Another contract

for BOOTH
STEEL DOORS

These large, electrically operated, steel doors were fabricated and fitted by BOOTH for Messrs. William Denny & Bros. Ltd. of Dumbarton. The opening is 47 ft. 3 in. wide and 44 ft. high.
Architects: Babtie, Shaw & Morton, Glasgow.

BOOTH have the facilities for fabricating and fitting all kinds of steel doors and rolling shutters—weatherproof and fireproof—for warehouses, factories, stores, transport depots and any other buildings which may have large or unusual openings.

Problem: **FUMES**

Solution: **COLT Ventilation**

Place: **ARTHUR GUINNESS SON & CO**
Pomona Docks, Manchester Region.

Exhaust gases from fork lift trucks and lorries were once a major problem in this storage shed. Colt experts were called in to make a scientific analysis and on their recommendation a series of Colt S.R.C./3080 High Duty Extract Ventilators was installed. Fumes no longer bother anyone.

In providing a permanent solution to this ventilation problem Colt have added yet another chapter to their record of success—success which has brought repeat orders from many world-famous concerns.

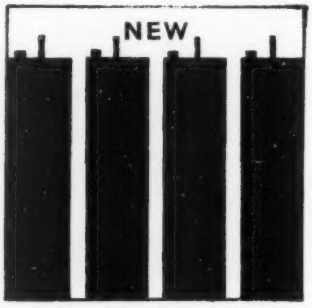
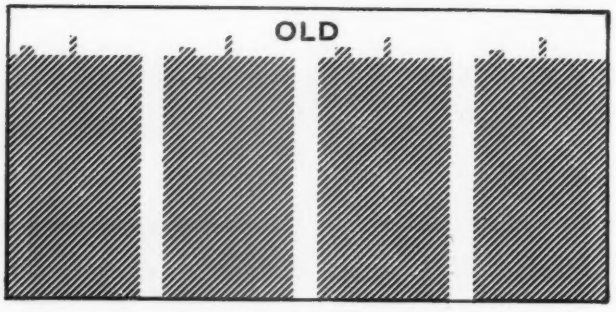
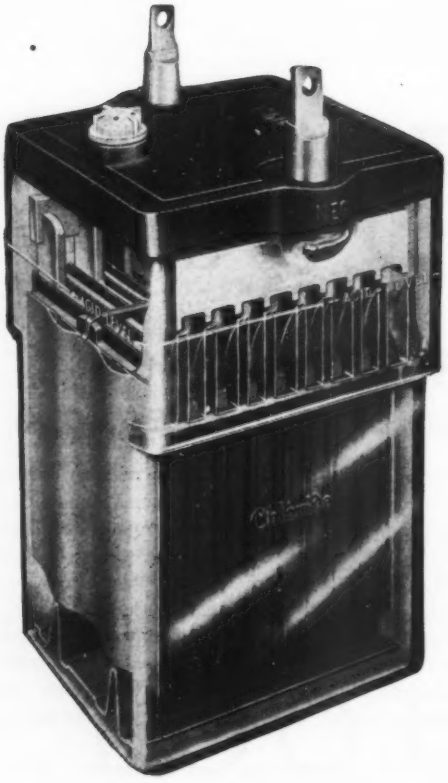
★ *A new and important advance by Chloride Batteries Ltd*

Stand-by power in half the space→



from the new CHLORIDE stationary cell





This new cell is specially designed for standby duties entailing discharge rates between, say, the 3-hour and the very high rates demanded for switch-closing purposes. With its Plante positive and pasted negative plates, Porvic microporous separators and many other improvements in material and in design, this light, robust cell will perform its duties with greater efficiency, with complete reliability and with a saving in battery space of approximately 50%. It is ideal for trickle-charge operation and has all the remarkable length of life associated with the Plante type of construction.

The field in which the new cell is designed to replace current Plante types is a very wide one. Emergency lighting*, switch operation and emergency supply in hospitals, theatres, cinemas and other public buildings, both nuclear and conventional power stations, all rely on trickle-charged batteries. In Great Britain today such batteries occupy millions of cubic feet of valuable space. The new Chloride cell could free almost half of it.

* *The new cell will from now onwards be fitted in all Keepalite units —the Chloride Company's automatic emergency lighting system.*

MORE COLD FACTS

Shops and Flats, The Quadrant, St. Albans. Designed and constructed by the T. F. Nash group of companies

Throughout the winter of 1958-59 repeated cycles of freezing and thawing occurred during the construction of this shopping centre, the lowest recorded temperature being 24 deg. F., falling at night to 18 deg. F.

Despite the freezing weather experienced, the Contractors with the aid of FEBSPEED PLUS CEMENT FROSTPROOFER were able to continue erection work without a break right through the winter months.

That FEBSPEED PLUS is the most efficient cement frostproofer available today is confirmed by the fact that year after year the T. F. Nash Group of Companies exclusively use FEBSPEED PLUS on construction work when the temperature falls below freezing point.

MODERN PRODUCTION METHODS SPEED BUILDING DEVELOPMENT

The Arcon system of construction simplifies planning, eliminates delays and enables erection to proceed more efficiently and faster than by other means. This step forward is achieved through the use of standardized major structural components of the highest quality manufactured by modern "assembly line" techniques, and the development of speedy erection methods on site. The wide Arcon range permits full expression of functional or aesthetic requirements. Arcon has simplified the construction of over 500 industrial buildings of many types in the U.K. and has proved equally successful in 105 countries overseas. We welcome an opportunity of showing how Arcon construction can help the most discerning client and his consultant at home and abroad through a full planning and erection service.

Seaboard Fir Plywood *in action!*

The walls of this modern Brighton home were pre-fabricated with Canadian fir plywood and erected in *one day.* Fir plywood sheathing not only speeded the job—it made this home permanently strong and rigid . . . highly resistant to wind-wracking or settling. Big, split-proof panels of Seaboard fir plywood can do the work of heavier, more cumbersome materials. Perhaps they can save time—and money—for you too? Investigate today.

CUT COSTS . . . SPEED CONSTRUCTION

with Compression Seals of DU PONT Neoprene

Pre-formed compression seals made of Du Pont Neoprene used for the curtain wall system in New York's International Airport, Idlewild, (above) were easy to install. Seals are effective . . . economical and far outlast conventional glazing compounds. They ensure a weatherproof, trouble-free seal that won't crack, dry out, become hard, soft, or "set" and lose sealing pressure. Sketch shows sealing method architects followed. Neoprene gaskets resist sunlight, oxygen and ozone. They stand up against exposure to the elements, and Neoprene's long service record in other products indicates they will provide dependable protection for many years. The simplicity of installing neoprene gaskets for curtain walls, helps solve the problem of sealing glass or panels into frames at minimum cost. No special skills are required to install them right on the job and there is little risk of careless workmanship producing a faulty seal. For more information on compression seals of Neoprene, see your Du Pont distributor, or send the coupon below for booklet, "Neoprene Gaskets for Curtain Walls", describing various installations.

TAS/BK.29

To be more accurate, in the case of this large block of flats, more than one jointing problem was solved by using Expandite 'Seelastik'—an all-purpose flexible sealing compound. It was used for sealing expansion joints as well as for pointing joints around windows and doors.

In all these applications, 'Seelastik' was chosen for both its durability and flexibility: it allows for the expansion and contraction of brickwork, concrete and metal without breaking down, thus preventing the ingress of rain, damp and draughts. 'Seelastik' is the ideal compound where, due to climatic variations, shrinkage, subsidence or mechanical vibration, movement is likely to occur.

For every specialised requirement in sealing and joint-filling Expandite can provide a product that will solve the specific problem. The Expandite Technical Service Department is ready not only to recommend to Architects, Builders and Civil Engineers on how best to use the many Expandite products that are available, but also to offer advice — without any obligation — on any problem concerning 'joints-that-move'.

PLASTAWELD BONDING

100's

OF SQUARE YARDS 'KEYED' EVERY DAY!

Over 100 sq. yards can be covered with a gallon can of PLASTAWELD, the Permanent Bond for gypsum plasters —the 'key' that goes on straight from the tin. And that's one reason why more architects are specifying PLASTAWELD. Another reason — PLASTAWELD slices labour costs.

Ideal for browning backing as well as skimming coats, PLASTAWELD Permanent Bonding Fluid is specially suitable for bricks, smooth shuttered concrete, tiles and even asbestos. Architects on major projects everywhere always specify PLASTAWELD, for Hospitals, Factories, Schools, Military and Ministry of Works contracts. Specify PLASTAWELD for all your work, too.

MANGER'S PLASTAWELD puts an end to hours of expensive labour

NO stippling! NO blinding with sand!
NO hacking! NO noise, dust or dirt!

Apply straight from the can

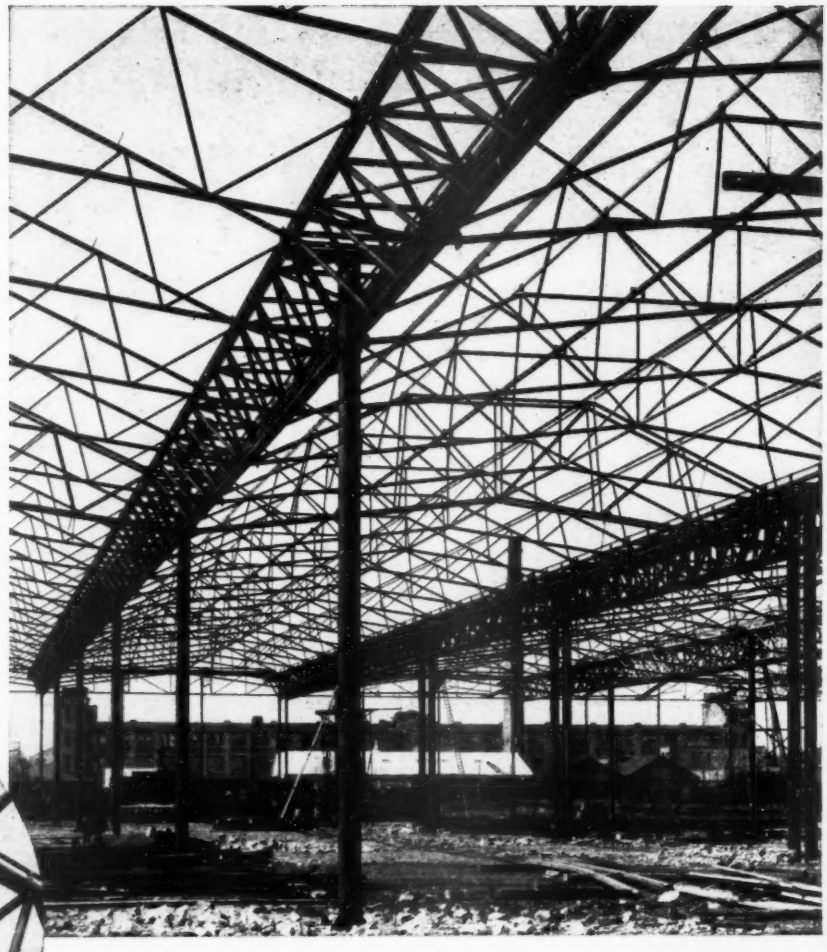
Tubewrights' Structures for economy and ease of erection



Tubewrights' welded tubular steel structures can be quickly erected and show a substantial saving in first cost, especially when of a standard design. They give a high strength/weight ratio and can be adapted for many industrial requirements.

The Harris Lebus furniture warehouse at Tottenham —with an area of nearly a quarter of a million square feet—is a tubewright structure. The Architects were Messrs. Clifford Tee & Gale and the Consulting Engineers were Thomas Bedford & Partners.

Top: General view of trusses and triangular girders of the tubular steel roof work.

Centre: Connection of roof trusses and triangular girders to column.

Below: An exterior view of the warehouse.

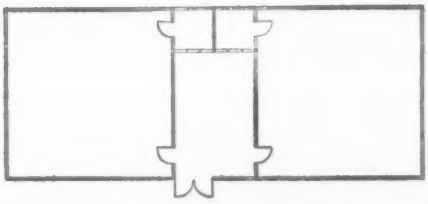
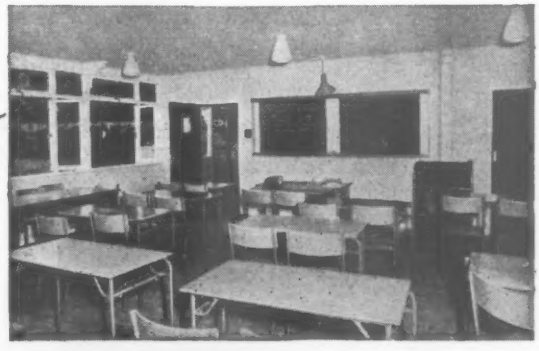
SPECIFICATION
A timber building to form two classrooms, each 24' x 24'. A store room for each classroom and a cloak bay to house 80 coat pegs. A timber floor and flat ceiling providing space for electric lighting. The building to be based on a panel unit, capable of being dismantled and removed to another site in approximately two years' time. Erection to be carried out by supplier on a prepared foundation.



FAIRFORD FARMOR'S SECONDARY MODERN SCHOOL near Cirencester, Glos.



Photographs by courtesy of the County Architect, Gloucestershire County Council.

Thorns' Contemporary Design, which conforms to Ministry of Education recommendations for school buildings, was eminently adaptable for this requirement. The consequent saving in time and cost was substantial. A trained THORNS' team was ready to start erection as soon as the foundations were completed.

The size agreed upon was 60ft. × 24ft. × 8ft. 6in. eaves. Walls were clad with vertical tongued and grooved boarding of Western Red Cedar with building paper behind, and lining of hardboard and insulation board. Partitions, similarly lined, were fitted to plan. The floor was constructed of tongued and grooved boards on joists, with sleeper plates. Rain-water goods were included in the contract.

THORNS

THORNS' prefabricated sections, as used at Fairford Farmor's School, are available on a 6ft. multiple basis.

All or any part of the construction work is undertaken by THORNS, at the client's request.
Catalogue of designs and prices on request.
Ask THORNS to quote for your own job.

SADIA gives you

more time to play with

From whatever angle you look at it, hot water by Sadia is the simplest, most economical system. To the architect, it means far easier planning and installation. No provision has to be made for flues, or boilers, or fuel stores. Pipe work is reduced to a minimum. And there's a standard Sadia model to suit almost every hot water need — from the smallest 2·2-gallon sink units to giant 120-gallon industrial models. To the client, hot water by Sadia means no dirt, no work, no maintenance, greater reliability and greater economy. Sadia water heaters are completely automatic and built to the most exacting specifications — many installed over 25 years ago still give perfect service.

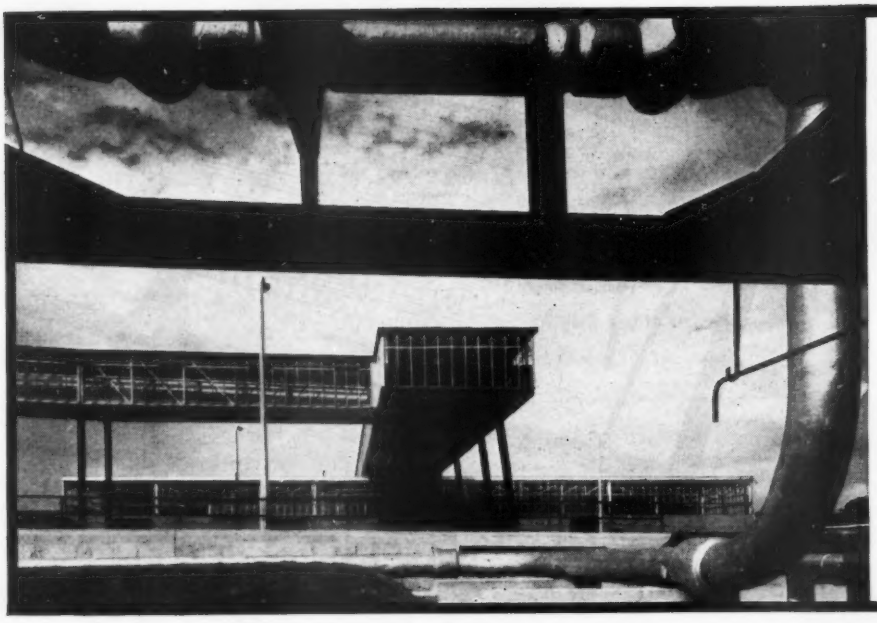
patent glazing is like windows only BIGGER and often it's IN THE ROOF and it doesn't have PUTTY



The new Heinz factory at Wigan is the largest factory to be built in Britain since the war. Shown here is the ancillary can-factory, clad in Williams & Williams "Aluminex" vertical patent glazing. The continuous opening lights are gear-operated to give critical control of ventilation.

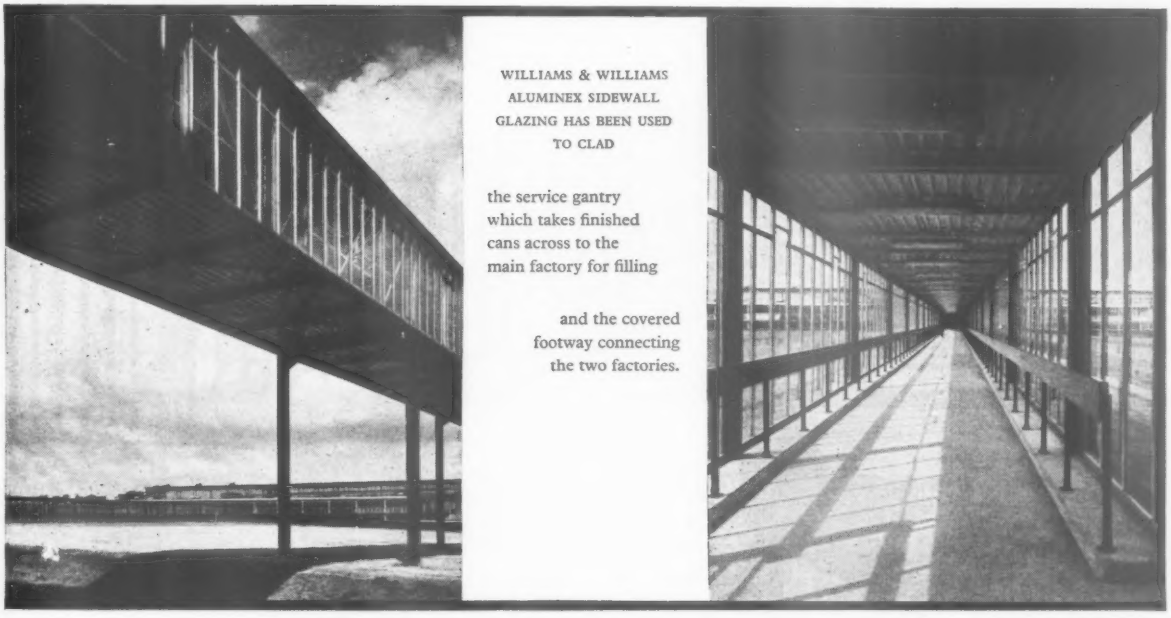
Architects:
J. Douglass Mathews and Partners, London in association with Skidmore, Owings and Merrill, New York.

The new Heinz factory is turning depressed Wigan into a boom area. By the time it is in full production it will be employing some 3,000 local people and taking up a good deal of the local agricultural produce, which is both abundant and high in quality.

The 127-acre site has a gradient of 1 in 40 which has been exploited to give the factory two working levels—both accessible to lorries.

Manufacture starts on the upper level with unloading, storage, preparation and cooking. Products are then gravity fed to the lower level for can filling, sterilization, packing, warehousing and finally dispatch.

The presence of old coal mines underneath the site meant careful positioning of the component buildings. The can factory is therefore at some distance from the food production unit



WILLIAMS & WILLIAMS ALUMINEX SIDEWALL GLAZING HAS BEEN USED TO CLAD

the service gantry which takes finished cans across to the main factory for filling

and the covered footway connecting the two factories.

and is linked to it by a service gantry which feeds the finished cans into the appropriate stage of production process.

Heard the news from WEYROC?

As a result of increased production from new automatic plant...

WEYROC has always had the reputation of being *the board you can trust*—to do so many jobs, so well. Now, new developments put WEYROC even further ahead as the *board of choice* for the Building and allied Trades.

Blue Label WEYROC has been discontinued and in its place comes a new, improved form of WEYROC... in quantities never possible before. This new, improved WEYROC is lightweight, strong, stable and durable, with smooth-sanded moisture-resistant surfaces for easier working. In short, a very much more *precise* board than before. As such, it has marked advantages for almost every job in building* which calls for flat-form timber. This new WEYROC is available...

in a choice of boards.

weyroc '34'
layer construction board
8′ x 4′ boards

weyroc '38'
graded density board
12′, 8′ and 4′ x 5′8″ boards

SEE US AT THE BUILDING EXHIBITION
NOV. 18—DEC. 2
Stand Nos.
572 & 574
Grand Hall Gallery
OLYMPIA

Both boards produced in ½″, ⅝″ and ¾″ thicknesses nominal and cost between 1/1¼d. and 1/6d. per sq. ft. (according to thickness).

Although these Boards are almost identical in strength characteristics and surface properties, we recommend WEYROC '34' particularly for the Building Trades. This is because it is available in the standard building board size and because it has a slightly higher impact resistance.

* N.B. *These Boards are not suitable for suspended flooring.*
As Blue Label WEYROC has now been discontinued, this means that there is at present no WEYROC board for flooring. However, it is our intention to produce a new, special flooring grade in the very near future.

Unique! Versatile! Economical!

that's STRAMIT 'MOVAFLUSH'

...THE NEW EASY-TO-ERECT PARTITION

Just consider the outstanding advantages! Stramit 'Movaflush' Partitions are erected speedily and easily. They have remarkable sound-deadening properties and afford excellent thermal insulation, as well as a high degree of fire resistance. They also have an attractive flush finish (no unsightly cover-fillets) and offer an exceptionally good surface for decoration. What's more, Stramit 'Movaflush' Partitions are of completely dry construction and are available in a wide range of sizes. They're rigid, durable and de-mountable. And for all this, they're surprisingly low in price.

TOMO double-glazing at London Airport

We think you'll agree that the appearance of these attractive offices at London Airport is enhanced by their TOMO double-glazed WINDOWS. But that's only a small part of the story. TOMO double-glazing also offers excellent thermal-efficiency values, remarkable sound-reduction properties, finely-controlled ventilation and total indoor window-cleaning.

On the subject of thermal efficiency, we should like to refer you to the report of a recent B.R.S. test quoted on the right. It speaks volumes.

When you work within whistling distance of aircraft, sound reduction becomes a matter of vital importance. Here TOMO WINDOWS score heavily. The total reduction in sound level depends finally, of course, on the thickness of glass employed and the space between panes. Using 32-ounce glass spaced at 1½in., TOMO double-glazing gives a reduction of approximately 40 decibels and will, we hope, save Shell-Mex and Esso personnel not a few headaches in the future.

One last point, TOMO double-glazed WINDOWS are suitable for inward or outward opening and can be top-hung, bottom-hung, side-hung or pivot-hung. Any further information you may require will be gladly supplied.

Administrative and operations offices for aviation fuel supplies at London Airport, half of which are occupied by Shell-Mex & B.P. Ltd. and the other by Esso Petroleum Co. Ltd. Architect: Frederick Gibberd, C.B.E., F.R.I.B.A., M.T.P.I.

★ ★

BUILDING RESEARCH STATION TESTS

When a standard-production TOMO WINDOW Wall-Unit (8ft. by 8ft.) was tested at the Building Research Station, Garston, the mean thermal transmittance of the complete unit was found to be 0·31 B.Th.U./sq.ft./h./°F. This is equal to the thermal transmittance of a traditional 11in. cavity brick wall! This impressive result was further improved to 0·29 when the TOMO pleated blinds, fitted between the panes, were lowered.

The U-value of the window-area only was found to be 0·38 which, with TOMO pleated blinds down, became 0·35. At 0·38, TOMO double-glazed WINDOWS are substantially (29%) better than the U-value of 0·47 quoted for conventional double windows in the I.H.V.E. Guide to Current Practice, 1955.

Now! Redfyre gives you

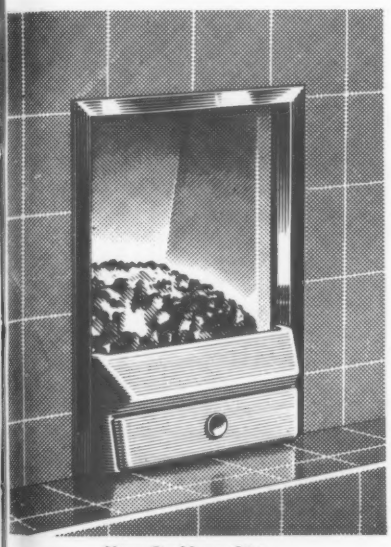
The new Redfyre Convector

A superb new open convector fire which gives two-way warmth, by radiation and convection. An adjustable throat restrictor increases efficiency still further, giving far more comfort from far less fuel. It burns a wide range of fuels and is easy to install in almost any fireplace opening—no fire back is necessary. Suitable for rooms up to 2,000 cu. ft. An Approved Appliance.

low-cost heating with *top-designer looks*

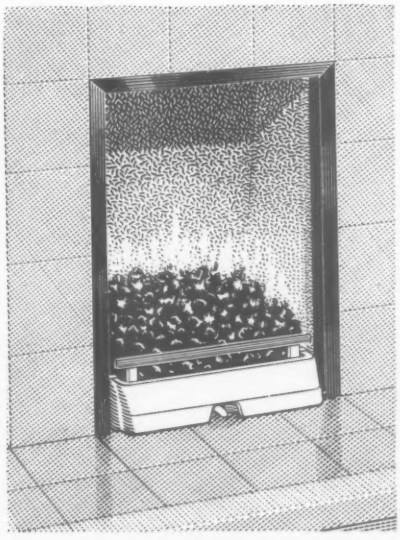
Redfyre—whose famous Bacboilers put them years ahead in low-cost heating—now take the lead in tackling a new problem: matching really low cost with the best modern design. Styled to merge successfully with any modern room scheme, these new Redfyres are equally suitable for modernising old property or for new buildings. And as you'd expect from Redfyre, the whole range is very practical, very economical, and remarkably low in initial cost.

Write for the REDFYRE HANDBOOK —a handy folder containing full specification sheets of all Redfyre products. The Redfyre mailing service will keep your handbook up to date *automatically*.



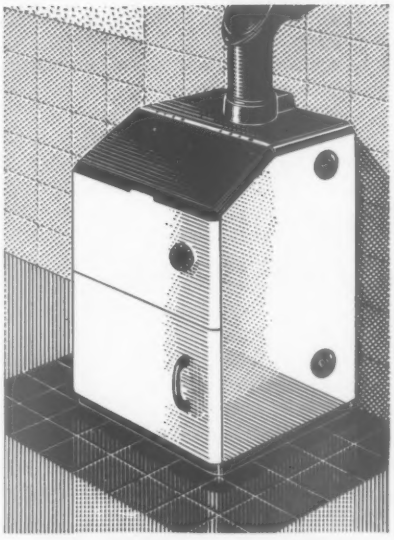
New Redfyre 60*

A controlled-burning fire with exceptionally clean modern lines. It's easy to install, and burns any solid fuel, efficiently and very economically. Suitable for rooms up to 1,750 cu. ft. and for use with standard size 16" brick back. An Approved Appliance.



New Hearth Redfyre*

An efficient new fire with under-floor air feed for extra warmth, fewer draughts. The Hearth Redfyre gives economical, easy-to-control heating for rooms up to 1,750 cu.ft. Suitable for use with standard 16" brick back, and for openings from 18-22 ins. high. An Approved Appliance.



New Redfyre Magazine Boiler

For hot water and radiators. Magazine feed-automatic control by thermostat. Compact and very efficient, the Magazine Boiler runs on any smokeless fuel. Continuous Heating Rating: 20,000 B.Th. U's/hr. Domestic Hot Water Rating: 35,000 B.Th.U's/hr. An Approved Appliance.

**Also available with the famous Redfyre Bacboiler as a complete unit.*

...and now

Metered warm air

FOR MULTIPLE HOUSING

Weatherfoil Metered Heat provides the best of all worlds for municipal housing. The Weatherfoil system of forced warm air heating provides greater comfort for tenants yet installation and running costs are both exceptionally low. The tenant sets his own thermostat and pays by meter for heat consumed.
The really dramatic economies of Weatherfoil Metered Heat are obtained, however, when dwellings are planned right from the start to exploit the unique advantages of the system.

WARM AIR CENTRAL HEATING
with . . .

- **Low cost installation.**
- **Economical running.**
- **Temperature and on/off control in each dwelling.**
- **Tenant pays by meter.**

TGA W228

How long will it last ?

We are asked this important question daily. And our short answer is...an ASBESTOLUX lining specification will outlast the life of the building in which it is installed!

THERMAL INSULATION AND FIRE PROTECTION

The new Thermal Insulation (Industrial Buildings) Act, 1957, specifies the kinds of materials which, if used to a substantial extent to achieve the standard of insulation, must either conform to a prescribed standard of resistance to the spread of flame or be used in such a way that they do not add to the risk of fire.

An Asbestolux lining specification *will provide a superior standard* of insulation and fire protection to the minimum standard as laid down in the new Act, and at the same time ensure EXTREME DURABILITY.

Technical data sheets on constructional details, planned fire protection and specification recommendations, finishes, etc. are available.
You are recommended to write for details or for consultant advice NOW!

Pioneers...

In 1620 Edmund Gunter, one of a group of English clergymen engaged in the pursuit of mathematical knowledge, introduced 'Gunter's Scales.' These were single lines marked into segments proportional to the logarithms of the numbers. Gunter's Scales inspired the Rev. William Oughtred (1574-1660) to evolve the principle of interchangeable scales by sliding one against the other. Oughtred's instrument was the precursor of the slide rule of today, a device which has made rapid calculation a relatively simple procedure.
In much the same way the Crabtree plate-frame, introduced in 1930, reduced the problem of special-purpose switch assemblies to the selection of a small number of standard components. It brought a degree of simplification and flexibility until then unknown and led directly to the development of the 'Closegang' type of assembly of today.
The plate-frame is typical of the many contributions which the Crabtree Company has made, and will continue to make, to the progressive development of electrical control equipment.

Control Gear
Air-break contactor starters for motors up to 70 h.p. Oil-break contactor starters for motors up to 15 h.p. Hand-operated starters for small motors. Remote push-button stations for general purpose, weatherproof and flameproof applications. Limit switches. Pilot light and indicator units. On-load isolating switches.

Wiring Accessories
Type AC and AC/DC tumbler switches of all types. Ceiling and suspension switches. 13 amp. socket-outlets and other ring-circuit wiring accessories. 2, 5 and 15 amp. socket-outlets. Plugs of all types. Ceiling roses, lampholders and bell pushes. Industrial wiring accessories.

Circuit Breakers
Miniature (moulded case) circuit breakers in single pole, double pole, and triple pole and neutral patterns up to 60 amp. Earth-leakage circuit breakers in double pole, and triple pole and neutral patterns up to 60 amp. Distribution boards.

A Modern Slide Rule

Rising Mains, Underfloor, Floor & Skirting Trunking.

