*The Kemsley Power Plant, Bowater Paper Corporation.
Architects: Farmer & Dark. Consulting Engineers: Ewbank & Partners Limited.*

Colt Equipment: 32 S.R.C.3080 Ventilators.

Just as the squat, smoke-belching power houses of the industrial revolution have given way to power plants of such orderly austerity as those that serve the Bowater Organisation, so has the demand for more positive control over the ventilation of these buildings grown stronger. The provision of effective, controllable ventilation called for a revolution in ventilator design. The precise, aero-dynamic lines of the Colt SR Extractor, shown above, epitomise the achievements of that revolution.

In this photograph of the Bowater Power Plant at Kemsley near Sittingbourne in Kent, 32 Colt S.R.C.3080 Controllable Natural Extractors are utilising to the full the free power of the wind and thermal currents to change the air in the building 10 times in each hour. The effect of this is to ensure the maintenance of temperate, fume-free conditions demanded by modern industry, and without which maximum output can never be achieved.

The careful attention to detail that went to the formulation of this, and of the other similar systems at the Bowater Mills in Northfleet and Ellesmere Port, is common to every ventilation scheme, large and small, that Colt undertake. The technical service of the Advisory Staff is always available without charge or obligation. Let Colt solve YOUR problem.

FUTURE EXPANSION IS TAKEN

CARE OF when this building technique is specified . . .

With Sherbourne industrial buildings you can plan for present needs and take care of future requirements. You can start with a small production shop, adding extra bays and administrative blocks whenever necessary.

Erected from pre-engineered units available in ten standard spans ranging from 105ft. to 15ft. they meet every industrial need. They may be increased in length, or new spans may be added at any time. Their low eaves-to-apex heights facilitate and economise in the erection of parapet walls. As they are lighter in weight than traditional rolled steel buildings, initial, erection and foundation costs are lower.

Sherbourne Buildings have been specified by over 100 leading architects, surveyors and consulting engineers

Heights to eaves may be arranged to suit individual requirements. Floors are completely obstruction-free and complete freedom can be exercised in choice of cladding and roof lighting.

Side walls when used need only be of panel thickness as the whole weight of the roof is borne by the vertical side pillars. Sherbourne buildings conform to the relevant British Standards and Codes of Practice.

CAST IRON STORAGE TANKS

ASSEMBLED FROM STANDARD SIZE PLATES

TO B.S. 1563 : 1949

Simple design—sound construction

Mather & Platt cast iron storage tanks are easily erected even in confined spaces. In basements, on roofs or on steel structures, erection and maintenance difficulties are overcome by simplicity of design and sound construction.

Flanges can be arranged internally or externally. Universal brackets and stay rods provide complete rigidity.

ROBERTSON Q-DECK PROVIDES 100% ELECTRICAL AVAILABILITY

Q. What is the connection between your Q-Deck and the electrical system?

A. *With the new Q-Deck Wiring System the cells of the deck act as ducting for electrical wiring to lighting points. Thus conventional conduits are unnecessary and considerable savings in material and labour costs can be made.*

Q. Is the system wired-up before the roof-deck is erected?

A. *No, the cables are drawn into the cells after the Q-Deck has been fixed and every cell functions as a large capacity conduit.*

Q. Is Q-Deck Wiring System more economical electrically than running cables enclosed in conduit to lighting points?

A. *Most certainly. Not only is it cheaper initially but the lighting scheme can be re-arranged simply by drilling holes at the position of the new points and of course additional points can be installed in the same way. This dispenses with the need for expensive and often inconvenient operations such as chasing of plaster and installing additional conduits after the building has been occupied.*

Q. With this system then, no conduit or ducting is visible on the surface of the soffit?

A. *That is almost true, but in fact at intervals of 50 or 60 feet along the roof, it is necessary to install Ceiling Header Duct (part of our range of accessories) which is used to carry cables to the cells from which lighting points are to be fixed. These ducts are neat in appearance and when placed adjacent to main beams are quite inconspicuous.*

A. Do you install Q-Deck Wiring System?

Q. *We supply all accessories but fixing and wiring of all electrical fittings should be carried out by the Electrical Contractor.*

your electrical system
is part-installed
when you put in
ROBERTSON Q-DECK

ELECTRICAL SYSTEMS CARRIED OUT IN Q-DECK WIRING SYSTEM—

- ✓ Cost as little as 50% of systems using conventional conduits.
- ✓ Provide large capacity 'conduits' at 6" or 8" centres over the whole roof.
- ✓ Permit speedy installation or extension of lighting systems.
- ✓ Make unnecessary, unsightly runs of conduit on ceilings.

WATERPROOF BUILDING PAPER

PUTTING IN THE DAYLIGHT

...at
**Messrs Colville's
new Ravenscraig Works**

The metal windows chosen for the extension to Messrs. Colville's steel works had to be good. Steelmen have a critical eye for any product made with the materials they produce. Standard Maclean Metal Windows were chosen—because Standard Maclean make a really thorough job of rust proofing their product. Their Electro Galvanising plant is fully automated, which ensures that no damage is done by careless handling during the finishing processes.

Technical note: all Standard Maclean Metal Windows are de-greased, pickled, zinc plated and phosphated, then two coats of primer are stoved on separately. 'Z' section mild steel sections are flash-welded for frame construction, whilst the fittings are of manganese brass and are screwed on.

THERMAL INSULATION

Aluminium foil insulation gives the greatest advantages

High efficiency

Whilst aluminium foil is a poor radiator, it is a very good reflector of heat. When an airspace (itself a good thermal insulator) of not less than 0.75 inches across is faced with aluminium foil it becomes three times as effective. In hot weather radiation of solar heat is greatly reduced, and in cold weather, heat losses are brought to a minimum.

Permanence

Tests over periods of up to 10 years have shown no appreciable deterioration in the thermal insulation properties of aluminium. If protected from prolonged exposure to moisture, foil insulation can be expected to last indefinitely.

Low costs

Foil used for thermal insulation is usually between .00035 and .00078 in gauge, and because of its light weight makes for most economical thermal insulation productions.

FISHER'S FOILS

**PRECISION
GRINDING**
*to Six-Millionths
near a main-line
railway*

*For advice on vibration problems
of any kind and on any scale, consult:*

Within a few yards of the railway at Colchester, Roller Bearings are being ground to micron-precision tolerances, on machines isolated from vibration on the Dunlop 'Foundation Mounting' principle. Messrs. Gamet Products Ltd. say "the limits of accuracy and the quality of production are exceptional". Behind this modest comment lies the fact that each roller must be circular to within six-millionths of an inch, and the surface finish has to be maintained between 1.5—2.0 micro-inches. The inner and outer rings (of some 8" diameter) must not deviate from circularity more than 0.0000197".

COLT *Canadian Cedar Wood* SHINGLES

Southern Grammar School for Boys, Baffins, Portsmouth.
City Architect, Frank Mellor, F.R.I.B.A.

NEW STYLE WALLS with an old and well tried method. Weathering to a pleasant silver grey, Shingles are a most attractive method of providing a distinctive elevation. Nailed to battens on brick, breeze or timber studding, the construction is most economical and is completely weatherproof.

The high thermal insulation of Western Red Cedar makes Shingles a valuable addition to the Architect's vocabulary of modern cladding materials.

Hall's give a service — when they sell a building

**OFFICES • CLASSROOMS
CHURCH HALLS • RECREATION HALLS
SPORTS PAVILIONS • HOSPITALS
CANTEENS**

For many years Hall's have been helping Education Authorities to meet the urgent need for extra school accommodation. Working with County Architects and Education Committees, Hall's developed basic designs which have resulted in the latest Hall's Demountable Building.

Clad in Cedarwood, these buildings need no painting or preservation treatment, are as durable as permanent buildings yet they are prefabricated to such a degree that they can be demounted and re-erected without damaging even the wall or ceiling linings.

Sitework, foundation and labour costs are reduced to a minimum; unskilled labour can be used.

These same buildings are now available for industry and Hall's expert staff are ready to discuss detailed modifications to fit the buildings to any particular need.

Write now for full specifications or ask one of Hall's advisory staff to call.

£250 design competition for a kitchen sink

BELIEVING that inventive skill has not yet produced the perfect kitchen sink, The British Sanitary Fireclay Association on behalf of its member firms is sponsoring an open Design Competition to stimulate ideas which incorporate improvements in the usefulness and appearance of this essential item of kitchen equipment.

White or coloured ceramic glazed Fireclay, of which most sinks are made, is ideal for its purpose since it can readily be moulded in complex shapes having smooth contours; it possesses great strength and resistance to wear. Already there is a choice of several good designs in fire-clay sinks available to the housewife, who knows from experience how functional and hygienic they are. Now the Association is searching for designs that are even better.

The Assessors will be D. L. Medd, Esq., A.R.I.B.A., R. V. Cooper, Esq., C.G.I.A., F.I.O.P., M.R.S.H., and the President of the National

Federation of Clay Industries. After the results have been announced, arrangements will be made to produce prototypes of at least the winning design (for which the collaboration of the successful competitor(s) will be invited). The Competition has been planned to appeal especially to architects, students, designers, sanitary engineers and others with a serious interest in sanitation and design.

It is already regarded as yet another progressive move by a flourishing British Industry. Considerable interest is being shown. The Competition is indeed a challenge, and the winning designs should command widespread notice. A first Prize of £100, two Prizes of £50, and five runner-up Prizes of £10 each await those who submit the best ideas. Closing date 31st May, 1958. Entry Forms are available on application to:—

**THE BRITISH SANITARY
FIRECLAY ASSOCIATION**

COMPLETELY NEW AND DIFFERENT!

The HOVAL BOILER represents the very latest development in Boiler design. Operating at the highest known thermal efficiency, it can be used for Central Heating and to supply Domestic Hot Water, or for only one of these purposes. The HOVAL BOILER is a single unit; no separate calorifier is required. Compact, convenient to instal and economical in operation, the HOVAL may be fired by oil or solid fuels, and the current range covers 60,000 to 800,000 B.T.U.'s per hour. The HOVAL design is covered by British and Foreign Patents, and full details of the Boiler may be obtained from

"WHAT! YOU'VE SPECIFIED WOOD BLOCK
FLOORING WITHOUT INCREASING COSTS!"

"I thought that would surprise you. A new technique has been developed which manufactures a prefabricated wood block flooring called *Alufloor*. * It's precision made and factory sanded. Not only is it inexpensive to buy; it can be laid 50% faster—so I save all round".

"Amazing!—But does it last?"

"Actually it has the same wearing thickness as 1" normal wood flooring and lasts at least as long. *Alufloor* is now extensively used in schools, shops, hospitals, offices, etc. It's the flooring of the future alright".

"Well I give you full marks for knowing all about it. After all, there's nothing so fine as wood block flooring".

Alufloor

LUXURY FLOORING AT A UTILITY PRICE

British Patent No. 746791

* *Alufloor* is made in square 18 inch panels each of 80 hard wood units $\frac{3}{8}$ " thick. It eliminates pinning and experimental positioning and provides a quiet and stable surface with the same wearing life as 1" nominal wood block flooring. It can be laid direct on wood or concrete and gives the pleasing effect of parquetry. And it's so economical to install that it can be specified in contracts without increasing costs—being cheaper than nominal wood block flooring.

BICC M.I. CABLES

Here is a new tool for stripping M.I. Cables. Swift and simple to use, it operates smoothly and gives a square, clean-cut end ready to receive the pot.

Stripping at the rate of a foot a minute, long "tails" now present no problem.

BICC Rotary Strippers are available together with instructions, from every BICC Branch Office.

For use in conjunction with the appropriate cable gland.

RILEY ROBOT

Hopper feed. Suitable for sectional boilers in domestic hot water or space heating systems—and vertical boilers for steam-raising.

'T' CHAIN GRATE STOKER

For horizontal shell-type boilers. Ensures efficient burning of low grade coals.

DIREKTO

Bunker feed. For sectional boilers in domestic hot water and space heating systems. Also for vertical boilers used in steam-raising. Feeds direct from bunker to boiler below floor level.

Hopper feed. For the larger vertical boilers, water tube and locomotive boilers, hot water and steam heating systems and steam processes.

INDUSTRIAL ROBOT

CLASS 'B'

Hopper feed. For Cornish, Lancashire and Economic boilers. Specially designed with grate to fit into circular furnace flues.

IT IS AN OFFENCE TO EMIT DARK SMOKE

Under the Clean Air Act it is now an offence to emit dark smoke. The problem of ensuring smokeless combustion within the meaning of the Act without costly conversions can be solved by the installation of Riley Chain Grate or Under-feed Mechanical Stokers. Write for full technical information.

THE NEW EDITION
OF THIS HELPFUL
BROCHURE?**

Fully illustrated and packed with information, this 24-page brochure shows many examples of TOMO WINDOWS in use throughout the country. Please complete and post this coupon for your copy.

WHEN a standard-production TOMO WINDOW Wall-Unit (8 ft. x 8 ft.) was tested at the Building Research Station, Garston, the mean thermal transmittance of the complete unit was found to be 0.31 B.Th.U./sq. ft./h/°F. This is equal to the thermal transmittance of a traditional, 11-in. cavity brick wall! This impressive result was further improved to 0.29 when the TOMO pleated blinds, fitted between the panes, were lowered.

The U-value of the window-area only was found to be 0.38 which, with TOMO pleated blinds down, became 0.35. At 0.38, TOMO double-glazed WINDOWS are substantially (29%) better than the U-value of 0.47 quoted for conventional double windows in the I.H.V.E. Guide to Current Practice, 1955.

In addition to their excellent thermal-efficiency values, TOMO double-glazed WINDOWS have remarkable sound-reduction properties and are specially recommended for offices, schools, flats, etc., in busy streets or near to airports. The amount of reduction in sound level depends on the thickness of glass and the space between panes—thirty-two ounce glass spaced at 1½ in. gives a reduction of approximately 40 decibels.

These high-quality windows afford all the advantages of finely-controlled ventilation and total indoor window-cleaning. They are suitable for inward or outward opening and can be top-hung, bottom-hung, side-hung or pivot-hung.

**To: TOMO TRADING CO. LTD., COWLEY PEACHEY,

Sound control is our business

Sound Control Limited, with their expert, highly experienced team of acoustic engineers, will analyse, diagnose and cure most problems in sound. Their successes range from the suppression of obstinate echoes or resonances in concert halls and cinemas to reducing general noise level in offices and factories. Full details of this service will gladly be sent on request.

THE CONSULTING DIVISION acts in a consultative capacity to architects, Government departments and industry generally on all acoustic problems. This service is available at moderate fees and includes advice on the design of new structures as well as the means of overcoming existing noise troubles. Expert supervision of your own contractors' work can also be undertaken.

THE CONTRACTING DIVISION exists to carry out all work needed to effect a cure. *The Division is under no obligation to use particular proprietary products.* The sole test applied is that the material used is up to the mark acoustically—irrespective of its source.

BPL/D.74

This delightful 3-bedroomed house, the property of Mr. F. A. Holder, is centrally heated by an up-to-date oil-fired warm air system. Shell-Mex and B.P. Ltd. supply the fuel.

Oil-fired heating in a Kentish house

IN THE VILLAGE of Keston, Kent, stands this attractive house, 'Kenwood' built in 1956 for Mr. F. A. Holder.

The interior of 'Kenwood' is attractive too, for even in the coldest weather it is kept beautifully warm by its Radiation 'Whole-house' warming system. Thermostatically controlled warm air from the oil-fired heating unit is blown gently through underfloor ducts into every room. The oil-fired unit also heats the water.

Oil-fired central heating means comfort and convenience. And oil fuel, bought in bulk, is surprisingly economical. Automatic controls give you clean, labour-saving central heating and plenty of really hot water whenever you want it. There is no stoking, no ash or clinker to dispose of; and the oil fuel flows directly from the storage tank to the burner.

For small or large houses, for full central heating or for hot water supply only, oil-fired heating is ideal. And manufacturers are now producing boiler/burner units specially designed for oil firing.

The two kinds of fuel oil for domestic heating are Shell Domestic Fuel Oil for the large installations and BP Domesticol, the new fuel specially developed for the smaller units with vaporising burners.

If you are designing or modifying almost any kind of public or private building, you will find it well worth while to make provision for this modern, highly efficient and convenient heating method. For further information write to Shell-Mex and B.P. Ltd., Fuel Oil Department D6L, Shell-Mex House, Strand, London, W.C.2.

The automatic heating unit is housed in the garage, with ducts leading into the house. Small, unobtrusive grilles, set in the walls, circulate the warm air throughout the rooms.

ESCALATORS

THE SILENT SERVICE

Up and down the country J. & E. Hall escalators are daily doing their work of carrying customers from one sales floor to another—quietly, safely, efficiently, economically, and in numbers up to 8,000 per hour.

But in addition to providing an essential service, J. & E. Hall escalators lend charm and dignity to any setting. This is well brought out by the illustration which shows two of four installations in the Regent Street, London store of Dickens & Jones Ltd.

For further information, send for our attractively produced brochure, "Escalators"—or ask for Publication 1004A.

STEELBRAC *fits*

STEELBRAC sectional steel partitioning fits any space, no matter how awkward, because its sections are individually "made-to-measure." Economically too, because STEELBRAC individual construction *frequently costs less than standard units* !

STEELBRAC partitions can be taken right up to meet a sloping ceiling, allowing for pipes or joists, or roofed over to form separate cubicles. Easily erected or dismantled by unskilled labour, any partition can be as permanent or as temporary as the situation requires.

STEELBRAC partitioning consists of strong welded steel sections filled with various combinations of sheet steel, glass and weldmesh according to customer's choice, including double skin construction where a high degree of sound and thermal insulation is desirable. At no extra cost it can be finished to match any colour scheme.

modern FLOORING

- with limitless opportunity
for design

AMONG those concerned with flooring problems many have come to the conclusion that "Semastic" or "Vinylex" tiles are the most practical and economical solution to covering sub-floors in industrial or commercial premises, in public buildings, and often in private homes, whether over new floors or to make old floors like new.

Tiles by Semtex provide ample opportunity for attractive designs, as the examples here show. They are quick to lay and immediately ready for use. This apart from other "user" considerations, such as the economy of longer wear; easy cleaning and maintenance; quiet, comfortable walking surfaces.

SEMTEX with over 20 branches, operate a complete contractual service throughout the United Kingdom, including technical and design advice, and installation. There are also approved laying facilities in several areas. For full information write or telephone to the address below.

Semastic Decorative and Vinylex Floor Tiles

Architect: Frank Scarlett, B.A.

STRAMIT partitions

for quieter, more attractive offices

Compactom Ltd., the partition specialists, erected these good-looking partitions in the offices of the Northern Aluminium Company in Bush House, London. They used hardboard-faced Stramit slabs of standard grade for the job. There were good reasons for this. Stramit partitions—so easy to erect and with such remarkable sound-deadening properties—commend themselves to architects

and contractors alike. As the Stramit partitions illustrated above, in flush 'V' joints and aluminium framing, are faced with hardboard, they offer an exceptionally good decoration surface. Stramit of standard grade, however, cheerfully accepts paint and plaster direct, if desired. It is also available faced with fabric in a variety of attractive colours and designs.

What is Stramit?

Stramit is a low-cost, dry-construction material made of scientifically-compressed straw. It combines great strength and rigidity with exceptional values of thermal insulation and sound reduction. And official tests (reports available on request) prove that it resists fire resolutely.

