposed building the intention is to span 40 ft. across the assembly hall, which will involve additional cost. The additional cost will be based on the intention to provide the additional strengthening to span the 40 ft. at a cost 25 per cent. less than the element "Frame" in Fig. 3. The amount to be added back is therefore:

$$\frac{1s. 3d. \times 75}{100} = 0s. 11½d.$$

The cost of the element of roof construction may, therefore, be calculated as follows: (8s. 10d. × 11,400 × 10,000)

$$\frac{12,100 \times 12,000}{100} + 0s. 11½d.$$

$$= 6s. 11d. + 11½d. = 7s. 10½d.$$

Element cost per sq. ft. (Fig. 3) × total floor area (Fig. 3) × roof area (Fig. 2)

Total roof area (Fig. 3) × total floor area (Fig. 2)

Roof Lights. 1s. 0d.

Assuming the same standard of specification as in the cost analysis, the element would be:

$$\frac{1s. 3d. \times 11,400}{300 \times 12,000} \times 250 = 1s.$$

Element cost per sq. ft. (Fig. 3) × total floor area (Fig. 3) × area of rooflights (Fig. 2)

Area of roof lights (Fig. 3) × total floor area (Fig. 2)

Windows and external doors. 5s. 8½d.

In many cases it is not possible to make these separate elements, as they are often in the same surround. But where possible they should be kept separate as two elements to assist in the

cost planning of buildings, such as multi-storey buildings where the number of external doors would be small in relation to total floor area. Assuming in this case windows and doors equivalent to galvanized steel in quality, similar to Fig. 3, the cost target for this element would be:

$$\frac{4s. 7d. \times 0.300}{0.240} = 5s. 8\frac{1}{2}d.$$

Element cost per sq. ft. (Fig. 3)
 \times window : floor ratio (Fig. 2)

Window : floor ratio (Fig. 3)

Glazier. 0s. 8 $\frac{1}{2}$ d.

This element is calculated in the same manner as the windows and external doors since the same ratio (0.240) applies.

$$\frac{7d. \times 0.300}{0.240} = 8\frac{1}{2}d.$$

PARTITIONING ELEMENTS

Internal partitions. 1s. 9d.

This target is not so easily calculated as the structural elements, and must depend upon an appraisal of (a) the partition element costs relative to their use and type in several buildings, (b) room heights, (c) the general arrangement of the plan as indicated by the line diagram.

It is assumed that an appraisal of the known facts suggests a target of 1s. 9d.

W.c. doors and partitions. 0s. 8 $\frac{1}{2}$ d.

Internal doors. 0s. 10 $\frac{1}{2}$ d.

Ironmongery. 0s. 7 $\frac{1}{2}$ d.

These three elements may be considered together since their targets may be based on their number per total floor area. In the cost analysis, 21 w.c. doors and partitions accounted for 0s. 7.5d. for a total floor area of 11,400 sq. ft. In this case 24 w.c.'s are assumed:

W.c. doors and partitions :

$$\frac{0s. 7.5d. \times 11,400}{21 \times 12,000} \times 24 = 0s. 8\frac{1}{2}d.$$

Element cost per sq. ft. (Fig. 3) \times total floor area (Fig. 3) \times number of compartments (Fig. 2)

$$\frac{\text{Number of compartments (Fig. 3)} \times \text{total floor area (Fig. 2)}}{\text{total floor area (Fig. 2)}}$$

Internal doors:

$$\frac{1s. 0d. \times 11,400}{66 \times 12,000} \times 60 = 0s. 10\frac{1}{2}d.$$

Element cost per sq. ft. (Fig. 3) \times total floor area (Fig. 3) \times number of doors (Fig. 2)

$$\frac{\text{Number of doors (Fig. 3)} \times \text{total floor area (Fig. 2)}}{\text{total floor area (Fig. 2)}}$$

Ironmongery:

$$\frac{0s. 9d. \times 11,400 \times 60}{66 \times 12,000} = 0s. 7\frac{1}{2}d.$$

It will be noted that double doors have been taken as equal to two single doors in the above calculations.

COST ANALYSIS OF PRIMARY SCHOOL

Element	Cost per sq. ft.	Specification
PRELIMINARIES AND INSURANCES	s. d. 2 1	—
CONTINGENCIES	1 1	—
WORKS BELOW GROUND FLOOR LEVEL	5 3	Strip surface soil 8 in. deep; trenches for foundations to outer walls and partitions, pier holes to columns in Assembly Hall. Hardcore: 4 in. Bed (8,900 sq. ft.) 8 in. (ditto) Bed (2,500 sq. ft.). Site Slab: 6 in. concrete (1-2-4). Strip foundations: Outerwalls, 9 in. \times 2 ft. 0 in. concrete (1-2-4). Innerwalls: 9 in. \times 2 ft. 9 in. concrete (ditto). Stanchion Bases: (14) 3 ft. 0 in. \times 3 ft. 0 in. \times 3 ft. 0 in. concrete (1-2-4). Foundation Walls: 11 in. cavity in stock bricks (1-3). FINISHINGS ELEMENTS

Floor finishes. 4s. 2d.

Ceiling finishes. 1s. 5d.

It is probably easier to arrive at a cost target for these two elements than most of the others since their areas generally are identical with the floor area of the building. It is important that the specification attached to the cost analysis shows the areas of the different finishes in different parts of the building so that the average quality expressed by the element price may be judged.

The choice of target costs depends upon this judgment, taking into account such requirements as fire protection, acoustics, etc. It is assumed that the Fig. 3 specification is suitable and that the targets of 4s. 2d. and 1s. 5d. for floor finishes and ceiling finishes respectively are adequate.

Wall finishes. 1s. 9d.

Decorations. 2s. 6d.

Like Internal Partitions these two target costs depend upon a comparison of several analyses, and appraisal of the different factors involved. Many of the factors affecting the cost of the partitions will also affect the wall finishes and decorations.

Some of the wall finishes will have to be more sound absorbent than $\frac{3}{4}$ in. gypsum plaster. The additional cost of this will be largely a matter of judgment and will be taken as 1s. 9d. Three coats of paint are required instead of the two shown in Fig. 3, and reference to the build-up of the cost analysis shows that the external two-coat painting accounts for 10d. Therefore for the extra coat a sum of 4d. is added to the 2s. 2d. to make 2s. 6d.

FITTINGS AND SERVICES ELEMENTS

With the possible exception of plumbing, these cost targets can at present only be chosen after comparison of a number of analyses. Detailed costs of the services are not always easy to obtain, so that the reasons for differences in cost cannot be analysed.

For example, there appears to be little published information on the effect on heating costs of an extra air change per hour or the increase of temperature by five degrees, or the saving obtained from increased thermal insulation of the roof.

Similarly, in electrical installations it is not always easy to discover the relative costs of different types of wiring or whether an increase of 5 per cent. in the lighting load means a substantial or negligible increase in costs.

For these elements, therefore, the fictitious cost analyses published in the Cost Analysis article (February 24) are set out below, with the element cost of Fig. 3, so that the targets for the proposed building in Fig. 1 may be chosen:—

Element	A	B	C	Fig. 3
Fittings	0s. 6d.	2s. 0d.	1s. 3d.	2s. 7d.
Plumbing (external)	0s. 6d.	0s. 2d.	0s. 8d.	0s. 8d.
Plumbing (internal)	1s. 10d.	1s. 3d.	1s. 2d.	1s. 8d.
Plumbing (sanitary fittings)	1s. 0d.	1s. 4d.	0s. 10d.	1s. 2d.
Gas installation ..	0s. 3d.	0s. 4d.	0s. 6d.	0s. 1d.
Electrical installation	5s. 0d.	2s. 4d.	1s. 8d.	2s. 3d.
Heating installation	6s. 5d.	5s. 6d.	7s. 6d.	6s. 4d.
Drainage	1s. 10d.	2s. 1d.	2s. 4d.	4s. 2d.

To make a choice it is necessary to consider the scale and quality of provision in each element in relation to its cost; that is to say, in practice

the cost analyses of schools A, B and C would contain the kind of information and specification which is provided in the cost analysis at Fig. 3.

Assuming that due consideration had been given to the provision in each element, the cost targets chosen may be taken as follows:

Fittings. 2s. 3d.

The architect's intention is to provide the building with as high a standard of fittings as is possible within the framework of the cost target. He chooses 2s. 3d.

Plumbing (external). 0s. 7½d.

The provision at Schools A, C and Fig. 3 appear to accord closely with the architect's intention. He chooses 0s. 7½d.

Plumbing (internal). 1s. 8d.

The piping in Schools B and C is not suitable to the water conditions applicable in the area of the proposed building. He allows 1s. 8d.

Plumbing (sanitary fittings). 1s. 1½d.

In this case it is possible to make a mathematical calculation. Where 60 sanitary fittings* are likely to be provided, the cost target can be calculated as follows:

$$\frac{1s. 2d. \times 11,400}{58 \times 12,000} \times 60 = 1s. 1\frac{1}{2}d.$$

Gas and electrical installation. 0s. 4d.; 2s. 3½d.

For both these elements some help in deciding cost targets may be obtained by making a calculation based on the number of points, but,

pending a systematic study of costs, a choice will have to be made on the inspection of cost analyses and the related standards of installation. Assuming this has been done, targets of 0s. 4d. for gas installation and 2s. 3½d. for electrical installation are chosen.

Heating installation. 6s. 6d.

For this element, selection of a cost target must rest on a comparison of required temperatures, air change rate, thermal transmittance of walls and roof, and heat losses: and these should assist greatly in selecting an appropriate target. It is assumed that a cost target of 6s. 6d. would be reasonable.

Drainage. 2s. 3d.

The cost of the element will be affected mainly by the falls and the nature of the ground and the disposition of the fittings throughout the building. It is advisable to refer to a plan of the buildings for which cost analyses are available. This appraisal might show a reasonable cost target to be 2s. 3d.

Playgrounds and paved areas. 3s. 0d.

This element will, like the drainage element, depend greatly on the falls, the nature of the ground and the areas and specifications of paving to be provided. Choice of a target will depend on the examination of other jobs and their related costs. Paved areas is an element which varies greatly from building to building, and it may prove more certain to decide the target by taking out approximate quantities. However, in this case it will be assumed that the conditions of the proposed building indicate a target of 3s.

The Cost Plan. In selecting the method of construction for each of these elements, the architect can check its cost against the target figure set.

News—continued from p. 109

more sure about the direction of modern architectural development and more certain of what to teach, we know really very little about teaching method itself. We learn quite a bit through experience, but the experience is gained on an entirely orthodox system of studio design subjects. Where the same educational problems have been found to recur in all schools, we tend to regard them as insoluble and inevitable. I do not think anyone has yet tried to solve them, or even discover the underlying cause. Teaching at the moment is too rigid. Our own experiment in the unit system might be a step in the right direction. It certainly aims at a closer and less formal contact between student and staff, but it is very far from being perfect."

RIBA

Council Meeting

The following items were among those discussed at the last RIBA council meeting.

Representation of Salaried Members: In the course of further consideration of the opinion expressed at the Annual General Meeting, it was agreed to set up a committee on which members in the following spheres of occupation will be represented: principals in private practice, salaried assistants in private practice, official architects, salaried assistants in Central and Local Government service, members employed in teaching, members in charge of architectural departments of commercial or industrial undertakings and a representative of Scotland. The first task of this Committee is to review urgently the work so far done on the question of machinery for the representation of salaried members and to make recommendations to the Council as to the immediate action to be taken in the light of the resolution passed at the Annual General Meeting. As a second and longer term task, the Committee are charged with considering the advisability of an extended investigation into the structure of the profession, the total income of the profession in relation to the scale of salaries that might be afforded, and the grading of architectural appointments in relation to age, experience and responsibilities, and to suggest to the Council, if thought practicable, a programme of work in connection with such an investigation.

Appointment of Honorary Officers for the Session 1955-1956: F. Charles Saxon, having been re-appointed Chairman of the Allied Societies' Conference, remains a Vice-President under the provisions of By-law 28. Basil Spence, was re-appointed a Vice-President. Kenneth M. B. Cross and J. Leslie Martin, were appointed Vice-Presidents. E. D. Jefferiss Mathews was appointed Honorary Secretary, and Thomas E. Scott was re-appointed Honorary Treasurer.