FLOOR TRUNKING

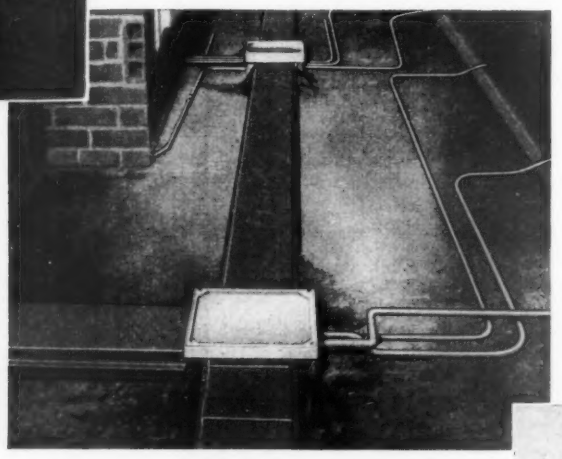
Choice of Covers: Available with chequer plate cover and gasket joint, or with recessed cover to carry any flooring medium—wood blocks, linoleum, tiles, etc.

Construction: With exception of chequer plate, Zinc coated steel is used throughout.

Sizes: Standard sizes available. Special sizes made to order.

Finish: Zinc coated natural finish or Grey Enamel.

Fittings: Elbow. Rising Elbow. Tee Piece. Four-way Box. End Bush. Blank End.



UNDERFLOOR TRUNKING

Choice of Covers: Solid or recessed for fitting with any floor medium.

Floor Traps: Cast or fabricated, in 1-way, 2-way, 3-way and 4-way forms.

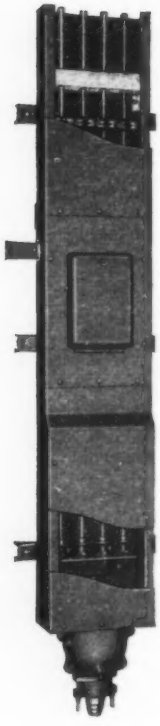
Levelling Feature: Traps can be supplied with provision for levelling.

Construction: With exception of solid cover plates, zinc coated steel is used throughout. The assembly is rigid and waterproof. Dividing fillets can be embodied.

Sizes: As above.

Finish: Zinc coated steel painted with red oxide.

Fittings: Rising Elbow. Elbow. Tee Piece. Four-way box. End Bush. Blank End.



RISING MAIN—BUSBAR TRUNKING

Construction: Zinc coated steel with cover plate secured by set screws and washers, to provide dust-proof enclosure.

Support Rack: Incorporated at base of riser to carry full weight of rising copper conductors.

Fire Proof Barrier: Fitted at each floor level.

Amperage Range: 100 amp. to 1,500 amp. in either 2-, 3- or 4-bar assemblies.

Finish: Grey Enamel.

SKIRTING TRUNKING

Construction: Zinc coated steel, with dividing fillets embodied as required.

Sizes: As above.

Finish: Grey Enamel.

Fittings: Elbow. Rising Elbow. Tee Piece. Four-way Box. End Bush. Blank End.

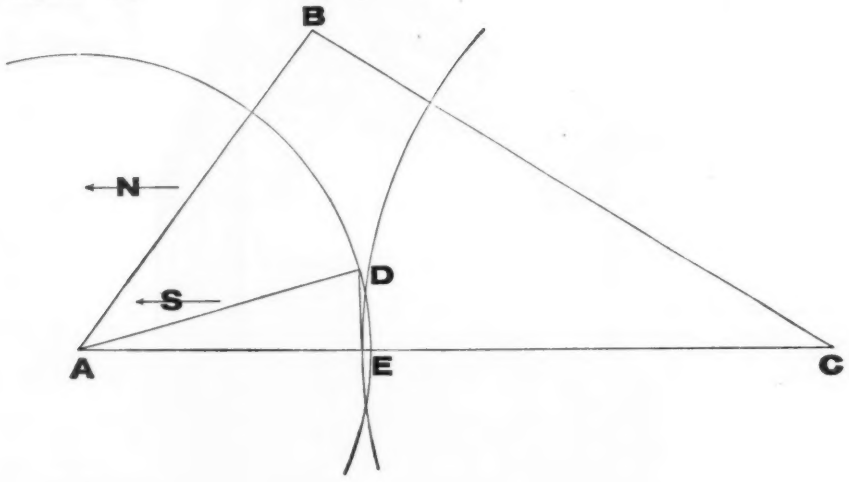
Theorems of **PLY** *thagoras No. 5*



That the use of Diffusing Plyglass in a revolutionary form of rooflighting gives glare-free daylight whilst improving insulation.

Use of Plyglass shows the saving achieved over conventional roof lighting. Architects: Gotch, Saunders and Surridge, Kettering

Let ABC represent a section of conventional sawtooth northlight roofing, and ADE a section of new design made possible by the use of Diffusing Plyglass, AB and ADE being the respective glazed areas. By describing arcs it will be seen that ADE is approximately equal to AB, and CE is appreciably less than CB. Further, it will be noted that AD is tilted towards the South, but is substantially opposite to the zenith, whilst AB faces North. Therefore ADEC, though smaller than ABC, admits a similar amount of light. It follows that, as Diffusing Plyglass has a lower heat transmittance than ordinary glass, heat loss in cold weather is close to that of an unglazed, well insulated roof.

Moreover, the volume represented by ADE is only 10% of that represented by ABC.

IT IS OBVIOUS, THEREFORE, THAT THE OUTSTANDING QUALITIES OF DIFFUSING PLYGLASS GIVE THE ARCHITECT UNPRECEDENTED FREEDOM OF SITING AND DESIGN, IN ADDITION TO MEETING CONTEMPORARY THERMAL AND LIGHTING REQUIREMENTS AT LOW COST.

More 'PHORPRES' bricks than ever before...

The programme is outlined on

IN SUMMARY

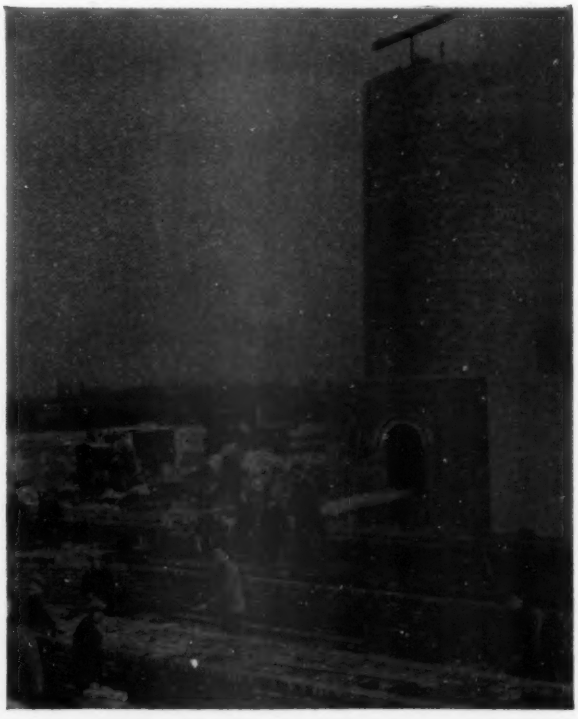
In November 1958, foreseeing an even greater demand for 'Phorpres' bricks, work was commenced on building a new large kiln at the London Brick Company's works at Calvert.

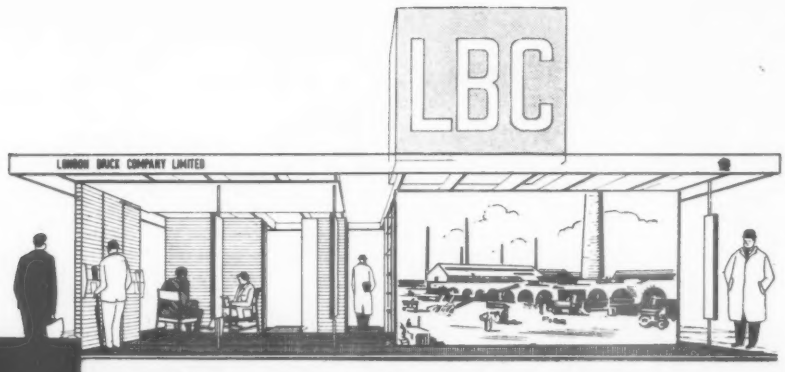
With the exception of stack erection, all building operations in this very considerable project were carried out by the Company's own operatives. Normal production at Calvert was maintained during the period of construction.

In addition to the Calvert programme, extensions were also planned and put in hand at the Company's works at Bletchley.

In fact, the overall result of the various operations will ensure that *an additional 100,000,000 'Phorpres' bricks will be available during the next twelve months.*

The illustration shown on the opposite page gives an idea of the extent of the programme. On the London Brick Company's stand at the Building Exhibition the facts are presented in greater detail. You are invited to examine them for yourself.

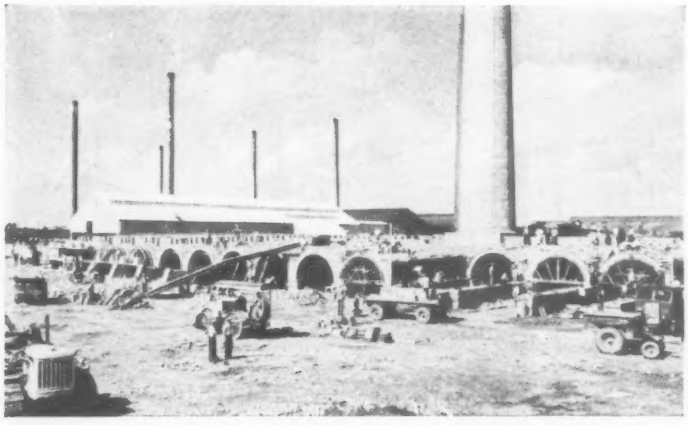




STAND 86-87 ROW E at the Building Exhibition

The Kiln at Calvert

Calvert in Buckinghamshire was the Works chosen for the main increase in production because of its favourable geographical position. The work of modification and extension was energetically pushed forward and schedules maintained without disruption of normal production.



Extract from the Chairman's speech at the lighting of the Calvert kiln, September 4th, 1959.

"We shall not rest upon our laurels and will only be satisfied when we can once again provide the industry with the delivery service on which our Company's reputation was founded."

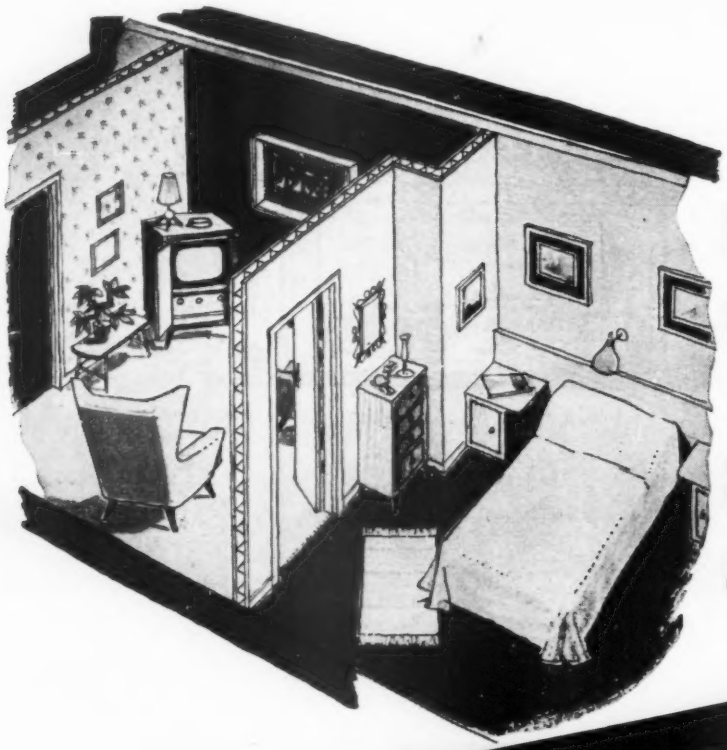
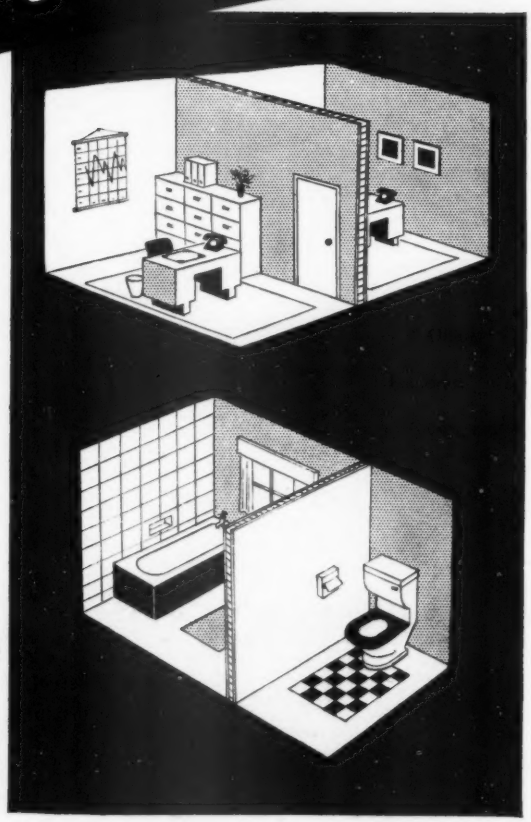
PHORPRES



Used exclusively for internal construction work in the Sceaux Garden Flats at Camberwell

Paramount Dry Partition



Ideal for inner linings to external walls, internal walls and partitions, Paramount Dry Partition is strong, rigid, easy-to-cut and handle. Light in weight, highly fire-resistant it has good sound and thermal insulating properties. Being a 'dry' product, it is ready for immediate decoration and saves hours of on-site labour. The accompanying illustrations give an idea of the impressive range of uses for this outstanding wall unit. Off-cuts have the same strength as the original panel and can be used for constructing built-in wardrobes, airing and meter cupboards etc. For full details about all Blue Hawk DRY CONSTRUCTION materials apply to:

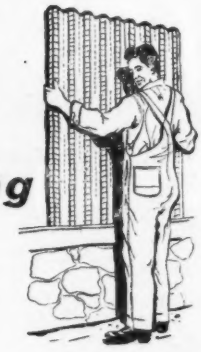
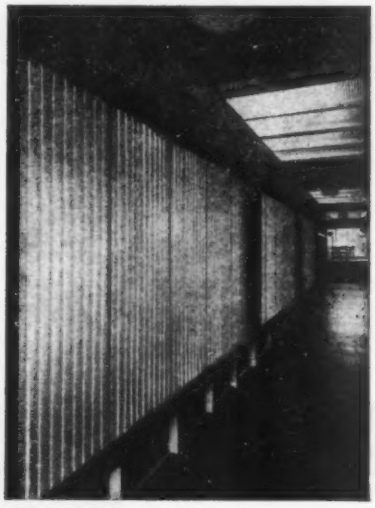
introducing

decorated corroglaze

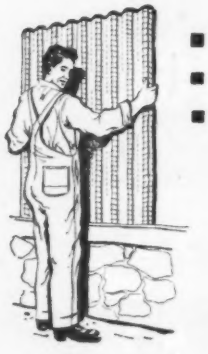
100% pure glass *internal partitioning*





Decorated Corroglaze sheets used to provide a corridor in a school.

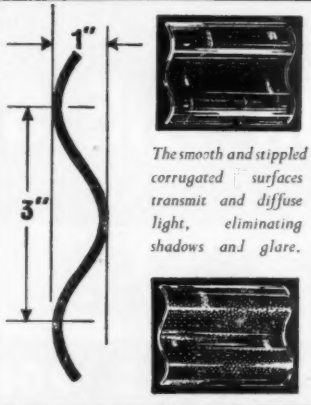
Decorated Corroglaze represents an entirely new approach to the problems of partitioning and sub-division of larger areas. It enables the architect to escape from the rigid, uninteresting, conventional design imposed by the use of flat sheets of glass, hedged in by numerous shadow-forming steel or timber supports and large areas of metal sheeting or masonry. It is 100 per cent. corrugated glass; one surface is smooth and the other stippled. The individual sheets are applied vertically, and are butt jointed by means of slender plastic or metal strips. The ONLY support required, irrespective of the length of run, is the outer framework. Decorated Corroglaze, when illuminated, gives a pleasing, slightly fluviatile effect, the upward flowing lines of the corrugation impart both elegance and dignity.



- faster to install
- more light
- more efficient

technical advisory service

Large stocks of all sizes are available for immediate delivery from area stockists throughout the Country. For further information and advice on applications, installations, etc., write to the Decorated Corroglaze, Technical Advisory service, Corroglaze Ltd., Wembley, Middlesex.
Telephone: Wembley 9411.



The smooth and stippled corrugated surfaces transmit and diffuse light, eliminating shadows and glare.

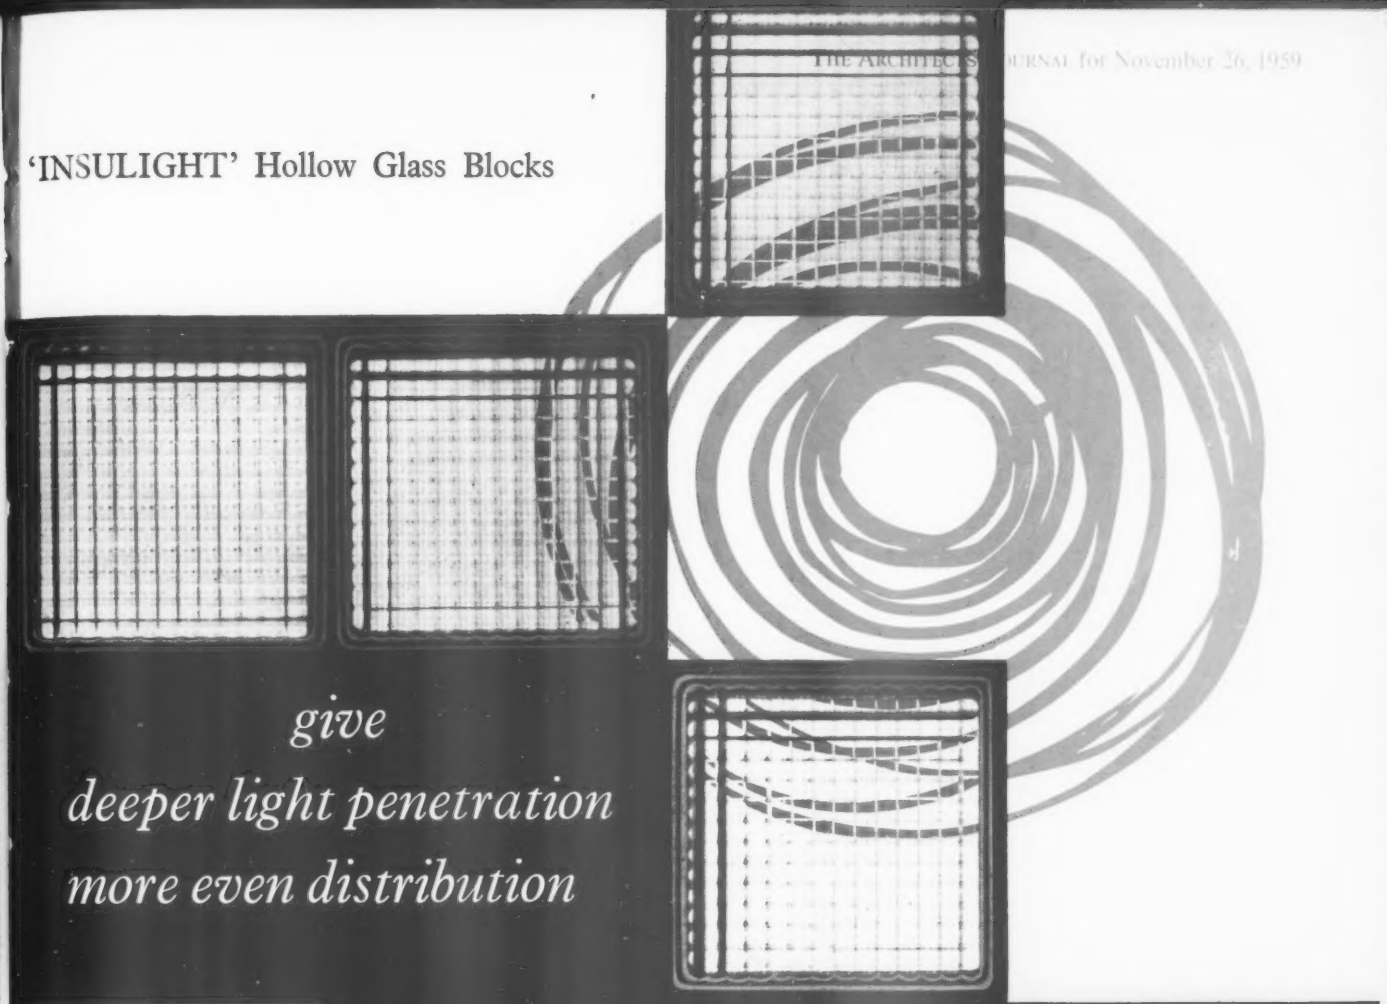
'INSULIGHT' Hollow Glass Blocks



give
deeper light penetration
more even distribution

Due to the patterned surfaces of 'INSULIGHT' Hollow Glass Blocks, the depth of light penetration is much greater than that resulting from normal transparent glazing. This means that blocks provide much more evenly distributed illumination within the building.

Light Diffusion is just one of the properties of this versatile building material, others are :—

Sound Insulation
Fire Retardance
Thermal Insulation
Reduction of glare
Privacy
Little Maintenance
Ease of Construction.

Blocks are available in a range of attractive surface patterns, sizes and shapes. Further information is readily available from the Technical Sales and Service Department, St. Helens (telephone : 4001) or Selwyn House, Cleveland Row, St. James's, London, S.W.1. (WHItehall 5672-6).

NOT QUITE ARCHITECTURE

History is strictly for Dad

The two unsolicited testimonials to works of architecture in the public eye, which appear below, were written by members of the same family—one with his eleven-plus just behind him, the other with life-begins-at-forty not far ahead of him. No prizes are offered for guessing which is which, and no attention will be paid to funny-guys who get it wrong on purpose. Nevertheless, people who "care about architecture" will note that the virtues of Modern are now, at last, apparent to the innocent eye of childhood, or—alternatively—that the revaluation of history is in full swing, Man! First, Castrol House:

*

The building's locality is on Marylebone high street opposite the library and the town hall. It is made for Castrol. It is used for an office block. The structure is made of glass steel and concrete, most of it glass. I think they are better than the older buildings which get very dirty and drab and are not easy to clean because of their nooks and crannies. The building is twelve storeys high. In between the floors are coverings of green glass. Buildings like these are very conspicuous because they are striking in appearance, towering above other buildings. Compared with other buildings it goes along more with the modern world. There is more space in the interior because each room goes in line with the next systematically.
The building is in two parts, the vertical which stands on the horizontal part. The ground is used for stock storing rooms for necessities like ink paper typewriters, etc. I think the building takes up much less space because it goes up instead of spreading around. The structure is almost all

Pointer for Piccadilly

Castrol House is a compromise. The RFAC wanted a simple rectangular block to continue the lines of Marylebone Road and thus perpetuate the corridor street. The slab of offices was also restricted in height by the proximity of Marylebone Town Hall tower. The architects' (Gollins, Melvin, Ward and Partners, in association with Sir Hugh Casson and Neville Conder and Associates) original conception was a tower block with a public patio at ground level. Compromise or not, the result is still pleasing: a street line has been retained and the bulk of the offices are getting the light and views to which workers are entitled. And if the influence of advisory bodies has slowed the development of an entirely twentieth-century solution, nevertheless the result is some badly needed variety to the London skyline and a further development of the simple, neutral, curtain wall by the firm which was among the first in this country to master it. How frustrating it is that there should have to be such disaster and public demonstration over Piccadilly when Castrol House shows—in terms of design if not of traffic engineering—how easy it is to achieve competence.

windows, so compared with other buildings it is much brighter and cleaner therefore pleasanter to work in. With the windows it is much lighter and airier. I should think it would be much easier to move around in a building like this being square and divided in parts, the ground part and the tower part, one offices and the other stock rooms.

*

I do not think I would like to live in it, because it is very cramped and I do not think I could sleep with artificial breathing system and ventilation. I like the building because it towers above other buildings and it is very exciting against the blue sky and fleecy clouds. Another thing I like about it is that it looks more like a simple pattern than a monotonous structure. It reminds me of a towering skyscraper of New York which you see in magazines and the cinema. Blocks like these are very plain now-a-days but the size, height and colour makes them very exciting to look at.

*

And now the Alhambra, having dealt first with a few other Spanish landmarks.

*

Suddenly there is Madrid: for no reason that one can determine: just standing out on the plain. No particular feelings about the place: seemed mostly to have been laid out and put up in an expansive mood at the tail end of the 19C, as part of the game "let's make a capital."

*

Toledo—a kind of picture postcard ghost town: scheduled in entirety as a national monument: a sunbaked little museum full of flick-knife shops and "the grandeur that was Spain." Jampacked with El Greco and that sort of thing. But—¿me dig espanol? Granada—now here is a cat of a different hue. The Alhambra is the most. Those old Moors really had the place sorted out: talk about *environment control*—it's no crazy talk to describe the Alhambra as real cool but laconically a temperature notation.

*

The rest of Spain seems strictly from guilt and Indian goïd: cast of thousands looking for death in the afternoon. But the Alhambra takes a fine emery board to those jaded old nerve-endings, and you know why they called every day from the muezzin (Allah has the message and Mahomet is his only true press agent). But the Alhambra was just the front office—to really relax those Moorish cats strolled along a few yards down to the Generalife—pronouncing it like the French "Highlife" and meaning it likewise—there they shacked up for the summer and latched their hubble-bubbles on to the mainline. My version has it then that the local voters, disenfranchized by these cool pagans and stuck out in the noonday sun really got the blues—and Man that's how Flamenco was born.

The Editors

A PLAN FOR PICCADILLY

THE drama of Piccadilly Circus was degenerating rapidly into farce when the Minister of Housing and Local Government decided last week-end to call the application in and hold a public enquiry. Not only was the public confused by the LCC's claim that the model and drawings submitted to the Council by the developers of the Monico site differed from the model and perspective published to the press (the differences appear in fact to have been slight), but in a television interview Hubert Bennett, the architect to the LCC, made it all too clear that the LCC is in no way committed to the overall design for Piccadilly Circus prepared by his own Planning Division. How can the Minister possibly decide whether any building does or does not prejudice the future redevelopment of an area if the LCC itself has no clear plan?

The enquiry will fail in its purpose if it is concerned only with the aesthetics of the building—important as this is—and whether it conforms to the zoning, plot ratio, daylighting, car parking and other formal town planning requirements. The real issue is whether Piccadilly Circus and the large adjoining area that is ripe for renewal (and for which the LCC has received several important applications) is to be carried out piecemeal or in accordance with a comprehensive plan. One cannot, when designing for the future, use Piccadilly Circus as one of London's major east-west north-south intersections (to handle some 80,000 vehicles a day) and as a pedestrian concourse, shopping and entertainments centre, all on the same level. A year ago the LCC published a model as a basis for negotiations with developers. Within the limitations imposed by the proposed road pattern it treated the Circus as an architectural unity; while retaining pavements at the road level, it made an advance towards

segregation by introducing a system of upper-level pedestrian walkways. This idea is full of difficulties, not least because it has to be realized in stages over a long time, but it was well worth exploring it to see whether it could not be made to work over a large area, with moving ramps or escalators and attractive shops and entertainments at the higher level. If the first developer is allowed to reject the idea out of hand, then all the others are likely to do the same. And if the LCC abandons the idea, as it has done on the Monico site, we are back at frontage development along narrow, crowded pavements lining roads jammed with vehicles. Similarly, if an aggressive and ill-proportioned building is approved on the Monico site, the architectural design of the entire circus is prejudiced.

It would be unfair to the LCC not to emphasize the appalling difficulties that face any planning authority attempting to secure good development in an area of fabulous land values. With a planning budget of only £1,500,000 a year, and its capital resources fully committed on urgent projects, the LCC cannot hope unaided to buy much land, and any desire to be firm with developers must be tempered by fear of having to accept purchase notices or pay heavy compensation. Unfortunately the LCC has neither explained these difficulties, nor argued the need for additional powers or finance to secure comprehensive development. It has lowered its reputation for good planning and architecture by entering into a weak compromise, and then defending it. Exchanges in Parliament and the attitude of the press show that had the LCC taken a much tougher line it would have had strong support.

Nevertheless, the LCC cannot solve this problem, which is of national concern, without national backing and national money. Piccadilly Circus and the whole of the adjoining areas where early redevelopment is probable should be made an area of Comprehensive Development. Pending the preparation of an over-all three-dimensional plan (which might well be the subject of a competition) all applications for new buildings should be refused. This would give the LCC time to reconsider, as it must, the long-term solution of the road traffic problems. No real harm would be done, and irreparable harm would be avoided, for nobody except the developers is in a tearing hurry about the Circus.

The government would have to stand behind the LCC financially, but it should not be thought that in the long run comprehensive planning would lose money; on the contrary, any public capital invested here would show a very high return —a point that Mr. Cotton can no doubt confirm.

By a striking coincidence the Piccadilly Circus row blew up at the same time that the City of London Corporation finally decided to approve Chamberlin, Powell and Bon's Barbican scheme, and rejected a proposal to hand the development over to private enterprise. The LCC is entitled to much of the credit for all the Barbican proposals, which mark a major, even a revolutionary advance in British town planning. The sordid muddle of Piccadilly Circus and the West End calls for an equally bold and imaginative plan.

OLYMPIAN DEPTHS

A little while ago *Architectural Forum* published a sketch showing what a town would look like if twenty or so distinguished buildings from various parts of the world were bunged together with no thought of planning. It was a horrible, cautionary picture, and I remembered it as I wandered round the Building Exhibition which is an Awful Warning that it's no good employing a hundred or more architects if you don't impose some sort of planning control. Well-designed products are hard to see amongst the pastiche and glitter at Olympia. When will the exhibition's organizers realise that gimmicky, over crowded stands are merely a nuisance to the professional visitor who is looking for information and not for the imbecile treatment handed out on television commercials?

*

The Minister of Works, Lord John Hope, opened the exhibition with a sensible speech, though it was a bit galling to hear his warning that everyone should show flexibility in specifying materials so that if one material was scarce others could be used. After all, it was the Government itself which helped to create shortages with its controls and decontrols. However, it was good to hear the Minister say he intended to pay particular attention to

spreading the word about research and new techniques throughout the industry. It's time we had that long-talked-about information service. It's time, too, that someone got on with the joint training of architects, surveyors and builders.

*

Talking of which, I was amused to find—at a time when inter-profession co-operation is the thing—that the Institute of Quantity Surveyors had designed its own stand. Frankly, it looked like it. But the RIBA, which is still sweeping with its new broom and turning over its new leaf, has transformed the sepia-tinted morgue it used to have as a club room, and now vaunts Conran chairs and Forrest lights.

