Building on the existing discourse of how stylistic International Modernism symbolically constructed new cultural identities for post-colonial statehoods of the Global South, this introduction seeks to ground the rereading of the post-World-War II public constructions—from Karim Sayed's Egypt, Van Molyvann's Cambodia to Mendes da Rocha's Brazil, William Lim's Singapore, and more—also through the lens of climate localization in the Anthropocene. Built in the age before the proliferation of air conditioning, these buildings were already using tectonic devices such as the deep facade, brise soleil, roof overhangs, atriums, and more, to shade and facilitate air flow, localizing stylistic modernism in the specificities of their geographic and climatic contexts, and manifesting Sri Lankan architect Minnette da Silva had termed "Regional Modernism." Today, the global aspirations for the gleaming, tautly-enclosed and thin-skinned new structures, which represent economic prosperity and reflect the economics of construction under capitalism, are threatening to replace these very same civic buildings, both symbolically and functionally. Building on a trajectory of analysing architecture through their political ecological as well as environmental governance impacts, critical re-examination of the genealogies and materialities of some of the lesser-known modernist public buildings or the lesser-known aspects of well-known modernist buildings from the Global South framed by climate and context responsiveness, and the potentials for their valorisation and conservation is today much warranted.

"the South is going north" – Yung Ho Chang

Architectural modernism proliferated, in the aftermaths of World-War-II, as the internationally-circulating tectonic language. Its progressive expression for technological advancements and industrialized mass production were not only utilized for the rebuilding of the devastated cities of Continental Europe and the flourishing capitalist landscapes of North America,[1] representing both the liberal ideals of a democratic West and the collectivist ideals of a socialist East. The universalist architectural *lingua franca* of modernism is, perhaps more monumentally, deployed in constructing the historical identities of the many newly-independent nation states. In the new capital cities and public architectures representative of a new global order, the plastic expressions of modernism molded in reinforced concrete were tasked to be the material manifestations for post-colonial nationhoods.

Existing architectural discourses have already canonized the Punjab capital of Chandigarh (1950s) by Le Corbusier and his team and the capital city of Brasilia (1956-60) by Oscar Niemeyer and Lucio Costa and their team, as exemplars of how modernism came to express the aspirations and identities of the new nation-states through their urban design and architecture.[2] The Capital Complex in Dhaka, also a known architectural symbol for the establishment of the new nation of Bangladesh in 1971, highlights the famous modernist master Louis Kahn. Increasingly coming to the fore are the post-war public architectures in many parts of what is today referred to as the 'Global South,' in an expanding and more inclusive global history of architecture.[3] Many "local" architects, until-now unknown outside small circles of geographically-specific disciplinarians, and themselves often multi-lingual transnational cosmopolitans traversing global flows of knowledge—Vann Molyvann, Karim Sayed, Lim Chong Keat, Minnette da Silva, amongst numerous others—are also increasingly acknowledged for their contributions to and the realizations of the aspirations of a global modernism.[4]

From parliaments to schools, from stadiums to markets, these expressions of nationhood from what were formerly considered the 'periphery,' themselves where half the world's population lives, are additionally, *also* becoming recognized for the wisdoms and lessons they may offer the 'centre' today for environmental sustainability. Before the age of sealed facades and energy-intensive climatization, the taut skin of which seem to represent economic development and prosperity, many of the designers of the public buildings located in the Global South not only imbued their architectures with the modernist ideals of light, air, sun. But more crucially they localized these manifestations of the civic in their geographic and cultural specificities.

The shift to understanding architectural modernism as climatic is being tabled by recent scholars, in today's urgent need to address the human impacts on climate change. The research of architectural historian Daniel Barber, as published in his book *Modern Architecture and Climate: Design before Air Conditioning* (2020), begins with the understanding that "modern

architecture was formulated, initially, as a strategy of climatic adaptability,"[5] and proceeds to examine its spatial and institutional consequences. From Le Corbusier's concern with the façade to the architecture outputs from Brazil, soon to become the poster child of and natural inheritor of European modernism, from the deployment of modernist tectonics in the American embassy buildings to represent Western liberalism in the ideological battles of the Cold War to the proliferation of a sealed and conditioned "planetary interior," Barber outlines an architectural evolution towards the contemporary spaces of capital and carbon. In his monograph *Modernism's Visible Hand Architecture and Regulation in America* (2018), the architectural historian Michael Osman went further to show how the management of the interior environment through mechanical ventilation, specifically in the context of American industrialization, was crucial to the evolution of infrastructures for social governance.[6]

Since the "facade was a mechanism of climatic mediation and environmental management,"[7] Barber focuses on tracing the development of shading devices, louvres, screens, jalousies, *brise-soleil* under modernism. While the envelope seems the most visible and representative tectonic device and component for the interaction of architecture with climate, it is but only one of the many case studies for understanding architecture's entanglements with "energy, politics, technology."[8] That the *brise soleil*, the deep façade and the overhang, made canonical by Le Corbusier's public buildings in Chandigarh and his later projects, including the Carpenter Centre in the northerly climate of Boston, was not the only spatial device for climate response would be obvious to practitioners in the South, whether a Global one or not. Many other devices and strategies deployed since historic times, including that of atriums, ceiling heights, interior spatial proportions for naturally ventilated air, water collecting roofs for natural cooling, and more all have and continue to contribute to the relationship of architecture to climate.

As architectural historian Jiat Hwee Chang's work, including his monograph *A Genealogy of Tropical Architecture: Colonial Networks, Nature and Technoscience* (2016) have shown already,[9] closer examination beyond only the envelope opens up the opportunity for scholars to probe how the post-war global circulation of modernism went beyond that of "climatic mediation and environmental management."[10] In Chang's analyses of the architectural languages used to represent the locality of British Malaya transitioning to the post-independence contemporary states of Malaysia and Singapore, it was the legacies of 'colonial regionalism,' which deployed vernacular symbols to justify the benevolent colonial rule, together with many of the local architects' understanding of the specificities of Southeast Asia's socio-climatics that shaped a new modernist architecture that is 'tropical.'[11]

In former British Malaya, the tropicality of architecture that was shaped by the "climate of decolonization" and produced as part of the aspirations for nation-building and identity formation was "not just designed to be in dialogue with the international discourse of tropical architecture"[12] that was being broadcast contemporaneously and more prominently. The most known

of these internationally recognized and circulating versions of tropical architecture was that of the British architects Jane Drew and Maxwell Fry, whose design research books *Village Housing in the Tropics* (1947)[13] and *Tropic Architecture in the Humid Zone* (1956)[14] advocated for the studies of climate localization as part of the viable transplantation of International Modernism, its ideals and forms originating in the temperate colder climates of the north. Having also worked closely with Le Corbusier on Chandigarh[15] the British architects' scientific research and development of shading and ventilation instruments made for a tectonic "dialect of internationalism,"[16] itself attesting to the directionality of learning-froms and civilizing missions as vestige of the colonial enterprise.

Architectural historian Hannah Le Roux cogently argued that the emergence of the study of a 'tropical architecture' was not only demarcated by a latitudinal-located equatorial zone and its indication of the combination of high temperature with high precipitation, but also was a legacy of the post-war reordering of global order shaped by the newly independent sovereign states.[17] The replacement of the term "colonial" with "tropical" in the building guidelines formerly called Colonial Building Notes and subsequently published as Tropical Building Notes drives home the continuities and ruptures of the term itself.[18] The 2024 exhibition entitled "Tropical Modernism" at London's Victoria and Albert Museum underlines,[19] if not starting to challenge, these oversights and exclusions that the technocratization of the 'tropics' has reinforced in architecture. As Chang also points out, publications with titles like *Tropical Houses: A guide to their design* (1961) and coming out of London was already criticized in the 1960s by architects who originate from Southeast Asia, who read them as reductive if not simply naïve.[20] The dominant conceptions of a 'tropics' or a 'South,' including their etymologies, underlying presumptions and insinuations, and as consequence their architectural manifestations all deserve examination and a re-writing of their historiographies.

Embedded in the term of a 'South' that is 'global' itself is a coincidence of the cardinal direction delineating the formerly colonial territories carved out by the Age of Conquest with the stage of development of these post-colonial states. That the contemporary term of the 'Global South' is used in lieu and to encompass 'developing' or, more optimistically, 'emerging' countries,[21] does not erase the legacy left by historic extraction from imperialist enterprises. A 'South' that is not dubbed 'global' at the same time also still denotes the cultural practices shaped by climatic and geographic specificities that are materially manifested in their built structures.[22]

Not soon after the re-publication of Drew and Fry's *Tropical Architecture in the Dry and Humid zones* (1964), the architectural historian Reyner Banham's *The Architecture of the Well-tempered Environment* (1969) would be one of the first to locate the development of modern architecture in the centre as being inextricable from the provisions of comfort and access that technological developments has made possible.[23] That Banham had been trained as an engineer underscores his reading of

modernism through the lens of technology and a fundamental scrutiny of architecture's disciplinary and professional role in relation to larger social transitions. Even though there were predictions that the global energy crises of the 1970s would challenge the constructions of centrally air-conditioned buildings enclosed by curtain walls,[24] the sealed and tempered environment has proven to be relentless, with the proliferation of ever-taller glass towers from Dubai to Singapore still today.

In the wake of a globalization of postmodernism in the 1990s, the architectural historians and theorists Liane Lefaivre and Alexander Tzonis's book *Critical Regionalism* called for a reconcilability of the modern and the local.[25] In their recalling of the works of the American historian and sociologist Lewis Mumford, whose *The South in Architecture* (1941)[26] had not rejected the positivism toward technology, but also opposed a reductive pitting of a local against a global that renders the universalist inevitably generic, their version of 'critical regionalism,' though starting to include token projects from the 'Global South' remains positioned from a vantage point where the fundamental assumptions of modern and tradition, of the developed and developing, of historical progression of ideas and of importation of ideas remained. This lingering presumption that International Modernism would be, in the non-West, an inevitable implant and in conflict with the continuity of traditions rooted in culture and place, often shaped by geography and climate, is what contemporary scholars re-evaluating the historiography of a tropical modern, itself fluid and evolving, are unpacking through their findings.[27] Already in the works and writings of architects like Tay Kheng Soon the specificities of socio-cultural and climatic regions are contesting an all-encompassing universality that the promise of technology boded.

Today, the growing body of examinations of buildings such as Lim Chong Keat, William Lim and Chen Voon Fen of Malaysian Architects Partnership's Singapore Conference Hall and Union House (1965),[28] shows how the 'South' has always been part of the consciousness of modernism localized and not only imported. Yet many works, for example Kington Loo's University of Malaya Grand Hall (1966), now called Dewan Tunku Canselor, remains to be understood in terms of influences of climate localization. Examination of the Cambodian modern master Vann Molyvann's civic buildings in Phnom Penh,[29] the construction of the National Stadium Complex (1963),[30] the State Palace (1966), and the Institute of Foreign Languages (1971), have also yet to fully unpack his seamless integration of climatically-localizing architectural elements within the evolving language, which both harks to venerable historic Khmer traditions of urbanism and architecture while deploying new modernist tectonic languages. Even though the distilling of how the atriums, *brise-soleils*, roof water collecting systems, window ventilation systems from Vann Molyvann's building have been conducted in the setting of design studios,[31] there remains little published analyses from which future generations could build, especially in light of the precarity

31. The 2024 spring semester studio that the architect Human Wu conducted at the University of Hong Kong, "Towards a New Vernacular Rethinking Housing Development in Phnom Penh," for example, looked closely at the tectonic and spatial devices of Vann Molyvann's and Geoffrey Bawa's buildings.

of many of these buildings in face of demolition-based development, replacing them with air-conditioned interiors enclosed by curtain wall.

Other blindspots of what Sri Lankan architect Minnette da Silva had termed "Regional Modernism" that deserve further unpacking, for example, are the works of Balakrisha Doshi, who also worked for Le Corbusier (1951-1954), including the Centre for Environmental Planning and Technology (CEPT) (1966) in Ahmedabad amongst many others. In South Asia, the buildings of Charles Correa in India and Jeffrey Bawa in Sri Lanka, similarly warrant further probing. In the Middle East, legacies of vernacular building practices for climate localization, as analysed by architectural and urban historian Sascha Roesler,[32] that could have influence on the modernism of Karim Sayed's realizations, including his masterplan of the Medinat Nasr (City of Victory) in Cairo,[33] amongst many other urban propositions also would worthy to draw out, if any.

The expansion of the architectural type of the public buildings, from congress halls to stadiums and sports facilities, the museums, libraries, universities, schools, post offices, market buildings, that have all become classic forms for modernist expression, includes another opening for the understanding of the meaning of civicness. In political economic contexts of rapid economic development, privately-developed buildings, including bank buildings, for example in Thailand, were also nodes of public education and modernization. Re-examining the office tower, in the rapid developments of Taiwan and Hong Kong, Asian Tiger economies by the 1970s, is another architectural type, whose instrumentalisation in the context of modernisation makes them also remarkably civic.

New ways of thinking today about architecture has been compelled by the irreversible impact that environmental degradation and climate change has wrought our planet, and through it the reframing of the Modern Movement in its engagement of the ecological. A repositioning the discipline as one deeply rooted in the specificities of geographies that shape the material and cultural construct for the built environment in fact is not innovative, but in parts of the world known as the Global South, ongoing since modernity. ■

BIOGRAPHY

Ying Zhou is an architect teaching at the University of Hong Kong. Her current research on East Asian art spaces intersects with heritage conservation, architectural reuse, gentrification, and creative cities discourses. Her book *Urban Loopholes: Creative Alliances of Spatial Productions in Shanghai's City Center* was published in 2017. She is an editor of *Architectural Histories*. Her writings appear in *Critical Planning, Topos, Urban China, Art Journal*, and she has exhibited at the Rotterdam Biennale, Swiss Architecture Museum and the Haus der Kunst, amongst others. She earned her BSE at Princeton, her MArch at Harvard, and her PhD at the ETHZ.

URBAN TEXTURED PAINTINGS: EXPLORING CHEN CHI-KWAN'S HIGH-RISE MODERN ARCHITECTURE AND OVER-ALL INK PAINTINGS FROM THE "GLOBAL SOUTH"

ABSTRACT

This paper re-evaluates post-war architecture in Taiwan from the perspective of the "Global South," critically examining its interactions with and resistance to the modernist influences from the "Global North." The focus is on Chen Chi-Kwan, a key figure in post-war architecture and painting, exploring how his designs—high-rise office buildings and over-all ink paintings—reflect localised adaptations to Taiwan's specific geopolitical and economic conditions and its climate, culture, and regional aesthetics.

Employing the framework of Critical Regionalism, Chen's work integrates modernist principles with traditional Chinese culture. His architectural designs make extensive use of local materials and construction techniques, creating structures that harmonise with Taiwan's subtropical environment. Similarly, his ink paintings innovate on traditional Chinese techniques, strongly influenced but not constrained by Western abstract expressionism, capturing the lightness and pleasure of contemporary life. Chen's work in both architecture and painting illustrates a shift from the "tradition of form" to the "freedom of life," from the continuation of national consciousness to the expansion of civic consciousness, mirroring the evolution of Taiwan's artistic and cultural landscape.

This study reveals the complex dynamics of globalisation, modernism, and tradition within Taiwan's architectural realm, enhancing our understanding of the global architectural discourse. It also unveils Taiwan's rich, yet overlooked cultural heritage, proposing new narratives and visions for its modern urban development through Chen's innovative integration of architecture and art.

1. INTRODUCTION: REVISITING POST-WAR ARCHITECTURE IN TAIWAN FROM A "GLOBAL SOUTH" PERSPECTIVE

"Global South" is a crucial term in contemporary international politics and economics, serving as a lens for understanding global shifts. The Cold War era's three-world model has evolved into today's "North-South divide." Modernism achieved dominance in the Global North, including Europe and the United States, spreading southwards through war, colonisation, trade, and cultural dissemination. The "Global South" typically refers to economically disadvantaged countries, primarily in South America, Africa, Asia, and Oceania. These regions have experienced rapid economic growth in recent years, boasting abundant natural resources and cultural heritage. While pursuing modernisation, these countries continually dissolve and resist Northern influences with their unique cultural and geographical climates.

Taiwan has always played an intermediary role on the world map. During the Japanese colonial period, it served as a springboard for Japan's southward expansion. After World War II, during the Cold War, it received U.S. aid and played a logistical role in opposing the Second World. In the 1970s, Taiwan lost its position as the representative of "orthodox China" after the Republic of China withdrew from the United Nations (1971) and severed diplomatic ties with the United States (1979). Despite its political and regional marginalisation, Taiwan's economy and commercial activities rapidly developed during this period, with a surge in the construction of residential and office buildings, which became part of the mainstream architectural production system. In Taiwan's modernisation process, post-war Taiwanese architects responded to the local climate and culture to resist the cultural dominance of the Global North. They sought to explore local practices within the context of globalisation.

This paper examines Taiwan from the perspective of the "Global South" through the work of post-war first-generation architect and painter Chen Chi-Kwan. His educational background bridges East and West: born in Beijing, China, in 1921, he studied and worked in the United States from 1948 to 1959, immersed in the trends of American modernist architecture and modern art. Since the 1960s, he has lived in Taiwan, successfully developing his architectural career and modern ink painting. His architectural and painting works reflect the absorption and resistance to modernism, blending traditional Chinese cultural connotations with Taiwan's regional characteristics. This paper focuses on Chen Chi-Kwan's high-rise office buildings and his Over-All Ink Paintings, which are clearly influenced by Western modernist architecture and abstract expressionist painting but are transformed to express a regional "texture." In architecture, this texture reflects changes in building facades in response to Taiwan's subtropical climate. In painting, it refers to innovative textures created using experimental techniques and multiple perspectives. The paper reveals the intricate connections between architecture and painting.

2. REVIEWING THE DEVELOPMENT OF CHEN CHI-KWAN'S HIGH-RISE ARCHITECTURE AND OVER-ALL INK PAINTING

Chen Chi-Kwan's painting style is closely linked to his architectural design. However, unlike architects such as Le Corbusier or Steven Holl, Chen did

not use his ink paintings as sketches for his architectural work; there is no direct link between the two. Instead, "painter" is another important identity of his as an "architect." His architecture and painting resemble parallel lines, displaying a complementary and resonant quality that requires future generations to study both together to understand and interpret them. This paper focuses on a special type of his ink painting, defined as "Over-all Ink Painting," similar to the "Over-all Painting" in American Abstract Expressionism. This means a unified treatment of the entire canvas, eliminating the hierarchical differences between top, bottom, left, and right. This flatness also demonstrates a departure from the traditional Western painting's emphasis on single-point perspective composition.

According to Fu Chao-Ching's (2019)[1] and Lin Chi-Chin's (1998)[2] research on Taiwanese office buildings, as well as Hsiao Chong-Ray's exploration of the history of post-war ink painting in Taiwan (1994)[3], the period from the post-World War II era to the late 1980s can be roughly divided into three phases. Below, Chen Chi-Kwan's office architecture and Over-all Ink Paintings are examined in the context of the development of Taiwan's modern movement. Observing Chen Chi-Kwan's Over-all Ink Paintings, the modes of expression can be divided into three aspects according to the periods: 1. freedom and innovation of brushstrokes, 2. flattening and horizontal layering of space, 3. rotating and dispersed perspectives. Through such a comparison, the parallel characteristics of Chen Chi-Kwan's architecture and painting, as well as their interaction with Taiwan's contemporary environment, can be understood.

2.1. PHASE 1: POST-WWII TAIWAN TO U.S. AID PERIOD (1945-1965)

During this period, Taiwan's office buildings were just beginning to develop, influenced by Western international styles and Chinese traditional styles representing national identity. In 1957, Chen Chi-Kwan came to Taiwan and contributed to the design of Tunghai University campus. In the early 1960s, he designed many residential buildings on the campus, incorporating local materials like ceramic pipes and tube tiles, pioneering experimental textural surfaces.

The late 1950s to early 1960s saw the emergence of "Modern Ink Painting," guided by societies like the Oriental Painting Society and the May Painting Society, inspired by "Abstract Painting." The Cultural Revolution in China prompted the Taiwanese government to launch the "Chinese Cultural Renaissance Movement," encouraging artists to modernise "Chinese Painting[4]."

Chen Chi-Kwan experimented with various innovative methods, using simplified lines from Chinese calligraphy, ink rubbing, and colouring the back of the paper, replacing traditional brushstrokes. His work reflected contemporary busy life, creating a light, floating sensation, similar to how he used local materials for architectural facades with strong regional characteristics.

4. Chiung-Jui, "The Emergence, Development, and Reflection of Modern Ink Painting in Postwar Taiwan," 28.

2.2. PHASE 2: END OF U.S. AID TO THE SEVERING OF DIPLOMATIC TIES BETWEEN THE U.S. AND TAIWAN (1965-1978)

In the late 1960s, many Taiwanese companies built headquarters, adopting international styles. After opening his Taipei firm in 1965, Chen Chi-Kwan's office buildings gained prominence, including the Kaohsiung Export Processing Zone Administration Building (1967), Chiayi Land Bank (1968), and the Labour Insurance Bureau Building (1972). The Taipei Labour Insurance Bureau Building stands out with its cubic shape, central service cores, and north-south facing main spaces to reduce sunlight. Its facades feature protruding concrete blocks and recessed windows with hanging sunshades, reflecting traditional Chinese eaves brackets and adapting to Taiwan's subtropical climate.

In 1971, the Diaoyutai Islets Incident and Taiwan's withdrawal from the UN spurred local consciousness and the "Native Soil Movement." Chen's works like "Untouchable" (1967) and "Less is More" (1976) symbolised Taiwan-China relations, while "Vision" (1967) and "River Bend" (1977) explored complex landscape textures.

2.3. PHASE 3: SEVERING OF DIPLOMATIC TIES BETWEEN THE U.S. AND TAIWAN TO LIFTING OF MARTIAL LAW (1979-1987)

In the 1980s, Taiwan experienced a surge in the construction of office buildings of increasing heights and diverse designs, thanks to new materials and technologies like curtain walls. Modernist and late modernist styles dominated[5], as seen in Chen Chi-Kwan's works: Chang Hua Bank (1979), Central Bank First and Second Buildings (1979 and 1984), Taiwan Property Insurance Building (1979), Yang-De Building (1982), Kaohsiung Fishermen's Association Fisheries Building (1985), and Kaohsiung Hua-Yun Building (1987). These buildings featured vertical sunshades, creating an elegant yet silent beauty amidst urban chaos.

In art, Modernism returned to Taiwan with the establishment of the Taipei Fine Arts Museum's in 1984. Chen's prominence grew, with his first solo exhibition in Taiwan in 1980, followed by shows in 1991 and 2003. Beginning in the 1980s, Chen developed a new form of landscape painting, and his works viewed the world through "rotational" and "panoramic" perspectives, featuring compositions filled with totemic, radiating, concentric circles of clouds and smoke across long canvases. Although the patterned wind compositions in the paintings could be considered decorative, they, like the dense, fine sunshades of the Chang-Hwa Bank and Yang-De Building, serve not only to block Taiwan's hot sunlight but also to create a clean facade for the chaotic metropolis of Taipei.

3. INTERPRETING THE HEADQUARTERS OF CHANG HWA BANK IN TAIPEI (1979) THROUGH CRITICAL REGIONALISM

This paper selects a representative case from the third phase of architect Chen Chi-Kwan's work—the Chang Hwa Bank Headquarters in Taipei (1979). Located in the capital city of Taiwan, this building won the Taiwan Architect

5. Chao-Ching, *An Illustrated History of Architectural Culture in Taiwan: Architectural Transformations from the Seventeenth to the Twenty-First Century*, 807.

Magazine Award in 1979. Based on modernist principles, Chen responded to Taiwan's geography, climate, and cultural roots by using concrete structures to counter the crystalline and closed glass curtain office buildings of the global North. This approach aligns with the concept of "Critical Regionalism," named by Greek architectural theorist Alexander Tzonis and further developed by Kenneth Frampton in his subsequent essays[6]. Unlike the abstraction and formality of avant-garde modern architecture, Critical Regionalism underscores a direct dialectical relationship with "nature."

Both the "Global South" and "Critical Regionalism" stress the importance of preserving and developing local culture and characteristics in response to globalisation and modernisation. Architectural design should reflect the terrain, structure, climate, and light of Global South countries, opposing a singular modernist paradigm and seeking a path to modernisation that embodies local uniqueness. This chapter examines this work from the perspective of Critical Regionalism, referencing Frampton's discourse[7] on "shaping place-form", "world culture," "climate response and fenestration". It discusses how Chen Chi-Kwan used office architecture to construct the cultural identity of Taiwan as part of the Global South.

3.1. SHAPING PLACE-FORM

Critical Regionalism sets boundaries, emphasising how structures create a sense of place. In the 1970s, Chen Chi-Kwan attended urban design seminars, focusing on beautifying cities and understanding high-rise building issues. Taiwan's cities grew rapidly, and high-rise buildings became prominent, marking a transition from early development to urbanisation. Chen approached architectural design from an overall spatial environment perspective, akin to the situational atmosphere in his paintings.

The Chang Hwa Bank headquarters, located at Zhongshan North Road and Changchun Road **(Fig. 1)**, broke away from monotonous box-like high-rises by using an L-shaped configuration to create open urban space[8]. The building features an office tower and a business hall with a setback forming a column-free arcade, giving the building a floating, light aesthetic. The arcade responds to South China's spatial culture, providing shelter and display windows for businesses. Additionally, the rooftop garden, designed with Chinese classical motifs, integrates seating, ponds, and trees to express a Chinese-style landscape.

The design elements highlight the integration of architecture and environment, reflecting Chen's response to Critical Regionalism. He emphasised the building's role in the urban environment, enhancing the quality of urban public spaces. This holistic approach made the Chang Hwa Bank headquarters a city highlight and a reference for future urban design in Taiwan.

3.2. RESPONDING TO OVER-ALL INK PAINTING: CREATING AN IDEAL ENVIRONMENT OF "WORLD CULTURE"

Critical Regionalism cultivates a contemporary, place-oriented culture, while paradoxically creating a place-based "world culture." In a 1981 symposium, Chen proposed the concept of "world culture" for Taiwan's urban beautification,

8. Chen Chi-Kwan Architectural Firm, "Changhua Bank Taipei Building," *Architect Magazine* (February 1980): 47.

emphasising cultural integration and the best aspects of both Eastern and Western cultures[9]. Chen's landscape paintings allegorise the modern city, transforming the visual experience of skyscrapers into the atmosphere of Chinese mountains. From the 1980s onwards, his works like "Valley" (1990) **(Fig. 2)** featured ink-washed mountains and small figures, creating an ideal realm[10]. These mountains resemble high-rise buildings with empty spaces akin to urban green spaces, reflecting contemporary architectural design's value.

Chen's landscape paintings can be compared to Le Corbusier's Ville Radieuse sketches, envisioning buildings that provide sunlight, fresh air, and a tree-filled future for urban life. Through his paintings, Chen expressed a longing for an ideal society and then brought this concept to life in the Chang Hwa Bank headquarters, offering valuable insights into contemporary architectural design.

3.3. CLIMATE RESPONSE AND FENESTRATION

Critical regionalism emphasises how local light dynamically illuminates structures, considering light as the primary medium to reveal the capacity and construction value of a building. It tends to treat all openings as subtle transitional zones capable of responding to place, climate, and light[11].

The Chang Hwa Bank high-rise office building consists of 14 floors with evenly distributed windows across the entire façade **(Fig. 3)**. The design cleverly positions staircases and elevators inside the building, ensuring that the cantilevered floor slabs on the façade range from 255 to 382 centimetres, thus avoiding structural columns interfering with the free design of the windows. All windows are standardised to a width of approximately one metre, fitting the required height and scale of the floors and beams, forming consistent rectangles. Between the windows are two thin, protruding panels, with recessed spaces in between, creating delicate and refined visual lines. Chen's ink paintings often use dots to form lines, and the slender sunshade panels resemble conceptual drawing lines[12], softening the imposing mass of the building in the urban landscape. This design not only enhances the aesthetic value of the building but also harmonises it with the surrounding environment.

In the façade design of the Chang Hwa Bank headquarters in Taipei, Chen Chi-Kwan ingeniously echoed the design principles of the Seagram Building (1958), adapting them to the local climate of Taiwan. The Seagram Building used bronze steel and large glass panels for its façade, emphasising its modernist minimalist aesthetics. In contrast, Chen Chi-Kwan used small concrete columns and reddish-brown bricks as non-structural pillars for the Chang Hwa Bank façade, providing shading and adapting to Taiwan's rainy, humid climate. Additionally, Chen used dark brown lines in the wall design to create a visual effect of fine lines, enhancing the building's three-dimensionality and aesthetics. The low, flat volume of the business hall is clad in beige stone, and the bevelled connection with the high-rise volume adds elegance and a harmonious transition to the overall building appearance. This design not only inherits the classic style of Mies van der Rohe but also integrates Taiwan's unique materials and climatic characteristics, showcasing Chen Chi-Kwan's localisation of modern architectural language.

4. CONCLUSION: CULTURAL DYNAMICS IN TAIWAN'S ARCHITECTURE: MODERNISM, TRADITION, AND REGIONAL CONTEXT

This paper takes a fresh look at Taiwan's post-war architecture from the perspective of the "Global South," delving into its interactions with the dominant modernist influences from the Global North and its modes of resistance. Taiwan's unique political migration background since the end of World War II has led to the absorption of political, cultural, and economic developments from China. During the 1970s and 1980s, as rapid economic growth fuelled the rise of capitalism and consumerism, both the official architecture representing the Republic of China and the flagship buildings of capitalist private enterprises made their mark on the architectural stage.

Through the works of Chen Chi-Kwan, this paper reveals his assimilation and transformation of modernism. His high-rise office buildings adorned with ink painting artworks demonstrate localised responses to the subtropical climate, and the cultural, economic, and technical conditions of China and Taiwan. Architectural works such as the Taipei Changhua Bank Headquarters are seen through the lens of Critical Regionalism. This building, situated on an urban corner along the green belt in Taipei in the late 1970s, creates public spaces for civic life, continuing the tradition of incorporating green spaces into the city. It uses local materials and construction methods, transforming the Western modernist glass curtain wall buildings with a reinforced concrete column and beam system combined with window layout and sunshade

design. This creates spatial interfaces suitable for the subtropical climate, filtering sunlight to create shade. At the same time, the ink paintings draw from Western abstract expressionism and reattempt traditional Chinese ink painting techniques, incorporating perspectives of modern life experiences, merging traditional landscape painting with modern life. Additionally, from the 1950s to the late 1980s, the evolution from traditional forms to traditions of living in office building types in Taiwan can be observed, transitioning from Chinese imagery to gradually discarding formalism, from national consciousness to civic consciousness, creating urban green spaces and open areas for public sharing. Despite not being civil buildings, these structures are equally important, enriching Taiwan's urban spaces.

Chen Chi-Kwan's contributions highlight the complexities between globalisation, modernism, and Chinese tradition, showing a deep understanding of Taiwan's architectural environment and shaping of cultural dynamics of artistic expression. Re-examining Chen's works allows us to gain a deeper appreciation of the diversity of global architectural discourse and the richness of Taiwan's architectural cultural heritage, bringing reflective retrospection to the ongoing development of high-rise buildings today. ■

ABSTRACT

The architecture of school buildings in former colonial territories became archetypal in terms of climate response by architects who mastered the language and technological lexicon of the Modern Movement. These architectures have been identified as optimal responses to a discourse close to current theories of mitigating the Anthropocene, insofar as they were focused on sustainable design and reduced the use of climate control technologies. After WWII, pivotal studies on designing with climate, by authors trained in former colonial geographies, such as the British architects Jane Drew and Maxwell Fry, encouraged school buildings to adapt adjusted to the various challenges of modern culture, including the climate and local resources. This position was widely promoted in the early historiography of the Modern Movement, which centred on the Global South, and extended to the study of Portuguese colonialism.

Against this background, this paper examines two nursery schools built in Maputo (Mozambique) and Luanda (Angola) in the early 1960s by the architects Pancho Guedes and Simões de Carvalho. These projects conveyed international debates that were in broader meetings promoting modern culture, such as the UIA (*Union Internationale des Architectes*). In particular, the *Charter for School Buildings*, resulting from the Rabat meeting in 1959, would have a direct impact on the rejection of the monumental scale, the introduction of spatial flexibility, structured circulation, and outdoor spaces on a child's scale. The nursery in the Cazenga neighbourhood (Angola) and the Piramidal kindergarten (Mozambique) are now established as educational institutions adapted to contemporary societies, with little maintenance and occasional adjustments to new programmes, reinforcing a formal and technical performance open to post-colonial societies and challenging the framework of their original conception. As true *Architectures for Children*, these buildings continue to contribute to early environmental education.

1. INTRODUCTION[1]

In 1944, the British architects Jane Drew (1911-1996) and Maxwell Fry (1899-1987) wrote a first book about architecture. Topics ranged from shelter as a biological need to systems of construction, design, history. It is not clear why this first edition was titled *Architecture for Children*, but it may have been from a didactic perspective. From the first pages, the school programme appeared as a potential guide to understanding the need for architecture.[2] According to the young couple, the school added to the problems raised by the design of the house: "There is the question of how to warm you in winter; how to keep you cool in summer, how to give light when dusk falls (…)."[3] The study was renamed *Architecture and the Environment* in 1976, emphasising that modern forms should follow sustainable avant-garde design.

Further books published by the duo between 1956 and 1964 would reinforce a "Tropical Modern" design,[4] in which the "Educational Building" became one protagonist in shaping new African nations. Drew and Fry also became notable for designing schools from the British colonial period to post-independence, "delivering an architecture that was not overtly 'colonial', yet responded to the colonial notion of school,"[5] as Jackson and Holland argued. Drew made the first plan for a school for a model village in Kenya (not built, 1938).[6] However, it was Fry who added one of the two types of nursery school to the duo's list of educational buildings **(Fig.1)**. These "small nurseries", from 1956,[7] were included in a larger series of schools built in Chandigarh (from 1951 onwards) and had "the front façade designed to be opened, blending the inside with the outside."[8] Similarities to this plan can be seen in the proposals by the architect Fernão Lopes Simões de Carvalho (b. 1929, Luanda, Angola) – whose work will be discussed in this paper – as the kindergarten in Novo Redondo, now Sumbe, Angola, from 1961.[9]

Between 1950 and 1966, Drew and Fry designed more than twenty-five school buildings, from the UK to Kenya, Ghana, Togo, Nigeria, and India.[10] These designs were adapted to tropical climates before any innovative programmatic formulation was considered. Of "primary schools," they wrote: "The program is simple – a room or rooms, a store, a latrine."[11] If in Africa the more conventional aspects of education were shaped by the axial organisation of these buildings, in post-colonial Punjab, India, the Model Secondary School in Sector-23 may have represented a step towards the "school under the tree", confirming the belief attributed to Drew that "education could take place beyond the classroom."[12]

This language was consistent with later guidelines for school design, which proposed the school as "a complement to housing"[13] and a promoter of "active teaching."[14] Major professional bodies, such as the International Union of Architects (UIA), began to include teaching in outdoor spaces in their recommendations. Collaboration between pedagogues and architects was advocated with the aim of "establishing standards"[15] that could be extended to functionalities and construction systems.

The school building soon became an architectural reference, placing children as interlocutors of the possibilities of modern design. It should

be noted, though, that the interplay between a modern educational system and modernist architecture remained a "paradox" that "imposed a foreign pedagogy and associated cultural ethos, only partially modified to local conditions," as Liscombe argued about Fry and Drew's work in Africa.[16] In colonial circles, shaping "new" individuals had more complex aims than "climate literacy" through architecture. It oscillated between a process of re-education to create (so-called) "civilised" societies, or a pragmatic response to the "developmental" demands of organisations such as the United Nations (UN). Portugal, a UN full member since 1956, accelerated the construction of schools in the post-war period in compliance with international agreements.[17]

This paper considers the extent to which colonial architects sought to go beyond the abovementioned socio-political goals while incorporating groundbreaking interpretations of the latest pedagogical approaches of the time. Although most architects were part of the group of experts who participated in supporting colonialism – a process with significant physical, social, and identity nuances that architectural history has come to engage with, challenging the positivist and Western-centric views that have been earlier ascribed to the Modern Movement[18] –, they introduced key devices into their proposals that transformed schools into places open to local cultures.