RIBA Representatives on the National Consultative Council of the Building and Civil Engineering Industries for the year beginning July 1, 1955: Michael Waterhouse, Past President, and E. D. Jefferiss Mathews were nominated for re-appointment by the Minister of Works as the RIBA representatives on the National Consultative Council.

National House-Builders' Registration Council: RIBA Representatives: C. E. Culpin in place of Kenneth J. R. Peacock. The other two representatives are A. W. Kenyon and Miss J. G. Ledebor.

Code of Practice Committee to decide whether a Code on Flues for Larger Appliances in Buildings should be drafted, and Drafting Committee for this Code: RIBA Representative: Frank H. Heaven in place of G. M. Kingsford.

designed by WALTER and EVA SEGAL

quantity surveyors, GODFREY and BURGESS

The building is a medium-sized office block of 8,500 f.s. which was built for Tretol Ltd. for a gross figure of 47s. per f.s.—a figure which would be regarded as low even in the housing field. The architect attributes this achievement to such factors as clients who could make their minds up, to a general contractor whose firm was the right size for the job, to a helpful local authority who agreed to the use of calculations for the design of load-bearing brickwork instead of the usual "rule-of-thumb" and to the fact that working drawings were nearly all complete by the time the contract was signed. In addition, the design was based on materials which were easily obtainable, required little specialist performance and a minimum of sub-contracting. There is little doubt that the low figure is also due to the determination to keep to simple domestic construction, to the limitations of floor-span, and to the fact that the architect has resisted the temptation of resorting to expensive materials for the sake of spectacular effect. The general contractors were A. T. Rowley (London) Ltd. For sub-contractors see page 136.

The east facade of the offices from the Edgware Road. Viewpoint 1.

Key plan showing the photographic viewpoints

Above: general view of the building, viewpoint 2, showing the main entrance. The facing bricks are purple-grey wire cuts. The windows in the long range are framed up in gurjun, waxed and oiled, the opening lights painted white. The windows light the general typing offices on the ground floor, and individual offices on the first floor. In the projecting block above the main entrance are situated the managing director's quarters, away from the somewhat noisier offices. Right: a detail, viewpoint 3, showing the joint between sill and jamb of the gurjun frame round the main range of windows.

Left: viewpoint 4, detail of a more traditional sill. Note the letterbox let into the wall beneath the window. This letterbox opens into the main entrance hall. The fact that the architect has been obliged to construct it in wood is a reflection of the painful lack of resourcefulness on the part of English ironmongery firms, who have never yet produced a standard letterbox capable of taking any package larger than *The Architectural Review*. A flower-bed is placed below the letterbox.

Below: viewpoint 5, tiling detail from a panel in the main range of windows. The tiles are in two shades of purple, and are designed by the architect. They tone in a well-mannered way with the brickwork, and mark a welcome departure from the tendency of many modern architects to place too great a reliance on strong saturated colours for external use. The tiles are fixed on to a masonry backing (see Working Detail in the JOURNAL for August 4, 1955).

OFFICES AT HENDON

Above: main entrance, viewpoint 6. Architect's details of entrance doors are shown below, and it will be noticed that the gurjun frames are placed with their greater dimension on section at right-angles to the main plane of the door. This considerably reduces whip, and provides a much greater

body of material where it is needed to resist the impacts to which a swing door is subjected. The columns supporting the projecting office above the entrance doors are reinforced-concrete faced with terrazzo. Above right, viewpoint 7, detail of main entrance door, showing depth of hardwood frames.

OFFICES AT HENDON

Key plan and elevation, detail plan and sections B-B and C-C of main entrance doors [Scale: 1" = 1' and 1/4" = 1' 0"]

Section A-A [Scale: $\frac{1}{16}'' = 1' 0''$]

First floor plan

Ground floor plan [Scale: $\frac{1}{32}'' = 1' 0''$]

Roof plan

Basement plan

Above left: the west side of the offices from viewpoint 8. Instead of tiled panels here, there is vertical gurjun boarding. Note the zinc flashing to the top of the projecting window-frame. The coping to the low parapets is of pre-formed pressed zinc in 8-ft. lengths. Only the corners, which are mitred, are worked *in situ*. Above right: a close-up of the zinc parapet.

Section opening light window in SE wing
[Scale: $1'' = 1' 0''$]

Detail of a window in the projecting wing at the south end of the building, viewpoint 10. The unusual glazing division of this window and the soldier courses of brickwork round the opening should be noted.

Above: a view of the main entrance hall. The wall at the back is a slate blue. All woodwork is gurjun, oiled and waxed. Other painted surfaces are white. Floor finishes vary throughout the building. Note the extremely simple domestic detailing of the enquiry desk. Right: all glass partitions terminate in a brick load-bearing pier. With piers at 4 ft. centres, adequate flexibility is achieved in the rearrangement of partitions without the need to resort to clumsy detailing where partitions run into a window wall.

OFFICES AT HENDON

Key plan, detailed plan and elevation and section of enquiry desk
[Scale: $\frac{1}{8}'' = 1' 0''$ and $\frac{1}{4}'' = 1' 0''$]

Left: the foot of the staircase in the main entrance hall. Plate glass occupies the spandrel formed by the stringer and newel post of the stairs. Above: a view down the staircase well from the landing at main roof level. Below: detail of the treads and half risers of the staircase. The actual rise of this staircase is very steep, but there is no feeling that this is so as one ascends the stairs; this the architect attributes to the use of half risers. The carpeted tread is retained in position by the screwed-on nosing. In this particular case the heavy pile carpet and underlay result in too great a thickness over the tread and confuse the foot as it descends on to the nosing when coming down stairs. The architect comments that a thinner underlay would have given a more satisfactory solution. This staircase will be illustrated as a Working Detail in the JOURNAL for August 4, 1955.

Opposite page, top: the general typing room on the ground floor. This is used as a means of access to the individual offices, the entrances of which are seen on the right. It is remarkable that although hard and unabsorbent surfaces are used throughout, the noise of typing does not seem to be a nuisance. Opposite page, bottom: semi-glazed screens between the individual offices in the central section. These screens are all prefabricated and consist of hardboard on studding with a glass fibre infill. (See sketches.) The open view afforded by the glass screens assists in personnel relationships and reduces the feeling of oppressiveness which otherwise might result from small offices only eight feet wide. As the tones of the black and white reproduction indicate, each screen and each end wall of the several offices are in different pastel colours, and this device is remarkably successful in reducing the scale.

OFFICES AT HENDON

Section through head of doorway [Scale: 1" = 1' 0"]

This detail shows how the frame acts as a ground for the plaster in the usual way, but the minute bead (at juncture of frame and plaster on the right) used as an architrave is in hardwood and is applied after wall and frame have been "painted through" together

Section and plan of typical internal partition
[Scale: 1" and 1/2" = 1' 0"]

Below left: the bar counter in the canteen. Below, a general view of the canteen. It is a sad reflection on Britain's place in a competitive world market that the very comfortable and not inelegant chairs are imported from Germany at £3 each.

CLIENT'S BRIEF : his stated requirements

A modern office building, capable of sustaining increases in staff. An extra wing and a third floor to be added later. Emphasis of design on a well-lit, stimulating building for a young and progressive organization. Efficient circulation and flexible partitioning were essentials.

SITE : topography, surroundings, access, planting

Roughly rectangular corner site, sloping 2 ft. 9 in. north to south, amid mixed development (industrial and suburban), fronting Edgware Road. There is one horse-chestnut tree in south-east corner, and the surrounding area was turfed and planted after completion. Area of site before development was approximately 15,500 sq. ft.

Site plan

PLAN : general 'appreciation

Open plan with minimum of corridors. Circulation on principle of larger less differentiated units giving access to smaller specialized unit. Units closely knit and carefully located in accordance with administrative functions.

MAIN CONSTRUCTION

Basis of construction is calculated brickwork on the principle of the platform construction

Load bearing element	Location	Beam spans	Column grid	Reasons
Brick platform construction, with piers at 4 ft. 9 in. centres	Main office wing	Continuous slab (rc.) spanning 15 ft. 0 in.	9-in. \times 13½-in. calculated brick piers at 4 ft. 9 in. centres (calculated with very narrow margin to take a third storey)	To achieve economy and avoid delays normal with steel and rc frame construction
Load bearing brickwork	Towers structure	No beams in main construction to avoid formwork. Beam here and there for ancillary purposes		
Foundation type	Location	Sub-soil		
RC strip foundation	Throughout	Loamy clay with good bearing clay at depth varying from 4 ft. 6 in. to 9 ft. 0 in.		
Outer wall type	Location	Material	Finish	
Cavity construction, outer skin 4½-in. brick with tile finish	In main office wing	Silver-grey facings, flettons behind tiling, lightweight concrete blocks	Tile facing to panels east facade	
13½-in. brick	In tower structure		Red cedar cladding to west facade	
			Pointed brickwork elsewhere	
Roof type	Location	Material	Finish	
"Wet" roof on 20-year guarantee, with one overflow	Throughout	6-in. rc slab, 2-in. woodwool insulation, 1-in. screed	3-ply bituminous felting with spar finish	
Floor structure type	Location	Material	Finish	
Continuous rc slabs 6 in. thick, cast in situ	Throughout	rc	Screeded for: a. thermoplastic tiles b. PVC tiles c. woodblock d. granolithic e. quarry tiles	
Internal wall type	Location	Material	Finish	
Light, half-glazed purpose-made partition on standard grid	In main office areas	Studding with glazing and hardboard cladding	Painted	
2-in. and 3-in. breeze and 4½-in. brick	In ancillary area		Plastered and painted	
Ceiling type	Location	Material	Finish	
Plastered ceilings	Throughout	Plaster base with gypsum finish	Painted

300 line exchange with 3 manual switchboards

SPACE REQUIREMENTS FOR TYPICAL INSTALLATIONS.

- A composite line finder, line relay and final selector rack
- B group selector rack
- C relay set rack
- D composite relay set and group selector rack
- ☐ E manual switchboard
- ☒ cable turning section
- ☐ F main distribution frame

600 line exchange with 5 manual switchboards

37.H11 STROWGER TELEPHONE EQUIPMENT : PRIVATE AUTOMATIC BRANCH EXCHANGE TYPE NO. 3.

This Sheet describes the performance, and equipment required, for the Type No. 3 private automatic branch exchange (P.A.B.X.) system and gives the space requirements for typical installations.

A P.A.B.X. combines the facilities afforded by a manual exchange for external traffic and a private automatic exchange for inter-departmental calls. From each instrument connected to the P.A.B.X. it is possible to dial a departmental number or to make calls to the public exchange.

Equipment

The following equipment is necessary for all Type No. 3 installations, the number of units depending on the size of the system.

Automatic switching equipment: This is mounted in open-type racks 7 ft. 6 in. in height by 1 ft. 2 in. in depth and 3 ft. 9 in. or 4 ft. 6 in. wide (depending on the functions of the equipment, as given on the face of the Sheet). All the equipment is mounted on the front of the racks and, with few exceptions, wiring and cabling is taken to the rear to give maximum accessibility to both equipment and wiring. Each rack is a self-contained unit and each item of equipment is provided with an individual dust cover. Most of the equipment is of the jack-in type to facilitate inspection and maintenance.

Manual switchboard: The overall dimensions of each switchboard unit are 2 ft. 2½ in. wide by 2 ft. 9¾ in. deep by 4 ft. 8 in. high, and they are designed so that a number may be placed together to form a continuous block, which may be extended to meet future requirements. Detachable panels at the rear of the switchboard make it possible for inspection and maintenance work to be carried out without interruption of the service. At the end of each block of switchboards is a cable turning section which provides a suitable entrance for the cable and facilities for its connection to the units. This section is 1 ft. 2½ in. wide by 1 ft. 6½ in. deep by 4 ft. 8 in. high and can be located at either end of the block of switchboards. Its location determines the direction in which the block can be extended, additions being made to the opposite end.

Main distribution frame: This is normally 6 ft. 8½ in. high by 2 ft. deep but can be 8 ft. 6½ in. high where floor space is restricted. The width depends on the size of the installation.