ICE MELTS FOR ARCHITECTS

I'm glad to hear that architects will be welcomed by the Traffic Engineering Study Group which was founded last week at the ICE by Sir Herbert Manzoni and other civil engineers. Richard Nugent, MP, the former Parliamentary Secretary to the MOT, spoke at the Group's press conference—very sensibly correcting pressmen who thought America had solved the urban traffic problem with traffic engineering. He pointed out that while we had a lot to learn from America, we were twenty years ahead in public transport.

TIMES OUT OF JOINT

Does *The Times* know anything about planning? Last week it attacked Henry Brooke, the Minister of Housing, for his determination (see page 57€) to stop office concentration in central London. Then it criticized the Government for trying to persuade Fords to build their new £50 m. factory in Scotland, where there is unemployment, instead of in Dagenham, where there is neither labour nor spare housing.

*

Someone should explain to Sir William Haley that the more offices that are built outside London, the fewer the workers who will have to travel to and from the City. As W. F. Deeds (Ashford, Con.) said in the excellent Commons debate on landscape last week: "A Government which allows the fantastic concentration of commerce in London which has been countenanced in the last decade . . . and which also pursues a policy of overspill from London into the country ought to have its head examined."

The end of Regent Street. The new BBC extension faces on to Portland Place with, naturally enough, a face of Portland stone. But no one seems to have remembered that the Mary Ann back side would be equally important in forming a new termination to Upper Regent Street. Nash's All Souls thus looks like Osbert Lancaster's "amenity preserved," and where once it neatly turned the eye into the curve of Langham Place it has now been rendered architecturally meaningless. If it had to be there at all, the new building would have been better twice the height. St. Mary le Strand comes off better than this under the cliffs of Bush House. This is two-dimensional planning at its worst, or how to obstruct from behind.

SIR AMBROSE HEAL

It's difficult for a merely middle-aged body like ASTRAGAL to imagine a state of affairs where Heal's didn't exist, or —what's even more difficult to imagine —didn't exist in its present form, with its present reputation as one of the cornerstones of English Taste.

*

Yet, as the learned obituaries of Sir Ambrose Heal, who died last week, make clear, the Heal's we know and admire, the Heal's that angry young designers simultaneously respect and execrate, is the creation of Sir Ambrose himself, in the years since he took over the chairmanship in 1913. Before that it was just a bedding company (they still have a four-poster on a lot of their trade literature, it occurs to me) and the build-up into the present status as number-one well-designed universal household furniture emporium is entirely since that time.

*

The other sobering thought that one gleans from the obituaries is that he was born early enough (he was eighty-seven when he died) to have known not only people like Lethaby and Voysey, but William Morris as well.

M. O. DELL

If you were to ask me for the couple of names that had most to do with putting modern architecture across when it was struggling to establish itself in the 1930s, my answer wouldn't be Lubetkin and Tecton or Cornell and Ward or Gropius and Fry. It would be Dell and Wainwright, the two photographers who worked for the *Architectural Review* up to the war and had a genius for bringing out in their photographs the special qualities modern architecture had to offer.

I am reminded of these past days by the sad news of M. O. Dell's death. He retired after the war, since when H. L. Wainwright has been carrying on alone —still producing impeccable photographs. But to architects old enough to remember the controversies of the 1930's the two names are inseparable, and those whose buildings D. & W. photographed will remember not only their skill and understanding but how firmly their genius was rooted, as genius is supposed to be, in an infinite capacity for taking pains.

MOTROPOLIS REPRINT

Additional copies of *Motropolis* (which sold out and has been out of print) are being printed to meet the continuing demand, and will be available shortly at the price of 1s. 6d. post paid.

SfB Filing System

SIR: The approval of the RIBA Council and the wholehearted support of your good selves to the SfB system is to be welcomed; and the tribute to Dargan Bullivant for its introduction to this country is well-deserved. There is some danger, however, in spoiling a good thing by over-enthusiasm. The International Building Classification Committee approved the SfB "for use in the classification of trade catalogues, codes of practice and other documents dealing with building elements, building products and building works and intended for filing in practitioners' offices." It went on to state "The IBCC recognizes, however, that the UDC remains the principal classification system for international documentation." The UDC also in this country remains the principal classification system for information in the building field; it is used by the three publications, *RIBA Library Bulletin, Building Science Abstracts* and *MOW Library Bulletin*, which analyse the world literature. It is used in the library of the Institution of Civil Engineers and on British Standards.

The SfB is essentially a rough grouping and as such can be very useful for breaking down a small collection. For the finer division required by a large collection of items, the authors of SfB themselves recognize that recourse to UDC is necessary, as indicated in the filing manual published in your issue of September 17. For any collection of general information that is likely to grow large, it would be advisable to adopt the UDC from the beginning; a limited number of the main UDC numbers may be employed while the collection is small and may then be expanded as the collection grows, without the necessity for re-classification.

Within its limitations the SfB can be of great value and its universal adoption for pre-classification of trade catalogues, etc., can be most helpful to practitioners.

B. AGARD EVANS,
Chief Librarian, Ministry of Works, Vice-Chairman, International Building Classification Committee.

Architects As Directors

SIR: The question is "Will the change in the Code give the public a better architectural service?" If the key word is "service" then the answer is probably "Yes." I am never sure of the definition "architectural" and perhaps this lack of definition is one of the main problems that, as a profession, we have to face.

To me the key would seem to be a "declared interest." Many clients prefer to deal with someone whose knowledge, integrity and context they respect. They are less concerned with professional names or hieroglyphics, and the protection afforded to them by the Code is mostly unknown and sometimes ridiculed; the knowledge of a man's integrity and the competition of an open market being regarded as better protection than remuneration on "cost plus"

In selecting its Governors the Bank of England prefers knowledge with integrity to dis-associated professional impartiality. There would seem to be no reason why business interests should select their architects differently.

R. BADEN HELLARD

London.

SIR: The crux of this argument arises from the necessity for better architecture, but I submit that the projected amendment of the Code would be largely abortive.

A cursory glance at the post war scene and the Press abundantly exposes the disgraceful standard of work turned out by a large section of the profession. Really good design is in the capable hands of a few who one imagines have no need to extend their activities to directing contractors firms. For the rest, who would no doubt welcome this move, it would merely extend the scope of their phoney "contemporary" cliches. Such architects as directors would merely be the blind leading the blind.

The maintenance of impartial status is essential if we are to continue as a profession. A solution follows when the results of improved standards of training coincide with an awareness by the layman of the function and qualities of an achitect. When this level is reached, and not before, legislation to ensure architects controlling all building work will produce the results we now seek.

JOHN G. FRYMAN

Medmenham.

Top Industry: Motors

SIR: I am surprised at Professor Wright, in the November 5 issue of the JOURNAL, making the common mistake of assuming

that the prediction of 1,300,000 new motor vehicle registrations will be in addition to the number of vehicles *already on the roads*. Of course it means nothing more than something over 1,000,000 motor vehicles will be turned into the breakers' yards, either due to old age or "write-off" accidents, for there is only a certain percentage of the population which wants to, or can afford to, buy and run motor vehicles, and this number of people can only be increased by (*a*) increase in the population with the percentage remaining stationary, and (*b*) increased purchasing power at the lower income levels, which will increase the percentage.

Trade vehicles have the shortest life, for they are worked to death, mechanically and structurally; big cars, expensive to buy and expensive to run, are not for the masses; but the moderately priced vehicles, cheap to run, will live as long as the "do-it-yourselfer" can buy replacements for worn parts, and there are plenty of Austins, Morrises, B.S.A.s, and Ariels, etc., 25-30 years old, which are still quite roadworthy and regularly licensed, and which will be replaced only when their owners can afford a newer old model. The new motor vehicles poured out of the factories each year only push the old ones off the roads at the other end of the sausage-machine.

If Professor Wright cares to make a rough calculation of the number of motor vehicles *registered* since, say, 1945, and compare this total with the number of currently *licensed* vehicles, he will see what I mean.

T. O. M. UPFIELD

London

The net increase in vehicle registrations has averaged more than half a million a year since 1954, as shown in the graph in Motropolis (AJ, October 1). The figures for the year to September 30, 1959, have not yet been published, but it seems unlikely that the wastage will reach anything like the figure of one million. Wastage in 1957-8, for example, was 504,745, or slightly more than half the new registrations.—THE EDITORS.

Check Lists

SIR: The check-list contained in the AJ for October 15 is excellent, and there is no doubt of its usefulness. But it took, by your admission, a *year* to formulate! When will the further check-lists that are promised appear?—when today's working-drawings are no longer the system used for showing the contractor what we want? Please, let us have our check-lists now, week by week, or even month by month, and not as historical curiosities.

J. B. LEHRMAN

Ottawa

SIR: Allow me to comment on Mr. Davies' letter criticizing your review of my Radburn Exhibition (AJ, October 1).

To me, as to your reviewer, the half-hearted way in which some of the new towns have taken into account the existence of the motor car is not at all impressive, although perhaps better than those who continue to bury their heads in the sand completely. In the sense in which these developments are "no longer strictly Radburn" they are worse than the original idea. I believe they are a compromise not with a way of life but with the ignorance of those who plan. The new town of Cumbernauld shows what the approach of the other 15 might have been.

The Radburn separation of motor cars and pedestrian is essentially so wonderful because it makes life better for both. The criteria underlying this are, first of all the primary creation of a footpath system within a superblock, the paths being the working link with shops, playgrounds, pubs, and anything else that serves groups of people. Even in a tiny lay-out of a few dozen houses this can be achieved. Secondly, the creation of service road access to every house with a similar provision of private garages.

It is obvious that any lay-out which lavishes much of the open space to areas adjoining roads and not connected to a footpath system disregards the basis of the Radburn Idea. The mere addition of a service cul-de-sac to a front motor road is as far removed from the Radburn Idea as one can get, and a very inefficient way of planning. Such minor Radburns as are under construction in some of the new towns do not obscure but accentuate the tragedy that the New Towns Mark I did not seriously consider separation.

The Radburn Idea was effectively used twenty years before the New Towns Act. Lewis Mumford's masterpiece *Culture of Cities* illustrates the Radburn schemes and has this to say:

"Here was the first town built anywhere that consistently abandoned the corridor avenue lined with houses, that divorced the functions of domestic living from the noise and traffic of the street, and that provided a continuous belt of park space within the residential superblocks, instead of placing the park on the outskirts. Each superblock was planned in relation to a school, a playground, and a swimming pool: open spaces were treated as part of the original cost of development. By means of footpaths with underpasses and bridges one can walk from one part of the community to another without encountering a motor car."

The book was first published in 1938. Radburn was built ten years before that!

PAUL RITTER

Nottingham

Australia and Sydney

SIR: I have read with intense interest John Carter's observations on Australia AND Sydney. The salient point that he has missed is that Sydney is no more Australia, than London is England, or Paris is France. I spent a year on that continent, mainly in Adelaide, but also frequently visited Melbourne. Both these cities are very different in atmosphere and "tempo" than Sydney, as every native-born "Aussie" will tell you. At heart Australia, despite it's veneer of North American Influence, is still very British. Indeed, most Australian Cities, and their outer environment is much closer to that of Southern Rhodesia or New Zealand than USA.

DEREK ABBOTT

Basildon

SANITARY WARE COMPETITION

"Disappointing Standard"

Gordon H. Taylor, Wolverhampton, has won the first prize of £1,000 in the Associated Builders' Merchants Limited Competition for designs in ceramic sanitary ware. There were two other finalists, L. Daniels, A.R.I.B.A. (Second Prize, £350), and John V. Sharp, A.R.I.B.A. (Third Prize, £250).

The Assessors were C. J. B. Pratt (succeeded by T. E. Marshment) and Wallis M. Goslett (both appointed by A.B.M. Ltd), P. A. Newnham, A.R.I.B.A., and F. B. Pooley, F.R.I.B.A. (both appointed by the RIBA). As the promoters intend to arrange for the articles in the first premiated design to be manufactured and marketed as soon as possible, photographs and details of the winning designs are not being issued at this stage, and the Assessors have been asked to avoid describing the awards in their reports.

The Assessors had full regard to the Promoters' wishes that the object of the competition would be to achieve better designed sanitary ware which could be mass-produced at no additional cost to articles currently being marketed. The Assessors were of the opinion that it was unlikely that any revolutionary or novel designs in sanitary ware could be produced whilst the existing Statutory Regulations and By-laws remained in force. Half-full size models of the three premiated designs were made for the second stage.

In the first stage of the competition all competitors were asked to design a lavatory basin, low level closet suite and a urinal, and the three chosen for the final stage were asked to produce in addition designs *en suite* with their originals for an angle basin, a high level closet suite and a bidet. 424 applications were received for entry forms for the competition: 177 people registered as competitors and 42 valid entries were received.

There were half a dozen entries which, in the view of the Assessors, reached a very high standard indeed, but the general standard of entry for the competition was disappointingly low. Before coming to their

final conclusion the Assessors took advice from experienced ceramic manufacturers and were satisfied that the three designs which they selected for prizes were capable of economic mass manufacture within the next year or so.

In arriving at their final conclusions the Assessors particularly bore in mind the following six points which they thought to be of importance: (*a*) quality of design, (*b*) standard of hygiene, (*c*) ease of plumbing arrangements, (*d*) suitability for manufacture, (*e*) method of fixing, (*f*) economics and sales appeal. They were satisfied that the winning designs came nearest to meeting these points and were likely to be a commercial success.

COMPETITION

Flats at Halesowen

The Borough of Halesowen invite registered architects in Great Britain and Northern Ireland to submit designs in competition for development comprising about 250 flats at Highfields, Halesowen, Worcestershire. The assessor is Eric Lyons. There is a further £1,000 to provide up to ten further premiums. The sending-in day is March 31, 1960. Conditions are available from: Town Clerk, P.O. Box 14, Council House, Halesowen, Birmingham. Applications should include a cheque for £2 as deposit returnable on submission of design or return of Conditions by March 3, 1960.

MOH DESIGN UNIT

Out-patients Department

An out-patients department at Walton Hospital, Liverpool, will be the first project to be undertaken by the Ministry of Health's new Design Unit, under the Chief Architect, W. Tatton-Brown. It has been included by the Minister of Health in the expanded hospital building programme for 1961-2. The Minister announced in the Commons last week that £31 million will be spent on capital development in the hospital service in England and Wales in that year, compared with £25½ million for 1960-1.

According to a Ministry spokesman, the Design Unit is now discussing the accommodation schedule for the Walton out-patients department with the regional board and the hospital management committee. The Unit will do the whole of the design, working drawings and supervision, following the practice of the Ministry of Education. An out-patients department has been selected for the first study because these departments are not only one of the most difficult problems in hospital planning, but show wide differences between individual hospitals.

It is probable that the Walton out-patients department will provide beds for day patients, who have to spend a few hours in hospital because they have to receive an anæsthetic, or need time to recover from their treatment, or some such reason. At present these patients have to be given beds as in-patients, and over-all economies may result from accommodating them in the out-patients department. It is also expected that instead of providing special consulting rooms and facilities for individual consultants (who may only use them for a few hours a week) general purpose consultants' suites will be provided.

OFFICES IN LONDON

Henry Brooke's Statement

Henry Brooke, Minister of Housing and Local Government, said last week that he is determined to stop the concentration of all new office employment in Central London. When opening a new office block at Kew Bridge he said he hoped that the new block would give impetus to a trend with far-reaching consequences.

"In Central London, 22 million sq. ft. of new office buildings have been completed since the war, and another 9 million sq. ft. or so are in course of erection. Of course, not by any means all of that is net addition. A great deal of it is replacement of office buildings destroyed in the war. Six million sq. ft. of offices were lost in the City of London alone. We also have to reckon that on average the new offices are distinctly more spacious than the old, so in proportion to size they do not contain as many staff. But, after allowing for all that, the fact remains that office employment in Central London has been continuing to go up and up and is very difficult to stop; and you can see the direct effects in traffic blocks and crowded rush-hour trains and buses.

"In modern life with its growing complexity, an increase in office work, proportionately to the total of work of all kinds, is natural and inevitable. It is inevitable, too, that much of it must be in or near London, for London is the capital city and the centre for so much trade and commerce. What is not inevitable, and what I am determined to stop, is that all the new office employment should be concentrated in Central London.

"Of course there are disadvantages too; the upset of making the move and the problem of communications if part of the staff stays in the centre, as it must often do. The advantages are permanent; the disadvantages are largely transitional."

RIBA

Electric floor heating

The rapidly growing interest in electric floor heating was reflected in a well attended meeting at the RIBA last week. Organized by Anthony Williams and chaired by architect Richard Eve, the meeting aimed to bring together architects, electrical engineers and manufacturers to discuss common problems and exchange experience. Like most new, or comparatively new ideas, electric floor heating suffers from an imperfect understanding of when and how it should be employed. Difficulties arising out of this should not be allowed to prejudice its consideration as an efficient means of whole house heating at a time when the standards of comfort demanded by the public in terms of heating are steadily rising. This was the underlying theme of the speakers, Oliver Cox of the LCC and J. B. Dick of BRS.

Oliver Cox spoke about the studies of this form of heating in flats made by the LCC architect's department. His talk necessarily centred on cost and he pointed out that as a result of the studies made, a figure of 0·8d. per unit had been arrived at as the optimum point at which electric floor heating would be competitive with other forms where the heating demand was high. In London, at present, where the off-peak tariff is 0·95d. per unit it could only be competitive where the heating demand was low. He was the first of several speakers who suggested that the logical role of electric floor heating was as background heating at temperatures not exceeding 65° F. For this he was taken to task by an architect from Hertfordshire county architect's department who pointed out, amongst other things, that a background temperature of 55° F., which really was adequate, could reduce operating costs by as much as half on a figure of 65° F. as suggested by Mr. Cox. He also stated that studies made by his own authority had shown that electric floor heating was not a suitable system for flats in terms of running costs.

Architects who, after all, have the final say in advising their clients on the type of heating system to be used, were invited by the chairman to put their questions to the meeting and many took advantage of this opportunity to make use of the engineers and manufacturers present. It fell to C. J. Wheeler, of Thermodare (Great Britain), to answer most of the architects' questions and, in doing so, he made a number of useful points. A 2-in. screed, according to Mr. Wheeler, is not sufficient. Hollow block floors are quite satisfactory provided air in the cavities is static. Again, 1-in. fibreglass is not suitable as thermal insulation as it can compress to as little as ¼-in. between floor slab and screed. Insulation to suspended slabs should always be on the underside of the slab and not between slab and screed. (Nobody explained how this should best be done.) Complete thermal insulation to a ground floor slab is not essential, though perimeter insulation should always be provided. Mr. Wheeler went so far as to say that the influence of the structure on electric floor heating was over-rated. This is the very sort of basic information which architects who contemplate the use of electric floor heating should know at the earliest stage. However elementary some of it may seem to be, the fact is that it is not sufficiently well known. There is, therefore, much to be said for the suggestion (made by one of those present) that an explanatory booklet should be published as soon as possible.

It was obvious, moreover, that even on basic principles the experts present were unable to agree. Figures ranging from 60° F. to 80° F. were mentioned as an average comfort level, and the use of special equipment such as thermo-time regulators was the subject of debate.

MOTROPOLIS

American Traffic Engineer in London

Paint and clear signals were two of the main features of successful traffic engineering, according to Henry A. Barnes, the Commissioner of Traffic in Baltimore, USA, who visited this country last week. By hanging traffic lights directly overhead, and painting the signals yellow, so that they could be seen, he claimed that right-angle collisions decreased in Baltimore by 92 per cent. in the first year after installation, and accidents of all types decreased by 57 per cent. He claimed that traffic capacity could be doubled by painting lanes, ten foot wide as a minimum, in every street. He used 50,000 gallons of paint to mark out Baltimore's streets. Baltimore, with a population of a little over one million, had provided 25,000 off-street car-parking spaces. The city lends up to 85 per cent. of the cost of a garage at 3½ per cent. interest. So far 26 garages have been built by this system. When a garage has been built the city's no parking laws imposed in the area virtually guarantee that the garage is fully occupied.

Mr. Barnes's main contribution to the Baltimore traffic problem, however, is in the introduction of electric computers to help regulate the traffic lights. One thousand intersections are controlled by eight computers; 900 radar detectors on mast arms over the street count the traffic flow at various points in the city and the electronic computers work out from 220 possible timing variations the sequence of traffic light signals which will best ease the constantly varying traffic conditions at different parts of the city. Mr. Barnes reckoned that this electronic computer system only cost $100,000 more than an orthodox system. Since introducing it accidents had dropped 46 per cent., and, at maximum density, speeds were now 18 m.p.h. when before they were only 6 m.p.h. Traffic had increased on one main street from 450 vehicles per hour to 1,200 v.p.h.

Mr. Barnes maintained that one of the greatest handicaps to an efficient traffic system was indiscriminate car parking. They had banned stopping on 250 miles of Baltimore's streets. Nevertheless, he maintained that there had to be a limit to car usage. The long term solution for Baltimore was a three-lane bus system, travelling on motor ways (cantilevered over backyards at $3 m. a mile) which would be more rapid than the motor car.

MANAGEMENT

Cardiff Course

A short course in management studies was held in Cardiff recently by the Welsh College of Advanced Technology, the Welsh School of Architecture, and the Department of Building and Structural Engineering.

Mr. Woodbine Parrish, misquoting Napoleon ("There are no bad workmen, only bad managers"), said that in the US the average workman was productive for about 50 minutes out of every hour, but in Great Britain the corresponding figure was nearer 30 minutes. He placed the responsibility for this firmly on the shoulders of management and said that this country was failing to obtain increased production because of its failure to appreciate "the high cost of low overheads." Insufficient planning in the early stages causes muddle, waste and confusion later on.

Architects, quantity surveyors and builders were at the conference in about equal numbers, and Mr. Austin-Smith spoke about the architect's role in management. In his view, the architect is the commander-in-chief who controls strategy and leaves tactics to the man on the ground—in this case the contractor. Giving the contractor's viewpoint, Mr. Cousins, area manager of a Cardiff firm of building contractors, thought that after signing the contract the leadership should pass from the architect to the contractor so that he would be free to organize the job in any way he chose. Both he and Mr. Austin-Smith came up with the idea that there should be two kinds of site meeting, one held by the architect to check progress and sort out queries, and the other held by the contractor to plan and arrange the running of the contract. At the contractor's meeting the architect should merely sit in as an observer.

Mr. Myrddin Williams, Chief Quantity Surveyor in the Swansea Borough Architect's Department, discussed the relations of architects and builders with consultants and quantity surveyors. At present the relationship was confused and unco-ordinated with nobody firmly in charge, and he thought that unless the architect took firm control of the situation, a new man—the co-ordinator—might appear on the scene. A client wishing to build would then appoint a co-ordinator, one of whose first tasks would be to advise on the choice of consultants—electrical, structural, architectural and heating.

Mr. Baden Hellard put the general case for cost planning. The reaction of the contractors to this idea seemed more enthusiastic than that of the quantity surveyors who were heard muttering together that they would need extra fees for the work involved. This seems a genuine problem which sooner or later will have to be solved.

Many contractors present regretted the passing of the old type specification which gave them a means of locating the items measured in bulk in the bill of quantities. It was generally agreed that either annotated bills or schedules of location were essential for efficient building.

Builders made no bones about it that they can never hope to organize contracts and manage them efficiently if vital decisions are left to the last moment, and clients and architects are allowed to change their mind at any time. In their view, "P.C." stood for "postpone consideration."

The general conclusion of the course seemed to be that all the members of the team have a lot to learn about efficient management and that there is a genuine need for management training courses. Mr. Alex Gordon, when summing up, said that it was hoped in Cardiff to start such courses and to integrate the training of the various members of the team so that students would work in the same relationship to each other as they would eventually take up in real life.

HOUSING CENTRE

Does Radburn Work?

Paul Ritter continued his campaign for the Radburn housing layout (his slogan is that it should be "a recognized crime" to make unsafe roads and footpaths) with a whirlwind talk at the Housing Centre last week. If Mr. Ritter would learn to present his material with less dash and more logic he would win more support for his case. But when every slide is presented upside down or back to front, and facts and figures are replaced by a floodtide of eloquence, it becomes very difficult to follow. Mr. Ritter may be right, for example, in claiming that the Radburn layout is cheaper than an orthodox layout, but if so he should give the figures. One wondered, too, at what densities it is possible to design a Radburn scheme that provides a garage per house, and parking for visitors as well.

His audience was strongly with Mr. Ritter in his desire to plan for the complete segregation of vehicles and pedestrians, but less unanimous on the merits of the Radburn layout. By common consent the main problem is the contrast between the pleasant but little used fronts, on the footpaths, and the squalid (or "undignified") but much-used backs, on the vehicular culs-de-sac. Cleeve Barr, who has recently visited some of the 10 British Radburn schemes, confessed that the experience had shaken his confidence in the idea, largely because they had all failed to solve the problem of the fronts and the backs. He told a story about an old lady who wouldn't have a Radburn house at any price because she wouldn't like to be "carried out" through the back door.

Mr. Ritter retorted that there's nothing undignified about being "carried out" along a footpath. But he conceded that most of the British Radburns have failed to solve this problem of backs and fronts. In his view, however, the difficulties can all be overcome without abandoning the Radburn principle of separate footpath and vehicular cul-de-sac access and have been overcome in Coventry's latest Willenhall scheme. The meeting left the writer with the impression that Cleeve Barr's new development group at the MOHLG could do a useful service by promoting a Radburn scheme that attempted both to solve all the problems of layout and to achieve good architecture as well. Mr. Ritter's legitimate plea that Radburns should not be judged by their architecture is understandable.

ABS BALL

All tickets for the ABS Annual Ball at Grosvenor House on December 9 have now been sold and there is, in addition, a waiting list for returned tickets.

The Seestern flyover roundabout, on the urban motor road linking Düsseldorf (in the background) with the West by the Nordbrücke over the Rhine. This scheme which brings the autobahn system to within two miles of the city centre is more fully illustrated on page 582.

URBAN MOTOR ROADS IN WESTERN GERMANY

Report on a British Road Federation Delegation

Has Western Germany, which pioneered the construction of motorways in Europe, now begun to find the answer to the urban traffic problem? In the hope of finding an answer to this question Malcolm MacEwen went with a delegation organized by the British Road Federation to Western Germany last month. Delegates who travel in high speed buses, keeping to a tight schedule in foggy weather between banquets, cannot expect to probe very deeply. But, despite the abundant evidence of German skill in engineering and landscape (to which the pictures on these pages bear witness) and the boldness of their road planning, the delegation was shown no evidence that in town planning and town design Western Germany is any nearer mastering the motor vehicle than we are.

The standard of living and the level of motor-car ownership in Western Germany are not yet as high as they are in Britain, but the rate of increase is very much greater. Private cars have risen in number from 1,129,471 in 1954 to 2,940,037 in 1958 (in Britain they rose from 3,099,547 to 4,548,530), and the official estimate that Western Germany will attain the current British level of one car to every 10 people by 1970 seems to err very far on the cautious side.

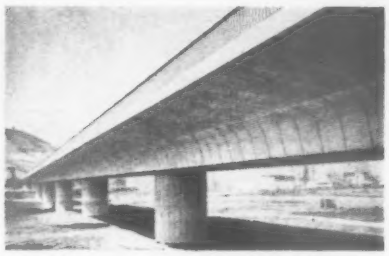
While motorists in Britain look enviously at the autobahnen, the Germans are complaining that the rate of road construction is far too slow, and threatens to check the progress of the motor industry. Dr. Goerner, the head of the German Roads Research Association, told me emphatically that the road construction programme (which is expanding from £260 millions in 1956 to £470 millions in 1966) is being rapidly outstripped by the 18 to 20 per cent. annual increase in motor vehicle registrations.

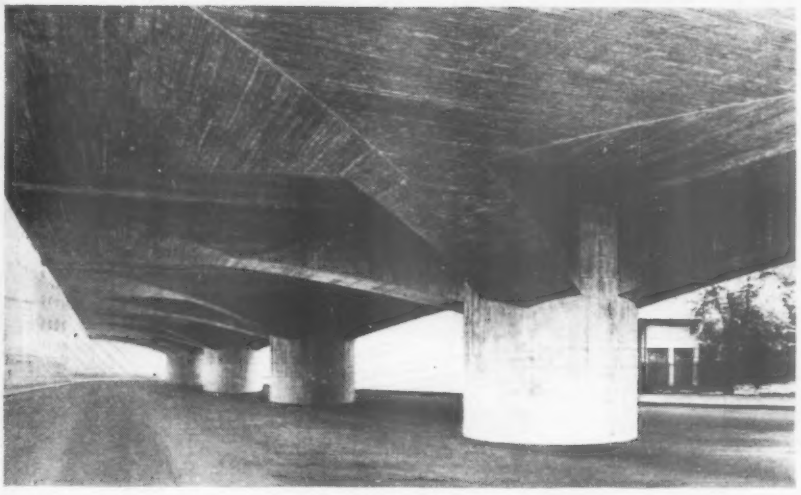
Until the present time the Germans have concentrated on extending the national autobahn system begun by Hitler before the war. By the end of 1958 Western Germany had more than 1,500 miles of autobahn in use, 190 miles were under construction, and over 800 miles planned. One cannot fail to be impressed by the work of the German engineers and landscape architects on these roads, both old and new. The simplicity and lightness of the bridges is well illustrated in these pages. The care taken in planting, the screening of abutments so that overhead bridges seem to leap out of the landscape, the planting of trees on embankments so that the forest sweeps right up to the highway, the unfussy detailing of railings, kerbs, signs and road furniture of every kind is obvious everywhere. Anything so crude as some of the M1 bridges seems to be inconceivable.

The federal autobahns, however were originally designed to give the cities a very wide berth, and the urban problem has been neglected. Even today the German grant system encourages the provision of roads for "through" traffic, and discourages the improvement of the internal communications system within the cities themselves. In Germany, as in Britain, the "through" traffic is only a small proportion of the whole in large cities—16 per cent. in Düsseldorf, only 4 per cent. in Hamburg.