Stramit of standard grade costs from 1s. per square foot, including delivery. Also available—Roofing grade, Low-Density grade (for non-load-bearing thermal insulation) and a special asbestos facing which gives a Class 1 rating for spread of flame.

STOCK SIZES: 4ft. wide x 6ft., 8ft., 9ft., 10ft. and 12ft. long.

Colour and Texture give LIFE to a building

Large plain exteriors, which otherwise might appear monotonous, can be made lively and interesting with Brick.

Good brickwork, with its characteristic texture, is a valuable medium to the designer of modern buildings, and the great variety of brick types and colours available offer exceptional scope for imaginative treatment.

A brick exterior requires no periodical rejuvenation; it remains a source of pride throughout its life.

**BUILD IN
BRICK**

here's where **POLICROME** scores

... from ONE tin of Policrome a beautiful multi-coloured pattern is sprayed with one gun. Policrome is ready for use in the tin—you see the pattern when you lift the lid. Policrome is not just a paint—it's a decorative scheme in itself—and extremely tough and hard wearing too. If you haven't full details of Policrome at hand please write to us today.

Flame Eternal, Symphony and Nocturne from the range of 17 Policrome patterns were used for the interior of the South Eastern Gas Board's Croydon Showrooms.

Complete reliability . . .

All the materials and fittings used in the extensive London County Council building projects are subjected to the most exhaustive tests to ensure complete dependability. Among the L.C.C. Estates making wide use of Siemens Ediswan wiring accessories are Abbey Wood, Roehampton, and Britwell, Farnham Royal and this endorsement of the rugged quality of our products is especially satisfying since no effort has been spared to design them for long life and reliability together with installation simplicity. Furthermore, they are pleasing and dignified in appearance and prices are competitive.

Part of the L.C.C. estate at Abbey Wood.

April 17th, 1958.

Dear Sir,

Shell roofs in Barrel Vault Form, North Lights or Cantilevers in Shell may be adopted in numerous economical alternatives, in the "sketch project" stage. At this stage—without placing the architect or his client under any obligation whatsoever—we provide our initial service, very early, when it is most required.

In many instances, our service begins when we receive site dimensions of length, breadth and height, or preferably the architect's own thumbnail dimensional sketch. Once we are advised of any special requirement, our experience is brought to bear on problems of economic spans, prestressing, daylighting area, degree of insulation required and other matters to be agreed, and we prepare preliminary concrete arrangement drawings, and estimations of cost, etc.

Many eminent architects are numbered among those who have expressed their appreciation of our unique services, and since the first Shell project was completed in 1934 we have collaborated in a wide variety of schemes, including:—

Factories in Barrel Vaults and North Lights,
Works Canteens and Assembly Halls,
Market Halls and Live Stock Markets,
Omnibus Garages and Ambulance Stations,
Power Stations and Boiler Houses,
Breweries and Bottling Halls,
Schools and Technical Colleges,
Research Laboratories and Test Stations,
Covered Swimming Pools and Dance Halls,
Cantilever Sports Stands and Pavilions,
Railway Platforms, Butterfly Cantilevers.

Information sheets Nos. 815, 817 and 820, as published originally in the Architect's Journal, and which serve as a standard guide for architects contemplating Shell structures, will be sent on request.

Yours faithfully,

"CHISARC" & SHELL "D"

J. M. Pryce

A new look for interiors

Wherever vertical or ceiling surfacings must be moisture resisting, durable and easily cleaned, new colourful WARERITE Wallboard is the obvious and economical choice. Bathrooms and kitchens, partitions, cupboard fronts and flush doors are typical applications. WARERITE Wallboard can be screwed or pinned, or fitted into extruded sections.

THE NEW BALANCED BOARD FOR VERTICAL SURFACES AND CEILINGS

- Melamine-surfaced both sides
- No warping
- Resistant to steam and moisture
- Core of high density fibre board
- Easier construction at lower cost
- 16 attractive colours and patterns
- Standard boards 3 ft. x 4 ft.

WARERITE Specialist Service

WARERITE Specialists are located in 150 cities and towns throughout the country and supply WARERITE Wallboard from stock. Write for literature, samples and name of your nearest WARERITE Specialist.

Permoglaze

THE TILE-LIKE FINISH

Permoglaze is a liquid surface coating made by a special process which imparts exceptional hardness of surface and durability.

It is made in GLOSS, EGGSHELL and MATT finishes in grades to suit all surfaces, interior and exterior, and is of particular interest to the architect seeking a finish of outstanding quality and resistance to steam, condensation, oils, soaps, washing and hard wear.

Grades are available to meet special corrosion problems, to resist chemical attack and to combat mould and other conditions which quickly affect conventional paints. Descriptive booklet, colour cards and full particulars will be sent on request.

good thermal insulation calls for

VERMICULITE

No other material gives such good thermal insulation efficiency—at the same cost—as vermiculite. In lightweight concrete and plaster, or as a loosefill, vermiculite is being used more and more widely in modern building construction.

By constant research into the development of vermiculite and its application to modern building methods, the A.V.E. is making an important contribution to the advancement of general building design and construction.

Results have proved that this permanent, fire-proof, lightweight aggregate provides better thermal insulation efficiency—for no extra cost—than any other material.

Specify one of these
branded A.V.E. Vermiculites

for roofs of double duty

Some roofs only have to withstand wind and weather. Their job is single-purposed. Protection, pure and simple.

But other roofs have a specialised, *dual* duty. They are promenades also; roof gardens, verandahs, terraces, playgrounds. And for these, Ruberoid has a specialised answer — *Ruberdal Roofing*, a Ruberoid built-up roof with a hard-wearing, fireproof tiled surface which complies with the London Building Act and the Ministry of Health Model Building Bye-Laws.

Above: GRAND STAND, CHELTENHAM RACE COURSE.

Durable....

Vitreous China has given 'durable' a new meaning, and because all "Standard" Sanitary Appliances are made of Vitreous China, it takes a lifetime to discover just how durable they are. With Vitreous China comes a higher resistance to harsh treatment than with ordinary ware. Much higher. And because "Standard" Sanitary Ware lasts and lasts, its cost for each year of service is much lower.

Beautiful....

The clean, fresh beauty of "Standard" Sanitary Appliances made of Vitreous China is a joy to behold. A brilliant, practical beauty. A modern beauty that has been achieved by years of planning, styling, shaping and re-shaping. And below the surface there is the beauty of a superb craftsmanship. Inside and out, this Vitreous China ware is really beautiful.

Vitreous

★ In many countries it is officially required that Sanitary Appliances be made of Vitreous China. Many British architects, doctors, and Public Health Authorities would like to see similar legislation in Britain and so, not unnaturally, would the makers of "Standard" Sanitary Appliances.

Hygienic...

Fired at a much higher temperature than ordinary ware, Vitreous China is a dense and non-absorbent material which remains steadfastly hygienic.*

And it does not depend on its glaze to make it watertight.

It is non-porous and non-crazing. Germs cannot lodge and breed in it. "Standard" Sanitary Ware made of Vitreous China guarantees hygiene for the lifetime of whatever building it serves.

ous China

Durability. Beauty. Hygiene. Economy. These are the characteristics of "STANDARD" SANITARY APPLIANCES made of VITREOUS CHINA which appeal to the house owner and builder no less than to the doctor and the architect.

CONTRACTORS' HUTS

ROOF DECKING

Plywood Sheathing

for roof decking, box beams, floors, shuttering and scores of outdoor uses

Produced with a full phenolic bond . . . waterproof, weatherproof and boil-tested . . . Seaboard Douglas fir plywood is now available in two sheathing grades at prices which open up an entirely new field of use for plywood

Known as SHEATHING and UNDERLAY SHEATHING, these grades have all the structural qualities of smooth, top quality grades. Each panel covers 32 square feet, greatly reducing time and labour costs; it is split-proof and draft-proof . . . requires fewer and smaller nails; it builds into the structure the extra strength and rigidity of a material pound for pound stronger than steel.

Uses for sheathing and underlay are almost unlimited — roof decking, sarking, laminated trusses, gussets, contractors' huts, farm structures and solid bases for other materials are just a few.

Investigate Seaboard fir plywood sheathing grades. If your supplier does not stock them he can order them for you.

SPECIFY FRIGIDAIRE BUILT-IN REFRIGERATORS

Pictured here is the Frigidaire MY-32A: compactly-built, it shows the convenience of the left-hand door

Frigidaire's most popular model, the MY-32A (gross capacity 3.2 cu. ft.), is ideal for building-in at floor or waist level. The door of this luxury Frigidaire opens within its own width and can be hung on either the left or the right-hand side of the cabinet. The MY-32A is available in the full range of Frigidaire colours. The larger Frigidaire models, the MY-45A and the DY-45A (both with a gross capacity of 4.5 cu. ft.) can also be built-in at floor or waist level. Like all Frigidaires they are quality-built; they give the largest possible storage capacity in the minimum of room; they are powered by the 5-year warranted, cost-cutting "Meter-Miser".

Let Frigidaire's complete range — from 3.2 to 11.1 cu. ft. in gross capacity — add to the kitchen-appeal of the houses *you* design!

Frigidaire also has the best equipment for commercial refrigeration

Frigidaire's complete commercial range includes: display cases and service cabinets for shops and supermarkets; cold rooms for the conservation of food; ice-cube makers, beverage and water coolers for hotels and public houses; low temperature cabinets and mortuary chambers for hospitals. Frigidaire equipment gives perfect service in all fields of industry and commerce.

Now all Frigidaire compressors carry a Five Year Warranty — one of the benefits of Frigidaire's Five Point Programme for commercial refrigeration. Specification sheets on building-in, literature and further details of commercial refrigeration equipment available on request. Write (address below), or see your nearest Frigidaire Distributor, today.

Conder pioneered the NEW LOOK in steel construction — elegant, efficient, economical. During the past ten years we have erected several hundred rigid frame buildings designed according to the Plastic Theory. Conder experience in the modern method of steel construction is therefore unequalled.

An example of Conder Steel construction is shown above — Cloth Weaving Shop. Architects: Vallis & Bird, Frome, Som. Conder steelwork provides the Architect with a brilliant new design medium, including portal frames up to 150' clear span and multi-storey frames. Conder complete erection service includes cladding and glazing. You are invited to send for the Conder Book. Profusely illustrated with examples of Conder steel buildings, it gives useful data on roofing materials and insulation.

Wise flies know...

A Steelbrac suspended ceiling is practical, economical and speedy. The special light-weight framing is exclusive to the system, and the metal lathing which has 500 meshes per square foot ensures a tenacious key for the plaster. Special effects such as barrel or vaulted ceilings can be demanded without the embarrassment of prohibitive cost. The void between the ceiling and the floor above acts as a natural barrier to noise, and is the obvious place to accommodate services, since absolute latitude is obtained. We have an interesting technical booklet and will be pleased to send you a copy if you will kindly send us your name and address.

Another Building Operation Simplified

BEACON steel door frames are supplied **COMPLETE** with the fittings—just ready to be built in! These pre-assembled units will simplify **AND** speed your building schedule.

Made of Zinc-coated steel, BEACON metal door frames will support a load of 135 lbs., carry the usual load of breeze hollow block and 4½ in. brick work without a lintel in complete safety. Corners are electrically welded and neatly cleaned off.

Internal door frames are coated with a rust inhibiting primer, stoved-on at a high temperature. External door frames are hot dip galvanised

Comprehensive literature gladly supplied on request.

EASY TO ERECT

Metal anchors are fixed into the brick courses and hold the frame firmly into position while building continues.

TO TAKE EXTRA WEIGHT

Beacon steel lintels will support a load up to 750 lbs. in safety. They are designed to fit easily into the head of the door frame with the minimum of trouble. These steel lintels save concrete and shuttering on small spans.

BRICKLAYERS' LINE GUIDE

Line guides are supplied to enable the bricklayer to quickly line his work through, between door-frames.

ALL EXTRAS ARE FACTORY MADE AND FITTED

Base ties, hinges, lock strikes, rubber buffers and fixing lugs are already fitted into the frame when it arrives on site. BEACON complete door frames will cut down your building time and storage problems.

LINO

Service

Catesbys have laid lino for sixty years. Service built upon the fruits of this experience—complete understanding and knowledge of the craft—is worth having. Only Catesbys can give it.

Staff

Well laid lino gives longer, better service than lino laid indifferently. Catesbys send an expert and their own fully trained fitters to every contract. They ensure perfect lino laying.

Advice

Catesby's advice is impartial. They will recommend a certain type of lino only when lino is known to be the ideal floor covering. Catesbys will suggest the most suitable grade.

Stock

It is always easier and quicker to choose and specify a design, colour and grade from lino in stock. At Catesbys you see lino in the piece—and you can choose from the biggest stock in Europe.

Catesbys

TOTTENHAM COURT ROAD, LONDON, W.1. MUSEUM 7777

A Hardwood floor *improves* with age

The illustration above shows a dining room floor of Oak Strip.

For new or replacement floors. Hardwood Strip is fixed to the ordinary joists by means of hidden nailing.

For covering existing softwood floors. Hardwood Overlay Strip is fitted over the old floor. This can be done quickly, easily and at a very reasonable price, giving a 'reconditioned' floor that lasts a lifetime and adds to the attractiveness and value of a house.

- ★ Natural beauty of appearance
- ★ Extremely long lasting
- ★ Resilient to the feet
- ★ Low initial cost
- ★ Easy and economical to keep clean

A floor made from hardwood retains its unique charm and warmth and even improves in appearance through the years. Unrivalled as luxury flooring of high quality at low cost, natural polished hardwood provides the perfect ground for antique, traditional or contemporary furnishings.

All enquiries for Hardwood Strip and Block Flooring should stipulate

THERMATIC

- the oil fired space heater
with **EVERYTHING** to commend it

LOOK AT THESE FEATURES

- no installation problems or expenses
- even and quick heating-up
- efficient and economical in operation
- adaptable, compact and safe
- supplied either "Free-Blowing" or with Duct Connections
- Semi-Packaged unit designed for transportation in sections and easy assembly on site

The THERMATIC is the new space heater that takes all the problem out of how to warm large quantities of air fast, cheaply, safely, and with the absolute minimum of installation expense or trouble. It burns oil and is fitted with a completely sealed heat exchanger of maximum efficiency. In order to install the

heater all you have to do is to connect up the oil supply and plug in the electric power for fan and automatic controls. No special foundations, no water supply, no time wasting assembly. Not only is the THERMATIC the safe and efficient way to warm factories, offices, churches, assembly halls, garages—in fact any building—but its compact and clean design enables it to fit in with any surroundings. If you are stuck with a heating problem today, THERMATIC can have it solved for you by tomorrow. Write for full details now to the Sole Manufacturers and Sales Organisation covering the U.K. and the British Commonwealth.

Glass Cladding today...

Bousfield Primary School London S.W.5. Architects: Chamberlin, Powell & Bon A/R.I.B.A., London S.W.3. Awarded the R.I.B.A. London Architecture Bronze Medal for 1956 "MUROGLASS"

Architects and builders everywhere recognise glass cladding as the ideal material for providing modern buildings with permanent, colourful protection. There is a wide range of glasses manufactured by Pilkington Brothers Limited which can be used for cladding, and these include "MUROGLASS", "ARMOURCLAD", "VITROLITE", Georgian Wired Cast and Rough Cast Glass. Both "MUROGLASS" and "ARMOURCLAD" have been specially designed to meet the demand for coloured cladding materials. Both have ceramic colour fused into one face—the former being a Rough Cast annealed glass and the latter, a toughened glass, available with a textured or a polished surface.

"MUROGLASS", "ARMOURCLAD" and "VITROLITE" are available in a wide range of attractive colours.

For further information, including glazing recommendations, on glass cladding and any other Pilkington product, please write to the Technical Sales and Service Department:

NOT QUITE ARCHITECTURE

SPACE, FICTION AND ARCHITECTURE

While we are still nursing our sundry grievances at not being invited to the Oxford Conference, here is a thought on architectural education to be going on with. My text is:

The commander eyed him. "Is she a native?"

"No—a *human being*, and she needs therapy quickly!"

*

Adepts will immediately realize that this is a capsule version of the whole condition of science fiction today; an expedition from earth is hard up against an alien culture, and worried minds are beginning to buckle under the load. That this is SF will probably come as news to those who have been prophesying the collapse of western civilization on the basis that SF is all about muscle-bound crypto-fascists armed with ray-guns, bulging popsies armed with slipping shoulder straps, and Things, armed with. . . er. . . well, not *arms*, anyway.

*

Those days of space-opera innocence are long gone, at least in the *Galaxy Astounding* belt, where readers and authors have learned to take the technical equipment as read—time-jump ships, force-fields, blasters and so forth—and concentrate on sociological and anthropological encounters so fraught with bizarre possibilities that the better class of expedition tends to retain a reliably accident-prone goon to go ahead of them and commit all the social gaffes and ethical *faux-pas* in the book, so that they know what to avoid. The presence of anthropologists on the expedition staff can be taken as much for granted as that of rocket crews, but so unimportant have the electronic and nuclear gimmicks become that a carefully contrived cultural crisis in

South African Architecture

Nikolaus Pevsner, after seeing the architecture of the Transvaal, expressed the doubt as to whether there was any other part of the Commonwealth "which can offer the eye so consistent and convincing a vision of the style of today." Some examples of this style are shown above, from the exhibition of South African Architecture which opens at 66, Portland Place on April 19. But, as W. D. Howie, senior lecturer in architecture at the Witwatersrand University, writes in an exhibition leaflet, a number of South African architects, although aware of the nature and significance of the work of the leaders of architectural thought in Europe and America are "neither willing slavishly to follow them, nor prepared to translate such philosophies into the different and difficult environment which is South Africa without a searching examination of appropriateness and performance." South African architects, like British architects, have discovered that blind imitation of superficial aspects of the so-called "modern style" often results in significant failures in performance. The first trends can be observed in the buildings shown here of the evolution of a South African architecture more appropriate to the resources available and the South Africa environment. Above, Dutch Reformed Church by Johannes de Ridder at Parys, Orange Free State. Above left, a women's hostel, Pretoria University, by Strauss-Brink. Left, Meat Board Building, Pretoria, by H. W. E. Stauch and Partners. Extreme left, the Johannesburg Railway Station, by Kennedy, Furner, Irvine-Smith and Joubert.

a recent story in *Astounding* was settled with guess what—fists!

*

Every second story you turn up nowadays projects some future or alien society, many of them highly possible, like the two cultures in Isaac Asimov's *Daneel Olivaw* stories: on Earth an overcrowded, artificially lit, plastic subtopia, saved from dead-beat automation only by the sheer pressure of humanity crammed into its windowless skyscrapers, the other—on a planet of another star—an underpopulated, aseptic, Usonian subtopia that could not be saved from *rigor mortis* by a populace so egg-head that they had only abstract art and not the other sort. Both societies are clearly possible because they are only extrapolations of the schizophrenia of our own, but it is worth noting that Asimov, unlike an Orwell, passes judgment on neither—probably because he knows that good men have been happy in worse. It is a tech-man's view (Asimov is a biologist of distinction), not a moralist's, though certain clear ethical principles emerge from it.