2. EARLY CHILDHOOD SCHOOLS IN THE TROPICS

This paper surveys two nurseries designed in Africa in the early 1960s by the architects Pancho Guedes (1925-2015) and Simões de Carvalho: the Piramidal Kindergarten[19] and the nursery and kindergarten at the Cazenga Assistance Centre.[20] The first, in Lourenço Marques, now Maputo, the capital of Mozambique, was commissioned by Catholic nuns.[21] It was built from 1957 onwards in the Summershield neighbourhood, a city's "wealthy suburb,"[22] and opened in 1961.[23] The latter, in Luanda, the capital of Angola, was part of a community centre, designed in 1963 for the Administrative Commission of the Fund for the Popular Neighbourhoods of Angola (CAFBPA). It was intended for disadvantaged African populations.

While Pancho Guedes' drawing belongs to a new lineage in his creative production – which he provocatively called the "American-Egyptian style", incorporating the "eighth book" of *Vitruvius Mozambicanus*[24] – Simões de Carvalho's nursery was most likely an adaptation of a project developed around 1962 for the Angolan Provincial Settlement Board (JPPA). Both proposals were designed for children between the ages of three and five, as were Fry's schools built in India.

Significantly, they were launched at a singular moment in the debate on educational buildings in Portugal. The third edition of the UIA, held in Lisbon in 1953, had innovatively set up a working group on school buildings. Two main dilemmas guided the debate: on the one hand, the urgency of finding constructive and design solutions to overcome the serious lack of equipment for children and young people after WWII and in the face of increasing literacy programmes; on the other hand, the preference for buildings located in open and green spaces, integrated into "nature."[25]

Pedagogical and hygienic needs were also discussed. Regional variations within national contexts were encouraged based on differences in climate. There was agreement on the idea of an "open school, because air, light and movement give students greater vitality and interest in their lessons."[26]

Portugal was represented by the architect Januário Godinho (1910-1990). His account of the Portuguese situation focused on the interplay between a country's economic situation and its constructive performance. He called for traditional systems to be used in the construction of schools, within specific regional and socio-economic contexts,[27] reacting cautiously to the wave of serialisation and prefabrication of post-war modern culture.[28]

Although architects in Portuguese colonies in Africa were not engaged in the central debates, they produced architectural works that reflected some aspects of the discourse. Until the late 1950s, the typological options for school construction were largely determined by the Colonial Public Works (CPW)'s models, crossing a range of architectural styles.[29] From that point onwards, "the notion that climate was the first constraint to be considered for building low-cost schools" began to emerge in the minds of architects.[30] This rationale could be depicted in the schools designed in Angola by architects Manuela Silva Mota (1936-?) and Antonieta Jacinto (1930-2021), around the early 1960s. These plans used devices to open the classrooms, "completely eliminating any separation between inside and outside."[31]

Despite the purported scientific and climatic standards, the examination of colonial school programmes must consider the socio-political circumstances in which they were implemented, acutely the enduring colonial networks of expertise and the asymmetric power dynamics of colonialism.[32] Moreover, the post-war rise in mass literacy in Africa cannot be understood in isolation from the outbreak of the struggles for liberation in Angola in 1961 and Mozambique in 1964. The warfare would influence the development of new educational models in both rural and urban areas, while driving architects to search for quick solutions with various construction materials.

2.1 THE PIRAMIDAL KINDERGARTEN (MAPUTO, MOZAMBIQUE, 1957-1961)

Pancho Guedes has been highlighted as a key figure of architectural production in colonial Africa.[33] Pancho's design of school buildings is well-documented, gathering aesthetic and constructive diversity. In his words, schools were "learning machines" and he was motivated to design them after discovering a "multiracial school in Swaziland."[34]

By 1972, Pancho had designed around nine school buildings. If the Piramidal kindergarten was the starting point, the clandestine school in the "caniço" (slum), also in Maputo, designed eleven years later, was the height of his reflections on this programme, evoking the traditional habitat. This was the building he showed to Alison and Peter Smithson in the late 1960s.[35] Both schools use modular squared elements with a pyramidal roof. This latter element had a double meaning: in the Piramidal kindergarten it was a scholarly citation of Louis Kahn (1901-1974); in the clandestine school it mimicked the

local self-produced constructions. While the *caniço* school supported the city's poor community, the Piramidal kindergarten was aimed at settler children.

The Piramidal school, with a capacity for 180 children (later 300), had a two-storey body, leading to a chapel (now a gymnasium), and giving rise to a series of external modules (storerooms). The main volume housed the classrooms, separated by the sanitary facilities.[36] The upper floor, intended as a dormitory, was converted into more classrooms. In 1964, Pancho described the building as being "white and blue with a little grey."[37] Today it has a much more vibrant colour palette **(Fig. 2)**.

Pancho wanted the school to be transformed into "many rooms of joy... and that every day [would] be one of celebration."[38] The outside had plenty of trees, making the "courtyard surrounded by a large and pleasant wall of green shade."[39] Given Pancho's strong awareness of the artistic impact of architecture, it was not the technical means of adapting to the climate that stood out in his speech – despite their power in defining design – but rather the sculptural elements evoked archaic architectural presences, the most obvious being ancient Egypt. The playgrounds of Dutch architect Aldo Van Eyck (1918-1999) also echoed.

2.2 NURSERY AND KINDERGARTEN AT THE CAZENGA ASSISTANCE CENTRE (LUANDA, ANGOLA, 1963-1965)

In Angola, Simões de Carvalho represented a different type of architect to Pancho. Despite his close association with Le Corbusier (1887-1965),[40] Simões saw himself as a technician and avoided the more artistic aspects of the architectural discipline.

The architect – who grew up in Luanda – promoted an architectural design anchored in climate control. While designing the nursery and kindergarten at the Centro Assistencial da Cazenga, in the early 1960s, he also worked on other projects for early childhood.

In 1963, after completing a two-rooms nursery for Sumbe, Simões proposed, with the architect Pinto da Cunha (1921-1985), a primary school and a kindergarten for the Fishermen's neighbourhood in the Island of Luanda (1963). The classroom was seen as a cell, creating relationships between the other programmatic elements. The simple plan was made complex by the elevation of the volumes. The walled elements were a key response for cross-ventilation and visually filtered the relationships between public and private outdoor spaces.[41]

Later, the kindergartens for the JPPA presented architectural elements inspired by other programmes – such as housing – by having vaulted roofs and an L-shape, with outdoor areas.[42] They in neighbourhoods mainly inhabited by the local African population as Simões trusted the school as the anti-segregation programme par excellence. These earlier plans were decisive in the design process of the Cazenga' project **(Fig. 3)**.

Neither the drawings nor the working process of the Cazenga buildings have yet been located. Recent visits to the site revealed that the educational area was accessed via a passageway. The nursery was organised around a

courtyard with a large tree, shaped by a portico of columns with a circular section. This central courtyard gave access to the rooms. The interiors were equipped with toilets and furniture adjusted for children. A mural of children's drawings faced the entrance hall, marked by a low bench with an organic shape. Plastic details can still be seen in small squared and rectangular openings in the staff office's façade, giving the interior a sculptural luminosity.

It is worth noting that Simões de Carvalho used the Modulor's dimensions to increase the sense of comfort, contributing to the almost domestic scale of the building. Ventilation ran freely along the ceilings.

3. CONCLUSIONS

The kindergartens by Pancho and Simões de Carvalho in Mozambique and Angola proposed different typologies and unique ways of learning. While the former maintained a linear logic and was innovative in its approach to outdoor spaces and circulation between functions, the latter stood out for taking advantage of a central courtyard to extend teaching activities and circulation outdoors, while also transferring the playground to open space.

Both went beyond the *form-follows-climate* formulation to propose spaces that were a real alternative to colonial education from the richness of their functions. This process resulted from previous experiences, including those of other architects, who began to open buildings' plans to the playground. These were broad interpretations of the theses promoting education beyond the classroom – such as those of Jane Drew.

In the case of Pancho's school, differentiated education was offered in the context of private structures, aimed at upper-class settler families. Simões de Carvalho's proposal, on the other hand, directly affected the education of low-income African populations, following his beliefs in a multiracial public school, strongly rooted in the so-called *popular* neighbourhoods.

The two schools ended up replacing the "civilizing" purposes foreseen in the educational dynamics of the colonial war,[43] by adopting a more universal and humanist approach. Architecture was thus supposed to be an active part of a "mental" construction by rejecting the monumental and aesthetic languages of the colonial state. Architects believed they were contributing to a future society with higher demands concerning function, technology, comfort and environmental behaviour. The permanent use of the two nurseries over the last 60 years, with minimal maintenance work and minor adaptations, mostly to increase their capacity, reveals the resilience of their modern design. They are considered here as true "Architecture(s) for Children" which shaped and continue to shape societies that are more rigorous about the value of their collective spaces. ■

BETWEEN TROPICALITY AND MODERNISM: EXPLORING ROBERT G. BOUGHEY'S ARCHITECTURAL SYNTHESIS IN THE GLOBAL SOUTH

FATEMA TASMIA
BOSTON UNIVERSITY

#15

ABSTRACT

In the transformative period of East Pakistan's (now Bangladesh) architectural development from the mid-1950s to the late 1960s, the region witnessed a fusion of local and international architectural dialogues. This era, significant for its architectural renaissance, was marked by the engagement of globally renowned architects alongside local experts, creating a distinctive modernist identity underpinned by regional sensibilities and climatic adaptations. Among the architects who left an indelible mark were Robert George Boughey (RGB) from Louis Berger Consulting Engineers (Pak) Ltd., whose contributions, despite their significance, have largely gone unrecognised. Boughey's involvement in East Pakistan was characterised by significant civic and infrastructural projects, facilitated by international collaborations and funding from entities like the Ford Foundation and the World Bank. These projects were not merely architectural feats but were emblematic of a broader ambition to forge a national identity through modernist architecture. Despite playing a crucial role in this architectural narrative alongside contemporaries like Louis I. Kahn, Paul Rudolph, and C. A. Doxiadis, Boughey's projects often go unnoticed or are underrepresented. In his projects, he used shading devices, such as *brise soleil*, vertical drop walls, projected verandas, shaded semi-open corridors, or overhanging roofs, to counteract the tropical sun and save the interior spaces from overheating by direct contact with the exterior. For monsoons and seasonal heavy rain, he included features like rain devices, waterspouts, and scoops to protect structures while representing rain as a celebrated architectural element. Arguably, his projects express modernity through these building features while aligning with local climatic traits. This study examines Boughey's architectural designs in East Pakistan, focusing on how they integrate modernist aesthetics with the subtropical climate's demands. It explores his use of natural ventilation, shading devices, and climate-appropriate materials, situating his work within Tropical Modernism and highlighting its role in advancing climate-responsive modernism in the Global South.

1. INTRODUCTION

In the tropics, nation-building in developing countries often involves embracing modern design and construction techniques. The adoption of Western design knowledge marked the spread of modernist architecture in post-colonial nations, symbolising a move towards national identity and hopeful futures.[1] During the 1950s and 1960s, South Asian architects such as Charles Correa, Minnette De Silva, and Muzharul Islam re-evaluated the concept of architectural design based on climatic traits through their localised modernistic design approaches[2]; arguably initiating the trend of incorporating climatic traits into buildings to establish national cultural identity.

Following the British India Partition in 1947, the strategic location of newly decolonised Pakistan played a significant role in its alliance with the USA in Cold War politics.[3] As a consequence of soft power and the theory of modernisation, there were US-based attempts at technical advancement, which led to the creation of new premises and developments, both infrastructural and technical, ultimately resulting in the recruitment of foreign architects and agencies through Ford Foundation grants, USAID, and World Bank sponsorship.[4] This also led to the opening of a local office in Dacca (now Dhaka) for the US-based consulting firm, Louis Berger Group.[5]

Among the foreign architects, Boughey's work was noteworthy for being locally adapted and harmonised with the contextual attributes.[6] Boughey's tenure as chief architect for Louis Berger Consulting Engineers (Pak) Ltd. from 1962 to 1964, alongside his academic and professional journey, highlights a narrative of contextual adaptation. Trained at the Pratt Institute and further educated through postgraduate studies in Tropical Studies, Boughey based his approach on sensitivity to the local climate, culture, and technological constraints.[7] His work, exemplified by the iconic Kamalapur Railway Station, demonstrates the application of modernist principles tailored to East Pakistan's subtropical milieu.[8] Despite his notable contributions, Boughey's works are often overshadowed by the more popular architecture of Louis I. Kahn, Paul Rudolph, or Doxiadis, whose works are recognised as the architecture of nation-building for a newly independent Bangladesh.

This research analyses Boughey's architectural projects in East Pakistan, scrutinising how his designs reconciled modernist aesthetics with the climatic exigencies of a subtropical environment. It explores the integration of natural ventilation, shading devices, and materials conducive to thermal comfort, positioning Boughey's work within the broader framework of Tropical Modernism within the Global South.

The research method adheres to Groat and Wang's interpretative historical research approach.[9] It involves conducting a literature review of secondary sources, analysing field surveys of local projects, and creating drawings from survey sketches. Additional steps include acquiring architectural drawings and photos from archives as well as conducting interviews with the architect to gain first-hand insights.

2. TROPICAL MODERNISM:

After World War II, the focus on architecture in tropical regions increased as decolonising areas of the British and French Empires started to consider the impact of climate on building design.[10] Tropical Architecture transitioned from a focus on hygiene and medicine to modernism, with a particular emphasis on adapting to local climates. This shift was influenced by European modernist architects engaging with colonial traditions, forming a distinct post-war architectural movement.[11] In the 1950s and 1960s, Tropical Architecture emerged as climate-responsive modernism, recognising economic constraints that made mechanical climate control impractical in the Third World. Scholars such as Iain Jackson see it as an adaptation of European styles for the Tropic of Cancer and Capricorn[12], while Mark Crinson views it as a metropolitan phenomenon perpetuating colonial frameworks through imperial channels like architects, publishers, and schools, suggesting a neo-colonial aspect.[13]

The environmental discourse often categorises Tropical Architecture as a scientific approach to climatic design, devoid of colonial connotations.[14] However, debates persist, such as those between Fry and Drew, who disregarded prior indigenous practices[15] and scholars like Chang and King, who emphasise 'transculturation'—exchanges between colonisers and colonised.'[16] Vandana Baweja underlines Tropical Architecture's dual role in reinforcing colonial ties and promoting sustainable design.[17]

On the other hand, a technical view of Tropical Architecture can be identified in Koenigsberger's "Manual of Tropical Housing and Building: Climatic Design." The book suggests orienting buildings to catch prevailing winds and minimise solar heat, using a north-south alignment and east-west elongation to optimise airflow and thermal comfort.[18]

In extreme climates, such as deserts or polar regions, specific architectural forms are necessary. However, sub-tropical climates welcome a type of architecture prioritising regional specificity and climate responsiveness. Scholars like Harry Seckel emphasise aligning building orientation with prevailing winds to facilitate natural ventilation.[19] Tropical Modernism leverages open layouts and extensive overhangs to promote air circulation and light penetration, essential for comfort in tropical environments.[20] Barreneche emphasises balancing tropical breezes and sunlight with protection against heat and seasonal storms.[21]

In Bangladesh, characterised by a subtropical monsoon climate with seasonal temperature fluctuations, high humidity, and significant rainfall, architectural considerations are shaped accordingly.[22] The following section analyses four buildings designed by Boughey, examining how his design approaches align with Tropical Modernism and the extent to which climatic traits influenced his designs. Did his design attributes reflect the context of Tropical Modernism, and how did climatic considerations influence his architectural choices?

3. ANALYSIS OF THE SELECTED PROJECTS OF ROBERT G. BOUGHEY THROUGH THE LENS OF TROPICAL MODERNISM

3.1 KAMALAPUR RAILWAY STATION (KRS):

Kamalapur Railway Station in Dhaka, Bangladesh, exemplifies modernist architecture, blending functionality with cultural symbolism. Initially designed by Daniel C. Dunham and revised by Boughey, the project evolved to meet the demands of a major transport hub and the cultural expectations of the Railway Board[23] **(Figure 01)**. Boughey advanced the "Dome Umbrella Scheme" into a three-dimensional parasol roof, balancing modern modular design with the railway authority's desire for Islamic identity, emphasising practical concerns about large-scale construction and climatic comfort.

The primary challenge was creating a parasol roof that met functional demands and adaptability. Boughey aimed to establish a flowing structure supported by a grid-patterned system, providing shade from sun and rain.

The terminal's central feature is a parabolic shell roof, shading the main pedestrian circulation above low-rise structures. These buildings, arranged linearly, house essential passenger amenities like ticket counters and waiting lounges. Forty-nine columns support thirty-six cusped shells in each square bay, using locally sourced materials and traditional construction techniques.[24]

The cusped, thin-shell modules were constructed using locally sourced, reusable formworks and bamboo scaffolding.[25] This arrangement integrates the spaces below and aligns with traditional building practices that incorporate overhanging roofs, vertical shading devices, and shaded semi-outdoor spaces, suited to the local climate.

The roof mirrors the traditional Mughal pavilion, promoting air circulation and offering protection from sun and rain.[26] The lower platform roof, constructed from elongated concrete vaults, ensures a continuous covered walkway for passengers, providing shade.

3.2 BOYS HOSTEL BUET:

Following the British Partition in 1947, architectural trends favoured heavy brick walls with small openings, dark interiors, and clichéd art deco exteriors. Against this backdrop, architect Boughey introduced a design approach in 1962 at Bangladesh University of Engineering and Technology (BUET) for the boys' hostels **(Figure 02)**.[27]

Boughey's design utilised concrete frame structures, allowing for nearly transparent internal walls, cantilevered balconies, and spacious corridors. Each hostel features two identical residential wings, a canteen block, and a multi-purpose block housing common rooms and prayer spaces. Two offset wings create a central courtyard, enhancing communal interactions. These wings, 232 feet long and 33 feet deep, are oriented along the East-West axis to maximise exposure to the north and south, optimising conditions for the tropical climate.

The layout features open verandas and corridors with wall-to-wall windows to the north and south. Cantilevered beams support the corridors and balconies, adding visual depth and passive cooling features. The

facade emphasises horizontal lintels and vertical downspouts, avoiding arbitrary decorative elements for a logical, climate-oriented design.

Boughey incorporated downspouts to channel rainwater from the roof to the ground via concealed vertical shafts, addressing monsoon rains. The design features vertical drop walls, pervious railings, and overhanging verandas, protecting the structure from the harsh southern sun while maintaining its aesthetic and functional qualities.[28]

The ground connection is subtly elevated, blending in with the gardens and outdoor spaces. This thoughtful integration, along with a disciplined use of materials, aligns with the tropical modern architectural philosophies conveyed in the designs of Paul Rudolph at the Bangladesh Agricultural University and Muzharul Islam at the Faculty of Fine Arts, Dhaka University.

3.3 BUET GYMNASIUM:

Designing large structures presents significant challenges, particularly when creating column-free, expansive spaces. Built in 1964, the BUET gymnasium serves as a model for multiple indoor sports and various university events.

The building's east-west orientation maximises natural light from the north and south, while solid brick walls on the shorter east and west sides shelter indoor spaces from the heat. The building's structural integrity is reinforced by massive sine-curved beams inspired by bridge construction and designed to vary in depth according to the roof's load **(Figure 03)**. Diagonal beams brace the columns on each side of the mezzanine floor. The roof design incorporates outward folding edges and scuppers to channel rainwater, while clear-story lighting beneath the roofline illuminates the interior. Vertical fins adorn the external walls on the western and eastern sides, mitigating heat gain and adding visual interest.[29]

3.4 SAINT JOSEPH HIGHER SECONDARY SCHOOL

St. Joseph Higher Secondary School in Dhaka, built in 1964, incorporates climatic adaptations into its architecture **(Figure 04)**. Shielded by trees, the academic wing is split into two parts, extending along the East-West axis to maximise southern and northern exposure, thus ensuring cross ventilation and optimal daylight, centring around a courtyard, which enhances visual and environmental connectivity.

Stairways connect the two wings, with the north wing accessible from ground level and the south wing from an elevated landing. Modular drop walls break up long corridors, providing shade and maintaining a comfortable indoor environment.

The reinforced concrete structure supports cantilevered corridors free from vertical obstructions, enhancing the facade's modular nature. Originally designed breakout spaces in the south wing facilitated natural cooling and informal learning but they were later converted into additional classrooms, reducing passive cooling features. Angled sunshades and vertical drop walls protect against rain penetration.

Figure 01. Kamalapur Railway Station (K.R.S), Dhaka, Bangladesh (then East Pakistan), 1961-1964. Source: RGb Associates, 1964.

Figure 02. Boys Hostel BUET, Dhaka, Bangladesh, 1962 - 1964 Source: RGB Associates Archive, 1964.

Figure 03. BUET Gymnasium, BUET, Dhaka, Bangladesh, 1962-1964. Source: RGB Associates Archive, 1964.

Figure 04. St. Joseph Higher Secondary School view from North-West Corner, 1962-1964. Source: RGB Associates Archive, 1964.

These designs illustrate effective climatic adaptations and align with the features of Tropical Architecture discussed in Koenigsberger's book and other scholarly discourses. Boughey's buildings are elongated along an East-West axis to maximise natural ventilation, enhancing comfort and energy efficiency. Features like vertical drop walls, louvres, brise soleil, projected verandas, overhanging roofs, airy interiors, and courtyards for better light and ventilation reflect the principles of tropical design.

Rain gutters, rain downspouts, and scuppers are inevitable and obvious building attributes that are accommodated to redirect and channel out the rain. Boughey has incorporated these elements in all

his buildings **(Figure 01-04)** and, arguably, attempted to enhance the aesthetics of rainfall as expressed in his design sketches.[30] Through downspouts and scoopers, rainwater was collected and channelled with a rhythmic splashing sound creating a harmonious and symphonic connection between the user, the built spaces, and nature. Moreover, to protect the pavilion-like space of Kamalapur Railway Station, Boughey initially designed a perimeter grill or *jali* surrounding the main structure that would allow air flow while reducing solar gain. However, this feature was not included in the final design. These design choices demonstrate a nuanced understanding of the interplay between architecture and the tropical climate, ensuring that buildings not only function optimally but also resonate with their environmental context.

In sections 02 and 03, I disagree with the idea of associating Boughey solely with the emergence of Tropical Architecture or Tropical Modernism in "Global South," as he was not a discrete figure in the context of the post-colonial 1960s but an active agent of this transcultural exchange and transnational institutional network. However, his buildings are well equipped with climatic features and effectively incorporate logical planning, and spatial coherence, accentuating their design and making them more user-friendly in terms of climatic comfort without relying on mechanical means. Hence, his design approach can be argued as one of the pioneering attempts to follow Tropical Modernism in post-colonial East Pakistan and South Asia.

4. CONCLUSION

Considering these historiographical, socio-political, and climatic conditions, Boughey can be viewed as a transnational agent who localised his modernist training to suit tropical climates. His designs, including rain devices, sunshades, overhanging verandas, and airy interiors, reflect a blend of modernist principles with local climatic needs.

Boughey's appointment through transnational networks and Cold War politics places him among expatriates who adapted their modernist ideas to local contexts. This aligns with Mark Crinson's views on the development of Tropical Architecture and the influence of architects, publishers, or schools in colony-metropoles. Boughey's practice in 1960s East Pakistan positions him as a pioneer and field-level expert of Tropical Modernism in South Asia, demonstrating expertise in climate-adaptive design before it was formally recognised as a distinct architectural theory in the Global South. ■

Her research interest focuses on Tropical Modernism in Global South/South Asia, Critical Regionalism and Modern Architectural History.

FLEXIBLE ARCHITECTURE FOR NEW EDUCATION: NORDIC INSTITUTE FOR DEVELOPMENT MANAGEMENT (IDM) IN TANZANIA.

MARYIA RUSAK
ETH ZURICH

#15

ABSTRACT

In the second half of the 20th century, educational buildings played an important role in the process of nation-building of the newly independent African states. Between the 1960s and 1970s, hundreds of elementary and technical schools, teachers' colleges, and universities were endowed with the task of educating the new generation of African professionals and public administrators. Large university projects were among the most significant public buildings constructed at the time, contributing to public and civic life. The educational politics of "Africanisation" was also reflected in the buildings' architectural language, as imported modernist forms were adapted to local climatic realities through a wide range of tectonic devices, local materials, and stylistic elements. Today, the architectural histories of these educational buildings and their role in national heritage remain severely overlooked. The paper aims to address this shortcoming by dissecting the many architectural layers behind the project for the Institute of Developmental Management (IDM) in Tanzania, built in the early 1970s and financed through the joint effort of Nordic countries. Originally intended to address Tanzania's manpower requirements, the project underwent a series of design transformations introduced by local and foreign "experts." Its architecture then represented a site of negotiation between local Tanzanian needs and imposed Western techno-scientific education models of the late 1960s. Building on the original archival research, the paper investigates the many archaeological layers behind this seemingly typical "tropical modernism" university project, intending to complicate the long-assumed divide between the Global South and the Global North. Today, these buildings are still in use, and through focusing on histories of architectural inter-dependencies, this paper introduces the term "mixed modernisms" to encourage a different line of thinking about the architectural value of such projects—and therefore, their preservation.

1. INTRODUCTION

In 1969, German art historian Udo Kultermann wrote that educational buildings were among "the most significant architectural achievements in Africa."[1] Indeed, as countries in the region acquired independence after years of colonial rule, processes of nation-building closely correlated with the development of national educational systems. In the 1960s and 1970s, hundreds of elementary and technical schools, teachers' colleges, and universities were constructed across the region, translating abstract ideas of nation, statehood, educational and labour priorities into built form. University projects, in particular, played a crucial role in the political processes of decolonisation and served as catalysts for technological and social development, where different ideas of statehood were tested and negotiated.[2] However, while endowed with representational values, new national university projects faced financial constraints. Often, they required substantial financing from abroad and were sponsored by a string of international donors. This meant not only an influx of foreign capital but also technological and personnel "assistance"—architects, engineers, planners and bureaucrats who brought architectural and technological models from the Global North to the Global South.

Through a brief study of the Institute for Development Management, originally a branch of the University of Dar es Salaam built in the early 1970s and financed via networks of Nordic foreign aid, this essay engaged with complex institutional dynamics behind educational buildings in post-independence East Africa. Financed from abroad, at the request of the Tanzanian government, and designed by British architects under the supervision of Nordic "experts," the project reveals the complex multi-layered nature of the architecture of foreign aid. Such transnational architectural projects not only delivered practical programmatic solutions but became complex instruments of nation-building and negotiating various geopolitical power alliances.

2. NORDIC SPIRIT IN EAST AFRICA

Nordic Involvement in East Africa began in the early 1960s with the establishment of an inter-parliamentary ministerial council, Nordisk Råd, which joined the efforts of respective Nordic organisations. Newly independent countries in East Africa—Tanzania, Zambia, Kenya and Uganda—were selected as "focus areas" based on the principle of geographic concentration.[3] During the Cold War, Nordic countries fashioned themselves as "humane internationalists." This meant providing generous international aid packages for large "developmental" projects to fill the void created by the withdrawal of colonial powers.[4] Norwegian urban theorist Karl Otto Ellefsen, on discussing Nordic involvement in the region, argued that it could be seen as an extension of the tradition of protestant missionaries, which aimed to impose "good" by transferring ideas, knowledge and money—often with political gains at home.[5] There was a shared belief among Nordic politicians that the social-democratic model could be exported.[6] Projects in education

and healthcare were prioritised since they also contributed to creating the idea of the North based on "common goodwill."[7]

And while Nordic financial support was generous, it came with an implicit assumption that the sponsored projects would also rely on Nordic technical expertise. Norwegian political scientist Terje Tvedt, coined the term "regime of goodness,"[8] to describe Nordic involvement abroad. Indeed, as Nordic specialists heavily drew from their building experience at home, they translated a Nordic version of techno-scientific modernity into a different social and political context. They often introduced sophisticated building methods based on prefabrication, modular standardisation, and computer quantification, which were rarely appropriate for the realities of the local building industry. East African politicians, on their part, often prioritised the volume of financial assistance over suitability, leading to peculiar design hybrids.

3. MANAGERIAL PASTORAL

In the summer of 1968, Denmark received a request from the Tanzanian government to discuss the possibility of providing Danish capital costs and technical assistance in establishing the new Development Management Institute (IDM) as a branch of the University of Dar es Salaam (UDSM).[9] The purpose of this new project was to complement the existing University's profile and alleviate the pressing Tanzanian need for qualified manpower in the management field.[10] Up until then, most managerial positions were occupied by expatriate staff, but Tanzania's new politics of self-reliance emphasised the "Tanzanisation" of all managerial positions. Thus, in Tanzania's Second Five-Year Plan, establishing new educational facilities for management, administration, accounting, and secretaryship became a primary focus.

In 1968, initial designs for a new managerial institute were developed, envisioning a facility of 12 classrooms for a cohort of 280 students. In January 1969, the plans were expanded upon, and a request was filed for Danish—and possibly Nordic—capital assistance.[11] Eventually, the project was moved to Mzumbe, in Morogoro Region, 130 miles from Dar es Salaam, to both capitalise on the existing infrastructure of the Institute of Public Administration and to encourage educational decentralisation. The new Institute aimed to educate Tanzanian specialists in the fields of management, accountancy, secretaryship, public administration, local government and mutual development and, ultimately, "provide social, economic and political progress for the people of Tanzania."[12]

The Nordic states were to provide financial and technical assistance for these ambitious goals. A Nordic Study Group made up of educational planners, architects, development advisers, and accountants was set up to evaluate the existing plans and cost estimates, examine construction drawings, draw up a work programme, and appraise educational programming.[13] A British architectural firm of Norman and Dawbarn, experienced in designing educational institutions in the region, was contracted to draw new teaching blocks, administrative buildings and seven hostel blocks.[14] As the Institute moved to a more rural setting, beyond 32

classrooms, it should provide housing for 780 students, as well as teaching and administrative staff.

According to the Nordic Group experts sent to appraise the project, the new campus was located within "extraordinary fine scenic quality mountains" at an altitude of 500 metres, on a site with a "pleasant climate" and "beautiful growth."[15] The natural setting particularly stood out for the Nordics, and the new campus layout was to rely on existing infrastructure, preserve vegetation and exploit "the brilliant possibilities" of the site location. The plan proposed by Norman and Dawbarn took into account several elongated east-west orientated 3-storey teaching wings connected with the administrative building by corridors and covered walkways. The rectangular layout created an enclosed courtyard to be used for film projections and social gatherings. The administrative building housed staff offices along with a common room for the teachers, while a separate assembly hall accommodated large university gatherings.[16]

However, as the Nordic specialists evaluated the project, they found its British-designed architecture "too formal" and "too rigid." Educational wings were too uniformly shaped without accommodating for the programmatic requirements of each department. Specialised building wings prevented the interaction of students from different departments. Instead, the Nordics suggested that the buildings should be differentiated in size and height for "functional and social advantages from an architectural point of view" and blend in more within the existing landscape.[17] Additionally, large lecture theatres were absent, as well as rooms for group and flexible work—in principle, the British-designed layout accounted only for individual classrooms. While moveable walls were proposed for some classrooms, this solution introduced acoustic problems.

The Nordics claimed extensive experience in planning "newer schools and higher education institutions in Europe," and their vision of modern university buildings differed from their British colleagues. According to the Group, the campus layout proposed by the pre-WWII-generation British architects was not flexible enough and did not respond well to the new pedagogical principles and demands of its time.[18] The Nordic Group maintained that modern education required "flexibility, possibilities for extensions and space for experimental learning."[19] Indeed, new structuralist educational buildings in Europe—for example, the Candilis-Josic-Woods Free University campus in Berlin—offered a physical form to more democratic pedagogical principles. The university campus was to serve as a microcosm of society, a model of the city, where individual study units were no longer isolated but connected through circulation spaces, which provided places for interdisciplinary encounters and overlaps. For the Nordic specialists, the new IDM project was an opportunity to experiment with a more flexible and open educational architecture.

Therefore, the Group maintained that notions of flexibility "could serve as an inspiration even in Tanzania." The Group insisted that IDM's architecture should be "a frame of construction," which would not just "contain" different

activities but rather "directly inspire" new educational approaches. The Group then suggested that the layout should be based on a standardised load-bearing frame to create "built-in flexibility" and avoid becoming a "strait waistcoat for teaching."[20] A physical modular skeleton structure in concrete was designed to ensure "optimal flexibility." Only staircases and bathrooms were constructed with load-bearing walls. Partitions between seminar rooms consisted of 6" by 9" concrete blocks that could be moved or removed, and windows could be adjusted with sliding glass panels. Ceilings were to be plastered and painted, while floors were to be constructed with a granolithic finish. Overall, reinforced concrete was to be left exposed, and timber constructions painted white. While the overall technical quality of the building was deemed "slightly inferior" to the buildings of the University of Dar es Salaam, the "simple style of architecture" set within a "pleasant climate," as well as the need for larger educational areas with limited economic means justified the material and design selection.

4. ARCHAEOLOGICAL LAYERS

Today, the Institute's buildings conceal the many archaeological layers behind its architectural and political decision-making. From the original Tanzanian quest for new spaces for managerial education, British-drawn "tropical modernism" designs were modified by a group of Nordic experts. The Tanzanian administration much preferred the original, down-to-earth designs by Norman and Dawbarn, as the firm had extensive experience with university designs in the former British colonial context and did a "brilliant job keeping within the estimates."[21] At the same time, Nordic project funding arrived with a set of "quality compliance," as Nordic experts attempted to translate post-1968 European educational models into the context of Tanzanian post-independence, all the while working within strict financial budgets.

As a consequence, IDM's architecture falls within the category of "unpretentious" tropical modernism, with white-washed, clean-shaped concrete buildings placed within lush, undulating tropical terrain and with some local textures and elements included in the final finishes.[22] Among the few modifications of the IDM buildings were large horizontal "tyrolean" overhangs to provide shade and a "breathing blockwork screen."[23] As a later critical Nordic report from 1974 indicated, "The design represents a typical international style where only tropical climatical conditions have been taken into consideration."[24] Throughout the 1970s, IDM underwent several expansions, also financed through Nordic assistance and was later incorporated into Mzumbe University.[25]

Therefore, the following must be asked: what are the preservation lessons for these kinds of "bread-and-butter" tropical modernism buildings? Unlike the landmark university projects, IDM represents one of the many everyday educational buildings in East Africa. This paper argues that designs of buildings like IDM go beyond the conventional narrative of "tropical modernism."[26] Driven by Tanzania's domestic economic interests and mediated with the imposed "expertise" of Nordic actors, IDM offers

a version of "mixed" or "hybrid" modernism embedded into the project from the outset. While the contemporary preservation approaches make a clear division between the "original" and later "additions," I argue that university projects built through networks of foreign aid forego such imposed dichotomies. Rather, projects like IDM are complex spatial hybrids, reflecting a form of "mixed modernism" from the start, originating from the interconnection between different political interests.

The historical value of such a project comes to the fore precisely in the many archaeological layers associated with its design, use and adaptation. In a 2023 *Docomomo Journal* issue, architectural scholars Babatunde Jaiyeoba and Bayo Amole advocated for the preservation of the Awolowo University campus in Nigeria not only because it was a project which reflected the "machine-age aesthetics" but also because it uniquely reflected the Israeli-Nigerian technical development relations.[27] In a similar way, the IDM campus in Mzumbe stands as a unique testament to the Nordic-Tanzanian technical development aid. Detailed construction histories of such buildings—and histories of international encounters—should guide its preservation efforts. ■

BIOGRAPHY

Maryia Rusak is an ETH Postdoctoral Fellow (2022-24) at the Chair of the History and Theory of Urban Design, gta, ETH Zurich. Maryia's postdoctoral project investigates the Nordic architecture of foreign aid in postcolonial Africa, focusing on the pragmatic economic rationale behind architectural production. Before joining gta, Maryia completed her PhD at the Oslo School of Architecture and Design (2022), dealing with the architectural output of a large post-war Norwegian construction company, Moelven Brug. Rusak holds an M.Arch.from the Royal Institute of Technology in Stockholm, Sweden and a BA from Princeton University, USA.

POST-INDUSTRIAL LANDSCAPES: PROJECTING VALUES AND USES FOR NEW LIFE CYCLES IN THE ANTHROPOCENE

OSVALDO MORENO FLORES
SCHOOL OF ARCHITECTURE, PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT

The growth of industry in the nineteenth and twentieth centuries led to the construction of imposing buildings, using new materials and construction methods of the time. Such buildings also incorporated new elements that modified the territory and began to define a landscape in the cities, which were at the forefront of economic and industrial development. This transformation was associated with the emergence of new cultural and social values such as economy, production and progress.