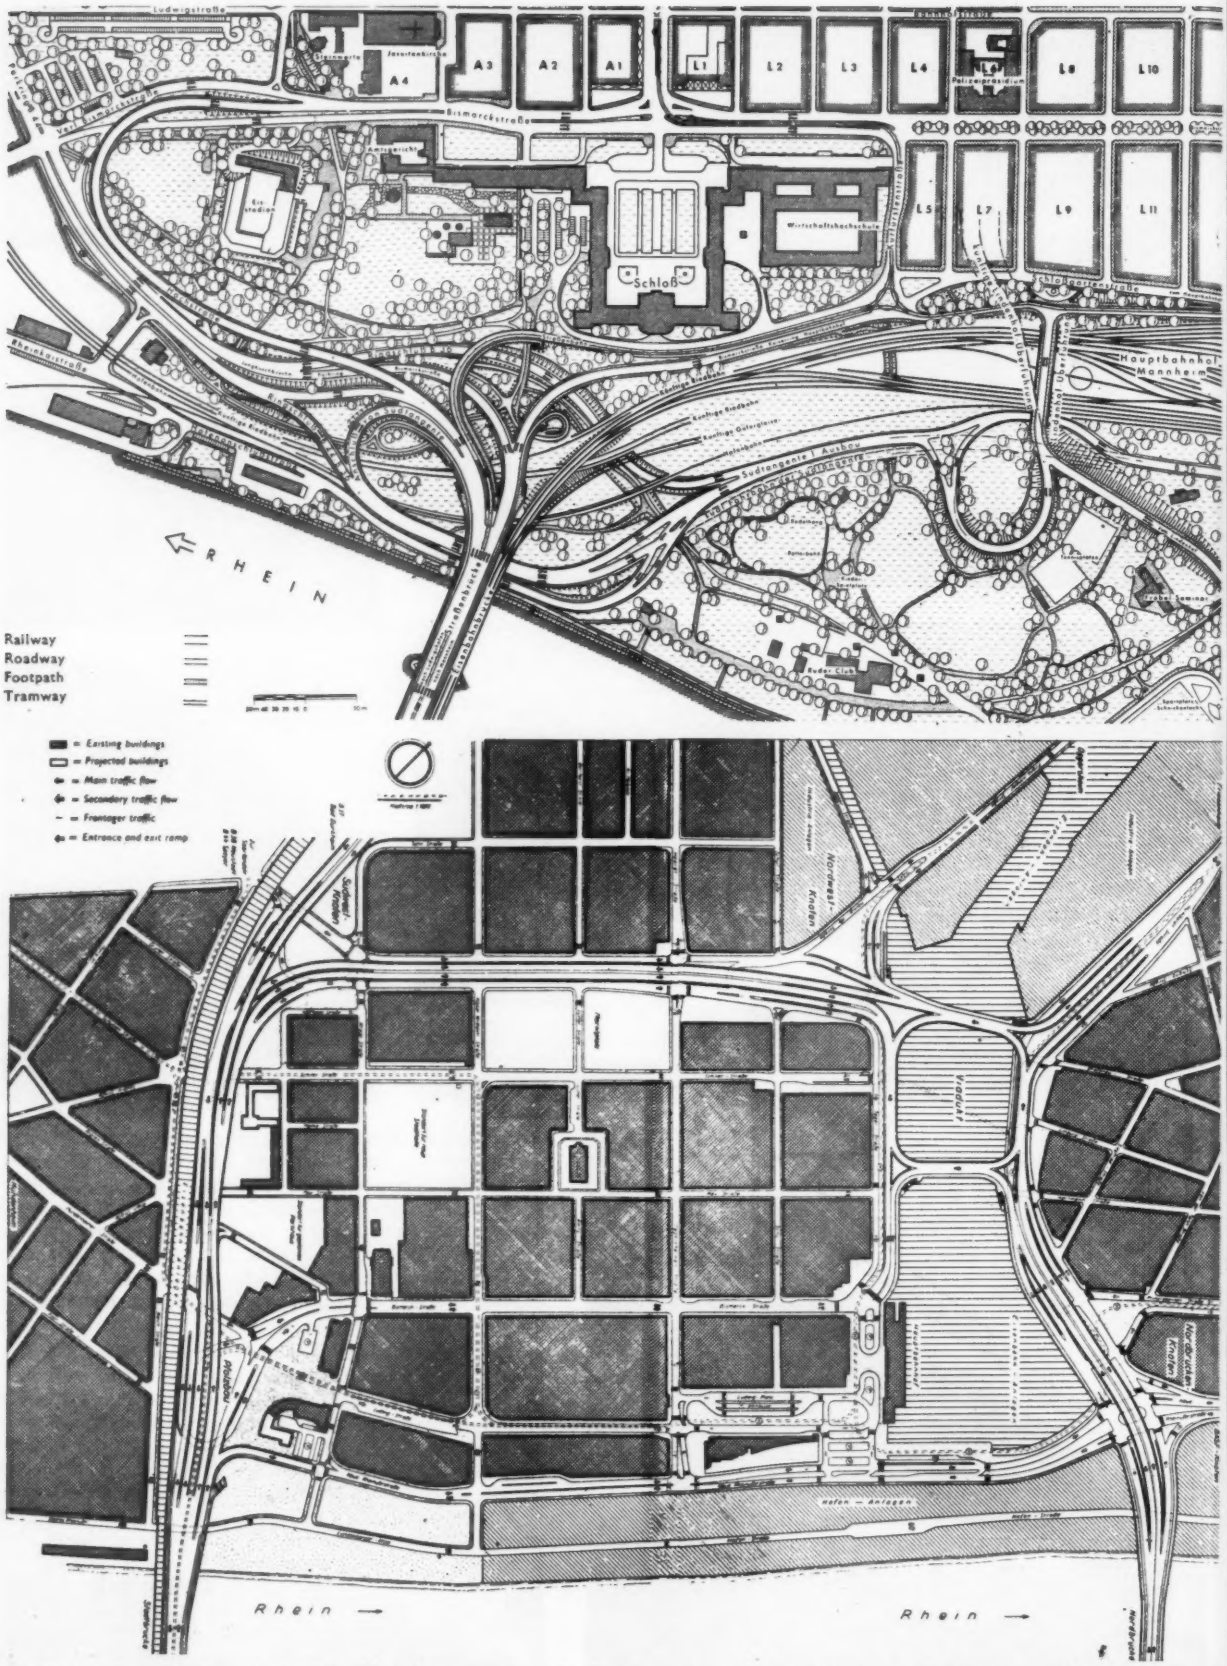
The Germans are now changing their policy to some extent, and a number of urban motor road schemes are planned or under construction. These are designed primarily either to relieve the acute congestion in the central areas by by-passing them, or to bring the autobahn network into the central areas; sometimes one road achieves both aims. At the same time the local authorities are encouraging the building of parking garages by private enterprise on a substantial scale, often by leasing sites to developers at a nominal rent, and are installing parking meters to curb the all-day parker. But these

(Continued on page 583)





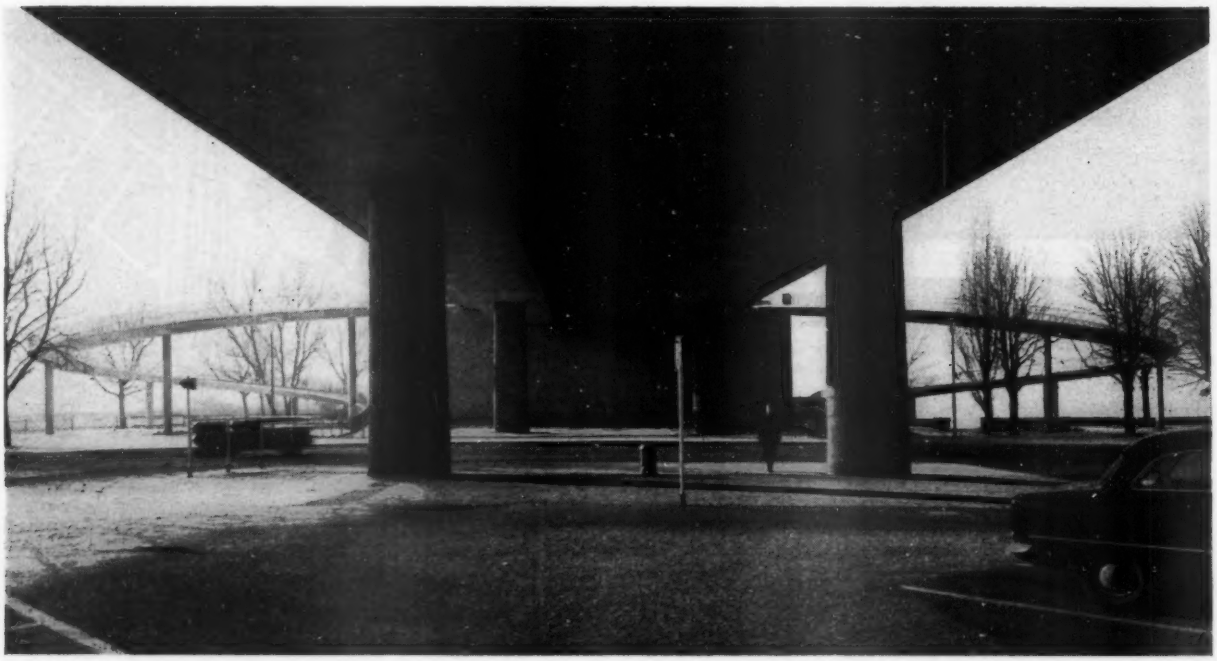
These pictures show a variety of solutions adopted for the elevated road or bridge approach carried on a single row of r.c. columns. Left, from top to bottom: the tramway approach at Mannheim, mushroom-shaped columns supporting a 4-lane highway at Ludwigshaven, and a single carriageway at Düsseldorf. Right, from top to bottom: 4-lane by-pass at Bingen, 4-lane viaduct at Unkelstein, 2-lane approach to Severins Bridge, Cologne, and (below) the experimental Alweg monorail near Cologne.

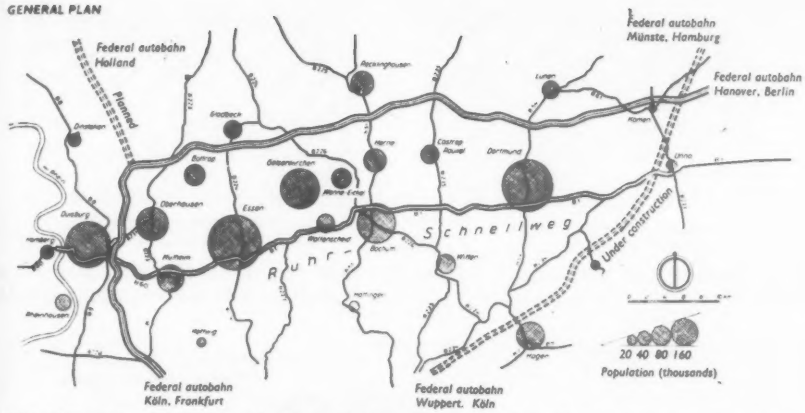


Ludwigshaven on the West bank of the Rhine is connected to Mannheim, on the east, by one bridge, the Stadtbrücke, which also provides the main road link between the Saar and Germany. The plans, on different scales, show (top) the new multi-level approaches being built in the riverside park on the Mannheim side, with separation of road, tram track, footpaths and railways, and (below) the elevated road system that is to encircle the centre of Ludwigshaven from the Stadtbrücke (left) to the future Nordbrücke, and take through traffic west.

Top: a view of the Mannheim bridge approaches under construction, with Ludwigshaven on the other side of the Rhine, and the separate tramtrack in the foreground. This complex of roads discharges its traffic straight into the streets of Mannheim, whereas in Ludwigshaven the intention is to build one elevated road to carry through traffic out of the city, and another to encircle the central area (see plan, opposite). The smaller pictures show, left, close up of the Mannheim approach and Castle; below, left to right, three views of the Ludwigshaven ramps: (a) tram track entering the town under the elevated bridge approach, (b) lorry emerging from underpass, and (c) the elevated roads left unfinished at the point where the road to the west is to join the inner ring road; the complete scheme is expected to take 10 years.

One of the finest engineering works in Western Germany is the Nordbrücke (top, and above left) across the Rhine at Düsseldorf. It is described by the German engineers as " a girder bridge suspended on ties arranged in the shape of a harp." It achieves a wonderful economy of means and purity of line, which are equalled by the detailing seen, above right, in the 370-yds. long elevated approach road on the Düsseldorf side and, below, in the spiral ramps for mothers with prams (or boys with roller skates). The space underneath the road is used for car parking.





The plan, top, of the 39-mile Ruhr Expressway (Ruhr Schnellweg), which is to link the towns of the Ruhr conurbation, shows its connections with the Federal autobahn system. Below, the scale of the Expressway (4 lanes, with tramway in centre) is seen in this excavation in Essen.

Above, "The Picasso Bridge," near Wuppertal, on the new Wuppertal-Cologne autobahn, showing the use of saplings to bind the embankment before planting. Below, bridge carrying an approach road over the motor road at a Cologne intersection.

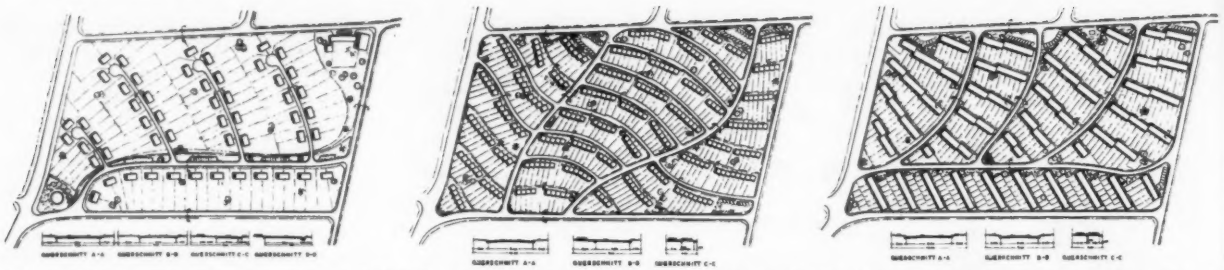
measures, even when allied to more energetic application of traffic engineering principles, do not add up to a policy for dealing with the motor vehicle in the city. A closer look at some of the schemes will show what I mean.

At Mannheim and Ludwigshaven, where the only bridge across the Rhine carries the traffic from the Saar to south Germany, the bridge has been widened and multi-level intersections built at its approaches. On the Mannheim side (Fig. 1) a large area of parkland has been swallowed up by an enormous intersection with separation at different levels of vehicles, pedestrians, trams and three railway lines. The trams and motor vehicles, however, then enter the existing Mannheim street system, which adheres to the pre-war pattern.

In Ludwigshaven, where the engineer is also the town planner, the bridge approach is to be continued as an elevated road, which will encircle the town centre completely, and will be connected to another elevated road to the west. This bold idea, which is being brilliantly executed in its initial stage, makes it possible, by diverting all through traffic to create pedestrian precincts within the city centre, but nothing of the kind seems to be contemplated. Ludwigshaven, like Mannheim, has been rebuilt on the pre-war pattern. The space created on the ground by the elevated road is to be used for roads and car parks, and the building line is to be set back 60 metres from the new road.

The post-war rebuilding of Cologne, while an impressive example of enterprise, is a planning and architectural disaster. It was painfully evident that the desire of private enterprise to rebuild on the old sites (even if in a modern style) had destroyed the possibility of creating a new city within which the pedestrian-vehicle conflict was resolved. The town centre is unpleasantly dangerous and noisy. The principal shopping street is closed to traffic from 10 a.m. onwards, as it was before the war, but it is not even designed for servicing from the rear. The authorities are concentrating on bringing the autobahn into the city centre over the new Severins bridge (an ugly but original structure, in which the deck is suspended from a massive triangular pylon), linking the bridge to the west by improving the existing streets, and improving an outer ring road. Private enterprise is providing parking garages, often linked to shops or hotels, but these appear to be scattered indiscriminately about the city and are not related closely to the points of access to the motor roads.

The Ruhr Expressway will run for 39 miles connecting the Ruhr cities; about a third of it (in rural areas) has been built, and the remainder is to be completed by 1965. Much of it will be in cuttings or on stilts, and in Essen it will pass under the city centre in a tunnel. It will take four lanes of traffic, and two tramlines, but one saw no sign in Essen, for example, that the problems of the centre were being tackled with equal boldness or imagination. As an afterthought vehicles have been excluded from one half of the main street (a length of 100 yards or so), but here as elsewhere the pedestrian



Three alternative housing layouts suggested in the Hamburg traffic plan show that Hamburg's ideas on planning residential areas for the motor car lag behind the imagination shown in the city's decision to plan its transport system as a whole, with the major emphasis on public transport and tube railways.

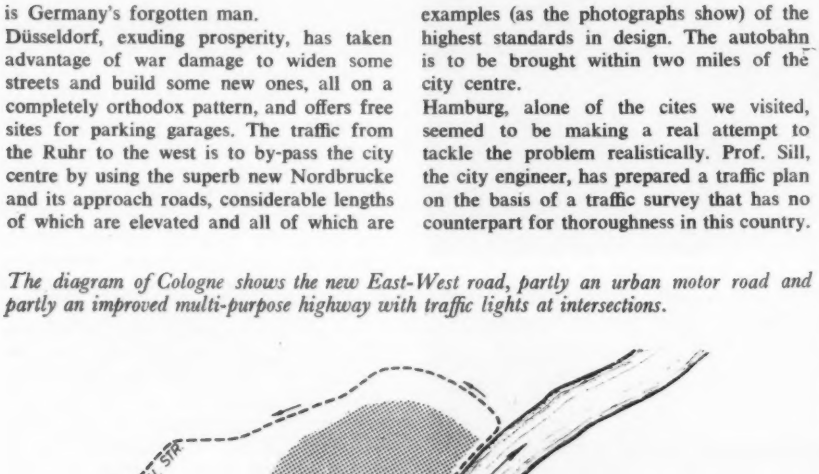
The East-West road in Hamburg (2 kilometres long, 120 ft. wide overall), shown with other road improvements in the plan of Central Hamburg (right) is being developed with shops and offices along the frontages (left), as a multi-purpose road.

is Germany's forgotten man.

Düsseldorf, exuding prosperity, has taken advantage of war damage to widen some streets and build some new ones, all on a completely orthodox pattern, and offers free sites for parking garages. The traffic from the Ruhr to the west is to by-pass the city centre by using the superb new Nordbrucke and its approach roads, considerable lengths of which are elevated and all of which are examples (as the photographs show) of the highest standards in design. The autobahn is to be brought within two miles of the city centre.

Hamburg, alone of the cites we visited, seemed to be making a real attempt to tackle the problem realistically. Prof. Sill, the city engineer, has prepared a traffic plan on the basis of a traffic survey that has no counterpart for thoroughness in this country.

The diagram of Cologne shows the new East-West road, partly an urban motor road and partly an improved multi-purpose highway with traffic lights at intersections.



This shows that it would be wrong to attempt to provide for unlimited use of the private car; 170,000 car parking places would be required if everybody commuted by car. The City Government's policy while providing car parks and improving the road system, is to provide public transport for 75 per cent of commuters. Although public transport is losing money, over £3 million is being spent this year alone on a new tube railway, the completion of which will lead to the elimination of trams in the centre.

But even in Hamburg one saw no sign of any attempt to extend pedestrian precincts. The new East-West Road is simply a 120-ft. wide, six-lane, multi-purpose road carved through the city, with zebra crossings and offices and shops along the frontage.

There must, I think, be some significance in the fact that our party only met engineers; not one landscape architect, architect or town planner (unless he was an engineer) came to explain their contribution to road planning. It was equally significant that only one British architect was in this party, and that every local authority (except Glasgow which sent its chief planning officer and the chairman of its planning committee) sent the chairman of its highway committee and the engineer. Urban road planning, both in Germany and Britain, is treated in isolation, as an engineering problem.

My conclusion is that while the Germans are far bolder, spend more money, and have much to teach us in engineering and landscaping, they have little to teach us in the fields of town planning and town design. I feel sure that if our town planners, architects and engineers were given money and opportunities on the German scale they could probably make better use of them.

technical section

THE INDUSTRY

From the industry this week Brian Grant describes an oil-fired boiler, embedded heating cables, an electric heating element and sliding garage door.

Oil-fired boilers

When so many of the established boiler makers are introducing oil-fired versions with comparatively small outputs for hot water and 100 ft. or so of radiation, it is easy to forget the larger models for full central heating. Hope's have just announced a new model, which is available in five sizes with outputs from 100,000 to 220,000 B.Th.U. per hour, at prices from £195 to £285, though this does not include the cost of the oil tank. The boiler is a sectional cast iron type, well insulated and enclosed in a rectangular stove enamelled case. The burner is a fully automatic on/off pressure jet type with an adjustable boiler thermostat and the usual safety devices. In order to reduce installation costs the refractory block combustion chamber is prefabricated and all main controls are wired at the factory, so that provided the oil tank is in position and an electrical supply available the conversion can be completed in a few hours. Hope's also have a service organization which covers most parts of the country. (*Hope's Heating & Engineering Ltd., Smethwick, Birmingham.*)

Embedded cables for heating

Volex Electrical have recently introduced a full range of special heating cables for embedding in floors, walls or ceilings, as well as specially modified types for horticultural and other uses. The cables consist of a copper or copper alloy conductor with an inner sheath of a flexible heat resistant rubber-like compound to absorb conductor movement and an outer covering of p.v.c. for mechanical strength and protection. Installation costs vary from about £10 to £14 per kilowatt, or about 3s. per sq. ft. of heated area. Cables can be supplied to specified lengths and ratings, but a number of sizes are available from stock, in lengths from 120 ft. to about 1,400 ft. with loadings from 540 to 7,800 watts. Floor temperatures of about 62 deg. F. are usually possible, depending on personal tastes and the type of floor finish, and the manufacturers maintain an advisory service to suggest cable ratings, spacings, floor layouts and control arrangements. (*Volex Electrical Products Ltd., Salford, 6.*)

Electrical convected heating

Inferation Ltd. have evolved a plastic electric heating element which is claimed to be perfectly safe and which can be made in panels or in long lengths. The illustration on the right shows a skirting heating board which has a loading of 60 watts per foot and which costs about £1 per foot run fixed. Wooden board of the same profile is provided to fill in the spaces between panels when the required loading has been reached. The same panels are also used in a combined heater and clothes dryer which sells at £24 5s. including purchase tax and which has a loading of 600 watts. (*Inferation Ltd., 12/13 Copthall Court, London, E.C.2.*)

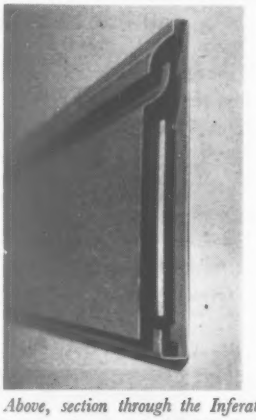
Asbestos cement data

The UAM Group's new Mills-Bullivant catalogue was introduced just before the printers' strike, and was somewhat belatedly noticed here only a few weeks ago. A further instalment dealing with Fort sheet has just been produced, and various improvements have been made in presentation, the drawings improved, while all fixing accessories are now shown on a single fold out sheet so that reference is much simpler. Congratulations to a group intelligent enough to listen to comments and then do something about them. (*UAM Group, Tolpits, Watford, Herts.*)

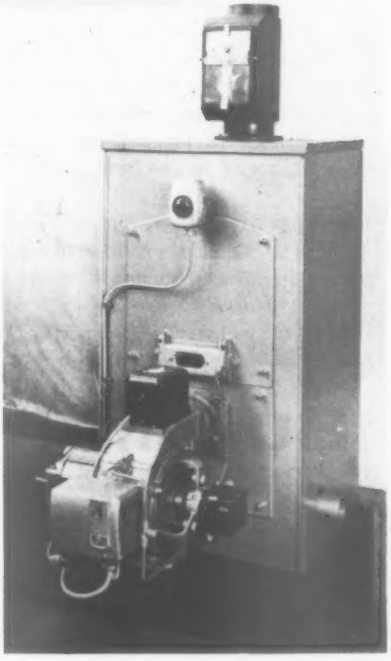
Garage doors

The new Bolton Glydover garage door slides up under the ceiling on nylon pulleys on a curved track, and is spring counterbalanced so that it needs very little effort to lift. It remains balanced in any position and has a rubber cushioning strip at the foot to act as a draught seal. The standard size is 8 ft. wide by 7 ft. high but other sizes can be made to fit any opening. Construction is rustproofed steel. (*The Bolton Gate Co., Ltd., Waterloo St., Bolton.*)

Above, the Bolton Glydover garage door.



Above, section through the Inferation plastic electric heating element. Below, Hope's new oil-fired boiler.



Revolutionary

THERE'S A NEW MATERIAL for insulating buildings. It's called Fibreglass Crown. This has all the advantages that Fibreglass has always had, only more so.

Crown is lighter and stronger. Crown is easier and cheaper to handle and store. Crown is more flexible and has a higher tear strength. Crown is more resilient and more compressible. Crown is the finest and most effective structural insulation ever produced by anyone. Including us.

Is it more expensive? No!—it doesn't cost a penny extra. In most applications it costs less.

19 CONSTRUCTION: DETAILS

minor roads and external pavings, 2 sub-base and base

This is the second of four articles by W. Houghton-Evans. From a discussion of the principles of design and the general problems of construction,* the author now moves to more specific details. This article is concerned with foundations and considers, first, the sub-base and then the base. Whilst a sub-base is not always essential, as the author points out, there are good reasons why it should be included where possible and these are set forth. In considering the base, various alternative materials are examined from hardcore, the traditional material, on the one hand, to stabilized soil on the other.

The architect's choice of construction will first be conditioned by the performance he requires. Iron-tyred machinery and animals will rapidly destroy all except concrete. Concrete is relatively expensive, but on a contract where external pavings are small and concrete is being extensively used, it may prove an economical choice. An asphalt contractor employed elsewhere on the works may be able to give a keen price for external pavings in which his firm may specialize, and construction may be designed to take them.

The local authority may be willing to maintain, in which case materials used on adjoining highways would be most appropriate. If the local authority is to adopt, the road will almost certainly be to their specification. The possibility of using industrial waste, demolition, and other less orthodox materials which may be available locally at low cost should not be overlooked. A farmer-client may wish to use his own labour and machines as far as possible. Materials, machinery and labour available, the quantity of work to be undertaken, and its appearance on completion must from the outset be considered.

The sub-base

A sub-base is not always essential but is generally desirable. It acts as a subsidiary foundation, and as it may be of material inferior to and cheaper than the base, a saving may result from its inclusion. It serves also as a previous layer through which water can move into sub-soil drains; as a temporary working surface on a muddy site; as a plane of cleavage between a concrete base and the sub-grade, permitting free temperature movement; and to true-up and act as a cushion to an uneven rocky sub-grade.

Materials generally used are hard clinker, ashes (not "Fly" ash), gravel, crushed brick or concrete rubble, and some shales. Any granular material, neither powdery nor too coarse, chemically inert and unaffected by water, will suffice. With shales this last point is especially important, as many are unsatisfactory in this respect. A minimum thickness after consolidation of 2 in. will do, but as has been pointed out, a greater depth may lead to a saving on the base itself. With the materials noted above, a CBR of about 15 per cent. is usually associated.

After spreading and raking to the correct profile, the sub-base should be rolled in the same manner as the sub-grade. This, and all subsequent rolling, must not exceed that initially given to the formation.

Granular bases

The base may then be formed. Any inert material, capable of stable compaction to a fairly even profile, unaffected by water or frost, and with a CBR not less than 80, may be used. Various materials and methods of laying are as follows:

(*a*) *Pitching or "Telford" bases:* In stony areas pitching may be economical, but this traditional method, where large stones (5 in.-9 in.) are handpacked on their broader ends and blinded with knapped smaller material is likely to be expensive and over-strong for light roads. Hard bricks from demolitions may be used in this manner. Hand-knapping to give an even surface and fill voids has now in the main given way to rolling which has much the same effect. Any stones standing proud of the general level in a manner likely to cause the roller to tilt, must, however, be knapped before rolling commences.

(*b*) *Hardcore or "Macadam" bases:* Hard angular stone, shale, hoggin, hard brick rubble, are all suitable. They should be well-graded and reasonably free from dust. Maximum size should be less than the base thickness. A supplier may be required to deposit samples in accordance with BS812, and slags should accord with BS1047.

The material should be dropped at intervals upon the sub-base, the delivery vehicles "drawing-out" the load during discharge. Segregation in transport of fine and coarse particles should be avoided—either by lightly moistening during loading, or by requiring the separate delivery of the screened finer material which should be filled into the voids of the previously placed coarser fraction.

This construction is essentially similar to that used by

*See AJ November 12, 1959.

technical section

Macadam, who placed 4-inch layers of stones broken down to 2 inch size on a cambered formation. Where machinery is not available, his method, which relied on subsequent traffic for consolidation, may still be used. Care, however, is necessary to ensure that the whole is uniformly traversed by wheel tracks and ruts are not formed.

(*c*) *Wet-mix bases:* Crushed limestone, graded from 2 in. down and mixed with water to render it sufficiently plastic to be placed by a mechanical spreader of the type used for surfacing (a "Barber Greene") is now increasingly used. The mix must be as dry as workability will permit, weather conditions must be favourable, and care must be taken that the base dries out before surfacing. Failure in this last respect can lead to frost damage to the surface or failure of the sub-grade.

(*d*) *Lean-mix bases:* A lean concrete (1:18-24) with all-in aggregate (1½ in. down to sand) may be used in a manner similar to wet-mix. The material may be hand-placed, but mechanical spreading is possible. Care again should be taken to ensure adequate drying out and the mix should be kept as dry as possible.

With all the foregoing, the base must be dressed to the finished profile and compacted to an even-textured stable mass. For this an 8-10 ton roller should be used until no further compaction is obtained. The road is then ready to receive the final surfacing.

Soil-cement bases

An alternative to placing material *on* the soil to improve its capacity is to mix something *in* it. The admixture may be bitumen or Portland cement, and the process is known as *soil stabilization*. The use of bitumen is not likely to be successful in our climate, and it is with the *soil-cement* road that we shall concern ourselves.

Two methods of stabilization are used—"mix-in-place" and "plant-mix"—the latter usually where the native soil is unsuitable and imported material is used.

It is clear that a process which obviates the need to bring large quantities of material to the site may be attractively cheap, and especially on jobs where first cost is a major consideration, the possibility of using it should be considered. Prices as low as 5s. yd. sup. for the base are not uncommon.

Coarse boulder gravels, silts, silty clays, peats and highly organic soils are difficult to stabilize, and heavy cohesive soils may require the addition of coarser granular material such as slag dust to make them workable. It is of course possible with unsuitable soils to substitute suitable imported material.

It is first necessary to ensure that the soil is suitable for treatment, and if so, the treatment necessary. This will involve sampling and testing. If undertaken by a laboratory, the total cost of this may well run into hundreds of pounds, and at first sight this appears formidable. This sum should, however, be related to the total cost of pavings and the saving likely to be effected. Furthermore it should be remembered that preliminary investigation would be sufficient to establish a soil as unsuitable, and for this charges are unlikely to exceed £50, and may be as little as is involved in visual inspection made during one site visit. Samples must be taken at such depths and frequencies as to be representative of the base as a whole, and the testing laboratory may be asked to advise in this. In general, trial holes about 3 ft. deep should be excavated at 100-ft. intervals along the line of the road, and the excavated material sealed into airtight containers. With very consistent soils, intervals of 300 ft. may suffice. Test results will indicate whether the soil is, or can by additives be made, suitable for stabilization; at what moisture contents pulverization and mixing should be carried out; what amount of cement should be used; and how much water should be added before compaction. Copies of test reports should be sent out with all invitations to tender.

An alternative to laboratory testing which may be undertaken by the designer himself is described as follows in an admirable leaflet issued by the Ministry of Agriculture and Fisheries (*Fixed Equipment of the Farm: Leaflet No.* 19; *Soil-Cement Roads;* HMSO. This leaflet also describes in detail how farm equipment may be used in making a soil-cement road.):

Home-testing can be done in two ways: either a small strip of road can be tried out *in situ* or some small samples can be made up "on the bench."

The best way is to be prepared to do both; the samples will show whether there is reasonable hope of the soil being stabilized and, if so, the strip will show what happens in the field. Apart from the result of the test, this method gives . . . a chance to see how the job is done.