*

But what, you ask, has this to do with architectural education? A very good question, and here is a very good answer in the form of another quotation:

We need Utopians of genius, a new Jules Verne, not to sketch in broad perspectives an easily-grasped technological Utopia, but the very condition of future men whose basic laws of being respond to instinctive simplicity as well as the complicated relationships of life.

Those are the words of one of the greatest architectural educators our technological century has produced, Moholy-Nagy, and I don't think I need labour my point any further.

*

I suppose I'd better though. This is not a plea for pun-struck thesis projects for "satellite towns," nor to have next year's Tite Prize subject a "Baroque space-port on the shores of Lake Nemi." SF, so intellectually omnivorous that it has even heard of an ARIBA—the late Michael Ventris, cited with bated breath in a high-minded story about Martian Archaeology—is one of the great mind-stretchers, specialization-smashers of our day. Only the MIT "Arcturus IV" programme (Architectural Review, *Machine Made America* issue) has tried to put it to work, and it would be difficult to build it into any conceivable RIBA finals syllabus. But every student ought to get with it, as the saying goes. It is part of the essential education of the imagination of every technologist—and can you think of any better minimum definition of the architectural frame of mind than "imaginative technologist?"*

NO FEE SHARING

THE RICS has just re-affirmed an eleven year old statement that architects and quantity surveyors should not merge their fees (see page 563). This is said to be both illegal and contrary to the Code of Conduct. The statement says that the work of quantity surveyors and of architects is quite separate and distinct and that if the quantity surveyor's duty is properly fulfilled there is nothing to justify fee sharing—which would be bad for professional morale. This is the classic method of solving problems by pretending they are not there.

Why is fee sharing becoming more popular? It is partly because an increasing number of clients, when asked to pay, separately, several fees which add to a sizeable proportion of the building costs, are frightened into the arms of other organizations whose fees are either a single amount or are merged into the building cost. How much more satisfactory it is for the client to be told "your building will cost £x thousand—complete."

If the client's experience of professional men is that their final account for fees exceeds the percentage quoted at the beginning, because of expenses, reduction bills and variations, he may become convinced that the whole thing is a racket.

How much more satisfactory it is for the organizations like the all-in service to be able to apportion their total bill to design, quantity surveying, programming and construction costs as they wish. It is now a truism that more money spent on preparing to build could save money (and time) in the actual building. We know of one or two architects who favour the idea of group working—separate architects, surveyors, structural and services consultants who work as one practice for particular jobs—merging their fees. This is not necessarily an attempt to meet the competition of the all-in service; it could bring other advantages—to the client.

It is a pity the RICS refuses to face the problem. Does the RIBA agree with them?

THE PROFESSIONS IN NALGO

In his Presidential address to the ABT on March 22, E. E. Hollamby devoted much time and argument, as was to be expected, opposing the probable formation of a Local Government Architects' Society, recently proposed by the RIBA's Ad Hoc Committee. Reviving a familiar bogey, he feared that this would "still further fragment the profession, dividing its loyalties." Yet an essential ingredient of any split is that one section of the profession should be set in opposition to another. The Local Government Architects' Society would be "opposed" to no one except, when necessary, the employers. It is essentially a local authority expedient to deal with a local authority situation. No one denies that if all architects' interests everywhere could be united under a single protective society commanding universal respect, that might be even better, but the immediate obstacles are well known. While that can remain the ultimate aim, it would be foolish to allow the best to be the enemy of the good; that is, to reject this partial answer simply because the ultimate one must wait.

Then Mr. Hollamby was distressed because "the proposed organization could exist only by grace of NALGO." It is no more than realistic to acknowledge, as the Ad Hoc Committee have done, that *any* such protective association is in part dependent on the goodwill of NALGO and must work through it; but this is not at all the same thing as "simply falling back on NALGO," as he maintains. To think of the new Society as just one more to be added to NALGO's Consultative Committee is in fact to miss the point. The proposal is that the Society should join with lawyers, accountants, engineers and education officers to form a Professional Panel which, within the existing framework, will promote the interests of professional officers as distinct from the general run of local government employees who are necessarily NALGO's chief concern. Such a consortium of leading professions can wield an influence beyond anything a single society could hope to command. The Panel and NALGO may therefore work amicably together simply because it will be seen to be in the best interests of both parties to do so. Like any innovation, this will take resolution and hard bargaining to get established, but it represents much the best chance that has yet occurred to make the voice of the professions properly heard in local government.

Obviously the ABT sees the formation of a Local Government Architects' Society as a rival. But in opposing it, the ABT will join forces with some very reactionary elements of the Old Guard of the RIBA. It is distressing to see a body such as the ABT, which has done such progressive work in the past, now adopting a dog-in-the-manger attitude and opposing progress. The time has come for the ABT to undertake some soul-searching on its own account, and to evolve a new policy which would make the position of its representative on the RIBA Council less of an anomaly.

A WELL-CHOSEN EXHIBITION

Pausing only to brush the April snow from his boots, ASTRAGAL rushes hot-foot into print with the news that Britain has prepared a good architectural exhibition to show in Russia. For once we are sending abroad a well-chosen and elegantly-presented exhibition of our post-war achievements. Largely owing to the initiative of the Building Centre (where the exhibition can be seen until April 18), we shall be represented at the IUA congress in Moscow in July by a really professional job.

*

The theme of the congress ("Construction and Reconstruction of Towns, 1945-57") is illustrated by drawings and photographs of London (mostly the LCC comprehensive development areas and housing), Coventry and Harlow new town. The strict conditions laid down by the congress about size and arrangement of panels did not leave much scope for detailed technical or statistical information, but presumably this will be added in the form of congress papers and discussions.

*

Visually the exhibition does us great credit. The quality of the architecture, with very few exceptions, is surprisingly good. It should impress those gathering in Moscow.

NOTTING HILL RUN DOWN

If you read Geoffrey Gorer's *Sunday Times* statistical article on "Television in Our Lives" (one out of every two people in my house started to read it, which was one more than those who managed to finish it), you will be delighted to know that 700 people turned out on a recent cold night to talk about the townshaping of their district. At a time when six houses out of every ten have television (according to Mr. Gorer), it is nice to know that people still care about other things.

*

The 700 I am talking about went to Kensington Town Hall to discuss the Notting Hill Gate scheme. Was this because of bad television, the good publicity by Mrs. Christiansen, of the Kensington Society, or that dear old-fashioned thing, a community spirit? Whatever got these people away from the electronic theatre, they certainly had a rewarding time. Sir Hugh Casson took the chair, an LCC spokesman explained the proposals, Ian Nairn criticized them, R. E. Enthoven described the character of the district he had known for so long, and Kenneth Browne gave an eye-level townscape investigation. (Remember his sketches in the AJ for December 26?)

*

Although several top planners from the LCC were present—including the chairman of the Town Planning Committee—the meeting kept its doubts. Critics of the scheme objected to the absence of a shopping precinct, the encouragement of big store development instead of a cheap local shopping area, the vagueness about elevational appearance, and the failure to deal with the absurd dog-leg traffic junction. It was also said that an architectural competition should have been held for the development, and that the public should have been given a chance to say what it thought about the proposals.

*

It was clear from this meeting that if public opinion had been consulted it would have been worth having.

NOT USUAL OFFICES

If you want to enter for the TDA's office furniture competition (details in AJ on February 27) you must hurry. The last entry day is April 30. And don't be put off if you have seen Conran Furniture's new range of office designs. These are as smart as paint

Hugh Pope, one of the assistant architects working on the new Coventry Cathedral, has built himself an experimental studio in the grounds of his house on Kingston Hill (Surrey) made entirely of glass on a light timber frame. The interior is lined with panels which can be taken out or put in to suit the weather and lighting wanted. The actual frame of 150 separate triangles was put up by Mr. Pope, his wife Jennie, and a friend, artist Peter Kermode, over a week-end, "Though I confess," he adds, "that the foundations and glazing were done by a building firm to my design. I believe that there will be many houses and religious buildings constructed in this way in the future."

in the usual stick and slab Conran manner, and after seeing them ASTRAGAL wondered if there was any need for a competition. Wasn't this, he wondered, the modular, interchangeable range of office furniture which everyone had been waiting for?

*

In fact, excellent though this range is, there still remains plenty of work for intelligent designers and manufacturers to do. The problems of storage (particularly for paper sizes) and adjustable working-top heights still need study. Incidentally, the Anthropometry Committee of BSI have just issued an interim report price 2s. post free) on the dimensions of office furniture which all competitors should look at. What with this and the TDA competition (planned, as you may know, with the JOURNAL, the COID and others) there is hope of better comfort con-

ditions for pen pushers. Let's hope the sink competition, assessed by David Medd (the architect who, with Brian Adams, revolutionized the wash basin) will help the pen pushers when they get home to their less white-collared activities.

HOW TO LEAD A FULLER LIFE

While most of you have been looking in your back gardens for the grounded sputnik, Mr. Pope, of Kingston, has been proudly fighting his way in and out of a geodesic dome which sits space-shipwise behind his house. Naturally enough a photographic agency, which was longing to catch a space missile on somebody's grass, nipped along and took pictures. It issued the two published here, accompanied by the stern warning that "This caption must not be altered." In fear and trembling ASTRAGAL reproduces the caption unaltered, for the profes-

sion to peruse and to marvel at the simple faith and application of the designer.

*

These Fuller-type domes are wonderful "first thoughts," but that is about all. They lightly imprison space, and do not do much else. They are hard to get into (Mr. Pope burrows under, like a rabbit, to come up inside); they are hard to furnish (Mr. Pope keeps his books on the floor), and they have a built-in, condensation problem (the photographs are too small to show the sinister staining on Mr. Pope's inner lining to the triangular panels). Nevertheless, congratulations to Mr. Pope on his initiative. If he manages to solve the problems inherent in this type of structure we shall all be delighted.

*

Incidentally, the above comments are my own and must not be altered, even in fun.

SOMETHING NEW UNDER THE STARS

Congratulations to the AA on their new *Guide to Modern Architecture in London*.* It consists of an Index (gazetteer would have been a better word) listing 127-odd buildings, an *Esso* map with the index references of the buildings overprinted thereon, and a tall pocket-format folder to stuff them both into.

*

Nothing implicit seems to have been left out, misprints are conspicuously absent and the guide is up to date to the end of 1957. No doubt there will be criticism of the star system. Thirty-five starred buildings are said to be "musts" even for visitors with little time to spare, and everybody will be up in the air about something or other that has not been starred. ASTRAGAL treading the narrow path of fairness (*i.e.*, neither partial nor impartial) can only wonder on what basis the awards were made. Since every comprehensive development scheme included has been starred, you might think that choices leaned to the sociological rather than the purely visual. Yet Wells Coates's *Isokon* flats in Lawn Road, whose virtues are notably sociological, as well as visual and historical, get no star. Very odd.

RIBA Subscriptions

SIR.—Those readers of the ARCHITECTS' JOURNAL who have written to you expressing their dissatisfaction with the financial affairs of the Royal Institute of British Architects may care to know that a letter, signed by 100 Members and Students of the Institute in public and private offices on Merseyside and in north Lancashire, was sent to the Secretary of the RIBA on March 31 protesting in the strongest possible terms at the recent increase in the annual subscriptions.

J. W. STEVENSON.

West Kirby.

Superficial Architects

SIR.—The architect has for so long been completely out of communication with the society in which he lives and works, and recent signs that this gap is tending to close are a great encouragement. The lead, to better communications, has been given by designers of cars, spin-driers, cookers and so on, and one hopes that the architect will, in the future, readily adjust himself to a new attitude. If he doesn't, who knows, the profession may cease to exist and intending architects may be slowly but surely absorbed into big manufacturing and official organizations.

For the young architect it was truly depressing to see this gap tending to widen at the public meeting held in Kensington Town Hall on Tuesday, April 1, to discuss the Notting Hill Gate Scheme.

The panel of architects, planners and Dogooders, under the chairmanship of Sir Hugh Casson had been invited by the Kensington Society to explain and criticize the proposals before a gathering of local residents and shopkeepers.

Firstly, the architects for the rebuilding (Cotton, Ballard and Blow) did not turn up. Then the LCC officials explained the general layout and circulation in the most apolo-

getic terms, saying they were sorry but this scheme had been originally proposed for 1937. One can only conclude that when the money was eventually sanctioned, the LCC were unprepared except with their modified pre-war scheme. Kenneth Brown and Ian Nairn discussed the superficial details of the scheme but somehow failed to make any impression on an audience which was much more concerned with the basic concept of the proposals.

It was the audience which collectively realized the fundamental fault in the scheme, namely the circulation of traffic and pedestrians. Little helpful guidance or criticism on this was forthcoming from the panel and it was pathetic to hear the LCC's road engineer suggest that people in London do not really like fly-overs near their homes and offices. He did not even sound convinced himself that the fly-over was a beneficial part of a road system, and yet another roundabout was his only answer and this only if traffic demanded it. The final blow was struck in the midst of the public's concern about the traffic system when Sir Hugh Casson, trying to change the trend of the argument, asked the audience what they thought about the architecture and said he really did not care what happened to the traffic. From then on the mention of the words architecture or architect brought forth a pitiful snigger from the audience and any respect they had held for them at the beginning of the meeting was completely lost.

CHARLES MICHAEL PEARSON.

London.

Now I Understand

SIR.—Mrs. Booth (AJ, April 10) supports a town planning officer's refusal to accept Messrs. Emmerson and Sherlock's elevation. She has a right to her preference, whether she has a right to be legally supported in what can never be more than a preference, is far more fundamental. The whole issue is more important than that of mere architecture, more important even than the fact that no planning officer can have any qualifications other than those of a fully qualified architect to justify him in vetoing the work of a fully qualified architect. The matter is really Voltairean; I disapprove of State control of elevations of which I disapprove.

London.

R. FURNEAUX JORDAN.

Architect-Builder At Director Level

SIR.—From time to time there appear in the technical press various statistics concerning the amount of building work untouched by an architect's hand. It is difficult to ascertain on a national scale, the exact proportion, but the disconcerting fact remains that an awful lot of building is planned, or cribbed, submitted and built without qualified help. It is high time that we as a professional body not only recognized this unpalatable fact but took some positive step towards rectifying it.

Legislation demanding that submission of drawings should be by qualified architects only is unrealistic and unworkable, but there does exist a very simple alternative. Let there be a lawful amalgamation of architect and builder at director level! Instead of allowing the insidious spread of the "all-in service" now offered by the larger contracting organizations, complete with qualified design staff (and yes, their designs are just as good as yours—and cheaper!), let the architect participate officially at director level and with a director's status, not as a hired hack! The precedent of the 18th century architect-builder is behind us and current American practice before us.

The whole structure of our profession and its relationship with the building industry

and the public has been changing over the years, and yet still we strive to administer the rules and regulations which were evolved to meet a completely different set of circumstances.

Let us have a little realistic spring-cleaning at Portland Place and a particularly vigorous dusting of the commandment which says—"Thou shalt not become a director of a building firm."

The moral is, I suppose, let us "Span" our bridges before we come to them!

K. R. HERBERT.

Notts.

Timber Housing

SIR,—In an otherwise well-informed and objective appraisal of the timber house designs resulting from the recent competition run by the British Columbia Lumber Manufacturers' Association (AJ, March 27), the suggestion is made that the larger houses included in the "off the peg" series are not timber houses in the true sense because brickwork is employed as external wall cladding. The author of your review makes the guess that, since the by-law restrictions are unlikely to apply to timber houses on larger sites, brick facing has been retained for its "traditional appeal" to clients.

In fairness to the architects concerned and to the BCLMA it should be mentioned that, by-law requirements apart, the designers were given a free hand to choose whatever cladding media they deemed appropriate.

It should be emphasized perhaps that the BCLMA has no purist bias in favour of all-timber housing but is seeking to popularize the basic principles of timber frame construction in this country. In Canada and the United States, timber frame houses, more numerous than other kinds, are as often as not clad partially or completely with brick, stone or stucco. Timber external walls have undoubted aesthetic appeal and there must be many people now contemplating frame construction who will want to see timber used throughout. There are as many, however, who find charm in the use of contrasting materials. The choice surely lies with the client and his architect? One obvious advantage of platform frame construction is that it makes possible a wide choice of cladding materials.

CHARLES G. TICKLE.

Hertford.

SIR,—We would like to make the following comments on your article on the BCLMA timber frame houses (AJ March 27).

Whilst it may be unusual for reach-me-down house schemes to include designs in the £4-£5,000 price range we feel that there is good reason for so doing.

It is true that most people wanting to spend such a sum on a house will want to have an individual design. It is also true that by far the greater proportion of these people, even today, do not employ an architect but go straight to a builder for a "design," and we hope that this large market may be made more aware of our profession as a result of the BCLMA scheme.

The final paragraph of the article is concerned largely with our own particular design, and especially with the problem of the brick facing. At heart we must confess that we are with the purists—and presumably your writer—in this respect, but would plead the following in amelioration: The perspective as shown is extremely misleading by itself and we can only assume that your correspondent has seen neither the model nor other drawings. Only the small studio or study is brick faced—and how small in relation to the house may be seen from the plan. The whole of the rest of the house is, where not glazed, clad completely in timber.

It is important to remember—and a part of our brief—that in a scheme such as this it is essential that prospective buyers should

obtain building society approval for mortgages with relatively little trouble. As we all know, and as Eric Lyons restated so well, the building societies are the real monsters behind the housing horrors of this country, and it is frankly a sop to them that the small amount of brick cladding was introduced into our design.

We feel that we should make it clear that there has been no "hesitancy on the part of the BCLMA" in this matter. They have been ideal clients throughout the scheme.

JOHN NELSON.

J. ROY PARKER.

Liverpool.

RIBA

Architectural Education Conference

First reports on the RIBA's Education Conference at Oxford suggest that it was a great success with no effective opposition by reactionary architects to extending and developing the school training system. Everard Haynes, the secretary of the Board of Architectural Education, has issued the following interim statement:

The Conference on Architectural Education was held at Magdalen College, Oxford, on April 11-13. A list of those attending and the programme of the discussions have already been published (see AJ of March 27.—Eds.).

The discussions, in which all members took an active part, considerably widened the framework outlined in the Conference programme. The record of the discussions will form a valuable statement on the present position and problems of architectural education.

The Conference members included those of widely differing points of view, both within and outside the profession. Nevertheless, as the discussions proceeded a substantial degree of unanimity was reached on several fundamental issues.

A full report embodying recommendations will be made to the Council of the Royal Institute for publication, discussion and action.

RICS

No Fee Sharing

The RICS republished in their March *Journal* a statement first issued in 1947—prohibiting any merging of the architect's and quantity surveyor's fees. This is objected to on the grounds that it is "thoroughly bad for the professional morale of both architect and surveyor and is calculated to discourage care in their work." The statement goes on to suggest that any participation of the architect in the quantity surveyor's fees might "render the parties

to be liable under the Prevention of Corruption Acts, 1906 and 1916." For an architect it might "constitute an infringement of the Code of Professional Conduct."

The 11-year-old statement is republished with the "warm approval" of the Quantity Surveyors' Committee of the RICS. The *JOURNAL's* warm comments appear on page 559.

TPI (SCOTTISH)

Successful Study Group

The present ferment of ideas on housing layout were well reflected at the highly successful study group that was arranged by F. P. Tindall for the Scottish Branch of the Town Planning Institute at St. Andrews, from March 25-27 (writes a correspondent).