The subsequent process of deindustrialisation brought with it the gradual closure of industrial complexes, which had significant economic, social, environmental and urban effects on the cities built around this activity. As a result, on the one hand, the landscape was transformed, with abandoned factories, ruined buildings, and infrastructure remnants becoming visible. On the other hand, the state of abandonment of these sites allows them to be preserved as a vestige of the past frozen in time.

In this context, ruins and abandoned sites resulting from deindustrialisation offer an opportunity for intervention and conversion, making it possible to disseminate and raise awareness of the values of post-industrial landscapes. These sites have the capacity to re-establish the link between the inhabitant and their landscape and history, and to generate a sense of belonging by preserving aspects of local culture through the evocation of an imaginary and an acute sensitivity to observation.

The conservation and enhancement of post-industrial sites allows for the transmission of a historical account of the future of the city and the territory, as well as contributing to projections of future reconversion, designing possible scenarios for new programmes and alternative life cycles in the current socio-cultural, productive and ecological context of the Anthropocene.

1. THE NOTION OF LANDSCAPE IN POST-INDUSTRIAL CONTEXTS

Our new conceptions must design landscape along with both accepted and disturbing elements, both harmonious and interrupting ones. The result is a metamorphosis of landscape without destroying existing features, an archetypal dialogue between the tame and the wild. The image of nature can be made of the 'untouched' and the 'built'.[1]

The term "post-industrial landscape" refers to the physical environment that emerges as a result of the decline or transformation of industrial activities in a region. It encompasses the spaces and structures left behind after industrialisation, such as abandoned factories, warehouses, and infrastructure, as well as the environmental impacts of industrial processes. Post-industrial landscapes often experience urban decay, economic restructuring, and environmental remediation as societies transition away from industrial economies towards service-based or knowledge-based economies. These landscapes can present both challenges, such as blight and pollution, and opportunities for redevelopment, cultural revitalisation, and sustainable urban planning.

The growth of industry in the nineteenth and twentieth centuries led to the construction of imposing buildings, using new materials and construction methods of the time. Such buildings also incorporated new elements that modified the territory and began to define a landscape in the cities, which were at the forefront of economic and industrial development. This transformation was associated with the emergence of new cultural and social values such as economy, production and progress[2 3]. Industrial architecture was regarded with fascination, as a symbol of monumentality and grandeur, and was valued for its functionality and an aesthetic model based on the machine.

The subsequent process of deindustrialisation brought with it the gradual closure of industrial complexes, which had significant economic, social, environmental and urban effects on the cities built around this activity. As a result, on the one hand, the landscape was transformed, with abandoned factories, monumental silos, deteriorated and empty, ruined remains of buildings, constructions, infrastructures and installations[4 5 6 7]. The buildings, once considered a symbol of progress, were abandoned, and no longer served their original productive purpose. Over time, this led to their transformation into ruins inserted in empty and degraded sites, making them remnants of a bygone era of past grandeur.

This context configures a new reality, where "industry, the maximum expression of progress and future, is now a symbol of the past,"[8] and post-industrial sites are now a symbol of deterioration and abandonment, which entails a risk associated with different factors, such as the footprint of ecological damage, resulting urban rubbish dumps and focal points of social insecurity. On the one hand, the state of abandonment of these sites allows them to be preserved as a vestige of the past frozen in time. However, on the other hand, ruins and abandoned sites resulting from deindustrialisation offer an opportunity for intervention and conversion, making it possible to

disseminate and raise awareness of the values of post-industrial landscapes. These sites have the capacity to re-establish the link between the inhabitant and their landscape and history, and to generate a sense of belonging by preserving aspects of local culture through the evocation of an imaginary and an acute sensitivity to observation.

The relationship between post-industrial landscapes and modern industrial architecture is a dynamic interplay of history, design, and social change. The rise of modern industrial architecture in the early 20th century was highly significant, as it marked a departure from traditional architectural forms and practices, introducing new materials, construction systems and design principles that prioritised functionality, efficiency and structural honesty. Today, the shift from industrial to post-industrial eras reflects broader shifts in the economy and society, with important implications for cultural heritage, sustainability, and urban development.

2. EMERGING CULTURAL, ECONOMIC, AND ECOLOGICAL VALUES IN POST-INDUSTRIAL LANDSCAPES

> *Instead of a master narrative, the emergent ecologies of ex-industrial places (…) combine fragments of planned and unplanned action, geological, human and biological agency, natural and human-made ruination. They have fragments of each, but no single one dominates.*[9]

The notion of cultural, economic, and ecological values in post-industrial landscapes encompasses the various ways in which these landscapes are perceived, utilised, and valued by individuals and communities[10 11 12 13]. It expands beyond just physical geography to include economic, cultural and environmental dimensions.

- Physical framework: This aspect refers to the actual physical environment shaped by past industrial activities. It includes abandoned factories, warehouses, industrial infrastructure, brownfield sites, and natural landscapes altered due to pollution or resource extraction. The physical landscape often bears the scars of industrialisation, such as polluted waterways or degraded soil.

- Economic dynamics: In post-industrial landscapes, there is a shift from manufacturing-based economies to service-based or knowledge-based economies. This transition leads to changes in the economic landscape, with former industrial hubs experiencing job losses, disinvestment, and economic decline. However, it can also create opportunities for new industries to emerge, such as technology, finance, or creative sectors.

- Cultural values: This aspect refers to the cultural heritage and identity of post-industrial communities. It includes the traditions, stories, and memories associated with industrialisation, as well as the cultural artifacts and landmarks left behind. Cultural landscapes in post-industrial contexts often undergo reinterpretation and repurposing, with former industrial sites transformed into cultural centres, museums, or creative spaces.

- Environmental systems: Industrial activities often result in environmental degradation, such as pollution, habitat destruction, and resource depletion. The environmental landscape in post-industrial contexts involves efforts to remediate and rehabilitate degraded ecosystems, as well as to promote sustainable development practices that mitigate future environmental impacts.

Understanding the notion of landscape in post-industrial contexts requires considering the interconnected nature of these dimensions and recognising the complex challenges and opportunities inherent in the transition away from industrial economies. It involves not only addressing the physical legacy of industrialisation but also promoting social, economic, cultural, and environmental resilience in affected communities.

3. POTENTIAL USES AND NEW LIFE CYCLES OF POST-INDUSTRIAL LANDSCAPES IN THE ANTHROPOCENE

> *"The disappearance, the threat of loss, is key to the attraction of ruins – and to their essential ambiguity"*.[14]

In the Anthropocene era, human activities have become the main drivers of environmental change, including climate change, biodiversity loss, and alterations to the planet's biogeochemical cycles. Post-industrial landscapes exemplify the profound influence humans have had on the planet, both in terms of physical infrastructure and ecological disruption[15 16 17]. These landscapes are not only characterised by their industrial relics but also by the processes of ecological succession and reclamation that occur after industrial activities cease. They represent a complex interplay between human intervention and natural processes, raising questions about sustainability, environmental remediation, and the resilience of ecosystems in the face of human-induced change.

17. Paul J. Crutzen. "Geology of mankind – The Anthropocene". *Nature* 415 (2002): 23.

Within the context of the Anthropocene, the planning and design process in post-industrial sites and landscapes are essential for grappling with the environmental challenges of the present and future, promoting cultural narratives that emerge around themes of industrial heritage, urban decay, and the new relationship between humans and the emerging ecologies[18] [19] [20]. Furthermore, they play a key role in envisioning more sustainable and resilient forms of human coexistence with the planet[21] [22].

The transformation of post-industrial landscapes gives rise to new life cycles that reflect changing societal values, environmental awareness, and economic imperatives. Here are some key aspects of these evolving life cycles:

- **Adaptive Reuse and Repurposing:** Rather than abandoning post-industrial sites, many communities are embracing adaptive reuse, repurposing old industrial buildings and infrastructure for new functions. This could involve converting factories into residential lofts, warehouses into art studios, or industrial brownfields into parks and green spaces. Such transformations breathe new life into these landscapes while preserving their historical and cultural significance.
- **Ecological Restoration and Regeneration:** In response to environmental degradation, there is an increasing emphasis on ecological restoration and regeneration of post-industrial sites. This involves rehabilitating contaminated land, restoring native habitats, and reintroducing biodiversity. By reclaiming abandoned industrial areas for nature, communities can mitigate pollution, improve air and water quality, and create valuable ecosystems within urban environments.
- **Creative and Cultural Revitalisation:** Post-industrial landscapes often become incubators for creativity and cultural revitalisation. Artists, entrepreneurs, and community organisers are drawn to the raw authenticity of these spaces, using them as canvases for artistic expression, hubs for innovation, and venues for cultural events. Through initiatives like art installations, music festivals, and pop-up markets, these landscapes foster a sense of community and inject vibrancy into formerly neglected areas.
- **Sustainable Development and Green Infrastructure:** Increasingly, post-industrial redevelopment prioritises sustainable practices and green infrastructure. This includes integrating renewable energy systems, implementing water-sensitive design, and promoting walkability and public transit. By embracing principles of sustainable development, post-industrial landscapes can minimise their environmental footprint, enhance resilience to climate change, and contribute to more liveable and equitable cities.
- **Community Engagement and Participatory Planning:** Successful revitalisation of post-industrial landscapes often hinges on community engagement and participatory planning processes. By involving local residents, businesses, and stakeholders in decision-making, projects can better reflect the needs and aspirations of the community. This collaborative approach fosters social cohesion, builds trust, and ensures that revitalisation efforts are inclusive and equitable.

Overall, the new life cycles of post-industrial landscapes reflect a shift towards more sustainable, resilient, and socially inclusive forms of development. By embracing adaptive reuse, ecological restoration, cultural revitalisation, sustainable development, and community engagement, these landscapes can be transformed into dynamic and vibrant spaces that enrich the fabric of urban life in the Anthropocene. ■

BIOGRAPHY

Osvaldo Moreno Flores is an Associate Professor and Deputy Director of Academic Affairs at the School of Architecture, Pontificia Universidad Católica de Chile. He holds a PhD in Architecture and Urbanism and a Master's in Landscape, Environment, and City from the National University of La Plata. He has served as a visiting professor in graduate and postgraduate programmes across Chile, Argentina, Peru, Spain, the USA, and Belgium. Dr. Moreno directs and leads research on various topics, including landscape planning, landscape rehabilitation, cultural landscapes, green infrastructure, and urban resilience.

SPRING BAY MILL; THE TRANSFORMATION OF A PECULIAR MODERN INDUSTRIAL HERITAGE SITE

ROSS BREWIN
MONASH UNIVERSITY AND GILBY BREWIN ARCHITECTURE

#16

ABSTRACT

Spring Bay Mill, located near the small regional township of Triabunna on the east coast of Australia's island state of Tasmania, is a 43-hectare site-wide repair and regeneration of a former industrial wood chipping facility into a culture and environment-oriented events venue. This paper presents a first-hand account of the architectural design and built realisation of this project with an emphasis on the critical decisions taken in relation to the retention and adaptation of existing industrial fabric. Through a discussion of four design and material actions: Retainment, Removal, Integration and Addition, it will show how the strategic reworking of the existing infrastructure was used to bring contemporary visitors into the close proximity with the vast scale of the industrial operation, it's environmental devastation and, at the same time, amplify the visceral experience of the regenerating landscape. A brief discussion of the territorial, environmental and political context in Tasmania will ground the discussion and define the project's local meaning and significance.

1. INTRODUCTION

Spring Bay Mill is located on the traditional lands of the paredareme, an original language group of the palawa (Tasmanian Aboriginal people) that are estimated to have lived in lutruwita (Tasmania) since around 40,000 years before British settlement at the turn of the 19th century. This long occupation of the land is evident on the headland of the site where remnants of an extensive seashell deposit marks the harvesting and consumption of shellfish over thousands of years. This important cultural site and similar others nearby suggests that for millennia, the area was significant place of cultural and social gathering. The long custodianship of the lands and waters of lutruwita by Aboriginal people was violently and profoundly disrupted with the arrival of sealers and British colonial settlers in the early 1800s from which point the original inhabitants were murdered, dispossessed and forcibly moved off their country to make way for the clearing, division and sale of land and the extraction of natural resources.[1]

One of the earliest industries to emerge on the island after colonisation was logging, exploiting the ancient forests for high quality construction hardwood to serve the new colony and the broader British empire. The logging industry first began expanding in the 1850's with the introduction of steam and continued to grow to become a large part of the economy over many decades following. In the early 1970s the wood chipping industry emerged and became responsible for the clear-felling of thousands of acres of ancient native forests each year to meet the insatiable demand for paper pulp in Japan. Around this time saw the rise of the Greens movement and the commencement of the so-called Forest Wars, marked by years of intense conflict between loggers and environmentalists over the destruction of native forests that was exacerbated by an historically partisan political setting.

The Triabunna Woodchip Mill was established in the late 1970s, originally to process the waste timber from harvesting forests for construction hardwood. However, over the subsequent four decades the mill instead processed countless tonnes of high-grade, old growth forest logs to meet demand, at one point becoming the largest wood chip mill operating in the southern hemisphere.

In 2011, in the context of an ailing industry unwilling to transition to a more sustainable way of operating, the mill was sold to the current owner, environmentalist philanthropist Graeme Wood who purchased the mill with the intent to cease production of woodchips and end old growth forest logging in southern Tasmania. Despite deep resistance from industry and government, this mission was eventually achieved, the backstory of which is chronicled by John Van Tiggelen in his 2014 essay called" The Destruction of the Triabunna Mill and the Fall of Tasmania's Woodchip Industry".[2]

The strategic purchase of the woodchip mill by Wood was a significant moment in the Forest Wars around the time of the signing of the 2012 Tasmanian Forest Agreement. This agreement aimed at supporting the timber industry's transition away from a reliance upon native forests and the creation of over 500,000 hectares of additional forest reserves. However,

2. J. van Tiggelen, 'The destruction of the Triabunna mill and the fall of Tasmania's woodchip industry', *The Monthly*, July 2014, https://www.themonthly.com.au/issue/2014/july/1404136800/john-van-tiggelen/destruction-triabunna-mill-and-fall-tasmanias-woodchip-#mtr, accessed 13 December 2023.

despite the progress made by this agreement and recent bans in other Australian states, Tasmania still has an active native forest logging industry, one that continues to be heavily subsidised despite providing relatively little employment and one that continues to create political and social tension. Meanwhile, Tasmania's forests have become globally recognised for their unique species and conservation value and are regarded as some of the most carbon dense forests on the planet. The reduction in native forest logging since 2011 has been a major factor in the state's recent achievement of negative greenhouse emissions.[3]

2. DESIGNING THE TRANSFORMATION

Remaining on the site at the time of the acquisition by the current owner was a range of poorly maintained administration buildings, dilapidated industrial sheds, and decommissioned conveyors, cranes, and other mechanical equipment and infrastructures that once supported the mill's operation. Having made the strategic purchase of the mill, the owners were faced with the difficult question of what to do with this significantly damaged site. Following the exploration of a range of ambitious, large scale development plans for the site by a number of different designers, Gilby Brewin Architecture and horticulturalist Marcus Ragus were engaged to design a relatively modest, adaptive reuse master plan for the site. Instead of erasing what might have been regarded as not worth keeping due to associations with a damaging past, practical uselessness and perceived ugliness, the plan outlined an approach that sought to work with and to maximise the practical and aesthetic qualities of these extant structures, spaces and landscapes. This approach, whilst addressing an ethical concern to minimise waste and responding to a constrained budgetary reality, aimed to ensure that the site remained a relatively unsanitised vestige of the destructive recent past.

Over time, parts of the proposed master plan have been incrementally completed alongside an ongoing program of remediation, revegetation and upgrading of the former industrial infrastructure. These parts include the conversion of a trio of existing buildings and structures into spaces for events and gatherings, and the addition of new facilities for overnight accommodation. Rather than describe in detail each of these new parts, the following sections outline a series of strategic design approaches to what was retained, removed, integrated and added to the remnants of this former industrial facility and the critical intentions of these in relation to the broader environmental agenda of the project set by the owners.

2.1 RETAINMENT

From our first visit to the site, we were attracted to and fascinated by the remaining industrial buildings and infrastructure – in particular the unusual arrangement, proportions and materiality that has come about through having been simply designed and built for no other reason than functional necessity. The physical manifestation of these structures could only have come about in the way that they have in this place, for this particular use – a typ1.e of

3. Refer Australian Institute research in native forest logging in Tasmania https://australiainstitute.org.au/post/native-forest-logging-in-tasmania-the-facts/

pure functionalism, the kind captured so beautifully by Berndt and Hiller Becher in their typological photographs of industrial structures to which they referred to as *anonymous sculptures*. Also contributing to the sculptural quality of these remaining structures is the patina of dents, scratches and rust that marks the passage of time and the industrial processes that once took place on the site.

In the new development, as much of the existing buildings and structures as possible was retained to ensure that the industrial functionalist qualities of these are able to be experienced by visitors. On one hand this is about offering a thrill and excitement of being in and around these particular and unique industrial relics and on the other, about bringing people into direct proximity to the enormous scale of environmental destruction that this site once contributed to.

2.2 REMOVAL

To deal with the legacy of decades of environmentally damaging industrial activity on the site and be able to open it up for new public use, a large and ongoing clean-up and removal process has been undertaken. This has been primarily in the form of ground remediation of soil contamination and the removal of a large stockpile of remaining woodchips through an ongoing process of composting. This industrial scale composting process is purposely expressed and experienced via mounded forms of new landscaping located on the former hardstand and on the large hill adjacent to the amphitheatre. On one hand, these mounds are a practical way of creating new landscaping over damaged ground and on the other, they recall the stockpile mounding of wood chips that once took place on the site, subverting this once destructive action.

Some of the industrial buildings were also emptied of contents, cleaned up and repaired to help make them able to be reused. Care was taken to not remove too much in order to preserve the industrial grittiness and patina of time that characterises the site and makes the experience of these structures and spaces so compelling. In some instances, parts of the remaining industrial facility were selectively removed which was initially a result of the strategic decommissioning of the site by environmental activists[4] and later a decision driven by necessity due to the poor condition of the existing buildings.

In some areas, purposeful removal has created moments of absence that strengthens the experience of the place. For example, the former weighbridge tower that once housed record keeping archives and offices was in such poor condition that it was deemed surplus to requirements in the new use of the site. However, rather than it be completely removed, the building was stripped down to the structural steel frame over which a new native vine is grown. The roof above the frame was kept but the ceiling was replaced with mirrored stainless steel that amplifies the effect of the greenery below and creates a moment of intrigue as visitors arrive over the old weighbridge. This hollowed out folly made from the weighbridge building that was once the central control tower for the industrial operation, now serves as a symbol of the repair and regeneration at the entrance to the site.

4. Refer John Tiggelen's essay called" The Destruction of the Triabunna Mill and the Fall of Tasmania's Woodchip Industry" in the July 2014 edition of The Monthly.
This idea is derived from a prompt by Joan Ockman for a symposium in Sydney in November 2022 called Beyond Landscape, who asked "How might architecture address the frequently destructive relationships that exist in the ecological chain. How might architects and landscape architects bring these far-flung relationships to light and materialise them architecturally?".

2.3 INTEGRATION

A significant design challenge for the reoccupation of the former industrial structures and spaces with new public uses, was how to integrate the necessary infrastructure of safety and universal accessibility without impeding the thrill of experiencing the perceived 'riskiness' of the site. The design approach to this was to blend building compliance features such as accessible ramps, tactile indicators, balustrades and fences into the existing conditions as if they might have always been there.

The design of the entry and gathering spaces around the Tin Shed performance space provides an example of this design approach. In order to negotiate the level change between the hardstand parking area and the interior of the performance space, a building code compliant disabled access ramp was required. The length, linearity and gently sloping nature of this particular compliance feature were traits harnessed in the design of the new entry bridge that is designed to resemble a piece of industrial infrastructure that serves to convey people to and from the venue over a gap between the carpark and the building. The required tactile indicators at each end of the ramp were specifically selected in bright yellow to echo the industrial yellow paint used for safety signage and markings throughout the remaining industrial infrastructure. At the end of the ramp, before entering the performance space, the handrail turns the corner and becomes an unusually long, continuous element that guides people into an undercover gathering space, forming part of a new galvanised chain mesh fence used to prevent people injuring themselves on or accessing below the existing gangway structures. This type of cylindrical steel pole fencing is used throughout the existing facility, blending this new element into the existing built fabric.

The design approach to blend these typically visually obvious safety and accessibility elements into the architectural language of the existing built condition serves to preserve the so-called 'integrity' of the existing conditions and subsequently creates an uncanny sense of the abandonment of the facility.

2.4 ADDITION

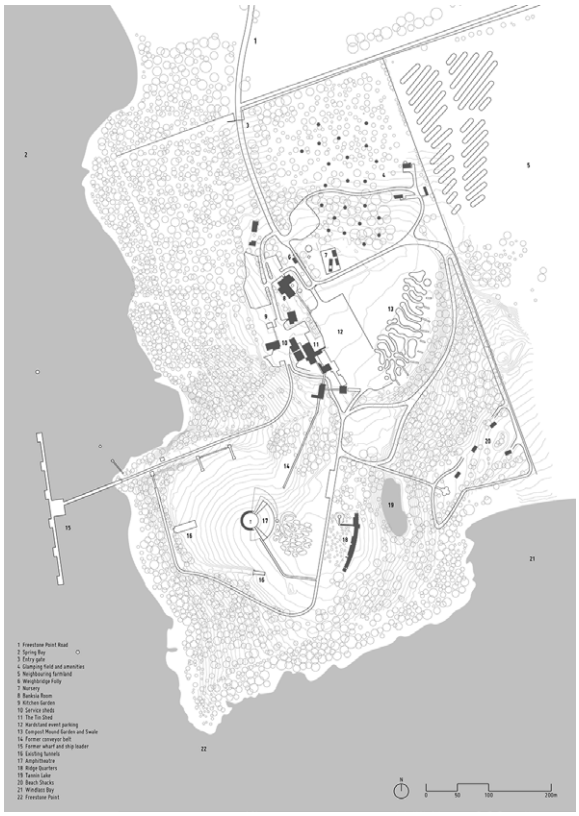
Along with new parts to ensure safety and accessibility, there was also a need to add new built elements to create particular functional spaces around the site. In these cases, the aim was to try work with the existing spatial and material logics of the site to augment the existing conditions, rather than detract from them.

An example of this is the design of the Amphitheatre that is set within the now removed slew crane's concrete footing. For decades the crane slewed back and forth along a rail on top of this semi-circular footing, spewing out woodchips into a huge stockpile. Inside the remaining footing, a new circular concrete platform and set of bent timber bleachers were inserted, making an outdoor gathering and event space that makes use the wall as shelter from the prevailing wind. A new sloped lawn was also added facing into the space, the form of which also follows the circular geometry of the concrete footing. At the centre of the space, a sundial gnomon was grafted onto the

old crane pivot column, accompanied by half-hour markers set into the new concrete floor. Here the rotational action of the crane has been replaced by a registering of the earth's rotation around the sun – another symbolic gesture towards the environmental repair and regeneration of the site.

The former rotation of the crane is also made apparent in the design of the Ridge Quarters accommodation building located nearby to the Amphitheatre. The bent geometry of the building was created from extruding radiating lines from the old pivot column, notionally pulling the Ridge Quarters into the gravity of the Amphitheatre space. This gesture helps this building that is one of the few fully new parts added to the site, to form a physical relationship with the existing conditions, one that accentuates rather than takes away from it, further reinforcing for the visitor the experience of the destructive forces of the site. This design approach is reinforced in the structural and material language of this new building which is derived from the infrastructural scale and materiality of the former industrial structures on site. In this way, the new building forms part of the continuum of the site rather than something distinctively new and separate from it.

Another aspect of the design approach to adding to the site is the way that a number of the new constructed elements purposely reveal how they are made, acknowledging the contemporary industrial processes that underpin this very site's ongoing repair and regeneration. This idea is manifest in the mounded forms of the landscaping that embody the process of composting and planting, the exposed upcycled aggregates that reveal the particular composition of the concrete, the expressed saw cut marks in the timber that make evident the mechanical processing of this natural resource, and the elemental assembly of new structures that acknowledge and make legible, the method of construction. For visitors, this enables a connection to the site's layers of industrialisation: the destructive recent history as a woodchip mill; the ongoing process of environmental repair, and the forms of resource extraction and production that are an ongoing part of the contemporary building industry.



3. CONCLUSION

In the Australian context, few examples of modern post-industrial landscapes of this enormous scale exist whereby a site so deeply damaged and once damaging has been strategically acquired, remediated and opened up for new cultural and environmental uses. Unlike other examples of industrial heritage adaptive reuse projects that typically exist in Australia's major urban centres, Spring Bay Mill is peculiar in terms of the environmental political context, regional location, and landscape orientation. It is easy to understand why the site might not be regarded as precious or particularly worthy of preservation given it's remote location and the enormous scale of environmental destruction it once supported. However, the concerted effort to keep and work into the industrial remnants as described in this paper, preserves the site as an important reminder of a destructive recent past, whilst making visible and visceral, the positive example of human endeavour

in the form of the site's regeneration. Although it being impossible to ever return the site to a condition prior to European invasion, the Spring Bay Mill project is determinedly repairing some of the damage to, and caused by, a site that symbolises the rampant exploitation of natural resources synonymous with the Anthropocene and is once again allowing groups of people to gather in this beautiful ancient landscape. ■

BIOGRAFÍA

Ross Brewin is a director of Gilby Brewin Architecture and an academic in the faculty of Art, Design and Architecture (MADA) at Monash University in Melbourne, Australia. Ross's entwined practice, teaching and research engages with culturally, socially and environmentally responsible projects across a range of urban scales, types and settings.

MODERN PRE-EXISTING STRUCTURES AND URBAN RENEWAL: CRISTINA XAVIER'S INTERVENTION AT THE HEADQUARTERS OF O2 FILMES

MÔNICA JUNQUEIRA DE CAMARGO
SCHOOL OF ARCHITECTURE, URBANISM AND DESIGN. UNIVERSITY OF SÃO PAULO

#16

ABSTRACT

This article analyses an intervention in pre-existing structures in an industrial area undergoing renovation. O2 Filmes headquarters was designed (2007-2012) by architect Cristina Xavier (FAUUSP, 1994). Located in the Vila Leopoldina neighborhood, characterized by the presence of the largest distribution center for fruits and vegetables in the São Paulo metropolitan area, it is surrounded by large warehouses and low-income houses. The announced transfer of this supply center to a more distant location has rapidly changed the local landscape. Large lots, often occupying entire blocks, have attracted strong interest from real estate investors, leading to the replacement of old warehouses with gigantic, gated apartment complexes surrounded by high walls and totally isolated from city life, distorting the original industrial landscape. This goes against desirable urban policies in terms of cultural preservation, social diversity, and sustainability.

The expansion of O2 Filmes led to the purchase of five bordering warehouses, depots, and mechanic workshops. These were large, simple constructions, whose demolition would generate a high volume of waste and eliminate an urban reference point that is present in the daily memory of workers, residents, and visitors. Although those pre

existing buildings neither had exceptional value nor were listed as heritage, the proposed intervention incorporating them has the merit of turning pre-existing structures into cultural assets. The design was based on a profound understanding of the changing industrial area, the importance of existing structures in the neighborhood, and the goal of bridging the gap between work routines and the city. It aimed to create a space where people could gather and exchange ideas.

The commitment to reshape the area while respecting its urban context, promoting sustainability by reducing waste, and improving the environment through increased green spaces can inspire new approaches to revive the collective memory of everyday life and work in the region.

1. INTRODUCTION

The headquarters of O2 Filmes, an award-winning producer of well-known Brazilian movies, were designed (2007-2012) by architect Cristina Xavier. She majored in 1994 at the School of Architecture and Urbanism of the University of São Paulo (FAUUSP) under the legacy of *Paulista* modern architecture. Accordingly, she joins the public aspect of architecture and its constructive features in designs that range from urban structures to furniture. Although she had suffered the strong influence of the *Paulista school*, as her father João Xavier had been a member of the group of young architects that were close to architect and professor João Vilanova Artigas, whose works were seen as the epitome of the school, Cristina Xavier took the necessary steps forward towards a critical reflection about the Anthropocene. Joining together diverse experiences, from the São Paulo real estate market to training workmen to use wood in the Amazon, Cristina Xavier has developed a keen critical sense of contemporary issues.

Her architectural practice has become more and more exemplary as she changes possible obstacles into design investigations. Xavier has been developing a design intelligence that has enabled her to propose innovative experiments unforeseen by the client and absent from the articulation of the problems she has been asked to solve.

> *This is not about proposing visionary solutions for the past century's problems, but about adopting unpredicted innovative practices that were not even remotely foreseen when considering a problem.*[1]

Questioning the requirements she is given and reflecting upon what is really being asked, Xavier relies on her own field of expertise, taking advantage of the design not only as the conductor of the action, but also as the means, the instrument, the structural axis of the entire creative process, considering it in its real dimension as presented by Argan:

> *Design is structure, in the most current and precise sense of the term. Tracing the guidelines according to which the existence of society will unfold and at the same time denying that these lines are predestined or prefixed, it expresses first of all the virtuality of current conditions, their implicit possibilities.*[2]

Without much fuss, but with full conviction, her designs have been stimulating important changes in São Paulo architecture. Such is the case of the housing proposal Vila 897, designed on a steep slope in a neighborhood undergoing an accelerated process of renewal. It was a turning point in the trajectory of the developers and consolidated a new standard for housing complexes. The real estate company which until then had a portfolio fully determined by the market came to understand the real role of architecture in facing the conditions of each different case. Always willing to study and interpret the regulations to build v*ilas (a group of similar houses on a secondary dead-end street, without*

1. Michael Speaks, "A inteligência do Projeto. " In SYKES, A. Krista (ed.). *O campo ampliado da arquitetura*. (São Paulo: Cosac&Naify, 2013), 163.

2. Giulio Carlo Argan, *História da Arte como História da Cidade*. (São Paulo: Martins Fontes, 1992), 51.

the character of a public place), Xavier proposed independent and carefully arranged units to create a generous common area, ensuring at the same time some privacy for each house, which model has spread throughout the city, although not with the same quality.

After this successful experience, in which all units were sold with no more than the architect's initial sketches, the company began to work with renowned São Paulo architects and Xavier understood the market's strategies and its artifices to obtain the highest profits from a mere preliminary design. Shocked by the backstage of real estate developments, Xavier ventured to propose herself a housing complex – Vila Fidalga – which valued not only the first drawings, but the whole process, including fair payment for all those involved.

The result of this undertaking is a reference in São Paulo architecture at the end of the twentieth century: six partially overlapping units integrated into a common route that connects two streets and allows independent access to each house. The flexibility of internal spaces and particularly the arrangement of the common spaces have introduced a new model for multifamily complexes in the city, breaking with usual standards and giving a new meaning to common areas, in the opposite direction of real estate market practice.

Based on this housing complex and on the partnership established with engineer Hélio Olga, responsible for all wooden elements, she had the opportunity to develop a constructive system of wooden panels for walls, floor and roof slabs, based on the use of solid wood leftovers from prefabricated houses at ITA Construtora, Olga's company. The proposal was designed to combine innovative, low-cost and easy-to-implement technology, aiming for its adoption in future demands. From a 10 cm module, it is possible to create panels from 0.20m to 3.00m wide and between 1m and 5.50m high. The sizes have been chosen to facilitate prefabrication, storage, transport, and assembly on site. This system was tested in Vila Taguaí.

Located in the outskirts of the capital and inside an environmental preservation area, the housing complex consists of eight houses, with three compact standard plans of one or two floors, located to make the best use of the topography and maintain the original conditions of the land as much as possible. The internal spaces were defined taking advantage of maximum natural lighting and ventilation. Rainwater is captured and sent to the existing stream, and sewage is treated in the underground station within the condominium itself and reused in toilets and irrigation, reducing water consumption by 30%. A solar energy system heats the water. Design and construction were in tune with contemporary environmental issues, a concern which the architect has been perfecting in each work.

2. MODERN PRE-EXISTING STRUCTURES AND URBAN RENEWAL

The design for O2 Filmes aggregates previous contributions and advances in the sense of preserving urban landscape. The analysis presented herein is based on the architect's design process beginning with the study of her drawings, from the first sketches to the detailing of each design and comparing them with the several visits to the works and its impact on the region.

Vila Leopoldina, the neighborhood where the buildings are located, is characterized by the presence of the largest supply center for fruits and vegetables in the São Paulo metropolitan area – CEAGESP. Over time, its operation has caused a concentration of large warehouses and sheds in its surroundings, interspersed with existing housing in the region, a typical occupation of the modern productive system. This very particular and intense commerce has attracted many informal workers who have settled in tenement houses and slums in the surroundings. In recent decades, given the diversification of production and the expansion of the creative sector, these warehouses have proved to be an interesting option.

On the other hand, with the growth of the city, this neighborhood, which is not very far from downtown and whose commercial and services dynamics are quite different from the standard of more central areas, has started to attract schools, universities, and public institutions. Evidently, always attentive to new possibilities of expansion, the real estate market has been promoting great changes in the area without any concern for urban context and neighborhood history. Old warehouses and sheds are being replaced by gigantic, gated communities with apartment towers, surrounded by high walls and totally isolated from the city, running counter to a desirable urban policy in terms of cultural preservation, social diversity, and sustainability. According to Kühl,

> *cultural assets are, and should be, an integral part of our daily life and are present, as they should be, in sociocultural policies and practices as well as within contemporary economic dynamics, therefore taking part in the design of the city.*[3]

These real estate investments have ignored the surroundings, forcing strange-looking buildings into the cityscape and yet refusing to participate in its daily life.

O2 Filmes has been in this neighborhood since 2007, and its expansion led the film producer to purchase six neighboring warehouses – sheds, depots, and mechanic workshops – adding 7,600 square meters to accommodate a wide program aimed at diversifying the products offered, such as TV shows, movies, feature films etc. The destruction of those simple but large structures would generate a high amount of residues and also eliminate a reference in urban occupation, present in the daily memory of workers, dwellers, and users of the area. Although the assets were of no exceptional value, let alone listed as historic heritage, this intervention, which incorporates existing edifices, has the merit of transforming pre-existing structures into cultural assets, whose value, according to Meneses

> *comes from social action. To be socialized and changed into standards, choices and options made by individuals and groups need mechanisms of identification, enculturation, and acceptance.*[4]

3. B.M. Kuhl, "O papel do patrimônio arquitetônico no projeto da cidade contemporânea. " In Retto Júnior, Adalberto da Silva (eds.). *Coleção Primeiras Aulas*. (Tupã: ANAP, 2019), 42.

4. Ulpiano Toledo Bezerra de Meneses, *Os usos culturais da cultura. Contribuição para uma abordagem crítica das práticas e políticas culturais. Turismo: espaço, paisagem e cultura*. (São Paulo: Hucitec, 1996), 92.

The purchased structures had to be integrated to the building currently being used by the film producer so as to constitute an integrated complex and not mere outbuildings.

The design developed from an understanding of that factory territory in a process of transformation, of the meaning of pre existing structures in the block and in the neighborhood, and from a concern to establish a dialogue between the work routine and the city. Its goals were to create an environment where people could get together and exchange ideas, to expand the permeable areas and introduce green areas (for which landscape architect Ciça de Souza was hired), and also, as much as possible, to avoid residue generation, thus contributing to sustainability. Rearranging the space of the six warehouses could not obstruct the daily activities of the film producer which was going to remain in place during the intervention. This forced a simultaneous work of design and construction, a situation until then unprecedented in the architect's history, that required a careful strategy for the construction site, the office, and the fees, since the length and time of the work were unpredictable.

On the basis of a preliminary idea of the entire process, including a plan of all stages of the work, the fees proposed by the architect and agreed to by the client were divided between a fixed amount for the conceptual design and monthly payments for the whole team's work hours. Aiming to optimize costs, the budget included the use of the producer's own resources and employees, including scenography and lighting teams to execute the furniture and lighting. The company technicians' participation in the implementation of the project ended up creating a positive connection among the entire team, minimizing any resistance to disturbances during the works. To coordinate the complexity of the simultaneous design and construction, and to harmonize with the company's staff that kept up their usual work regime, Cristina Xavier set up her office in the construction site from which she controlled the entire drawing and execution processes. Between the first visit and the inauguration of the project, there were five years of intense coexistence between the design team, the construction company, and the client.

The work unfolded in line with the following stages: survey of all warehouses and their respective maintenance conditions; analyses of the client's work dynamics and demands during the construction period; study of the proposed brief; layout of both design and execution works, anticipating the gradual move of several sectors of the company's team.