Power equipment: This consists of batteries which must be mounted on shelves or racks. They are supplied by the Post Office Department but full details of the provisions that must be made for them and for ancillary equipment (control panels, rectifiers, dynamotors, etc.) are set out in BS Code of Practice CP.327.101 : 1952, *Telephones and Telegraphs, Public Services*.

Space Requirements

The diagrams on the lower face of the Sheet show space requirements for typical installations. The automatic switching equipment and main distribution frame should be situated in one room and the manual switchboards in another. Where open-type secondary cells are used a separate battery room must be provided, adjacent to the automatic switching apparatus room. In the apparatus room a floor-to-ceiling height of 10 ft. 10 in. is desirable, although 9 ft. 0 in. is the acceptable minimum.

Operation

Automatic switching equipment: This can provide service for up to 1,200 extensions. Standard "dial," "ring," "engaged" and "number unobtainable" tones and ringing current are provided. The circuit arrangements are such that, if a fault should develop in a selector, extensions are not thereby prohibited from making calls. If a handset is incorrectly replaced, or if a line fault develops, the automatic equipment thus "held" is released and again made available for general use. Automatic alarms indicating the nature and location of such faults are extended to the manual switchboard and can receive attention.

The automatic equipment and the line circuits are adequately protected from the effects of sudden or sustained excessive currents and high voltages.

Manual switchboard: Extensions have access to the manual board via relay sets connected to level "0" of the group selectors. The digit "9" is employed for connecting extensions to the public telephone exchange and other single digits for connecting extensions to inter-switchboard lines.

The first free exchange line is indicated by the illumination of a green lamp. When lines are taken into service by extensions dialling the appropriate code (e.g., "9" for exchange line), by the manual operators or by an incoming call, the lamp is extinguished and the next free line indicated. This means that operators need not waste time testing for free lines. The facility is available on each group of exchange lines and inter-switchboard circuit.

Service

The following services are available on every P.A.B.X. Type No. 3 installation.

Internal calls via automatic switching equipment: All inter-departmental calls may be made directly by dialling the required number; the connection is made in a few seconds.

Incoming public exchange calls: These are received on the manual switchboard and connected to the required extensions by the operator. If the extension is engaged on an internal call the operator can interrupt, if necessary, to offer a public exchange call. It is impossible for an incoming call to be accidentally connected to an extension that has not been cleared from the public exchange.

Outgoing public exchange calls: Calls may be made to the public exchange by dialling "9" from an extension followed by the required number (direct access). Where the number cannot be dialled direct, the P.A.B.X. operator can be called by dialling "0." If required, direct access to the public exchange can be withheld from certain extensions so that outgoing calls can only be made through the manual operator. The timing of toll or trunk calls ceases immediately when the handset of the extension from which the call was made is replaced.

Holding public exchange call while making internal enquiries: By pressing a button on the extension telephone, the public exchange call is held while another internal extension is being dialled. The button is pressed again to re-establish the connection with the incoming call.

Recalling operator: It is possible to speak to the P.A.B.X. operator during a public exchange call by pressing the button on the extension telephone twice.

Tie-line installation: The Strowger Type No. 3 P.A.B.X. may be connected to other private automatic or manual exchanges, so that separate premises of any organisation can be linked without making use of the public telephone service. Calls to the other exchanges may be dealt with by the automatic switching equipment or by the manual operator, whichever is the more convenient.

Satellite service: Where there are separate premises but it is desirable that public exchange calls be handled by one exchange only, a Type No. 3 P.A.B.X. in the main building can be connected to satellite automatic switchboards in the subsidiary buildings. Extensions connected to the satellite switchboards may be given a number of the facilities available to those connected directly to the main P.A.B.X.

Night service: Normally night service may be provided by connecting exchange lines to certain extensions which can then make and receive outside calls. Where night calls are likely to be numerous, a night service switchboard, to which selected exchange lines are diverted, may be installed to be operated by a night watchman or caretaker.

Further Information

The manufacturer has a technical advisory department available to answer questions dealing with the installation of this equipment. Maintenance is carried out by the G.P.O.

The manufacturer's reference number for this Information Sheet is 1274 : 7/55.

TABLE OF SIZES AND LOADS.

35.B1 ESCALATORS : DESIGN AND SPACE REQUIREMENTS

This Sheet describes the general design and application of escalators and gives the space requirements for typical installations. Layout and siting data are given on Sheet 35.B2.

General

An escalator system has a passenger carrying capacity which could only be equalled by an excessive number of lifts occupying a larger floor area. It gives an improved service for a smaller operating cost. It provides more incentive to movement from one level to another than does a lift. The escalators described on this Sheet are reversible and normally require no intermediate support between floors, except for floor heights in excess of 18 ft.

Nominal widths

Three nominal widths are available as standard. (The width of the escalator is measured between the inside casings at a point just below the handrails.) They are as follows:

Type	Width between balustrade casing	Width of step	Capacity in persons per hour*
32U	32 in.	24 in.	5,000
40U	40 in.	32 in.	7,000
48U	48 in.	40 in.	8,000

* Operating at a step speed of 90 ft. per min., with allowance made for passengers not feeding consistently on to the escalator.

Choice of width

The carrying capacity of an escalator is governed primarily by its width. Selection of the most suitable width for a given application involves consideration of the following factors:

32 in.: This width of escalator is suitable for small departmental stores, banks and similar buildings. It allows one adult and a child to stand side by side on the escalator or, alternatively, one person laden with parcels to stand on a step with comfort.

40 in.: This width is a recent development designed to give more room for two persons standing side by side and to allow passing on the steps, if desired.

48 in.: This width of escalator is normally used for the British underground railways and allows adequate room for persons to pass easily even when carrying baggage. It is also suitable for public buildings and can be used with advantage in very busy departmental stores where heavy traffic is anticipated.

Angle of inclination

The angle of inclination to the horizontal for these escalators is normally 30°.

Speed

Experience has shown that a speed of 90-100 ft. per min. for the step on its incline is the most suitable for all applications other than those involving vertical rises in excess of 30 ft. or where large peak crowds have to be handled.

Increasing the speed up to about 145 ft. per min. will improve the capacity of the escalator but not in direct proportion. There is little advantage gained from speeds in excess of this figure other than a psychological effect on impatient passengers.

Space requirements

The space requirements for typical single installations are given on the face of the Sheet. Layouts for multiple arrangements are shown on Sheet 35.B2. Where the end of the escalator is adjacent to a wall a minimum clearance of 8 ft. must be allowed. The motor room is located at the top end of the escalator within the "truss"; two points of support only are normally required.

Installation

The escalators are installed by the manufacturer, but the following provisions must be made by the architect:

- (1) All escalator supports including steel bearing plates where concrete beams are used.
- (2) Electric light points at each end of the escalator.
- (3) Bearers at each end of escalator and access pit for lower end when at ground level.
- (4) Balustrade or fireproof enclosure to floor opening at upper end of escalator.
- (5) Plasterboard on timber battens or other cladding to the exterior of both sides of the escalator and to the soffit.
- (6) Main electric wiring terminating in main switch and fuses (or circuit-breaker) in motor room at top of escalator.
- (7) All builders' work in preparation of building for escalator and in making good up to and around it; also in covering with suitable flooring material "trays" in access trap doors at top and bottom of escalator.

Applications

Escalators are suitable for use in departmental stores; banks; office buildings; factories (for bulk movement of operatives); railways (surface and underground); entrances and exits to subway tunnels; public exhibitions; amusement parks.

Further information

The manufacturer should be consulted at an early stage where installation of the escalators described on this Sheet is contemplated.

ARTIFICIAL LIGHTING

<i>Source and fitting type</i>		<i>Illumination level</i>
Mainly fluorescent light fittings with spot lights for decorative effects in display areas of entrance hall		Sub-contractors' recommendation accepted
<i>Wiring and switching types</i>	<i>Location</i>	<i>Reason</i>
Screwed conduit on ring main system	Throughout	To ensure flexibility
<i>Power supply type</i>	<i>How distributed</i>	
Screwed conduit on ring main system	A selected number of points to each unit in accordance with requirements	

NATURAL LIGHTING

<i>Wall glazing</i>	<i>Location</i>	<i>Reason</i>
32-oz. sheet glazing	Throughout	Required by sizes of openings
<i>Roof glazing type</i>	<i>Location</i>	<i>Reason</i>
6 ft. 0 in. x 4 ft. 0 in. dome lights	Tower Board Room	To give added light to staircase well To ensure an atmosphere of concentration

HEATING AND VENTILATION

<i>Heat exchanger type</i>	<i>Location</i>	<i>Criteria temp.</i>	<i>Reason</i>
L.p.h.w. radiators	Under windows	69° F.	Client's requirements
<i>Boiler type</i>	<i>Fuel type</i>	<i>Stoking method</i>	
Solid fuel	Welsh nuts	Automatic feed	
<i>Water heater type</i>	<i>Location</i>		
Gas geysers	Canteen, cloakrooms, laboratory		
<i>Cold water storage type</i>	<i>Location</i>	<i>Capacity</i>	
Galvanised purpose-made cistern	On roof in fibreboard casing	400 gallons	

ACOUSTICS

<i>Sound insulation</i>	<i>Location</i>
Sound insulation by planning; quiet parts segregated	Managing Director's office in north wing. Canteen in separate wing

SOIL WASTE

<i>Type of system</i>	<i>Location</i>	<i>Materials</i>
One pipe	In lavatory wing	Cast iron
<i>Drain types</i>		
Standard construction using 4-in. centre ware pipes to 1 in 40 falls		
<i>Rainwater disposal type</i>	<i>Location</i>	<i>Materials</i>
One overflow pipe to control "wet" roof	In north-west corner	Vitrified enamelled steel pipes at 3-in. centres

FIRE

<i>Structural precautions</i>
Not required in two-storey building

COLOUR

<i>Paint types</i>	<i>Where used</i>	<i>Comments</i>
Flat oil	Interior walls and ceilings throughout	Strong primary colour scheme throughout; few pastel shades in individual offices. Chosen to suit client's requirements
High gloss	Interior walls and interior and exterior woodwork throughout	
Chlorinated rubber	Concrete soffit to main porch	

TIME SCHEDULE

<i>Contract signed</i>	<i>Work commenced</i>	<i>Work completed</i>	<i>Type of contract</i>
February 20, 1954	March 1, 1954	October 1, 1954	RIBA

DETAILED PLANNING

The possibility had to be provided for possible extension upwards. This will probably take the form of a light structure on the roof, and accounts for the fact that the entrance block is taken up three floors.

The entrance hall: This forms the focus of planning as in most office buildings. It was designed to give the building a feeling of spaciousness and pleasure, and to introduce visitors informally to a raised exhibition area.

The general colour scheme consists of smoky blue (ceiling and facing wall), white with a wide use of acid yellow for the remaining walls. All woodwork is waxed polished gurjun.

COST ANALYSIS

		Element	Cost per sq. ft.
			s. d.
Total floor area (including basement)	8,500 sq. ft.		
Tender date	February 15, 1954		
Tender cost of superstructure, etc.	£14,863	Preliminaries and insurances	1 9
Heating	£1,354	Contingencies	2 6
Lighting	£900	Work below ground floor level	5 8
Partitions	£950	External walls and facings	4 1
Floor finishes	£1,100	Internal load-bearing walls	1 9
Painting	£850	Internal partitions	2 0
Gross total cost	£20,017	Upper floor construction and staircase	3 9
		Roof	4 10
Cost per foot super of floor area,		Rooflights	2½
including basement	£2 7s. 0d.	Floor finishes	3 6
Cost per ft. cube, including basement	3s. 9d.	Windows and doors (external)	3 1
		Doors (internal)	10
		Ironmongery	7
		Plumbing (external)	7½
		" (internal)	10
		Sanitary fittings	6
		Gas installation	Added later
		Electric installation, plus fittings	2 8
		Heating installation	3 4
		Drainage	7
		Glazing	8
		Decoration	1 11
		Paved areas	2
		Special thermal insulation	9
		Difference between tender cost and final cost owing to increased depth of foundation required in south-east corner	£615

COST COMMENT

It is hoped that the cost of this building, which is of particular interest, will form the subject of

an article by the architect in a later issue of the JOURNAL.