It was attended by architects, engineers and surveyors as well as planners from local and central government. A large collection of layouts, contributed by progressive housing authorities in Britain and Scandinavia were examined, and over 1,600 coloured slides shown. The proceedings were run on seminal lines by Tom Lyon, Head of the Department of Town and Country Planning, Royal Technical College, Glasgow.

Dissatisfaction was unanimous with the lack of order and human dignity in the sprawling corridor street layouts which are all that remain of the garden city tradition; with the flat and flimsy elevations of the prefabricated, but not machine made, buildings, and the failure to civilize the ground about them.

The road layout, although very expensive, had far too high an accident rate. The houses themselves in no way fitted the present household sizes, let alone the smaller and ageing structure of the future, and were technologically backward. Will it be possible to let houses without central heating, without privacy or without a garage in 20 years' time?

Many hours were spent examining the Radburn idea. The Willenhall Wood schemes were illustrated by Mr. Lyddon, of Coventry's Architectural and Planning Department, together with others based on the separation of pedestrian from vehicular traffic; of kiddie cars from motor cars.

Single aspect and L-shaped blocks of houses round common greens such as that at Frankendael, Amsterdam; Milestedet, Copenhagen, appeared most suitable to the Scottish climate.

Hugh Wilson, outlining the plan of the new hill-top town of Cumbernauld, described the integrated footpath system which had a distinct urban character and all the community buildings placed along it. The roads' widths were being calculated and members of the group undertook to make surveys so that roads could be designed for traffic and parking needs rather than by rule of the surveyor's thumb. The use of tar-sprayed gravel on parking areas was advocated by Mr. Meldrum, Burgh Engineer of Kirkcaldy, to save cost, and there was much support for "slowing-down surfaces" to control speeds in housing areas. The design and siting of children's playgrounds and the space about buildings were also discussed.

The group is to be followed up by exhibitions of the layouts and meetings in Glasgow and Edinburgh and should prove a valuable stimulus to improved housing practise throughout Scotland.

IN BRIEF

The AA Council announce that, following a reorganization of staff duties, three new appointments of Year Masters will be made, to start in September, 1958. The salary will be £1,100 per annum. Private practice is encouraged and office facilities in the school

BRUSSELS PREVIEW: PAVILIONS NEARING COMPLETION

Above: the Swiss pavilion, composed of a series of hexagonal units (steel columns, timber trusses, aluminium curtain walling and cladding). Architect, Werner Gantenbein. Below: the Japanese pavilion, architect Kunio Mayekawa. On the left is part of a traditional Japanese house and on the right is the main pavilion, a steel and glass structure sheltered by a

vast butterfly roof. Note the imported Japanese rocks and the traditional white gravel. Below: general view of the Spanish pavilion, architects Ramon Vasquez-Molezun and J. A. Corrales Gutierrez. Like the Swiss, this is a "unit" type pavilion.

News—continued from page 563

buildings are available. Applications must be submitted by May 31 to the Secretary, AA, 36, Bedford Square, London, W.C.1, from whom full particulars of the appointment may be obtained.

The School of Architecture, Edinburgh College of Art, announces the introduction of the Andrew Grant scholarships, which carry no means test, and are designed to attract students who are not able to obtain a local authority grant because of their parents' income group or any other reason. The scholarships are each £200 a year: one for four years from the first year of entry, and two for two years with post-intermediate entry.

S. L. G. Beaufoy has been appointed Chief Housing and Planning Inspector, Ministry of Housing and Local Government, in succession to F. Collin Brown, who is retiring on May 5. E. G. S. Elliot, M.A., M.T.P.I., will succeed Mr. Beaufoy as Chief Technical Planner, and J. R. James, B.A., F.R.G.S., becomes a Deputy Chief Technical Planner.

The Council of Industrial Design announces a change of name for *Design Review*, its photographic and sample catalogue of well designed consumer goods. From April 1, *Design Review* will be known as *Design Index*. *Design Index*, it is felt, conveys more clearly the nature of the service offered—a permanent reference which manufacturers, trade buyers, retailers and the general public can use as a source of information and ideas on new and well designed household goods on the market. It should, too, remove the idea that the index is a publication.

The Faculty of Architects and Surveyors will be holding professional examinations from May 19 to 23, 1958 (inclusive), in the Building and Quantity Surveying sections. Applications from candidates for permission to sit must be received by the Secretary not later than Monday, April 21, 1958.

The Plymouth, Devon and Exeter Planning Officers are to co-operate with the Town and Country Planning Association in a proposed weekend Study Tour in June which would include Plymouth Town Centre and other City developments, a conducted coach trip across Dartmoor National Park and a study of development in the centre of Exeter.

The cost will be not more than £7. Those interested are asked to get in touch with the TCPA 28, King Street, Covent Garden, W.C.2.

The TCPA has also arranged for a holiday-study tour of Yugoslavia led by Sir Frederic Osborn from September 9 to 28, at a cost of £85.

DIARY

CRITICISM

by J. M. Richards

EXTENSION OF COUNTY HALL, LONDON, designed in the office of the architect to the LCC

It used to be believed by some people that a period-style building could be made into a modern building by shaving off the period ornament. I thought that fallacy had been exposed a long time ago, but the newly completed extension of County Hall indicates otherwise. It is a compromise that falls between all possible stools. Normally I don't discuss such unsatisfactory buildings in these articles, thinking the space better used to make comments on the buildings that are most worth commenting on. But it may be useful to say something about this one because of a number of important principles it raises.

Before doing so I must refer to the question many people must have been asking after seeing this building: How does it come about that an office with the distinguished record of the LCC Architect's Department, can produce a building which is not only contrary to all the forward-looking principles that have given the department such a high reputation, but puts into reverse the policy of enlightened development the LCC has been pursuing on this very site: its own South Bank? Having permitted—indeed perpetrated—this senseless cliff of solid-looking stonework along one boundary of the new South Bank area, the LCC can no longer assume the rôle of the injured party when the ponderousness of the new Shell building is complained of.

A partial answer to the puzzle is that this extension

From along York Road; showing the glazed ground floor at the end of the building which reveals the structural columns, elsewhere concealed.

Block plan: the extension discussed in this article is shown in solid black.

SOUTH BANK

Typical floor plan [Scale: 1/4" = 1'0"]

to County Hall is not, in the normal sense, the creation only of the LCC Architect's Department. The original plans produced by Mr. Hiorns (working with Sir Giles

Scott) in the 1930s showed the extension as a return of the rear blocks. When Robert Matthew was instructed to proceed with it the work was given to a group of

The main front of the new extension facing the South Bank site. On the right of the picture can be seen a corner of the original Ralph Knott building; on the left the Giles

Scott addition to which the extension is attached. Note the higher roof of the extension and the recessed balcony, both discussed in the article.

The new LCC building from the direction of the river, showing the solitary central window in the end elevation, which the article claims leaves dark corners inside, and the high flat-topped roof.

architects some of whom had worked on the original building. The plan for the South Bank which was being developed by Leslie Martin, who was just taking over from Robert Matthew, showed the extension as a taller, partially isolated, block which was clearly modern in character. This was quite unacceptable to officials of the Council, who insisted on an extension with the stone face and tiled roof of the existing building. At the same time the urgent need to increase accommodation made a simple replica impossible. It would be reasonable to interrupt here and ask whether Dr. Martin decided rightly in the first instance when he showed a modern building in his South Bank layout. The argument against his policy would be that the extension had no right to a separate identity, being simply the completion of a missing corner of an established design. His arguments, I imagine, were that some adaptation to meet modern requirements were necessary, that to make the minimum adaptations to the original Ralph Knott conception would have been one thing, but to have adapted the Giles Scott design, which was itself an adaptation of Knott's (and stylistically a watering down of Knott's vigorous if, to our eyes somewhat elaborate, Edwardian baroque) was quite another thing and would produce only a

characterless compromise; also that the new project was more than an extension to County Hall, because it had the additional rôle of providing the background to the new South Bank development and should conform to it in style, which there was then every reason to hope would be a frame-and-cladding rather than a masonry style. Although the end elevation of the Ralph Knott wing also faced the new site, this was due later to be partly blanketed by the National Theatre.

The question of principle I have referred to is this: either it was worth sacrificing convenience and paying the cost of completing the Scott design unchanged (and a strong case, I feel personally, could be made out for doing this) or it was not; in which case a new design, conceived in modern terms, was required. The resulting building illustrates the defects of simply compromising.

In deploring this compromise I am not thinking only of what is proper stylistically and satisfactory aesthetically, though judged on these grounds it is, in my view, a most unfortunate design. You only have to look along York Road (as in my first illustration) and see the towering stone-faced end of the building, crowned with its steep tiled roof, perched over the columns on which it is really carried, to see the artistic calamities that architecture which follows the rules of neither traditional nor modern construction is apt to lead to. But my criticisms go much deeper than this. The new extension is in several practical ways less satisfactory even than the Scott building which was its starting-point.

Structurally the Scott building is what you would expect. It has a steel frame, embedded in the stone walls. In the new extension the frame (of reinforced concrete) does not directly support the apparently massive stonework, which consists of thin panels resting on the floor-slabs, with the columns standing free inside them. This is, of course, a reasonable method provided it is reasonably done. But here the columns are too near the outer walls for the space between to be usable. They simply get in the way. Moreover the point of this kind of wall detached from the structure is to let all the light it requires into the building. Here the walls are pierced with square windows almost as widely spaced as though they had to leave enough solid masonry to support the roof, and the interior is badly underlit. The occupants, except those working immediately beneath a window, have to use artificial light all day—itself a devastating criticism of a newly constructed office building.

This under-lighting is only partly due to the refusal, presumably for stylistic reasons, to provide larger windows. It is chiefly due to the width of the building being far too great. This, I suppose, the present architects can blame on the original layout of the rear portion of County Hall, but does not the fact that this was obviously an inefficient width provide an additional argument against following the previous pattern? In this respect, likewise, compromise has produced the worst of both worlds.

The total width of the wing is 51 ft., giving an office depth of at least 20 ft. when a reasonable corridor is subtracted—far too much for good daylighting. The

The glass-walled entrance vestibule: left, from outside; right, from inside. The windows are to be used for displays illustrating LCC activities, which have not yet been installed. The left-hand picture also shows the curved outline given to the end wall, criticized in the article.

columns are spaced at 14 ft. 4 in. And as the columns have equal spacing, corridor partitions cannot be made to coincide with the internal rows of columns. In spite of unnecessarily wide corridors everywhere, free-standing columns clutter up the office floor-space. There are no fixed internal partitions (the one improvement on the design of the earlier portion) and parts of nearly every floor are left open from outside wall to outside wall, to provide drawing-office space. These spaces have large and wastefully under-lit areas

Part of the main staircase. This photograph does not fully bring out the coarse detailing and colouring, but does show (top left) the strangely casual juxtaposition of planes and angles.

in the middle. They also have almost unlighted areas at either end because of the way the windows stop short of the corner (again presumably for stylistic reasons), and this is aggravated by the fact that the ends of the building are lit by only a single window in the centre of each elevation.

These end elevations, though generally designed to follow the Scott elevation are, for some unaccountable reason, given a slight curve in plan, which looks very odd indeed when seen obliquely along York Road and from the main entrance of the original building. It would be interesting to know how the architects justify this curve. On the main elevation facing the empty South Bank site (but later to face the side of the Shell building) there is also a fanciful addition to the Scott repertoire of architectural features in the shape of long recessed balconies at first-floor level. These again need explaining. They can hardly be of much practical use. They cannot have been put there to give emphasis to certain principal rooms, since the easternmost balcony, for example, spans successively across the front of part of a drawing office, a secretary's office, two principal offices and another drawing office, and all it does to these rooms is to make them narrower than the rest, so that if they are of a length appropriate to important rooms they have uncomfortably cramped proportions. The principal's office, moreover, contains a single oddly placed free-standing column, depriving it of any of the dignity the provision of this imposing balcony was presumably meant to give it.

The elevations are crowned by a steep French château-style roof covered in Roman tiles, echoing the style of the earlier parts of the building. But on the extension this roof rises higher than it does on the rest of the Scott building, two extra storeys being concealed in the roof. The top storey is lit from above, through glazing set in the flat central strip. The lower storey is wholly artificially lit and is used for storage.

Such vast storage space is of course very useful in any building, and the top-lit upper area admirably serves, as it happens, the needs of the photographic and photo-printing sections of the LCC Architect's Department which occupies the whole of the new extension. I say "as it happens" because the building was not designed for the architects but simply to provide badly needed extra space for LCC purposes. It was allocated to the

Architect's Department only when it was on the point of completion.

This is not of great significance (unless architects can be said to suffer more than other office-workers when the standard of lighting is poor) because well laid-out office space should be adaptable to whatever type of office work it is required for, and the chief defects that show themselves at the moment, lack of privacy for senior staff requiring private offices and insufficient lavatory accommodation for the men (who have exactly the same as the women, though they outnumber them ten to one) can presumably soon be remedied by the erection or adjustment of partitions.

Yet it is sadly ironical that it should be this particular department which has to suffer daily contact with the most prominently sited of the very few examples of backward-looking architecture that the LCC has been responsible for in the last ten years. The members of the department must feel they have been made to look fools in, as it were, their own home territory. They must feel particularly unhappy when they enter the building, passing through the glass-screened vestibule which does give some hint of the airy interior a well-designed office building can have, and does suggest the architectural opportunities an openly planned frame structure offers, and are then confronted by the main staircase. This is intolerably vulgar, both in its general design, in its detailing and in the way the materials are used. Its showiness and insensitiveness are the very qualities that were too much associated with the word modern until the good buildings that the LCC architects have put up in London showed the public otherwise.

A main corridor. The glazed screen on the left has been curtained to give privacy.

This staircase and other inept examples of design are the architects' responsibility alone. But as to the general conception of the building, it may be that I am being unjust in putting the whole of the blame on the group of architects who worked on it. They had an extraordinarily difficult brief, and some of the blame must go to the Council which wished such a task on them. The Council should have had more faith in the architectural policy which in the last ten years has brought so much credit to them, and has been admired all over the world.

New Requirements for the RIBA's External Examination

Although the very fundamentals of architectural education were being discussed at the RIBA's recent Oxford conference, at the same time constant work is being carried out to improve the present standards of education and examination. In the article below, A. Douglas Jones, principal of the Birmingham School of Architecture, describes and comments on the new requirements for exams taken externally.

The modifications which the RIBA are going to make to the Intermediate examination are expected to come into force in November, 1960, and to the final examination in November, 1962. The changes in the testimonies of study will, of course, be effective sooner (Intermediate, January, 1959; Final, January, 1961). The Special Final will follow the pattern of the Final Examination. In very broad terms the changes amount to this:

The four sheets of composition that form part of the present intermediate testimonies of study will be dropped.

In the Intermediate Examination the Special History paper will give way to another sort of History Paper in which one or two questions will be asked on the related arts; and two additional three-hour papers will be added to the examination making a total of seven examinations instead of five. One of the new papers is on simple heating and drainage and the other is an examination in the properties and uses of building materials. A testimony (which is really a drawn thesis incorporating a report) replaces the written thesis and one of the design testimonies. One design testimony is dropped altogether.

In the Final Examinations the two-hour professional practice paper will be replaced by two 1½-hour papers covering "Building Law Regulations and Bylaws" and "Contracts, Scale of Charges and Code of Conduct." The changes seem to be an improvement.

The candidate for the intermediate examination will be let off the four dreary sheets of composition, but he will have to face the two new examination papers in heating and drainage, and on materials. Although this is a step forward it is a pity that the RIBA did not have the courage to balance the addition of the two new papers by dropping the three-hour paper on "Special History," instead of replacing it by a similar paper called the "History and Appreciation of Architecture." Had this been done there would only have been an overall increase of one examination paper

instead of two, and the intermediate examination is already fairly tough. There is, in any case, an examination in General History and there will be agreement that this paper should remain; but why persist in having two similar history papers?

From the specimen papers that the RIBA have published the "History and Appreciation of Architecture" appears to be no more than a further test in the General History of Architecture with a question added on the related arts. But then, what else could it be?

There is also an improvement in the conditions for the Final candidate who will be able to prepare a drawn thesis with a report instead of a written thesis. This will bring him nearer to his cousins in the Recognized Schools. The thesis will be assessed in conjunction with the Design Examination and candidates will be able to gain a Distinction in Design. Why it should be a Distinction in design instead of an all-round "Distinction" is difficult to understand. The thesis will supersede an equivalent amount of work; in fact there will be an overall gain for candidates of one design testimony.

Another improvement is that the technical examinations will have to be passed before the Design Examination is taken. There are some other modest changes which are enumerated further on. It would be both unproductive and ungallant to complain about matters of detail. So long as the RIBA intend to maintain the *status quo* in architectural education the new examination arrangements appear to be a step forward, but it would be encouraging if the RIBA Council now decided that it is time to study the whole system of architectural education instead of tinkering with it. While the examination itself is improved the drafting of the new regulations is quite dreadful. To my knowledge the RIBA issue eight booklets on the subject (not to mention the specimen examination papers). The information given in these booklets should be systematized and the booklets rewritten.

SUMMARY OF THE CHANGES IN THE INTERMEDIATE EXAMINATION PAPERS

Testimonies

The four sheets of composition are dropped.

Examinations

1. *The Special History Paper* is superseded by a history paper of similar length that deals with history in a more general way and includes a question on the related arts.

2. *The new Design Paper*

Twelve hours instead of nine will be allowed to work on the paper.

3. A new three-hour paper called the "*Special Requirements of Buildings*" will deal with simple drainage, heating, thermal and sound insulation, electricity, fire precautions.

4. A new three-hour paper called the "*Properties and Uses of Building Materials*" will deal with materials such as concrete mixes, timber, roofing materials, bricks, etc.

SUMMARY OF THE CHANGES IN THE FINAL EXAMINATION PAPERS

Testimonies

Apart from the regulations governing the submission of the testimonies, two main design testimonies and the subsidiary working drawing testimony and the written thesis give place to a new testimony (called the "Examination Testimony" because it will be marked in conjunction with the design exam.). This new Testimony is the equivalent of a Recognized School thesis.

Examinations

With the exception of the paper in Professional Practice there appear to be no basic changes though there are slight variations. A little more time is given to candidates to work three of the new papers (Construction, Hygiene and special requirements of buildings, Specification) as can be seen from the analysis of the final examinations set out here.

Candidates will have to pass the technical subjects before sitting for the design examination.

The two-hour Professional Practice paper is to be superseded by two new 1½-hr. papers called "Building Law, Regulations and Bylaws" and "Professional Practice, Contracts, Scale of Charges, Code of Conduct."

THE CHANGES IN MORE DETAIL

Intermediate Testimonies of Study

1. Testimony 2.C which requires four sheets of annotated sketches of composition is replaced by a Design subject.
2. Testimony 2.D will be developed not only as a design programme, but as one for working drawings.
3. Testimony 3.A asks for a design and working drawings. This design will be dropped and working drawings of the previous design testimony will be carried out instead.

Intermediate Examinations

Obviously it would be unrewarding to compare the old and the new papers question by question, but from a study of the new specimen question papers a rough guide to the changes that are to take place is given below.

Present paper

1. "*General History of Architecture*" (3-hour paper)

No change.