A strip one or two yards long by the width of the road is enough, as this area can comfortably be compacted by hand tamping or ramming; there is no room to manoeuvre a roller. After hardening, the ideal test is to allow traffic to run over the strip for some months, preferably throughout the winter. There is, of course, the risk that a few bags of cement and some labour will be wasted, but the cost is still likely to be considerably less than a laboratory fee.

The making up of samples is not difficult; the equipment needed is:

Pestle and mortar, or something similar, in which to pulverize and mix. Kitchen scales weighing down to ½ oz. Watering can with rose. Six old round tins, each of which should comfortably contain 1 lb. soil. (A cocoa tin with a diameter of 2¾ in. and a height of 4¼ in. is a suitable size). Tin-opener. Oil can. Carpenter's hammer with a flat-ended handle. Tinman's snips. Soil, cement and water.

The procedure is as follows:

1. Collect about 7 lb. of soil from the site of the proposed road. The sample should be representative of a layer 6 in. deep after the vegetation has been removed.
2. Pulverize the soil into a fine crumb and weigh out six samples of 1 lb. each.

Architects: John Dudding & Partners, F/A.R.I.B.A., in collaboration with F. Hamer Crossley, Esq., Dipl. Arch. (L'pool), F.R.I.B.A., County Architect.

technical section

Figs. 1-3. Multi-pass method for mix-in-place soil stabilization. Fig. 1 (top). A rotary hoe with a cement hopper attachment mixes the cement with the pulverized soil. (Note in the previous operation the same rotary hoe but without the hopper, was used to scratch up and pulverize the soil.) Fig. 2 (centre). Water is added to the cement soil mixture. Fig. 3 (bottom). A smooth wheeled roller gives a final surface.

3. Into each of three samples thoroughly mix 1½ oz. of cement (10 per cent by weight). There are now three samples of soil-cement mixture and three samples of soil.

4. By adding water, bring one sample of mixture and one sample of soil to the right consistency so that when a handful is squeezed it should just hold together in a cake. It should not be possible to squeeze water out of it, nor must it crumble away when the hand is opened . . .

5. Take one of the remaining samples of mixture and make it rather wetter than the first; take the last sample of mixture and add rather less water than was added to the first. Do the same with the remaining two soil samples. There are now three different moisture contents, A, B, and C, in the six samples, *i.e.*, one of soil-cement-mixture and one of soil at A, one of each at B, and one of each at C.

6. Take the tins and slightly oil them round the inside.

7. Put each of the six samples into a tin and label it; put a little in at a time and ram each layer hard with the end of a hammer handle.

8. Leave the six tins in a cool, dry place for seven days to "cure."

9. At the end of the "curing" period, cut the bottoms out of the tins with a tin-opener and gently tap each sample out with the end of a hammer handle. If a sample refuses to come out, cut down the side of the tin with snips; the snips will score the soil-cement but this does not matter and is not an indication that the sample is a failure.

Common sense should now tell whether the soil can be stabilized or not. If unsuitable, the cylinders will probably have crumbled to pieces during their removal from the tins. If they are quite hard, an eminently suitable soil is indicated. If they are slightly soft so that they can be marked with a finger-nail, but still holding together as cylinders, it is well worth while waiting another seven days. Vegetable matter may be the cause of delayed hardening, and it is possible that the samples will be hard at the end of 14 days. The hardest of the soil samples will show the moisture content at which compaction is best.

10. When hard, soil-cement cylinders should be immersed in water for 24 hours, at the end of which time they should be unaffected.

Wherever the soil changes in the line of the road, the test described above must be repeated.

If the samples have not hardened at the end of 14 days, the failure may be due to organic matter in the soil. It is then worth while repeating the test with the addition of ½ oz. hydrated lime or calcium chloride to each sample.

CBR methods of design are appropriate in determining the thickness of a soil-cement base. Six inches will satisfy as a rule.

Mix-in-place construction proceeds as follows:

Strip top-soil and grade to finished levels, digging out and replacing isolated patches of unsatisfactory material.

technical section

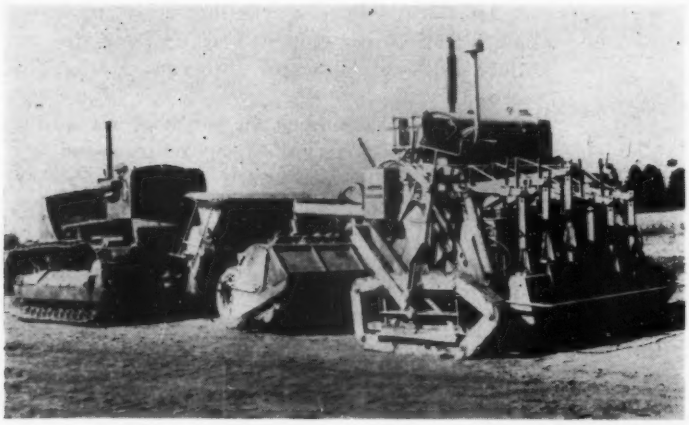

Fig. 4. A train of equipment used for single phase stabilization.

Pulverize soil to fine tilth—for 6 in. finished thickness, to loose depth of 8 in. remove stones greater than 3 in.
Re-grade and compact with light roller.
Check moisture content (simple field instruments are available) and bring to recommended level. Distribute extra water evenly without ponding. Evaporate excessive moisture by continued tilling. With heavy cohesive soils it is better to add all necessary water after mixing in cement.
Mix in water to full depth.
Spread cement: either mechanically or by placing bags at predetermined intervals, breaking open and raking evenly.
Mix until all loose material uniform.
Test moisture content and mix in any additional water required.
Re-grade and compact.
Compaction should continue until the base ceases to yield under the roller. With cohesive soils a pneumatic tyred roller will give better results to start with, finishing with an 8-10 ton smooth-wheeled machine. The base should then be kept free of traffic, covered and cured as for normal concrete work for a period of seven days.
Mix-in-place stabilization may also be effected by the "single-phase" of a train of specialized equipment performing all the above operations in sequence. (Fig. 4).
Plant-mix stabilization employs stationary plant in a manner similar to concrete work. A large mortar-mill is preferred to rotary drum concrete mixers to ensure intimate mixing. Placing may be by hand or mechanical spreader. The same careful control of mix and water content as for mix-in-place stabilization is necessary.
The addition of Portland cement will alone usually be necessary, but test results may have called for calcium chloride where organic matter is present, or for hydrated lime to "break-up" heavy ground.
Soil cement is also suitable for paved areas other than roads. A compacted thickness of 3 in. will generally be satisfactory for playgrounds and footways. In all cases a wearing surface is necessary to prevent abrasion.

The Gas Council on the domestic kitchen

On the following pages is a supplement on the domestic kitchen which is sponsored by the Gas Council. This is the seventh of a series of supplements which have as their object to give a full technical description for architects of the different uses to which gas and coke can be put. Like Information Sheets, these supplements are a journalistic hybrid: they are "advertisements" in the sense that the space they occupy is paid for by the sponsors and that their ultimate object is to foster the greater use of gas; but they are "editorial" to the extent that the means chosen is to provide as much reliable information as possible and that this information has in fact been "approved" by the JOURNAL'S *Technical Editor. We hope that readers will extract and keep these supplements for future reference. For this purpose a special binder can be obtained, free of charge, on application to the Publicity Manager, Gas Council, 1 Grosvenor Place, S.W.1. Alternatively, readers may apply through the business reply folder at the back of this issue. The first six supplements "Domestic Space Heating 1. Fires and unit heaters," "Domestic Space Heating 2. Central heating by gas and coke," "Domestic Water Heating," "Gas Flues," "Coke," and "Flues in Tall Buildings" appeared in the* JOURNAL *for November 29, 1956, April 25, 1957, and September 26, 1957, and April 24, 1958, January 22, 1959, and October 8, 1959 respectively.*

gas supplement

gas supplement

UDC No.	696·2

DOMESTIC KITCHEN

This supplement begins with a discussion on general matters to do with kitchen planning: in particular, on the correct heights of working surfaces and of each piece of equipment and on the amount of permanent ventilation to be provided. Next comes a review of each different type of gas-fired cooking equipment followed by a similar review of gas-fired refrigerators. Attention then turns to home laundry, beginning with a discussion of general planning and passing to a review of gas fired equipment: first, for washing, then for drying. The supplement ends with a suggestion that gas might well help with the problem of refuse disposal.

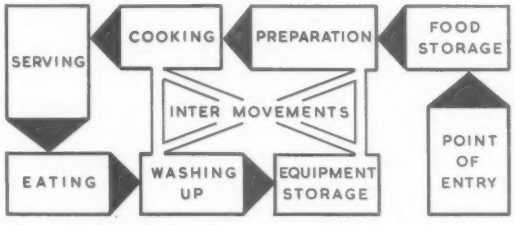

Fig. 1. Sequence diagram.

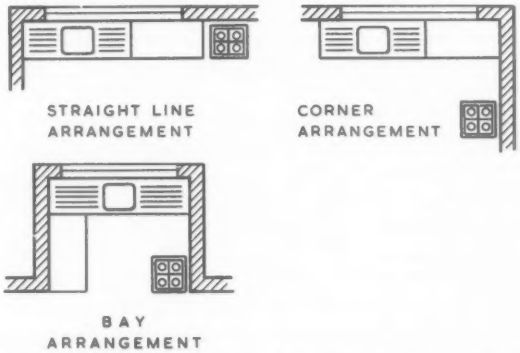

Fig. 2. Simplified diagrams of the three shapes in which the cooker, worktable and sink may be arranged.

The domestic kitchen is often called the hub of the home; certainly a well-planned and labour-saving kitchen lightens and makes more pleasant the daily routine of the housewife and thus contributes in no small way to the comfort and happiness of the family.

Practically every kitchen is used for a number of purposes which may have little bearing on its accepted functions of cleaning, cooking and laundry work, which vary with every family and which must be taken into consideration when planning. Basically, however, there are only three kinds of kitchen: the working kitchen, which is apart from "family" activities; the dining-kitchen, where, in addition to the work, some or all of the meals are eaten; and the living-kitchen, which not only combines the functions of the other two but is also the place where the family carries out its leisure pursuits. In many dining and living kitchens the sink and laundry equipment are housed in an adjoining scullery or utility room so that the "dirty" jobs are not in evidence when the family relaxes.

Recently the Building Research Station found that 75 per cent. of the working time of the average housewife was spent in the kitchen, and that for two-thirds of this time she was actively engaged with some aspect of the meals cycle, in preparing, cooking or serving the food, clearing away or washing up. Thus the arrangement of the equipment and appliances concerned in this particular work cycle should be considered and planned before any of the other purposes for which the kitchen is used, such as laundry work and cleaning. Work should flow consecutively from one stage to another; this is best shown diagrammatically, and the sequence applies equally to the smallest kitchenette as to the largest catering establishment:

Thus the cooker, sink and worktable are the three main pieces of equipment and are used interdependently. They therefore require to be sited close together in such a way that the housewife is never in her own light when working at any one of them. There are three "shapes" in which they may be arranged to achieve this: a straight line, two sides of a cooker, or three sides of a bay.

Once the cooking cycle has been settled the equipment needed by other kitchen processes may be fitted round it, following its own work cycle as far as possible in the circumstances. The washing

machine, for example, should be near the sink, even if it does have to be moved a little way from its storage position to its working position on wash-days.

Working heights

The correct working heights for all kitchen equipment can never be completely standardized; they depend very largely on the individual who is to work at them, and her height in relation to the length of her arms. Ideally, all equipment should be at such a height that it is never necessary to stoop to use it; in practice space limitations make some modification of this rule necessary, but it should still be possible to make sure that the most used pieces of equipment are at the most convenient levels.

To find the ideal working height for an individual she should stand, in her working shoes (½in. heels) upright against the piece of equipment with her arms straight in front of her and her palms flat on the work surface. For some kitchen operations, however, she will need a second level, depending on whether she is working with her arms bent (as in beating cakes) or straight (as in rolling pastry). Both heights, therefore should be available in the kitchen, although this does mean that the popular "continuous worktop" arrangement of equipment has to be discarded.

The average woman stands 5 ft. 3½ in. in her working shoes, and originally the British Standards Institution fixed the standard working height at 36 in. from the ground. It is now generally agreed that this is too high for many women, and fittings and equipment are available with the working surface at a lower level.

Ventilation

Whatever the fuel used by the equipment in a kitchen, the need for adequate ventilation which will ensure reasonable conditions of temperature and humidity during periods of cooking and clothes washing always exists. Although doors and windows if used intelligently could provide a good standard, it cannot be assumed that these will always be open, and some form of permanent ventilation should preferably be installed.

The recommended minimum rate of fresh air supply to kitchens cooking for not more than six persons, given in the Code of Functional Requirements, is 2,000 cubic feet per hour. When calculating ventilator areas to provide this, allowance can be made for adventitious air infiltration through door and window gaps. The following table allows for this, assuming that the equivalent ventilating area of the gaps at the inside wall and doors exceeds that of the windows by an average 6 sq. in., and shows the equivalent ventilating areas to be provided according to the ventilating rate required; the flow rates given are for the ventilators in series on the outside and inside walls. The areas give a guide for provision of natural ventilation under average conditions for the particular type of situation mentioned.

Ventilating rate in cu. ft. per hour according to locality			*Equivalent area of ventilator to be provided (sq. in)*	
Sheltered (Built-up areas)	*Normal (Suburban)*	*Exposed (Country and outskirts of towns)*	*In outside wall*	*In inside wall*
500	990	1,490	15	9
660	1,320	1,980	20	14
820	1,650	2,470	25	19
990	1,980	2,970	30	24
1,160	2,310	3,470	35	29
1,320	2,640	3,960	40	34

In order to calculate the air change necessary to avoid discomfort from humidity and temperature rise and to ensure safe operation of gas appliances the size of the room, the type of appliance and the diversity of usage of the equipment must all be taken into consideration. The introduction of a wash boiler or heated washing machine, for example, requires a higher air change per hour to offset the steam and humidity produced by clothes boiling; if a drying cupboard or tumbler dryer is introduced in addition the problem can become even greater. It is not generally realized that the amount of moisture discharged from one drying cabinet by one load of clothes (9 lb. dry weight) may be anything from 5-10 lb. of water. Air changes from eight up to sixteen changes per hour will be necessary if condensation is to be completely eliminated and reasonable working conditions assured.

As air changes of this magnitude can make the kitchen decidedly uncomfortable when the drying cupboard is not in use some auxiliary ventilation should be considered; this could take the form of a flue from the appliance to the outside air or a small extract fan. The latter, if fixed in an outside wall or the kitchen window, for example, would also assist the removal of cooking smells, vapours, steam, etc. which is a decided advantage. There is no need to provide a hood or duct over the cooker for this purpose; it is far better to ventilate the whole kitchen in a general way and therefore employ the extract fan to much better advantage.

Preferably natural ventilators should be fitted on opposite walls, one external and one internal. To improve air dispersal and avoid draughts one should be at a high level and the other preferably at a low level. The inside louvres should point upwards to deflect any draughts towards the ceiling. The flue accommodating a solid fuel appliance can act as the internal extract ventilator if a ventilator is fitted into it, preferably at high level. If this is done it is necessary to check the operation of the boiler and capacity of the flue to deal with the additional ventilation. There are cases where unused flues exist and these can easily be employed as a ventilator shaft.

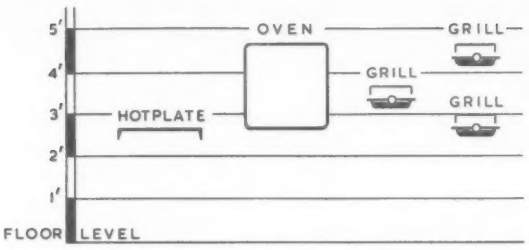

Fig. 3. Ideal positions for individual cooking units.

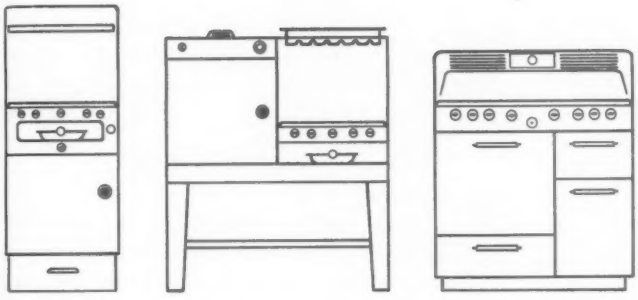

Fig. 4. Vertical cooker (left). Raised oven cooker (centre). Range cooker (right).

The gas cooker in the domestic kitchen

Four basic units are required for the cooking process; the hotplate, which includes the boiling burners, the grill, the oven, and plate warming facilities which may be either a plate rack, a hot closet, a warming cupboard or a warming drawer. Gas cooking appliances consist of one or more, or combinations of all four, of these basic units.

The ideal heights of the individual units for the average (5 ft. 3½ in. in ½-in. heels) woman are as follows:

Hotplate: 32 in. to the top of the working surface.

Oven: 32 in. to the oven floor.

Grill: 38 in. to the pan supports. This position poses many design problems, and cannot generally be used. There are two alternatives which are nearly as good, *i.e.* 50 in. to the pan supports to give easy viewing or 30 in. to the pan supports to give easy manipulation. When these units are installed individually the ideal position for each may be achieved without difficulty, but space and design limitations call for compromises when they are combined together as complete cookers. As the hotplate accounts for three-quarters of the total gas consumption of the cooker it is obviously the most-used part, and should if possible be at the ideal height. This means that some or all of the other units may have to take up secondary positions.

There are three main designs of cooker:

(*a*) *The vertical cooker*, where the units are arranged one above the other. There are several ways of combining the units in this arrangement (see next section): the grill may be in either of the two alternative positions already discussed, but the oven may not be quite as conveniently placed. In many cases the hotplate itself will have to be 36 in. from the ground so that the grill and oven below are not too low for comfort.

(*b*) *Raised oven cookers*, where the units are more or less in their ideal positions with the base of the oven side by side with the top of the hotplate.

(*c*) *Range cookers*, which give a large working area at hotplate level, but where the oven will not in consequence be in the ideal position.

It is difficult to give more than a very general guide on the size of cooker required for a given number, because the cooking habits of any particular family vary greatly; for instance, a large family with simple meal requirements will be adequately served by a standard vertical cooker, while a small family with more elaborate tastes will need the extra hotplate burners and space on a range cooker. As a rough guide, however, the capacity of the cooker should be adequate for the full requirements of the household including occasional extra demands, and a family of from three to six persons can be catered for adequately by a cooker with a four boiling burner hotplate, a grill, and an oven of from 1,500 cu. in. to 2,500 cu. in. in capacity (oven dimensions are included in a table at the end of this section).

There is a very wide range of gas cooking appliances and one will be found to fit every requirement. A short description of each kind follows: for approximate dimensions of each, reference should be made to the table at the end of the section.

Table cookers

(*a*) *Boiling burner or ring.* A single boiling burner may be fitted to a flexible connection of approved design for use either as extra cooking equipment or as a useful accessory for the bed-sittingroom. No tap is provided on the appliance as it is undesirable to leave gas in flexible tubing when the appliance is not in use. The plug-in control between the tubing and the main gas supply is used as the control and the appliance is thus disconnected when not in use.

(*b*) *Hotplate.* This appliance is not normally portable, and should be rigidly fixed to the main gas supply. If a flexible fixing is unavoidable the connection ends and flexible tubing must be of the heavy duty armoured type. Hotplates may have from two to four boiling burners, and some of the larger ones may be built-in to other equipment.

(*c*) *Hotplate with grill.* The conditions for fixing are the same as those for the hotplate. The appliance takes up the same amount of space as the hotplate but provides a much more flexible service.

(*d*) *Breakfast cooker.* This appliance is rigidly connected to the main supply. It consists of two or more

Fig. 5. Boiling ring.

Fig. 6. Hot plate.

Fig. 7. Hotplate with grill.

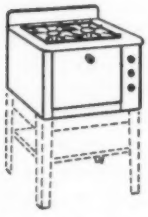

Fig. 8. Breakfast cooker.

boiling burners, a small oven, and a grill. The grill may be an integral part of the cooker, or may be completely removable when the full capacity of the oven is required.

(*e*) *Separate grill.* Separate grills are often used to supplement the service given by an ordinary cooker.

Small cookers

Small cookers are intended for one- or two-person families who do very little cooking, or for installation where space does not allow for a standard model. They are not suitable for small families where the numbers are likely to increase. Small cookers consist of an oven, two or more boiling burners, and a grill. Some are fitted with a shut-down cover which fits over the hotplate when the cooker is not in use; this arrangement is useful where there is no separate kitchen and the cooker is installed in the living-room or bed-sitting-room.

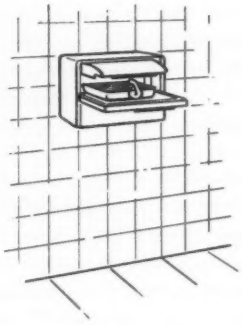

Fig. 9. Separate grill.

Fig. 10. Small cooker.

Full size vertical cookers

These contain a hotplate with four or more boiling burners, a grill, an oven, and platewarming facilities; the units may be arranged in a number of combinations.

Vertical cookers are available in various widths from 1 ft. 9 in. (to fit in with British Standard requirements for kitchen fitments) up to just over 2 ft. 6 in.; thus all needs from the flat to the boarding house are considered.

Raised oven cookers

These are double the width of the normal vertical cooker but the overall heights and the arrangement of the units may vary; the grill in particular may be placed in one of several positions. Storage cupboards or pot racks are often incorporated in the design. A slight disadvantage in this arrangement is that the high oven side limits the ease with which pans may be manipulated on the hotplate.

Range cookers

Range cookers are either double or one-and-a-half times the width of the normal vertical cooker. The hotplate may be at one of several levels and may include extras, such as a griddle plate, which as well as its main purpose also provides extra simmering facilities. There may be one or two ovens, either similar in size, or one larger than the other; if there is only one oven it must be remembered that this kind of

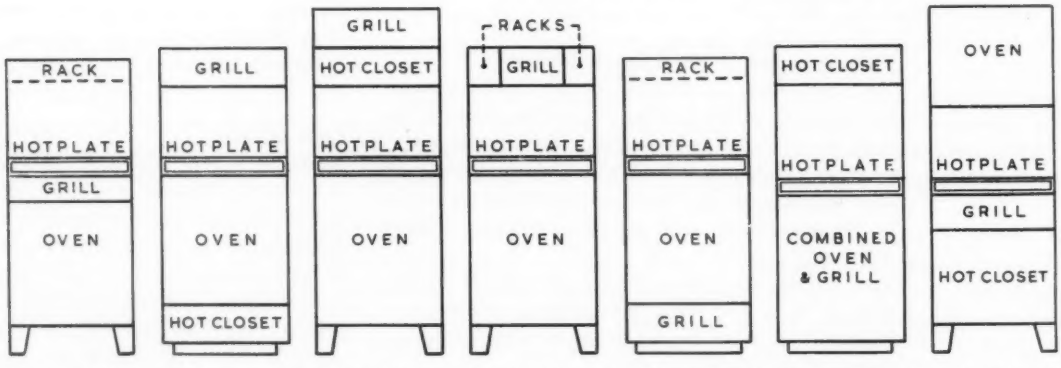

Fig. 11. Diagrammatic arrangements of units to make up vertical cookers (above).

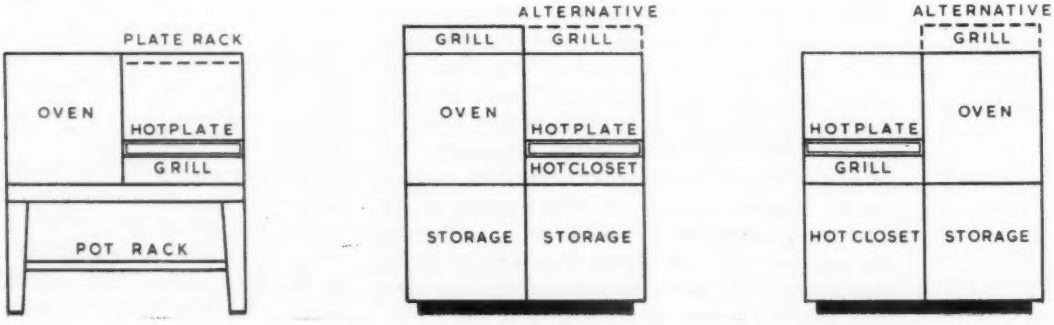
Fig. 12. Diagrammatic arrangements of units to make raised oven cookers (below).



gas supplement

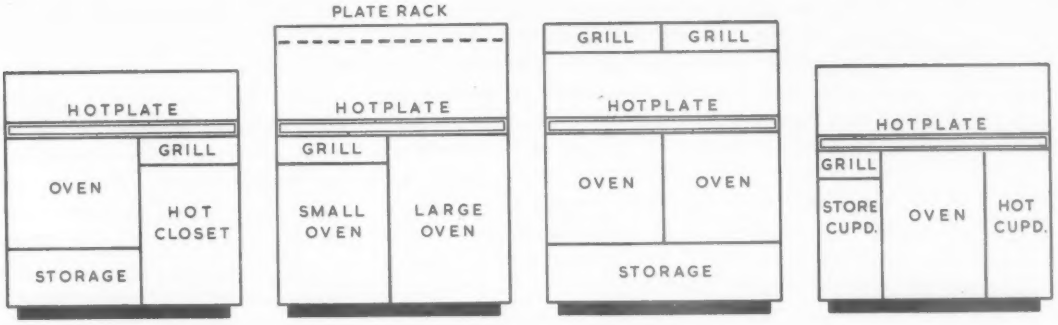


Fig. 13. Diagrammatic arrangements of units on double size range cookers.

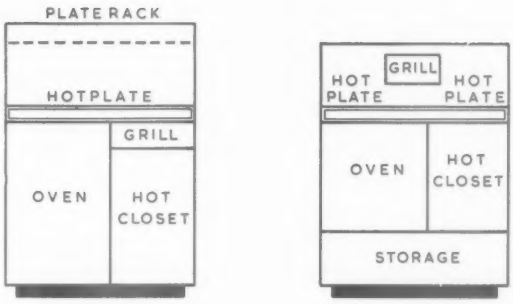

Fig. 14. Diagrammatic arrangements of units on one-and-a-half range cookers.

range is simply an ordinary domestic cooker with certain added facilities and that although it provides an increased and much more flexible domestic service it is not large enough to fulfil the requirements of boardinghouses and small catering establishments as are cookers with double-ovens.

Dimensions of representative samples of the range of domestic cookers

	Overall dimensions in in.				*Oven size in in.*					
	Ht. to hotplate	*Height*	*Width*	*Depth*	*Best cooking area Height*	*width*	*depth*	*Maximum cooking area Height*	*Width*	*Depth*
Boiling ring	—	3½	10¼	10¼	—	—	—	—	—	—
Hotplate	—	4	18½	11½	—	—	—	—	—	—
Hotplate with grill	7⅜	12½	19	18½	—	—	—	—	—	—
Breakfast cooker	13	13	20½	13½	6½	9	9	6½	13½	12½
Separate grill	—	14½	21½	5½	—	—	—	—	—	—
Small cooker (no stand)	19½	23½	18½	18½	9½	11	9½	9½	13¾	13½
Standard vertical cooker	36½	53½	22	22	14	13½	10½	14	16	11½
Large vertical cooker	36½	58½	22¾	25	15½	14	11½	15½	17	13
Boardinghouse vertical cooker	36½	61	31½	28	17½	18	13	17	18	13
Raised oven cooker	32½	48½	45	22½	16	14½	10	16	17	11
Range 1½ size	35¾	47	35½	22½	18	12⅝	12⅝	18	17	16
Range full size	36½	44½	38½	24¾	15¾	14½	10	15¾	17	11
Separate oven (b.i.)	—	26¾	21¼	22½	16	14½	10	16	17	11

Overall width includes lighter elbows if provided. " Best " cooking area is that over which good cooking results can be obtained. Maximum cooking area is the amount of usable space in the oven; using this may mean a slight falling off in evenness of heat distribution with some kinds of food.

Features of modern gas cookers

So far the gas cooker has only been discussed very generally, and some mention of the features which go to make up modern cookers must be made in order to give a complete picture of the equipment available today. Not all the features appear on every cooker, but it can be seen that any particular requirement may be met out of the variety of designs at present on the market.

Ignition. Automatic ignition is becoming common on all sizes of cookers: from now on no new cookers will appear on the market without hotplate ignition, and already some are available with ignition to all burners. Automatic ignition provides a convenience service, and fully automatic cookers no longer require a lighter elbow at one side, and therefore can be more easily fitted into a run of kitchen fitments.

Time control. With automatic ignition to all burners it is also possible to provide time-control mechanisms, which enable the oven to be preset to come on and go off in the housewife's absence. Time-control mechanism is already available on several of the more expensive models.

Timers. On many cookers, even on those without automatic ignition at present, four- or five-hour " pinger " timers are available.

Lights. Strip lighting is sometimes supplied above the cooker hotplate, and a light has been introduced into the oven itself on one model.

Safety taps. All taps controlling burners which do not light automatically are now of the " push-in-and-turn " variety which makes it impossible for the burner to be knocked on accidentally.

Hotplate burners. Hotplate burners which light at all rates, and which are easy to clean and difficult to clog with spillage are appearing on many of today's cookers.

Griddles. At least one cooker incorporates a griddle on the hotplate which can be used either for griddle cakes and scones, bacon, eggs and other fried foods, and also as an auxiliary simmering burner which will

accommodate several pans at one time.

Grills. The high-level grill has contributed considerably towards easier cleaning for the cooker hotplate. As the grill has been removed from under it, the hotplate cannot become heated and therefore grease and spillage, instead of burning-on, remain semi-liquid and are easy to wipe off. The fear of some people that fat will splash into their eyes while working at a high-level grill is unfounded; fat splashes upward rather than outward and is burned away when it comes in contact with the hot grill frets.

Front flues. Modern cookers may be fitted flush against walls so that they do not break the line of equipment in the kitchen. This has been made possible by bringing the oven flue out at the front, around the hotplate level, instead of at the back as in earlier models. This also eliminates wall staining as the food vapours and grease from the oven are disseminated into the room and not directed on the wall.

Drop doors. An oven with a drop door is particularly useful when the cooker has to be fixed in such a position that a side-opening door would prevent light from reaching the oven. The door also forms a useful shelf on which dishes may be rested while their positions in the oven are being altered or while they are being attended to during cooking Drop doors do, however, have the slight disadvantage that they make the back of the oven a little less accessible for cleaning for people with short arms.

Glass doors. These are always popular with certain sections of the public although their usefulness is probably not so great nowadays, as the oven thermostat has removed most of the guesswork from cooking. One design of door consists of two sheets of toughened glass held in a frame with an air space between for insulation: the other has a solid outer half which can be opened independently of the plate glass inner half when viewing food. The glass will only steam up during the first few moments when the oven is lit; after it is heated all condensation vanishes and during the cooking process the glass remains clear.

Back burner ovens. A single oven burner across the back of the oven has now virtually replaced the older design which had a burner down either side. This means that the entire width of the oven is available and dishes may be placed side by side on a shelf instead of one behind the other as in side burner models. Where automatic oven ignition is not available provision is made for lighting the burner through a flash tube from the front of the oven, so that it is not necessary to reach into the oven with a match.