TECHNICAL SECTION

The recently-formed Gypsum Building Products Association has called attention in a circular letter to the need for a return to a more rigid specification for timber used as ceiling joists. The faults quoted are the use of imperfectly seasoned timber, the general abandonment of the use of noggin pieces, excessive variation in the depth of joists (amounting at times to $\frac{1}{2}$ in.) and the use of joist thicknesses as small as $1\frac{1}{2}$ in. (which does not allow sufficient thickness for nailing ceiling linings) and irregular spacing between joists. The Association recommends that, for $\frac{3}{8}$ -in. plasterboard, joist spacing should be 1 ft. 4 in. centre to centre, which may be increased to a maximum of 1 ft. 6 in. for top floor ceilings; and that for $\frac{1}{2}$ -in. plasterboard the joist spacing may be increased to 2 ft.

CURRENT PRICES FOR MEASURED WORK

Prepared by Davis, Belfield & Everest, chartered quantity surveyors

Prices are for work executed complete and are for an average job in the London area. All prices include overhead charges and profit for the general contractor. Current prices of materials and rates of wages last appeared in the JOURNAL for July 14.

PRELIMINARIES

To all valuations for measured work add for Preliminaries, Water and Insurances, according to the nature of the job (say) 10%

EXCAVATOR

Excavation

N.B.—The following prices are applicable to hand excavation in heavy soil.

Surface digging, 6" deep	Yd. super	1/1
Ditto, 12" deep	"	2/2
Excavating not exceeding 10' 0" deep to reduce levels	Yd. cube	8/8
Excavating not exceeding 5' 0" deep to form basement	"	9/9½
Ditto exceeding 5' 0" and not exceeding 10' 0" deep ditto	"	14/2
Excavating not exceeding 5' 0" deep to form surface trenches	"	12/-
Ditto exceeding 5' 0" deep and not exceeding 10' 0" deep ditto	"	16/4
Excavating not exceeding 5' 0" deep to form basement trench commencing 10' 0" deep	"	20/8

Disposal

Returning, filling and ramming around foundations	Yd. cube	3/10
Wheeling excavated soil not exceeding 100 yards and depositing	"	4/4
Ditto and spreading and levelling	"	5/8
Ditto, ditto, and consolidating to make up levels under floors and pavings	"	7/2
Filling into lorries and carting away	"	14/-

EXCAVATOR—(continued)

Planking and Strutting

Planking and strutting to sides of surface or basement excavation not exceeding 5' 0" deep	Ft. super	-/7
Ditto not exceeding 10' 0" deep	"	-/9
Planking and strutting to sides of surface trenches not exceeding 5' 0" deep (both sides measured)	"	-/2
Ditto not exceeding 10' 0" deep (ditto)	"	-/3

Hardcore

Hardcore filled in, in layers, each layer well rammed with a mechanical rammer	Yd. cube	19/1
Bed of ditto, 4" thick	Yd. super	3/2

CONCRETOR

Concrete (Basic Prices)

Portland cement concrete 1 : 3 : 6 with $1\frac{1}{2}$ " coarse aggregate in foundations and masses exceeding 12" thick	Yd. cube	66/2
Ditto 1 : 2 : 4 with $\frac{3}{4}$ " coarse aggregate ditto	"	72/3
<i>Add to basic prices for:—</i>		
Working around rod or mesh reinforcement	"	4/4
Being in beds less than 12" thick (6"-12")	"	2/2
Ditto less than 6" thick ($4\frac{1}{2}$ "-6")	"	6/6
Being in small quantities not exceeding 3' cube	"	17/4
Being in suspended floors and roofs	"	13/-
Being in walls not exceeding 6" thick	"	21/9
Ditto exceeding 6" but not exceeding 12" thick	"	15/3
Ditto exceeding 12" thick	"	10/10

CONCRETOR—(continued)

Add to Basic Prices for:—

Being in lintels, beams, etc., not exceeding 72 sq. in. sectional area	Yd. cube	32/7
Ditto exceeding 72 and not exceeding 144 sq. in. sectional area	"	26/1
Ditto exceeding 144 sq. in. sectional area	"	21/9
Being in columns not exceeding 72 sq. in. sectional area	"	41/3
Ditto exceeding 72 and not exceeding 144 sq. in. sectional area	"	32/7
Ditto exceeding 144 sq. in. sectional area	"	26/1

Formwork

Flexible formwork to soffits of barrel vault roofs	Yd. super	19/7
Close boarded formwork and supports to soffits of floors not exceeding 12' high	"	15/11
Ditto to vertical faces of walls (both sides measured)	"	16/2
Ditto to sides and soffits of lintols and beams	Ft. super	2/3½
Add to the above for wrot boarded formwork and rubbing down concrete	Yd. super	2/11

Reinforcement

½" to 1" diameter mild steel rod reinforcement, hooked, bent and tied at intersections as required and fixing in concrete	Cwt.	54/1
½" diameter ditto	"	59/-
¾" diameter ditto	"	74/2
Steel wire mesh fabric reinforcement to B.S. 1221, weighing 4.71 lb. per yard super, well lapped at joints and embedded in concrete	Yd. super	3/7
Ditto weighing 9.32 lb. per yard super ditto	"	6/11

BRICKLAYER

Common Brickwork

		Flettons	Rough stocks
Reduced brickwork one brick thick in cement-lime mortar (1 : 3 : 9)	Yd. super	30/11	37/6
Add to the above:—			
If in cement mortar (1 : 3)	"	-/3	-/3
If circular on plan to flat sweep	"	5/2	5/6
Ditto to quick sweep	"	10/2	10/11
Half brick wall in cement lime mortar (1 : 3 : 9)	"	16/10	20/2
Ditto built fair and pointed both sides with a neat flush joint	"	19/-	22/4
One brick wall built fair and pointed both sides with a neat flush joint	"	36/8	43/3
11" hollow wall with 2" cavity and galvanized iron twisted ties	"	36/5	43/1

Engineering Brickwork

		Lingfield Engi- neering Wirecuts	Blue Pressed bricks
Reduced brickwork one brick thick in cement mortar (1 : 3)	Yd. super	46/3	78/4
Half brick wall in cement mortar (1 : 3)	"	25/-	41/4
Ditto built fair and pointed both sides with a neat flush joint	"	27/2	44/3
One brick wall built fair and ditto	"	51/-	83/9

Sundries

Extra for internal fair face and flush pointing	Yd. super	1/3
Horizontal damp-proof course of two courses of slates and bedding and pointing	Ft. super	3/10
Ditto of hessian base bitumen well lapped at joints	"	-/10
Fixing only metal window, size 1' 8" x 4' 0", including cutting and pinning lugs to brickwork, bedding frames and pointing in mastic one side	Each	9/-
Ditto, 3' 3" x 4' 0" ditto	"	13/11
Ditto, 6' 6" x 4' 0" ditto	"	24/7

Partitions

		2"	2½"	3"	4"
Clinker concrete solid partition blocks to B.S. 2028 (Type B and C) and setting in cement mortar	Yd. super	8/4½	9/9	11/7	14/1
Hollow clay partition blocks to B.S. 1190, keyed on both sides and ditto	"	9/2	10/2	11/9	14/7
Moler hollow partition blocks, keyed on both sides and ditto	"	19/11	21/5	23/3	28/-

BRICKLAYER—(continued)

Facings

		White glazed facings p.c. 1,504/- M for stretchers 1,480/6M for headers and pointing with white cement
Extra over common brickwork built with bricks p.c. 113/- M for facings as described and pointing with a neat weathered joint:—		
To solid wall in Flemish bond	Yd. super	15/4
To cavity wall in stretcher bond	"	12/7
To ditto in Flemish bond with snapped headers	"	14/11
Half brick wall in facings in stretcher bond built fair and pointed one side with a neat weathered joint	"	28/1
Ditto pointed both sides	"	29/3
One brick wall in facings built fair and pointed one side	"	52/4
Ditto pointed both sides	"	53/6
Brick on end flat arch in facings 4½" on soffit and 9" high and pointing	Ft. run	3/3
Brick on edge coping to 9" wall with two courses plain tiles under, laid breaking joint, two cement angle fillets and pointing	"	5/5

ASPHALTER

Tanking

		To B.S. 1097	To B.S. 1418
Horizontal asphalt tanking in three thicknesses on brick or concrete	Yd. super	18/5	29/5
Vertical ditto	"	23/8	33/7

Roofing

		To B.S. 988	To B.S. 1162
¾" asphalt flat in two thicknesses on and including felt underlay	Yd. super	13/2	22/1
Asphalt skirting 6" high with angle fillet at bottom and rounded top, turned into groove	Ft. run	2/4	2/7
Asphalt fascia 6" high with solid water check roll at top and undercut drip at bottom	"	4/6	5/3

DRAINLAYER

Trenches and Beds

N.B.—The following prices are applicable to hand excavation in heavy soil, only requiring planing and strutting for depths of 3' or more.

Excavate trenches for 4"-9" pipes, including planing and strutting, filling in and ramming, and wheeling and spreading surplus:—		
For each 12" in depth, for trenches not exceeding 3' 0" deep	Yd. run	3/5½
Ditto for trenches exceeding 3' 0" and not exceeding 5' 0" deep	"	4/11
Ditto for trenches exceeding 5' 0" and not exceeding 10' 0" deep	"	7/9
6" concrete (1 : 3 : 6) bed and benching for pipes	Yd. run	4" 9/-
6" ditto, and surround	"	14/7 17/8

Drains

		3"	4"
Clayware butt-jointed land drains and laying in trench	Ft. run	-/5	-/6
"Seconds" quality glazed stoneware socketed drains and laying and jointing in trench	"	2/1½	3/-
"British Standard" quality ditto	"	2/6	3/7½
Extra on "Seconds" quality for bends	Each	3/3	4/9
Ditto "British Standard" quality ditto	"	4/1	6/-
Extra on "Seconds" quality for equal single junction	"	5/7	8/1
Ditto "British Standard" quality ditto	"	6/10	9/11

DRAINLAYER—(continued)

Cast iron socketed drains to B.S. 437 and laying and jointing in trench	Ft. run	4" 12/4	6" 18/6	9" 36/2
Extra for short radius bend	Each	25/2	60/6	158/9
Extra for single junction	"	46/2	101/3	263/10

Fittings, etc.

Glazed stoneware trapped gulley with galvanized grating and outlet and setting in concrete	Each	4" 23/-	6" 42/6	
Ditto with vertical inlet ditto	"	28/6	48/1	
Cast iron trapped gulley with high invert, grating, and 4" outlet and setting in concrete	"	71/2	—	
Ditto with vertical inlet ditto	"	80/11	—	
Glazed stoneware intercepting trap with inspection arm, stopper and chain and fixing in manhole and jointing to drain	"	72/4	84/4	
Brown glazed stoneware half round straight channels and bedding and jointing in cement mortar	Ft. run	1/11	2/10	
Ditto ordinary channel bend and ditto	Each	5/8½	8/-	
Cast iron coated single seal manhole cover and frame to B.S. 497 Grade C and setting frame in cement and cover in grease	"	24" × 18" 24" × 24"	45/3	66/8
Galvanized ditto	"	75/8	114/10	

PAVING

Cement and sand (1:3) floated screed to receive pavings	Yd. super	¾" 1" 1½"	3/8½ 4/6 5/1	
Ditto trowelled smooth to receive linoleum	"	4/1½ 4/11 5/6		
Cement and sand (1:3) paving trowelled hard and smooth	"	4/2 4/11½ 5/6½		
Granolithic paving (1:2½) laid on concrete	"	1" 1½" 1¾"	6/5½ 7/3½ 8/3	
½" red composition paving to B.S. 776 laid on prepared screed	Yd. super		16/7	
½" terrazzo paving (Portland cement and spar aggregate) laid on prepared screed	"		34/2	
Extra for white or cream cement	"		5/3	
½" rubber flooring in all colours, laid on prepared screed	"		55/2	
½" × 12" × 12" rubber tile flooring ditto	"		45/8	
½" × 12" × 12" cork tile flooring (brown shades) laid in mastic on prepared screed, surfaced and polished	"		45/11	
6" × 6" red quarry tile paving to B.S. 1286 laid on prepared screed with straight joints	Yd. super	¾" 2"	23/8 26/4	
6" × 6" buff quarry tiles as last	"		26/6 30/1	
2½" (finished) gravel path laid on prepared bed, well watered and rolled to cambers and falls	"		2/10½	