2. "*Special History of Architecture*" (3-hour paper)

Choice of a paper in:

Classical
Byzantine, Early Christian,
Romanesque
Medieval
Renaissance
19th and 20th Century

New Paper

- "*History and Appreciation of Architecture (General)*" (3-hour paper)

- "*History and Appreciation of Architecture—Appreciation*" (3-hour paper)

This appears to be General History in the sense that the questions in the specimen paper deal with buildings in various parts of the Western world. A question in the specimen paper deals with hieroglyphics, sculpture and stained glass

3. "Mechanics and Simple Structural Calculations" (3-hour paper)
No change
4. "Design and Construction, Stage 1" (9-hour paper)
No change except in the time allowed to do the paper (i.e. three hours added for the new paper)
5. "Design and Construction, Stage 2" (3-hour paper)
No change
6. "Building Science Paper 1—Structure" (3-hour paper)
This is a paper which does not have a parallel in the present examination. It is intended to cover in a reasonably simple way; drainage, heating, thermal and sound insulation, electricity, and fire precautions
7. "Building Science, Paper 3. The Properties and Uses of Building Materials" (3-hour paper)
This is another paper which has no parallel in the present examination. Candidates must have a working knowledge of concrete mixes, timber, roofing materials, bricks, etc.
8. The Oral Examination
No change

FINAL TESTIMONIES OF STUDY

Present arrangements	New arrangements
Generally All testimonies to be approved before admittance to the examination Note. Part 2 (technical exams.) may be taken with, before or after Part 1 (Design) The Testimonies Six testimonies required (four main and three subsidiary) and a written thesis	Generally All testimonies, <i>except the main testimony</i>, to be approved before admittance to Part I of the examination. (Part I consists of the technical group of subjects) Note. Part 1 (technical exams.) must be passed before candidates may sit for Part 2 (Design) The main testimony to be completed before admittance to Part 1 (Design exam.) The Testimonies Four testimonies required (two main and two subsidiary) and an "Examination Testimony" which is the equivalent of a thesis. The candidate has to choose a subject and site and draw up a programme for approval. Design drawings and perspective, working drawings and a report are required The dropped subsidiary testimony (working drawings) is included in the "Examination Testimony" The dropped main testimonies are the housing layout design subject, and the design subject involving "one large mass and smaller masses"

FINAL EXAMINATIONS

At present the Design exam may be taken with, before, or after the other group of examinations, with the exception of Professional Practice which is something apart. In the group of technical subjects at least two subjects have to be passed before they can be added to one by one. In the new arrangements the group of technical examinations must all be passed before candidates may sit for the Design Examination. No statement appears to have been made about the minimum number of technical exams that must be passed at one time.

Present Paper	New Paper
1. "Design" (27-hour paper) No change	"Design and Construction" (27-hour paper)
2. "General Construction" (3½-hour paper)	"Advanced Applied Construction" (4-hour paper)
3. "Theory of Structures" (3-hour paper) No change	"Building Science, Paper I. Structure" (3-hour paper)
4. "Hygiene and Specialized Requirements of Buildings" (2½-hour paper)	"Building Science, Paper II. Special Requirements of Building" (3½-hour paper)

Judging from the new specimen questions the two papers are basically similar but with reasonable variations. An extra half hour is allowed for the new paper.

5. "The Specification and Properties and Uses of Building Materials" (3-hour paper)	"Building Science, Paper III. The Specification, Properties and Uses of Building Materials" (3½-hour paper)
---	---

(a) The questions appear to group themselves a little differently, and in the new paper a question on approximate cost is introduced.

People specially interested should get the booklet of specimen questions from the RIBA.

(b) An extra half hour is given to work the new paper.

6. "Professional Practice" (2-hour paper)	"Paper 1. Building Law Regulations and Byelaws" (1½-hour paper) Building Legislation, Town Planning Requirements, Rights of Owners, Easements, Dilapidations, Administration of the Law
7.	"Professional Practice, Paper 2. Contracts, Scale of Charges, Code of Conduct, etc." (1½-hour paper) This paper also deals with the relationship of the Architect with others; Arbitration; Competitions

The two new papers take three hours to work instead of the two hours allowed for the present single paper.
The Town Planning Acts will form a part of the new syllabus. The new paper seems much the same as the old one, but appears to expand it.

MEMBER OF THE METAL  WINDOW ASSOCIATION

THE INDUSTRY

The annual Exhibition of the Associated Society of Electrical Engineers was held at Earls Court from March 25-29. We print below a report by our Specialist Editor for Electrics. After deploring the fact that the Exhibition has taken the broad way of all British Trade Exhibitions he records such dest improvements that he was able to find in switchgear and lighting and describes the present state of the developments of underfloor heating, and of the rationalization of fluorescent light fittings and fuseboards.

This year's ASEE Exhibition was Bigger and Better and Louder and Glossier than ever before. The organizers should examine the current trend very carefully and consider whether anything can be done about it. Three years ago this exhibition was one of the pleasantest of the year. There was time to meet people and exchange opinions on new products and problems, and the atmosphere was extremely friendly. Now things have changed. The exhibition is far too large and is coming to be regarded merely as an opportunity for wining and dining the more important customers. There is no time, and in some cases, not even the wish, to discuss common problems in an easy atmosphere. On some stands one feels that nobody who does not intend to place a large order then and there is really welcome.

There are notable exceptions, of course, and the courtesy shown by certain firms stands out in marked contrast to the rest. Nevertheless, those of us who used to look forward to this exhibition as the major

event of the electrical year cannot but feel depressed.

The exhibitors are no more to be envied than the visitors. This is the salesman's marathon. For five days he must remain on his feet with a smile that by the third day has become fixed and staring, ready at any time to serve drinks, to take a customer to lunch—however many lunches he may already have eaten—and to discuss the hysteresis loop of silicon steel, or the pull-out torque of the latest motor.

I made a practice of saying, at every stand I visited—"How you must dread this week!" All thought carefully before replying. Those who eventually said Yes could be trusted. Those who said No were obviously tough, and experienced, and plausible, and would have great success selling floor heating in Central Africa.

An exhibition of this kind also serves to make one thing very clear. Only a few firms are innovators, most are imitators. It is obvious that there cannot be enough new ideas to go round, but what manufacturers lack in originality they make up in impudence, since they rarely steal an idea without claiming that it was their own to start with.

There was a special exhibition this year devoted to electro-medical equipment. This was not laid out as a series of trade stands, but was an unattended display on the first floor with one piece of equipment of each kind set out in a mock-up of the room in which it is used. It was certainly effective—a friend who was with me on the

first day began to feel faint as we passed the operating theatre. I found it one of the most interesting parts of the exhibition, and the only one I looked forward to revisiting, perhaps because I was able to watch the iron lung without anyone trying to sell it to me.

And now for the new products:

Accessories

Switches: The most interesting new switch is by Britmac, and is shown in Fig. 1. This is an adaptation of their plaster depth switch in which the dolly has been replaced by a lever. The switch mechanism is, I understand, entirely unaltered, but this is the first British design which breaks away from the more conventional dolly, although on the Continent such designs are becoming quite common. The switch dolly is associated with the quick-make and break tumbler switch, and there is no especial reason to use the same action with an a.c. switch, although it has been retained hitherto, I presume, from force of habit.

A rocking lever can be a much neater arrangement, and Britmac are to be congratulated for having been the first to introduce it. Let us hope for more progress in this direction, and that Britmac will drop their present bulbous shape in favour of a more elegant one.

Falk Stadelmann, who last year produced their "Snapfast" switch for use in competitive housing have this year brought out the "Metalcast" range with die-cast plates and boxes. A typical surface-mounting unit

technical section

is shown in Fig. 2. This is, in my opinion, the best looking protected dolly gridswitch on the market, largely because so much more can be done with a die-cast plate than with the metal pressings which most other firms use. The tooling costs must have been formidable.

The same firm also offer a number of ingenious devices for fixing accessories to prefabricated hollow tile partitions, and even to Stramit. I have no doubt that they would develop a method of fixing a switch to a cretonne curtain if the need arose.

Crabtree have brought out a range of grid-switches under the name of "Closegang." It is such a pity that this firm, which makes excellent switches, should have fallen so badly behind in the matter of styling. There are several better looking plaster-depth switches than the Crabtree "Lincoln" with its clumsy plate and square section dolly, while the new "Closegang" range is not nearly so well styled as the MK flush grid-switch, although in the protected dolly patterns both firms lag far behind Falks'. It is about time that manufacturers of accessories undertook a proper design policy, since even those firms which do make some neat units also make so many hideous ones that the whole thing appears haphazard and accidental. I was informed by a representative of one of the firms, whose 13 amp plug has recently been criticized, that retooling for this component alone would cost £20,000. It is therefore easy to understand why a design, however bad, is retained for so long, especially if it continues to sell. All the same, if it is so expensive to change a design once introduced, all the more care should be taken in drawing it up in the first place.

Nettle are now in production with a switch of which prototypes only were available last year. It has been given the unpleasant name "Findalite," and is fitted with a neon lamp which is alight when the switch is off. It is a good idea, but not half so good as to install a sufficient number of two-way switches so that one does not have to grope about in the dark at all.

F. C. Blackwell ("Blaco") have produced a box for plaster depth switches fitted with nylon pillars to accommodate the fixing screws, which are thus completely insulated for the whole of their length. "To earth or not to earth" plaster depth switch boxes in T.R.S. installations is a very tricky point. All makes of switch except one are fitted with metal fixing screws, which are accessible at the front of the plate, and might become live if anything goes wrong inside the box. It seems unnecessary to earth the box against this very slight risk, and nylon pillars, which eliminate the risk of the screw coming into contact with live metal are a very effective solution. Now that two firms have produced boxes of this kind (the other being Crabtree, who had prototypes available last year) it is to be hoped that the IEE will insist on the use of such boxes when the next edition of the wiring regulations is issued. Hitherto they have refused to commit themselves, even when a specific

query was raised. Perhaps they have been waiting for a development of this kind.

Lampholders: Nettle have prepared prototypes of two new lampholders designed by John and Sylvia Reid, which they will put on the market if enough interest is shown in them.

I understand that they have gone down very well and will be in production soon. The prototypes are shown in Fig. 3. While I

Fig. 3. Two new lampholders by Nettle.

do not think that they are much, if any, improvement on more conventional designs, any attempt to find a fresh approach to components of this type is to be applauded. I hope that other manufacturers will attempt the same sort of thing, provided that they do genuinely try to improve the design, and not merely bring out some novel shape for the sake of being different.

Floor heating: Three firms have entered this field for the first time during the past 12 months, and all employ cables that are embedded in the screed and cannot be re-wired in case of breakdown. The increasing popularity of these non-ducted systems testifies to the confidence with which floor heating is coming to be regarded. Only a short while ago nearly all writers and commentators were very suspicious of any system that did not permit rewiring; the common experience now is that architects and engineers will insist on a ducted system for their first scheme, but are likely to use a non-ducted system thereafter.

The first of the new cables is the "Flora-warm" range, manufactured by the Wandle-side Cable Works. This cable consists of a conductor covered by a nylon sleeve with an insulating sheath of p.v.c. The cable is not sold in set lengths of fixed loading, but each type covers a range of wattages depending on the length used. The ranges of the different types of cable overlap, so that any loading from 250 watts up to about 5.5 kilowatts can be obtained by a suitable selection of conductor and length. In this way it is possible to design to exact requirements, and, in my opinion, this is the best of the non-ducted systems available. I am glad to see that the new data sheets are much easier to read than those originally issued.

The next system is the "Ashatherm" cable made by Aerialite. It consists of a conductor insulated with a "heat resisting elastomer" (whatever that may mean—it

would be much better to give the name of the material) and an outer sheath of p.v.c. This cable is sold in lengths of fixed rating, although the steps between successive sizes are quite small. An ingenious system of spacers has been developed for use with this system. Quadrant formers are clamped to conduit, and a portable frame is made up round which the cable can be stretched. Once the cable is laid out round the frame and fixed in position by fillets of cement, the frame can be removed complete and used elsewhere. Although more expensive in its first cost, this system seems to be preferable to the wooden or metal bobbins which are offered by other manufacturers. Simplex have also brought out a heating cable, insulated with p.v.c. The cable is available only in fixed loadings, and the range is at present rather restricted. An interesting feature of this system is a specially designed junction box to which the heating cables can be connected at one side and the mains cables at the other without risk of overheating. This avoids the rather clumsy devices of conduits filled with sand or factory-made sealed connectors on which other manufacturers rely.

Controls for floor heating: Both Mantel Metalworkers and Wylex have brought out Consumer's Supply Control Units for use in houses which have electric floor heating. These are cabinets with provision for separate fusing of the floor heating, and in the case of the Mantel units, space for a second meter and time switch. There is nothing startlingly original in the idea, but it is useful to have standard units available at a reasonable price.

Lighting fittings

I did not notice any very exciting new products this year. Rowlands Electrical had on show a vapour proof fitting which has spent many months in a laboratory fume cupboard at the Northern Polytechnic without suffering any damage. The final answer to corrosion has been announced so often that I have become a little wary of each fresh one, but this does seem promising, and makes a useful companion to the Simplex "Endura" fluorescent fitting.

GEC had an imposing display of their "101" range of fluorescent fittings which came out with great *eclat* about two months ago. This range is based on a standard channel to which reflectors, louvres or Perspex panels may be added to form a complete series. These fittings invite comparison with the Crompton "New Range" which came on the market rather more than two years ago.

From the purely technical point of view, both ranges are hand sewn, rubber tyred and jewelled in every hole, and can be cleaned and relamped by the laziest and most incompetent maintenance man with a casual flick of the wrist, or so we are told. (I am inclined to favour Crompton against GEC in these respects.)

Although neither range was issued for the first time at this year's exhibition, I think

that they are sufficiently interesting to merit a detailed discussion, since both are the result of something we hear a great deal about these days—rationalization.

Convertible fittings of this kind should have the following advantages:

1. They are easier to manufacture, since the number of different parts is reduced.
2. They are easier to stock. Instead of holding 200 fittings of each of five different kinds, a wholesaler need only keep 800 basic channels and 300 of each of the more important types of accessory, and still be able to fulfil a larger order for any one kind of fitting than before, without having increased his capital outlay or his storage space.
3. In factories, offices and department stores the use of different rooms and areas may be

altered radically and at short notice. If convertible fittings have been used the basic channels may be left in position and the light output altered to suit the changed requirements solely by the addition or subtraction of reflectors, diffusers and louvres. This saves a great deal of money, and, what is often just as important, time.

4. Such fittings make possible a step-by-step approach to lighting. When a building is first erected money is often limited, and only the basic channel need be installed. The other accessories can be added later as money becomes available.

Crompton have concentrated their efforts on the plainer types of fitting (Fig. 4), and have achieved a design which does enable ready conversion from the basic channel, through various intermediate stages of

screening, to a fitting with Perspex side panels and a louvred bottom. Beyond this point the Crompton range is less successful. To obtain a fitting more elaborate than the one described, many of the accessories already added have to be taken off, while additional, and rather expensive, reeded Perspex screens and cast endplates have to be added. If this is done it is possible to build up the sort of fitting one would expect to find in the entrance hall of a bank. However, this does not matter very much, since the trough with Perspex side panels and a louvred bottom is quite good enough for most purposes, and far too good for banks.

GEC have attempted far more, and have succeeded less well. They are much weaker than Crompton on the industrial side, and their metal and Perspex troughs besides not permitting easy interconvertibility from open end to closed end, and open top to closed top, look very clumsy. On the other hand, the fittings employing reeded Perspex, one of which is shown in Fig. 5, are much better looking than those which Crompton offer, and if the demand for fittings of this kind were comparable with that for industrial troughs, one would say that both were equally successful in their different ways. In fact, probably five industrial type fittings are required for every one of the "commercial" type, and it will be most interesting to see whether industrial users support the better fitting.

Atlas, who themselves made a half-hearted shot at rationalization with their "Atlantic" range of fluorescent fittings, which are based on a standard channel but are not easily convertible, are still gallantly trying to popularize fluorescent lighting in the home. In this they now have the support of Herman Smith Smithlite Limited, who had on show some fittings for the centre contact fluorescent tube. This tube might lead to some interesting designs in the future, but the fittings they have produced for it to date are not very impressive.

Fig. 6 (far left). Sanders' "Sandaline" fuseboard.

Figs. 7 and 8 (left and above). The "Slydlok" fuseboard.

Ingenuity

This large greenhouse was constructed by Messrs. C. Zwetsloot & Sons with their Nursery labour. The structural framework is iron tubing with welded joints and conveys hot water from a stand pipe with flexible coupling. When the plants have finished flowering, the whole of the greenhouse is moved forward to ground previously planted. It is transported over pulley wheels fixed in line on dwarf concrete piers, the heat being uncoupled and re-connected to a stand pipe in the new position.

When additional greenhouses called for a larger Boiler House with an elevator pit, this too was constructed with Nursery labour. The depth of the pit is 16' 6" from ground level and, upon excavating, subsoil water was found at a depth of 7 ft. and water bearing sand at 13' 6".

Completed pit surrounded by 9' 6" head of subsoil water.

Waterproofing was effected by the inclusion of 4 lbs of 'PUDLO' Brand Waterproofer to each 100 lbs of cement in a 3:2:1 mix. A copy of the specification and descriptive Booklet will be sent upon request.

technical section

Fig. 9 (above). The Bill "Majestic" fuseboard.
Fig. 10 (below). The Dennis "Hi-Style" fuseboard.

Wanted, a design for a fluorescent fitting which will exploit the shape of the tube, as opposed to concealing it. The Atlas "Kitchenlight" is the nearest thing to a solution so far, but is restricted in application owing to its ballast lamp circuit. For the rest, several new modular panels for suspended ceilings have appeared, but none that I would recommend, and the shape mongers have been searching diligently in the Swedish and Italian magazines for new designs for glassware. It would not matter so much if they merely copied what they found, but they always succeed in spoiling it.

Fuseboards

Until recently the "Superform" range by English Electric was the only type of fuse-

board that one could consider placing on the surface in any building other than a factory.

This has led to the practice of using industrial fuseboards in all types of building, and erecting cupboards round them. This year, however, there are four makes of fuseboard on the market of which there is no need to be ashamed, and although all cost about 60 per cent more than competitive industrial boards, they are much less expensive than the "Superform" range, and it is probably cheaper to use them than to pay for an ugly board and a cupboard to go round it.

These boards are:

1. The "Sandaline," made by William Sanders & Co., Fig. 6.

The smaller sizes are entirely die-cast, while the larger are of sheet steel with die-cast corners. The fuses are fixed to the back of the board only, and for wiring the sides and front come away allowing complete access to the terminals.

2. The "Slydlok" Fusecab (!) made by Edward Wilcox & Co., Figs. 7 and 8.

This board can be obtained either with plain fuse carriers, or with a pattern incorporating a miniature neon lamp which glows when the fuse has blown.

3. The "Majestic" range, made by Bill Switchgear, Fig. 9.

Bill are one of the most popular manufacturers of switch and fusegear, and have hitherto been among the worst offenders in the matter of appearance. Let us hope this means that they intend to mend their ways, and will they please take their trademark off the front, or get a better one.

4. The "Hi-Style" fuseboard made by G. P. Dennis Ltd., Fig. 10.

The fact that there are as many as four boards in this category is encouraging. Can it be that manufacturers are becoming more interested in design?