Making the most of what was already there and reinforcing structures, roofs, and concrete floors, zenithal and side light spots and drainage floors were introduced. With self-supporting wooden structures created by the architect in partnership with Hélio Olga's Ita Construtora, different blocks were created to accommodate the brief, such as casting test studios, production offices, costumes and art work areas, finance/ administrative rooms, and a projection room in the central area.

Furniture, fixtures, and the support for electrical installations were designed according to the specifics of each environment and executed by the building company's locksmiths alongside the film producer's scenography and lighting

technicians. Partitions, wheeled screens, curtain-like fabrics, cabinets, shelves, iron legged work tables with wooden tops, wheeled side tables, plywood benches, and cushions were created on site. Conceived like a citadel, the space resulting from the integration of all warehouses was organized into a main street crossed by a series of secondary streets from which squares and alleys sneakily emerge. The latter join together the several work environments, each one with its own specifics: auditorium, common areas with different scales and motivations – rest area, coffee area, conversation area, gatherings area – even a certain amount of unpredictability that only public spaces allow. The workers' bicycles parked along the paths reinforce a continuity with usual urban dynamics. At the same time, the design did not neglect the necessary privacy and safety of some sectors, such as post production areas, with sophisticated equipment requiring high doses of concentration at work, the dressing-rooms for casting selection, or the administrative sector, but always preserving freedom of communication within the entire complex. Interaction between the company personnel and shared projects among several sectors – important aspects of the film producer's identity – took on a prominent role in determining the fluidity of the space, lending daily activities a fundamental aesthetic component, either related to the internal environment or to its relationship with the city. The internal perspectives generated by the different volumes, which were strategically implemented to see to the functions spelled out in the brief, are enriched by people coming and going and getting together in the open canteen, by discussions at the work stations or by resting in the hammock area, resulting in a dynamic visual composition in constant renewal – a notion of beauty that is not restricted to the balance of proportions.

Likewise, the showcase with dolls, masks, and costumes from the films establishes a good-humored dialogue with the city, bringing passers-by closer to the film production company's universe. The wall set aside for graffiti incorporates and values the artistic expression of the local community.

The O2 headquarters has become a very intense urban phenomenon. Xavier managed to transform grim abandonment into collective life and street desires into reality, configuring a new territory, as defined by Milton Santos

> *The territory is the ground plus the people, i.e. an identity, the fact and the feeling of belonging to what belongs to us. The territory is the basis for working, for living, for material and spiritual exchanges, and for life itself, upon which it has influence. When you talk about territory, you should readily understand you are talking about a territory that is used, utilized by a given population.*[5]

The original industrial landscape can still be identified by the presence of many other warehouses that can be rehabilitated, following the example of O2. The maintenance of workspace reinforces the original character of the industrial landscape and avoids its spectacularization, a strong contemporary trend. Pre existence structures transformed into a cultural asset, not by the brief, but by the quality of their design.

3. FINAL REMARKS

This intervention brings in many elements that stimulate a reflection on the complex conditions of contemporary world and how to face them for a more harmonic future between society and environment, without neglecting the past in the transformations of each time. This is an architecture that knows how to deal with the changes not fighting them but working with them.

The O2 Filmes headquarters are the result of a refined reflection on an industrial landscape faced by the Anthropocene's impact. An understanding of a cultural asset, a respect for pre-existence, a revitalization of the territory respecting its urban scale; a reduction of residues, contributing to sustainability; an increase of permeable areas by the introduction of vegetation in favor of the environment – all these are factors that can induce a new standard for urban interventions that seeks to invigorate the memory of a landscape built up by everyday life and work, . The modest presence in the urban context and the use of simple materials do not take away its importance in transforming the neighborhood, on the contrary, the beauty of its architecture lies precisely in bringing dignity to everyday life. ■

SAPIENZA UNIVERSITY OF ROME

ABSTRACT

In the context of a broad framework of urban-historical, technological, and industrial archaeology studies conducted by the authors and focused on Tivoli's historic manufacturing areas, the paper illustrates the research tools in favour of a methodology for designing the landscape of work that derives from long industrial and pre- and proto-industrial processes. The paper reports the main elements of meta-design underlying the redevelopment of an entire historically productive urban neighbourhood and discusses the design application of a specific case within a systemic vision.

The methodology is fundamentally based on the specificities of historic urban and industrial heritage: sites, areas and intangible elements that recall the foundations of contemporary humanity. Upstream of the proposition of the intervention methodologies were the inventory of the artifacts, the survey of the complex water/city system, the reading of the processual building fabric, and the reading of the morphology expressed in the current open spaces.

Within these systems, with their reasons for memory and urban resources, is the history of the Amicucci-Parmeggiani Paper Mill, built in the 19th century and connected to the medieval city and pre-existing Roman archaeological remains.

This is a true case of multiple archaeology in which the specificities of labour architecture need to be highlighted and its ability to be supportive of a new social and cultural sustainability needs to be grasped. The final stages of the process involve the transfer of technology from the university to the community through the star-tup BEST design, which finally implemented the architectural project according to the aforementioned value principles.

In view of the next steps, the proposition of a rigorous methodology shows the possibility of surgically operating on a modern element of an industrial landscape with an awareness of contemporary values, even when a new use is not even strongly characterized.

1. INTRODUCTION

An intense productive and industrial history has left its mark of modernity on the edges of the middle age city urban fabric of Tivoli downstream. There, the numerous canals, after moving oil mills, paper mills, tanneries, and ironworks, having exhausted their useful function, released the waters in a famous complex of waterfalls and cascades that are part of the beauty sought in Tivoli by Grand Tour travellers during 18th and 19th cc. New construction and production technologies have been prominent in this fringe of the city since as early as the late 19th century, massive industrial realizations have left a new built-up area edge that has decisively challenged the ancient landscape relations between city, land and river. There is a clear need for an action to regenerate Tivoli through the recognition of the values witnessed by the oldest and most recent presences, in order to place them at the basis of an overall rethinking of the area.

As part of the collaboration of the authors with the VaVE Institute of the Ministry of Cultural Heritage and the Municipality of Tivoli, the paper outlines, in particular, the research tools in favour of a methodology for designing the landscape of labour resulting from long industrial and pre- and proto-industrial processes. In particular, the paper outlines the elements of meta-design underpinning the redevelopment of an entire historically productive urban neighbourhood is an approach definable, in words of other times, as metaplanning. The design application on one of the largest old mills, the "Amicucci-Parmeggiani Paper Mill," acquired by the City of Tivoli as part of a recovery strategy to be identified for the entire area, is also explained in the final section.

2. THE METHODOLOGY

The article reports a methodology based on the specifics of industrial heritage: sites, areas and intangible elements reminiscent of the foundations of contemporary humankind. Methodological invariants are postulated related to the inventory of artifacts, the survey of the complex water/city system, the reading of the processual building fabric, and the reading of the morphology of current open spaces. Then typical modern values and fragilities related to modern use of materials, typological and constructive experimentation, and functional adherence are highlighted.[1]

Within these systems, with their reasons of memory and urban resources, lies the story of the Amicucci-Parmeggiani Paper Mill, built in the 19th century and connected to the medieval city and the pre-existing Roman archaeological remains. Values elements traceable to the Nizhny Tagil Charter and the Joint TICCIH-Icomos Dubline Principles were highlighted in the industrial asset. It is a true case of multiple archaeologies in which we need to highlight the specificities of modern industrial heritage and grasp its ability to be supportive of new social and cultural sustainability. This resulted in a process of technology transfer from the university to the community through the BEST design start-up, which finally realized the architectural design according to the principles of industrial archaeology and adaptive re-use.

3. INDUSTRIAL ARCHAEOLOGY IN TIVOLI CONTEST AND VALUES

The medieval urban fabric of Tivoli is permeated by numerous ancient and modern canals, and, at least since the 1500s, there are many paper mills, ironworks, and tannery moved by the water. The transition to modernity is punctuated by two major events with impressive hydraulic works at their centre.

The first was after the disastrous flood of 1826, when the papal government entrusted engineer Clemente Folchi with a definitive hazard mitigation project. Folchi builds a basin to collect river waters upstream of the city, the St. John's Basin, and a tunnel in Mount Catillo, which from the basin conveys river waters directly downstream of the city, generating the new Gregorian Waterfall that adds new value to the landscape.[2] The intervention as a whole preserved and improved the industrial functionality of the river and provided new productive plants.[3]

The second major technological and entrepreneurial dive was due to the initiative of a Roman engineer, Raffaele Canevari, who founded the "Società per le Forze Idrauliche" in 1884.

Conveying the waters that, thanks to Folchi's work, flowed steadily into the Vesta Valley, Canevari settled the Vesta power plant in 1886 and built a new canal, called the Canevari Canal. This new canal allowed the settlement, in the area of the Shrine of Hercules Vincitor, of the Segrè paper mill, the Pantanella pasta factory, a wire drawing mill and a hardware store, a second power plant, called Acquoria, from 1892, the first European power plant to carry alternating current electricity for 25 km from Tivoli to Rome.[4]

The 20th century is marked by the effects of the establishment of such a favourable environment. Huge industrial structures, mainly made of reinforced concrete, rise on old sites, expanding, elevating, replacing. What emerges is the context visible in the **Fig 1** and **Fig 2**, of a medieval city that has a walled edge in historic concrete industrial structures.

Some of them retain only the values of labour, memories of intangible data; others soar as unintended monuments from the intriguing forms of industry's reinforced concrete; still others, finally, enclose some technological or scientific novelty, such as power plants or cutting-edge architectural construction solutions.

There are many elements for heritagization, but also critical environmental and conservation issues. Neglect has led to collapses and serious degradation phenomena, but some operations of renovation, although animated by the most laudable intentions, have already led to the loss of architectural elements of considerable value, such as, for example, the metal vaults made by engineer Gino Covre for the Tiburtina paper mill[5].

4. THE URBAN CONTEST AND A STRATEGY BASED ON TWO CULTURAL PATHS.

Following an initial census of disused or surviving industrial presences, surveys of a significant number of industrial facilities, particularly paper mills, have been conducted over the years. From the perspective of regeneration, knowledge and representation of processes is imperative.

Therefore, the surveys, in a vast interweaving of engineering, architectures and histories, have been critically guided by a meta-design intent.

Three main systems are considered as intrinsic references of any design hypothesis:

- Industrial compounds, with terracing and building arrangements dictated by the rugged orographic nature of the slope and the numerous archaeological presences;
- Hydraulic works that innervate the city;
- Urban and open spaces.

In particular, with reference to the latter, the geography of the paper mills is linked to two open space structures, one consisting of the ancient via del Colle with the Vesta valley, the other that of the modern via degli Stabilimenti.

The relationships between these streets and the surrounding industrial and non-industrial buildings, along with historical-economic events, highlight two potential cultural paths of industrial archaeology. Via del Colle emerges as a key infrastructure of historical industriousness, interwoven with canals and artisanal or proto-industrial sites. It represents a cultural route of urban manufacturing and mills, reflecting the evolution of contemporary paper mills.[6]

The valley path is the via degli Stabilimenti, which for a good stretch runs over the Canevari Canal and is configured as a cultural route of the urban industrial district of the contemporary age. The route breaks off from Via del Colle, past Porta del Colle, and, after serving the Mecenate paper mill, runs from west to east and, having encountered the Graziosi-Carlucci and Marziale paper mills, enters the Società per le Forze Idrauliche tunnel built under the rocky spur on which the Amicucci-Parmeggiani paper mill rests. Past the tunnel, it skirts the Vanni paper and woolen mill, the power plant and the Vesta paper mill and then bends in a 'U' shape, ascends the Vesta valley with the Ranzi-Sibilla, Tani, Arato-Boratto paper mills and rejoins, through the Vesta and Rinserraglio streets, at the other end of Via del Colle.

Therefore, a spindle is formed between the two tracks, which gathers almost all the industrial estates and is characterized by considerable enclosure toward the city.

The industrial enclosures form impermeable urban blocks of excessive size for pedestrian-oriented urban use and an enhancement of them suggests a strategy of "crossings."

Making traversable and usable the current closed enclosures of industrial realities is a credible part of any strategy, based also on a mixite of new uses. The renewal is the opportunity to bring out and enhance the phases and vicissitudes of the complexes, integrated with the water paths of industrial processes.

5. THE AMICUCCI-PARMEGGIANI PAPER MILL, A PROJECT CASE STUDY

5.1 HISTORICAL EVOLUTION OF PAPER MILL

The Amicucci-Parmegiani paper mill is characterized by a continuous evolutionary development over time that began around the 1920s and

6. Fulvio Cairoli Giuliani, *Forma Italiae, Regio I, Vol. VI, Tibur, Pars Prima* (Rome: De Luca, 1970); Michele Zampilli et al., "Formazione e Trasformazione Della Struttura Urbana Di Tivoli 3. Dalle Prime Fasi Di Insediamento Al Rinascimento," in *Tivoli, Un Laboratorio Urbano. Ieri, Oggi, Domani* (Roma: Roma TrE-Press© Roma, 2019), 168–69.

then ended during the 1960s. The evolution has been recorded in a 4D HBIM **(Fig 3)**.

Phase 1: In the early 1920s, Cav. Giuseppe Amicucci purchased Cincinelli land and constructed the first building, replacing an old barn. By 1925, the paper mill expanded eastward, adding a new section towards a nearby alley.

Phase 2: Between 1934 and 1938, a driveable courtyard with a gatehouse and loading deck was built on the north side of Piazza Tani. Additionally, a boiler room and a new building for setting up were constructed in the eastern part of the courtyard.

Phase 3: From 1940 to 1946, significant expansion occurred to the north of existing structures. Buildings were allocated for both main and ancillary functions, including technical rooms and production facilities.

Phase 4: In 1947, the downstream building was extended eastward to accommodate the first continuous machine line. Another smaller building was added for processing with a Hollander beater. Further extensions were made to the central building and the boiler room in 1949.

Phase 5: By 1951, the original building was expanded with a large canopy, and the courtyard was reorganized for raw material unloading. The boiler room was widened westward, and a new warehouse was constructed in the northwest, partly on ancient Roman ruins.

Phase 6: In 1952, a significant expansion took place, enlarging the continuous machine building to install a second line with an annexed workshop. This extension also included two upper floors for straw storage.

Phase 7: In the early 1960s, the paper mill expanded further with the construction of a new production line building in the northwest, involving the demolition of existing structures. Simultaneously, offices adjacent to Piazza Tani were demolished and reconstructed to improve raw material unloading maneuvers.

Phase 8: In 2009, a partial collapse occurred at the paper mill. Subsequent interventions included the reclamation of the eternit roof section in 2014 and the partial demolition of the courtyard canopy in 2016. The final intervention in 2019 aimed to secure the collapsed portion of the mill.

5.2 ARCHITECTURAL DESIGN STRATEGIES AND CRITERIA

The project proposal suggests removing the top floor of the existing paper mill to improve the view from Piazza Tani and along Via Maria SS. di Quintiliolo. Despite focusing on conserving the perimeter of the paper mill complex, the design identifies two significant urban themes:

1. Landscape redesign of the North and North-West fronts along Via degli Stabilimenti.
2. Development of urban connections between Piazza Tani and a new elevated area, potentially the site of a future auditorium or belvedere square.
3. A key project constraint is that the maximum summit height should not exceed the level of Piazza Tani, allowing for an extension of the square and panoramic views of the valley and Roman countryside. The

redevelopment aims to maximize the area's panoramic views while enhancing the urban fabric and architectural features.

The functional reorganization of the paper includes selective preservation and demolition of non-essential parts, emphasizing the preservation of historically significant elements.

Two connection systems are proposed:

1. A public external route along Vicolo del Riserraglio, leading to a new public terrace at level +204,00 m., connecting to a future "low belvedere" square at level +199,00 m..
2. An internal system within the building complex providing vertical connections between various levels.

The strategy presents a new spine for the complex, the layout of which is set through the planimetric alignment with the medieval tower of the convent of Santa Caterina, accommodates the entrance to the service areas of the museum, and the lift block and new staircase between the 209.00 elevation, the two main levels of the museum-purpose building: 204 and 201.00 m.a.s.l., a level in direct relation with the new 'low' square.

The functional organisation of the interior spaces pursues the objective of defining a promenade and the definition of a route adherent to the original production process. In this direction, the proposal envisages defining a main exhibition area at elevation 204.00 with an annular path around the kettles' aisles that, through a system of walkways, allows views of both the external landscape and the extraordinary double-height spaces of the former paper mill,

On level - 3, at a height of approximately 197.05, a multifunctional space for events and public demonstrations is planned below the 'kettle aisle': a longitudinal space of remarkable quality that can host events and collective activities for approximately 100 people.

5.3 THE ADAPTIVE-REUSE PROJECT

The intended uses are outlined as part of an overall function of museum space dedicated to the fundamental segment of Tivoli's industrial history, complementary and integrated with the functions of cultural centre, civic pole for the city and exhibition space for contemporary art.

The reference musealisation model is that typical of alternative spaces - as places for rethinking the relationship between the observer and the work of art - which emphasise the relationships that can be established between the visitor, the work of art, the exhibited document and the industrial structure. An important element of the project consists in the attempt to integrate the pre-existing buildings subject to constraint (artefacts at the entrance to the former paper mill and the wall along vicolo del Riserraglio, with the new redevelopment work) through an overwriting operation. In addition to the recovery and restoration of the small constrained artefacts at elevation 208.00, the project envisages the maintenance and restoration of the wall along vicolo del Riserraglio, whose height defines the altimetric limit of the

new artefact, characterised by a lower height than the existing wall and a similar horizontal profile of the planned new artefact.

6. CONCLUSIONS

The case study highlights a *positive anomaly* in the application of protection to a listed modern complex of historical and artistic interest[7]. This anomaly

affects the redevelopment of a disused industrial site and the integration of a public building value chain, enhancing urban life quality. The anomaly stems from the protection imposed by Italy's highest institutional body for protecting cultural assets. This constraint establishes gradual transformation levels for different building portions, leading to the partial demolition of certain artifacts – an unusual practice in protecting such assets.

This selective protection arises from a specific hierarchy of values attributed to the paper mill complex. The primary value recognized prioritizes the extraordinary site of the original building nucleus, located within a remarkably valuable landscape overlooking the Aniene waterway and the Sanctuary of SS. Maria of Quintiliolo. This value has been chosen over preserving the industrial artifacts, reflecting a shift towards recognizing the landscape's significance.

These principles informed the overarching criteria for the transformation and revitalization of the area, as outlined in the design guidelines for the *Design Competition for the construction of an auditorium*. They were also reflected in the general proposal of the winning project.

Beyond specifying the program of uses and delineating areas for demolition versus preservation involved considering visual connections both towards and from the valley system of the former paper mills, extending to the Sanctuary of Hercules Winner, as well as the opposite slope, where the Sanctuary of SS. Maria of Quintiliolo is situated.

At the urban level, the retrofitting and recovery project of the former paper mill covered the creation and organization of three new public spaces for revitalize the urban significance of this remarkable landmark in the city of Tivoli. This ambitious undertaking is currently underway, and its impact will be assessed in the coming years to gauge its effectiveness in transforming disused modern industrial assets into enduring public values and integrating them with historic assets. ■

MODERNISM ON THE POST-INDUSTRIAL RIVERFRONT: HERITAGE SITE OR OBSOLETE RELIC?

ELIZABETH M. KESLACY
VIRGINIA TECH

#16

ABSTRACT

In the 1970s, major cities in the American Rust Belt heavily invested in their river- and lakefronts, initiating a transformation from primarily private, industrial uses to landscapes for public recreation. In cities like Detroit, Cincinnati, Dayton, and Flint, municipalities constructed parks, plazas, amphitheaters, and fountains in raw concrete. The designs utilized a Brutalist idiom—commonly associated with the landscape architect Lawrence Halprin—to facilitate new public access to, and enjoyment of, the water's edge. These projects occurred largely under the aegis of the cities' first Black mayors who rose to political power on the heels of white flight, controversial urban renewal strategies, and myriad crises that plagued them in the wake of mass suburbanization.

Fifty years on, the age of these landscapes is currently forcing cities to reckon with their future, to decide whether their design, condition, use levels, history, and public affection have transformed them into valuable heritage sites to be restored or obsolete relics to be cleared away. In this paper, I examine case studies that span the range of municipal assessment and response to better understand the factors and the political calculus with which they evaluate the heritage value of late Modernist landscapes. In particular, I discuss three projects. First, I examine the recent renovation of the Isamu Noguchi-designed Hart Plaza at the center of Detroit's Civic Center. Second, I discuss Cincinnati's unsympathetic renovation and neglect of its Concourse Fountain at Yeatman's Cove. Finally, I unpack Flint, Michigan's partial demolition of its very own Halprin-designed Riverbank Park mandated by its 2010 Riverfront Restoration Plan. Situating these projects within their historical and contemporary racial politics, I elaborate on both the difficulties and opportunities in the preservation of Late Modern landscapes of the post-industrial riverfront.

1. INTRODUCTION

In the 1970s, major cities in the American Rust Belt heavily invested in their river- and lakefronts, initiating a transformation from industrial uses to public recreation. In cities like Detroit, Cincinnati, Dayton, and Flint, municipalities constructed parks, plazas, amphitheaters, and fountains in raw concrete. The designs utilized a Brutalist idiom—commonly associated with the landscape architect Lawrence Halprin—to facilitate new public access to the water's edge. These projects occurred largely under the aegis of the cities' first Black mayors who rose to political power on the heels of white flight, controversial urban renewal strategies, and myriad financial crises that plagued them in the wake of mass suburbanization.

Fifty years on, the age of these landscapes is currently forcing cities to reckon with their future—to decide whether their design, condition, use, history, and public affection have transformed them into valuable heritage sites or obsolete relics. Heritage scholars and landscape preservationists have noted the difficulties inherent in preserving cultural landscapes. But what factors influence cities' decisions to treat them as heritage at all? What other values do cities recognize in addition to heritage? In this paper, I examine three riverfront urban landscapes that span the range of municipal assessment and response to better understand how cities evaluate the heritage value of their late Modernist landscapes: the Isamu Noguchi-designed Hart Plaza in Detroit, Cincinnati's Concourse Fountain designed by Louis Sauer, and Flint, Michigan's Lawrence Halprin-designed Riverbank Park. In so doing, we will see how cities negotiate the competing values of historic or heritage value, life-safety risk and accessibility, and environmental resilience.

Heritage designations, such as listing on the National Register in the United States or being named as a UNESCO World Heritage Site, confers a great deal of value. And yet, such designations also confer obligations that private owners and governments can be hesitant to assume. The landscapes treated here, completed in the mid- to late-1970s, are all within their fourth decade of life and will soon reach the 50-year mark that makes them eligible for listing on the National Register of Historic Places.

In the early 1990s, the National Park Service (NPS) issued a typology of cultural landscapes that outlined the categories of sites that could be listed. They include historic vernacular landscape, historic sites, ethnographic landscapes, and historic designed landscapes.[1] In all but the ethnographic landscape, the NPS emphasises the historicity of the site, and the four treatments that the NPS recommends in order to maintain their National Register eligibility privilege the preservation of historical elements: preservation, rehabilitation, restoration, and reconstruction.[2] While rehabilitation allows for the most contemporary flexibility, the *Guidelines* privilege historical conditions over present-day need.

Modern landscapes in particular have been ill-served in the past by both the National Register's formulations of value and the inherent difficulties of preserving such landscapes. Laurie Olin has pointed out that landscapes are "less stable" than buildings or artworks because of their size, cost and

2. Birnnaum and Capella, *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Treatment of Cultural Landscapes*, 3.

value.[3] As populations grow, he argued, open space attracts dreams of development while the resources needed to maintain them stretch ever-shrinking municipal budgets.

2. DETROIT'S HART PLAZA

Designed by the famed sculptor and landscape designer Isamu Noguchi, Hart Plaza is the centerpiece of Detroit's Civic Center, serving as the primary ceremonial and event space in the symbolic center of the city. Hart Plaza is a large, irregularly shaped hardscaped plaza featuring the Dodge Fountain, a metal torus held aloft by diagonal arms, and a larger sunken round amphitheater with below-grade service facilities. Drawing on his earlier landscape and playground designs, Noguchi included a monumental aluminum pylon, a stepped concrete pyramid facing a second amphitheater, and two smaller abstract concrete sculptural forms.

For years, Hart Plaza was home to the city's ethnic festivals, and it continues to host major music festivals. Although it functions well in that capacity, visitors seeking passive recreation have long complained about its austerity, including its lack of shade, bathrooms or permanent vendors. In 2003, the Detroit Riverfront Conservancy began its work to develop the RiverWalk, a recreational, pedestrian path along five-and-a-half miles along the Detroit River, linking a series of existing and new parks. As their work progressed to include the edge along Hart Plaza, increased visitor traffic drew attention to the non-working fountain, crumbling concrete walls, and broken granite paving.

In 2020, the City of Detroit Parks and Recreation Department hired Detroit-based architecture and urban planning firm Rosetti to study the assets of the city's East Riverfront [ERAS] as a part of its quinquennial update of its Strategic Plan, making recommendations for Hart Plaza improvements.4 The study pointed out that Hart Plaza was in the process of being nominated for the National Register of Historic Places as a cultural landscape on the basis of its original features designed by Isamu Noguchi. As such, its recommendations emphasized preserving those features to retain the integrity of the site.[5]

Community feedback collected as part of the study coalesced around desires to see the Dodge Fountain restored to daily operation, to improve landscape and amenities to encourage everyday use, and to attend to the plaza's backlog of deferred maintenance. Building upon this feedback, Rosetti established a framework of four objectives that guided their final design proposal. Any investment in the site should enhance public accessibility, reinvigorate the plaza with activity, preserve and maintain historical and cultural monuments on the site, and improve event management and operations.

The City of Detroit received an $826.7 million grant from the American Rescue Plan Act [ARPA] and they committed $9 million to Hart Plaza improvements. While the city was not able to address all of the Study's recommendations, in 2023 the city solicited bids for adjustments to the Grand Stair, restoration of the Dodge Fountain, repair of the amphitheater

5. The Mannik & Smith Group, Inc., *East Riverfront Asset Study: Condition Assessment & Seawall Shoreline Investigation*, September 13, 2021. Included in note 2.

seating and stairs, as well as other upgrades to fire prevention, plumbing and security systems.[6] While the fountain repair and plaza improvements generally approached the project as a restoration, the design brief called for more significant changes to the Grand Stairs and adjacent River Terrace green space. The primary goal is to improve handicap accessibility between the RiverWalk and Plaza, and to an Underground Railroad memorial that sits on a landing halfway down the Grand Stairs, and as such is inaccessible to the mobility-impaired.

The decision to modify the Plaza's edge while maintaining the originality of its core is an attempt to balance support for the Plaza's National Register nomination with the goals of the ongoing RiverWalk project. The NPS' *Guidelines for the Treatment of Cultural Landscapes* acknowledges the need to modify landscapes for accessibility code compliance."[7] More importantly, increasing access to the monument and strengthening the connection between plaza and river develops the "social value" of the plaza. Posing an alternative to the limited notions of value proffered by the National Register, the Getty Conservation Institute outlined a broader typology of heritage values that included both socio-cultural and economic values.[8] "The social values of heritage enable and facilitate social connections," and "might include the use of a site for social gatherings (…)—activities that do not necessarily capitalize directly on the historical values of the site but, rather, on the public-space, shared-space qualities."[9] Creating barrier-free access to the RiverWalk strengthens Hart Plaza's already strong social value. However, the City's commitment to the social value of the Plaza is circumscribed by the economic and prestige value of the National Register listing, leading Parks and Recreation officials to avoid changes (such as the addition of trees or benches) that would respond to present-day community preferences but degrade the integrity of the site.

3. FLINT'S RIVERBANK PARK

The Flint Riverbank Park, located in Flint, Michigan, was designed in 1975-6 and completed in 1979 by Lawrence Halprin Associates. The project was first conceived in the late 1960s when the Army Corps of Engineers [ACE] was called in to help address the regular flooding of the Flint River. After the ACE proposed channelizing the river, the city and citizen groups demanded a riverside park they hoped could reverse the fortunes of Flint's declining downtown.[10]

Riverbank Park utilized a raw concrete Brutalist idiom to create a variety of passive recreation and event spaces. The park was constructed on both sides of the Flint River along the edge of Flint's central business district. The designers activated the southern two blocks with program: market stalls, concession stands, and an amphitheater. A shallow canal cut through the site and could be traversed by a series of elevated walkways. At the eastern end of the northern block, an Archimedes screw drew water up from the river to flow down a long flume. This water fed the Water Wall block, which featured an artificial waterfall set behind a path of concrete block steppingstones that

allowed visitors to traverse the riverfront. The spectacular north-westernmost Grand Fountain block featured a massive fountain designed as a series of rooms carved into the riverbank.

As the Park underwent construction, the city of Flint experienced urban crises typical of the era. The city experienced decline when retail business was siphoned off by the Genesee Valley Mall, and with the impending closure of its major automotive factories. Upon its opening, Riverbank Park was programmed with summer festivals and musical performances. In more recent years, it has continued to play host to the annual Flint Jazz Festival and Flint Pride celebrations. Despite this, the Grand Fountain has run dry since 1992, and the parks have accrued years of deferred maintenance.

While the city has already made some changes to the park, larger changes are planned for both the park and its interface with the Flint River. A 2009 study of Riverbank Park proposed a comprehensive set of improvements to the park in to make it more usable, accessible, and safe.[11] In 2010, the Flint Riverfront Restoration Plan added environmental concerns to the existing urbanistic goals of recreation, urban connectivity, and economic development.[12] The Plan promoted the "naturalization" of the river, dissolving its hard edges into something more permeable, naturalistic, and hospitable to aquatic and riverine life. The centerpiece of the plan involves the replacement of two existing dams them with a series of navigable rock rapids drop structures, which will intersect with the edges of Riverbank Park, replacing its seawall with large boulders and plantings.

The changes to Riverbank Park that flow from those improvements suggest that the integrity of the park as an historic designed landscape is less important culturally than its larger environmental context. In *The Value of Life* (1996), Stephen Kellert established a typology of relationships that humans maintain with the natural world.[13] Riverbank Park, and the channelization of the Flint River that preceded it, reflect utilitarian and dominionistic values: the river was approached as a problem to be solved, a resource to be exploited and controlled. Halprin's design extends this impulse by imposing a totalizing hardscape along the river's edge. The forthcoming changes to the river, by contrast, suggest naturalistic, aesthetic, and humanistic values. The design encourages haptic experience, it returns the beauty of nature to the site, and it seeks to reestablish connection to the community.

4. CINCINNATI'S CONCOURSE FOUNTAIN

Cincinnati built the Concourse Fountain as a gateway to Yeatman's Cove, the first park of many built along the Ohio river that, together with the Riverfront Stadium (1970) and the Riverfront Coliseum (1975), transformed a flood-prone industrial landscape into a recreation and entertainment destination. It was designed by Philadelphia architect Louis Sauer to be a theatrical space, consisting of a large, 13" deep rectangular pool flanked by two wedge-shaped stepped forms—one dry, and the other slicked by a cascade of water. Visitors could take in the whole basin-like space and watch the throngs of children frolicking in the water by standing atop either set of steps, or on

the terrace separating the fountain from a residential tower. The fountain's most spectacular feature were the water jets mounted to a 30' tall concrete pier that shot streams of water down into the fountain below.

The new Simpkinson Bridge over the freeway transformed the Concourse Fountain into the primary gateway by which Cincinnatians accessed Yeatman's Cove. The park quickly became a popular recreation area, in the summer months it hosted events that could draw upwards of 300,000 people.[14] The fountain served as a cool respite from the shadeless park. It was so popular with residents during its first decade that in 1985 the *Cincinnati Enquirer* declared the fountain the most exciting place in the city.[15]

After an incident in which a man fell between the pool wall and a concrete pylon, the fountain underwent an unsympathetic renovation in 2007 that was motivated by a new consciousness of risk.[16] Many aspects of the fountain did not meet life safety codes, and new city regulations reclassified the fountain as a pool, requiring lifeguards. To avoid such costs, the Parks Department transformed ten existing city pools, including the Concourse Fountain, into "spraygrounds"—depthless, danger-free, environments of water jets and sprinklers.[17]

Moreover, the wet steps' fiberglass surface had deteriorated into sharp fissures, and new life-safety codes required a railing along any vertical drop

greater than two feet. The city installed copious black commercial fencing along the wet steps and the front edge of the pool, degrading the vista once framed only by concrete and water. The fountain's use has dwindled as the city opened new park spaces closer to the riverfront stadia and new commercial developments. In particular, the 45-acre Smale Park designed by Sasaki features no less than three spraygrounds, a playground, gardens, and a carousel.

The Concourse Fountain was not the only site of its kind to be modified in response to safety concerns. The water level in the Philip Johnson-designed Forth Worth Water Gardens (1974) was lowered a few years after four people drowned in one of its pools. Cleveland's Chester Commons (1972) was designed with depressions and vertical elements that blocked the view in from the street, making policing difficult. After a shooting took place there in 2009, the park was demolished and its topography flattened. In all three examples, the respective municipalities adjusted or removed the landscape to mitigate the risk of injury or death to visitors, and the legal and financial liability of such possibilities. In his essay "Risk Design," Johnathan Massey outlined the ways in which "risk management" shaped the design of 30 St Mary Axe (2004) in London. There, Foster and Partners mitigated the risk (or its appearance) of climate change, terrorism, and financial globalization through a series of design decisions.[18] We can similarly understand the changes to the Concourse Fountain as a form of risk management. The city came to take on a greater consciousness of risk as its building codes and municipal regulations reflected the city's duty to prevent harm in public spaces. Heritage sites or cultural landscapes often produce no net income for its owners, but in this case the aesthetic and social value of the site declined in the face of the risk of liability, sliding its economic value into the negative.

5. CONCLUSION

As late modern urban landscapes approach their fiftieth birthday and become eligible for the National Register, they also begin to show signs of aging, functional obsolescence, and a decline in use due to changing populations or cultural preferences. Cities are confronted with a dilemma in which they may be able to restore the site and maintain integrity, or alter it in a way that aligns with contemporary needs and goals. In this paper, I surveyed three such cases to elucidate how factors like accessibility, ecological concerns, and the desire to mitigate risk and comply can amplify or detract from the city's heritage valuation of their cultural landscapes. ■

THE SOCIAL CONSTRUCTION OF POST-INDUSTRIAL HERITAGE VALUES IN POBLENOU: NEW URBAN LANDSCAPE VISIONS

MELINA GUIRNALDOS DÍAZ
WELSH SCHOOL OF ARCHITECTURE, CARDIFF UNIVERSITY

#16

ABSTRACT.

Since deindustrialization began in the second half of the 20th century in Western countries, communities and labour organizations have been actively using post-industrial heritage to reflect on the past, reconsider the present, and construct alternative scenarios for the future. Over the last twenty years, alternative social approaches to this form of heritage have questioned its assessments by experts and public institutions and challenged post-industrial areas' urban transformation planning—usually defined by 'institutionalised' private agencies. These alternative visions have facilitated investigations into heritage-valuing processes and their spatial impact on the built environment at a more empirical level. Drawing on dialogical approaches to heritage and by focusing on how post-industrial heritage values are socially constructed nowadays, this paper reflects on the urban implications and principles within design strategies dealing with this built legacy.

This investigation explores two intertwined cases, Taula Eix Pere IV and Can Picò in Poblenou, the most industrialized area of Spain in the 19th and 20th centuries. This area in the northeast of Barcelona constitutes a paradigmatic example of social claims for the preservation of its industrial past and innovative place-based community regeneration strategies since the 1970s when its transformation towards the tertiary sector economic model began. The two spatial practices analysed share a common principle: the use value of industrial spaces for solving social needs and halting the neoliberal path that the area's urban development took since the 1990s.

The conclusions will raise issues related to the urban impact resulting from the social alliances around post-industrial heritage and the associated values, which have started to envision alternative futures for Poblenou. Finally, the paper argues for the need to understand post-industrial heritage preservation as the result of mutable interventions at a small scale that consider a medium- and large-scale development vision in their conception rather than searching for timeless solution.

1. INTRODUCTION

Over the past two decades, the concept of 'value' has played a central role in assessing heritage and guiding conservation practices in Western countries. In the context of heritage preservation, 'value' refers to the positive or negative characteristics, meanings, and qualities that individuals or groups assign to objects or sites.[1] This value-based approach is crucial in decision-making regarding cultural heritage resources, as it involves identifying, assessing, and prioritizing the diverse types of values associated with these assets. It goes beyond merely considering the physical attributes and recognises that heritage objects or sites hold various forms of significance, such as historical, cultural, social, aesthetic, and economic values. Poulios,[2] Walter[3] and Fouseki et al.[4] advocate moving away from the traditional value-based framework that simplifies heritage significance into specific categories. They propose methodologies more adapted to the daily lives of communities, reflecting their identities, beliefs, and social practices. Fredheim and Kalhaf[5] argue that identifying something as heritage inherently involves appreciating existing values, which leads to recognizing that 'thing' as worthy of preservation. Regardless of its origin, nature, or political context, the concept of value is intrinsically linked to the valorization of heritage.