MASON

Portland stone and all labours in pilasters, and quoins	Ft. cube	49/7	
Ditto in jambs, lintols, etc.	"	51/10	
Ditto in arches	"	65/-	
Ashlar av. 6½" on bed with plain dressed face	Ft. super	29/3	
	Port-land	Arti-ficial	
Portland stone or artificial stone to B.S. 1217:—			
4½" × 4" sill, sunk, weathered, throated and grooved for water bar, set and jointed in cement mortar	Ft. run	10/3	4/5
9" × 3" ditto	"	13/6	6/9
2" × 12" Coping, weathered and twice throated, set and jointed as last	"	12/-	5/10
3" × 12" Ditto	"	16/2	8/11
5" × 12" Saddle back coping twice throated, set and jointed as last	"	25/4	13/7
6" × 12" Ditto	"	32/-	15/4

SLATER, TILER AND ROOFER

	Slates	20" × 10" 16" × 10"	
Best Bangor slates to B.S. 680 laid with 3" lap, each slate nailed with two stout copper nails	Square	351/9	283/6
Ditto hung vertically to dormer cheeks and gables	"	357/-	291/4

SLATER, TILER AND ROOFER—(continued)

	Tiles		
Best sand faced plain (ribbed) tiles to B.S. 402, 10½" × 6½" laid to a 4" gauge with each tile in every fourth course nailed with galvanized nails	Square	204/9	178/6
Ditto hung vertically to dormer cheeks and gables to 4½" gauge with each tile nailed with galvanized nails	"	224/9	197/6
Berkshire hand made sand faced red pantiles 14½" × 10" laid to 2½" head and 1½" side laps, each tile in every third course nailed with galvanized nails	Square	204/9	220/6
Ditto to mansard slopes	"		
Bridgwater hand made Double Roman red sandfaced tiles 16½" × 14" laid to 3" laps, each tile in every course nailed with galvanized nails	"		139/8
Concrete plain (ribbed) tiles to B.S. 473, 10½" × 6" laid as before described for plain tiles	"		118/8
Ditto hung vertically to dormer cheeks, and gables, ditto	"		147/-
Concrete interlocking tiles 15" × 9" laid to 3" lap, each tile in every third course nailed with galvanized nails	"		93/6
Ditto to mansard slopes ditto	"		99/9

Asbestos Cement

6" corrugated asbestos cement sheeting fixed to wood roofs with galvanized drive screws and washers with a side lap of 1½ corrugations and an end lap of 6"	"	106/-	
6" ditto but fixed vertically	"	116/6	
Add to both last if fixed to steel purlins or sheeting rails with galvanized hook bolts	"	5/3	

Felt

Reinforced bituminous roofing felt laid with 3" laps and nailed to rafters at 18" centres with galvanized clout nails	"	21/3	
	Two layer	Three layer	
One-ply bitumen felt to B.S. 989 laid on concrete. Each layer bedded in hot bitumen	Yd. super	8/8	11/7
Extra on last for finishing with granite chippings	"	-9½	-9½

CARPENTER*Carcassing*

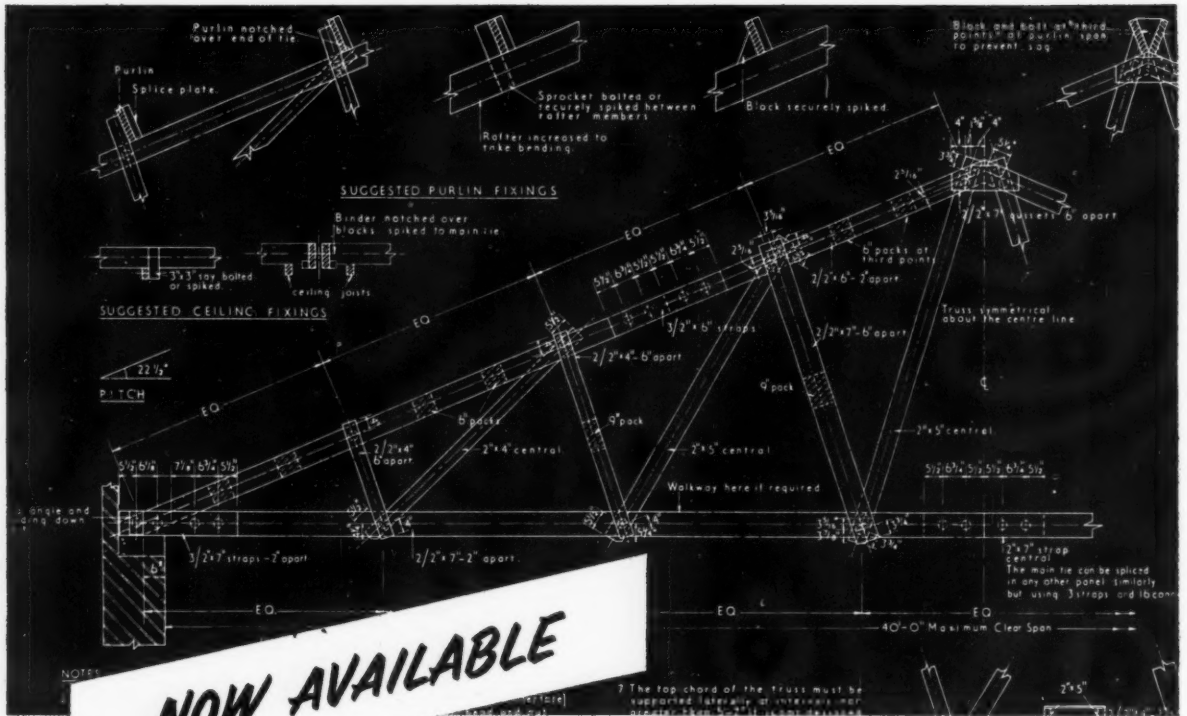

Softwood, sawn and fixed, in plates, sleeper joists and lintols	Ft. cube	15/4	
Ditto in floor and ceiling joists	"	17/5	
Ditto in stud partitions, purlins and struts	"	19/3	
Ditto in rafters, framing and ridge	"	19/2	
Ditto in hip and valley rafters including cutting rafters to sizes	"	21/7	

Battening and Boarding

¾" × 2" battens nailed to softwood for 20" × 10" slates to 8½" gauge	Square	Roof slopes 32/3	Vertical hanging 34/5
Ditto 16" × 10" slates to 6½" gauge	"	42/-	45/2
¾" × 1½" ditto for 10½" × 6" tiles to 4" gauge (4½" for vertical hanging)	"	54/7	52/6
		Roof slopes	Mansards
¾" × 2" ditto for 14½" × 10" pantiles to 12" gauge	"	23/1	25/3
¾" × 1½" ditto for 15" × 9" concrete interlocking tiles to 12" gauge	"	18/4	19/5
Roof boarding in batten widths close jointed and fixed to flat or sloping roofs	"	115/3	142/11
Ditto tongued and grooved and prepared for felt roofing including furring to falls	"	172/-	201/-
Sawn gang boarding fixed to joists in roof	Ft. super	1/3	1/6½
Wrot and cross-tongued eaves soffit	"	2/1	2/4½
6" wrot and grooved eaves fascia planted on	Ft. run	-/11	1/1

Wall and Ceiling Boards

½" fibre board to B.S. 1142 fixed with galvanized flat headed nails to softwood	Yd. super	Vertically 6/-	Soffits 6/2

HY-RIB

the designed plaster-base

For plaster ceilings and partitions, flat or curved, Hy-Rib gives a rigid, true base though fixed to widely spaced supports. The plaster pricking-up coat at once fills the three-dimensional mesh, which both controls and laces the key, eliminating waste.

Hy-Rib is supplied in standard sheets . . . easy to order . . . easy to handle and fix —

	Maximum centres of supports	Dimensions of Sheets	
		Lengths	Width
24 G. Hy-Rib	5' 0"	6' 0" to 13' 0"	10½"
26 G. Hy-Rib	4' 0"	6' 0" to 16' 0"	10½"
28 G. Hy-Rib	3' 0"	6' 0" to 8' 0"	10½"
Hy-Rib Lathing	2' 0"	7' 8" & 8' 2"	1' 6"

For your convenience

The best toilet seat—at no extra cost

L.S.52

Polyflex
Patent pending and registered trade mark

The 'Polyflex' toilet seat has a *flexible mounting*. Breakages are very unlikely. 'Polyflex' includes a flexible PVC rod attached to the seat and firmly fitted into Polythene seat pillars. The pillars, reinforced with a threaded brass insert, are self-centering in the WC pan with polythene washers secured by wing nuts. The 'Polyflex' seat can be fitted by the housewife without any tools, and, because of the flexible mounting, it will stay firmly in position. The 'Polyflex' is hygienic. The seat, hinge, and pillar heads cannot corrode or peel. All are easily cleaned. The 'Polyflex' is available in black, white and a range of standard pastel shades.

MADE BY LORIVAL* AND SOLD BY

Shires

for your convenience

* The firm well-known as 'Lorival Plastics'—designers and moulders of components and complete articles in modern plastics.

Shires are the largest manufacturers of moulded cisterns in the country. They also make WC pans and seats, flush-pipes and complete WC suites.

THE INDUSTRY

From the Industry this week Brian Grant reports on a new valve for preventing burst pipes, studded rubber flooring, polythene piping and a publication on the uses of Gypsum.

PREVENTING FROST DAMAGE

It may perhaps be the wrong time of the year to mention burst pipes and damage by frost, but readers may like to be reminded of the Zeross Anti-burst Valve which is produced in a range of sizes to protect everything from water mains of 6 in. in diameter down to $\frac{1}{2}$ -in. pipes in the house. When a pipe starts to freeze, the ice forms as a film on the inner walls of the pipe and this film increases in thickness until the pipe is frozen solid. An ordinary safety valve on the side of the pipe is therefore not of much use, but the discharge orifice of the Zeross safety valve is placed on the centre line of the pipe so that water pressure can be relieved after the pipe has started to freeze but before it has frozen solid. For internal plumbing the valve is produced in various types for use with screwed iron pipes, or with compression and capillary joints for copper piping. In these types the valves are spring loaded, but for water mains flanged fittings are used with a lever and weight type safety valve. The safety valve unit is fitted into a specially designed chamfered tee piece which avoids any restriction of water flow from the projection of the valve head into the water stream and keeps frictional loss at a minimum. Prices vary from 11s. for the $\frac{1}{2}$ -in. screwed fitting to £5

or more for 2-in. copper pipes with compression joints. (Zeross (Engineers) Ltd., 12a, West Street, Chichester, Sussex.)

NON-SLIP RUBBER FLOORING

The photograph below shows detail of the studded rubber flooring which has been laid at Wokingham Secondary Modern School. A number of other schools have now been laid with this material, which is silent and non-slip and at the same time highly resistant to wear and tear, while maintenance is easy. The flooring is produced in 12-in. squares with an overall thickness of $\frac{7}{8}$ in., of which $\frac{1}{8}$ in. is the thickness of the studs. The flooring costs 29s. 1d. per sq. yd., inclusive of purchase tax, the installed price is roughly half-way between that for $\frac{1}{4}$ -in. and $\frac{3}{8}$ -in. material, and it has a wearing value very much the same as the heavier gauge. Colours can be chosen from a range of 18 plain and marbled patterns.

Production of a studded surface on rubber flooring was suggested by the chief architect of the Ministry of Education and was developed with the help of the Brynmawr Rubber Company, now a unit of the Dunlop organization. (Dunlop Rubber Co. Ltd., St. James' House, St. James' Street, S.W.1.)

FITTINGS FOR POLYTHENE PIPE

A number of firms are now producing polythene pipe, both for underground water services in farms, and for cold-water services in houses. In the past, tees and elbow joints have been made with fittings similar to those normally used for copper pipe, but ICI have now produced a range of fittings made of polythene and conforming to the composition clause of BSS 1972 and 1973. The fittings have all the merits of polythene tube, will not corrode, and when buried underground need no protection, while there is no restriction of the bore.

NEW PUBLICATION ON GYPSUM

The Gypsum Building Products Association has started the publication of *The Gypsum*

A polythene tee joint, from a new range by ICI.