Easy clean oven roofs. The easily cleaned oven roof is a new feature being introduced on modern cookers; the roof is the most difficult part of the oven to clean and also becomes dirtier than other parts. On some models the roof is completely removable, while on others it is hinged at the front and can be freed from the back so that it lets down for cleaning.

Governors. Modern cookers are unaffected by changes in mains gas pressure as they are all fitted with governors which only allow a constant pressure of gas to the cooker. This has meant that all gas rate controls can be eliminated, and has thus simplified the design of the burners.

Finishes and colours. Gas cookers are finished in vitreous enamel; basically they are white or cream with colour accents on taps and trims, or on small pieces of the cooker itself. Plastics, coloured anodised aluminium, polished aluminium, and chromium plate are also used for accents and decoration.

Separate units. Something has already been said about the advantages of fixing individual units in a kitchen instead of complete cookers. At present there are several "split" cookers on the market designed to be built-in at will; in the future it is expected that other developments will come, including individual boiling burners which may be sunk wherever they are required into worktops. The "split cookers" at present available are, as their name implies, the oven and hot plate (with grill) of a standard cooker, split into two units and especially designed for building into kitchen fitments.

Installation of gas cookers

Average figures for the space requirements of the range of gas cooking equipment are given in the Table on page 594.

Unless cookers are built-in to other fitments a space of 4-6 in. should be left on either side of them to allow for cleaning; this will also provide for any lighting device that may be fixed to a cooker which has not fully automatic ignition. A clear space of at least 3 ft. should be left between the cooker hotplate and any permanent fitment above the grill, while high-level and independent grills should have a clear space of at least 1 ft. 6 in. between the top of the grill and any permanent fitment. Cookers should not, if possible, be fixed in corners or against tall fitments because these will restrict the free positioning of saucepans on the hotplate; built-in appliances should be provided with means to prevent spillage falling between the sides of the cooker and the adjoining fitments. When a cooker is in use the temperatures of the adjacent surfaces will not exceed 150 deg. F., therefore no special precautions to prevent over-heating of surrounding equipment are necessary.

Cookers must be installed in accordance with manufacturer's instructions; in almost every case the correct pipe size is $\frac{1}{2}$ in. B.S.P. An isolating main cock should be avoided on domestic cookers.

Rigid connections are advisable in all circumstances, but if the cooker is specially required to be movable it should be fixed only with armoured heavy duty tubing and connections. It should be pointed out that cookers fixed on flexible connections may not always be properly level after they have been moved, and that there is also the danger that the cooker may be used by the housewife to raise herself after she has been attending to the oven and will be pulled over on top of her. This, in fact, is a danger with all flexibly connected full-size cookers, and is not confined to those which use gas.

gas supplement

Fig. 15. Free standing refrigerator (left). Built-in at floor level (centre). Built-in at eye level (right).

The gas refrigerator

All gas refrigerators work on the absorption principle, which means that there are no moving parts to go wrong, and no vibration troubles which may shorten their life. They are completely silent in operation, low in capital cost (particularly the smaller models) and have an economical running cost. Installation is simple and any servicing will be carried out by the Gas Board. Gas refrigerators may be free-standing or built-in. The free-standing models range from 1.7 to 7.6 cu. ft. in capacity; up to 3.5 cu. ft. capacity their total height is under 36 in. and they are therefore provided with flat tops for use as working surfaces or parking areas; some have removable "tray" tops which have many uses in the kitchen.

Built-in refrigerators come in the 1.7 in. to 2.7 cu. ft. capacity range, and can either fit under draining boards or be fixed at any required height in the range of kitchen fitments. Doors are designed to open from right or left and integral flint lighters are provided for easy ignition. Special ducting arrangements are made to permit free flow of air across the unit and to dispose of the flue products at the front of the appliance.

The following table gives details of the range of refrigerators available, including their outer dimensions:

Choosing the refrigerator

Although the popular trend appears to be towards very large refrigerators these are not always necessary for the average family; their space is often not used to the best advantage, and may even be used to store fruit, tins, etc., which keep equally well in a larder. Households which do a lot of entertaining will probably need a model in the 4 to 7.6 cu. ft. range, but the smaller sizes will meet the demands of the average household very adequately. Refrigerators should never supersede the larder or ventilated food cupboard; they should only be used for goods which will deteriorate if not stored under cool conditions.

Refrigerator "furniture" varies with the model; some contain egg racks, cheese and butter compartments, dishes and containers. The larger ones have interior lights and frozen food compartments.

Siting the refrigerator

The ideal site for the refrigerator should be somewhere convenient both from the point of entry into the kitchen and from the preparation worktable. Consideration should be given to freedom from draughts, firm and level flooring, a minimum clearance of 6 in. above the flue for free-standing models, good visibility into the cabinet, and reasonable clearance for the open

Details of gas refrigerators

Capacity in cu. ft	*Overall dimensions in in.*			*No. of ice trays*	*Type of refrigerator*
	Height	*Width*	*Depth*		
1·7	35 1/8	20½	21½	1 (12 cubes)	Free-standing
1·7	31⅞	21	20⅛	1 (14 cubes)	Built-in
2·2	36¼	20⅞	22¼	2	Free-standing
2·3	36⅛	22 1/16	21⅞	3	Free standing
2·6	32¼	21⅛	25	1	Free-standing
2·7	34 1/16	21⅛	23½	1 (14 cubes)	Built-in
3·6	46½	24½	26½	3 (10 cubes)	Free-standing
3·75	38¼	22¼	26	1 (14 cubes)	Free-standing
4·0	41½	22½	24	3 (12 cubes)	Free-standing
5·0	53¾	27½	27½	4 (16 cubes)	Free-standing
7·6	60½	31	29¾	5 (14 cubes)	Free-standing

door. They should not normally be fitted in larders or closed cupboards because of the lack of ventilation.

Lighting and controlling the refrigerator

Some refrigerators are lit directly down the flue by holding a light above it. Others have integral flint ignition; in this case no space need be left at the side for the hand to reach in for lighting, but for those without integral ignition this must be done in order that they may be lit without discomfort.

All refrigerators are provided with a thermostat; at normal temperatures the setting is usually either 3 or 4, but when the air temperature is very hot or very cold the thermostat must be altered accordingly to compensate for the change in temperature.

Installation

In modern refrigerator design the gas controls are not accessible from the front of the cabinet, but are at the back with the unit. To instal the appliance the connection must be prepared with the refrigerator out of position and completed once it has been sited. A gas cock should be supplied to the installation as one is not normally supplied to the refrigerator itself.

When access is possible from below the supply can be run and the control cock fitted underneath the cabinet, provided that the cock is easy to reach. If this is difficult, or if access from below is not possible, the cock should be fitted externally on the supply near the refrigerator. If necessary the supply must be run to a point adjacent to the appliance, and another run back from it: the two supplies are then connected by the cock after the refrigerator has been placed in position.

Gas and home laundry

Practically everybody washes some personal garments at home, and many housewives habitually do the whole weekly wash. Only 40 per cent of all households send part of their wash to the commercial laundries, generally consisting of the heavier items, such as sheets and bath towels, which are difficult to dry and iron at home. Laundrettes are also playing their part, but even so there is a considerable and growing demand for laundry facilities in the domestic kitchen. This is met in the simplest form by providing a wash boiler or washing machine alone. Ideally this should be placed next to the sink, but in small kitchens this position may interfere with the cooking cycle; provided the connections are so placed that the appliance can be moved to the sink on wash days it is often more convenient to store it in another part of the kitchen.

When full laundry facilities are required either in the kitchen itself, in an adjacent scullery or utility room, or in small washhouses such as are found in flats, planning becomes more important, although the laundry cycle is more flexible than the cooking one. Generally the machine should be next to the sink; the sink, if used solely for laundry, should be 15 in. deep, and a second, shallower sink should be available for rinsing: a draining board, on which stain removal and other pre-treatment is carried out, is an advantage. If outdoor drying is required the whole laundry cycle should be sited as near as possible to the back door; an indoor drying cupboard should form part of the group as a whole, but its precise location is not important.

Ironing facilities should also be considered, although many housewives prefer to iron in the "leisure" parts of the house where they can be with the rest of the family. Ironing boards should be rigid in use, as wide as possible, and adjustable to several heights, including one suitable for the worker who prefers to sit while ironing. Rotary irons and pressers should be placed at a table so that they are at the right height for the seated worker, and for those who iron sheets and other large articles an ironing table is necessary. The ventilation of the laundry section is important and has already been discussed; flooring should be water-resistant and easily washed down, and walls and ceilings treated so as to reduce condensation. A drain-away on floor level is an advantage.

Washing equipment

Today the importance of the temperature at which garments are washed is realised as being greater than either the detergent used or the agitation, although both are essential. Temperatures for the wash vary from 100 deg. F. to 160-180 deg. F. for washing, and go up to 212 deg. F. for boiling; the gas-heated washing appliance, with its infinitely flexible heat control and capacity for reaching any given temperature quickly and holding it indefinitely provides the whole range of temperatures and makes the housewife independent of the domestic hot water

Fig.
agita
conve
boile

supply, which may not meet her requirements at the higher temperatures.

The range of equipment described below caters for all requirements from the small table wash boiler to the fully powered machine.

Washboilers

The gas washboiler developed naturally from the old-fashioned wash copper. Modern washboilers are neat, and occupy very little space in the kitchen. Most of them are small enough to be stowed away under draining boards or work tables when not in use. There are small table models, particularly useful for the baby's wash; full size rectangular pans with rounded corners which are economical in space, because the pan and outer case are one and the same; or circular pans fitted into a rectangular case, which may go under kitchen fitments or be free standing. All boilers are lit from a flash tube, so that it is not necessary to kneel on the floor to light the burner, and most have viewing mirrors through which the flames may be seen without having to bend down. A special feature on some models is a turn-down position for the gas tap so that a constant temperature, once reached, may be maintained without further adjustment. The capacities of full-sized pans are normally 5 to 7 lb. dry weight of clothes at a time, depending on the size of pan.

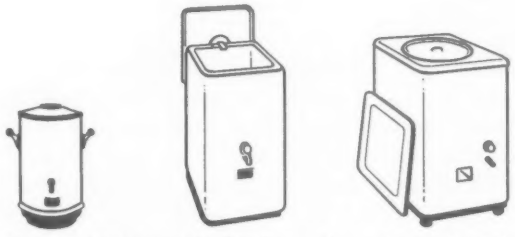

Fig. 16. Table model (left). Pan and case in one (centre). Pan with outer case (right).

Washboilers with wringers

The ordinary washboiler becomes much more useful when it is supplied with a wringer; some are sold with wringers already fitted, while on others they are available as extras. The width of the wringer rollers varies from 10 in. to 16 in.; even the shortest ones will deal adequately with a blanket or double sheet. Wringers are generally designed to fold away after use either into the pan or down the back of the boiler, but they may fold on top of the lid under a table-top or be removed altogether for storage. The provision of a footrest at the base of the boiler to steady it during wringing is a useful feature of some appliances.

Convertibles

It is possible to buy lids fitted with paddles, and a handle by which the paddle can be turned, for fitting into the tops of most washboilers. This converts them, in essence, into hand-operated washing machines, and doubles their usefulness. The amount of energy needed to agitate the paddles is slight, and the dirt removal is very good.

Fig. 17. Hand agitator for convertible wash boilers.

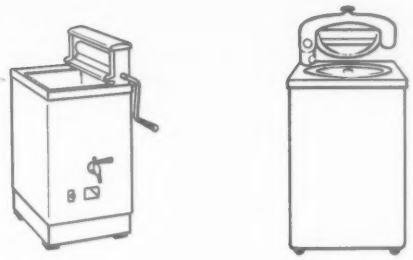

Fig. 18. Simple washing machine (left).

Fig. 19. Large model washing machine (right).

Washing machines

The gas-heated washing machine is either partly or fully powered by electricity, which means that it is a labour-saving and very flexible appliance which gives the maximum of agitation at the optimum temperatures for each washday load. In its simplest form it is electrically agitated but wringing and emptying are done by hand. The next stage still has a hand wringer, but electricity drives the agitator and pumps away the water. The hose through which the water is pumped can often be fixed to the sink tap to help in filling the machine. Finally, there are large models which have power-driven agitators, pumps and wringers. Those in the first two categories are approximately the same size as washboilers, and can be stored under kitchen fitments; the larger ones are higher, however, and are therefore free-standing pieces of equipment. Capacities rang from 3½ to 9 lb. dry weight of clothes according to the size of the machine and/or the type of agitation; the most popular method of agitation is the reciprocating paddle, which fits over a central spindle in the base of the pan, but spinners, tumblers, and forced water movement are also employed and give good dirt removal.

Combination appliances

At present there is only one gas-heated combination appliance on the market; it consists of a washing machine and a spin dryer side by side in the same case. Although the floor area taken up by this appliance is greater than that required by other machines, it is a great convenience to have the two sections close together and so avoid water spillage, lifting, etc. The capacity of this machine is from 3½ to 4 lb. dry weight of clothes, depending on the bulk of the articles in the

Fig. 20. Combination washing machine and spin dryer.

gas supplement

wash. This is also the capacity of the spin dryer.
In the table below the spread of dimensions over the range of gas-heated washing equipment is given: in some cases several machines are available with the same dimensions. The figures refer to the appliances when shut down ready for storage.

Installation and fixing
Washboilers and convertibles are very simple to install, as they only require to be connected by a flexible tube to a plug point in the main supply. Washing machines also need a 3-pin plug and properly earthed socket; the loading required varies with the machine.

Dimensions of gas washing equipment

Drying equipment
The vagaries of the British climate make the provision of indoor drying facilities a highly desirable feature of the domestic kitchen; these, however, are all too often overlooked, even in modern dwellings where no outdoor drying is possible.
While recognising that the "spin dryer" is part of the answer to the problem, only the lightest materials are completely dried by it, and most garments still require a certain amount of further drying before they are ready for ironing. A gas-heated dryer or drying cabinet will do this in a very short time, or else will dry completely from the wet state, after the clothes have gone through a wringer, in a longer time. These times depend to a certain extent on the composition of the load and the way it is arranged in the dryer.

Fig. 21. Airing cupboard heater.

Ventilation
With any drying process using heated air it is clearly desirable either to provide ventilation direct to the outside or to ensure ventilation for the drying room itself and this has already been discussed. Where room ventilation is not adequate, full-size drying cabinets may be ventilated directly to the outside air, and means for attaching a suitable length of circular duct are generally available on them; they may also be ventilated into vertical flue ducts, as long as the material from which the ducts are made will stand up to the moist air during the initial stages of drying.
Various sizes of domestic drying equipment are available to meet differing household requirements.

Airing cupboard heaters
These small heaters give a slight but steady quantity of convected heat; they may either be used as background heaters, or be installed in a cupboard and used for airing ironed and finished laundry. They are particularly useful where drying accommodation is small, or where the wash is normally dried out of doors. Airing cupboard heaters do not require flues, but must be fixed and connected rigidly to the gas supply.

Towel rail heaters
Although these heaters are primarily intended for bathrooms they also have many uses in the kitchen; they not only provide a certain amount of background warmth but can be used for drying kitchen cloths, etc., and for airing small articles. They are low-rated and economical in use and do not require flueing; they should, however, be rigidly fixed.

Fig. 22. Towel rail heater.

Fig. 2
dryer.

gas supplement

Fig. 23. Portable dryer.

Portable dryers

These are small heating units with a series of rails above them which are either enclosed in a case or by a cover of some suitable fabric. They are useful for drying the light wash, personal garments and the entire baby-wash; they are not suitable for drying heavy articles because their low rating will make the drying time over-long, and the rail space also is insufficient for such a load. Portable dryers do not require a flue, and are connected to the main supply by a flexible tube and a plug-in cock.

Small fixed dryers

These appliances are roughly half the height of the normal cabinet and will give a satisfactory service to homes where the larger household articles are sent out to the laundry or laundrette. Medium-weight materials will dry in two to three hours from the wet wrung state; very light articles can be dried in a shorter time, but much depends on the size of the articles in the load and their distribution in the dryer. The dryers normally have flat tops, which provide a useful extra parking surface in the kitchen when they are not in use.

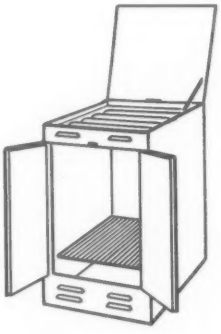

Fig. 24. Small fixed drying cabinet.

Free-standing drying cabinets

Full-sized drying cabinets are designed to take a complete washing machine load (about 7 lb. dry weight) at a time and to dry it completely in one or two hours; the time to reach "ironing-dryness" is, of course, considerably less. The cabinets are thermostatically controlled to give several heats, from airing through warm and medium temperatures to hot, so as to provide the different conditions required by various fabrics. They should be rigidly connected to the main gas supply, and care must be taken to ensure that they are adequately ventilated.

Fig. 25. Free standing drying cabinet.

Built-in drying cabinets

These are similar in performance and in ventilation and fixing requirements to the free-standing models; they are available with one side and the front frame and door, or with the front frame and door alone, so that they may be built into a corner of a room or into a prepared recess. Space and capital cost are thereby saved. This type of assembly is most suitable for installation at the time when a house is built.

The following table gives average dimensions of the range of drying equipment so that some idea of the space required for them may be obtained.

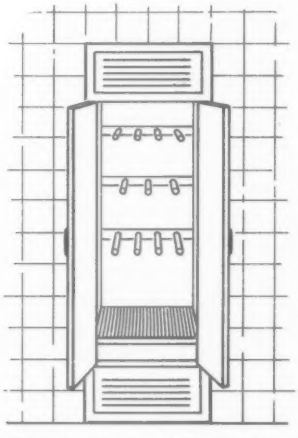

Fig. 26. Built-in drying cabinet.

Refuse disposal

The problem of domestic refuse disposal, always difficult, has been made increasingly so in recent years with the introduction of modern space- and water-heating methods which have to a great extent done away with open fires and domestic boilers. The cost of local authority refuse services is already high, and labour for the work is increasingly difficult to obtain; alternative methods must be sought, particularly in tall blocks of flats which present the further problems of the provision of space for chutes and collecting bins, and the danger to health which is always present when refuse is allowed to accumulate.

Gas incineration is the answer to this modern problem; the small incinerators originally designed for sanitary purposes in cloakrooms, hospitals, etc., have already proved efficient in domestic installations. In flats, especially in tall blocks, they are best flued into a common duct, using mechanical extraction, rather than into single flues. A slightly larger free-standing version of this kind of incinerator is now available for domestic purposes in kitchens.

From this start special domestic incinerators which are completely smokeless and odourless, fitted with safety controls and automatic timers, have been developed. Shortly a large model will be available, and later it is expected that a smaller version will also be produced. These will eliminate the necessity to keep any household refuse which may become objectionable, and leave dustbins free for tins and bottles, which do not attract flies to the same degree.

Other services in the kitchen

Although space- and water-heating have been dealt with comprehensively in previous supplements a few words on special kitchen applications might be useful here.

Space heating

A hot kitchen is never desirable, but some form of background heating should be available where no constantly burning solid fuel appliance is installed. There are many activities carried on in kitchens which do not involve appliances producing heat, and the housewife under such conditions is often forced to use the cooker as a heater. This is uneconomical. Small radiators, or portable fires which may be fixed high on a wall or in some other place where they do not interfere with the flow of work in the kitchen provide a satisfactory and much-appreciated service here.

Water-heating

When the kitchen hot water is not obtained from a central source but is an independent supply, the gas sink water heater gives an efficient and economical service. It may be either of the instantaneous or storage variety, both of which are described in the water-heating supplement. The boiling water instantaneous sink heater is particularly effective in the kitchen, where it will replace the kettle.

Gas is a modern fuel adapting itself and its appliances to the needs of modern life; new techniques and designs are developing all the time, and it is quite possible that by the time this supplement is produced something new will already be on the market. The services of the Gas Boards are always at the disposal of the architect to help him keep up to date with new developments.

SIGHTHILL HEALTH CENTRE — *designed by the Department of Health for Scotland.*

Electric floor warming at the Sighthill Health Centre

Sighthill was designed as an Experimental Centre under the National Health Service Act. The building forms a hollow square round a central courtyard. The north wing holds administrative departments on the ground floor and dental theatres on the first floor. The south wing houses the joint services departments. The east wing comprises child welfare services and the west wing is divided into six medical suites.

Fully controlled warmth

The building is heated by electric low temperature underfloor radiant heating. This is thermostatically controlled and designed to maintain against an outside temperature of 25°F. the following inside temperatures: surgeries, recovery and X-ray rooms 70°F.; passages and lavatories 60°F.; kitchen 52°F.; other rooms 65°F. Electrical intake is "off peak" and available between 7 p.m. and 7 a.m., and 11 a.m. and 3 p.m.

Loadings

Total loading amounts to 262 kW and is designed for off-peak operation. This load comprises 232 kW embedded in the concrete floors and 30 kW in concealed wall panels. The total floor area of the building is 35,000 sq. ft.

A variety of floor finishes tested

Floor finishes laid were: wood block, cork tile, thermoplastic, mastic asphalt, Caithness stone slabs and terrazzo. All these have given very satisfactory service under heated floor conditions.

Results

The installation has been running for over five years and the average annual consumption for floor warming purposes is 418,960 units costing £1,400.

Thermograph records were taken during the winter 1955/56. These show that when, in February 1956, the mean daily outside temperature was 22.6°F., the maximum drop in inside temperature during the cut-off period was only 2.6°F. Even under these extreme conditions the internal air temperature did not fall below 60°F.

Issued by the
Electrical Development Association, 2 Savoy Hill,
London, W.C.2. Telephone: TEMple Bar 9434.

INTERIOR OF PETER ROBINSON'S STRAND SHOP

The building consists of four sales floors (from lower ground floor to second) and two for offices above. The sales floors are designed to give as great an impression of space as possible and to present the goods for sale in a reasonably restrained setting (below). The atmosphere is in contrast to the eye catching sparkle and crispness of the external display windows (above). On the lower ground floor are the soft furnishings and fabrics. In the fabric section (right) material is displayed on easily movable rollers, and where semi-recessed lighting has been used it has been designed to give a certain amount of horizontal light for the proper showing of fabrics.

Coats and suits are on the first floor and are hung in simple mahogany racks. These are arranged around the walls and columns which are also mahogany faced (above). A noticeable feature of the store is the attention that has been given to the lettering of the various signs. The store guide panels (right) which are strategically placed inside and outside the doors to the various departments, are unusually neat and clear due to good typography by Ronald Ingles. The designers of the general interior scheme for this Fry, Drew, Drake and Lasdun building were Misha Black and Alexander Gibson of Design Research Unit.

CAR SHOWROOM IN HAMMERSMITH

This car showroom and hire department in King Street, Hammersmith, has been remodelled by John Bruckland, who has taken the chance offered by a slight enlargement of the premises to turn two separate lock-up shops into a single showroom (above, left) linked by an open staircase with the car hire department and garage in the basement (above, right, and below). The architect has tried to give it a more spacious air by providing an overall translucent ceiling and considerable use of mirrors. Colouring is black, white and light grey. More colour has been used in the hire department below, where chequered floors, wall cupboards, seats and curtains produce a rather restless brightness which is perhaps the right mood in which to hire a car. DRI-SIL

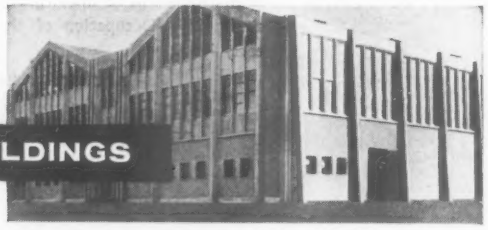
silicone masonry treatments protect...

...NEW BUILDINGS



Central Engineering Works for Bryant & May Ltd by Beecham Buildings Ltd, Shipston-on-Stour, Warwickshire. Architects: Hastie, Winch & Kelly.
All prefabricated concrete components used in the construction of this building are treated with a water-repellent solution based on DRI-SIL 29.

...OLD BUILDINGS

All Saints Church, Hastings, mainly 14th century but contains older walling, part prehistoric. With passage of time the penetration of water through the walls has become more prevalent, resulting in the usual decay and fungus. Water penetration has been stopped with DRI-SIL silicone solution. (By courtesy of the Rector and Consultant Architect).

DRI-SIL silicone masonry treatments

- ★ Protect buildings from the damaging effects of weathering.
- ★ Keep buildings cleaner because water-borne dirt is less liable to penetrate into the surface pores.
- ★ Prevent staining and streaking.
- ★ Do not block the pores of building materials, thus do not inhibit "breathing".
- ★ Improve the thermal insulation of buildings by preventing the absorption of moisture by the walls.

...BRIDGES & ROADS

Highway overpass after a rain storm. The treated part of the concrete fascia (right) has not absorbed the water and is much more visible than the untreated section on the left. Silicone treatments also prevent spalling or scaling due to frost action on concrete road surfaces.

THESE FIRMS SUPPLY WATER-REPELLENT MASONRY TREATMENTS BASED ON DRI-SIL. IT IS IMPORTANT TO NOTE THAT TREATMENTS SHOULD CONTAIN 3 TO 5% ACTIVE SILICONE BY WEIGHT FOR SATISFACTORY PERFORMANCE ON MOST SUBSTRATES.

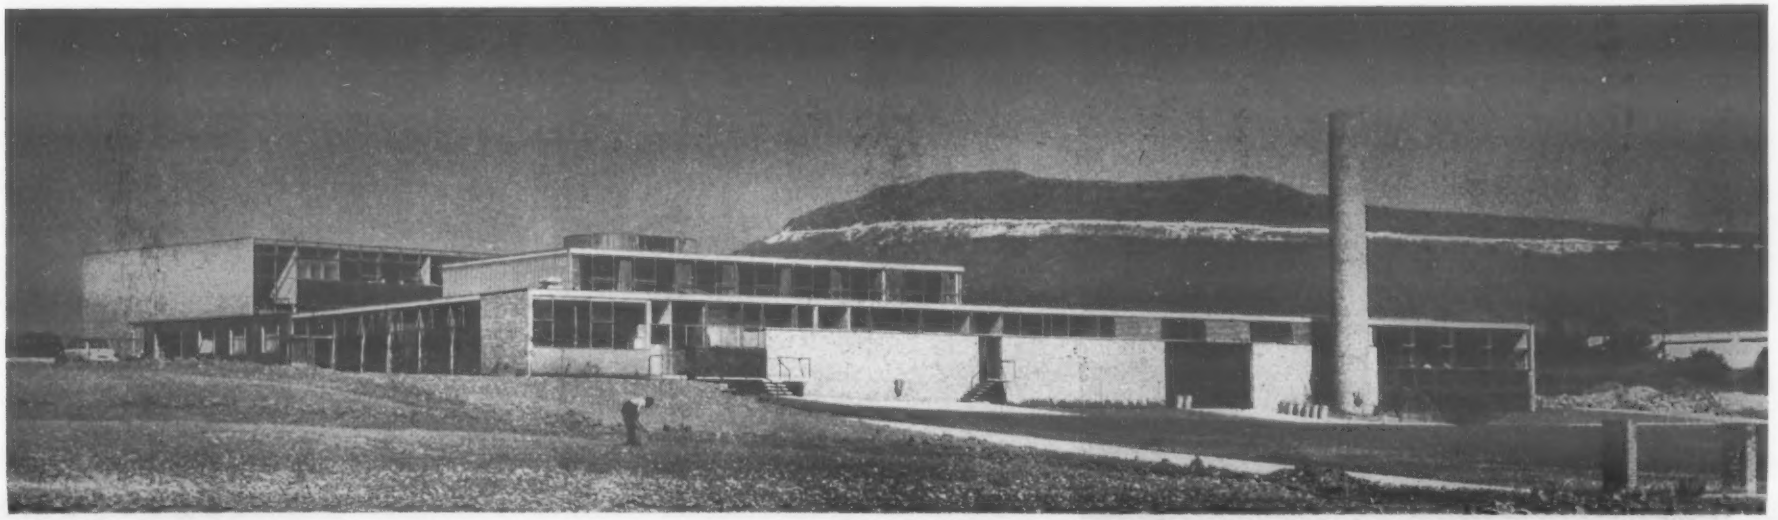
SECONDARY SCHOOL

at HILLSIDE SECONDARY SCHOOL FOR BOYS
FOLKESTONE, KENT
designed by ELIE MAYORCAS
in collaboration with E. T. ASHLEY SMITH, Kent County Architect
assistant architects L. E. TATUM, JOHN HOILE, MICHAEL POLLARD
quantity surveyors C. JOHN MANN & SON, YEOMAN & EDWARDS, who prepared this cost analysis
consultants (mechanical and electrical services) J. STINTON JONES & PARTNERS

The building illustrated forms the first instalment of a four form entry secondary modern school for boys. The school caters at present for 360 boys. This number will be increased to 600 when the gymnasium and additional classrooms and workshops have been built.

The school from the approach road. The block in the foreground contains the hall, space for the gymnasium to be built later (to the right of the hall) changing rooms, and dining room and kitchen, etc. Behind is the two-storey teaching block, which will be extended to the left in the second instalment.



building illustrated

APPRAISAL: The building of schools by instalments usually involves the extension of each type of accommodation provided initially. This complicates the architect's task by adding yet another set of factors to those to be weighed up in the search for a fair compromise between educational and technical requirements. This is particularly so in the case of small schools, which would normally be housed under one roof; later instalments will almost always involve the extension of existing buildings, with consequent inconvenience to the school and additional expense. In larger schools, additional accommodation may be provided in separate blocks on the periphery of the school.

At Folkestone, the architect has rightly not allowed these transient problems to prejudice the final scheme. No attempt has been made to group the additional accommodation in one part of the site, but two of the three additions consist of virtually independent blocks.

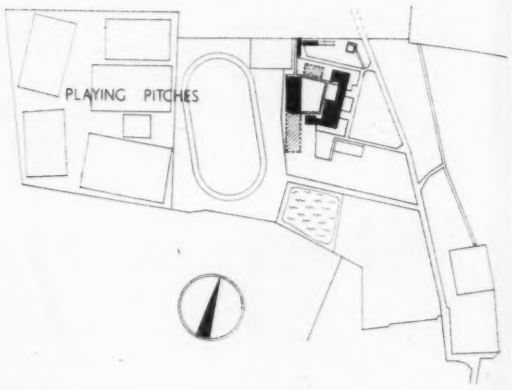
The client's brief was contained in two sets of instructions, the first, being requirements particular to this school, are given below under the heading of client's requirements. The second set apply to all secondary schools built for the Kent Education Committee and are contained in a large loose leaf manual. The instructions cover many aspects, both major and minor, of school building and are the fruit of many years' experience, but their usefulness seems limited because no reasons are given for the pronouncements. This must lead to a blind following of the rules, which will result in codified, rigid designs from which all innovations, and hence any progress, is barred. For instance, assembly halls in secondary schools are required to have a clear height of 18 ft. It is difficult to believe that this is an invariable requirement, but even if it is, it seems unlikely that the effect of using exposed spaceframes was foreseen; the additional 5 ft. of headroom detracts from rather than adds to the assembly hall at Folkestone.