The relationship between values and heritage is intricate due to their political significance, as they influence practices that have an impact on the built environment and, consequently, social life. It is widely accepted that all values are intangible and that heritage, rather than a product, is a process of social construction, the role of materiality in this process remains ambiguous, opening a gap between heritage theory and practice.

Harrison's dialogical approach to heritage[6] is a significant contribution to the ongoing debates on redefining heritage practices to better address the changing needs of heritage and society. Drawing from Actor-Network and Assemblage theories, as well as various social scientific methodologies that recognise the social and worldly elements as part of continually evolving networks of relationships, Harrison advocates for a 'dialogical' perspective on heritage. According to this approach, heritage is understood to arise from the relationship between a range of human and non-human actors and their environments.[7] This perspective emphasizes the dynamic and interconnected nature of heritage, highlighting the importance of various interactions in its formation and evolution. Furthermore, Harrison highlights that neglecting any participants, including the material dimension, diminishes the perceived value of heritage. Hence, valuing heritage goes beyond attributing worth to objects; rather, values emerge intrinsically from these interactions.

Lefebvre argues that analysing the landscapes of industrial decay brings attention to the idea that spatial dimensions are socially constructed, and the social sphere is inherently spatial.[8] Industrial landscapes demonstrate a dialogue between the physical elements—the industrial landscape itself—and the social and human interactions with that landscape, including its uses and the emotional responses it evokes. Moreover, since the beginning of deindustrialization, communities and labor organisations have increasingly

used post-industrial heritage to reflect on the past, reassess the present, and envision alternative futures. These landscapes embody the memories, stories, and socio-economic fabric of the communities that once occupied them, offering insights into the aspirations and struggles of those times. However, these sites are not merely static historical markers; they are dynamic entities characterised by cycles of use and obsolescence. They reflect ongoing changes and adapt to new realities, as seen in Poblenou (Barcelona) during the global crisis of 2006 and the subsequent burst of the real estate bubble in Spain in 2008. This context opened new avenues for alternative understandings of heritage and for research into the origins and evolution of its values, as discussed in the subsequent sections of this paper.

2. POBLENOU

In the second half of the19th century, the city of Barcelona initiated a transformative period marked by the implementation of the iconic Ildefons Cerdà's Eixample urban planning project. This process involved breaking with the historical dominance of military-led urban planning by a profound trust in the growing industrial model. The new Barcelona's formal evolution aimed at establishing itself as a prominent center in both the Spanish and European contexts. Since then, Barcelona's historical trajectory has been closely intertwined with fluctuations in industrial activity, experiencing both periods of growth and decline. This includes the process of deindustrialization that commenced in the late 1970s with the advent of the nation's democratic era. These transformations were particularly noticeable in the new expansion areas of the city that emerged when the industries initially located in the city centre started requiring more space. One of these new areas was Poblenou, the most industrialized district in Spain during the 19th and 20th centuries, situated in the north of Barcelona.

The original rural character of Poblenou, which can still be observed in certain aspects of its urban fabric, began to undergo transformation during the First Industrial Revolution (1846-1861). Initially, the area was home to steam-powered textile and chemical industries, which were later replaced by the metal industry with the introduction of electric power.[9] By the mid-1970s, the service sector in Barcelona experienced a significant growth and a substantial portion of industrial production shifted to the outskirts of the city, leading to many factories in Poblenou became vacant or repurposed as parking lots and storage warehouses.

Poblenou's economic decline experienced a slight reversal in the 1990s when 32% of the investment for the Olympic Games was directed to the area. However, this process and the subsequent urban transformation involved significant destruction of the post-industrial buildings and infrastructure to make way for new constructions, triggering a process of land revaluation that attracted private real estate investment. But this extensive demolition also marked a turning point, sparking local demands and spatial practices against aggressive urban politics, including those derived from the most recent urban planning, the '22@', which has been in

9. Taffunel Nadal, *Sant Martí de Provençals Pulmo Industrial de Barcelona(1847-1992)*, Barcelona: Columna, (1992), 24.

force since 2000, and resulted in a social revaluation of the significance of this form of heritage in the area.

Today, the urban reality of Poblenou and its post-industrial heritage is complex. In addition to successful conservation practices, there are also generic designs, neglected or abandoned spaces, and scattered industrial remnants all of which obscure the contentious politics surrounding housing and tertiary sector services. This poses a significant threat to the preservation of the area's industrial urban legacy. In light of this, and within the global post-crisis economy of 2006, local associations and social platforms have advocated for the protection of their industrial heritage, opposing the urban densification proposed by authorities and private developers, particularly prior to the burst of the real estate bubble in 2008.

During a personal interview conducted by the author of this paper, Salva Claròs, the former president of the neighborhood association of Poblenou stated, *"The industrial heritage and social capital were the primary resources for reshaping our reality."* Consequently, local groups began their efforts to shape their reality by focusing on Eix Pere IV, the main industrial axis of Barcelona during the industrial era, which was undergoing a regeneration process marked by generic proposals under the 22@ urban planning initiative.

3. THE CONSTRUCTION OF HERITAGE VALUES IN THE EIX PERE IV AND ITS URBAN IMPACT

Bandarin proposes that contemporary heritage conservation is founded on two fundamental principles. Firstly, to ensure that heritage is acknowledged and appreciated, it must be at the core of community life. Secondly, active community participation is crucial for effective preservation.[10] Expanding on Harrison's dialogical approach to heritage construction, this section explores two distinct yet interconnected socio-spatial practices that highlight the collaborative efforts of the community to reassess the significance of post-industrial heritage in Poblenou: Taula Eix Pere IV and Can Picò. While the former focuses on the revitalization of Eix Pere IV, the latter, an old factory dating back to the early 20th century located along this axis, raises questions about intangible elements associated with post-industrial structures, such as the workforce, to shape the ongoing urban transformation of Poblenou.

3.1 TAULA EIX PERE IV

Recognising the absence of a comprehensive strategy for the conservation of Eix Pere IV within the 22@ Plan, the neighborhood Association of Poblenou created the Taula Eix Pere IV social platform in May 2014. This collaborative effort brought together local associations, cooperatives, and scholars with expertise in heritage conservation and urban regenerationl. The Taula, which means 'roundtable' in Catalan, focused on devising strategies for the recovery of post-industrial heritage that would address social, cultural, and economic dimensions, aiming to safeguard and revitalise the axis.

The interventions conceived by the Taula were organized around three core principles. The first principle emphasized the social potential of heritage,

10. Francesco Bandarin, and Ana Pereira Roders. *Reshaping Urban Conservation : The Historic Urban Landscape Approach in Action*. 1st ed. Singapore: Springer Singapore : Imprint: Springer, 2019. https://doi.org/10.1007/978-981-10-8887-2

particularly along the Eix Pere IV, exploring its connection to the area's historical evolution before its segmentation into two different areas in 2005 due to new urban policies, and its significance to the diverse contemporary population of Poblenou. The second principle focused on addressing local needs, while the third advocated for adopting a circular economy model.

United by a commitment to the social aspects of urban and architectural design, these principles foreground values such as cooperation, innovation, communication, solidarity, and care. These values underpin the Taula's vision for fostering a novel approach to urban development, aiming to construct a cityscape that is both socially vibrant and sustainably designed. Since the creation of the Taula, different activities have been undertaken within former factories and related infrastructures.

To date, the Taula, oversees different spaces located in the Eix provided by the city council. The first of them, Passatge Trullàs, is in the eastern part of the axis. Originally a pre-industrial rural path, it has been transformed into a public space for temporary activities related to tactical urbanism and citizen participation. In the same node, the Taula, in collaboration with the artists association P9Artiu i Fundiciò del Poblenou, manages a space in the Canela i Puig del lívol factory. This space, known locally as 'Can Tiana', has been a site for textile machinery production since the late 19th century. This space was identified for its connection to the artistic heritage of the neighbourhood and its potential for fostering collaboration between local residents and artists[11].

The second node is Can Ricart, a 19th-century textile industry that serves as the physical centerpiece of the axis. Furthermore, it symbolizes the social movement advocating for the preservation of Poblenou's industrial legacy. Its planned demolition by the 22@ urban planning sparked significant social claims and efforts to preserve the industrial heritage of the area. Since 2015, the Taula, has managed a space in Can Ricart provided by the city council, as well as a second renovated space dedicated to the youth of the area, managed by La Xemeneia, a local youth association. These two spaces, have hosted diverse activities aimed at raising awareness about the industrial heritage of the area, particularly focusing on Pere IV.

Lastly, the Taula has been managing a third node since 2017, which is located in the western part of the axis. This node serves as an intergenerational hub for neighbourhood activities, including workshops and cultural events. Its aim is to support new projects related to the social and solidarity economy. The current space, known as Casal de Ca l'lsidret, is built on the site of a 19th-century industrial complex called Ca l'Isidret. Although the original complex was demolished in the 1960s and replaced with a new building, the name was kept to honour the collective memory of the place's history. This preservation of history is also evident in Can Picó, as well as in the other places managed by the Taula, which are redefining the landscape of Poblenou.

3.2 CAN PICÒ

Can Picò is an industrial building situated at the western end of the Eix Pere IV. Constructed in 1907 in the neoclassical style, the building has served

11. Maribel Rossello, Taula "Eix Pere IV: revitalizar desde la cohesión social y la economía solidaria el patrimonio industrial de Poblenou de Barcelona". in *Jornadas Internacionales de Patrimonio Industrial*. "Resiliencia, innovación y sostenibilidad en el patrimonio industrial" , 125-146, CICEES, 201.

various industrial purposes over the years until it was ultimately abandoned in the 1990s. Although the Barcelona council acquired ownership of Can Picó in 2007, its deterioration continued until 2015 when it was handed over to the cooperative Biciclot, a founding member of the Taula Eix Pere IV.

The conservation project was funded by the city council, which provided 40% of the total cost. Biciclot contributed an additional 37%, with the remaining 23% covered by a cooperative financial service[12]. The design strategies were guided by the building's original spatial flexibility and its historical requirements for vertical physical and visual connections due to industrial activities. The project also considered the building's public significance by integrating it into the Eix Pere IV through the transformation of the warehouse entrance into an open space known as 'Bikes Square', which has now become a bustling meeting point within the Eix.

However, the regeneration strategy of Can Picò not only involved repurposing an obsolete industrial infrastructure to accommodate new activities but also encompassed the general reuse of materials to advance circular economy principles and promote cultural sustainability. While this program had a forward-looking vision for the development of the building and the area, it also recalled one of Poblenou's industrial periods, particularly in the 1980s when numerous workshops and warehouses, including Can Picò, were primarily engaged in scrap metal recycling

In 2016, Biciclot experienced growth and launched the 'BiciHub' project, a think-tank consisting of 23 cooperatives and social entities, including the Poblenou neighbourhood association and the Taula Eix Pere IV. The main objective of this initiative was to explore new projects and proposals that would contribute to sustainable mobility, foster the cooperative movement, and address the social needs of Poblenou.

Within this project, Can Picò became a fundamental asset, providing significant value to the initiative. Firstly, the building represented an important period in the history of Poblenou and Barcelona, and therefore, its preservation would enhance the visibility of BiciHub. Secondly, BiciHub's core values of inclusivity, equality, the common good, knowledge, co-responsibility, and self-management aligned with the cooperative principles linked to the industrial legacy of Poblenou and sites such as Can Picò, thus promoting social cohesion and the urban identity of the neighbourhood.

The impact of BiciHub on the urban landscape of Poblenou is evident. One notable accomplishment is the establishment of an alternative transport network known as 'Bici Sense Edat,' which is specifically designed for local residents with special needs and older generations. This network, operated by 48 volunteers on tricycles, promotes intergenerational interactions and contributes to the revitalization and appreciation of past spatial experiences. These experiences include meeting points and local shopping areas, which have been mapped out by elderly residents, many of whom were former workers in Poblenou industries.

In 2018, the Taula Eix Pere IV released the inaugural edition of "The Social Map," offering a comprehensive overview of the cooperatives and

12. According to the semi-structured interview with Xavi Pratt conducted by the author in 2018.

associations in Poblenou. The publication unveiled that out of the 82 groups, 46 were situated in repurposed industrial buildings and other spaces closely linked to the neighborhood's industrial legacy. Within a year, this figure rose to 66, underscoring the substantial territorial influence of the emerging values associated with post-industrial heritage via these alternative social and economic networks.

#16

4. CONCLUSIONS

This paper has explored how the global crisis of 2006 presented new opportunities for neighborhood associations and local groups in Poblenou to re-assess the value of their post-industrial built legacy. These opportunities enabled them to advocate for its preservation against aggressive urban development policies, such as those initiated by the 22@ Plan, and to assert their rights to shape and manage these former industrial sites. The analysis has delved into the operations of Taula Eix Pere IV and Can Picò, which function at different scales within the area for the regeneration and reuse of post-industrial heritage. It has also revealed how the new values associated with Eix Pere IV and Can Picò emerge from interactions between a range of human and non-human actors and their environments, encompassing diverse stakeholders and the political, economic, and social contexts, as well as the material manifestations aligned with Harrison's dialogical approach to heritage construction. Moreover, the study illustrates how this model, initially based on small-scale interventions, has evolved into broader urban systems, extending to other post-industrial spaces in the area through the formation of new alliances with additional networks. This expansion illustrates a vision for a more inclusive urban development in Poblenou, which not only preserves but also continues to build upon its industrial legacy. ■

RADICAL ROOF GARDENS: DREAM SPACES OF SOCIAL COHESION AND PRIVATE RETREAT

NATHANIEL ROBERT WALKER
THE CATHOLIC UNIVERSITY OF AMERICA

JOSEPH M. WATSON
BELMONT UNIVERSITY

#17

ABSTRACT

This session examines modern roof gardens as sites of social cohesion, private retreat, experimentation, and aspiration. As ostensibly "natural" spaces that are lifted into the sky by human endeavor, they are fertile grounds for cultural, social, technological, or other meaning. Instead of proposing a single definition of what a modern roof garden is, we explore a range of possibilities embodied within these elevated landscapes. While we take the inclusion of roof gardens as one of Le Corbusier's "five points" as a starting point for our explorations, we do not confine our interests of the twentieth-century European avant-garde; neither do we limit our inquiry to any particular region, though we do aim to build on the work of scholars such as Luis E. Carranza and Fernando Luiz Lara, in *Modern Architecture in Latin America*, and Valerie Fraser, in "Cannibalizing Le Corbusier," who have discussed roof gardens in Latin American contexts. By taking a broader approach that carries us across several continents, socioeconomic and geopolitical contexts, and the better part of the nineteenth and twentieth centuries, we aim to address the following questions: what promises did rooftop terraces make as spaces of radical potential? Which have they kept or broken? How did roof gardens carry forward older dreams and aspirations—including, potentially, indigenous traditions—into the modernist period? What new meanings and objectives did they acquire? What might have been lost? How did they strengthen and/or problematize modernism's historically complex relationships with energy and ecology? How did the radical potential of roof gardens help to resist, reinforce, or propose alternatives to pre-existing social, economic, and racial divisions?

1. INTRODUCTION

Of Le Corbusier's "Five Points of a New Architecture," perhaps the most suggestive of utopian possibility was the roof garden terrace. Initially, he presented their possibilities in largely practical terms. A layer of plants and soil over a building's flat roof would help insulate it from climatic fluctuations. Moreover, these layers would limit runoff during a downpour. Because of the "highly luxurious vegetation" this substrate would support, however, "the roof garden will become the favourite part of the house."[1] This pivot from an entirely pragmatic rationale for roof gardens to their potential to revolutionize domestic life did not end with individual buildings; the implications would be urban, or even regional in scale: "In general, the roof garden means that a city can win back for itself the whole built-up area." Indeed, Le Corbusier argued that, together with the ground plane that was left open by pilotis, roof gardens would actually increase the amount of inhabitable earth available before building to 111 percent, although this required his readers to ignore the vast highways and airstrips that he laced through his city—an omission Jan Woudstra described as a "deception."[2] In any case, Le Corbusier found ample opportunities to put this theoretical "point" into practice. The solarium atop the 1928–31 Villa Savoye outside Paris is perhaps the most famous, but the way that the Casa Curutchet in La Plata, Argentina, weaves outdoor spaces around an existing tree growing through the house while also offering expansive vistas of a nearby park is at least as committed to the ethos of the elevated garden. That the largest communal space of the Unité d'Habitation in Marseilles is on its roof speaks to the social and urban potential Le Corbusier attached to roof gardens. Across these varied scales and contexts, roof gardens asserted modernism's technological exuberance and commitment to new perspectives and liberating reforms, while also, as Woudstra argued, testifying to the impulse to exert architectural control over entire landscapes and even distant vistas.

2. NOTHING NEW UNDER THE SUN

It is somewhat ironic then, that, roof gardens were also the least novel of Le Corbusier's "five points." They are expressive of a perennial longing to reconcile the city with the garden that is evident in the utopian visions of Plato and the biblical prophecies of the New Jerusalem, among other places. As an architectural typology, roof gardens have a deep antiquity stretching back to the Hanging Gardens of Babylon, enduringly famous spaces of imperial power and sensuality that were well-known in Le Corbusier's day. These had been imagined and depicted in drawings, paintings, and engravings with increasing frequency since the Renaissance, and in the 1800s, as travel accounts of the Middle East were published in Europe, thoughtful speculation on the original architectural composition of the Hanging Gardens gave them a new tangibility **(Fig. 1)**.[3]

A very different example is offered by the Gardens of Adonis. At the height of summer, the women of ancient Athens would set small baskets and pots of quick-growing herbs and grains on the flat rooftops of their

houses. In a "botanical re-enactment" of the untimely death of the youthful Adonis, the plants would sprout and immediately wither and die under the blistering Mediterranean sun. These short-lived roof gardens would then become sites of ritualized grieving and excessive drinking before the dead plants, along with an effigy of the god, were carried through the streets and cast into the sea. If the Hanging Gardens of Babylon suggest an approach to roof gardens as monumental, permanent, and legitimized through their associations with power, the Gardens of Adonis were small, ephemeral, and nonconformist. They served as a "more playful or even subversive" analog to the Thesmophoria, the official agricultural festival held in autumn, inspiring contemporary scholars to rethink the origins of farming and histories of sexuality and gender, among other things.[4] The Gardens of Adonis and their associated rituals were also described and depicted in the 1800s, as in the 1888 painting by John Reinhard Weguelin, cueing Victorians to imagine a *polis* transformed by collective elevated gardening, however briefly.

Roof gardens entered early modern architecture in several forms, both real and utopian. Pope Pius II built a small roof garden over his stables in Pienza in the 1400s. When Filarete imagined a roof garden on a palace near his imaginary city of Sforzinda in the first modern treatise on architecture **(Fig. 2)**, he described it as a "garden built in a new manner....high and all on columns."[5] By the late 1700s, roof gardens were firmly established as a utopian staple; Louis-Sébastien Mercier's influential science-fiction novel of 1771, *L'An 2440*, described them as covering a reformed modern Paris.[6] This joyful prophecy seemed more imminent when, little more than a decade later, the Parisian Jean d'Etienne announced that he had developed a new waterproof cement and used it to build a garden atop his house on the fringe of Paris.[7] His architect was Jacques-Guillaume Legrand, who would help design the glass dome over the Parisian grain market, and thus established d'Etienne's new roof garden as one node among others in the emerging modern city.

Modernist calls for a coherent, socially conscious, liberating architecture were partially prefigured in 1871 by the British writer Charles Reade when he launched a tirade against the "million blunders" of Victorian architecture.[8] Among his many targets was the "conical roof" of traditional houses, which he insisted "robs the family of a whole floor, and gives it to cats and sparrows," stealing from the urban worker "his country view." A "rational roof," Reade insisted, would be flat and serve as a family gathering space, and be especially useful as a "playground in a purer air for children that cannot get to the parks." His call was echoed in newspapers and books around the world, including by the women leading the urban Reform Movement in the United States, such as Lucia True Ames Mead, who called for rooftop playgrounds on model tenements in New York in her 1889 book *Memoirs of a Millionaire*.[9] Her work presaged the Unité de Habitation by decades. Hundreds of roof gardens were actually built in these years, atop libraries, apartment buildings, hotels, theaters, hospitals, sanitariums, prisons, factories, department stores, private homes, social clubs, and other

structures, especially in great urban centers such as New York, Tokyo, Mexico City, and Berlin.

Le Corbusier's famous Dom-ino scheme of 1914-15, which treats the roof terrace as an inevitable consequence of rational construction, has been described by scholars as both the origin of his "five points" and as the culmination of his study of classical Mediterranean and modern European architectures.[10] With the ancient and modern roof garden precedents cited above in mind, it might be fair to describe his elevated terraces as the Hanging Gardens of Babylon planted upon a model working-class flat. None of this was new, but it was perhaps still radical, particularly when amplified to the scale he imagined.

At no point was Le Corbusier the only visionary tending these elevated gardens. Already in 1922, artist Hugh Ferriss imagined "hanging gardens" as integral to life of the near future in Manhattan's "upper strata."[11] Throughout the 1920s, Harvey Wiley Corbett, who would help design Rockefeller Center in New York, proposed remaking the city with multilevel streets, often including upper terrace gardens.[12] Le Corbusier was no doubt influenced by these visions. Another influence was an early 1920s project for a ring of apartment towers connected by elevated gardens on the outskirts of Paris by Auguste Perret. This was published in 1922 with a visualization by architect Jacques Lambert.[13] Because Perret's and Le Corbusier's urban visions were informed by an earlier era of urban development in the U.S., the circulation of these ideas might be best understood as a kind of critical feedback loop, in which imported ideas were tested, transformed, and repurposed to suit local needs and desires. Perhaps the most intriguing example of this is Roberto Burle Marx's garden atop the *Ministerio da Educação e da Saúde* (Ministry of Education and Health) in Rio de Janeiro, built from 1936-42. His sinuous forms and native plantings drew selectively from modern European influences even as they also incorporated local perspectives and practices, a form of "cannibalizing" the European avant garde, as Valerie Fraser as put it in her study.[14] Whatever the local cultural milieux within which such gardens blossomed, however, their international reputation is attested to by the English-language name—"Roof Garden"—of a magnificent cabaret and restaurant that crowned the Cerro San Cristóbal in Santiago de Chile in the 1930s, designed by leading Chilean architect Luciano Kulczewski García.

One ambitious example was the network of gardens planned for the upper levels of Rockefeller Center in Midtown Manhattan in the 1930s. The most spectacular version of these plans, published in *Architectural Forum*, featured rooftops envisioned as a sprawling botanical garden suspended 140 feet above street level **(Fig. 3)**. These rooftops would have housed a sculpture gallery, amphitheater, restaurant, marionette theater, and conservatory, woven together by fountains, pools, flower beds, hedgerows, and small trees, and connected by pedestrian bridges spanning the streets. This would have been at once a "semi-philanthropic" public amenity, an additional source of revenue, and an opportunity to beautify the views from upper-level offices. In the end, regulatory restrictions and

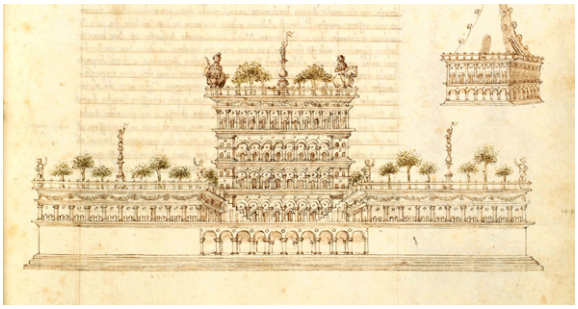
budgetary concerns caused these plans to be scaled back, resulting in the more modest and largely inaccessible formal gardens atop the Center's buildings.[15] New York, for all of its roof gardens, never achieved the vision that Le Corbusier articulated as a whole city lifting verdure into the sky. When the seasons changed and roof gardens entered the second half of the twentieth century, they did so alongside the other four points of modern architecture, even as they became the least common of them.

3. THE VIEW FROM ABOVE



The history of roof gardens, ancient and modern, offers a wide range of examples that support an equally wide range of social, cultural, and economic visions. With the other papers in this session in mind, it is perhaps worthwhile to offer some clarification on what we mean by the term "roof garden" and how it might differ from other spatial types. As opposed to roof terraces or green roofs, we understand roof gardens to be planted surfaces on generally flat rooftops which people are expected to inhabit. The plantings of roof gardens vary widely, from lush, immersive groves of trees to sparse ensembles of pots harboring succulents. Green roofs, on the other hand, may be planted but are not truly occupiable.

Roof gardens hold unique potential that is not always found in more conventional domestic, ground-level gardens, parks, plazas, and other civic landscapes. Beyond the unique structural considerations that differentiate ground-level versus rooftop gardens, the physical distance separating ground and roof has encouraged greater experimentation, whether in terms of social and cultural configurations or spatial and visual forms. There is, on a rooftop, a sense of miraculous seclusion, akin to a *hortus conclusus,* with vistas of privilege and pleasure. Roof gardens are distinct from other roofscapes, and they are also different from other gardens. Their utopian qualities arise from this unique combination of spatial, structural, and sociocultural conditions.

The papers in this session share some of Le Corbusier's combination of technical and social concerns, but they ultimately seek to answer a broader range of questions. Among them: how do roof gardens combine local ecology and landscape with the global aspirations and culture of modernism? How do they maintain ancient longings and fears while also asserting the revolutionary spirit of the new? How necessary is their redemptive, Edenic language to the potentially apocalyptic spirit of the modern *carte blanch*? Do they crown the ideal city, or are they the first stop on the path to suburban exodus? Do they represent a seed for sustainability that may sprout, at this late stage, from the cracks in the concrete of the modern movement? How did the radical potential of roof gardens help to resist, reinforce, or propose alternatives to pre-existing social divisions? Have they ever, even for one moment, brought us closer to paradise or utopia, or will the dreams they represent whither, like the Gardens of Adonis, under an increasingly merciless sun? ■

BIOGRAPHIES

Nathaniel Robert Walker is an Associate Professor of Architecture at the Catholic University of America in Washington, D.C. He received his Ph.D. in Architectural History from Brown University in 2014, and specializes in the history of urban form, public buildings and spaces, and the cross-pollinations of architecture, literature, movies, and other media. His studies and teaching often focus on the ways that people have used architecture to imagine and shape their dreams of a more beautiful, fairer, and healthier world. His publications include the award-winning book *Victorian Visions of Suburban Utopia: Abandoning Babylon* (Oxford University Press: 2020).

Joseph M. Watson is an Assistant Professor of Architecture at Belmont University. His scholarship examines the social and environmental dimensions of architecture in the twentieth-century United States. Joseph's current book project, "Usonia South: Frank Lloyd Wright below the Mason-Dixon," critically examines the work of Frank Lloyd Wright in the Southern U.S. Research for this ongoing work has been supported by a National Endowment for the Humanities Summer Stipend. Joseph's publications include articles in the Avery Review, Journal of Architectural Education, and Journal of Urban History. He received his Ph.D. in Architectural History from the University of Pennsylvania in 2018.

CAIPIRAS' ROOF GARDENS IN RIO DE JANEIRO

SILVANA NICOLLI
PONTIFÍCIA UNIVERSIDADE CATÓLICA DO RIO DE JANEIRO

ABSTRACT

The first Corbusian-influenced apartment blocks in Rio de Janeiro were usually not occupied by Roof Gardens for communal use. The *Barão de Gravatá* building belongs to the group of these first modern residential blocks developed in the early 1950s. It was designed by the architect Sergio Bernardes and foresaw the realization of the "Five Points", where part of the rooftop terrace served as a communal space and part was an apartment owned then by the Brazilian writer Rubem Braga. Braga informally took over the entire space of the terrace for himself. There he cultivated specimens of fauna and flora from different parts of Brazil. The alterations to architects' projects configured a process of appropriation and adaptation to the environment and to the society of Rio de Janeiro. It is proposed that Braga's rude and stern behavior is a legacy of the *caipira* culture. Such cultural heritage guides the taste of urban inhabitants to crave aspects of Brazilian rural life.

Caipira is a term of *Tupi* origin that describes a type of social and cultural character associated with rural life in the Brazilian Southeast, as described by sociologist Antonio Candido. The *caipira* culture developed from the fusion of elements of colonial Portuguese and indigenous culture. We conclude that the phenomenon of the *Caipiras*' Roof Gardens is mainly not about reflecting "cannibalization of modern" in a political sense to assert identity and seek foreign recognition. It represents the desire to experience the informality and itinerancy of spaces and relationships associated with the search for acclimatization to the tropical environment. Braga's roof garden shares the contradictory aspects of modern architecture as implemented by Brazilian developmentalist politics and expresses the wish to reconnect with a rural past.

1. INTRODUCTION

The *Barão de Gravatá* building by Sergio Bernardes belongs to the group of first Corbusian-influenced residential blocks developed in the early 1950s in Rio de Janeiro that foresaw the realization of the "*Five Points*". The writer Rubem Braga, who bought the penthouse apartment, informally took over the communal space of the terrace-garden for himself and threatened to receive his neighbors there armed. He transformed the modernist terrace into a fertile soil with an area shaded by treetops and a balcony, where he received his bohemian friends in an intimate sociability. It is proposed that Braga's rude and stern behavior is a legacy of the *caipira* culture, as described by sociologist Antonio Candido. This work analyzes what can be described as a transplant of the *caipira* Rubem Braga in the modern building, considering the flourishing cultural climate of Ipanema and its conflicting landscape of favela, nature and rapid urbanization. We conclude that the *caipira* terrace-garden did not serve to cultivate the spirit according to the Corbusian hygienist notion of *Unité d'Habitation*[1]. Braga's roof garden shares the contradictory aspects of modern architecture as implemented by Brazilian developmentalist politics and expresses the desire to reconnect with the writer's rural past. *Capira*'s nostalgia and urban melancholy meet.

2. HISTORICAL CONTEXT: METROPOLIZATION, BOSSA NOVA AND INDUSTRIAL ARCHITECTURE

2.2 THE BRAZILIAN METROPOLIS AND THE FAVELAS

The city of Rio de Janeiro was the capital of Brazil from 1763 to 1960, maintaining the status of an economic and cultural metropolis that it had since colonial times. It was the most populous city in the country until the mid-1950s, when it was overtaken by São Paulo. In 1872, it had 274,972 inhabitants, while São Paulo had 31,385. In 1950, the city of Rio de Janeiro had 2,377,451 and São Paulo, 2,198,098. In 1960, RJ had 3,281,908 and SP, 3,781,446. The explosive population growth was due to the drop in mortality, immigration, and the integration of the Brazilian space through roads. Such integration made possible the rural exodus on a national scale in the direction of the two cities that were evolving more rapidly. Until the early 1960s, Brazil was a predominantly rural country[2]. However, the issue of urban housing had already worsened in the capitals since the end of the nineteenth century, without the state considering action until the 1930s[3]. The national-populist policy of this period considered the favelas as provisional elements of the Brazilian development process. Favelas were formed in undervalued regions, close to work opportunities. They emphasized the political priority given to reproduction of cheap labor, so that the country could be competitively inserted in the international economic scenario, to the detriment of social equity. The development of modern architecture in Rio corresponded to the time of the shift from the political power of the agrarian oligarchies to the industrial and financial power in the 1930s. This change, however, did not substantially affect the way in which the housing issue was handled, although it fostered a broad debate and important initiatives.

1. Le Corbusier, *Planejamento Urbano* (São Paulo: Perspectiva, 2004), 65-72.

2. Milton Santos, *A Urbanização Brasileira* (São Paulo: Edusp, 2028), 23-34.

3. Nabil Bonduki, *Origins of social housing in Brazil: modern architecture, tenancy law and diffusion of home ownership* (São Paulo: Estação Liberdade, 2004)

The pioneering modern architecture reflected the contradictions of Brazilian politics by focusing on the development of representative and corporate buildings at the expense of social housing. The result was a contrasting metropolitan landscape of formal buildings and Favelas.

2.2 RIO DE JANEIRO, CULTURAL CAPITAL

As the country industrialized, the initial mixed-use occupation of the city, which was concentrated in the port region, was dispersed due to the division of urban space according to function and social classes. Industry and workers were dispersed to remote suburban regions, where housing infrastructure was scarce and state housing policy was unable to cover their precariousness, increasing the growth of slums. In the waterfront regions towards the southern part of the city, elite residential neighborhoods developed. The neighborhood of Ipanema in the city's South Zone, where Rubem Braga's penthouse is located, had slower infrastructure development than other upscale neighborhoods. Since it was isolated by hills, sea and lagoon. It developed, therefore, in the mainstay of Copacabana's growth, which was quite vertical and functioned as a subcenter with commerce and entertainment. Ipanema kept its distance from the formal work environment in downtown and the hustle and bustle of Copacabana. Neighborhood relations and the quiet life of the seaside resort were maintained since the neighborhood did not radically verticalize in the following decades. It was in the still serene environment of the 1950s that Bossa-Nova emerged and where groups of bohemian intellectuals and artists also gathered, illustrating the *carioca* life of the time.

2.3 SÃO PAULO, ECONOMIC CAPITAL

From the 1950s onwards, São Paulo became the most important Brazilian city from an economic point of view due to the concentration of industries in the state. The São Paulo International Biennials, in 1951 and 1953, brought together modern architects and artists from all over the world and awarded, contrary to the French-speaking carioca taste, two figures linked to the Bauhaus: Max Bill and Walter Gropius respectively. The Swiss architect and artist, Max Bill, then wrote about his visit to Brazil in the 1950s: *"We are facing the supreme of anarchy in construction, of virgin forest in the worst sense."*[4] The architect Sergio Bernardes was at that time a recent graduate and had already accumulated many commissions and some awards. He worked with Oscar Niemeyer and demonstrated some influence of his plastic virtuosity. Bernardes, however, was more interested in the technological innovations brought about by the industrial development that was taking place in São Paulo. In the work of Sergio Bernardes, one can see abstract austerity combined with a visionary spirit and a tendency towards monumental scale.

3. THE BARÃO DE GRAVATÁ BUILDING.

3.1 THE BRAZILIANIZED *UNITÉ D'HABITATION*

In Rio de Janeiro, the first Corbusian-influenced apartment blocks were not occupied by Rooftop Gardens and corresponded to social housing programs.

4. Alberto Xavier [org], *Testimonial of a Generation* (São Paulo: Cosac Naify, 2003), 161.

Due to the cost of weatherproofing the slabs, rooftops used to be covered with tiles. In the *Gávea Residential Complex* (1952), designed by Affonso Reidy as social housing, the roof terrace is occupied by a collective laundry room with tanks in series and clotheslines for drying. Reidy's project was an exception, most social housing projects were just functional spaces that were inaccessible to communal use.

The *Barão de Gravatá* building follows the typology of the *Unité d'Habitation* as adapted by Lucio Costa in the *Guinle Park Complex* (1945-1953). Costa promotes an acclimatization of the architectural details and the program according to the physical and social context of the Brazilian elite. Like the buildings of *Parque Guinle, Barão de Gravatá* does not have an intermediate floor of services and commerce[5] and its Rooftop has an apartment with a private terrace. All apartments have rooms for domestic servants. The *Barão de Gravatá* building was inaugurated in 1960, when the Ipanema neighborhood was already an elite residential neighborhood, although punctuated by favelas. From the beginning of the building's project, designed by Sergio Bernardes in 1952, to the occupation of the penthouse by the writer Rubem Braga, the population of the neighborhood almost doubled in formal and informal housing. The *Barão de Gravatá* belongs to the group of the first modern and tallest residential blocks developed in Ipanema. It has 12 floors plus the duplex penthouse placed in a plateau above the garage. Two side ramps and a central staircase, intermediated by landscaped areas, give access to the building. On this high level, the maintenance services, the elevator hall and the common leisure equipment are located. The accesses to the two side garages, parallel to the pedestrian entrances, are at street level. Its rustic stone walls act as a plinth for the building. The main façade (South), less sunny, is composed of continuous wood single-hung windows that extend in part of the side facades, drawing an abstract grid. The north façade and part of the side facades have windows in the sealing walls. The building is set freely into the landscape, oriented according to the course of the sun and supported on inclined pilotis. The tilting play of the pilotis is the greatest reference to the plastic exuberance of Rio de Janeiro's modern architecture, contrasting with the scale of the block and the homogeneous treatment of the main façade.