Journal to chronicle current uses of gypsum. The first instalment deals mainly with the material's fire resistance which is exceptionally high, not only because it will not itself support combustion, but also because it contains about 20 per cent. by weight of water which is gradually driven off as vapour until dehydration is complete. The vapour forms a very efficient heat barrier and gypsum plasterboard is in Group 1 of the flame spread tests of BS.476.

Further issues will deal with different applications of gypsum plasterboard, and the Editor (25, Lower Belgrave Street, London, S.W.1) will be glad to hear of unusual or interesting uses of the material. In general this seems an excellent publication with a welcome bias towards fact rather than propaganda.

CORRECTION

We regret that in *The Industry* for July 7, 1955, p. 31, the wrong photograph was used over the caption "The Planstore drawing storage unit by Randalrak Ltd."

Part of the studded rubber flooring, developed by the MOE and the Brynmawr Rubber Company, in use at the Wokingham Secondary Modern School.

Readers requiring up-to-date information on building products and services may complete and post this form to the Architects' Journal, 9, 11 and 13, Queen Anne's Gate, S.W.1

Announcements PROFESSIONAL

The Zinc Development Association and its affiliates, the Hot Dip Galvanizers, the Zinc Alloy Die Casters and the Zinc Pigment Development Associations, have moved from Oxford to London, at 34, Berkeley Square, W.1. The telephone number is GROsvenor 6636.

Mr. Lawrence Clarkson, A.R.I.B.A., of Messrs. Mence and Moore, A./L.R.I.B.A., is being transferred to their West Indies' office in Trinidad, where his address will be 33, Abercromby Street, Port-of-Spain, Trinidad.

A club for architects and surveyors interested in motor cars has been formed and is to be known as "The Architects' and Surveyors' Motor Club." Those interested should communicate with Mr. B. Meekins, 20, Balcombe Street, Dorset Square, N.W.1.

Mr. Reginald H. Gallannaugh, L.R.I.B.A., has moved to 54, Queen Anne Street, W.1, telephone number WELbeck 5484.

On the 1st July, 1955, Mr. A. J. Stedman, L.R.I.B.A., retired from Messrs. A. J. & L. R. Stedman, of Farnham, Surrey, and of 25, Victoria Street, S.W.1. The remaining partner, Mr. L. R. Stedman, A.R.I.B.A., is continuing the practice at the same address and under the same name.

Messrs. E. C. Harris & Partners, chartered Quantity Surveyors, have taken into partnership Mr. Donald M. Gritten, A.R.I.C.S., who has been with the firm for 18 years.

TRADE

Mr. Bryan Archer, A.R.I.B.A., A.A.D.P., has been appointed architect (Technical Development) to Messrs. Gliksten Building Materials, Carpenters Road, Stratford, E.15.

Messrs. Wm. Harland & Son, Ltd., have appointed Mr. D. F. Russell and Mr. J. Benson to their Board of Directors.

Messrs. Plaster Products (Greenhithe) Kent, have opened an office at 55/56, Windsor House, Victoria Street, S.W.1, telephone number ABBey 6500. Full technical service is available at this office which is in charge of Mr. J. T. Freeman, Senior Technical Representative.

It's "KING Door Gear," of course

Why is it that Geo. W. King's name is seen so often on Bills of Quantities? Because the KING reputation for first class work is known throughout the country and the

KING service is second-to-none. There's a KING Sliding Door Gear for every application, from domestic doors to power-operated giants. Please write for full details.

KING TUBULAR TRACK
in seven sizes for straight sliding
doors up to 2 tons.

WILLIAM KENYON & SONS LTD
DUKINFIELD · CHESHIRE

the Kenyon organisation embraces many interests. They offer the most complete range of thermal insulation materials for every type of steam consumption and chemical process, including erection services anywhere in the world. For builders and architects they produce a comprehensive variety of insulation materials for all requirements. Sheet metal work of all descriptions is another of their large scale activities.

The textile companies in the Kenyon organisation produce ropes, cords and narrow fabrics in natural and synthetic fibres.

A TOUCHY SUBJECT

What is this Tutch Latch that has aroused the interest of so many architects and designers, particularly in its application to modern built-in furniture? The Tutch Latch is a simple automatic latch which eliminates protruding knobs and handles and enables any cupboard or cabinet door to be opened and closed at a mere touch of the hand, wrist or elbow. The door is lightly touched and it opens; touched again and it closes. And since the Tutch Latch is fitted *on the inside and out of sight*, a smooth, stylish and unbroken appearance is presented in any room by the absence of door handles and fittings. We shall be only too pleased to discuss its possible applications with you in detail.

Ruminations on ROOFS...

We do not claim that THERMACOUST Channel Reinforced Roofing Slabs will do a dozen different jobs. They were designed and developed essentially for ROOFS. And for roofs, flat or pitched, felted or tiled, they cannot be surpassed.

STANDARD TYPE

No other insulating roofing material has greater structural strength. Supplied in large, lightweight, easily handled units: fire-resistant, sound absorbing, their attractive surface requires no ceiling-finish.

Thermacoust

CHANNEL REINFORCED
WOOD WOOL SLABS
are the BEST

REBATED TYPE

THERMACOUST 3" Rebated Slabs provide higher overall insulation. They are specially designed for buildings where the atmosphere is exceptionally warm or humid. They are rebated to take 1" cork strips to prevent condensation on the steel channels.

You've saved money by specifying Brolac AND MURAC P.E.P.

SAYS PAINTER BILL

The use of BROLAC high gloss finish and MURAC P.E.P. (p.v.a. emulsion paint) effects considerable economies. BROLAC—based on Hankol, world-famous for its waterproof properties—is the toughest high gloss finish. Retaining its superb gloss for years it cuts repainting costs many times over.

MURAC P.E.P. gives an outstandingly durable—and washable—matt finish with maximum safety on new work. Application costs are reduced by the elimination of the need for primer and undercoat and by quick drying—recoating is possible in two hours. BROLAC and MURAC P.E.P. are available in wide ranges of toning colours and are thus an ideal gloss and flat 'pair' for systematic decoration.

— HEAT CONTROL ?

— HEAT USAGE ?

— HEAT RECOVERY ?

TECHNICAL SOURCES

Our field is mainly steam and hot water for space heating and for process installations.

We are always glad to co-operate technically on questions of heat control, heat usage, and heat recovery.

There is a headquarters Technical Advisory Department at Cheltenham; throughout the British Isles our Resident Engineers are within easy reach.

We publish technical handbooks and other data (the two most recent are a 32-page Bulletin "Steam for Process" and a Pocket Manual "How to Fit Steam Traps"). Copies are free.

Also free of charge are three Correspondence Courses; two on steam and steam utilisation, the other on temperature control.

The mailing list is open for our bi-monthly periodical "Steam Topics". No charge.

WHAT WE MANUFACTURE

From among the heat control and heat transfer equipment made by Spirax-Sarco Ltd., perhaps the following are of particular interest:

STEAM TRAPS

Balanced-pressure thermostatic (self-adjusting).
Balanced-pressure thermostatic combined with strainer.
Liquid-expansion thermostatic (adjustable).
Closed-float mechanical with steam-lock release.
Combined float and thermostatic.
Inverted Bucket mechanical.
Open-top Bucket mechanical.

PIPE STRAINERS

For condensate, water, air, oil, gas, etc.

APPARATUS FOR AIR REMOVAL

Thermostatic air vents for air in steam.
Float air vents for air in hot-water systems.

AUTOMATIC PUMPS

(Operated by steam or compressed air.)
For lifting condensate to higher levels.
For draining sump holes.
For draining vessels under vacuum.

SIGHT GLASSES

Primarily for condensate, secondarily for certain liquid flows.

FLASH VESSELS

For the collection and distribution of flash steam.

STEAM SEPARATORS

COMPRESSED AIR TRAPS

For draining water from compressed air mains and receivers.

THERMOSTATIC CONTROLS (Self-contained, liquid-expansion operated.)

Modulating Controls for steam, hot water, brine, etc.
On/Off Controls for steam.
Modulating Controls for high-temperature hot water.
Control of accelerated hot-water systems from outside temperature ('E.T.O.').
Steam and water Mixers for hot-water tanks.
Blending Valves for delivering mixed flows of hot and cold liquids.
Diversion Valves for engine and other cooling water circuits.

Electrolux ^{'BUILT-IN'} REFRIGERATORS

help to sell
these attractive houses

LONGDOWN
LODGE ESTATE, SANDHURST,
Built by Lewood Ltd., Sandhurst, Camberley,
Surrey. Architectural Designers & Consultants:
Gilbert & Hobson, A.I.A.A., L.A.R.I.B.A.

Lewood Ltd., knowing that prospective buyers prefer kitchens which are properly equipped to protect perishable food, are offering the Electrolux Model M.151 as an added extra in the houses on their new Longdown Lodge Estate. The cost is included within the mortgage, at approximately 1/3d. per week.

Installation made easy. This Model M.151 is halfway in position. Seconds later it will be in final position—'built-in' with no trace to tell the tale.

In these attractive houses the refrigerator fits into the modern kitchen cabinet at convenient height without reducing the working space.

Electrolux excels in easy installation... with all these advantages: No moving parts to wear out. No interference with Radio or TV. Permanent *silence*. Operation by Electricity or Gas. 5 Year Guarantee on the *Silent* Cooling Unit. Electrolux M.151 are now readily available for all new housing—Private and Local Authority—for kitchen modernisation and conversions.

There's more to Thermal Storage than buying a few heaters...

Qualified Thermodare Technicians will provide you with a complete heating scheme—with plans.

THERMODARE ADVISORY SERVICE IS AT YOUR DISPOSAL

Although the principles of Thermal Storage are known to most architects, some guidance on its installation is often helpful. We at Thermodare specialise in this method of heating and will supply complete heating schemes with working drawings whenever required. It is beneficial to all concerned if we can be called in at an early stage. A preliminary discussion without obligation will often save time and expense later.

A range of five Models.

MAKERS OF CLAY ROOFING TILES FOR OVER A CENTURY

The experience of yesterday and the scientific approach of today combine to provide the tile for your roof of tomorrow.

Hand-moulded or machine-produced, each of our many patterns of high grade clay roofing tiles of age-old Bridgwater clay will stand the tests of appearance and durability.

The architect's expression in design needs the fixing skill of the roof tiler, and both find satisfaction when these tiles are used.

Can the client afford such a roof?

Low first cost and negligible maintenance answer this question.

in the

Free Trade Hall

The Free Trade Hall, Manchester, is another of the many important buildings that are protected from fire by A.F.A. automatic installations. The flush-fitting detectors each protect a wide area and are quite unobtrusive—until fire breaks out. Then they immediately "pin-point" the fire and automatically summon the Brigade to the exact location. May we send full particulars?

*Specified
for the best bathrooms*

THE **LEDA** HOT WATER TOWEL RAIL

A bathroom fitted with a 'Leda' hot water towel rail always wins approval—for its owner, for its designer and for its builder. This rail gives the bathroom a luxurious look, and the luxurious feeling that comes from constant dry, well-aired towels and constant warmth. The 'Leda' both in design and specification is undoubtedly the finest hot water towel rail on the market.

- Patented method of assembly which ensures leakproof joints.
- Two air release valves operated by a coin—no keys to lose.
- High standard chromium plating on nickel.
- Available in two and three rail models to suit every bathroom.
- Individually tested at 120 lb. per square inch air pressure in hot water.

NATURALLY resistant to damp

Like the Mallard "Aqualite", the Bitumen-impregnated Dampcourse is naturally resistant to water. Walls built over 50 years ago still depend on the original "Aqualite" for complete protection, and will last for years to come. To-day's Architects and Builders too specify the dependable Dampcourse that does justice to their work.

“XL - TALBOT”
**CONTINUOUS BURNING
COMBINATION GRATE**

The “XL-TALBOT” is an entirely new design of the popular 38in. by 38in. Side-oven Combination Grate, being continuous burning on Coke, Coal or any other solid fuel. It gives an open or closed fire as desired, providing an abundant supply of hot water, with ample cooking facilities.

The illustration shows this model with cast iron Architrave, Curb and Hearthplate, which shows a distinct saving on the traditional mantel surround.