The school is situated in dominant surroundings and the buildings are well sited. Lying at the foot of a strong line of chalk hills, the blocks run along the contours of land that falls away at right angles to this line. One block has been set at a slight angle to the other, thus opening up the courtyard to the distant southern face of the hills, and at the same time, making a more sensitive relationship between the hills and the building as seen from the approach road.

Within the building, however, the general arrangement of spaces seems less satisfactory. Although the double banked rectangular teaching block is undoubtedly an extremely economical form of building, it does not easily permit differentiation of the types of teaching space contained within it. A room lit from one side may be acceptable for a classroom, but is limiting as a library and dull for a laboratory. Moreover, it is difficult to make anything more of the central corridor than a place of congestion and bustle.

The structure consists of a steel frame with precast concrete floor slabs and felt covered strawboard roof decking. A number of cladding materials have been used, of which the curtain walling developed by the architect compares favourably with most of the commercially produced systems.

Opposite page, top: View from south of the dining space with hall behind. This shows the generally simple well-detailed external treatment. Bottom: main entrance. The porch roof is carried back into the entrance hall, and contains concealed lighting. The slim vertical tube inside the open door acts as a rainwater pipe. On the extreme left can be seen the vertical timber cladding of the staff wing. This treatment is carried right round the wing, both internally and externally, and thus creates a sense of enclosure and privacy.



Site plan

Staff wing.

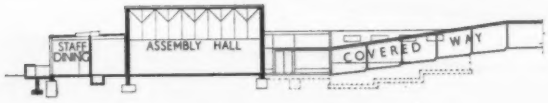
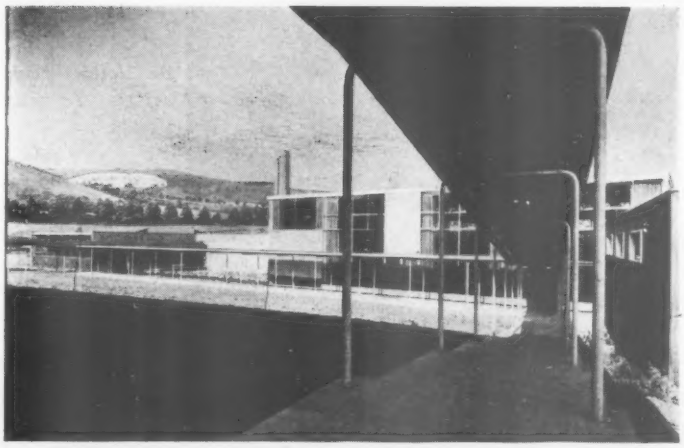
Section B-B

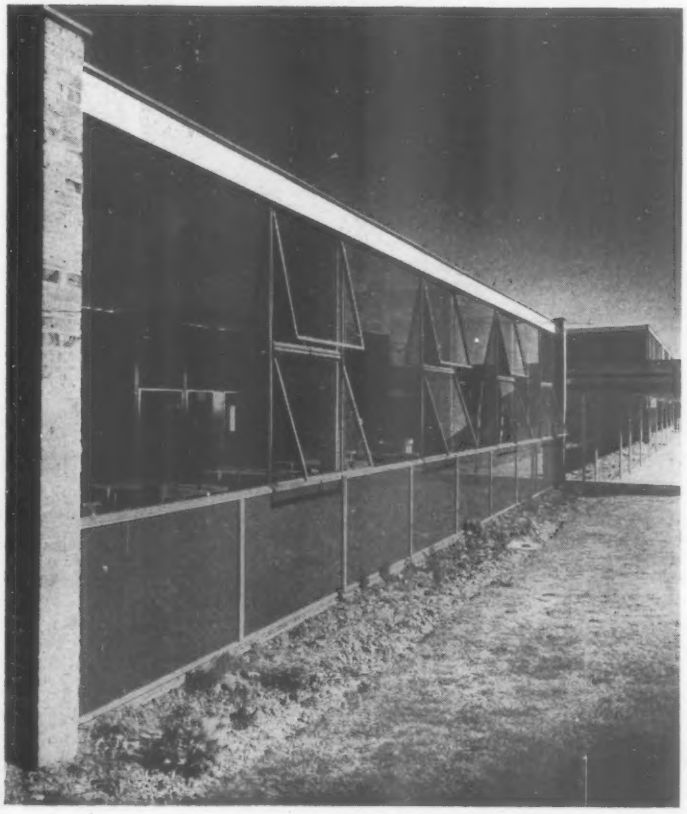


Section C-C

Opposite page, top: the courtyard from south-west corner, showing the hall and the space where the gymnasium will be. This building illustrates the least satisfactory aspect of this instalment. The courtyard has covered ways on three sides. These are virtually useless in wet weather since the rain drifts through th m and they detract from the appearance of the buildings. The school would prefer one fully glazed covered way. Centre: the teaching block from the north-east corner of the court-yard. Bottom: the woodwork shop.

Ground and first floor plans [Scale: 1/16" = 1' 0"]





analysis

CLIENT'S REQUIREMENTS

A four-form secondary school for 600 pupils replacing a previous boys' secondary school, to be erected in two instalments, of which the present buildings comprise Stage I (providing a two-form entry school of 360 " cost places "). It was required that classrooms should be on two floors, with direct access from corridors to each room and corridor communication between all classrooms on the same floor.

PLANNING AIMS

The clients desired a plan that would help in breaking the school down into smaller units. So each year's entry will be allocated to form bases in one section of the teaching wing, with separate lavatories and cloakrooms and individual storage for books, games and kit, conveniently placed in relation to the bases.

SITE

The site has extensive and interesting views, and a fall of approximately 25 ft. across from west to east. The main approach road is from the east. Previously this area was a clay pit and brickyard, and there was a local tip here for many years, so a great deal of levelling and filling work involved the movement of some 17,000 cu. yds. of material. It was also necessary to import 3,500 cu. yds. of good loam to supplement the earth stripped and saved on site, and to carry through an extensive fertilizing programme. Deep drains had to be installed prior to beginning this levelling work, to take the water from a number of springs and, after levelling, normal land drainage has been carried out, including mole drainage.

As a result, the new school was provided with a playing field of six acres, with three winter pitches, cricket table, high and long jump pits, a six-lane grass running track of four laps to the mile and four concrete practice wickets, surfaced with ruberoid, in addition to two soccer pitches on an existing playing field adjoining.

The cost of this new playing field is estimated at £8,200, of which over £3,000 was spent on provision of top soil and materials and £300 on levelling works. Though costs are high, the work has transformed a derelict waste piece of land into what will be a first class amenity.

The ground contours of the site had a major influence on the disposition of the buildings, which have been so placed as to minimize the amount of work below ground. The teaching wing, with classrooms facing east and west has been located on the highest point of the site on a level ridge, while the communal block is on the lower slopes to minimize road works to the various entrances.

When the school is extended, a further wing, similar to the existing one, will be added to the classroom block, extending in a southerly direction. The future gymnasium will occupy the space to the north of the assembly hall, and an additional workshop block will be added to the northern leg of the covered way. Allowance has also been made for the addition of a kitchen in the future.

SUMMARY

Ground floor area: 18,385 sq. ft.
Total floor area: 26,800 sq. ft.
Type of contract: Competitive tender.
Tender date: January 18, 1956.
Work began: April, 1956.
Work finished: April, 1958.
Tender price of foundations, superstructure, installations and finishes: £85,477.
Tender price of direct contracts:
Mechanical services: £13,009.
Electrical services: £4,492.
Contingencies, services contracts: £690.
Tar paving of playgrounds: £1,683.
Net cost, excluding external works and playing fields: £99,954.
External works, including drainage beyond collecting manhole: £9,980.
Total: £109,934.
Special cost for new playing fields: £8,200.

	s	d
Preliminaries and insurances		9¼
Contingencies	2	6¾
Work below ground floor level	6	2

Mass concrete stanchion bases and strip footings to brick walls.
6-in. reinforced concrete ground slab, reinforced with fabric (4·32 lb. per sq. yd.) laid on building paper on hardcore fill to make up levels.
Brickwork in special purpose sand lime bricks in 1–3 cement mortar faced with second hard yellow stock facing bricks.
Damp proof course: Hessian-based, lead-cored bituminous felt.

STRUCTURAL ELEMENTS

Frame or load-bearing element — 6 6¾

Steel frame, part exposed and painted, partly cased with concrete (150 cu. ft.) and partly cased with timber, expanded metal and plaster (323 sq. yds.).
(Note that the cost of expanded metal and plaster are given under " Finishes.")

External walls — 2 9½

Partly solid and partly 11-in. cavity in class B sand lime bricks in mortar (1 : 2 : 9 composition) faced generally with second hard yellow stock facing bricks. 45 sq. yds. finished with black quarry tiles.
The detached circular tapered boiler chimney stack, 6 ft. 6 in. o.d. at base and 53 ft. 6 in. high from foundation, is faced with dark stock facing bricks and lined with insulating bricks.
Administration wing has studded and 1-in. cedar weather boarding.
Note that curtain walls are included under " Windows " below.

$$\text{Ratio: } \frac{\text{solid walls}}{\text{floor area}} = \frac{0\cdot302}{1}$$

Windows — 9 0½

Purpose-made galvanized steel windows, part opening. Lower panels in curtain walling filled with concrete block and vitreous slab, or with vitreous slab with asbestos insulation board backing.
In the administration block there are 10 horizontally pivoted timber windows.

$$\text{Ratio: } \frac{\text{windows}}{\text{floor area}} = \frac{0\cdot404}{1}$$

building illustrated

The woodwork room. The exposed partition blocks and beams give this room the right character.

Above: external view of assembly hall. The ground level window lights a store under the stage. The loose pebbles on this side of the covered way form the open top of a land drain. Below: inside the assembly hall, used also as a gymnasium.

Entrance gates, piers and noticeboard. Mains for water, gas and electricity, roads, paths and external steps and paving. External crawlway for services.
per sq. ft. of floor area =
£99,954 (net cost excluding external works) / 26,800 sq. ft. (measured within external walls) = **74s. 7½d.**

COST COMMENTS

The erection of a building in two instalments, especially when working to a tight budget, always provides a problem of delicately dividing the total allowed cost, while enabling the first part of the building to work satisfactorily while the second part is being built. In educational projects the targets are clearly defined by " cost places." In this case the allowance is set at 360 cost places by £264, while the actual number of pupils is only 300, the difference being the Ministry of Education allowance for instalment building.
Normally services take a higher proportion of costs in instalment schemes, because the bulk of equipment and the boiler house have to be provided in the first phase. Examination of the costs at Hillside shows no outstandingly expensive group of elements, and comparison with similar secondary schools (Falmouth, AJ, February 26, 1959; Dawley, AJ, August 20, 1959) shows no great dissimilarities. Here is how the costs have worked out:

	s.	*d.*	*Per cent*
Preliminaries and insurances		9¼	1·04
Contingencies	2	6¾	3·43
Sub-structure	6	2	8·27
Structural elements	24	5¾	32·81
Partitions and fittings	10	2½	13·68
Finishes	10	3¾	13·8
Services	14	11¾	20·08
Drains to nearest collecting manhole	2	8½	3·64
Playgrounds	2	5	3·25
	74	7½	100

The purpose designed windows at 9s. 0½d. per sq. ft. of floor area, with ratio of 0·404 is equivalent to a cost per sq. ft. of window of $\frac{9\cdot0\frac{1}{2}\text{d.}}{0\cdot404}$, or 22s. 4d., which is not expensive, bearing in mind the cost of standard systems of curtain walling.
One unusual aspect of the site was the amount of earth-moving and reinstatement and reclamation of derelict ground, amounting to a cost of £8,200. The choice of a site requiring such an outlay reflects the shortage of available building land, and must have added to the architect's planning problems.

·SUPACOUST· ACOUSTIC TILES. Manufacturer : Petradene Ltd.

27.C3 ·SUPACOUST· ACOUSTIC TILES

This Sheet describes Supacoust tiles which are available in a range of patterns for fixing to all types of ceiling for sound absorption.

Description

The tiles are of hardened gypsum plaster, perforated in several different standard patterns, as shown in the drawings on the face of the Sheet; other designs can be supplied to the architect's individual requirements. The face of the tiles is tooled except in the case of the small hole pattern which is smooth. Fixing holes for screws are provided at each corner, and intermediately on the larger tiles. The tiles are normally backed with a sheet of glass-fibre tissue or, if required, they can be backed with 1-in. glass-fibre insulation cut to size and covered with a thin polythene sheet.

Sizes

Standard: 24 in. by 24 in., 24 in. by 24 in. (divided into 12 in. by 12 in. squares). 24 in. by 20 in., 24 in. by 18 in., 24 in. by 14 in., 24 in. by 12 in., 20 in. by 20 in., 20 in. by 16 in. 29¼ in. by 21 in., 23½ in. by 22½ in., 30 in. by 15 in. } ⅝ in. thick

Small hole: 12 in. by 12 in. by ½ in.

Random: 24 in. by 24 in., 24 in. by 36 in., 30 in. by 30 in., 23¾ in. by 23¼ in., 20 in. by 20 in., 23¾ in. by 23¾ in. (not milled). } ⅝ in. thick

Slotted: 24 in. by 24 in. by ⅝ in.

Other sizes may be obtained to order.

Weight

The tiles weigh 2¾ lb. per square foot.

Installation

The drawings on the lower face of the Sheet show typical applications of the tiles. The tiles are fixed in all cases by screwing through the holes provided. The first detail shows a metal fixing system obtainable from the manufacturer and the details on the right show suspension by timber bearers and battens from metal straphangers and fixing by battens and toggle bolts to hollow blocks. The tiles can be used for heated ceilings, as shown on the left, the pipes being embedded in the soffit or suspended. For ventilation purposes, to take into or extract air from a plenum chamber, the backing can be omitted from selected tiles. Any type of light fitting can be incorporated in Supacoust suspended ceilings: various manufacturers, e.g. General Electric Co. Ltd., Ekco-Ensign Electric Ltd., Harris & Sheldon (Electrical) Ltd., produce standard fittings to modular sizes.
The tiles are readily demountable for access to services.

Sound Absorption

The table on the face of the Sheet gives sound absorption figures for two types of tile with and without a 1-in. backing of glass fibres, and with different airspaces.

Fire Resistance

The tiles are non-combustible with a Class 1 spread of flame rating tested in accordance with B.S.476:1953.

Further Information

The manufacturer maintains a technical advisory service available to deal with acoustical problems and prepare layouts.

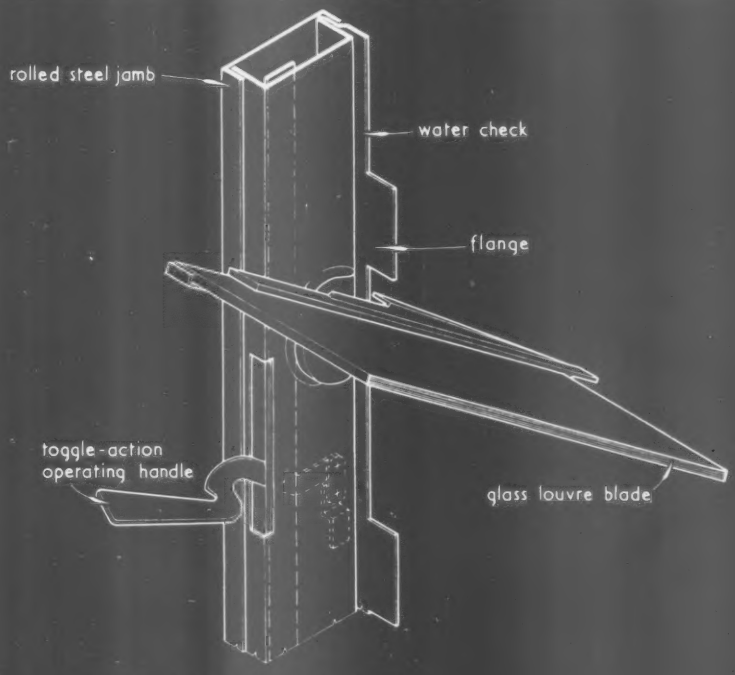
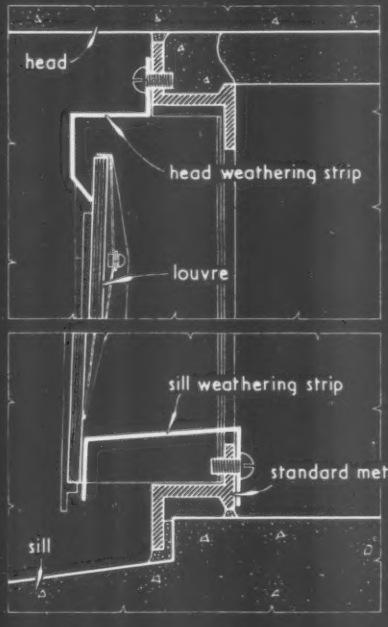
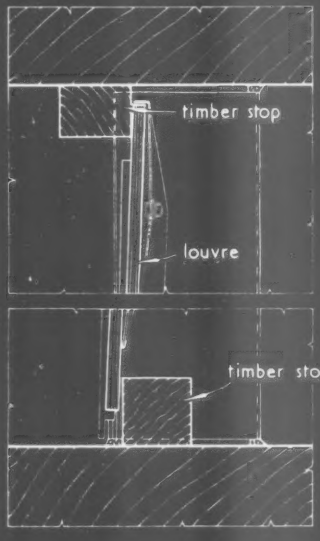
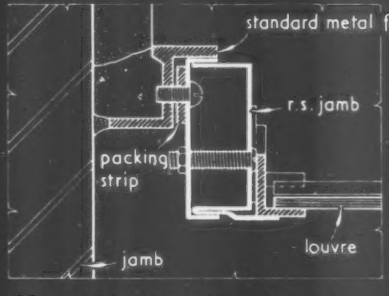
ISOMETRIC SKETCH OF TYPICAL LOUVRE.



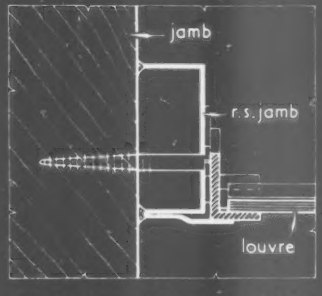
SKETCH OF OPERATING HANDLE.



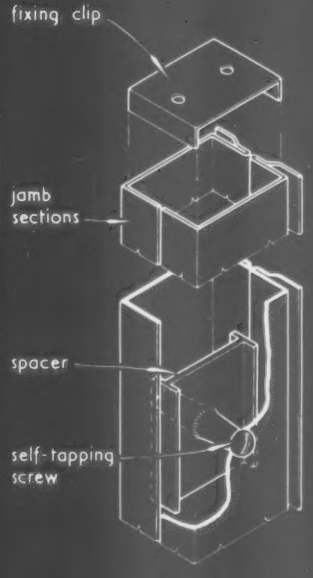




APPLICATION TO METAL FRAME.



APPLICATION TO TIMBER FRAME.



DETAIL OF MULLION FIXING.

FENESTRA GLASS LOUVRES. Manufacturer: The Crittall Manufacturing Co. Ltd.

30.D22 ·FENESTRA· GLASS LOUVRES

This Sheet describes Fenestra glass louvres which can be installed in metal or timber frames as complete windows or in conjunction with other glazing. They give complete ventilation and are entirely weatherproof even under extreme conditions.

Construction

The louvre consists of 18 g. galvanised rolled steel jambs with die-cast zinc-alloy bearers to take 6-in. wide glass blades from 32 oz. to $\frac{1}{4}$ in. thick. The blades are held by spring clips to prevent rattling and lap $\frac{1}{2}$ in. Each blade closes under and over a flange which projects from the watercheck on the jamb. One toggle-action operating handle is supplied as standard, but an extra handle can be fitted, if required, to enable two parts of the louvres to operate independently. The blades can be held open at any angle up to 5° beyond the horizontal, the last-named position greatly increasing the air flow. Where the louvre is to be used with standard metal windows, it is obtainable, for small extra cost, with head and sill weathering members and jamb covers prepared for application to metal frames. Fixing clips and spacers are available for coupling the jambs to form mullions.

Sizes and Types

For application to timber frames: The louvres are obtainable in heights from 1 ft. $5\frac{1}{2}$ in. to 6 ft. 6 in. in $5\frac{1}{2}$-in. increments (i.e. the width of one blade minus $\frac{1}{2}$-in. lap). The four larger sizes are fitted with two operating handles.

For use with standard metal windows: Single louvres are obtainable 2 ft. $0\frac{3}{4}$ in., 3 ft. $0\frac{3}{8}$ in., 4 ft. 0 in., 4 ft. $11\frac{5}{8}$ in. high by 1 ft. 8 in., 2 ft. $0\frac{3}{4}$ in. wide.
In addition two or three louvres can be coupled side by side within standard metal frames. Double assemblies are 2 ft. $0\frac{3}{4}$ in., 3 ft. $0\frac{3}{8}$ in., 4 ft. 0 in., high by 3 ft. $3\frac{1}{4}$ in., 4 ft. $0\frac{3}{4}$ in., 4 ft. $10\frac{1}{2}$ in. wide and 4 ft. $11\frac{5}{8}$ in. high by 3 ft. $3\frac{1}{4}$ in., 4 ft. $0\frac{3}{4}$ in. wide. Three-louvre assemblies are 2 ft. $0\frac{3}{4}$ in., 3 ft. $0\frac{3}{8}$ in., 4 ft. 0 in. high by 6 ft. $0\frac{3}{4}$ in. wide.
The four alternative heights have 4, 6, 8 and 10 glass blades, respectively.

Fixing

Application to timber frames: The jamb fitted with the operating handle should be fixed first, screwing it firmly to the side of the opening. The opposite jamb should be held by one untightened screw at the top so that the bottom of the channel can be adjusted. The glass blades are then placed in position by sliding them between the bearers at each side. The louvres are then closed and the unfixed side adjusted until all the louvres are close and firm across the window opening: the second side is then finally secured. The timber stops shown in the drawings on the face of the Sheet are screwed into position so that they just touch the blades of the louvre when closed: the use of a mastic caulking material under the bottom stop is recommended.
Where mullions are to be fitted, the outer jambs are fixed first and the mullion fixing clips at head and sill screwed into position. The spacers are fixed into the channel which has the operating handle and this channel is placed in the fixing clips at head and sill first: the other channel is then applied and the two screwed together.

Application to standard metal frames: The channel sections to which are welded full-length 14 gauge galvanised steel packing strips are screwed into the side rebates of the standard metal frame as shown in the first section on the lower face of the Sheet, so that the packing strips fit against the rebates. The jamb sections are then fixed and the head weathering applied to the outer face of the window frame, ensuring that it is firmly seated on the jambs, and mullions if any. The sill weathering strip is screwed to the inner face of the frame so that it forms a stop for the lowest blade of the louvre. Mullions are assembled as described under *Application to timber frames.*

Glass: The glass for the louvre blades should be not less than $\frac{5}{16}$ in. thick (32 oz.) or more than $\frac{1}{4}$ in. 32 oz. glass blades should not exceed 2 ft. 6 in. in length and $\frac{1}{4}$ in. should not exceed 3 ft. 0 in. Arrises should be ground.

Finish

Jambs, bearers, handles, etc., are finished with one coat of aluminium paint. Head and sill weatherings are galvanised.

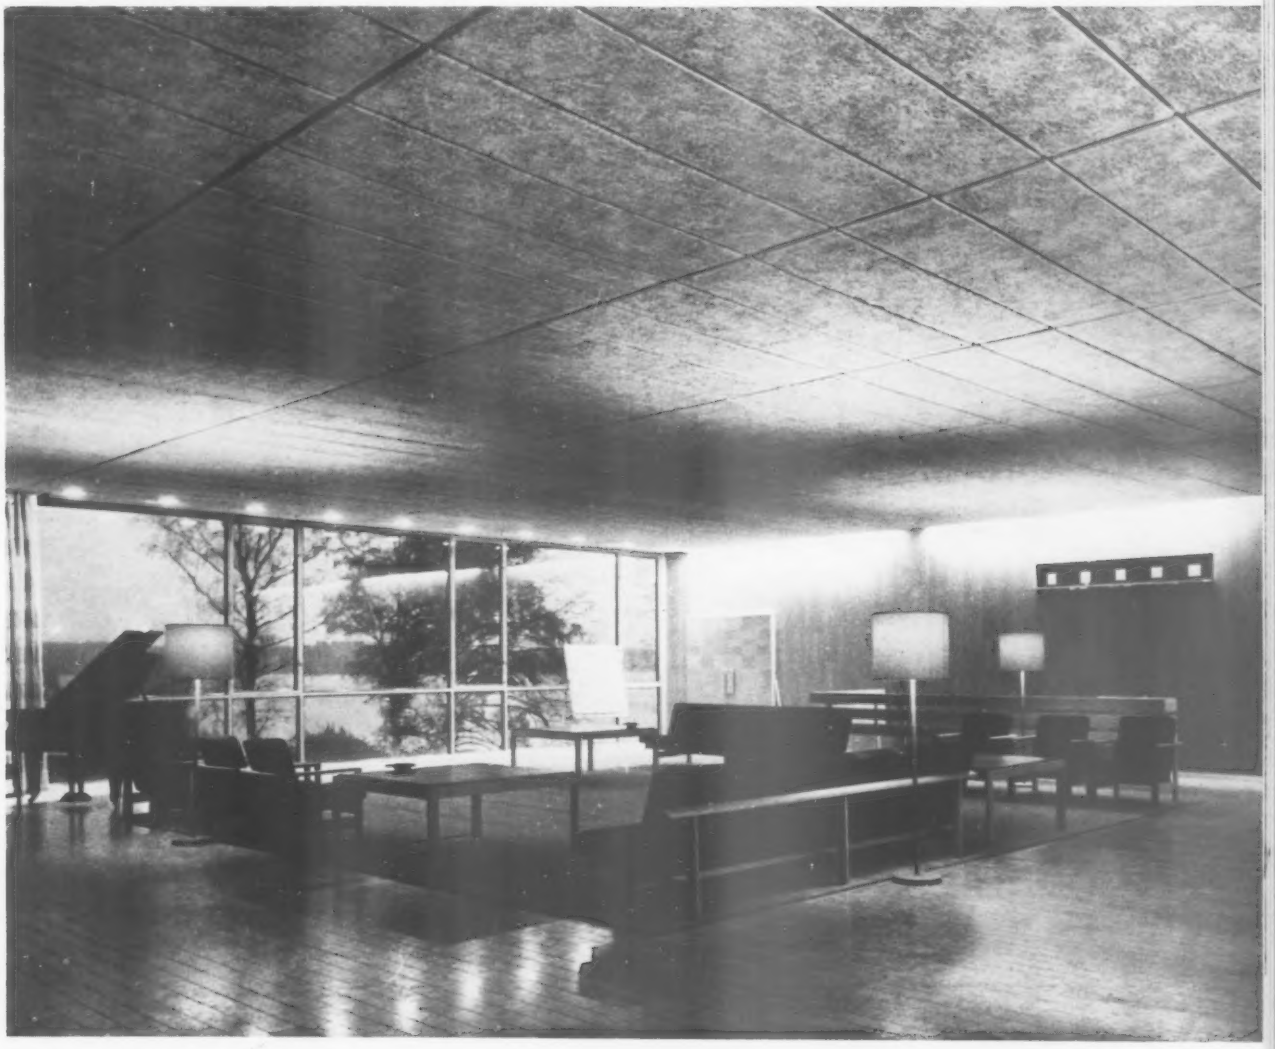
CEILING: TRAINING CENTRE IN STOCKHOLM

Anders Tengbom, architect (material supplied by Alice Mylo)



This ceiling in the main assembly room is of suspended woodwool slabs screwed to longitudinal battens. An air space is left between the ends of the slabs at the cross battens, the air passing through ventilating domes in the concrete roof. Fluorescent tubes are concealed round the ceiling perimeter and spot-lights and a curtain track are recessed above the window. The slabs are whitewashed, the longitudinal battens being printed white and the cross battens, grey.

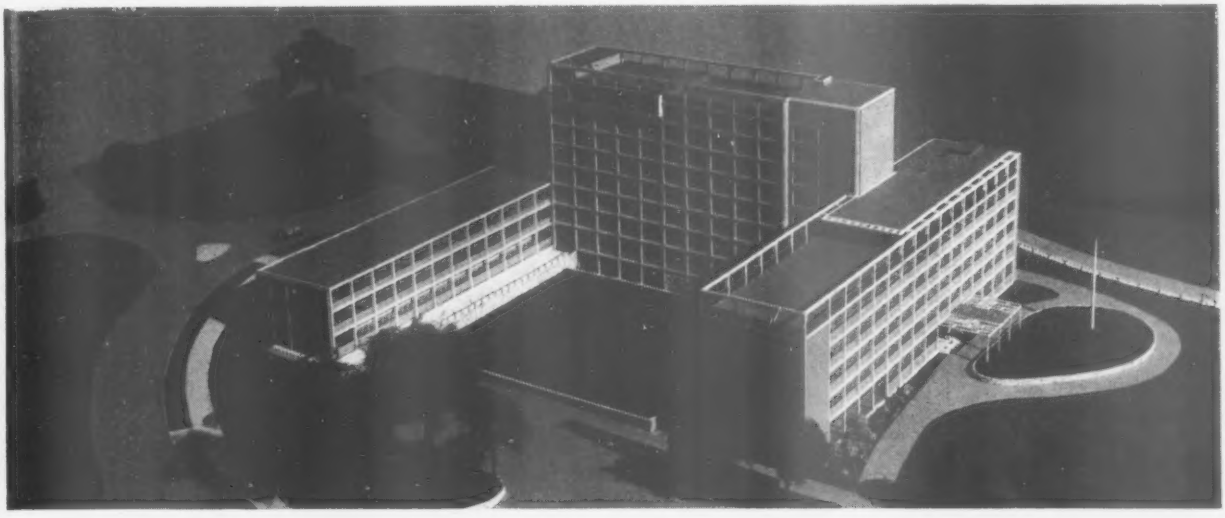
AIR MINISTRY METEOROLOGICAL OFFICE AT BRACKNELL



A model of the new Air Ministry meteorological office designed by H. A. Snow and K. H. Choate of the Ministry of Works architects division. The building is planned in three distinct interconnected blocks grouped around a central court. The three-storey block (left of picture) contains the Instrument Division and consists mainly of laboratories. Across the court from this is a five-storey block housing the administrative offices. The tall block linking these two is for the forecasting, research and communications divisions and a training school. A lift shaft at the junction of the two taller blocks serves both. It is intended to publish a full report of this building with a cost analysis in the AJ when the building is completed.