3.2 RUBEM BRAGA'S PENTHOUSE

The duplex penthouse apartment initially belonged to the engineer responsible for the construction of this building and works in Brasilia, engineer Juca Chaves. He was also the owner of Juca's Bar in the traditional Ambassador Hotel in the city center. Chaves facilitated the sale of the penthouse in 1964 to his bohemian companion and friend Rubem Braga. Thus, the bar life was prolonged in the Braga penthouse for some of his friends, who did not need to be invited to show up there and have a whiskey. The neighbors eventually accepted the rooftop appropriation by the grumpy writer. Today there is a plaque in his honor at the entrance of the building.

In the 1960s, Rubem Braga's penthouse had a view of the sea and a back view of the Cantagalo hill, whose green space was already being gradually

5. One of the blocks of the complex has commerce on the ground floor facing the street.

taken over by the favela. Braga commissioned several alterations to the architectural and landscaping projects to execute what was described by the writer Paulo Mendes Campos as a "farm in the air". The changes in the architects' projects configure a process of appropriation and adaptation to the environment and to Rio de Janeiro's society. First, he ordered the placement of an iron rod railing, covered with plants, which obscured the view of the favela at the back. He hired landscape architect Burle Marx to develop a project for the garden. From a certain point on, he himself conducts the engineering works to contain 40 cm of soil and the growth of tree roots: double waterproofed slabs overlapped by aluminum trays. He ordered a vegetable garden and an orchard. The Rooftop Garden is thus formed by two green areas lateral to the volume of the penthouse and another narrow at the bottom. There he cultivated vegetation and fauna from different parts of Brazil. Small vases are scattered everywhere. The front part of the penthouse corresponds to a balcony area with a rustic ceramic floor and a roof with a metal structure and a white corrugated roof. There was Rubem Braga's hammock and the varied seats for visitors. The undulating roof was calculated by an engineer not to be carried away by strong winds. The trees also required constant pruning because they attract lightning on stormy days, which are very common in Rio de Janeiro.

3.3 THE TRANSPLANTED CAIPIRA

Rubem Braga was born in the state of Espírito Santo in 1913 and had a comfortable childhood, spent between his home in Cachoeiro, his grandparents' farms and holidays on the beach. Braga left his hometown early because of a fight with a high school teacher and came to Rio de Janeiro for studies and work. The neighborhood of Ipanema made it possible to live informally, in contact with nature and to experience the cultural life of a metropolis. In addition, the work of a columnist could be done from home. His close relationship with nature led him to study the interaction between plants and birds, which he commissioned from various regions of Brazil and the world. He used to guide his guests through the terrace garden and introduce them to plants and animals. In this way, he returned the common space taken for himself to the collective use of the various species.

Except for the maid and a chauffeur, Braga lived alone. The writer was unmarried and had a son, but those who frequented the Rooftop Garden were his bohemian friends and artists. He kept the doors open to his friends, as well as lending them the guest room for furtive love encounters. His muses were often their wives. Due to nightmares about the Second World War, in which Braga participated as a correspondent, he did not sleep well at night. Thus, he took short naps in his hammock throughout the day, interrupted by some visit, reading, writing and contemplation of nature. Visitors sat on wooden benches, as those found in the squares. Braga liked to look at the sea through a spyglass and at the birds in the garden, which were attracted by the various fruit trees in the orchard. His writing is marked by lyricism and references to nature. It describes the Metropolis through his eyes of country boy fascinated with modern innovations and as an adult desolated

with Brazilian urban contradictions. Despite the quiet sociability offered in his penthouse, he was introverted and melancholy.

His biographer José Castello describes him as a *Caipira* transplanted into an avant-garde penthouse. *Caipira* is a term of Tupi origin that was used by sociologist Antonio Candido to express a way of being associated with a certain group that occupied the rural area of the Southeast region of Brazil. The group was formed from the encounter of the colonizer Portuguese with the aborigine at the time of the pioneer expansion into the interior of the country in the sixteenth and seventeenth centuries. This context of formation determined the quality of the relationships that would tend to be established with the occupied environment and among the members of the group. The tendency towards nomadism determined the taste for the temporary of the adventure, defining the characteristics of its dispersed dwelling. Isolation implied the development of rude, silent, and suspicious behavior. It is proposed that Braga's rude and stern behavior is a legacy of the *Caipira Culture*. Since Brazil has become a mostly urban country up the 1960s, most urban inhabitants have some rural reference. However, the desire to participate in modernity means that this aspect of Brazilian culture remains sublimated.

Many Carioca Rooftop Gardens reflect the *caipira* taste regardless of the architectural language developed in the rest of the building, as attested by the Guinle family's luxurious penthouse in the *Tucuman building* (1941) in Rio de Janeiro. The Guinle penthouse has two floors in classic French-style and is topped by a *caipira* Rooftop Garden. The abstract simplicity of the *Barão de Gravata*'s building must have pleased Rubem Braga, who had an aversion to pomp. He decorated the rooftop, however, with a profusion of eclectic objects: books, important modern artist paintings, classical sculptures, figurative modern sculptures, a collection of stones, bird cages. These disparate objects, taken together, lost their aura. They became banal, but they remained full of history. His garden's mix of species also allows him to reminisce about his own rural past and want to share.

4. CONCLUSION

We conclude that the phenomenon of *Caipira*'s Rooftop does not so much reflect a political sense of cannibalization of the modern to assert national identity and seek foreign recognition and approval. It corresponds to the feeling of nostalgia, resulting from the uprooting experienced in the process of accelerated urbanization and represents the desire to experience the informality and itinerancy of interpersonal and social spaces and relationships on a more personal and intimate scale. The *Caipira*'s Rooftop works as a spiritual retreat in relation to the rhythm of life in the city. The cult of bohemia in Rubem Braga's Penthouse implies an inversion of the ideal of health and cult of the body reserved for the terrace of the Corbusian *Unité d'Habitation*.[6] Despite Rubem Braga's speech in favor of simplicity, his garden was full of plant and fauna specimens, statues and vases. Such elements refer to the accumulation that is typical of urban life and that Le Corbusier criticized so much. For Rubem Braga, however, it was a way

to stay connected with his rural past and to connect with his urban guests. Braga establishes an approximate relationship with the nature he has planted, unlike the *Unité* Rooftop that offers nature to be seen from a distance and few garden spaces on the terrace. ■

BIOGRAPHY

Silvana Castro Nicolli is graduated in Architecture and Urbanism at the Federal University of Rio de Janeiro (1994) and post-graduated in Contemporary Philosophy at PUC-Rio (2000). She received a master's degree in social history of Culture from PUC-Rio (2014) and a PhD in Social History of Culture from the same institution (2019). Her thesis is entitled "Empty Forms in Architecture: Existence precedes Essence" and her dissertation, "Architectures of Disappearance". She also worked developing architecture projects and as a substitute professor of Architecture Theory, History of Architecture and Brazilian Architecture at FAU-UFRJ.

THE ITAMARATY PALACE ROOF GARDEN AND A POSSIBLE IMAGE OF BRAZIL

ANA PAULA POLIZZO
UNIVERSIDADE FEDERAL DO RIO DE JANEIRO

#17

ABSTRACT

This presentation will discuss the ingenious articulation between architecture, landscape design, and the environment through the roof garden of the Itamaraty Palace, by Oscar Niemeyer and Burle Marx, in Brasilia. Through the re-signification of the Corbusian plastic repertoire (especially the *jardin-suspendu*) and his understanding of nature, this paper will emphasize the ambiguities and complexities of this space and the constant confrontation between nature (*cerrado* landscape) and culture (materialized in the architecture and landscape design). This *jardin-suspendu*, used for the Ministry's receptions, with exuberant plants, establishes, on one hand, a kind of representation of a modern country, and seems to reflect the paradoxical modernity established in Brazil.

1. A BUILDING OF MULTIPLE COLLABORATIONS

The Itamaraty Palace (1959-70), the headquarters of the Ministry of Foreign Affairs, is one of the most striking buildings designed by Oscar Niemeyer in Brasilia. This distinction is due to its formal and structural qualities, but above all to its spatial attributes, the result of a complex combination of architecture and gardens. Roberto Burle Marx played a key role in this.

Located on the Ministries Esplanade, on the Monumental Axis set out in Lucio Costa's Brasilia Plan (1957), the Itamaraty plays an important representative role alongside the other ministries and agencies, and makes an equally symbolic transition to the Three Powers Square, where the Presidential Palace, the Federal Supreme Court, and the National Congress are located.

Inaugurated in 1970, 10 years after Brasilia's official inauguration, this long period reflects the complex process of negotiations and collaborations[1] between all those involved and the political and institutional commitment to making the image of a modern Brazil triumph.

Rather than dealing with this intricate and fascinating process, this paper will focus specifically on the intrinsic relationship established between Lucio Costa's Brasilia plan, Niemeyer's architectural solution, and Burle Marx's landscape design in the roof garden of the Itamaraty Palace, reflecting on the paradoxical and ambiguous relationship between nature and culture in Brazilian modernity.

This precise cut allows us to problematize the reinvention of the roof garden (specifically its variation, the *jardin-suspendu*), a recurring technical-functional device in the Corbusian repertoire, beyond its formal and spatial qualities, incorporating historical and symbolic ones. In this space, the presence of exuberant plants, including the positive and expressive Burle Marx's landscape design, and the lyrical[2] relationship with the dominant *cerrado* landscape (Costa's contribution), allow the image of a modern country to be projected the rest of the world.

2. GARDENS FOR A PALACE OR A PALACE FOR THE GARDENS

Contrary to what one might expect, Burle Marx did not play an effective role in the new capital. He developed a few isolated gardens[3], showing his fragmentary role in Brasilia. However, Itamaraty's gardens stand out for their great landscape value and the complete integration between the architecture, the landscape design, and the surrounding landscape.

Burle Marx created three gardens for the Palace: one on the access, one in the hall of the first floor, and one suspended in the noble hall on the terrace. The access garden (1965) is a water garden with small islands of regular geometric shapes, rounded edges, and masses of tropical plants of varying heights and textures. Its calm waters – an important humidity regulator for Brasília's dry climate and a counterpoint to its arid landscape – are home to various species of nymphs and the Bruno Giorgi's *Meteoro* sculpture (1966).

Niemeyer's building floats above the water *parterre*, reflecting its arcades and its immediate surroundings, such as the *buritis*[4] grove in the background,

1. Oscar Niemeyer's architecture design (1959 first study – 1963 final version with Milton Ramos), Burle Marx's landscape design (1962 first study - 1965/66 final version), Joaquim Cardozo's structure (1963), without mentioning the many collaborations for works of art and furniture design. This network is mapped by Claudio Brandão, "Com quantos arcos se faz um palácio? A arquitetura do Itamaraty em processo" (PhD diss., Universidade Federal do Rio de Janeiro, 2023).

2. According to Telles, Costa gives a lyrical sense to the landscape, as his plan seems to reiterate the memory of colonial Brazil by maintaining the rarefied presence of the urban scale in the *planalto's* geography. Sophia Telles, "Lucio Costa: monumentalidade e intimismo [1989]" in *Textos fundamentais sobre história da arquitetura moderna brasileira*, ed. Abílio Guerra (São Paulo: Romano Guerra, 2010), 173-206.

3. Itamaraty Palace (1965/66), Ministry of Justice (1970), Federal Court of Auditors (1973), Crystal Square (1970), Jaburu Palace (1975), Superquadra 308-Sul (1972), Claudio Santoro Theater (1976) and Pithon Farias Park (1976).

generating graphic but also symbolic effects. According to Flávio Motta, "here, the reflection draws uncovered roots on the surface of the undulating water. It's a kind of magic mirror, with allusions to the exiled."[5]

The water mirror and the geometric language of the garden that surrounds the palace invade its interior through the arcades, as a continuation of the exterior, generating the double-height internal garden in the first-floor hall, where diplomatic ceremonies and receptions begin. It symbolically evokes the "exuberant nature of the country"; it creates a humid *cerrado*[6] microclimate and an effect of light and shade among the foliage, typical of the rainforest. The result of the verticality of the trunks of tropical species is further exacerbated by the concrete totems surrounded by undulating *philodendrons*, *anthuriums*, and other epiphytics plants, which propel the gaze upwards, like the honor staircase that leads to the upper floor.

The solution given to the hall garden – a continuation of the exterior that expands onto the mezzanine – seems to introduce the spatial experience reserved for the roof garden. It is on this highest level of the building that the Palace's noble hall is located, used for receptions and government parties. From here, guests can enjoy a wide view of the young city through Niemeyer's arcades. It is also here that the most expressive force of Burle Marx's gardens in the Palace is felt.

This elevated garden – like an elevated *varanda*[7], a "completely open living room"[8] – is partially covered by a concrete pergola, making it an enclosed, controlled, and sheltered garden, unlike the access gardens, which are open, uncovered, and continuous. This solution protects users from the hot and dry climate of *Planalto Central*[9] and allows diplomatic celebrations to be held, almost in the open air.[10]

This garden adopts the same geometric language with rounded edges flowerbeds. It is characterized by the existence of contrasts: volumes, textures, and colors of the foliage of the plants, the surfaces of the coverings, and the works of art[11] located there. The light coming through the pergola and the arcades plays an important intermediary role between the strength of the structure and the ephemerality of the vegetation. With these spatial strategies, Burle Marx's garden is not passive in relation to the plans of the architectural construction itself[12]: it can redefine the spaces, giving new meaning to the architecture and its surroundings.

The Palace is a kind of "oasis" in the *Planalto Central*. Isolated from the continuity of the territory by the water mirrors that surround it, it is integrated into the environment by its large *varanda* that opens onto the city. From there, we can contemplate the expanse of the *cerrado* landscape and the possibilities opening up on the horizon of the newly created capital: the promise of a prosperous future.[13]

3. BRASILIA'S *JARDIN SUSPENDU*: A SPATIAL GENESIS

The Itamaraty Palace is the result of the articulation of two architectural volumes: inside, a closed glass box (discreet and secluded), and outside,

4. *Buriti* is a tree species typical of the *cerrado*.

a hollowed-out box formed by sequential arcades that surround it, configuring a kind of permeable closure (solemn and representative).

The interstitial space resulting from this manipulation is transformed, through the cooperation of architecture and landscape design, into an elevated *varanda* (a suspended garden, the Corbusian *jardin-suspendu*). It is a semi-open and semi-covered space where the pergola allows a relationship with the blue sky, and the arcades allow a total opening to the reddish and immense landscape of the surroundings. In this relational space, the tensions between the interior (the regulated and contained space of controlled sociability) and the exterior (the continuous horizontality of the *Planalto Central*) – constantly activate the spatial transitions and ambiguities that result from them.

The Corbusian *jardin-suspendu*[14] is the result of experimentation with the technical-formal possibilities generated by the Dom-ino system (1914-1917). In tectonic terms, the transformation of the roof slabs into habitable spaces enables a spatial relationship between the interior and exterior at an above-ground level. In addition, the Corbusian *jardin-suspendu* acts as a portion of air in the mass of the building[15], transforming the limits of the façade, expanding its boundaries and tensioning the dichotomies between public and private, inside and outside, architecture and city: "the sun penetrates everywhere, and so does the air (...) the table is set sheltered from the rains (…) we eat, we talk, we rest in the air."[16] It becomes a completely ambiguous space: it is both a visual link and a physical limitation in relation to its surroundings; after all, it is protected from the chaotic nature of the site by the ordering gesture of the architecture.

If, on the one hand, the Corbusian roof garden – through the mastery of technique – provided an intense experience of nature by promoting a relationship with the sky, the sun, and the surrounding environment, it also reflected an understanding of the order and harmony implicit in nature itself. In this way, the roof garden would be a mystical element[17] of modern architecture for the utopian dream of the future city.

The elevated garden would be different from the garden on the ground: it is the noblest, sometimes sacred garden because it rose to the heavens and carries the implicit fascination of the idea of *terra nullius*, a place untouched by human hands and left to nature[18]. It would be a counterpoint to the order imposed by technique: vegetation should be planted irregularly and the terrace garden should be left to its processes of biological succession, the restoration of nature in its pure state: "plants and shrubs orient and establish themselves as they wish, according to their needs. Nature reclaimed its rights. Since then, the garden has been left to its own devices...."[19]

At this point, we must return to the Itamaraty's *jardin-suspendu*. If, on the one hand, the paradoxes of this space are the result of Niemeyer's interpretation and manipulation of the Corbusian architectural repertoire, on the other hand, the solution of the landscape project seems to oppose Corbusier's vision, after all, Burle Marx's garden has nothing spontaneous

14. The *Jardin-suspendu* is the antecedent of the roof garden, initially used by Corbusier in the 1920s and perfected in the Indian experiments of the 1950s.

or natural about it. In this sense, the abstract Corbusian *in-between* space gains materiality with Burle Marx's garden, and becomes a positive, artificially manipulated space, capable of representing the true noble area of the building. By incorporating plastic research, the garden overcomes its functionalist tendency and emerges as the engine of modern living. There is a true reinvention of the Franco-Swiss architect's method, or in other terms, a "cannibalization"[20] of Le Corbusier by Niemeyer and Burle Marx.

The exuberant tropical plants combined with the concrete pergola form the atmosphere of an *Ombrophilous Forest* on the terrace, contrasting plastically with the harsh landscape of the *cerrado*. A vision of a "lost paradise" is constructed; the utopic city that was the fruit of reason and desire.[21] This manipulation tensions the opposites: myths and reality, dryness and humidity, interior and exterior, relaxation and formality, exuberance and infinite horizontality, the domesticated and the uncontrollable. Opposites that can be summed up, in the case of Brasilia, in the constant clash between nature and the culture established on the basis of the representation of a modern country.

20. Fraser suggests that Burle Marx had incorporated the forms of South American natural landscape (like noted by Corbusier) into the gardens for the new Ministry of Education building (1936) in Rio de Janeiro. 4. THE AVAILABILITY OF CONCILIATION: SOME (IN)CONCLUSIVE NOTES

The Itamaraty *jardin-suspendu* was used here to demonstrate the many paradoxes inherent in Brazilian modernity. It shows, on the one hand, the constant tensions between nature and culture, based on the work of Burle Marx, Niemeyer, and Costa, and, on the other, the establishment of a complex network of collaborations, resulting in a conciliatory vision capable of harmonizing apparently irreconcilable and antagonistic parameters. Finally, it shows how ideas (internal and external) were accommodated, generating a possibility of modernity in Brazil.

The natural disposition towards conciliation was highlighted by the German philosopher Max Bense when he visited Brazil in the 1960s. For him, the intrinsic tropical spirit (organic, vital, moving) and the inherited Cartesian spirit (analytical, logical, clear) were not in opposition, but in dialectic; and therein lay the hope of renewal, the construction of a "progressing essence" of man.[22] Thus, the "modern rational Brazilian form" was based on these constant contrasts perceived by Bense: joy and melancholy, nature and intelligence, improvisation and design, inertia and mobility.

All the possible tensions presented by Bense (and expressed in Itamaraty) are based on the modern constructive mentality that reflects the Brazilian historical and social process. The certainty and incisive gesture of design (characteristic of the 1950s culture) is a way of responding to a supposedly amorphous country, where order is implanted by disorder, after all, it is dominated by contingency. A country that "gave shape" to Brasilia, through a colonial gesture of "taking possession"[23] of an immense territory of reddish earth.

Itamaraty's *jardin-suspendu* is the legitimate space to contemplate Brasilia as the land of future promise, a project of modernity that had been sketched out since the 1930s and, to quote Pedrosa[24] again, condemned to the modern. ■

ONE THOUSAND AND ONE FLIGHTS: A ROOFTOP AIRPORT OASIS IN THE ARABIAN DESERT

JOSS KIELY
SCHOOL OF ARCHITECTURE AND INTERIOR DESIGN,
UNIVERSITY OF CINCINNATI, USA

#17

ABSTRACT

As the economic downturn of the 1970s deepened, U.S.-based architects looked abroad for commissions to keep their design practices afloat—among them, the Detroit-based office of Minoru Yamasaki and Associates (MYA). After the petroleum-fueled economy of Saudi Arabia outgrew MYA's modest 1964 Dhahran Civil Air Terminal—a project popular among the Saudi Royal Family and governmental officials—the firm proposed its replacement over the course of three decades, in partnership with including Bechtel Engineering and the Ralph M. Parsons Corporation. One design consideration was the way airports in the desert needed to demarcate the space while creating a sense of "place" where little existed other than wind, sand, and sky. In each of the firm's proposals, variations on the roof garden were leveraged as a central part of the infrastructure of placemaking, offering passengers and airport workers a respite from the midday sun, while offering the Kingdom an international gateway. Such gardens were frequently placed at the center of the airport terminal designs, serving as a link between programmatic elements and often placed atop parking structures to help mitigate the significant heat load such buildings would attract. Although it might seem anachronistic next to the sleek lines of modern jet travel, the roof garden has a storied history of imperialism, power, and decadence. This paper situates the airport roof garden within larger disciplinary trajectories of the late modern period and transnational exchange, joining scholarship focused on the rise of large architecture and engineering corporations working in tandem with smaller, design-focused architecture firms such as MYA and The Architects Collaborative (TAC) on projects throughout the Arabian Gulf region. Such projects signaled an exportation of Euro-American political and economic ideals through modern architecture and infrastructure, and further clarifies the ongoing development of relationships between architect and engineer in the postwar period.

1. INTRODUCTION

As the economic downturn of the 1970s deepened, U.S.-based architects looked abroad for commissions to keep their design practices afloat—among them, the Detroit-based office of Minoru Yamasaki and Associates (MYA). After the petroleum-fueled economy of Saudi Arabia outgrew MYA's modest 1964 Dhahran Civil Air Terminal—a project popular among the Saudi Royal Family and governmental officials—the firm found itself proposing its replacement over the course of three decades and in partnership with large-scale architecture and engineering firms working in the region, including Bechtel Engineering and the Ralph M. Parsons Corporation. One important design consideration was the way in which these airports in the desert needed to demarcate the space of the air terminal and its ancillary programmatic needs, while creating a sense of "place" where little existed other than wind, sand, and sky. In each of the firm's proposals, variations on the roof garden were leveraged as a central part of the infrastructure of placemaking, offering passengers and airport workers a respite from the midday sun, while offering the Kingdom a gateway worthy of the world stage. Such gardens were frequently placed at the center of the airport terminal designs, serving as a link between programmatic elements and often placed atop parking structures to help mitigate the significant heat load such buildings would attract.

Although it might seem anachronistic next to the sleek lines of modern jet travel, the roof garden has a storied history of imperialism, power, and decadence that renders the airport an obvious extension of its narrative into the late modern period as an ongoing symbol of opulence and excess. This paper situates the development of the airport roof garden within larger disciplinary trajectories of the late modern period and transnational exchange, joining scholarship focused on the rise of large architecture and engineering corporations working in tandem with smaller, design-focused architecture firms such as MYA and The Architects Collaborative (TAC) on projects throughout the Arabian Gulf region. Such projects signaled an exportation of Euro-American political and economic ideals through modern architecture and infrastructure, and further clarifies the ongoing development of relationships between architect and engineer in the postwar period.[1] The role of the architect within a larger service model marks a shift in disciplinary tactics. As historian Arindam Dutta has suggested, in this new world order, "the architect is merely a boutique reliant upon—if not nestled within—a much larger global delivery operation to service its clients."[2] In many cases throughout the Gulf Region, the projects were effectively large-scale infrastructure—the airport grounds and environs—combined with boutique architecture—the passenger-focused air terminals and their many associated amenities, chief among them an unlikely trio: the roof garden, the mosque, and the parking deck.

2. A NEW FRONTIER FOR ARCHITECTS

After World War II, private corporations such as Standard Oil of New Jersey, Standard Oil of California, and Texaco funded and constructed oil pipelines throughout Africa and the Persian Gulf region as the importance

1. Eva Franch I. Gilabert, et al, *OfficeUS Atlas* (Zurich: Lars Müller Publishers, 2015), 13.

2. Arindam Dutta, "Marginality and Metaengineering: Keynes and Arup," in Aggregate, *Governing by Design: Architecture, Economy, and Politics in the Twentieth Century* (Pittsburgh: University of Pittsburgh Press, 2012), 238.

of the extraction economy came into focus.[3] To support these efforts, large-scale architecture and engineering firms such as Bechtel Engineering master planned and designed entirely new cities in the deserts across the Arabian Peninsula, centered around massive shipping ports and large-scale airports constructed to serve growing international trade networks fueled by the sale and export of oil. Corporate investment was motivated by the skyrocketing global demands for fossil fuels, which in turn radically reconfigured international relations.[4] This was especially true in Saudi Arabia, where oil became the bedrock of Saudi Arabia's modernization efforts, and which motivated significant foreign investment. In turn, key outside investors—particularly those from the United States, Western Europe, and Japan—built up Saudi Arabia's airports and infrastructure to serve their growing business needs in the Kingdom and the region. Increased private investment in Saudi Arabia and the Persian Gulf meant that corporations were eager to enter an expanding market, building airports, hotels, and office parks to serve the agents of international trade as well as a burgeoning tourist market and Hajj pilgrimages to Mecca. U.S.-based architects jumped at the chance to take on large-scale commissions for corporations and governmental entities in Saudi Arabia, including Minoru Yamasaki and Associates (MYA), Edward Durell Stone (EDS), and Bechtel Engineering, among many others.

This project presents an interesting case and a difficult one to decipher; from initial design to final construction, the airport took nearly three decades to complete. The lengthy design development process was due to a variety of factors, including the changing landscape of air travel, the growth of the international oil export economy, and the instability in the region caused by the Iran-Iraq war from 1980 to 1988. KFIA was, in a word, complex. It needed to operate as a major international airport, a regional transit hub, and provide extensive program supporting the needs of residents, including a large-scale mosque and landscaped plazas for leisure and recreation. In other words, a kind of roof garden, in part to help mitigate the intensely high temperatures of the desert's midday sun. The designers at MYA were architectural image makers as much as they were architects. It appears that the power brokers of the Kingdom of Saudi Arabia recognized this quality in the Dhahran Civil Air Terminal (1964) and thus retained MYA for the larger KFIA project a few decades later.

3. 3. AN AIRPORT IN THE DESERT

The project officially began in 1974, and to help organize the overall plan, Yamasaki recommended hiring Tippets-Abbott-McCarthy-Stratton (TAMS) as the aviation engineering consultant of record due to their successes at the Dallas/Ft. Worth Airport and a large portfolio of projects in Africa and the Middle East.[5] Under this arrangement, MYA would be the lead architect for the project, responsible for the overall master plan, the terminal, and any ancillary structures, and TAMS would be responsible for the technical consultations, civil engineering, and the development of paved areas such as runways, taxiways, and the aircraft apron.[6] As evinced by an Executive

3. The concept of extractivism has been in use since the end of the 20th century to focus on economies based on extracting natural resources from the earth. Refer to Christopher W. 6. Yamasaki, Letter to M. Mahdi.

Summary sent from Bechtel Engineering's Civil & Minerals department to Minoru Yamasaki on February 22, 1985, King Fahd International Airport was the result of a complex development and construction process.[7] The firm completed an initial master plan for the Eastern Province International Airport (EPIA) in 1977, proposing to connect a centrally planned terminal to remote satellites via automated people movers.[8] This form is strikingly similar to the design of the Tampa International Airport, completed in 1971 by Cuban American architect Carlos Alfonso, Sr. According to MYA's design team, the goal was to create an "oasis from [the] 800 square kilometer site of virgin desert which is characterized by stationary and traveling sand dunes, an occasional palm tree and scrub-type vegetation."[9]

The passenger terminal was sited at the center of the project, and as with the original terminal, the design team concocted what might best be described as a new Islamic tradition in its formal ambition: "The buildings are modern in structure and design, with a distinct Arabic influence compatible with the desert environment."[10] The architects continued their description, suggesting that the proportions employed in the design aimed to make them "elegant and graceful" and that it "will be a national landmark, full of visual interest and designed to reflect both the tradition and progress in Saudi Arabia."[11] The overall experience was particularly important to the team considering that widespread air travel in Saudi Arabia was relatively new and that the project needed to incorporate a larger social program for people to enjoy "recreational, educational, and religious pursuits," which was at least in part related to the roof garden and oasis design.[12] As with the earlier Dhahran Civil Air terminal, why was it assumed the Detroit-based architects, many of whom had never visited Saudi Arabia, were capable of producing an "image" of the Saudis own culture? The formal aspect of the project appears to reference general allusions to architectural details from mosques—mihrabs, niches, elaborate grillwork—but taken entirely out of their functional or even symbolic context.

The existing Dhahran airport and facilities would be converted to a dedicated military and air force facility and the twenty-seven square miles of land that had initially been acquired for the airport's expansion would be used for other developments. The new location also afforded an expanded opportunity to serve the growing cities of Dammam, Alkhobar, Abqaiq, along with Bechtel Engineering's newly planned city of Jubail.[13] The initial proposal included a pair of large, vaulted shells spanning a distance of 360 feet between the two terminals and each covering an area of 450 by 900 feet.[14] From a practical standpoint, the shells shielded passengers and airport employees from the hot sun. But the dramatic shells would also act as a formally-unifying agent in the project that the architects described as "a symbolic gateway to the entire eastern region of Saudi Arabia and [one that would] signify the importance of one of the major entrances to the country; [the shells] represent the greatness and progressive aspirations to which the leaders of Saudi Arabia are so devoted."[15]

Sited in the middle of the desert, the view of the airport and its sweeping concrete shells was designed to be enjoyed from the air by arriving and

departing passengers: "With their large scale and long-distance visibility, the great shells of the terminal will be the focus for the entire eastern region of Saudi Arabia."[16] The airport was to become a kind of oasis in the desert, welcoming arriving passengers to a fast-growing region and center of the burgeoning oil industry. Once the site for the new airport had been finalized the firm settled on a general design scheme, a satellite concept with two core terminal buildings and four smaller satellites serving domestic and international flights. A core aim was to reduce lengthy distances passengers must walk, a revision to the "seemingly endless concourses" of airports like Tokyo-Haneda and Chicago-O'Hare, with which Yamasaki was familiar due to his grueling travel schedule.[17]

Even at this stage, Saudi officials were not yet convinced by the satellite concept, and in 1981, tasked MYA and Bechtel Engineering with another revision to the master plan. By August, it was agreed that three basic design configurations—satellite, line, and pier—would be the primary focus of the firm's investigation, evaluated on the basis of technical, economic, and architectural criteria.[18] Over the course of the following three and a half years, MYA produced hundreds of drawings, schematic layouts, and diagrams while finding a solution appropriate to the desert climate, the airport's programmatic demands, and the client's desires for opulence and grandeur. By October 1981, a meeting was convened with representatives from the International Airports Projects (IAP), Saudia employees (the national airline of Saudi Arabia), the Portland Cement Association (PCA), and members of MYA's architectural design team.[19]

#17

During the initial development phase of KFIA, several other major airports in Saudi Arabia had opened for service, and as such, provided useful feedback about the importance of aesthetics and the appeal to a wide public across the Kingdom. Having opened in Riyadh in 1983, the King Khalid International Airport (KKIA), a joint project between Bechtel and HOK—was overwhelmingly well-received by the general public, in part due to its "large open spaces accommodating major fountain structures and flower displays."[20] Nothing of the sort had been considered at KFIA, with those involved instead focusing on producing an "extremely functional" building while still "providing attractive architecture." Given the success of a central gathering area at KKIA, the design team was once again tasked with coming up with schemes that included a "central visual feature," whose purpose was "to provide the terminal visitor and both the arriving and departing passenger a chance to experience a landscaped water display within an exciting spatial environment."[21] In other words, the committee wanted to add architectural spectacle to the terminal's design. This seemingly small change led to several radical redesigns throughout the building and landscaping.

4. AT LONG LAST, KING FAHD INTERNATIONAL

After many years of design development and extensive negotiations between client, architect, and consultants, construction finally began. As built, the airport encompassed 3.5 million square feet in the terminal and

concourses alone, similar in size to Dallas/Fort Worth when it opened in 1974. In addition, the airport's ancillary structures included a 44,800 square foot control tower, a thirty thousand square foot on-airport mosque, and a large royal reception pavilion for the Royal Saudi family. The final design had two side-by-side terminals accessed by a multi-level roadway. The interior of the ticketing lobby of each terminal features an open plan, with airline baggage check-in desks as "island" counters floating in the spacious area. One of the striking elements is the highly articulated ceiling, which featured a repeating geometric pattern reminiscent of a *muqarnas* and not dissimilar to decorative elements in the firm's previous terminal. The entire complex was surrounded by lushly landscaped gardens—much like the oasis in the earlier Dhahran project—and further underscores the regal nature of a roof garden in the Arabian context. King Fahd International was one part of a major infrastructural push by the Kingdom of Saudi Arabia in the 1970s and 1980s, which saw the opening of King Abdulazziz International Airport in Jeddah (KAIA) in 1981, followed by King Khaled International Airport (KKIA) in 1983.[22] When KFIA finally opened, the project had morphed from a regional airport into a terminal befitting of a global transportation hub, reflecting the changing landscape of the Kingdom through architectural design. ■

BIOGRAPHY

Joss Kiely received a Master of Architecture and a Ph.D. in architecture at the University of Michigan. He is currently an Assistant Professor at the School of Architecture and Interior Design at the University of Cincinnati where he teaches courses in architectural history and advanced design studios. He has published in a variety of journals, most recently in *Arris*, the *JAE*, *Fabrications*, and the *Journal of Urban Affairs*. He is currently working on a co-authored manuscript with Michael Abrahamson, entitled, *Master Plan: Soft Power and the Politics of Architectural Expertise*, under advance contract with Princeton University Press, expected in 2026.

A NOCTURNAL ROOF GARDEN FOR SPECTACLES. THE LUMINOUS SHIP BY CARLES BUÏGAS

DAVID CARALT
UNIVERSIDAD SAN SEBASTIÁN, CHILE

#17

ABSTRACT

The Luminous Ship was an unbuilt project by the Catalan engineer Carles Buïgas, conceived in 1930 and reformulated several times until the year before his death in 1979. It consisted of a floating universal exhibition that was to travel around the world, with a large luminous garden on its deck with a synchronised display of water, light, colour, perfume, and music. For Buïgas, this project was more than just an engineering endeavour. To "climb" onto the deck of this ship, bringing the Good News of Salvation, was for him to enter a paradise on earth, materialised as a garden of luminous water. If the ship was the 20th century's utopian image of the architecture, the paradisiacal deck of this nocturnal ship was the utopia of an engineer convinced that he could improve humanity only by means of water, light and music.

1. INTRODUCTION

Carles Buïgas (1898-1979) was the Catalan engineer in charge of the lighting systems at the Barcelona International Exhibition (1929), a fair best known in architectural historiography thanks to the German Pavilion, the building designed by Mies van der Rohe with Lilly Reich. The exhibition was the second universal exhibition held in the city, following the first one in 1888, and reflected early Catalan efforts to position the city on the map of international capital cities.

One of the greatest successes of the event was, along with the Pueblo Español, the so-called Magic Fountain (the large central fountain) and the various water and light displays spread throughout the Montjuïc mountain designed by Buïgas. The young engineer was so fascinated by the night spectacle and convinced of the redeeming power of luminous water for the masses, that he devised a project called the "Luminous Ship" (1931) **(Fig. 1)**[1]. Since not everyone was able to visit the Barcelona fair, the engineer invented this ship to bring the exhibition —the water displays— to the crowds. This is how he explained the origin of the project. Its interior contained an exhibition of Hispanic art, along with a great set of luminous fountains on the deck. In other words, it was a mobile world's fair that had to travel the world always making its triumphant entry at night to bring the art of "water-light" ("agualuz") to the masses.

The deck was a large mineral garden of avenues with fountains transformed at night using light, music, colour, gas, temperature, and perfumes **(Fig. 2)**. This avenue culminates in the colossal magical fountain. The engineer worked from 1930 to the 1970s on this idea, creating nine preliminary designs and even writing a novel, inspired by Jules Verne, published in 1960 when he was aware that his project would hardly materialise[2].

In parallel to his ideal projects, it is estimated that the engineer created more than five hundred illuminated fountains throughout his career, in Spain and Portugal, France and Belgium, Morocco, the Dominican Republic, Puerto Rico, Venezuela, or Dubai[3]. He even had a notable participation in the Santo Domingo Peace Fair (1954) with the design and construction of the Agua-Luz Theatre[4], and was responsible for other projects such as the Peace Exhibition (1946) or the Total Water-Light-Music Theatre (1960) for Barcelona[5]. However, the Luminous Ship project accompanied him throughout his life, since he gave it a special transcendent meaning, a moral role of redemption for humanity.