This model can also be supplied with Tiled doors, Hearth Tiles and all Tiled Surround.
★ Approved by the Ministry of Fuel and Power ★

Smokeless combustion

PLUS

automatic fuel economy

The system of automatic underfeed Coal stoking employed by the Iron Fireman WILL reduce your fuel consumption without any loss in efficiency. In fact, on fuel savings alone the Iron Fireman soon pays for itself—then goes on saving. But fuel economy is not the whole story—the Iron Fireman method promotes smokeless combustion to combat atmospheric pollution. Full details on request.

8,000 miles from the Great West Road

In this country, the average car, though built to withstand extremes of temperature, crippling road surfaces and tropical storms, rarely experiences these things. But even so, the British car manufacturer, out to capture export markets, is ever on the look out for ways of improving the sealing of his vehicle against dust, water and climatic extremes ... It is in this direction that the 'Bostik' sealers play their part. 'Bostik' is used in a variety of ways in modern car production: for sticking draught excluders, anti-chafing strips, sticking anti-drum felt; bulk-head sealing and drip mould sealing, and many other jobs. If you have a sealing or adhesion problem, a discussion with the 'Bostik' man may provide the answer.

Just published

TOWN DESIGN by Frederick Gibberd, C.B.E., F.R.I.B.A., M.T.P.I., F.S.I.A.

A new, revised edition of Mr. Gibberd's widely acclaimed book (*The Listener* says that 'it is the best book of its kind . . . everyone connected with the making of cities should possess it') has now been published.

' . . . much more than just a beautiful book with a great many illustrations. Indeed the photographs, plans and diagrams form, with the text, a functional whole and, skilfully assembled, provide a key to a world of perception which will be new to many and which lies waiting at their doorsteps.'

NEW STATESMAN

' . . . an exceptionally important book, and a first-rate contribution to the literature of Town Planning . . . The illustrations, including many diagrams, are excellent, and always strictly apt . . . Altogether a most valuable and attractive work.'

JOURNAL OF THE TOWN PLANNING INSTITUTE

' . . . one of the finest things about the book is the splendid series of analyses of town plans and townscapes old and new (probably the completest picture yet available of contemporary work in this field) . . . in this invaluable handbook one finds an extraordinarily balanced summary of the best English practice in this huge field.'

Lionel Brett in THE ARCHITECTURAL REVIEW

Price £3 13s. 6d., postage 1s. 3d. THE ARCHITECTURAL PRESS, 9 Queen Anne's Gate, S.W.1.

Exports and the Balance of Power

THE CRANES THAT LOAD THE SHIPS that carry British goods to the four corners of the earth are—electric. The equipment that moves the goods through the factories that make them is—electric. The machines that *make* the goods are usually—electric. The goods themselves may well consist of electrical equipment—for electrical exports were valued at over £216 million in 1954.

Electricity plays a very big part indeed in British exports—and the part is growing bigger every year. So what happens to all the other users of electricity? It's very good news for them. Why?

It's a matter of balance. Different jobs need electricity at different times of the day and night. These varied demands help to even out the load on the power stations. When generating plant is continuously operated the price of electricity is kept low. All users benefit, therefore, the more widely electricity is used, for more and more purposes.

7 YEARS' PROGRESS

47 NEW POWER STATIONS

10,000,000 ADDITIONAL HORSEPOWER INSTALLED

**I'll say
this for
METALLIC
it's
consistently
accurate**

In factory and school, in hospitals or housing estate, the electrical installations as often as not embody 'conduit and fittings by METALLIC' Why is this? It's because architects and contractors alike know that METALLIC is really long-lasting. It's solidly made from the best materials and finished to resist moisture, chemicals, etc. Its consistent accuracy too cuts installation time to a minimum and avoids wastage.

Conditional hours, 44 per week. Annual leave, 24 days.

Application forms from the Chief Clerk, Architect and Surveyor's Department, New Scotland Yard, S.W.1, stating for which drawing office application is made. 9795

BUCKS COUNTY COUNCIL.

Applications are invited for the following appointments in the County Architect's Department:—

(a) SENIOR QUANTITY SURVEYOR. (Grade VII, £900 × £400—£1,100 p.a.)

Applicants must be Associates of the R.I.C.S. with considerable experience in the preparation of Bills of Quantities and final accounts on all types of Local Authority Projects.

(b) ASSISTANT QUANTITY SURVEYOR. (Grade V, £750 × £30 (5)—£900 p.a.)

Applicants preferably Associates of the R.I.C.S. with considerable experience in the preparation of Bills of Quantities and settlement of final accounts.

(c) ASSISTANT QUANTITY SURVEYOR. (Grade IV, £675 × £30 (5)—£825 p.a.)

Applicants preferably members of the R.I.C.S. with considerable experience and ability to undertake abstracting and billing.

(d) ASSISTANT ARCHITECT. (Grade V, £750 × £30 (5)—£900 p.a.)

The successful applicant will be required to work on a large and interesting building programme, including traditional and new building techniques.

The appointments are superannuable and subject to medical examination.

A weekly allowance of 25s. and return fare home once every two months may be paid for six months to newly appointed married officers of the Council unable to find accommodation.

Application forms giving further particulars of the appointment are obtainable from Mr. F. B. Pooley, County Architect, County Offices, Aylesbury, and returnable by 2nd August, 1955. 1995

METROPOLITAN BOROUGH OF FULHAM, BOROUGH ARCHITECT'S AND HOUSING DEPARTMENT.

(i) BUILDING SURVEYOR, A.P.T. II, £560 × £20—£640 + £30 p.a. London weighting. Must have practical experience of building, the work of a builder's quantity surveyor, preparing reports and correspondence, interviewing technical representatives, etc. A good knowledge of current rates and prices and preparing estimates for all types of maintenance repairs and alterations is essential.

(ii) ASSISTANT BUILDING SURVEYOR, A.P.T. I, £500 × £20—£580 + £30 p.a. London weighting. Must have practical experience in the building trade, have good knowledge of current rates and prices, and be experienced in inspecting, pricing and ordering all types of maintenance repairs on Housing Estates and Public Buildings.

(iii) SENIOR ASSISTANT QUANTITY SURVEYOR, A.P.T. V, £750 × £30—£900 + £30 p.a. London weighting. Applicants must be experienced in the preparation of bills of quantities, building management of large contracts for multi-storied flats and public buildings, A.R.I.C.S. (Quantities) exam, or equivalent.

(iv) ASSISTANT QUANTITY SURVEYOR, A.P.T. III, £460 × £25—£725 + £30 p.a. London weighting. Applicants must be experienced in taking-off, final measurement, preparation interim certificates, final accounts, and have passed Intermediate R.I.C.S.

(v) TWO ARCHITECTURAL ASSISTANTS, A.P.T. I or II (£500/£580 or £560/£640) + London weighting. Applicants must have had at least two years' drawing office experience.

Application forms from Town Clerk, Town Hall, S.W.6. Closing date 10th August. 2058

CITY OF NOTTINGHAM.

HOUSING ARCHITECT'S DEPARTMENT.

Applications are invited for the following appointments:—

(a) One ASSISTANT ARCHITECT, at a commencing salary within the A.P.T. Special Grade (£650 × £25—£775). Applicants should have passed Parts I and II of the R.I.B.A. final or special final examination.

(b) One ARCHITECTURAL ASSISTANT, at a commencing salary within the A.P.T. Grades I and II (£500—£640) according to qualifications and experience. Applicants should preferably have passed the intermediate examination of the R.I.B.A.

The appointments will be subject to the National Joint Council's Scheme of Conditions of Service.

Applications, stating age, qualifications, experience, present appointment and salary and naming two referees, should be sent to the City Housing Architect, The Guildhall, Nottingham, by the 16th August, 1955.

T. J. OWEN,

Town Clerk.

The Guildhall, Nottingham. 1992

ZETLAND COUNTY COUNCIL.

Applications are invited for the following appointments in the County Architect's Department:—

(1) ARCHITECTURAL ASSISTANT. Salary in A.P.T. Grades V—Va of National Joint Scheme. Candidates should be Associates of the Royal Institute of British Architects, and have had experience in the preparation of sketch plans and working drawings for housing, schools and other local authority projects.

(2) ARCHITECTURAL DRAUGHTSMAN. Salary in General Division of National Joint Scheme. Candidates should preferably have passed the Intermediate Examination of the Royal Institute of British Architects, and have had experience in the preparation of sketch plans, working drawings and details.

Written applications, giving particulars of age, qualifications and experience, and stating when applicants can take up duty, should be lodged with the Subscriber by 31st August, 1955. One copy of not more than three recent testimonials should be enclosed. Canvassing in any form will disqualify.

JOHN N. SINCLAIR,

County Clerk.

County Buildings, Lerwick, 6th July, 1955. 1930

CENTRAL ELECTRICITY AUTHORITY.

EAST MIDLANDS DIVISION.

Applications are invited for the following position within the Division:—

SENIOR DRAUGHTSMAN (CIVIL), Construction Department. (Vacancy No. 122/55/A.J.)

Candidates should have experience in the preparation of detail drawings and in the design of one or more of the following subjects:—

Reinforced concrete structures.

Piled and slab foundations for heavy components.

Cable subways, Bridges and Culverts.

The salary will be in accordance with Grade 4 (£750 × £20—£850 per annum) or Grade 5 (£640 × £20—£740 per annum) of Schedule D of the National Joint Board Agreement.

Closing date for receipt of applications: 11th August, 1955.

This appointment will be pensionable within the terms and provisions of the Central Electricity Authority and Area Board Superannuation Scheme.

Applications should be submitted on the official form A.E.S./ACT, which may be obtained from the Divisional Establishments Officer, Central Electricity Authority, P.O. Box 25, Barker Gate, Nottingham, and should be returned to the undersigned by the date stated. Please quote Vacancy Number.

L. F. JEFFREY,

Divisional Controller. 2025

SKEGNESS URBAN DISTRICT COUNCIL. ARCHITECTURAL ASSISTANT, GRADE A.P.T. III.

Applications are invited from suitably qualified persons for the appointment of Architectural Assistant, in the Engineer and Surveyor's Department, within the above-mentioned Grade, the commencing salary to be £675, subject to the Council being satisfied as to the qualifications and experience of the person appointed.

The appointment will be subject to the National Scheme of Conditions of Service, the provisions of the Local Government Superannuation Acts, and the passing of a medical examination.

Applicants should have had experience in the preparation of plans, designs, details and specifications, etc., for the architectural work normally undertaken by an Urban Authority.

A two-bedroomed ground floor flat on a service tenancy is available for the successful candidate, if required.

Applications, suitably endorsed, together with copies of two recent testimonials, to be delivered to the undersigned not later than 13th August, 1955. Candidates should disclose whether to their knowledge they are related to any member or senior officer of the Council.

IVOR M. CULE,

Clerk to the Council. 2045

Town Hall, Skegness. 20th July, 1955. 2045

CITY OF NORWICH.

CITY ENGINEER'S DEPARTMENT.

TOWN PLANNING SECTION.

Applications are invited for the appointment of a TOWN PLANNING ASSISTANT in Grade V of the new A.P.T. Division (£750 to £900).

Applicants should be Associate Members of the Town Planning Institute, and must have a sound knowledge of town planning and practical experience of development control and in the preparation of schemes for redevelopment areas. Applicants should give full particulars of their training, qualifications and experience, and should state their age, present and previous positions giving salaries and dates, and enclose copies of three testimonials.

The appointment is terminable by one month's notice on either side, and subject to the provisions of the Local Government Superannuation Act, 1953. The successful candidate, therefore, will be required to pass a medical examination. Relationship of applicant to members of the Council or staff must be declared in the application. Canvassing, directly or indirectly, will be a disqualification.

Applications should be delivered to the City Engineer, City Hall, Norwich, not later than 10 a.m. on Monday, 15th August, 1955, endorsed "Town Planning Assistant."

R. C. ROWLEY, M.I.C.E.,

City Engineer. 2013

City Hall, Norwich. 2013

COUNTY BOROUGH OF WALSALL.

PUBLIC WORKS DEPT.

Applications are invited for the following posts:—

(1) ASSISTANT ARCHITECT, Grade A.P.T. V, at a commencing salary of £750, rising by annual increments of £30 to a maximum of £900.

(2) ASSISTANT ARCHITECT, Grade A.P.T. IV, at a commencing salary of £675, rising by annual increments of £30 to a maximum of £825.