Footnote. Having noticed a battery of Strand Electric Spotlights in the entrance foyer at Earl's Court, I was surprised to find that Atlas are given a credit in the catalogue for this lighting. Strand Electric did not exhibit.

INFORMATION CENTRE

19.213 construction: details CUTTING A DPC

Damp-proof Course Insertion. BRS Digest 107 (HMSO 3d.).

The insertion of a d.p.c. into an old wall has always been thought of as prohibitively expensive as, until recently, it has involved the removal and rebedding of a course of bricks. This Digest describes a method which is "usually less than half as costly" as the traditional method, and which involves sawing a slot in a joint and inserting a membrane as you go along. This method has its limitations: you must have a through bed joint and the mortar itself must be sufficiently sound for the slot not to be filled by falling mortar before you can insert the d.p.c. In the development work which formed the background of this Digest a method was used employing an $\frac{1}{4}$ -in. saw and relatively modest equipment; and it is considered that this method is only suitable for brickwork built in lime mortar and (normally) for buildings not higher than two storeys. Mention is made of more elaborate equipment now on the market which gives this approach a wider application; and it is evident that we have here a very useful dodge for bettering our heritage of damp buildings.

23.228 heating and ventilation ELECTRICAL STORAGE HEATING

Off-peak Electric Space Heating, by Leslie Shepherd, B.Sc.(ENG.), M.I.E.E.

This booklet contains reprints of a series of articles published last year in *The Industrial Heating Engineer*, and deals fairly fully with the various means of off-peak electric heating available, of which the best known are block type thermal storage heaters and embedded floor elements.

The author is with the Eastern Electricity Board, and it is very useful to have an account of the various systems written by an independent authority, as so much of what has been published hitherto has been at the best a frank piece of propaganda for one system or another, and in many cases has been directly promoted by the manufacturers.

The articles were written for engineers, and contain a full account of each type of equipment and the best way of using it, but do not attempt a detailed comparison of the economics of this type of heating with oil and coke fired systems. This is a serious omission, but those who have already decided to use off-peak electric heating will find it a useful reference. Architects ought to be able to understand it quite easily, but, regrettably, many will find it heavy going.

PRIVATELY-BUILT HOUSING AT HAM COMMON, SURREY

Site plan

This housing development, consisting of 30 flats and 12 garages, is speculatively built by the Manouso Group of Companies and the flats are to be leased individually for a period of 999 years. The architects are James Stirling and James Gowan.

The site is the garden of a large Georgian house which fronts onto Ham Common. It is a narrow strip of land, 678 ft. long with a width of 107 ft. at the north end and 57 ft. at the south. There is a heavy belt of trees along the entire length of the east boundary. The unusual shape of the site largely

predetermined the layout and the day-lighting angles from the boundaries conditioned the number of floors in each block: three storeys in Block 1 which is situated in the wider section of the site, and two storeys in Blocks 2 and 3. There is a restricted road access from both ends of the site, but no through traffic, and the grounds are laid out as communal lawns.

Block 1 contains 18 flats (3 one-bedroom, 9 two-bedroom and 6 three-bedroom) which are all based on the same interlocking and handing plan. The living room, kitchen, balcony and plumb-

ing remain the same for either a 1, 2 or 3-bedroom combination. There are three separate entrance halls with staircases and each provides access to two flats at each floor level. Horizontally the alternating units are handed about a structural spine wall. This is reflected in the exterior where the living rooms project forward and the bedrooms of the adjoining flat are set back.

Blocks 2 and 3 contain six flats each (all two-bedroom) and, except for a handed rearrangement, both blocks are identical. In each the central space is a double height entrance hall with a suspended access "trough" at first floor level to provide entry to the upper flats.

The living, dining and kitchen area of all flats is articulated around a structural brick chimney pier which contains the fireplace, back boiler, calorifier and linen cupboard. The mantelpiece and corbels in these units are all precast concrete elements.

The structural walls are load-bearing brickwork with floors, roofs and staircases of *in-situ* reinforced concrete. Externally and inside the entrance halls, these materials are left exposed: London stock brickwork and timber shuttered concrete. But inside the individual flats the walls and ceilings are plastered.

The foundations in all the blocks are discontinuous r.c. strips carrying a continuous r.c. ground beam. In Block 1 the walling is essentially continuous while in

Issued by the Electrical Development Association, 2 Savoy Hill, London, W.C.2.

construction study

PRIVATELY-BUILT HOUSING AT HAM COMMON: continued

The four photographs on this page show general views of the exterior of Block 1. The exposed r.c. edge beams, 15 in. deep and 11 in. wide, carry 6-in. *in-situ* r.c. floor slabs and a 5-in. roof. The concrete apron under the windows is 6½ in. thick and has a vertical d.p.c. of 2 coats bitumen emulsion separating it from the inner brickwork. Much of the brickwork is very highly stressed and on the ground floor the piers between the windows are loaded to their maximum capacity. The windows are heavy EJMA softwood sections painted white

and the sills are blue quarry tiles, internally and externally. The balconies are drained by the U-shaped gargyle and the triangular projecting concrete block is the larder ventilator. The flat roof over the staircase half-landing is also drained by a gargyle of another type.

construction study

PRIVATELY-BUILT HOUSING AT HAM

CO

The six photographs on this page indicate various aspects of Blocks 2 and 3. The open ends of the spine walls are closed with large glazed panels. Heavy timber sections are used to give a feeling of security from within while retaining the characteristics of a glazed wall. The

opening windows are top hung, opening outward. In the third photograph on the left, the gargoyle carries the overflow pipes from the c.w. storage tank and the w.c. cistern. The flank wall is set back 15 in. so that the main structural elements are clearly stated (shown below).

construction study

COMMON: continued

To achieve a degree of individuality within a repetitive system of flats a number of different fireplace designs are used but each contains the flues, back boiler, radiator, cylinder and linen cup-

board. Above left and right are two types from Blocks 2 and 3. The brickwork is the same as on the exterior and the lintels, mantelpieces and shelves are of precast concrete. A number of these

precast elements are shown in the photograph below left, and below right is a close-up of the over-flow gargoyles used in Blocks 2 and 3 with the larder ventilator above it.

construction study

PRIVATELY-BUILT HOUSING AT HAM COMMON: continued

The three photographs on the left show the staircase of Block 2. The construction is of 9-in. load bearing flank walls and 15-in. deep $\times$ 9-in. wide r.c. cantilevered beams which carry a 5-in. r.c. landing slab. Each flight of the staircase spans from landing to landing and is kept 2 in. clear of the structure at the sides. The 9-in. flank walls are faced with stocks both sides and have an internal d.p.c. of bitumen poured in 12-in. lifts.

The last photograph is a view of the staircase from the first floor access trough. This is U-shaped in section with a slab and sides of 5-in. fair-faced r.c. spanning between a simple beam system.

The general contractors were Rice & Son Ltd.; for sub-contractors see page 592.

FLATS

at MILLPOOL HILL ESTATE, BIRMINGHAM; designed by A. G. SHEPPARD FIDLER, city architect J. R. SHERIDAN SHEDDEN, deputy city architect; J. W. BODDY, principal architect (housing) F. M. JONES, assistant principal architect; R. M. COPE, group architect (in succession to R. R. BURTON) quantity surveyors, City Architect's Dept.; consultants (structural) TRUSSED CONCRETE STEEL CO. LTD. (heating) City of Birmingham P.W.D. (Mechanical dept.)

The housing scheme at Millpool Hill is one of a series of high-density infill housing projects in outlying areas round the city. It is built at a density of 25.14 dwellings per acre, providing accommodation for approximately 810 people in 214 dwellings, of which 54 are in low, 2- and 3-storey blocks and 160 in five 8-storey point blocks, which are the subject of this analysis. These blocks make use of a new structural system specially developed for the purpose, and preplanned in collaboration with the structural engineers and contractors, the Trussed Concrete Steel Co. Ltd. Of the 32 flats in each block, 23 are 2-bedroom flats for four people and nine are 1-bedroom flats for two people. Technically, the interesting features of the design are the standardized structural grid of reinforced-concrete columns and plate floors, and the provision made by the structural engineers for using internal climbing cranes.

A general view of two of the blocks from the south-east looking across the covered reservoir which adjoins the site.

building illustrated

The flats in relation to the prewar housing estate which borders the site. Hitherto the site was considered too difficult for housing development and remained an isolated pocket of dead land.

Site plan, showing the five point blocks and the lower blocks which form part of the same scheme.

Detail floor plan of a south-facing flat [Scale: 1/4" = 1' 0"]

analysis

SITE

The area to be developed occupies a hillock with a steep north-south slope, 8.49 acres in area, with good views over a nearby golf course and open development beyond the southern city boundary. The part occupied by the flats is $4\frac{1}{2}$ acres. When the surrounding area was built up with two-storey housing before World War II, this area was considered totally unsuitable for building because of excessive variations in level and many small pits which it contained. When it was reallocated for housing, four existing dwellings had to be demolished to provide satisfactory access.

The area is approached from two sides, with roads at different levels connected by footpaths. The upper road serving the flats is a looped cul-de-sac. The flats are built round it on five artificial plateaux, staggered up and down the slope to give maximum openness of effect, many of the lower blocks being approached by ramped paths. Space has been provided in the layout for one or two shops later, if required.

CLIENT'S BRIEF

A fairly open layout of mixed development to be built at maximum speed to a density in the region of 100 persons per acre. This implied a greater use of tall blocks than had hitherto been attempted by the Corporation.

PLANNING AIMS

To keep down the rising labour cost involved in building tall flats, it was decided to use an economic structural grid as a planning module, to provide a perfectly flat structural floor, so that internal partitions could be freely arranged without beam projections. This structure would make for maximum simplification and speedy re-use of the shuttering throughout the programme, and permit the external exposure of perimeter columns and floor edges, between which external wall panels of standard size could be fitted. Appearance of the blocks could be varied by building in brickwork or in made-up panels faced with sheet cladding of different colours or textures.

Preplanning started early in 1954 for a hypothetical point block, to measure approximately 62 ft. $\times$ 54 ft. on plan. It was found that a column spacing in the region of 12 ft. centres was economic and a square grid of 11 ft. 6 in. was finally adopted. The r.c. column section on an 8-storey block could be standardized at 10 in. $\times$ 10 in. throughout, which satisfied fire requirements, while in-situ r.c. plate floors, derived from American industrial practice and only 5 in. thick, were chosen, after a mock-up had been designed and tested to destruction by the engineers. Lift shaft walls were reinforced to act as a structural element and enlarged slightly to take the mast of a climbing crane. Five blocks represented the practical minimum for the site organisation required.

The blocks measure 69 ft. 6 in. $\times$ 46 ft. 10 in. overall and each contains 32 flats. Four dwellings per floor are grouped round a central core containing the vertical circulation: a single 8-person lift and a scissor staircase. Each upper floor contains three 2-bedroom 4-person and one 1-bedroom 2-person flats, while on the ground floor a second 1-bedroom flat is substituted for one of the 2-bedroom types, to leave space for the refuse chamber. Each flat has an internal bathroom, with airing cupboard and separate internal w.c., both with access from the hall and separated by a vertical service duct and a drying cupboard. Borrowed light to the bathroom is provided by fixed partition glazing above door-head level on either side of the hall. Kitchens have external lighting and ventilation. The blocks are sited with the main axis running north and south, and staggered to provide maximum openness and

The steep slopes of the site have been dealt with by arranging access roads on two levels and siting each block of flats on an island "plateau" surrounded by retaining walls, as shown in the photograph above of block C, seen from the south-west. The beamless plate floor system developed specially for the scheme has been used to determine the general character of the buildings by exposing the perimeter columns and floor slabs on the facade. Whether this rather obvious architectural concept is legitimate is perhaps a matter for debate: is the lightweight "skin" of a building best placed within the skeleton (with consequent multiplication of weathering details on the skeleton itself, and numerous straight butt joints between columns and panels) or should it preferably be a skin in the anatomical sense: a protective outer layer which covers the structure but expresses its membrane quality by other means? Accepting for the moment the concept used here—that of panel infill between structural members—it will be seen that the panels chosen are of two types: brick and foam slag cavity walls with pierced window openings, and framed-up units, partly glazed and partly filled in solid. The one uses the window as a hole in the solid, the other the solid as an opaque part of the window, two diametrically opposed ideas which produce a disquieting effect when used side by side.

Typical floor plan [Scale: $\frac{1}{8}$ " = 1' 0"]Section A-A [Scale: $\frac{1}{8}$ " = 1' 0"]

building illustrated

The living rooms of each of the four flats per floor are situated on the corners of the blocks. Those on the south corners each have a balcony facing south, and of those on the north corners, one has a balcony facing east (seen on the left-hand side of the photograph above) and one facing north (centre of photograph). In other respects the plans of these last two flats are "mirrored." The balconies are precast extensions of the floor slabs, tied in by continuity reinforcement. The "waffle" section of the balcony units can be seen below.

analysis

daylight. The separate boiler house which provides central heating from three oil-fired boilers is in a semi-basement recessed into the angle of one of the retaining walls which are an essential feature of the scheme.

MAIN CONSTRUCTION

The main shell of each block, consisting of 10-in. $\times$ 10-in. in-situ columns and 5-in. plate floors, with lift shaft walls and fire-break wing walls to the scissor staircase were designed by the engineers in in-situ reinforced concrete. To match the exposed perimeter columns in white cement concrete the external floor edges are faced with similar concrete strips precast in bay lengths and projecting 3 in. from the column faces, with end joggles and lateral reinforcement to bond them to the in-situ plate floors. Two private balconies on each floor project 4 ft. 3 in., and are precast in single waffle-section slabs to bring their weight within the lifting capacity of the climbing crane. Failure in the mock-up floor which was tested to destruction had occurred from shear well above the required loading when the head of a column punched through the plate floor, so steel meshes were graded to give extra reinforcement in these zones. This raised a problem with the ventilation ducts to the internal bathrooms, which come inconveniently near the column heads, which was solved by using precast concrete floor grilles of aerofoil section in the floor of each duct. Three double rows of projecting bars on all sides of the grille ensured continuity of reinforcement with the surrounding plate floor.

Main staircase included in frame.

Roof construction

Curved concrete roof to lift motor room and concrete slabs to vent ducts included here, but main roof included under frame.

Area: 33 sq. yd. per block.

Glazing

Generally 24-oz. ordinary quality sheet.

 $\frac{1}{4}$ -in. Georgian wired polished plate in fire-resisting screens. $\frac{1}{4}$ -in. Georgian coloured cast glass in balcony balustrading panels and lower panes of staircase window and living room window.

Total of structural elements	21	5 $\frac{1}{2}$
------------------------------	----	-----------------

PARTITIONING

Internal partitions

Mostly breeze blocks, including party walls between flats.

Area of each type, per block: 2 $\frac{1}{2}$ -in. breeze, 2,123 sq. yd.4 $\frac{1}{4}$ -in. breeze, 106 sq. yd.Composite 4 $\frac{1}{4}$ -in. breeze and 4 $\frac{1}{4}$ -in. brick, 52 sq. yd.10-in. wall of two 4 $\frac{1}{4}$ -in. breeze skins, 734 sq. yd.4 $\frac{1}{4}$ -in. brick, 203 sq. yd.

Screens

Fire-resisting between stairs and central hall.

Timber-framed with infill of g.w.p.p. glass and asbestos sheet.

Internal doors

Number of single, per block, 412. Number of double, per block, 1.

Ironmongery

Birmingham standard, generally anodized aluminium.

Fittings

Meter cupboards; kitchen cupboards; standard kitchen storage units; draining boards; linen and drying cupboard and wardrobe fittings.

Total of partitions and fittings	6	11 $\frac{1}{2}$
----------------------------------	---	------------------

FINISHINGS

Floor finishes (cost includes screeds and insulating quilt) 2 9 $\frac{1}{2}$

Type of finish	Area in sq. ft.	Price per sq. yd.
		s d
2-in. concrete	108	11 9
$\frac{3}{8}$ -in. quarry tile	324	31 6
$\frac{1}{8}$ -in. thermoplastic tiles	20,709	10 0
2-in. granolithic	126	14 0
$\frac{3}{4}$ -in. asphalt (on balconies)	1,242	12 6

s d

Wall finishes

2 coat plaster generally. Cement dado to staircase. Wall tiling behind sanitary fittings. 3-in. timber skirting.

Ceiling finishes

Bonding plaster and finish $\frac{1}{4}$ in. thick.

Roof finishes

 $\frac{3}{4}$ -in. asphalt (BS988) on sheathing felt, fibreglass insulation and screed.

Area: 3,213 sq. ft. per block.

Decorations

Internal

External

Prime and 3 coats paint on woodwork and metal work generally, 2 coats distemper on walls and ceilings of flats, 2 coats of emulsion paint on walls and ceilings of staircases and halls. Externally, prime and 3 coats of paint generally.

Total of finishes	9	7
-------------------	---	---

SERVICES

External plumbing

4-in. cast-iron r.w.p. and balcony drainage units.

Hot and cold water installation

Copper pipes and fittings. Cold water to fittings off rising main.

Hot water from calorifiers.

Dry riser installation

4-in. galvanized steel pipes and standard fittings.

Sanitary fittings

Type of fitting and number per block: 32 baths, 32 sinks, 32 lavatory basins, 32 w.c.s (Birmingham standard types).

Internal waste disposal

Galvanized all-purpose, and anti-syphonage, copper waste and overflow pipes.

Heating and ventilation (boiler house and external heating ducts excluded)

Internal temperatures: 35 deg. rise in living rooms, 30 deg. rise in kitchens.

Air change: 1 $\frac{1}{2}$ per hour.

Boiler house chimney stack and external heating ducts

Gas installation

96 points per block.

Electrical installation

Type of point: Lighting Power Aerial, earth, TV
No. of each: 307 153 32

Lifts

One electric 8-person passenger lift per block.
100 ft. per minute.

Total of services	18	0 $\frac{1}{2}$
-------------------	----	-----------------

Drainage excluded.

Refuse ducts

Glazed stoneware surrounded with concrete, with iron hoppers and standard refuse bins.

building illustrated

Block C, the most centrally placed of the five blocks, carries the flue from the adjacent boiler house which provides central heating for the whole scheme. These are shown above; the boiler house is situated in a semi-basement at the corner of the retained "plateau" of Block C. Although the general aesthetic derived from the detailing at this corner may not be inappropriate for the boiler house, it is unfortunate that the same rather crude effect should have been achieved in the plant rooms on the roofs of the flats, since these are seen from a considerable distance.

The staircase shafts, seen left, at night, are ingeniously planned on the "scissors" principle, giving alternative fire escape routes within the area normally required for a single stair. The stair flights were precast and dropped into place by the climbing tower crane which was one of the main features of the site organization.

Although the structural grid has a regular column spacing, the flats are planned in such a way that free-standing columns are avoided in all rooms except the living rooms of the south-facing flats. Here, below, there is one column a short distance from the wall, the space between being filled with open shelves. It is interesting to see such shelves, normally associated in modern interiors with trailing plants, expensive pottery and casually-placed books, coming into their own in the Birmingham-made environment.

analysis

Balustrading

Wrought-iron balustrading to balconies and staircase window.

Sundries

Lightning conductors, stiffening bolts, larder slabs, etc.