2. SAVING HUMANITY

From the beginning, Buïgas endowed the project with a transcendental dimension. He saw the ship as a representation of The Good News of Salvation. For Buïgas, "Going up" to the deck of this ship symbolised redemption; accessing paradise on earth, a garden made only of water and light. What does the will to improve the emotional life of the masses suggest to us culturally, thanks to a luminous ship that we see arriving as our Salvation?

5. Carlos Buïgas, *Hechos, ideas y proyectos* (Barcelona: Ediciones Unidas, 1973).

In Christian iconography, the journey of life is often represented by the image of the church as a ship. It is Noah's ark that leads to salvation amidst a stormy sea. The ship also symbolises a sacred island, in the sense that it preserves its conditions within well-defined limits facing the "amorphous and assaulting" sea which alludes to the hectic outside world. The navigator must face the "sea of passions" until reaching paradise, and therefore also, "the conquest of a great peace is figured in the form of a navigation."[6]

Light and water have always had symbolic associations with mystical and spiritual processes. For example, the Temple of Solomon is described in the Old Testament as a structure of gold and water that, combining to create an entire universe of mirages. Islamic art also utilised rich decorative elements and refined treatments of light and water, creating fantastic architectural combinations. Crystals, precious stones, gold, are all equivalents that allude to spiritual transcendence. Such mystical associations are decisive, for example, in the stained-glass windows of Gothic cathedrals. The German expressionists' utopias of glass architecture and the cathedrals of light at the beginning of the 20th century also alluded to such meanings in which the brilliant colours would restore joy to the citizens of the great grey city[7]. In some way, the light spectacles of the 19th and 20th centuries incorporating precise light design and luminous fountains, often referred to as "magic," could evoke certain emotions with transcendent nuances similar to those awakened by sacred architecture over centuries.

In the engraving on the cover of Francis Bacon's *Novum Organum* (1620), ships are seen setting sail with the inscription: "Many will make their way home, and science will develop." The foundation of modern experience is not found in "land" but on the deck of ships, and in the back-and-forth movement. Captain Nemo's motto, *Mobilis in mobili*, perfectly encapsulates the motif of the anonymous modern individual, who navigates everywhere without being fixed in one place. As Peter Sloterdijk explains, the ship is an absolute palace-habitation-world, and represents, in its early modern form of adaptation to the high seas, the paradigm of the resolved contradiction between housing and adventure. It also symbolises a dream machine and a "great mother," a piece of homeland that goes sailing[8].

The avant-garde of the early 20th century regarded machines particularly the ship, as a paradigm of functional beauty. In one of the most influential architectural books of the 20th century, *Vers une architecture* (1923), Le Corbusier presented the ocean liners as the best example of mechanical purity, associating them with beauty and sincerity[9]. The ship is the utopian representation of metropolis architecture.

3. THE LUMINOUS SHIP PROJECTS

Although Buïgas had delivered public lectures in Barcelona and Madrid since 1931, the Luminous Ship project was first published in the magazine Mercurio in 1933. It was precisely a publication that promoted Ibero-American trade relations.

In June 1933, the Ministry of Agriculture, Industry and Commerce declared the project a "work of national interest" and published a brochure

entitled “La Nave Luminosa: Exposición de los mares organizada por España” (The Luminous Ship: Exhibition of the Seas organised by Spain). This official brochure from the Ministry contained a brief by Buïgas explaining the project and an estimated budget. The opening sentence is clear: “To transform a large ocean liner into a fantasy palace which, at nightfall, would radiate the sparkles of an absolutely original and grandiose vision.”[10]

The deck would feature the “Great Theatre of rhythm” on a 100x25 metre platform. Two lateral facades of illuminated water with 1,000 jets moving to the beat of the rhythms, as well as crystalline terraces of contemplation framed by glass columns. Inside there would be the Festival Hall, the Theatre, an Aquarium, and the Water labyrinth. As part of the interior visit, visitors would see the installations and machinery of “Spanish engineering” that made the water-light displays work.

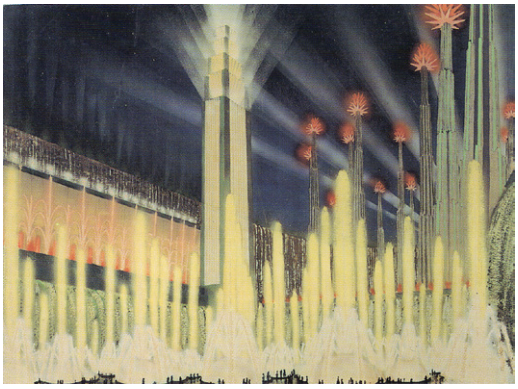
The ship was to set sail from the port of Barcelona alongside the Columbus Monument was designed by his father, the architect Gaietà Buïgas (1851-1919), for the Universal Exhibition of 1888. This detail reflects both the desire to internationalise the city and Buïgas’ marked romanticism.

The ship was scheduled to visit the world’s main maritime cities although it was not specified which ones. It would make stops at 127 ports a year, reaching some 90 million people. And the itinerary would be adjusted to take advantage of the best weather conditions in each place. According to Buïgas, the stay in the ports would be brief: “The novelty and grandeur of the project, together with a short stay, will ensure public success.”

Another of the principles that always sustained Buïgas’ project was that of a (Spanish) “pacifist mission.” The ship would be an instrument of “propaganda for greater harmony in international relations and universal economic collaboration.” This came at a time of growing political tension in Europe.

The primary disadvantage of the project was always the budget. The first project had an initial investment cost of approximately 150 million pesetas at the time. In February 1936, Buïgas presented another “improved” project[11], but the beginning of the Spanish Civil War (1936-1939) put it on hold for a long time.

After the Second World War, Buïgas designed a project for a World Peace Exhibition (1946) that was to be placed on a floating island with great illuminated fountains as the main elements. However, the context was not very favourable for optimistic and expensive exhibition projects.



The Luminous Ship reappeared in 1953. The new project contained a museum and Spanish export products inside. It now included an auditorium for 800 people at the bow of the deck, whose backdrop behind the orchestra could be opened and communicate the stage with the large avenue flanked by illuminated fountains **(Fig. 3)**. The dimensions of the first ship project were 320 meters in length, 60 in beam (or width) and 18 in depth (or height), making it larger than the famous ocean liner Aquitania, presented by Le Corbusier as the perfect machine in his book, measuring 275 metres in length, 29 in beam and 11 in depth. However, now the ship was 112 metres in length, 36 in beam and 16 in depth[12]. The dimensions of the ship had now been considerably reduced.

Figure 4. The Luminous Ship arriving at Rio de Janeiro. © Illustration included in the novel *La Nave luminosa* (1960) by Carles Buïgas.

During a disappointing period immediately after the war, as the engineer sensed that his utopia would never be realised, he decided to write the novel *The Luminous Ship*. This was completed in 1951 and published in 1960[13]. In it, he describes what he imagined could be the ecstasy of the masses during the ship's arrival at night **(Fig. 4)**. He details the shouts of joy, hugs and even tears of emotion. A fairy tale.

13. Buïgas was also a fantasy writer. He published 6 novels.

4. THE LUMINOUS SHIP, THE PROJECT OF A LIFETIME

The history of the Ship project was marked by a cycle of hope and disenchantment, and it would occupy Buïgas' time for forty-five years, during which he produced a total of nine preliminary projects. How could one person persist in the same project for so long?

Perhaps one answer lies in the fact that it was a deep childhood desire. In fact, since he was a child, he had dreamed of building the most beautiful ship that ever sailed the seas. According to Buïgas, the seed began to grow when he was a child living in Uruguay and observed the impressive ocean liners arriving to the River Plate from different nations with the exception of his own. In explaining his first project, Buïgas stated, "If Spain cannot compete with the fleets of the Italian, French, German or English navies, it could compensate with originality and wide scope of propaganda action. Building something new and sensational."[14]

In the last project report dated 1971, there is a brief timeline of events:

> *In 1930, the Berenguer Government intended to carry out project No. 2, but resigned prematurely. Then, on four occasions, the successive projects, 3, 4, and 5, were about to come into fruition. But the changes in Government came before. It was declared a work of 'National Interest'. Personally, I have not stopped promoting it since 1929 – with only two parentheses: the one imposed by our war and a period between 1956 and 1966. During such a long promotion, I have designed nine preliminary projects, of which four turned into very complete and detailed projects. All of this absorbed me sums that, in today's pesetas, would exceed six million. I quote this to demonstrate to what extent I am convinced of the great benefit, moral and material, that the work would bring to our country.*[15]

Moral and material? For Buïgas, this was undoubtedly more than just an engineering project. It was a mission, a way to give meaning to life, and an opportunity to improve humanity.

In late 1974, the Riba brothers, who were the directors of the Scala nightclub in Barcelona, showed interest in financing the project. An office was set up in Cerdanyola, a town very near to Barcelona, to develop the project. However, just as everything was ready to begin work, on January 15, 1978, an attack occurred that burned down and destroyed the Scala club, and with it, the last opportunity for the Luminous Ship. Very weakened, Buïgas died the following year.

Even though some emblematic ships from the 20th century, considered pieces of floating architecture, used their respective decks for musical performances, such as the boat designed in 1976 by Louis Kahn, the Teatro del Mondo by Aldo Rossi in 1979, and the dramatic and heroic *Fitzcarraldo* in 1982 none of them envisioned a scenario where an array of illuminated fountains scattered across the deck would dance to the music and possibly save humanity. ■

MODERN HERITAGE AND URBAN PRODUCTION

MAGDALENA VICUÑA
INSTITUTO DE ESTUDIOS URBANOS Y TERRITORIALES,
PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT:

This essay explores the intertwined evolution of modern heritage and urban development from the 20th century, emphasising the transformative impact of modernist architecture and urban planning. It argues that the modern movement addressed critical urban challenges —such as reconstruction, housing deficits, and decentralisation— by introducing functional zoning and innovative design principles. The principles advocated by the Congrès Internationaux d'Architecture Moderne (CIAM), including the separation of urban functions and the prioritisation of human needs, shaped the "functional city" paradigm. Despite facing criticism in later years, the modernist approach significantly influenced urban forms and policies, promoting public housing and urban renewal. The article highlights the need for a nuanced understanding of modern heritage's cultural and historical significance in contemporary urban development. It suggests employing innovative strategies like adaptive reuse and heritage-led regeneration to balance the preservation of modernist legacies with the demands of present-day urban environments, ultimately aiming for sustainable and inclusive urban futures.

1. INTRODUCTION

Modern heritage and city production are closely intertwined throughout the 20th century, representing a dynamic and evolving urban phenomenon of immense value and current interest. As is well known, the modernist legacy includes buildings, landscapes, and urban plans that collectively transformed urban environments and configurations, promoting a vision of orderly and efficiently designed cities to meet the needs of modern life. Modern architecture has offered diverse strategies tailored to various historical contexts and circumstances, significantly influencing urban production by introducing innovative principles and approaches that reshaped cities and urban regions. At its core, modern heritage introduced a city-building methodology of intrinsic value, meriting acknowledgment in both theoretical and historiographical discourse.[1]

The Modern Movement emerged at a critical moment for architecture, urban design, and urban planning, attempting to provide answers to the major challenges that cities and urban regions faced at the end of the first half of the century. In the context of a welfare state that assumed the tasks of urban and territorial planning as a public function, in what has been called the "age of spatial Keynesianism,"[2] these challenges included reconstruction, urban renewal, and the housing deficit, alongside the massification of new construction technologies, including the automobile, and decentralisation through satellite cities as an alternative to the industrial city.

The intertwined history of built modern heritage and urban development throughout the 20th century uncovers various efforts by architects, urbanists, and planners to address the ongoing tension between preservation and modernisation.[3] In the first place, the modern movement is a key contribution to the model of the functional city, also known as the "scientific city."[4] Functional zoning exemplifies the impact of functionalist urbanism after the Second World War. Modernist urban planning emphasised the separation of urban functions into distinct zones, such as residential, commercial, and industrial areas, aiming to improve efficiency and organisation within cities. The CIAM laid down principles for modern urban planning, advocating for functional cities that catered to human needs, including adequate housing, workspaces, recreation areas, and transportation.[5] The CIAM Sarraz Declaration (1928) stated that "in urban planning the first place is reserved for the classification of functions: a) housing, b) work; c) recreation," and "the means for the fulfillment of these functions are: a) zoning, b) traffic regulation, and c) legislation,"[6] for land use legal control and as an instrument for the design of the urban plan (compositional-formal aspects of the city).

Functional zoning officially entered the debate with the CIAM Charter of Athens (1933), which defined it as "a system of local authority regulations considered quite justifiable" and that "a reformed type of zoning must be set up that can bring the key functions of the city into a harmonious relationship and develop connections between them."[7] It also

considered that "the four keys to urban planning are the four functions of the city: dwelling, work, recreation (use of leisure time), transportation."[8]

Architectural innovation through design that prioritised functionality, simplicity, and the use of new materials like steel and glass led to the development of iconic structures and urban forms that emphasised clean lines and open spaces that would shape the built environment for decades to come. The modernist ethos embraced the principles of standardisation and mass production, which influenced the construction of housing and infrastructure. This approach aimed to provide affordable and efficient solutions to urban housing shortages. Thus, the modern movement strongly promoted the idea of urban renewal of deteriorated urban centres as a public housing policy, often involving the demolition of older, congested areas to make way for new, planned developments. This was seen as a way to address the problems of industrial cities and create more liveable urban environments.[9]

From the totalising idea of a modern city that could embody a specific ideological or political framework in its form, space, and image, to specific architectural interventions and urban art operations oriented to the establishment of a communicative code between politicians, planners, and the population,[10] from cutting-edge expressions to traditions, and from architectural autonomy to urban integration, modern heritage has played a major role in the creation, transformation, and management of urban spaces.

Modernist urban planning has often been the subject of criticism that, following in the footsteps of the postmodern orientation, focused its attention on the negative conditions of abstraction, and mainly on its development during the second half of the twentieth century. However, as stated by Manuel de Solá Morales, insofar as the concept of urbanity during the early modern period was characterised by regularity and repetition, it led to urban forms that, despite their flaws, have resulted in the largest volume of new urban construction ever witnessed globally.[11]

The principles of modern architecture incorporated clear visions of a new type of city, which assumed that the urban plan would define the relationships between architectural works and the proposed urban fabric. Such exemplary heritage ensembles were born from the dialectic between urban planning and building design through episodes in which the architectural and urban dimensions were considered a unitary whole.[12] This relationship and synergy of scales is perhaps the main contribution of modern heritage to urban production.

In conclusion, the modernist paradigm had a significant impact on urban development from the 1920s to the 1970s. This was evident on the one hand, through urban planning, public institutional architecture, and large-scale public housing that sought to renovate cities devastated by WWII in Europe or in modernist efforts that sought to bring growth and developmentalism to the global south and Latin American cities. On the other hand, legal and regulatory frameworks and the very logic of

economic, political, and social values of city production in each territorial context have determined how the legacy of the modern movement materialised over time. Consequently, preserving modern heritage requires a nuanced understanding of its historical, cultural, and architectural significance. At the same time, urban production must address the needs of contemporary society while respecting and integrating heritage assets, by adopting innovative approaches such as adaptive reuse, infill development, and heritage-led regeneration. ■

Her research focuses on comparative planning instruments, with an emphasis in the relation between planning and urban morphology.

ADDRESSING THE MODERNIST LEGACY THROUGH THE HISTORICAL TOWNSCAPE: RE-EVALUATING PUBLIC ARCHITECTURE OF THE 1970S-1980S IN GHENT (BELGIUM)

EVERT VANDEWEGHE
FLANDERS HERITAGE AGENCY

#18

ABSTRACT

In Flanders (the northern part of Belgium) the 1970's and 1980's are often described in architectural historiography as a period of crisis, referring not only to the economy but also to the poor architecture in general, with the exception of some small-scale, private initiatives. This paper goes against this view and highlights the heritage value of the public architecture from this period, focusing on three public projects in the city of Ghent, in which architect Jan Tanghe was involved. More specifically we want to demonstrate how these projects were influenced by the modernist legacy, as well as by the specific historical context of Ghent.

From the late 1960's onwards public architecture in Flanders – as elsewhere – increasingly diversified. Though functional modernism remained the frame of reference – most designers of public buildings in the 1970's-1980's started out their career as modernists or were educated in that idiom – several buildings showcase interesting departures from the modernist paradigm. Particularly revealing are some largescale projects with a long building history that show the gradual metamorphosis of modernism into new tendencies such as structuralism.

Closely related to this departure from modernism is the reference to the historical townscape. This reference includes formal aspects such as materiality, spatial siting, volumetry and proportions. Though some projects still imply a blunt tabular rasa, often associated with functional modernism, several buildings show different strategies to dialogue with the existing urban fabric: from a disappearing act over a symbolic reply to a delicate balance between architectural autonomy and urban integration . Furthermore, a remarkable number of valuable buildings from the 1970's and 1980's already include the adaptive reuse and repurpose of the existing building stock. Finally many projects not only referred formalistically to the historical town, they also contributed to the functional urban renewal of Ghent.

1. INTRODUCTION

Recently the Flanders Heritage agency conducted a documentation and protection of post-war built heritage in the city of Ghent, Flanders (the northern part of Belgium). While the project started with an explicit focus on modernism, it soon became clear that the research period (1945-1985) offered a much more diverse heritage, including the modern classicism of the 1940s-1950s and a wide array of postmodern tendencies from the 1970's and 1980's. This more recent period, from the mid-1970's until the mid-1980's, is often described as a period of decline in the architectural historiography of Flanders, referring to the economic crisis but also to the poor architectural quality.

In the Ghent project we aimed at an unprejudiced evaluation of the building stock from these more recent periods, regardless of personal or more general taste. To achieve this, it proved crucial to supplement the canonized, architectural historiography with bottom up research: field work, interviews with original clients and designers, archival documents and contemporary local publications and documents, such as the 1988 Ghent exhibition and publication "*Architectuur als Buur*" (Architecture as Neighbour), as well as recent websites and social media accounts on postwar architecture.

The result is an architecturally very diverse selection wherein buildings from the mid-1970's till the mid-1980's prove remarkably well represented. 62 buildings from that decade were added to the inventory of immovable heritage on a total of some 200 or approximately one third. And of the 20 protected monuments five date from that recent decade, one quarter. Even more remarkable is the large share of public buildings in this selection of young heritage, given the overall negative perception of this type of architecture amongst architectural critics of the period, as well as recently.[1]

The cause for this so-called malaise in public architecture is found in the increased political interference in the choice of architects (based on political affiliation, rather than competence) and in the insufficient financing, resulting in the endless delay and reworking of projects. One example of this negative perception in Ghent is the Belgacom tower **(Fig. 1)**, realized between 1971 and 1980, right in the historical town centre. Although there's recently a growing appreciation for this type of brutalism, it was still voted as the most ugly building of Ghent a couple of years ago. It is indeed a late and very blunt example of large scale modernism. Furthermore the realisation had an air of fraud and inappropriate political interference as the contractor was appointed without public tender and the competent minister Edward Anseele jr. had to resign because of it.[2]

However, the focus on cases like this conceals a much more varied palette of public projects, realised in the historical town centre of Ghent during the 1970's and 1980's. Stylistically the disappearance of functional modernism as a leading tendency in the late 1960's opened up a broad architectural spectrum, ranging from architectural movements such as structuralism and postmodernism, to a more general plea for small-scale interventions, user participation and the conservation of the historical urban fabric. In many cases

this change is visible in the oeuvre of individual architects and even in the realisation process of larger projects such as public buildings.

To highlight the characteristics and the qualities of this recent public architecture this paper will discuss three projects in which architect Jan Tanghe was involved. As a founding member of the multidisciplinary design firm Planning (later: Group Planning) he is one of the most influential architects in Belgium of the second half of the twentieth century. However, his trajectory and realisations in Ghent are also quite representative for many other architects.

2. A SLOW AND CO-CREATIVE PROCESS

The first project, the Provincial Trade and Language Institute **(Fig. 2)**, is located just outside the historical town centre, close to the medieval Bijloke hospital.[3] It was built on a swampy terrain, next to the river, on the site of a former cement tile industry. The complex was designed by Jan Tanghe (1929-2003) in cooperation with Francis Serck (1929-2020). Both were trained at the Saint-Lukes architectural school in Ghent between 1948 and 1953, at a moment when the international modernist style made its appearance in the school program. After graduating Jan Tanghe did internships at the office of Paul Felix and Peter Callebout, two of the most influential modernist architects in postwar Flanders. Francis Serck did his internship at the Paris architectural firm of none other than architect Auguste Perret.

Serck and Tanghe received the commission for the Provincial Trade and Language Institute in 1960 after winning a national architectural competition but the final building of the complex wasn't inaugurated until 1985, 25 years later. During those 25 years the project was built in three large phases. Unsurprisingly, their initial design and the first building phase (1966-1969) show a strong influence by postwar modernism and specifically by Arne Jacobsen, for example his town hall of Rodovre (1952-1956). The complex consists of a simple orthogonal composition of rectangular horizontal volumes, each assigned a specific function, arranged around a courtyard and built on pilotis with a skeleton construction allowing for a free plan. Long curtain walls in combination with completely enclosed end façades, carefully designed stairs and long canopies that form a transition from outside to the interior, are other modernist features.

During the second phase (1977-1978) and the third phase (1981-1985) certain formal and technical aspects of this modernism were retained, for example the concrete skeleton construction and the curtain wall. Yet the overall setup and the formal elaboration of the complex deviated increasingly from the original design plans, due to the evolving needs of the school and as a response to the changing architectural climate. For the third phase the architects were deeply influenced by the brutalist aesthetic of buildings like the Boston town hall by Gerhard Kallmann and Michael Mc Kinnell (1963-1968) and the structuralist theories of the Dutch architects Aldo Van Eyck and Herman Hertzberger. The first influence translates in a bold and complex, brutalist volumetry with cantilever parts on the outside. The structuralist

emphasis on user perspective influenced the very open and diverse interiors of the buildings with loosely defined, non-hierarchical spaces that could be claimed by the users at their discretion.

Though one can deplore that the initial modernist design was not fully realised, what took its place is at least as interesting. As such the endless reworking of the plans is not simply to be judged as unfortunate. It gave the designers the opportunity to respond to the changing needs of the program and to look beyond the issues of the day, creating a durable whole. Similarly, budgetary constraints cannot automatically be associated with a limited creativity or quality, on the contrary. The fact that two freshly graduated architects were assigned such a large scale project with a radical modernist design in the first place, was probably due to financial aspects, at least partially. Given the more conservative view of the client (the Province) and the competition program a more traditional design would have been expected.[4] However, the jury report on the Tanghe-Serck design stated that the extremely sober architecture and the simple construction would undoubtedly influence the cost in a positive way. Also when reworking the third phase of the complex, the client was probably less impressed by the structuralist theories of user perspective and the brutalist aesthetic than by arguments of time and cost efficiency that were made by the architects. The cantilevered floors of the main building for example were justified by financial arguments (allowing to save on blinds and air conditioning) as well as the use of concrete bricks instead of traditional ones in the interior.

Did these young architects receive this important commission because of their competence and quality of design, or because of (political) connections? Irrespective of the answer to this question, this project also illustrates that the architect is only one cog in the machine. Apart from budgetary restraints made by the client and the influence of several administrations on such a public project, many actors intervened. For this projects we can refer to specialists like the stability engineer who – during the third phase – was responsible for defining aspects like the cantilever parts on the outside and the pillars with stairways on the inside. Equally important are executive firms like Chamebel and La Brugeoise & Nivelles who designed and executed the curtain wall, a dominant feature that groups the different buildings phases into a unified whole. Exactly this idea of architecture as a co-creative process would become the base of Jan Tanghes later practice with (Groep) Planning, one of the first multidisciplinary firms in Belgium.

3. A SUBTLE BRUTALISM

A second public building that was designed by Jan Tanghe (Groep Planning) and Francis Serck in Ghent is an administrative wing for the province, realised between 1968 and 1971, right in the historical city centre, next to the representative province house **(Fig. 3)**.[5] Whereas the province house was delivered only a decade earlier in a pronounced historicist language, Tanghe and Serck opted for an outspoken contemporary façade architecture that can only be described as brutalist: a so-called honest use of materials

4. The competition programme asked for a distinguished, serious and sober architecture, avoiding fantastic, transient fashions ("*een streven naar voornaamheid, ernst en soberheid; zij zullen zoveel mogelijk fantasistische (sic) formules die veeleer de expressie zijn van een voorbijgaande mode weren*") at a moment when the Province put her new, traditionalist main building into service **(Fig. 3)**.

5. "Administratiegebouw van de provincie", INVENTARIS ONROEREND ERFGOED, accessed May 1, 2024, https://id.erfgoed.net/erfgoedobjecten/24741.

with repetitive prefabricated concrete beams and T-shaped columns, framing simple wooden window panes, a bold, expressive façade, compared to the more flat and immaterial curtain walls of modernism.

Yet despite this brutalist features the building is elegantly integrated in its historical surroundings. Respecting the façade silhouette and building line, making use of traditional architectural compositional elements such as a clear bay structure, customized corner bays with protruding, staircase turrets as a transition to the adjacent buildings, and a classic three-part structure with a socle, middle part and a (originally reclusive) roof floor. Moreover, the prefabricated concrete elements seem to communicate with the blue limestone bosse portal of the province house across the street.

Perhaps even more telling than the building itself are plans that remained unexecuted, made by the same architects in 1973-1974. These plans relate to a second building phase that would expand the complex up to the next street, with a similar brutalist façade architecture. However, these plans were finally discarded because it was decided that the existing buildings (19th-century neoclassicist houses) were worth keeping. Instead the adjacent house was incorporated in the existing complex. Again the phasing and the long term of the project yielded new insights, in this case a heritage-reflex.

4. (RE)BUILDING THE CITY

The third and last public building that was realised in Gent following a design by Jan Tanghe (this time in cooperation with Paul Lievevrouw) consists of a police station **(Fig. 4)**, situated in the dense fabric of a historical living quarter.[6] Designed in 1981 and delivered in 1996 this project again has a long building history. The building lot – a complete building block in between four streets – was historically the site of a 17th century monastery that was largely rebuilt in the 19th century. In recent decades it had been repurposed as police barracks with little respect for the historical architecture, for example by providing parking lots.[7] Hence it was decided to completely demolish the existing buildings and replace them with a new construction.

The architecture can be seen as typical for postmodernism in Flanders (and by extension in Belgium).[8] It blends in with the 19th-century neoclassicist bourgeois architecture of the surroundings with two or three floors (depending on the street), hipped roofs, a plastered façade on a socle in blue limestone, a horizontal structuring of the façades with cornices and strings, vertical structuring with pilaster strips and simple columns, carefully worked out corner solutions, traditional wooden window panes and decorative metal fencing. Yet at the same time the architecture is clearly contemporary through the unusual use of colour and the detailing. Despite the large scale and architectural variety, the complex is also clearly recognizable as a whole, in the first place because of the strong symmetrical lay out, which also contributes to a certain formality or monumentality, befitting the function as a police station.

In a nutshell the architecture successfully balances between urban integration and architectural autonomy. On a larger scale the complex restored the historical building block that had been compromised the previous

decades. A few small setbacks from the building line provide space for some greenery, privacy, light and variety. Equally important as the architectural form and town planning is the interaction between private, semi-public and public space, mainly with see-throughs and a courtyard.[9] Finally the program is also worth mentioning, as this complex combines the function as a police station with some 14 dwellings, as such contributing to the urban renewal, treating the city as a work space as well as a living space.

5. CONCLUSION

The three case studies that were dealt with in this paper confirm that public building projects during the 1970's and 1980's were often marked by long execution periods, phased executions, changes and budgetary restraints. However, these factors weren't solely detrimental but could also contribute to the quality, public support and sustainability of these projects. By looking beyond the issues of the day the projects proved forward-looking. An obvious example is the administrative building of the province where the plans for the expansion of the brutalist building were abandoned in favour of adaptive reuse and repurpose of the existing building stock, anno 2024 more relevant than ever.

It is clear that public architecture from this recent period is all too often reviled on the base of a few notorious building projects. Behind these oversized failures a lot of projects were realized that demonstrate an adaption to the human scale and to the context of the historical town. Apart from their formal appearance, be it modernist, brutalist or postmodern, they often contributed to the urban renewal, turning Ghent in a few decades from a place of decay and high vacancy rate into one of the most sought-after living environments of Flanders.

9. This attention for the private, public and semi-public sphere is also present in the Provincial Trade and Language Institute as this complex functions as a crossing between two streets, and offers an enclosed but publicly accessible courtyard.

Internationally this type of government architecture is increasingly recognised as heritage, for example in the Netherlands. Although the planning and political context there is quite different from Belgium, some similar heritage can be detected.[10] One example is the National Service for Archaeological Research in Amersfoort (1976-1987): a complex that is perfectly integrated in the historical town centre in siting and volumetry but clearly contemporary in the concrete façade architecture (strongly resembling the administrative province building in Ghent). This building is on a list of some 16 government buildings from the period 1963-1990 that were already in 2004 designated as "inspiring" by the Chief Government Architect of the Netherlands. Twenty years later none of these buildings have yet been designated as a national monument but most have become local monuments and – most importantly – none have been demolished.

The three buildings which are discussed in this paper have recently been recognized as inventoried immovable heritage, as were 60 other buildings from the mid 1970's till the mid 1980's in Ghent. The Provincial Language and Trade Institute is also protected as a monument. A future research project on similar architecture in smaller towns and villages in Flanders will hopefully further our understanding and appreciation of this recent heritage.[11] ■

BIOGRAPHY

Evert Vandeweghe (PhD in Art Sciences at Ghent University, 2013) is an architectural researcher at the Flanders Heritage agency, documenting and protecting the heritage value of 20th-century architecture such as social housing in Flanders and postwar buildings in the city of Ghent. His research fields include heritage care, architecture and town planning of the 19th and 20th century, as well as the intersection between architectural history and representation. In recent years he has also focused on the re-evaluation and management of historical mills and industrial heritage.

MODERN URBAN LANDSCAPE: TRACES OF IDENTITY, VECTORS OF SUSTAINABILITY. THE CASE OF THE MATTHEI NEIGHBOURHOOD IN OSORNO.

HUGO WEIBEL FERNÁNDEZ
UNIVERSIDAD DE LOS LAGOS, CHILE.

#18

ABSTRACT

The study aims to collaborate on constructing urban knowledge with cultural belonging. It seeks to identify and characterise the current state and usage of spaces and architectural types in the Matthei neighbourhood, a modern heritage urban landscape. The goal is to understand the role of said landscape in constructing a sense of belonging to generate knowledge that guides recommendations for improvement aimed at reinforcing aspects of uniqueness and identity and promoting sustainable updates.

The methodology included fieldwork, consisting of tours to identify, delimit, and gather information on the current state and usage of spaces and intentional photographic records focusing on public areas and modern architectural types. In addition, it involved analysis through observation and critical interpretation of the visual content and the development of a plan for the current state of space and modern structures. Sociology played a role through the creation and application of participatory cartographies and interviews to gather perceptions and assessments from neighbourhood residents. Results of the preliminary tour showed that the urban layout began as a garden neighbourhood, equipped with tree-lined public spaces and curved streets that created a particular spatiality with a marked sense of interiority. This novel urban configuration facilitated the practice of modern ways of life. Several houses adopted new stressed architectural forms, blending modern aesthetics with local factors.

However, this peculiar landscape is undergoing numerous transformation processes: Public spaces are deteriorating due to poor maintenance, and inadequate treatment is jeopardising the integrity of these assets. The single-family housing complex is changing its function and its overall characteristic appearance. Establishing commercial uses alters the modern spaces and structures within the neighbourhood, affecting its dynamics and residential way of life.

1. PROBLEMATIC OF THE TOPIC

The landscape, which encompasses both the tangible and intangible dimensions of culture, is presented as a "heritage bearing past significations"[1] and as an integrative synthesis of the interventions made within an environment.[2] This project investigates the residential urban landscapes of local modernity, using the Matthei neighbourhood in Osorno as a case study. It seeks to observe their spatial and architectural components, and the meanings and cultural values assigned to them by their inhabitants, which help define habitat and shape its identity.[3]

2. STUDY RELEVANCE

The proposal addresses a research area pertinent to understanding the complexities of inhabiting contemporary urban landscapes. It is relevant as it contributes to enhancing our understanding of the landscape as a construct of identity and a bearer of a sense of belonging, which are crucial aspects in achieving sustainable urban evolution.[4] Modern residential landscapes, as cultural phenomena, constitute essential elements in forming identity[5] since they provide individuals with components of self-recognition, fostering a sense of belonging within a community.[6] These landscapes are both material and immaterial constructs where the specific practices of their communities have been "sedimented" and manifested.[7] Studying these landscapes yields insights into "individual and community identity needs,"[8] enhancing quality of life and promoting contemporary social sustainability.

3. OSORNO MODERN LANDSCAPE

Since the beginning of the 20th century, Osorno has been regarded as a paradigm of regional progress, with its inhabitants pioneering "the future direction of the region and of Osorno as a modern city."[9] This dynamic, which was most pronounced between the 1930s and 1950s, facilitated the early stages of modern urbanisation, characterised by a collaborative effort between architecture and landscape architecture under the regulatory framework of the Osorno Transformation Plan. This plan, developed between 1929 and 1930 by the German landscape architect Oscar Albert Prager, had various impacts through its partial implementation. Its focus on landscape design significantly influenced the development of public spaces in Osorno, as evidenced by the fact that 10 out of 16 plans within the Transformation Plan were landscaping proposals for public spaces.

Prager's vision for urban development was rooted in the principles of Civic Art, an urban discipline influenced by the Arts and Crafts movement and Camilo Sitte's artistic urbanism. This approach enabled him to modernize while respecting the lifestyle aspirations of a local cultural group, considering "the manifestation of the moral and aesthetic truths of the classical tradition, along with the rational incorporation of modern needs within our cultural heritage."[10] Within this context, the Matthei neighbourhood emerged as a modern garden suburb for the small city of Osorno, which had fewer than 20,000 inhabitants at that time.

Today, a century after the inception of Osorno's modern urban landscape, the remnants of these modern constructs are still discernible, and many remain in active use. These elements form part of the ongoing local process of continuity and change, or "renewed continuity." [11] Intertwined with remnants of preceding and succeeding urban landscapes, these traces contribute to the rich diversity of Osorno's landscapes, including the Matthei neighbourhood.

4. OBJECTIVES

By approaching the study of the Matthei neighbourhood from a landscape perspective, we aspire to generate urban knowledge with cultural relevance and valuable information to support the updating of this local landscape. Our goal is to understand "how the community accepts the habitat that sustains it and sees itself reflected in it."[12] We consider this approach to the local urban landscape as an exploratory proposal to identify some defining attributes of the Matthei neighbourhood. This focus renders it a subject of study that has yet to be explored.

The expected objectives include:

a) Identifying and delineating the modern residential urban landscape unit corresponding to the Matthei neighbourhood;

b) Conducting an intentional photographic record of its spaces and modern architectural types;

c) Characterising the configurations of spaces and architectural types, their current state, and uses;

d) Observing the role of the landscape in constructing a sense of belonging;

e) Generating recommendations to reinforce aspects of identity and uniqueness, promoting the sustainable updating of the neighbourhood; and

f) Refining the modern landscape study technique for future applications.

Some questions raised include: What physical characteristics does the landscape of the Matthei neighbourhood present as a built, in-use trace of local modernity? Is it possible to view the modern landscape of the Matthei neighbourhood as a vector of identity and contemporary sustainability? What role does it play in building a sense of belonging, local quality of life, and sustainable urban evolution? How could it contribute to Osorno's identity projection?

A current problem we foresee is the increasing speed of its transformation processes and the consequential mutation of the neighbourhood from a purely residential area to one where commercial and service activities have gradually been established. This shift leads to the arrival of non-residential inhabitants whose commercial activities alter daily life and the original built landscape, transforming properties for new purposes and thereby affecting the built structure, social network, identity, and sense of belonging.

5. METHODOLOGY

The exploratory methodology of spaces and architectures of the Matthei neighbourhood consists of fieldwork. It includes carrying out urban exploration tours to identify and delimit this landscape unit and gather information about

its condition and current uses. At the same time, the execution of intentional photographic records focused on public spaces and modern architectural types is taking place. The sampling considered recording the diversity and wealth of the information. These tasks are, to date, what we have begun to carry out. Subsequently, the method contemplates organising the collected material to proceed with its critical interpretation through observation of the visual content. The methodology also considers the development of a plan for the arrangement and links of modern architecture and public spaces, the plan of modern built footprints. Sociology plays a part through the application of participatory cartographies and interviews with the neighbourhood's inhabitants regarding the meanings and valuation of modern traces.