Applicants must be Members of the Royal Institute of British Architects.

The posts are superannuated, and the person appointed will be required to pass a medical examination.

Applications, giving the names of two persons to whom reference can be made, and stating age, present position, salary and technical qualifications, together with details of experience, should be submitted to the undersigned not later than Monday, 8th August, 1955.

M. E. HABERSHON,

Borough Engineer and Surveyor. 2005

Council House, Walsall. 15th July, 1955. 2005

Applications, giving age, qualifications, experience, present salary, copies of two recent testimonials, to be sent to the undersigned not later than Friday, 12th August, 1955.

A. RONALD CLARK, A.R.I.B.A.,

A.M.T.P.I., County Architect. 2034

County Offices, Lincoln. 2034

SOUTH-WEST METROPOLITAN REGIONAL HOSPITAL BOARD.

Applications are invited for the following appointments on the permanent staff of the Board's Architect generally in accordance with the Conditions of P.T.B. Circular Nos. 19 and 40.

LONDON HEADQUARTERS (LONDON WEIGHTING APPLICABLE):

PRINCIPAL ASSISTANT ARCHITECTS, Scale II. The commencing salary will be at the minimum of the scale (£1,025 × £40—£1,225). Applicants must be Associate Members of the Royal Institute of British Architects, and have had sound practical experience of the planning and construction of hospitals and public buildings, and be capable of carrying through projects from commencement to completion. Applicants must also be able to undertake investigations of planning requirements and produce sketch schemes and attend Committees.

SENIOR ASSISTANT ARCHITECT. Commencing salary will be at the minimum of the scale (£900 × £30—£1,050). Applicants must be Associate Members of the Royal Institute of British Architects, and have had sound practical experience of the planning and construction of hospitals and public buildings, and be capable of carrying through projects from commencement to completion, working under the supervision of a Principal Assistant Architect.

ASSISTANT ARCHITECTS. Commencing salary will be within the scale £625 × £25 (7) × £30 (3)—£890. Applicants must be Associate Members of the Royal Institute of British Architects, and be capable of preparing working and detailed drawings, specifications, and supervising work on individual projects. Experience of hospital planning and construction an advantage.

ASSISTANT QUANTITY SURVEYOR. Commencing salary will be within the scale £625 × £25 (7) × £30 (3)—£890. Applicants must be Associate Members of the Royal Institute of Chartered Surveyors (Quantity Surveying Branch), and have sound practical experience in estimating and analysis of prices, working up and taking off of quantities for small contracts, and also checking contractors' accounts.

WESTERN AREA OFFICE at Winchester. (To reside in or near Winchester.)

SENIOR ASSISTANT QUANTITY SURVEYOR. Commencing salary will be at the minimum of the scale (£900 × £30—£1,050). Applicants must be Associate Members of the Royal Institute of Chartered Surveyors (Quantity Surveying Branch), and have sound practical experience in estimating and analysis of prices, working up and taking off of quantities for contracts, and also checking contractors' accounts.

SENIOR ASSISTANT ARCHITECT. Commencing salary will be at the minimum of scale (£900 × £30—£1,050). Applicants must be Associate Members of the Royal Institute of British Architects, and have had sound practical experience of the planning and construction of hospital and public buildings, and be capable of carrying through projects from commencement to completion, working under the supervision of a Principal Assistant Architect.

ASSISTANT ARCHITECTS. Commencing salary will be within the scale £625 × £25 (7) × £30 (3)—£890. Applicants must be Associate Members of the Royal Institute of British Architects, capable of preparing working and detailed drawings and specifications, and supervising work on individual projects. Experience of hospital planning and construction an advantage.

Applications, stating age, experience, qualifications, present appointment and salary, together with the names and addresses of three referees, should be sent to the undersigned, giving the appointment for which applying on the application and envelope, by not later than 12th August, 1955.

E. G. BRAITHWAITE.

Secretary.

South-West Metropolitan Regional Hospital Board, 11a, Portland Place, London, W.1. 2079

GOVERNMENT OF NORTHERN IRELAND.

ASSISTANT ARCHITECT. Applications are invited for Assistant Architect, Class II, posts in the Ministry of Health and Local Government. The posts are temporary but, so far as can be foreseen, will last for several years.

Candidates must be Registered Architects by examination. In addition they should have experience in up-to-date house or hospital design and layout, and some aptitude for research into comparative standards of design and construction.

The salary scale, which attracts pay supplement of amounts between £25 and £35 per annum, is £675 × £25—£750 × £30—£950 × £40—£1,000. The commencing salary of £675 is linked to entry at age 25, with an increase of one increment for each year above that age, subject to a maximum entry point of £900 per annum, plus pay supplement of £30. An officer between 25 and 26 will be given an inclusive commencing salary of £675; and if under 25 will be paid according to qualifications and experience.

Preference will be given to suitably qualified candidates who served in H.M. Forces during the 1914-18 or 1939-45 wars, provided that such candidates are, or within a reasonable time will be, able to discharge the duties efficiently.

Application forms may be obtained from the Director of Establishments, Ministry of Finance, Stormont, to whom they must be returned, together with copies of two recent testimonials, so as to reach him not later than the 12th August, 1955. 2041

MANCHESTER CITY ARCHITECT'S DEPARTMENT.

Applications are invited for the following appointments:

PERMANENT STAFF:

(a) **SENIOR ASSISTANT ARCHITECT.** Salary A.P.T., Grade IV (£675—£825 per annum). Applicants must be A.R.I.B.A., with some years' office experience.

(b) **ARCHITECTURAL ASSISTANT.** Salary Basic Grade (£650—£775 per annum). Applicants must have passed parts 1 and 2 of the R.I.B.A. Final Examination or its equivalent, and have had at least five years' experience, including the period spent in theoretical training.

(c) **ARCHITECTURAL ASSISTANT.** Salary A.P.T., Grades I/II (£500—£640 per annum). Applicants must have passed the Intermediate Examination of the R.I.B.A. or its equivalent.

(d) **ASSISTANT ELECTRICAL ENGINEER.** Salary Basic Grade (£650—£775 per annum). Applicants should be experienced in the design of electrical installations in buildings.

(e) **SENIOR HEATING, VENTILATING AND MECHANICAL ENGINEER.** Salary A.P.T., Grade IV (£675—£825 per annum). Applicants should preferably be Associate Members of the Institution of Heating and Ventilating Engineers or the Institution of Mechanical Engineers, and be capable of designing, heating and ventilating installations in all types of buildings.

(f) **ASSISTANT HEATING, VENTILATING AND MECHANICAL ENGINEER.** Salary Basic Grade (£650—£775 per annum). Applicants should be experienced in the design of heating and ventilating installations.

(g) **STRUCTURAL ENGINEERING ASSISTANT.** Salary A.P.T., Grades I/II (£500—£640 per annum). Applicants must be experienced in the design of structural steelwork and reinforced concrete.

(h) **SENIOR ASSISTANT QUANTITY SURVEYOR.** Salary A.P.T., Grade IV (£675—£825 per annum). Applicants must have had considerable experience in the preparation of Bills of Quantities and Specifications, Interim Valuations, and settlement of final accounts for all classes of local authority building work.

(i) **DISTRICT BUILDING SURVEYOR.** Salary Grade A.P.T. III (£675—£725 per annum). Applicants must have passed the Building Surveyor Examination of the R.I.B.A. or hold equivalent qualifications, be conversant with the Model Building Bye-laws, and have a knowledge of the Factories, Public Health and Town Planning Acts. They should also have had experience in the supervision of building works and the treatment of dangerous buildings.

TEMPORARY STAFF:

(j) **SENIOR ASSISTANT ARCHITECT.** Salary A.P.T., Grade IV (£675—£825 per annum). Applicants must be A.R.I.B.A., with some years' office experience.

Further particulars and forms of application should be obtained from the City Architect, Box No. 488, Town Hall, Manchester, 2. The completed form to be returned to the same address by 13th August, 1955.

Canvassing is prohibited. 2052

MONMOUTHSHIRE COUNTY COUNCIL.

APPOINTMENT OF ARCHITECTURAL STAFF. Applications are invited for the following posts in the County Architect's Department under the N.J.C. conditions:—

TWO ARCHITECTURAL ASSISTANTS, Grade A.P.T. IV, salary commencing at £765 by £30 annual increments to £825 per annum.

ONE QUANTITY SURVEYING ASSISTANT, Grade A.P.T. II, salary £560 to £640 per annum. Forms of application, particulars of post and conditions of service can be obtained from the undersigned.

Applications, together with copies of three testimonials, must be forwarded to the County Architect, Queen's Hill, Newport, Mon., not later than Saturday, the 6th August, 1955.

VERNON LAWRENCE,

Clerk of the Council.

County Hall,

Newport,

Mon. 1972

EASINGTON RURAL DISTRICT COUNCIL.

ENGINEER'S DEPARTMENT.

ARCHITECTURAL ASSISTANT, GRADE A.P.T. II (£560—£640).

Applications are invited for the above-mentioned appointment.

Applicant (1) must have had previous Municipal experience and have been trained in the office of a Municipal Engineer, Architect or Surveyor; (2) must be experienced in Municipal Housing and General Architectural work. Preference will be given to those holding the Intermediate certificate of the R.I.B.A. or equivalent.

These appointments are subject to the National Joint Council's Scheme of Conditions of Service and the Local Government Superannuation Acts.

Forms of Application may be obtained from the undersigned, and must be returned, accompanied by copies of not more than two recent testimonials, to reach the undersigned by not later than 15th August, 1955.

J. W. GRAY,

Clerk of the Council.

Council Offices, Easington, Co. Durham. 2065

COLLEGE OF TECHNOLOGY, BIRMINGHAM. DEPARTMENT OF BUILDING AND CIVIL ENGINEERING.

Applications are invited for appointment as full-time ASSISTANT (Grade "B"), in Structural Engineering and associated subjects.

Candidates should hold one or both of the following qualifications:—

(a) B.Sc.(Eng.), with structural engineering subjects.

(b) A.M.I.Struct.E.

Industrial experience is essential, and ability to teach structural engineering with an architectural bias will be advantageous.

Salary will be in accordance with the Burnham (Further Education) Scale for Assistants, Grade "B" (men), £525 × £25 (final increment £20) to £820, with additional graduate and training allowances where applicable. In fixing the commencing salary, account will be taken of teaching and industrial experience.

Further particulars and form of application may be obtained from the Registrar, College of Technology, Suffolk Street, Birmingham, 1, on receipt of a stamped addressed foolscap envelope. Completed forms should be returned not later than two weeks after the appearance of this advertisement.

K. R. PILLING,

Clerk to the Governing Body. 2029

Floors and after

A comprehensive service for Architects

Because of the trend to all types of synthetic floors in addition to those of wood and because of the need to reduce costs, architects have found our service to be invaluable. Here in one organisation is all the information and expert advice on the proper treatment and subsequent maintenance of floors in schools, public buildings and dwelling houses. There is no other service so wide in scope and comprehensive in detail. Over 20,000 schools and many public authorities are current users. Please write for information.

AT LONG LAST, THE COSTLY,
LABORIOUS TASK OF HACKING
HAS BEEN ELIMINATED!
Applied by brush or spraygun,
PLASTAWELD, the NEW
bonding fluid for the Plastering trade,
ensures a PERMANENT bond
between all types of Gypsum Plasters
and Porous or NON-POROUS
SURFACES including PAINTED
WORK, DENSE CONCRETE,
GLAZED BRICKS AND ALL SMOOTH
SURFACES.

Provides a bond stronger than the plaster itself!

Plastaweld can be plastered at any time after drying

Face coats can be applied direct on painted or smooth brickwork!

Scheme in Progress

Perspective drawing by John Bloxham A.A. Dipl. A.R.I.B.A.

Flats, Maisonettes, Shops Area 'C', Regent's Park, London

FOR THE METROPOLITAN BOROUGH OF ST. PANCRAS

Architects: Davies and Arnold, F.R.I.B.A., Consulting Engineers: G. A. Dodd and Partners

Area 'C' comprises the construction of 240 flats, five maisonettes and five shops and is part of a scheme for erecting 1,600 multi-storey flats.

The buildings will be faced with sand-faced multi-golden wirecut facing bricks. They will all have basements with lock-up storage and wash houses.