Total per sq. ft. of floor area:

$$\frac{\pounds 64,944 \text{ (net cost per block excluding external works)}}{20,896 \text{ sq. ft. (net habitable area per block)}} = 62 \text{ } 2$$

SUMMARY

Net habitable floor area: 20,896 sq. ft. per block.
Total floor area (including balconies): 24,960 sq. ft.
Type of contract: Negotiated.
Tender date: September 6, 1955.
Work began: April 2, 1956.
Work finished: April, 1958.
Tender price of foundations, superstructure, installations, finishes: $\pounds 315,520$.
Boiler house chimney stack and external heating ducts: $\pounds 6,407$.
Abnormal foundations: $\pounds 2,794$.
Tender price of external works and ancillary buildings: $\pounds 31,283$.
Total: $\pounds 356,004$.

COST COMMENTS

We suggest the following reasons for the low cost of the structure, which is the outstanding point of interest in this scheme:

1. Considerable forward planning and collaboration with the structural concrete specialist from the inception of the scheme, produced a smooth running contact from all aspects. This a negotiating contractor would consider carefully in his pricing, being able to eliminate extra costs sometimes included in tendering for unknown and unforeseen problems.
 2. The large scope of the contract (five separate 8-storey blocks) would be a reasonable inducement to reduce costs by the use of special equipment and carefully planned site operations.
 3. Simplicity in layout, modular planning and uniform size columns and floor slabs throughout produce economies in use of form work by constant repetition which reduces labour cost and setting-out problems on site.
 4. The timing of operations on site to give follow-on trades continuity of work in all weathers would be an added advantage when negotiating prices for this section of the work.
 5. The exact repetition of low cost brick infill panels and plastered internal partitions on every floor with few complications of cutting and with straight forward plastering assists in producing low costs.
- It is perhaps interesting to compare the concrete frame elements in this scheme at 14s 9½d per sq. ft. with the flatted factory for the same authority (AJ, February 20) at 13s 9½d per sq. ft. The latter was also an 8-storey block, but with differing beam spans and without the concrete lift walls and balconies. The approach to these two schemes has been different, but the ultimate costs are similar overall.

SITE ORGANIZATION

Restricted access and storage facilities on a small and most abnormal site made pre-planning doubly necessary. Both

in and outgoing traffic had to use the same access despite difficulties of passing. The five blocks were within an area of 4½ acres, and within a distance of 400 yards there was a rise of some 75 ft. to the average ground floor level of the flats.

This meant excavating and carting away some 25,000 cubic yards of soil which took from the beginning of April to May 7th, 1956. Working to a programme of one floor lift per six working days, the structural contractor was able to complete the frames of all five blocks in 10½ months. The original intention was for the frame to each block to be completed before the general contractors' men moved in, but it was found that bricklaying could start when frames were five storeys high without affecting the engineers' policy of working on three blocks simultaneously. Scaffolding was in erection for 2½ blocks during the whole progress of construction and panels were left out at each floor level for the purpose of hoisting various trades' materials, all floors being loaded at various times, to the permitted weight, for various trades. Plumbing and electrical work was prefabricated prior to installation and the plasterers had easy access to their materials.

Shuttering and materials were handled by the climbing cranes, operated by remote control, in the lift shaft of each block, while staircases were provided with temporary wooden treads to provide a gangway for workpeople. During erection of the final block a five weeks' delay was caused by the discovery that a part of the building overlapped the site of the original mill pool, which necessitated piling to a depth of 17½ ft. over half the block in the worst possible weather conditions. In general, however, the progress of the contract went smoothly, the men working continuously under cover, on breeze filling, door frames, etc., whenever bad weather occurred.

The job involved a considerable amount of site works, especially to the boiler house, which has an excavation of 21 ft. below ground level, while retaining walls are higher and more extensive than on a normal site. Average number of men engaged by the general contractor on the site has been 60, apart from sub-contractors. Monthly site meetings with the architect in charge, together with the general foreman and staff of the various firms engaged have done much to ensure smooth and harmonious working throughout the contract.

CONTRACTORS

General contractor: Morris & Jacombs Ltd. *Sub-contractors:*
Concrete frame: The Trussed Concrete Steel Co. Ltd.
Bricks: Lunt Bros. *Precast concrete:* Tarmac Ltd. *Concrete blocks:* Wolverhampton Floor Co. Ltd. *Climbing tower cranes:* Pignon et Cie. *Doors:* F. FIRST-FLOOR BANK IN BIRMINGHAM

Comfort for customers and inconvenience for bank robbers are combined in the new branch Barclays Bank opened recently in Birmingham High Street, designed by their architect's department (staff architect, G. B. Drury; architect in charge, R. J. A. Gazzard; assistant, D. H. W. Griffith). The building is on the first floor, approached by moving stairs from the street (shown above,

right). It is air conditioned and centrally heated by a radiant panel ceiling, with spacious waiting room (above, left). The whole area is visible to the chief clerk, and cashiers never need turn from the counter, because a conveyor belt behind them carries away payments-in, and money is paid out of mobile tills (shown below). General contractors: Sir Robert McAlpine & Sons Ltd.

•RONUK• APPLIED FLOOR TREATMENTS

Type of floor	Initial Treatment		Maintenance
	New floors	Old floors	
Hardwood block and strip	A clean smooth surface to be prepared by machine sanding where necessary or rubbing with coarse grade steel wool where footmarks, etc. only to be removed. Any nail-heads should be punched below the surface and filled with suitable stopping. Two coats of Ronseal to be applied. When seal is hard (48 hours) two coats of Ronuk Liquid Wax to be applied with Ronuk Applicator and buffed when dry with weighted or electric polisher	Dirt and any old wax finish to be removed by machine sanding. Two coats of Ronseal to be applied as for new floors	Daily sweeping, preferably with Ronuk sweeping mop (gritty sweeping compounds to be avoided). Ronuk Liquid Wax to be applied as necessary (particularly in entrance areas etc.). Regular buffing to be carried out with weighted or electric polisher. <i>Note.</i> Where traffic is heavy, re-sealing may be required every 4 to 6 months. The area to be prepared for retouching by removing all wax with Ronuk Floor Cleaner and Grade 3 steel wool, proceeding as for old floors
Softwood	The surface to be prepared as for hardwood floors. It may then be tinted to the desired shade with Colron Wood Dye and left overnight. Two coats of Ronseal should be applied. When the seal is hard (48 hours) two coats of Ronuk Liquid Wax should be applied and the surface buffed with weighted or electric polisher	Where floor is in good condition it should be scrubbed, ensuring complete removal of any old wax or previous treatment. Otherwise it should be resurfaced by machine sanding, proceeding as for new floors	As for hardwood floors
Concrete	To be washed with Ronuk Floor Cleaner and water, allowed to dry and two coats of Ronseal applied	Where surface is satisfactory, to be treated as for new floors	Daily sweeping with Ronuk Sweeping Mop or damp mop
Quarry tiles Concrete tiles Terrazzo	The surface to be washed with Ronuk Floor Cleaner and water, rinsed thoroughly and allowed to dry. One sparing coat of Ronseal to be applied by cloth pad and allowed to harden	As for new floors	As for new floors. Where the floor has been treated with Ronseal, very occasional re-touching is necessary
Non-magnesite composition (Granwood)	These floors are normally sealed by the floor-laying contractor. Two coats of Ronuk Liquid Wax should be applied and, when dry, surface buffed with weighted or electric polisher	To be stripped with strong soda solution and rinsed thoroughly. Two coats of Ronseal to be applied and allowed to harden (48 hours). Two coats of Ronuk Liquid Wax to be applied and the surface to be buffed with weighted or electric polisher	Daily sweeping with Ronuk Sweeping Mop and periodic application of Ronuk Liquid Wax. Buffing regularly with weighted or electric polisher. To be retouched with Ronseal every 3 to 4 months in areas of heavy wear, treating as for old floors
Thermoplastic tiles and jointless floorings (Semastic, Accotile, Semtex, Marley, Pitchmastic, Colourfelt, Leytone)	The floor to be washed with Ronuk Floor Cleaner and warm water, and when dry liberal dressing of Ronuk Emulsion to be applied*	As for new floors. Obsolete marks to be removed by rubbing with fine steel wool	Daily sweeping with Ronuk Sweeping Mop or damp mop. Ronuk Emulsion to be applied every two weeks, after washing and removing obsolete marks by light application of steel wool*
Rubber	As for thermoplastic tiles*	As for thermoplastic tiles*	Washing with warm water and Ronuk Floor Cleaner as required, avoiding an excess of water and drying carefully. Abrasives should not be used. Ronuk Emulsion should be applied as necessary in entrance areas etc. and every 3 to 4 months elsewhere*
Linoleum	A clean surface to be ensured by washing with warm soapy water and allowing to dry. One coat of Ronseal to be sparingly applied by cloth pad. When dry, two coats of Ronuk Liquid Wax to be applied and the surface buffed with weighted or electric polisher	Dirt and old wax to be removed by washing using Ronuk Floor Cleaner where necessary, proceeding as for new floors	As for hardwood strip and block floors

* Paraffin, spirits, seals, acid or any polish other than Ronuk Emulsion or similar water waxes must not be used on any surfaces in the thermoplastic group or on rubber or asphalt.

38.H2 ·RONUK· APPLIED FLOOR TREATMENTS

Type of floor	Initial Treatment		Maintenance
	New floors	Old floors	
Cork	A clean surface to be ensured by washing with warm soapy water, rinsing and allowing to dry. In-grained dirt can be removed by machine sanding. One coat of Ronseal to be sparingly applied with a cloth. When dry a second coat to be applied by brush or Ronuk Applicator and similarly a third coat. After 48 hours, Ronuk Liquid Wax to be applied and the surface buffed with weighted polisher	Dirt and old wax to be removed by washing using Ronuk Floor Cleaner where necessary, rinsing thoroughly and allowing to dry, proceeding as for new floors	As for hardwood strip and block floors

This Sheet describes Ronuk floor treatments. The table on the faces gives recommendations for the initial treatment and maintenance of various types of floor surface whether or not they have been previously treated by these or other means. The notes below describe the products and give details of the advisory and contract services available to the architect.

Ronseal

Description: This is an oleo-resinous drying oil combined with other ingredients during manufacture. It penetrates porous surfaces and seals them completely against dirt and surface wear. It is transparent and can be applied to all types of timber, tiles, concrete, cork and porous linoleum. It is suitable for finishing timber that has been stained with Colron Wood Dye (described below) and is recommended by the manufacturers of chipboards and hardboards.

Coverage: The approximate coverage per gallon, allowing for two coats, is as follows:

On softwoods, 40 to 50 sq. yd.

On hardwoods, 50 to 60 sq. yd.

On linoleum, 80 to 100 sq. yd.

On concrete, chipboards, cork, 30 to 35 sq. yd.

Terrazzo, quarry tiles, etc., require one coat only, sparingly applied, and the coverage exceeds 120 sq. yd. per gallon.

Colron Wood Dye

Description: Colron is a penetrative and preservative wood colouring material which can be used on hardwood, softwood, hardboard and chipboard. It has a solvent base to give even penetration and rapid drying. Twelve colours are available: light oak, dark oak, black oak, fumed oak, mahogany, oak, brown oak, walnut, grey oak, weathered oak, medium brown, dark mahogany. A guide to the colours, and other information, is obtainable from the manufacturer and specimens of timber dyed to any standard shade are available on request.

Coverage: One coat only is required and the approximate coverage per gallon is as follows:

On softwoods, 60 to 70 sq. yd.

On hardwoods, 90 to 100 sq. yd.

On chipboards, 30 to 40 sq. yd.

Ronuk Waxes

Description: Ronuk Concentrated Wax is a specially-formulated treatment for initial finishing of all surfaces other than thermoplastic tiles, rubber in any form or asphalt. It will produce a good gloss on completely new flooring and is antiseptic and contains an anti-slip ingredient. Surfaces that have been initially treated with Ronuk Concentrated Wax can be maintained with Ronuk Liquid Wax or Ronuk Floor Dressing.

Coverage: The approximate coverage for Concentrated Wax is 15 to 20 sq. yd. per lb. and for Liquid, Wax and Floor Dressing, 500 to 550 sq. yd. per gallon.

Ronuk Emulsion

Description: This is a water-wax polish for the treatment of thermoplastic and p.v.c. tiles, all rubber surfaces and asphalt, which would be affected by the spirit solvents normally contained in polishes.

Coverage: Three coats are required and the approximate coverage per gallon (allowing for the three coats) is about 175 sq. yd.

Contract Services

The manufacturer maintains a staff of experienced operators who will carry out the re-surfacing of old floors, and all preliminary work and initial finishing of floors and other woodwork.

Further Information

In addition to the contract services described above the manufacturer has an advisory department available to answer questions and advise on technical problems dealing with floors and woodwork.

BRICKS | CLAY CELLULAR | GENERAL DATA

The Architects' Journal Library of Information Sheets 668. Editor: Cotterell Butler, A.R.I.B.A.

13.FI
13.FI

ISOMETRIC SKETCH SHOWING DIMENSIONS OF BRICK.

TYPICAL APPLICATION.

COMPARATIVE WEIGHTS OF SOLID AND CELLULAR FLETTON WALLS (wall height 10'-0")

13.F1 · PHORPRES · CELLULAR BRICKS

This Sheet describes Phorpres cellular bricks which provide a lightweight walling material for use in conjunction with steel or reinforced concrete. They are suitable for normal domestic two-storey construction. The drawings on the face of the Sheet show the design of the brick and a typical application. The graph shows the comparison between the weights of various thicknesses of walling in cellular bricks and in ordinary bricks, the former showing a considerable saving over the latter.

Types

Cellular bricks can be supplied in common bricks or keyed on one stretcher and one header for rendering, and in the full range of Phorpres facing bricks.

Sizes

Phorpres cellular bricks are manufactured to the sizes suggested in B.S.657, *Dimensions of Common Building Bricks*, namely:

8½ in. by 4½ in. by 2½ in. (type 2).

8½ in. by 4½ in. by 2½ in. (type 3).

Wall thicknesses comply with the requirements of the LCC Building Byelaws and with those of the MOHLG Model Byelaws, Series IV, Buildings.

Weights

The following table gives the average weights of dry brickwork built in 1 : 1 : 6 mortar as tested by the London Brick Company's Technical and Research Department.

Type of brick	Weight of brickwork in lb.					
	4½ in.		9 in.		13½ in.	
	Per cu. ft.	Per yd. super	Per cu. ft.	Per yd. super	Per cu. ft.	Per yd. super
2½-in. cellular	84	263	85	559	86	855
2½-in. common	99	311	100	655	100	999
2½-in. cellular	83	262	85	558	85	853
2½-in. common	99	311	100	655	100	1000

Crushing Strength

The average crushing strength of Phorpres cellular bricks from routine tests is 1500 lb./sq. in. determined on the gross area of the brick.

Strength of walls

The following is a summary of tests by the Building Research Station of the Department of Scientific and Industrial Research and the National Physical Laboratory.

Summary of strength tests on 4½-in. and 9-in. cellular and Phorpres fletton brick walls in 1 : 3 cement mortar.

	4½-in. wall, 9 ft. 0 in. high, 4 ft. 6 in. long		9-in. wall, 9 ft. 0 in. high, 4 ft. 6 in. long	
	Cellular F	Phorpres F	Cellular F	Phorpres F
	Tons	Tons	Tons	Tons
Crushing load, total	99.5	130	178	280
Crushing load, per ft. run	22.2	28.9	40	62
Load at first crack	75	62.5	110	192
Per ft. run	16.7	13.9	24.4	43
Modulus of elasticity	0.59 × 10 ⁶ lb./sq. in. to 40 tons	0.51 × 10 ⁶ lb./sq. in. to 40 tons	0.85 × 10 ⁶ lb./sq. in. to 50 tons	0.91 × 10 ⁶ lb./sq. in. to 50 tons

The strength of the half-brick cellular fletton wall is considered ample for all purposes where a half-brick wall is normally used in building construction. Tests carried out at the London Brick Company's laboratories on 9-in. by 9-in. by 3-ft. brick piers built with Phorpres cellular bricks in various mortars show that they can support a uniformly-distributed compressive stress of over 1000 lb./sq. in. or ten times the permissible stress suggested in B.S. C.P.111, *Structural Recommendations for*

Load-bearing Walls, for bricks of a crushing strength of 1500 lb./sq. in. A high proportion of bricks is used for housing, etc., where thickness is determined by factors other than strength. The requirements for the strength of lightweight blocks used as an alternative to bricks in housing is for a minimum of 400 lb./sq. in. (Model Byelaws) and the loading in domestic construction seldom exceeds ½ ton/sq. ft., so the safety factor is apparent.

Thermal Insulation

The thermal-insulating properties of cellular bricks are similar to those of normal brickwork. Recent tests at the London Brick Company's laboratories have shown the importance of exposure conditions on thermal transmittance and that it is not safe to base calculations of heat loss on artificial conditions or calculated heat value. For walls with north exposure the U value of 11-in. cavity walls built with two skins of cellular bricks is 0.30 B.t.u./ft.² hr. for one degree F difference of air temperature.

Sound Transmission

For homogeneous wall construction, it is accepted that resistance to airborne sound is proportional to the mass per unit area of the wall, that is, the heavier the wall the greater its sound resistance. The relation between weight and insulation is such that each time the weight per unit area is doubled, the insulation increases by approximately 5 decibels (the minimum change significant in practice).

A 9-in. wall built in cellular bricks plastered on both faces and weighing approximately 72 lb./sq. ft. has a sound reduction value of about 48 decibels (against sound from a source whose frequency is between 200 and 2000 cycles/second). A 9-in. wall built with normal flettons has a sound reduction value of 45 decibels (against sound from a similar source). The minimum difference that can be noted in practice is about 5 decibels, hence the loss in sound insulation compared with solid brick is negligible.

Moisture Penetration

Moisture penetrates any wall via the mortar joints, and therefore the degree of penetration is the same for cellular as for ordinary brick construction. 9-in. walls in either type are unacceptable for domestic applications, but an 11-in. cavity wall correctly built in Phorpres cellular bricks is completely impervious.

Durability

With regard to weathering, Building Research Station Digest No. 53 (April 1953), *Perforated Clay Bricks*, states:

limited laboratory evidence and practical experience suggest that there is little difference between the behaviour of a perforated brick and a solid brick of the same material made by the same process.

As with other forms of brickwork, constructional detailing particularly at the tops of free-standing walls, must conform to good building practice.

This Series of Sheets on bricks and blocks covers general data on, and applications of, common, facing, cellular and keyed bricks, hollow walling, partition and floor blocks.

FIREPLACE: HOUSE AT DROTTHINGHOLM, SWEDEN

Hans Borgstrom and Bengt Lindroos, architects (material supplied by John Whalley)

Too many freestanding fireplaces smoke and some will not allow a fire to be lit in them at all. Points to notice about this one are the use of a welded steel frame to accommodate the natural stone lining below and the asbestos-sheet panels above, the neat steel hearth, the damper and the use of a toughened sheet glass vertical sash to control the draught.