38.*H2. REFERENCE BACK*

Readers are asked to note the following amendments. Ronuk Emulsion should be replaced throughout by New Ronuk Plastic Emulsion and Ronuk Concentrated Wax by Ronuk Wax. Table on face of Sheet, under "New Floors, Concrete," amend Ronseal to Ronseal Coloured Seal. "Maintenance, Hardwood block and strip," delete "every 4 to 6 months"; "Concrete" add "New Ronuk Plastic Emulsion should be applied for a gloss finish if desired"; "Quarry tiles, etc.," add "The floor should be periodically maintained with New Ronuk Plastic Emulsion"; "Non-magnesite, etc.," delete "every 3 to 4 months" and substitute "when necessary"; "Rubber," delete "every 3 to 4 months" and substitute "less frequently." Delete "or asphalt" from end of footnote to table. Reverse of Sheet, under heading "Ronseal," add "Ronseal Coloured Seal is available in red or green, specially formulated for concrete and similar surfaces. Coverage: 25 to 30 sq. yd. per gallon." Under heading Ronuk Emulsion (now New Ronuk Plastic Emulsion), "Description" should read "This is an emulsion of plastic resins in a water base for polishing thermoplastic . . ." and to the end of the paragraph should be added "It requires no buffing as it dries to a bright surface."

K. W. Paterson, M.C.D., B.Arch., A.R.I.B.A., A.M.T.P.I., has commenced as a part-time lecturer and studio instructor at the Liverpool University School of Architecture, but is also continuing in practice as hitherto with his partner, J. S. Macaulay, M.C.D., B.Arch., A.R.I.B.A., A.M.T.P.I., under the style of Paterson & Macaulay, 83, Wirral Gardens, Bebington, Cheshire (telephone Bromborough 3016).

Peter Hing & Jones of 121, Colmore Row, Birmingham, 5, have opened a London office at 20, Grosvenor Place, London, S.W.1 (telephone Grosvenor 1390), where Richard Vanderplank, A.R.I.B.A., recently taken into junior partnership, will be in residence.

Robert R. Bye, F.R.I.C.S., and R. Gibson, A.R.I.C.S., previously of Raglan Squire & Partners, have commenced practice at 1, Hobart Place, London, S.W.1 (telephone Sloane 9842).

Arthur F. Sewell, A.R.I.B.A., has moved to new offices at 1, Warwick Road, Carlisle (telephone Carlisle 2-6398).

Stuart Bentley, F.R.I.B.A., A.M.T.P.I., Chief Architect of the Dunlop Rubber Co. since 1946, has been appointed Consultant Architect to **Semtex Ltd.**

TRADE

The Key Engineering Co. Ltd. have opened a London office at Blackfriars House, 19, New Bridge Street, London, E.C.4.

British Insulated Callender's Cables Ltd. have appointed R. A. Turpin as Manager of their Exeter branch on the retirement of H. F. G. Bicker.

Richard Crittall & Co. Ltd. have acquired the business of Maddock & Wright Ltd. Under a reconstruction of the Board of Maddock & Wright Ltd., W. J. Holmes continues as a Director and is joined by W. R. Cox and A. W. Powley of Richard Crittall & Co. Ltd.

The Unit Construction Co. Ltd. have appointed G. T. Taylor to succeed J. C. Blackmore as Regional Manager for the North-West Region.

Englewood Ltd. has moved its Head Office to 70, Coombe Road, New Malden, Surrey (telephone Malden 8244). The Luton branch of this firm is now under the management of H. V. Lynn.

R. Bateman will be representing Sherwoods Paints Ltd. in parts of Hertfordshire, Buckinghamshire, Middlesex and Berkshire.

Powell Duffryn Ltd. have formed a new subsidiary company called Powell Duffryn Modulair Ltd. which will market the Dravo space heater.

G. B. Elphicke is now Deputy Chairman and Managing Director of the Fawcett Construction Ltd. and G. Ball is the London Manager.

The Coal Utilization Council, West Middlesex Committee, have set up a demonstration centre in the Twickenham Road (opposite the West Middlesex Hospital) for the benefit of householders affected by Isleworth's first smoke control area. It will be open on Wednesdays 2.30 p.m.—5 p.m. and Saturdays 10 a.m.—12.30 p.m. for five months.

The only drainage system for sites like this

Squelching round a waterlogged site at least makes you thankful that you specified pitch fibre pipes. Drain-laying goes on regardless of rain or frost, keeping your progress schedule up to date. That's when you bless those simple, precision joints that need not wait on the weather. There are so many good reasons for specifying pitch fibre pipes. May we remind you of seven?

SEVEN reasons why pitch fibre pipes cut your costs

- Laying, testing and backfilling are simple and swift—rates up to 500 ft. an hour can be achieved with semi-skilled labour
- Concrete and cement joints are unnecessary
- Schedules can be maintained regardless of weather conditions
- Pitch fibre pipes are light, non-brittle and precision made to BS 2760
- Wastage caused by breakages on site is drastically reduced
- Corrosion, root penetration, water infiltration and cracking through settlement are all eliminated
- Improved hydraulic flow makes flatter gradients possible

Pitch Fibre Pipes

MARLEYMURA

12″ x 6″ vinyl wall tiles

bringing a new proportion
to stimulate a fresh approach
to permanent decoration . . .

Marleymura . . . wall tiles of vinyl . . . attractive, distinctive, pleasantly colourful, clean—and **tough.**

In new buildings and the reconstruction of old, Marleymura ends the monotony of large wall surfaces. Resistant to grease and acid; condensation reducing; easy to fix to any wall without any special surface: easy to clean, easy to maintain in beautiful condition. Simple washing keeps them bright and new and a lustrous sheen can be given to them with Marley Superwax.

MARLEYMURA tile sizes

The actual dimension of each tile is 12″ × 5 1/16″ which permits any design to be used while still maintaining an equal 1/8″ framed spacing between tiles.

GYPKLITH WOOD WOOL SLABS

... strong ... permanent ... unequalled for roofs, walls, linings and partitions wherever thermal insulation is vital

GYPROC products include:

GYPROC WALLBOARD
GYPROC PLANK
GYPROC LATH
GYPROC SARKING BOARD
GYPUNIT PANELS
GYPROC COVE
GYPROC PLASTERS

- Paristone Browning Plasters
  Haired, Unhaired and Metal Lathing grades
- Paristone Wall Finishing Plaster
- Gypstone Board Finishing Plaster
- Cretestone Concrete Bonding Plaster
- Gyproc Metropolitan Stucco
- Gypklith Surface Filler
- Gyplite Ready-Mixed Plasters

UNIT CONSTRUCTION PRODUCTS
- Gypunit Partition System and Wall Linings
- Gypstele Roof and Wall Linings
- Gypstele Suspended Ceilings
- Plaxstele Suspended Ceilings
- Gyproc 2-inch Solid Partition

ACOUSTIC PRODUCTS
- Gypklith Acoustic Tiles
- Acoustic Gyproc
- Gyproc Slotted Acoustic Tiles
- Gyptone Acoustic Tiles
- Acoustele Suspended Ceilings
- Dekoosto Acoustic Plaster

THERMAL INSULATION PRODUCTS
- Gyproc Insulating Wallboard and Lath
- Gypklith Wood Wool Slabs
- Zonalex Mineral Insulation

Literature is readily available on any or all of these products.

GYPKLITH wood wool slabs are light in weight and have great structural strength and durability. They have exceptional fire protective properties, being virtually incombustible, with Class I surfaces (B.S.476). As a thermal insulator GYPKLITH is excellent – a one inch slab of GYPKLITH is equivalent in thermal insulation to seventeen inches of dense concrete. These are only a few of the features worth studying. Write for leaflet AJ 358B which gives you complete information.

"Twitterton! Is this really FORMICA*?"

Can it really be? Plastics piping made by FORMICA? Actually FORMICA is the name of a Company who manufacture a great many first rate products, including their famous surfacing material FORMICA decorative laminates. Plastics piping for instance. FORMICA's plastics piping has overcome every major disadvantage of metal. And the other FORMICA extruded plastics products too, are opening exciting new projects every day; FORMICA plastics containers for attractive see-through packs for toothbrushes and cosmetics . . . FORMICA extruded rod for shock-proof screwdriver handles.

If you're interested in any type of extruded plastics be it piping, containers or rod, please write for full information . . . . . and remember . . . . .

LATTICE BEAMS

AND OF COURSE STANCHIONS

These beams are widely used in the modern planning of factories, school classrooms, offices, canteens, etc., where spans of 20ft. to 40ft. are encountered. They are most economic for all light roofing, combine well with the many prefabricated slabs which span directly between supporting joists.

Our Beam system gives a maximum of standardization to obtain economy and yet at the same time allows complete freedom to architectural planning.

Adaptable for all multi-storey buildings

ANTI-AC

PATENT REFUSE CHUTES

DESIGNED ON THE 'SHUNT' PRINCIPLE

The units are made from a dense impervious refractory concrete and have rebated joints. The separate entry of a slightly smaller section obviates blockage of the main chute and eliminates the possibility of accident through heavy objects falling from above striking bulky refuse during insertion. Specially designed, robust, silent-action hoppers, sliding gear at base and 'Shunt' ventilating terminals are available.

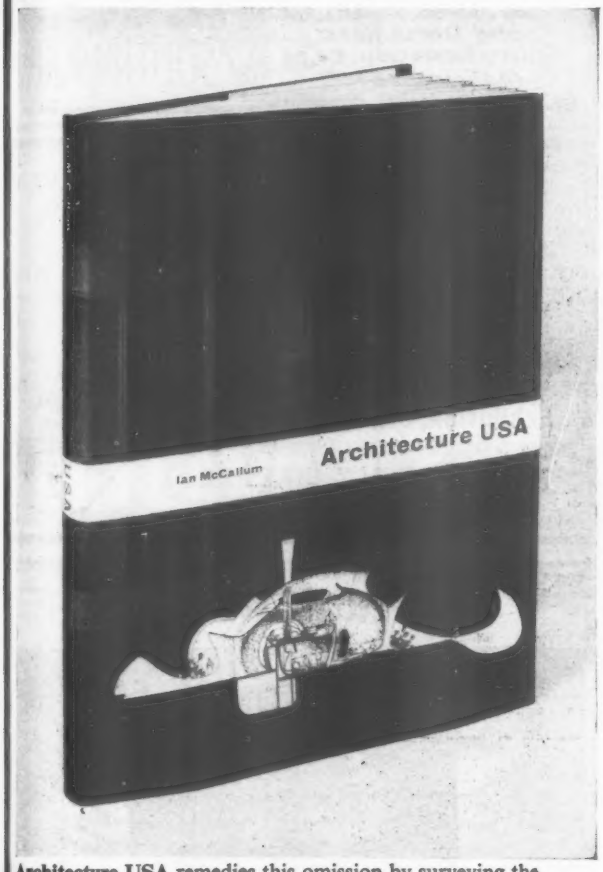
Architecture USA by Ian McCallum

SINCE 1950 AMERICA, a land of opportunity and a land of achievement, has attained a dominant place in world architecture. But it has remained largely unknown territory for want of a book that sets out to map the whole field.



Architecture USA remedies this omission by surveying the field in breadth and depth, studying not only the major architects in America today, but also their antecedents—the great pioneers and the social and historical developments that have carried their ideas to fruition. Here, in close enough juxtaposition to make comparisons possible and influences clear, are H. H. Richardson and Louis Sullivan and Frank Lloyd Wright, the pioneers of the Middle West; Greene and Greene and William Maybeck, pioneers of the West Coast; Raymond Schindler, Richard Neutra, Gropius, Breuer, Mies van der Rohe, the Europeans who have made an heroic contribution to US architecture; Edward Stone, Philip Johnson, Charles Eames, Buckminster Fuller, Paul Rudolph and others who have helped to make modern American Architecture both modern and American.

In **Architecture USA**, Ian McCallum has combined first-hand experience with extensive research to draw a group portrait of the most stimulating assembly of architectural minds in the world today.

Size 11¼×8¼ ins., 216 pages, with 474 halftones and 90 line illustrations and a bibliography. 63s. net, postage 1s. 9d.

(*a*) Applicants must be corporate members of the Institution of Structural Engineers and have had several years' experience in the design and detailing of reinforced concrete structures.

(*b*) Applicants must be corporate members of the Institution of Structural Engineers with some experience in reinforced concrete design and detailing.

Application forms from the County Architect, P.O. Box 26, County Hall, Preston, to be returned as soon as possible. 6600

SURREY COUNTY COUNCIL

Applications invited for the following appointments:—

SPECIAL GRADE (£785—£1,070 p.a. plus £30 p.a. London Allowance). This grade is particularly suitable for newly qualified Assistants.

ARCHITECTS. Must be A.R.I.B.A. and experienced in design and detailing.

GRADE I (£610—£765 p.a.) and GRADE II (£765—£880 p.a.) plus up to £30 p.a. London Allowance according to age.

ARCHITECTURAL ASSISTANTS. Must be of good general training, preference given those who have passed Inter. R.I.B.A.

Candidates will be appointed at the appropriate point within the scale according to age and ability.

Full details, present salary and three copy testimonials to County Architect, County Hall, Kingston, as soon as possible. 6883

COUNTY BOROUGH OF SOUTHEND-ON-SEA
BOROUGH ARCHITECT'S DEPARTMENT

Applications are invited for the following posts:—

ASSISTANT ARCHITECT
Special Classes Scale (£785 × 40(6) × 45—£1,070).

TECHNICAL ASSISTANT (ARCHITECTURAL)
Grade A.P.T.I. (£610 × 30(4) × 35—£765).

ASSISTANT QUANTITY SURVEYOR
Grade A.P.T.IV (£1,065 × 55 × 50(2)—£1,220).

ASSISTANT QUANTITY SURVEYOR
Special Classes Scale (£785 × 40(6) × 45—£1,070).

Candidates must be suitably qualified and experienced.

The appointments will be subject to the provisions of the Local Government Superannuation Acts and the National Joint Council's Scheme of Conditions of Service so far as adopted by the Council. Medical examination.

Applications, stating age, qualifications and experience, with the names of two referees, should be submitted to the Borough Architect, 30, Alexandra Street, Southend-on-Sea, by 14th December, 1959.

Canvassing will disqualify. Any candidate who is related to member or officer of the Council is required to disclose the fact.

ARCHIBALD GLEN,
Town Clerk.
6858

DIRECTOR OF HOUSING STUDY
required for the Metropolitan Halifax-Dartmouth Area

This study will examine, over a period of three years, the housing situation in the city of Halifax, the town of Dartmouth, and that part of the County within the Metropolitan Area, with particular reference to the quantity and quality of housing in relationship to the present and future needs of this area; it will also make recommendations for future action.

Applicants should possess a degree in Community Planning, Architecture, Social Science, or Engineering, should have experience in conducting detailed surveys of housing requirements and must have the ability and experience to relate the results to regional planning proposals. The part of Director will carry an annual salary of between $8,000 and $10,000 dollars commensurate with qualifications and experience.

For further information and application forms please write to: D. J. Bird, Director of Community Planning, Department of Municipal Affairs, Halifax, Nova Scotia. 6777

BOROUGH OF BEXLEY
ASSISTANT ARCHITECT

Applications are invited for this appointment at a salary according to qualifications within Grade APT.III (£880 to £1,065 per annum) or Special Scale (£785 to £1,070 per annum) plus London Weighting.

Candidates should have experience in school and housing projects.

Form of application and conditions of appointment are obtainable from the Borough Engineer, West Lodge, Broadway, Bexleyheath, Kent, to whom completed applications must be returned by the 1st December, 1959. The Council may be prepared to assist in the provision of housing accommodation.

Canvassing will disqualify.

ARTHUR GOLDFINCH,
Town Clerk.
6879

NATIONAL COAL BOARD
EAST MIDLANDS DIVISION
ARCHITECTS AND ARCHITECTURAL ASSISTANTS

Applications are invited for superannuable posts with the National Coal Board, East Midlands Division, on the staff of the Divisional Chief Architect at 69, Lower Parliament Street, Nottingham.

SALARY SCALES

ARCHITECTS, GRADE 2, £815 × £30—£1,125. Open to Corporate Members of the R.I.B.A. with wide practical experience.

ARCHITECTURAL ASSISTANTS, GRADES 1 & 2. £715 × £25—£850 (exceptionally £1,000). £595 × £25—£710.

Qualifications: Preferably Intermediate R.I.B.A., although regard will be paid to good practical experience.

The work of the department provides excellent experience in the design and construction of large Welfare and Industrial Buildings.

Applications within 14 days, giving age and full details of qualifications and experience, to:—
Divisional Chief Staff Officer,
National Coal Board, East Midlands Division,
Sherwood Lodge, Arnold, Nr. Nottingham. 6903

ARCHITECTURAL ASSISTANTS
REQUIRED BY
MINISTRY OF WORKS

For employment in London. Keen and enthusiastic Assistants of Intermediate R.I.B.A. standard are required for the design of interesting and varied types of buildings in all parts of the world. The salary range is from £560 (at age 21) to £980. Starting pay according to age and experience. 5-day week. 3½ weeks annual leave. Good prospects of promotion and permanency. Permanent posts are pensionable and the pension scheme is non-contributory. Apply, giving details of age, training and experience to: E. Bedford, C.B., C.V.O., A.R.I.B.A., Chief Architect, Ministry of Works, Abell House, Room 435, John Islip Street, London, S.W.1. 6466

BILLINGHAM URBAN DISTRICT COUNCIL
APPOINTMENT OF
CHIEF ARCHITECTURAL ASSISTANT—
Special Grade (£785—£1,070 p.a.).

Applications are invited from persons with suitable qualifications and experience. Extensive town development is taking place within the Urban District and the appointment offers opportunity of interesting work. The commencing salary will be in accordance with qualifications and experience; housing accommodation is available.

The appointment is subject to the National Scheme of Conditions of Service and the Local Government Superannuation Acts. Applications stating qualifications and experience together with the names of two referees must be delivered to the undersigned by the 4th December, 1959. Canvassing will disqualify.

FRED M. DAWSON,
Council Offices, *Clerk of the Council.*
Haverton Hill. 6873

COUNTY BOROUGH OF BARNSLEY
BOROUGH ENGINEER & SURVEYOR AND PLANNING OFFICER'S DEPARTMENT
APPOINTMENT OF PLANNING ASSISTANT AND JUNIOR ARCHITECTURAL ASSISTANT

Applications are invited for the following appointments:

(*a*) PLANNING ASSISTANT (Special Grade, £785—£1,070).

(*b*) TEMPORARY JUNIOR ARCHITECTURAL ASSISTANT (Grade A.P.T. I, £610—£765).

The commencing salaries in both cases will be fixed within the appropriate Grades according to experience and qualifications.

For appointment (*a*) candidates must hold a recognised Diploma in Town Planning and/or be A.M.T.P.I. and should have had previous experience in town planning and development control.

Post (*b*) is suitable for a young man in his early architectural training and offers a good opportunity for gaining sound practical experience.

The appointments will be subject to (*a*) the Scheme of Conditions of Service for A.P.T.C. staff; (*b*) any other general conditions of service in operation within the Corporation from time to time; (*c*) one month's notice on either side and (*d*) to the Local Government Superannuation Acts, for which purpose the successful candidates will be required to pass a medical examination.

Housing accommodation can be provided if necessary and 50 per cent. of removal transport expenses will be paid in approved cases.

Applications, stating age, present and previous appointments, qualifications, experience, etc., together with the names of two persons for reference, should reach the Borough Engineer, Town Hall, Barnsley, by Wednesday, 2nd December, 1959.

Canvassing will disqualify.

A. E. GILFILLAN,
Town Clerk.

Town Hall,
Barnsley.
November, 1959. 6815

CITY OF CANTERBURY

Applications are invited from persons who have passed the Final Examination of the R.I.B.A. for the appointment of an ASSISTANT ARCHITECT. Special scale (£785—£1,070). The commencing salary will be fixed within the scale according to qualifications and experience.

Applicants should have had varied experience and be capable of good detailing and presentation.

The Council are prepared to make housing accommodation available if required.

Applications, together with the names of two referees, must reach the City Architect & Planning Officer, Mr. John L. Berbiers, F.R.I.B.A., A.M.T.P.I., not later than Tuesday, 1st December, 1959.

Canvassing will disqualify.

J. BOYLE,
Town Clerk.

Municipal Buildings,
Canterbury. 6769

BOROUGH OF EALING

1. ARCHITECTURAL ASSISTANT, A.P.T. IV (£1,095—£1,250 inclusive). Must hold recognised architectural qualifications.

6775

BOURNEMOUTH EDUCATION COMMITTEE
BOURNEMOUTH MUNICIPAL COLLEGE OF ART

Applications are invited for the post of Lecturer in charge of the Architecture Department, to begin as soon as possible after 1st January, 1960.

Salary in accordance with the Burnham Scale: £1,370 to £1,550, plus allowance for degree or equivalent, training, etc.

Applicants should hold the Associateship of the Royal Institute of British Architects, and have had teaching experience.

Particulars and application form from W. R. Smedley, Chief Education Officer, Town Hall, Bournemouth. 6875

WARWICKSHIRE COUNTY COUNCIL
COUNTY ARCHITECT

Applications are invited for the post of County Architect. The salary will be £3,465 per annum, rising, subject to satisfactory service, by three annual increments of £135 to a maximum of £3,860 per annum. The appointment will be subject to three months' notice on either side and to the Conditions of Service of the Joint Negotiating Committee for Chief Officers of Local Authorities.

Candidates must be members of the Royal Institute of British Architects, and preference will be given to those having had experience with large public authorities.

The appointment will be subject to the provisions of the Local Government Superannuation Acts, 1937-1953, and the successful candidate will be required to pass a medical examination.

Applications, on forms obtainable from the undersigned, must state the names and addresses of not more than three persons who have knowledge of the applicant and his work and to whom reference can be made. They should be returned to the Clerk of the Council, Shire Hall, Warwick, in a sealed envelope marked "County Architect," so as to reach him not later than first post on Monday, the 7th December.

L. EDGAR STEPHENS,
Clerk of the Council.

Shire Hall,
Warwick.
6th November, 1959. 6783

NANTWICH URBAN DISTRICT COUNCIL

Planning Assistant (Research)

Applications are invited for the appointment of a PLANNING ASSISTANT (Research) in the County Planning Department. Salary within Special Grade of the National Scales (£785—£1,070 p.a.) according to qualifications and experience. Applicants should be university graduates with an honours degree in Geography or Economics or qualified Planning Assistants with experience in research work and development plan procedure and in each case should have had at least five years' experience (including the period spent on theoretical training). Duties include collation of statistical material and investigation of problems connected with population, industry and housing, and work on the review of the county development plan and town maps. N.J.C. Service Conditions; car allowance; post pensionable; medical examination.

Application forms obtainable from the County Planning Officer, Shire Hall, Bury St. Edmunds, to be returned as soon as possible. 6929

BOROUGH OF CROSBY
CAPITAL WORKS PROGRAMME
ARCHITECTURAL ASSISTANT

Applications are invited for the appointment of an ARCHITECTURAL ASSISTANT in the Borough Engineer's Department at a salary within the range A.P.T.I. to Special Grade (£610 to £1,070) according to qualifications and experience.

The successful applicant will be engaged mainly upon works of a capital nature, including the construction of a new swimming bath.

It is the Council's policy to assist in the provision of housing accommodation upon satisfactory proof of need.

Applications on forms obtainable from the Borough Engineer at the address below must be received, suitably endorsed, as soon as possible.

Canvassing directly or indirectly will disqualify.

HAROLD O. ROBERTS,
Town Clerk.

Town Hall,
Waterloo,
LIVERPOOL, 22.
November, 1959. 6928

ARGYLL COUNTY COUNCIL
ARCHITECTURAL ASSISTANT

Applications are invited for the post of ARCHITECTURAL ASSISTANT in the County Architect's Department, Dunoon. The salary scale will be Executive III-IV (£735—£865 per annum) with placing according to qualifications and experience. The post in superannuable.

Applicants must have had a general architectural training, be capable of surveying, levelling, preparing detailed drawings and specifications and have had experience particularly in connection with housing and schools.

The successful applicant will be given the tenancy of a four apartment council house if required.

Applications stating age, experience and qualifications and giving names of two referees to be lodged with the County Architect, County Offices, Dunoon, not later than 5th December. 6919

BOROUGH OF REDCAR
APPOINTMENT OF CLERK OF WORKS
MISCELLANEOUS GRADE IV £590×£20=£650

Applications are invited for the above appointment to supervise all types of building and engineering works.

Applicants must have worked in a supervisory capacity.

Housing accommodation will be provided and the Council will consider contributing towards removal expenses.

Applications on the forms obtainable from the undersigned must be returned before noon on Friday, 11th December, 1959.

H. CALDWELL,
Town Clerk.

Municipal Buildings,
Redcar.
November, 1959. 6983

COUNTY BOROUGH OF EAST HAM
BOROUGH ENGINEER'S DEPARTMENT

Applications are invited for the following temporary appointments:—

SENIOR ASSISTANT ARCHITECT, Grade IV, £1,065—£1,220.

ARCHITECTURAL ASSISTANT, Grade II, £765—£880.

London weighting is paid in addition, and salaries in excess of the minima may be paid according to qualifications and experience. The appointments are for work on a new Technical College and are expected to be for a period of not less than three years.

Further details and application forms returnable by 11th December, 1959, from the Town Clerk, Town Hall, East Ham, E.6. 6964

BOROUGH OF WILLESDEN
BOROUGH ENGINEER AND SURVEYOR'S DEPARTMENT

Applications are invited from suitably qualified and experienced persons for the following permanent appointments:—

ASSISTANT ARCHITECT within Special Grade (£750—£1,030 p.a.).

ASSISTANT ARCHITECT within Grade A.P.T. II (£765—£880 p.a.).

ASSISTANT ARCHITECT within Grade A.P.T. I (£610—£765 p.a.).

London weighting, maximum £30 p.a., is payable in addition to the above salary.

The Council is unable to assist with housing accommodation.

Forms of application and conditions of appointment may be obtained from the Borough Engineer & Surveyor, Town Hall, Dyne Road, Kilburn, N.W.6. Applications to be returned to the undersigned not later than 9 a.m. on Tuesday, 15th December, 1959.

R. S. FORSTER,
Town Clerk.

November 18, 1959. 6918

SHEFFIELD REGIONAL HOSPITAL BOARD

Applications are invited for the following posts on the Board's Architectural staff:—

ASSISTANT ARCHITECTS—candidates must be Registered Architects and have passed the requisite examinations. Salary (at present under review) within scale £730—£1,055 per annum according to age and experience.

ARCHITECTURAL ASSISTANT—candidates should have passed the Intermediate Examination of the R.I.B.A. or an examination giving exemption therefrom. Salary (at present under review) commencing within scale £545—£630 rising to £765 per annum.

DRAUGHTSMAN—for general drawing office duties, including tracing. Candidates must have had suitable training, including three years' technical experience in architectural, surveying or engineering drawing. Salary (at present under review) within scale £445 at age 21 or over rising to £660 per annum.

Appointment is subject to Whitley Council terms and conditions of service, to the National Health Service (Superannuation) Regulations and to one month's notice on either side. Applications, stating age, experience, together with the names of three referees, should be sent to the Secretary to the Board, Old Fulwood Road, Sheffield 10, not later than 11th December, 1959. 6915

NORTH EAST METROPOLITAN REGIONAL HOSPITAL BOARD

W. G. PLANT, DIPL. ARCH. (LIVERPOOL), F.R.I.B.A.,
REGIONAL ARCHITECT

EXPANSION OF ARCHITECTS' DEPARTMENT

The Board is engaged in an expanding programme of hospital development, and the undermentioned appointments offer to Architects exceptional opportunities of gaining experience in designing and supervising the construction of hospital buildings, and to Quantity Surveyors experience in a wide, varied and interesting field; most of the building work is designed and supervised by the Board's own staff which is now being substantially enlarged, and those appointed will be expected to accept a considerable degree of responsibility.

Own car may be used for visiting hospitals, etc., for which adequate mileage allowance paid. Posts pensionable and excellent prospects of promotion. Previous hospital experience is NOT essential. All salary scales now being reviewed.

PRINCIPAL ASSISTANT ARCHITECT

Salary £1,245—£1,470 (new entrants commence at minimum). Applicants must be registered Architects having passed the requisite examinations and must be good designers, capable of preparing working drawings and specifications for and undertaking site supervision of all types of building projects. The person appointed will be required to control the work of a group of Architects working as a team.

ASSISTANT ARCHITECTS

Salary according to age and experience up to a maximum of £1,105. Applicants must be registered Architects having passed the requisite examinations, and must be good designers, capable of preparing working drawings and specifications for, and undertaking site supervision of, all types of building projects, under limited supervision.

SENIOR ASSISTANT QUANTITY SURVEYORS

Salary £1,100—£1,295 (new entrants commence at minimum). Candidates must be Corporate Members of the Royal Institution of Chartered Surveyors (Sub. Div. III Quantities), or, in certain circumstances, Associate Members of the Institution of Quantity Surveyors. The duties comprise taking off and working up, specification writing, site surveys and measurements, valuations for certificates, preparation of estimates and final accounts. The work covers a wide and interesting field of traditional and modern construction, alterations and adaptations, drainage and site development schemes.

ASSISTANT QUANTITY SURVEYORS

Salary according to age and experience up to a maximum of £1,105. Candidates must be Corporate Members of R.I.C.S. (Sub. Div. III Quantities) or in certain circumstances Associate members of the Institute of Quantity Surveyors. The duties comprise site measuring, taking off and estimating (all under supervision), working up and final accounts.

QUANTITY SURVEYING ASSISTANTS

Salary £555—£795. Applicants must have passed the Intermediate Examination of the R.I.C.S. (Sub. Div. III Quantities). The duties comprise generally assisting in the Quantity Surveyor's Section, both in the office and on building sites, with some opportunity for taking off, under supervision. Some facilities may be provided for training.

Application forms from Secretary, North East Metropolitan Regional Hospital Board, 40, Eastbourne Terrace, W.2. 6913

Tenders Invited

E. J. COPE-BROWN,
Town Clerk.
6895

WANSTEAD AND WOODFORD CORPORATION

Applications are invited for the following established appointments in the Borough Engineer and Surveyor's Department, the salaries indicated being exclusive of London Weighting.

These appointments are urgently required to deal with capital works of area reconstruction, town hall development and a large civil engineering programme, including improvements to trunk and county roads, sewage disposal works reconstruction, main drainage, recreation ground construction and estate development.

1. Chief Planning Assistant A. P. T. V. (£1,220-£1,375)

2. Senior Assistant Engineer A. P. T. V. (£1,220-£1,375)

3. Senior Assistant Engineer A. P. T. IV. (£1,065-£1,220)

4. Assistant Engineer A. P. T. II. (£765-£880)

POST 1 The successful applicant will control the Town Planning Section and must hold the final examination of the Town Planning Institute, whilst an additional architectural or engineering qualification will be advantageous. Applicants will be preferred who have experience in urban redevelopment with a local authority in addition to routine control of development.

POSTS 2 & 3 Applicants must hold recognised professional qualifications and some previous experience in design and construction of highway works will be advantageous.

POST 4 Applicants should have passed the intermediate examination of a recognised professional institution and also preferably have had some years' practical experience in the service of a local authority.

The starting salary for all appointments will be fixed in accordance with the experience of the successful applicants. Casual user car allowances are payable in respect of Posts 1, 2 and 3, but housing accommodation is not offered, although this question is at present under review by the Council.

Forms are obtainable from, and must be returned to the undersigned, not later than first post on 9th December, 1959.

L. S. JEFFERY,
Borough Engineer and Surveyor.

Municipal Offices,
High Road,
Woodford, E.18.