INSULATION IN FACTORIES

GOVERNMENT TAKE OVER BILL

FROM A POLITICAL CORRESPONDENT
Thermal Insulation (Industrial
Buildings) Bill, a private member's
measure introduced by the Conservative
M.P., Mr. Gerald Nabarro, is now
sponsored by the Government and is
likely to become law. The
Bill will provide that all new industrial
buildings equipped for space heating
must be insulated against loss of heat if
they are erected after 1958.

moved a new clause empowering the Minister to make regulations to restrict the use of certain materials.

It was said that the new clause arose from further consideration and consultation on the content and implications of the Bill. There had been strong representations from the Structural Insulation Association, and according to the new clause empowered the Minister to make regulations excluding the use of materials if they did not conform to the standards of resistance to the spread of flames and those regulations would specify the particular materials.

Plans deposited with the local authority which showed that restricted materials were being used in a building would not be accepted by that authority unless they also showed that the materials were to be used in such a fashion that would not increase the risk of fire breaking out or spreading. The standard of resistance could be that in the British Standards Specification 476 of 1953 which were well known to architects and

Extract from The Times

Thermalite-Ytong building blocks provide exceptional thermal insulation and are at the same time load bearing. They achieve a "U" value as low as that obtained by using specialised insulation lining materials but produce it as an integral part of the construction method.

There are numerous other advantages. They are light weight yet fully loadbearing, they are incombustible and provide exceptional fire resistance, are easily handled and quickly erected.

Competitive in cost to brick and concrete construction, use of Thermalite-Ytong provides a rapid and entirely efficient method of integral insulation with which no other construction method can compare.

Thermalite Ltd. is in building, too. An additional factory for the manufacture of Thermalite-Ytong is nearing completion. Sited near Birmingham it will provide a strategically placed production unit and speed delivery to your site.

All the facts and figures for Thermalite-Ytong are to be found in an illustrated brochure which also shows construction methods and other details of interest. We shall be pleased to send you a copy.

THERMALITE-YTONG

The DURABILITY of HARDWOOD FLOORS

More than 60 million people have trodden this floor at least once during the last six years. Wear during this period amounts to less than one-sixteenth of an inch. The life of the floor is about 50 years or more of at least sixty million people. No other type of floor can equal this for service, beauty and economy.

Hardwood floors last a lifetime

FLATS AND MAISONNETTES IN LAMBETH, LONDON, S.E.1

A new landmark in Royal Street, Lambeth, London, S.E.1, is this new block of nine-storey flats and maisonnettes, recently completed by Wates Ltd., who built them for St. Thomas's Hospital. Four months were knocked off the allotted building time as a result of collaboration at the pre-planning stage between builder, architect and consulting engineer. The architect is Leslie Creed; the engineer, Felix S. Samuely. Several new ideas for cutting building time were introduced by the site agent, Norman Wakefield, who introduced them after working for Wates' American organization. These flats are part of a rehousing scheme undertaken by St. Thomas's Hospital which will house 70 families, and will be the subject of a full-length feature in the *AJ* shortly.

Announcements

PROFESSIONAL

J. Arthur Miller, M.C.D., A.R.I.B.A., B.Arch., has transferred his office to Burnside, Burghfield Hatch, Reading (telephone Burghfield Common 272). He will continue to be available for interview by appointment at 21a, Kings Road, Reading.

As from March 25, the practices of William H. Laithwaite and Joseph Bak, consulting engineers, formerly of 24, Baker Street, W.1, will be merged in partnership and continue at the above address.

J. W. Stockings, F.R.I.C.S., Chartered Quantity Surveyor, of London House, London Street, Norwich and Bridge Street, Thetford, has taken into partnership P. P. Clarke, A.R.I.C.S. The style of the firm has been changed to Messrs. Jack W. Stockings & Clarke, Chartered Quantity Surveyors.

TRADE

On March 31, Cecil Martin resigned his appointment as Managing Director of Tarmac Limited, and his Directorships of Tarmac (South Wales) Limited, Tarmac (Scunthorpe) Limited, Plascom (1909) Limited, Sheepbridge Macadams Limited, Shotton Slag Limited, and the Five Towns Macadam Co. Ltd. He will continue to act as a director of Tarmac Limited. Tarmac also announce the resignation of R. G. Corbett as Secretary of the Company on March 31; he will be succeeded by J. M. Beckett, M.A.

British Insulated Callender's Cables Ltd. announce that from April 7 the address of their Dundee branch office will be 2, South Ward Road, Dundee (telephone: 5926/7).

The Simplex Electric Co. Ltd., manufacturers of the Creda range of heavy duty cooking equipment, have fitted out a mobile demonstration coach which will be taken to the caterer's door, where he can not only see the equipment, but see it demonstrated or try it out for himself. The range of equipment covers all the main items of cooking apparatus, Chef's range, heavy duty ranges, light duty ranges, hotcupboards, Salamander-grillers, rotary toasters, bulk water-boilers, etc.

The new telephone number of Sissons Brothers & Co. Ltd. is Hull 41431.

F. Hills & Sons Ltd., Norton Road, Stockton-on-Tees, have appointed a further distributor of Duramel in the London and Home Counties area who will be maintaining ample stocks of Duramel to meet the continued demand for this product. The new distributor is the Southall Timber Co. Ltd., Norwood Wharf, Southall, Middlesex.

The Parks Department of the LCC has now moved to Room 493, The County Hall, Westminster Bridge, S.E.1.

Correction

In our issue of March 6, on page 374, Messrs. Bair & Tatlock (London) Ltd. should have read Messrs. Baird & Tatlock (London) Ltd.

ARCHITECTS' OFFICES TRANSFORMED

68% FLOOR SPACE SAVED by New Lateral Filing System

In your office, you need constant reference to a multitude of plans, drawings, bills of quantity, contracts, letters, etc.

These must be housed somewhere; yet the best of your office space must not be cluttered by filing.

The new Lateral Filing System gets to the very core of this problem. With it, you can put your files almost anywhere (Lateral is the 'thin man' of filing); yet it *actually* occupies 68 per cent. less floor space.

That odd corner or unused passageway (too wide to be wasted, too narrow for orthodox filing) fits it like a glove.

How? Lateral Filing embodies two revolutionary space-saving principles:—

1. Utilisation of height.
2. Abolition of filing drawers.

Special tall cabinets (similar to Library bookshelf units) are used. Files go in sideways—just like books—but are suspended from a single rail for really quick handling, convenient grouping and freedom from wear.

Results:—

- (a) Instant finding of any file by means of permanently visible title strips (no sorting through drawers).
- (b) Great compactness, allowing one clerk to handle up to 10,000 files with ease.
- (c) Congestion relieved by building *up* instead of *out*.

Briefly then, Shannoblic Lateral Filing means this to the Architect: considerable relief from high office costs; filing space coverage condensed to less than half—*plus* a ready-made control centre with coloured file signals 'flashing' contact progress, cost levels, approval dates, and so on.

A brochure has been prepared which will explain to you exactly how urgent problems of office congestion may be solved. May we send you a copy? Just write 'Shannoblic Lateral' on your letterheading and post to—

HISTORY OF ARCHITECTURE

THEN — *Through hundreds of years, buildings, whether Greek, Roman, Gothic, Elizabethan or Renaissance in style, have stood the test of time by the very massiveness of their construction. These monolithic structures, many of them architectural gems, are still stable and free from cracks due to the ingenuity of the builders and the sheer weight of the fabric itself.*

NOW —

EXPANDITE

JOINT-FILLERS & SEALERS FOR CONSTRUCTIONAL "JOINTS-THAT-MOVE"

With the inevitable march of time, the search for new materials and methods and the increasing shortage of labour and cost of construction, modern buildings are much less massive and employ lighter components than was previously thought possible.

This change in building techniques has not produced less stable structures, but has raised new problems with regard to movement of the fabric, which previously were unknown. To-day the Architect or Engineer is well served by jointing materials which are 'elastic' and which permit functional joints to be incorporated in a structure with no fear of cracks or bulges occurring.

OTHER EXPANDITE PRODUCTS INCLUDE

SEELASTIK* For sealing cracks, and joints in walls and round doors and windows.

SEEL-A-STRIP The strip sealer for joints which are under continuous pressure.

MULSEAL* For waterproofing roofs, walls, gutters and floor slabs.

WATERSTOPS In rubber or PVC for all types of joints where water must be excluded.

ASBESTUMEN* For sealing joints in roofs, gutters, down pipes and around skylights.

AEROLASTIC* A fuel resistant sealer for floors in garages, factories and for airfields.

PLASTIJUNT For all vertical joints in walls in buildings and water retaining structures.

ASSOCIATES AND DISTRIBUTORS THROUGHOUT THE WORLD

at one time

the 2" plain heavy duty slab was the only wood wool roofing slab available. To-day this slab has been almost superseded by the many new types which Thermacoust Ltd., have evolved by constant research and development.

Stage 1 of this evolution was to fix steel channelling to the long sides of the slab which more than trebled the safe span. This slab is now referred to as 2" C.R.F. (or 2" channel reinforced).

Stage 2 was the incorporation of a pre-plastered surface during the manufacture of the slab which made it more attractive and better suited to special conditions. The new slab was called 2" C.P.P. (or 2" channel reinforced pre-plastered).

Stage 3 resulted from the need for a steel channel reinforced slab for use in conditions of abnormal to high humidity. This 3" Reb. Slab (3" rebated channel reinforced slab) when used with cork or ONAZOTE strip avoids condensation on the steel channels by preventing "cold bridge" effects.

Stage 4 was a natural step, the addition of a pre-plastered surface to the 3" Reb. Slab. The new slab was listed as 3" Reb. P.P. (3" rebated channel reinforced pre-plastered).

Stage 5 followed out of the frequent desirability to use a prefabricated roof unit suitable for "dry construction" and incorporating as many of the exclusive Thermacoust features as possible. The 3" Reb. slab was given a pre-screeded top surface and became known as the 3" Reb. P.S. slab.

All the above roofing slabs are available direct from Thermacoust Ltd. The range is constantly being expanded and new types will be announced as they are developed.

EFFICIENT CONVECTION HEATING SOFONO CONVECTOR FIRE

- ★ Simple installation and no maintenance
- ★ High thermal efficiency
- ★ Good convection
- ★ Accurate combustion control
- ★ Burns smokeless fuels
- ★ Abundant domestic hot water

The Sofono Convector Unit has a high overall efficiency of the order of 40% and can be supplied fitted with any model from the wide range of Sofono Overnight Burning fires. The unit, which can be installed in any tiled fireplace with standard 16" wide opening, has been chosen for many important Housing Schemes throughout Britain. Typical forms of installation of the Underfloor Air and Overfloor Air models are shown below.

The Sofono Convector Fire is Approved by Ministry of Power and is included in the List of Domestic Solid Fuel Appliances recommended to Local Authorities.

To Grange-Camelon Iron Co., Ltd., FALKIRK. Without obligation please send me full details of the Sofono Convector Fires.

FLOORINGS

SEAMLESS FLOORS
for every purpose...

WHATEVER the building, whatever the purpose... consult Surfex Flooring Co. Ltd., the specialist manufacturers and laying contractors.

Do you want the toughest, extra-heavy duty flooring, to resist shocks, blows, wet and dry abrasion, that will withstand heavy steel shod trucks and Tank traffic, non-slip, non-dusting waterproof?

Then you need

SURFEX-SORODUR

Do you want a decorative industrial floor that will withstand heavy foot and truck traffic, non-slip, no dusting, grease and oil resisting? For offices, canteens, workshops. (The only satisfactory covering for over old TIMBER FLOORS.)

Then specify

INDUSTRIAL-VINYL-SURFEX

Do you want the perfect seamless flooring for inside and outside use in a wonderful range of colours? Suitable for factories, cafes, homes, canteens, laundries, dairies and wherever a smooth, steam, water and acid resistant surface is essential.

Then you need

COLORAZZO

Do you want the plastic flooring with the original and exclusive veined finish? The most economical surface for use in offices, home, etc.?

Then ask for

POLYFLEX-POLYVINYL

All these Surfex Floorings can be laid by your operators, or we will send an experienced Surfex team anywhere in G.B.

Translucent Sheeting

NOTES ON A MODERN ROOFING AND DECORATIVE MATERIAL

Resin-bonded fibreglass sheeting has special characteristics which render it of great interest to the architect and of great value to his client. It admits light without glare and is shatterproof, both of which properties render it the roofing material par excellence. It is manufactured in corrugations to nest with all standard opaque corrugated roofing sheets. Tinted fibreglass sheeting, both flat and corrugated, solves many problems where structural strength is required without sacrifice of decorative appearance; and many charming effects may be created by arranging for natural or artificial light behind it.

The manufacture of any material in the form of a "sandwich" presents its own peculiar difficulties and it must be attributed to this fact that no rigid standard specification of universal application has yet been evolved for resin-bonded translucent fibreglass sheeting. The architect will therefore naturally largely be guided in his choice of sheeting by the reputation of the manufacturer. In this respect the Cascelloid Division of the British Xylonite Company Limited stands high: it has for many years been recognised as a leader in plastics manufacture and research and it guarantees the reliability of the translucent sheeting which it manufactures under the name CASCALITE.

The following brief notes on the properties and characteristics of Cascalite serve to indicate standards to which, it is suggested, all such material used for roofing should conform.

Cascalite structural sheeting has a load strength of 100 lb per square foot. Flexural strength averages 25,000 lb per square inch, tensile 12,500 lb per square inch (it should be noted that thickness of the sheet is not a reliable criterion of quality.)

After 1,000 hours in a standard accelerated weather testing machine—equal to five years' normal outdoor exposure—Cascalite sheets show little change and indeed they are unaffected by climate, whether tropical or arctic.

When considering fibreglass translucent roofing material it is important to discover whether the percentage of light transmission claimed for it is by comparison with glass or with air. The untinted Cascalite transmits 85 per cent of the light transmitted through plain glass and its heat loss coefficient is actually better than that of glass. (Light transmission may be seriously reduced by poor manufacturing techniques which may not reveal themselves until after weathering has taken place.)

To sum up, Cascalite glare-free shatterproof translucent sheeting nests with all standard corrugated sheets, weight-for-weight is stronger than steel, is unaffected by moisture or temperature, is immune to the corrosive action of acids, alkalis, and normal industrial fumes, and is virtually indestructible.

Architects seeking further information about

Cascalite

are cordially invited to write or telephone to

just published

The Design and Practice of Joinery

by John Eastwick-Field, B.A.RCH.(HONS), A.R.I.B.A. and John Stillman, DIPL.LONDON, A.R.I.B.A.

Foreword by Robert H. Matthew, C.B.E., M.A., F.R.I.B.A.

THIS, THE ONLY AUTHORITATIVE, UP-TO-DATE BOOK about present-day joinery practice, is published at the recommendation of the Text and Reference Books Committee of the Royal Institute of British Architects and is intended primarily for architects, assistants and students of architecture. But, because its scope is broad and because it is concerned with the basic principles of design and practice, it will also be of great interest and value to the members of kindred professions, especially quantity surveyors, and to all who are engaged in the handling and conversion of timber, including joinery manufacturers, joiners, cabinet makers, carpenters, shop fitters and other woodworkers.

The text includes chapters on the timber yard; moisture movement in timber; an analysis of construction; the design and machining of sections; and of joints; specification and practice. Among its useful appendices are a selection of timbers suitable for joinery, set out in tabular form, a complete list of British Standard Specifications and Codes of Practice applicable to joinery, and a general bibliography. It is comprehensively illustrated: there are nearly 90 photographs and over 200 specially drawn line illustrations—more than 80 in the chapter on joints. And there is a good index.

Size 9½" by 7½". 224 pages, over 290 illustrations in halftone and line, including 200 line drawings specially drawn by Robert Maguire. Price 42s. net, postage 1s. 9d.

THE ARCHITECTURAL PRESS, 9-13 Queen Anne's Gate, London, S.W.1.

Good News travels fast!

These 3 ft. pipes made by Doulton save 880 joints in a mile run...

4" and 6" diameter Doulton pipes are now available in 3-feet lengths at the same cost per foot as smaller pipes! They save 880 joints in a mile run.

This news has been enthusiastically welcomed by contractors. When using 3-foot lengths they find the saving of labour and jointing materials is considerable. They know, moreover, that the corrosion- and abrasion-resisting qualities of Doulton Salt-Glazed Stoneware have been proved beyond all doubt over a period of 110 years. And where the health of the community is concerned, confidence in drainage and sewerage materials is a first consideration.

Felix
Walter
F.R.I.B.A.

THE FIRST comprehensive illustrated book on the subject of the conversion and improvement of all kinds of house property. It is designed to help architects, local housing authorities and private owners. Mr. Walter thoroughly illustrates and describes a large variety of successful conversions, from luxury Belgravia terrace houses to remote rural cottages, giving full details of building costs, rent and rates for most of them. And specialist authors contribute chapters on law, finance, management and town planning.

The modern architectural model

by T. W. Hendrick F.R.S.A.

Foreword by Hugh Casson

THIS FASCINATING HANDBOOK is the first to deal in full detail with every aspect of the construction of models of modern buildings. The author, himself an expert and experienced model maker, deals with models of all scales, sizes and types, mobile and static, realistic or diagrammatic, as well as their surrounding landscape and impedimenta; careful instructions are given on the construction of every conceivable detail from pylons to potted plants, from glass domes to door handles. The author describes the proper uses and the virtues and vices of traditional materials, plywood, card, glue, and the many new synthetic materials now available, not even forgetting such unorthodox things as dental plaster or cherry sticks.

Architects are increasingly using models to express their projects in a three-dimensional form, and this book will be of invaluable help both to them, their assistants, students, model makers professional and amateur, and all who are intrigued by buildings in miniature.

The book is illustrated with line diagrams, and photographs of a selection of models of all types of buildings by well-known contemporary architects.

Size 8½ in. by 5½ in. 144 pages including over 50 halftone and line illustrations 16s. net, postage 1s. 0d.

Are you using Group Specifications

FOR
PLUMBERS
BRASSWORK?

This handy Manual published by Peglers introduces a new system of Group Specifications. It saves time and trouble by grouping all the fittings for a particular unit, such as a sink or bath, under a *single key number*, thus eliminating the tedious detail work involved in itemised specifications. To simplify your specification work still further, fittings are clearly illustrated and arranged in various groups. An important advantage of this

system is that the fittings in each group are similar in design and of uniform high quality.

Lady Allen of Hurtwood, F.I.L.A. and Susan Jellicoe

The new small garden

THIS IS A PRACTICAL book in which, with over 130 photographs and plans, the authors illustrate and describe an expertly made selection of successful and charming small gardens. Most of them have been constructed at small cost; all are designed to provide the maximum of peace and relaxation for a minimum of hard work. The plans have been worked out to meet a wide variety of site problems and conditions and the examples include long narrow gardens, children's gardens, a tree garden, a water garden, a roof garden, a scree garden. . . Full details of the materials and plants used in many of the gardens are given; and there is a useful 'How to find out' appendix.

Size 8½ in. by 5½ in. 128 pages with over 100 half-tones and 25 line blocks.
Price 15s. net, postage 1s. 2d.

THE ARCHITECTURAL PRESS 9-13 Queen Anne's Gate Westminster S.W.1.

Jupiter

**Metal Angle Bead
protects
Plaster Corners**

More and more architects now rely on JUPITER Metal Angle Bead to protect window reveals, lintels and chimney breasts.

Easy to fix, it simply keys in with the rendercoat: there's no shrinkage; and it gives permanent protection against unsightly, chipped plaster corners.