6. PRELIMINARY EXPLORATORY TOUR

Having only part of the work to hand, some observations can be made. Based on the information gathered from tours and preliminary photographic records, it can be observed that, unlike the checkerboard layout of the historic centre of Osorno, the layout of the Matthei neighbourhood features wide streets and tree-lined curved paths. Its spatial design is characterised by a free geometry that determines a marked sense of interiority that identifies and sets its spatial experience apart from surrounding sectors. This characteristic, added to the fact that this subdivision only admitted plots for isolated single-family housing with a front garden and large public spaces for circulation and permanence, including three squares, gives it a unique identity.

6.1 HYBRID SINGLE-FAMILY HOME

The novelty of this urban configuration soon became a scene for the practice of modern lifestyles, and as such, many of the single-family homes built incorporated new architectural forms while also taking local factors into account. The author observed that modernisation processes and local architectural traditions have been superimposed on these houses, resulting in a particular form of local modern expression. Along with reflecting the reality of our Latin American cities, in which "traditions have not gone away, and modernity has not just arrived,"[13] the southern context has also influenced them resulting in architectural expressions marked by new dialogues and synthesis **(Fig. 1)**. This heritage legacy, still in effect, became an architectural identity in conflict with tradition and modernity, whose tensioned or hybrid forms have made use, in each case, of a pool of available architectural elements, modern and traditional, used flexibly to design the architectural expression of these homes.

6.2 PUBLIC SPACE

The constituent elements of the Matthei neighbourhood's public space make up a spatial network of circulations including roads and sidewalks, and permanences consisting of squares and neighbourhood squares, whose sense of unity is verified in a continuous network of public spaces linked and visually integrated into the front gardens of the homes.

13. Néstor García Canclini, *Culturas híbridas. Estrategias para entrar y salir de la modernidad* (México: Grijalbo, 1990).

This plot or public "green system" included, as spaces of permanence, a small square, known today as the Plazoleta del Obispado, and originally as Miraflores and two neighbourhood squares, the first of which is called Prager square, originally Argentina **(Fig. 2)** and the second called Suiza square, originally Adolfo Matthei **(Fig. 3)**. These spaces are strategically located, positioned at the ends of the neighborhood, and feature a notable plant collection, highlighting the landscape presence of various large tree species. The experiences of space are different in each plaza. Square Prager's design considered the topography, which slopes gently towards the east. The space was organised based on an extensive plane of grass surrounded by a peripheral paved circuit that assumes said topography. This circuit not only allows access to the free link with the vast interior grass space, but also links with two other relevant systems. On the one hand, the small perimeter squares are arranged in corners and on each side of the square, whose particularity is that, when facing away from the square, they connect with the neighbourhood.

On the other hand, the circuit is related to a system of unpaved paths that zigzags into the square, intersecting with the trees. Finally, the trees do not seem to follow an apparent geometric pattern. However, they are all arranged close to the edges, leaving the central space clear, thus configuring a central void and a clear boundary. Due to the arrangement and relationship of these elements, the interior space of this square manages to block out the city noise.

Another way of conceiving the central open space was tested in Suiza square. The longitudinal proportion of its space gave rise to the design of a built central axis, running the length of the entire square, incorporating elements such as a staircase and a rotonda. The space is cleared on both sides of this longitudinal axis, like a *vert tepis*. All three species are arranged around the perimeter, defining and enclosing it. On the contrary, there are no trees planted at the ends of the square as the neighbouring housing complexes constitute the visual boundary. Finally, similarly to Prager square, a peripheral paved ring is designed, linking the square with the surrounding neighbourhood.

The Plazoleta del Obispado, triangular in shape, uses similar design files. It is also organised by a perimeter pavement strip surrounding a grass plane. In addition, it presents an unpaved circulation system that enters the green centre from each side, joining the centre, where it makes up a living space. This circulatory system's seats are oriented towards the square's interior. All trees are arranged on the grass plane, close to perimeter areas. A vertical conifer planted at the southern vertex of the square stands out, marking its triangular shape. Currently, the replacement of tree species with shrubs can be observed.

In addition to these squares, the public "green system" included wide pedestrian sidewalks that link them. The subdivision defined proportions, location, and modes of relationship between sidewalks and green strips and the tree planting location (sometimes implemented with specimens of foreign origin), which characterised the streets of this new residential sector as a notably greener space than other sectors. Prager announced in the text of the Osorno Transformation Plan that "By making the plantations with a certain art, amazing effects are obtained, similar to a park."[14]

7. AFTER PRELIMINARY EXPLORATION

We have observed that the particular urban landscape of the Matthei neighbourhood would be of interest as an identity construct. This particularity is at risk given the current processes of change and degradation to which the neighbourhood has not been immune.

Along with the particularities observed in architecture and public space, it has also been observed that the neighbourhood has begun to suffer from the processes of transformation and deterioration. Due to aging or poor maintenance, the squares, small squares, and street profiles deteriorate. Trees have been mutilated or cut down because they have pathogenic processes. The poor treatment and lack of prevention have put the integrity of such assets at risk. For its part, the housing complex has progressively mutated its function and, with it, also its characteristic overall image. The installation of commercial premises has visibly affected the neighbourhood's structures and spaces, their way of residential life, and neighbourhood dynamics. However, this group of homes still collaborates in the configuration of this particular stressed modern urban landscape, leveraging the local identity image and preserving the modern historical memory of Osorno.[15] Maintaining their residential use, these homes continue to foster a sense of belonging and social sustainability.

We have yet to obtain meanings and valuations regarding this modern landscape by its inhabitants. In doing so, we will have the information necessary to allow us to make recommendations for improving this local landscape, reinforcing aspects of uniqueness, identity, and quality of life that promote its sustainable updating. Given the state of the Matthei neighbourhood, the study and assessment of its local modern architecture and spaces is urgent. ■

SUN, SPACE, GREENERY AND GLOBAL WARMING. THE POTENTIAL OF THE MODERN HOUSING LANDSCAPE IN CLIMATE CHANGE MITIGATION

RODRIGO GERTOSIO SWANSTON
DOCTORADO EN ARQUITECTURA Y ESTUDIOS URBANOS,
PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT

Walking through some modern mid-century housing complexes, a recurring pattern can be observed. Regardless of their shape, size and location in the world, the following is repeated: blocks surrounded by large areas of permeable soil and, on top, vegetation-covered paths and squares leading to intercommunal avenues. Both features, from an Urban Ecosystem Services (UES) approach, hold instrumental value in climate change, as both attributes are the basis for reducing urban heat islands and flood risk. Unfortunately, the lack of research demonstrating this in such housing developments has led to overlooking this capacity and a lack of solid arguments for its conservation.

Through the combination of remote sensing instruments LST, NDVI, and fieldwork, this paper will demonstrate how the maximum temperatures are lower inside than outside their perimeters and the role played by urban morphology for this to occur. The case study includes a group of nine modern architecture housing complexes made up of isolated blocks in the municipality of Ñuñoa, Santiago (Chile). It is possible to establish a causal relationship between the large areas of permeable soil, the fragments of continuous vegetation between the buildings, and the lower surface temperatures.

1. INTRODUCTION

Numerous modern architecture housing complexes are recognised as heritage sites worldwide, valued for their tangible and intangible attributes. Unlike most heritage built before the 20th century, these complexes' significant attributes lie not in their buildings but in the spaces between them, specifically their public spaces and green areas with permeable soil. An essential aspect of their authenticity lies in the environmental considerations embedded in their designs. Revisiting the concept of authenticity and modernity through ecological, feminist, and postcolonial lenses offers a nuanced understanding of modern architecture.

Technological advancements now allow us to quantify the environmental considerations in these designs, emphasising their relevance in the context of climate change. Examining the modernist approach to sustainability allows us to appreciate and preserve the instrumental value of these architectural works in addressing current environmental challenges. However, preserving this "green heritage," a term used to describe the unique and irreplaceable green spaces within these modern architectural housing complexes, presents challenges due to three primary issues. First, there is a lack of knowledge on preserving these green spaces amid climate change. Second, maintaining the intricate mix of vegetation in public and private areas requires significant resources. Third, climate change effects, such as rising temperatures, drought, and floods, complicate preservation efforts. These green spaces, as they are living entities, they have rapid life cycles and swift deterioration, underscoring their fragility compared to buildings.

Despite these challenges, ongoing vegetation and permeable soil lessen global warming effects, such as urban heat islands and flood risks. This article suggests that demonstrating the instrumental value of these green spaces in tackling climate change can aid their preservation. By emphasising their ability to reduce maximum temperatures, strategies can be developed to conserve their vegetation and the environmental benefits they provide.

This paper combines remote sensing instruments NDVI, LST, and field measurements to show how maximum temperatures within these housing complexes are lower than outside their perimeters, influenced by urban morphology. The case study examines nine modern housing complexes in Ñuñoa, Santiago (Chile), demonstrating how lower surface temperatures relate to building groupings and surrounding vegetation. The study also identifies how to adapt existing vegetation to enhance ecosystem services and benefits that nature provides, such as clean air, water, and food, contributing to human well-being in these complexes.

The article is divided into three sections: 1) Introduction, 2) Permeable soil, continuous vegetation, and lower temperatures: The ecosystemic potential of modern housing complexes, and 3) Conclusions.

2. PERMEABLE SOIL, CONTINUOUS VEGETATION AND LOWER TEMPERATURES IN MODERN HOUSING COMPLEXES

It is well known that there are two responses to counteract the impacts of climate change: mitigation and adaptation. Among the adaptations, one

of the most important is the creation of urban green infrastructure, such as parks and biological corridors, as they contribute to improving air quality,[1] mitigate the impact of heat waves[2] and reduce the risk of flooding by absorbing rainwater.[3] The latter corresponds to ecosystem services of climate regulation. Ecosystem Services is an anthropocentric and relatively recent concept, referring to the direct and indirect benefits people obtain from nature's processes in urban contexts.[4] In this sense, it does not hide the interest of instrumentalising that ""something" for material or immaterial human benefit. It refers to the instrumental value based on its usefulness or capacity to achieve specific desired results.[5] This concept places human needs and preferences at the centre of the ecological universe, measuring the health of ecosystems in terms of their capacity to benefit humans, and thus, we understand them as "services."[6]

It is important to note that regulating SEUs is closely related to the soil cover in a given area. It refers to the different types of vegetation, permeable surfaces (able to absorb water), and impermeable surfaces (soil sealed by concrete, asphalt or other, which prevents water from penetrating the subsoil).[7] On the latter, walkways, streets, buildings and parking lots directly affect the soil's capacity to absorb water and regulate the hydrological cycle, and, consequently, areas with a high proportion of impervious surfaces can give rise to flooding and runoff problems, negatively affecting the provision of regulating ecosystem services. In this sense, scientific evidence amply supports the importance of permeable soils in urban contexts. Furthermore, vegetation in urban forests, parks, squares or large green areas also plays a vital role in the provision of regulating services. In this sense, the size, spatial distribution and accessibility of trees determine the quantity and quality of ecosystem services they provide,[8] since they provide habitats for fauna, promote biodiversity and pollination,[9] and facilitate ecological processes essential for the functioning of the ecosystem.[10]

One of the most effective ways to reveal the presence of Ecosystem Services is by using satellite remote sensing tools. This technique has been widely used to calculate surface temperatures, location and vegetation health and to identify the planet's different land covers. Thus, for this research, two remote sensing tools used, the LST index and NDVI. The first one refers to the temperature of the earth's surface in a specific geographic area. For the case of Santiago, Chile, the seasonal average of the last summer, from 12/21/2022 to 03/20/2023, was obtained. The second one is an indicator of photosynthetically active biomass, which allows one to locate vegetation spatially, quantify its density, and determine its forms of clustering or fragmentation.

In line with the above, large areas of permeable soil and continuous vegetation can be distinguished in numerous housing complexes typical of the Modern Movement built in the mid-twentieth century. Despite the diversity of their shapes, sizes, and locations worldwide, it is possible to identify extensive areas of permeable soil and vegetation comprising grass, shrubs, and trees of various sizes and species immediately surrounding their buildings. These characteristics warn that, beyond the scenic beauty caused

by the abundant vegetation, it is possible to hypothesise about the presence of Ecosystem Services of climate regulation thanks to the abundance of permeable soil and continuous vegetation in each of the cases.

In various municipalities in Santiago, Chile, numerous medium-rise housing complexes were built from 1936 by the Caja de Habitación Popular and the Corporación de la Vivienda (CORVI). Particularly in the municipality of Ñuñoa, located in the eastern sector of the capital, there is a group of 9 housing complexes made up of semi-detached houses and isolated blocks of 4 and 5 floors along Grecia Avenue. This area is part of a large-scale urban project typical of 20th-century modernity. It corresponds to the expansion of urban areas towards the eastern periphery on agricultural farms. Consequently, it represents both an urban planning and architectural endeavour, in which it is possible to compare different projects carried out by different architects and therefore, different forms of both their buildings and their arrangements within an area built in a similar period.

Under the LST, it is possible to observe three phenomena related to surface temperature. Firstly, within all the blank polygons, which indicate the typology of isolated blocks, the temperature is lower than outside them. These differences between inside and outside vary; for example, they are more explicit in the right sector of the frame than in the left sector. It is also observed that these lower temperatures exceed the limits towards the sectors constituted by semi-detached houses (a).

Secondly, it is also observed that in all the selected assemblages, there are continuous fragments of lower temperatures along their perimeter avenues, especially in the right sector of the frame, mainly along the diagonal avenues (b) and along Irrarázaval Avenue and sector 1 of Villa Frei (c). Third, and conversely, the highest temperatures are observed as isolated fragments of varying sizes. The largest fragment is located near the National Stadium (d), while the smallest fragments appear as isolated fragments in supermarkets, shopping centres, warehouses and minor industries (e).

Figure 2 below shows the same frame with isolated pixels between 30° and 36°. This reveals another striking phenomenon. In some cases, the masses of lower temperatures seem to originate from within the polygons of isolated blocks, from which their temperature radiates (fragments 2, 3 and 5). In others, the masses of lower temperatures originate externally and encompass the sectors of isolated blocks (fragments 1 and 4). In addition, it can be seen that the green fragments (between 30° and 35° C) form distinct continuous temperature masses over sectors comprising buildings of different shapes and heights in fragments 1, 2, 3, 4 and 5. For example, the temperature range is the same in fragment 5, consisting of the 5-storey Villa Olímpica and a sector of 8 towers, measuring 22 storeys in height in the upper left corner (6). This is also the case in the upper right corner of fragment 1. Moreover, along Irarrazaval Avenue, there are numerous buildings up to 25 storeys high with very little green space, as the spectral classification model will show in the next section. Interestingly, along this fragment, the Villa Frei sector, made up of blocks and high-rise towers, has the lowest surface temperature within its context (7).

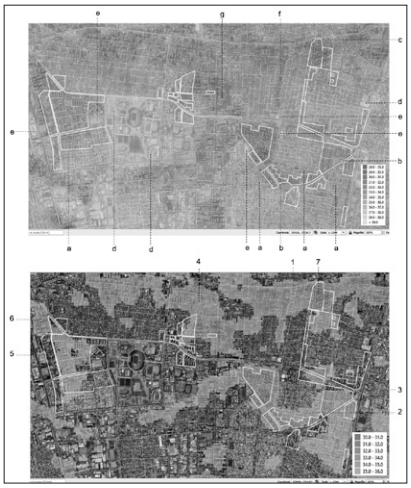

Figure 2. Top image shows LST index on 9 case studies in white polygons. Bottom image, LST index highlights temperatures between 30°C and 36 °C. © Elaborated by author.

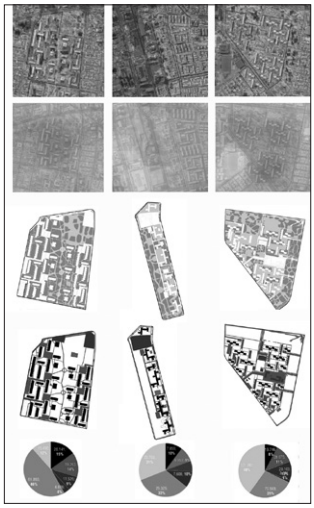

Figure 3. A comparative table between the NDVI index (top line), LST index, and permeable and sealed ground cover maps in Villa Frei, Villa Canada, and Villa Los Presidentes. © Elaborated by author.

When assessing the same sector under the NDVI vegetation index (as seen in the upper images), three housing developments showed higher indices of photosynthetically active vegetation: Villa Canadá (VC), Villa Los Presidentes (VLP) and Villa Frei (VF). As discussed above, the composition of the soil cover could play a direct role in these indices. For this reason, a field study is carried out to categorise the 3 scenarios into 2 groups: sealed soils (residential buildings, footpaths, streets, car parks, and equipment) and permeable soils (pasture and soil and Marcello).

In all 3 cases, the permeable soil surface is more significant than that of the sealed soil. In addition, almost all of the soil immediately surrounding the blocks is permeable and continuous and is only interrupted by the access paths to the blocks. Regarding the type of permeable soil cover, VF has the highest amount of grass cover (46%), and the lowest percentage is found in VLP (28%). While in VF, 100% of the ground cover surrounding the blocks is grass and in the other cases, this proportion decreases to less than half, as shown in the surveys. In terms of sealed ground cover within the total area, VF has the highest percentage (42%), followed by VC (36%) and VLP (32%). The same decreasing proportion is observed in the area covered by buildings: VF 15%, 10% VC and 8% in VLP.

However, when comparing the LST for each case, a correlation is evident between the lower temperatures and the permeable soil surfaces, particularly where the wooded and pasture surfaces are located. However,

it is striking how, in VLP, there are higher minimum temperatures despite having smaller areas of pasture and larger areas of nude soil. One possible answer is the spatial clustering of the blocks.

3. CONCLUSIONS

This study uncovers a causal relationship in modern housing complexes between permeable soil surfaces, continuous vegetation and lower surface temperatures. The spatial structure of these groups promotes significant environmental benefits, especially in mitigating the effects of climate change, such as lower temperatures. This phenomenon arises from large areas of permeable soil surrounding the buildings, which allow vegetation to form continuous fragments from the empty spaces between buildings to surrounding avenues.

Furthermore, the shape of the buildings influences the amount of surrounding vegetation, while the more significant the discontinuity in the plan, the greater the amount of green areas generated.

Considering the global nature of climate change challenges, it is essential to recognise the importance of these solutions, which are already available but often overlooked due to a lack of knowledge. Therefore, highlighting the value of these green spaces involves safeguarding their individual components and raising awareness of their instrumental role in the context of climate change. ■

URBAN VALUES HERITAGE: GILBERTO GATTO SOBRAL'S MODERN ARCHITECTURE IN CUENCA, ECUADOR

PAOLA PRETI
UNIVERSIDAD NACIONAL DE LA PLATA

FERNANDA AGUIRRE
UNIVERSIDAD DEL AZUAY

VERÓNICA HERAS
UNIVERSIDAD DEL AZUAY

ABSTRACT

Modernity emerges in Ecuador as a result of urban and developmental needs. At first, it is presented as an imposition, which has led to several debates and is also reflected in the devaluation of this architecture. Only in recent decades has the valuation of modern architecture as heritage in Ecuador become relevant, driven by policies aimed at the identification, protection and conservation of international modern heritage.

Although modernity in Latin America may be understood as a cultural imposition, this research seeks to analyse modern heritage in Ecuador as a locally produced phenomenon. The analysis focuses on the work of the architect Gilberto Gatto Sobral in Cuenca and recognises its values from a heritage perspective that looks beyond its architectural character as a modern project. In this sense, the study addresses the aesthetic value of the building from a heritage standpoint to demonstrate that the value does not lie solely in the architectural decisions but in its unique blend of tradition and avant-garde elements. It also proposes that the historical value of the works studied is directly tied to the construction of the city's history and is an example of local artisanal and traditional production. Finally, it reflects on the importance of the symbolic value that is linked to the sense of appropriation and belonging; and without which the concept of heritage could not exist.

1. INTRODUCTION

The appreciation of modern architecture as heritage in Ecuador has only gained significance in recent decades, driven by the identification, protection, and conservation policies of international modern heritage. In the country, architectural heritage has a conception strongly linked to the history of colonial and republican architecture. However, examining the configuration of our cities, the thrust for the study of Ecuadorian modernity has acquired greater importance.[1] Much of the documentation of modern heritage in Ecuador is predominantly focused on the architectural production of the capital, Quito.[2] Nonetheless, this void has been a starting point for many researchers who are currently writing about the modern heritage of other cities in the country such as Guayaquil, Cuenca, Loja, among others.

Ecuador embraced modernity in the 1930s, initially through urban planning. The professionals responsible for these first steps were foreign architects fleeing the political and military crisis in Europe at that time, or whose circumstances were related to this historical event.[3] These pioneers were followed by the first Ecuadorian professionals who could study abroad, as there were no architecture schools in the country at the time. Consequently, this led to the creation of local architecture schools and allowed for professional education within the country.

However, education abroad did not inhibit the development of a social conscience about the value of "one's own." In the works to be analysed here, it is revealed that the modern values acquired are the source to influence the environment and solve a need with their constructive processes. It is tangible evidence, therefore, of the duality of tradition and avant-garde.

MODERNITY AND MODERN URBANISM

Modernity, as a phenomenon that transforms the social, economic, and political structures of a city[4] beyond an architectural term, represents, for the city of Cuenca an impulse towards territorial restructuring. In 1947, Gilberto Gatto Sobral developed the First Territorial Master Plan based on the general guidelines of what modern urbanism had promulgated up to that point, primarily addressing the city's growth, its road communication systems, and the sectoring of commercial, industrial, and residential zones.

This had great repercussions in a social aspect for Cuenca, since even after the liberal revolution, it remained morphologically almost unchanged from colonial times, with a highly conservative and traditionalist society. For the new modernising influences, integrating into this context would not be an easy task.

Gilberto Gatto Sobral, in addition to the Territorial Master Plan in 1947, designed the city's main administrative building, Palacio Municipal, in 1954 and the local cultural building named La Casa de la Cultura in 1955, making these two the only buildings from his work that are inserted in a historic centre.

2. MODERN HERITAGE VALUES IN CUENCA

Various authors in Ecuador have studied the works of Gatto Sobral.[5] However, much of this research focuses on the unique aspects of his

1. "Within the collective culture of Ecuador's citizens, the concept of heritage is associated with historic centres and the eclectic-historicist styles they contain. However, several years ago, a number of specialised spheres began to recover the spirit of modern architecture in the configuration of our cities and in the identity of our architecture" Rosero Verónica, *Movimiento Moderno y patrimonio en el hábitat*. (Quito: Trama Ediciones, 2021).

2. "For many historians who have focused their work on Quito, the architecture and historical research of Ecuador arises and is exhausted in the capital, as they consider that what happens in the rest of the country is marginal or anecdotal." Florencio Compte *"Modernos sin modernidad. Arquitectura de Guayaquil 1930 – 1948."* (PhD diss., Universidad de Palermo, 2020).

3. Paola Preti, *"Conservación y Restauración del patrimonio moderno en Ecuador. El caso de Gatto Sobral en Cuenca."* (Master's degree, Universidad Nacional de la Plata 2023), 62.

4. Paola Preti, *"Conservación y Restauración…"*, 92.

5. To name a few researchers: Nelson Muy, Mónica Rivera, Gabriela Moyano, Carlos Villagómez, María Paula Auquilla, Paula Rodas, Vicente Mogrovejo, among others

work, highlighting inherent modern values while often neglecting the symbolic and social dimensions that contribute to the broader recognition and valuation of heritage. This article aims to shed new light on these overlooked aspects.

Gilberto Gatto Sobral's work in Cuenca and the country is an evident representation of the modern project as an urban episode, characterised by architectural and urban systematisation.[6] Gatto Sobral takes on the challenge of inserting a new way of designing in a historic city, where the recognition of the urban and built environment is his main tool.

The first connection between the two buildings is the site where they are located, Central Park. In addition, certain aspects of the urban project's design language are evident: volumetrically, the buildings consist of interconnected blocks that are easily distinguishable, separated from the pre-existences by a "breathing space" that, in turn, in both cases, allows the passage of light to the lateral edges.

The direct relationship with the street and the sensitivity towards the built environment allows Gatto Sobral to make decisions that contribute to this condition: like nearby republican architecture buildings, he creates generous portals for the Palacio Municipal, fostering a communal transition space into the building's interior.

For the Casa de la Cultura he utilises the foyer as an opportunity for a collective space within the building that provokes a direct relationship with the entrance hall of the theatre. In addition, the bridging volume that connects the two lots in which it is located, also creates a large portal on the street that divides them. In both instances, the use of these urban-scale resources allows for the pedestrian to claim the streets and relish the vivid experience of the colonial environment.

The respect for the historic environment is seemingly revealed in the way the volumes are implemented. One of the characteristics of the traditional housing typology in Cuenca is the use of internal courtyards. Gatto Sobral also implements this resource in his works creating large empty spaces inside the buildings. In the Palacio Municipal, he designs a large internal courtyard to illuminate the inner blocks adjacent to the street, while in La Casa de la Cultura, he creates such spaces both in the foyer of the theatre and the space that shelters beneath the bridge.

In addition, these volumetric decisions are not simple geometries, but results of intense constructive relationships. For example, the selection of carpentry and specific materials that accentuate the verticality or longitudinality intended by the author. This fact favours a clear reading of the buildings; for Gatto Sobral, the opportunity to insert himself as an architect in a city's historic centre and harmonise his designs with timeless architecture was a challenge, and therefore, his decisions required acute sensitivity.

On the other hand, there is an intentional artistic expression present in the constructive solutions that are part of its building language. The link between tradition and avant-garde is evident from the implementation to the construction involving local crafts, such as carpentry and blacksmithing.

6. Helio Piñón defines the modern project as an urban episode where "it is not enough to identify continuities but it is necessary to perceive relationships through visual judgments that are irreducible to the common eye". Helio Piñon Org. Teoría del Proyecto. Escritos y Conferencias. (January, 2024) https://helio-pinon.org/escritos_y_conferencias/det-teoria_del_proyecto_i58447

3. TRADITION, CULTURE AND HERITAGE

One of the main issues identified in safeguarding modern Ecuadorian heritage is its lack of recognition. Therefore, applying the concepts of conservation to it is difficult, even though its value as cultural heritage is only understood through these concepts.

This deficiency in the social perception of modern heritage is based on the idea that it is viewed solely as a value associated with the preceding architecture, and this fact is reflected even in the instructions for the registration and inventory of heritage assets of the National Institute of Heritage and Culture. Within the characterisation of the different typologies that are contemplated, modern architecture is referred to as "style" or "modernist style"[7] These labels are framed within a Eurocentric perspective that overlooks the authenticity of local production.

Regarding the local context's heritage valuation, the heritage inventory of Cuenca's protection area defines the Municipal Palace as "without architectural value" while La Casa de la Cultura is catalogued as "Architectural Value B".[8] In the first case, this cataloguing allows for transformations or alterations without any regulation, while in the second case, different conservation actions are allowed that do not modify the building in an aesthetic sense due to its contribution to the urban structure.

Why is the Casa de la Cultura known for its formal values and the Palacio Municipal is not? Both buildings have a public function, are located a hundred metres apart, were designed by the same architect under the same design strategies, and retain their original use to this day. The difference lies, perhaps, in the social appropriation of each of them, which is what gives them a real sense of heritage.

For society, La Casa de la Cultura has traditionally served as a space that nurtures and preserves Ecuadorian culture and all its forms of expression, fostering a sense of belonging. In contrast, the Municipal Palace, built to meet governmental needs, may have been perceived as an imposition, making it harder for a conservative society to accept. **(Fig. 3)**.

Until the mid-twentieth century, Cuenca remained very traditional in its ideals, religion, and customs. Civic, governmental, and commercial activities were limited to the area around the Plaza Mayor, now Central Park, and its surroundings, like any other colonial city. However, with the advent of modernity, it has been modified by new progressive trends that bring with them a new way of life, thoughts, and architecture within a strong traditionalist context. This fact could well denote a cultural imposition.

The lack of valuation makes these assets vulnerable to the constant danger of unjustified interventions, alterations lacking sensitivity, serious modifications to their aesthetic integrity, and even their demolition. This also influences the disarticulation of their context, preventing a complete understanding of the work. It is precisely at this point where its main value is found from the perspective of the modern project.

In this sense, paradoxically, although La Casa de la Cultura is formally "valued" by the national regulatory entity, its autonomous character has not

7. "It is the set of architectural currents or styles developed throughout the twentieth century. In Ecuador, modern architecture could be considered from 1950 onwards. Modern architecture has been characterised by the simplification of forms, absence of ornamentation, rationalism and functionality..." Ordenanza que determina y regula el uso y ocupación del suelo en el área del Ejido (June 2010)

8. Buildings of Architectural Value B (VarB): These are buildings that respond to a relationship with the urban fabric and are an example of culture and identity. Ordenanza que determina y regula el uso y ocupación del suelo en el área del Ejido. (June 2010)

made major interventions possible due to a lack of funds. On the other hand, the Palacio Municipal has been significantly altered, assaulted, and transformed over the years for the new uses and requirements of different mayors.

These two highlighted cases clearly demonstrate how social awareness and cultural apprehension about a building's value generate acceptance or profound rejection. This duality is strongly linked to the buildings' use and the physical and social context in which they are inserted.

Examining the heritage value of modern works from a broader perspective, it is deduced that their main value is found in the conceptualisation of the modern project. Here, the author's intention is present in each of the project's decisions and in how they relate to each other, from the programme, the facade, the distribution, zoning, construction details, formal details and most importantly, the environment.

Only by this method can we grasp the particularities of each work, which makes it unique and universal. For the modern project, the materialisation of the work makes the intention clear.[9] Therefore, considering the aforementioned, it is obvious to analyse modern heritage using the same values and attributes of modern architecture.

The aesthetic value of the building from a heritage perspective does not lie solely in these architectural decisions which we will call "attributes." Instead, its unique value lies in how these attributes merge to demonstrate the artist's intention, as "for modern or contemporary art authenticity no longer resides in the original material, but in the idea, in the intention with which it was created".[10]

The historical value is directly related to the construction of the city's history as a sample of the development, craft, and traditional practices present. The works of Gatto Sobral on display attest to a cultural exchange and its adaptability. For this reason, this value is closely linked to the symbolic value that has to do with the sense of appropriation and belonging and without which, the concept of heritage could not exist. In this way, the axes of valuation of modern heritage and the information they contain are no different to the values of the heritage that precede it but are adapted and reinterpreted.

4. CONCLUDING REMARKS

This research presents an alternative approach: understanding that modern architecture changes its condition when it is understood as heritage. Its aesthetic values move beyond mere formality and are transformed through a sense of appropriation by the culture to understand the true value of the building. By analysing their heritage characteristics, it has been possible to propose a re-interpretation of Gatto Sobral's works in the city.

However, it should be emphasised that this is not the endpoint of categorisation, but a way of redefining identity and generating a debate on modernity's heritage as a continuous part of the city's history that ought to be part of the sense of cultural appropriation. It is essential to broaden perspectives, reconsider stigmas, and reassess the terminology that has been linked with modernity and contributes to its devaluation.

9. In the words of Helio Piñon "the construction is a way of conceiving, not a technique to solve, it should not determine any solution, but propitiate decisions whose meaning must necessarily transcend it"

10. Paola Preti, *"Conservación y Restauración…"* 13.

Figure 3: Architectural draft. In the left column: the proposal for the Municipal Palace; In the right column: the proposal for La Casa de la Cultura. © Credits (Vicente Mogrovejo, 2008).

It is important to demonstrate the ability to build a quality architecture within a given environment, using the materials available, applying and developing the techniques learned, regardless of their origin. It also means validating an architectural process that we have observed and that has contributed to shaping our cities and cultural identity beyond a purely formal approach.

This reveals one of the most fundamental values of our modernity, which is intrinsic to its historical and cultural values and is closely linked to and enhances its formal, material, and scientific values; that is "universality." This concept is understood as far from being a prescriptive model, but rather the individual, local, and cultural development of global architecture. ■

ARCHITECTURE OF THE 'PROPERTY STATE': PUBLIC OWNERSHIP OF LAND & THE PRODUCTION OF THE BUILT ENVIRONMENT IN POST-INDEPENDENCE SINGAPORE

JACOB MEYERS
INDEPENDENT RESEARCHER

#18

ABSTRACT

Singapore is well-known for its commercial city-centre and successful public housing system, accommodating upwards of 75% of the resident population. Less well understood, however, is the programme of systematic 'land reform' upon which these developments were realised. Singapore constitutes what Haila famously described as a 'property state', referring to a large proportion of public land ownership, collection of land rents as public revenue, and high levels of state control of physical development. To achieve this, the state embarked on a programme of sweeping land acquisition following independence in 1965. Today over 90% of land is in public ownership. However, the spatial impact of this programme on the physical landscape has not been systematically analysed. To bridge the gap between hitherto siloed social scientific scholarship on land and post-independence architectural histories, this paper seeks to ask: how may we foreground 'land reform' as an agent in the production of Singapore's post-independence built environment? The paper begins by recounting the political roots of land reform in Singapore and its legislative basis in the sweeping Land Acquisition Act of 1966. Subsequently, it is argued that two dominant uses of state-owned land in the post-independence period, mass public housing development and public-private urban renewal projects, each embody different conceptions of land's 'value' – as public good and source of public revenue, respectively. Two case studies are highlighted, the Toa Payoh New Town and the 'Golden Shoe' financial district, to illustrate that the varied values ascribed to publicly owned land informed differing models of architectural production, including centrally planned homogeneous mass-housing and decentralised heterogeneous commercial development. In conclusion, a wider appeal is made for the analysis of land as a dominant system of social relations to elucidate myriad social, economic, and politics forces that shape the production of the built environment.

1. INTRODUCTION – THE ROLE OF LAND

Singapore's rapid urban development since its independence in 1965 is a story well chronicled. Once a colonial port city characterised by an eclectic commercial core, districts of dense shophouses, and informal kampong village settlements, by the late-20th century the country had emerged as the modernist city *par excellence*. Images of Singapore during this period invariably show rows of modernist public housing blocks and a financial centre of International Style 'podium-and-tower' skyscrapers.

Less well-known than accounts of Singapore's rapid social, economic and physical development is the programme of 'land reform' through which they were realised. Between the mid-1960s and the early-2000s, the state had acquired upwards of 90% of the land in the city-state, through a combination of inherited British Crown Land, forcible acquisition, and land reclamation[1]. Recent literature has concentrated on the significance of land reform from the perspective of urban studies and economics, seminal among which is Anne Haila's 2015 book *Urban Land Rent: Singapore as a Property State*. Haila coined the term 'property state' to describe Singapore's large proportion of public land ownership, collection of land rents as public revenue, and high levels of state control of urban development, as near-utopian, albeit *sui generis*, institutions of equitable governance[2].

Despite the incisive nature of Haila's and others' accounts of the role of public ownership of land in Singapore's development, land reform's systemic spatial impact upon the physical landscape has not received detailed attention. This absence is particularly conspicuous given that, as architectural historian Chang Jiat-Hwee and others have noted, land acquisition "empowered state agencies … to remake Singapore into a comprehensive planned modernist built environment"[3].

In recognition of the fundamental role state ownership of land played in the formation of Singapore's modernist built landscape, this paper thus poses the question: how may we foreground 'land reform' as an agent in the production of Singapore's post-independence built environment? In attempting to elucidate this relationship, the political, ideological and legislative roots of land reform in post-independence Singapore will first be briefly recounted. Following this, two modes of 'valuing' public land – for subsidised public housing and for revenue-maximising commercial development – will be illustrated through the case studies of Toa Payoh New Town and the 'Golden Shoe' financial district, respectively. In each case, it will be shown that the acquisition and specific valuation of publicly owned land had its corollary in distinct forms of urban and architectural production.

2. THE ROOTS OF LAND REFORM IN SINGAPORE

When the socialist-leaning People's Action Party (PAP) acquired full internal self-government from the British in 1959, it was elected on a platform of affordable mass housing construction, industrialisation, and economic redistribution. At the time, property ownership was concentrated among a small number of absentee landholders, comprising less than 10% of the

population[4]. Existing colonial-era eminent domain law, particularly the Land Acquisition Ordinance introduced in 1920, was seen as insufficient and legally onerous, given accommodation for legal contestation[5]. As such, radical changes to the management of land were enacted following Singapore's independence: the amendment of the constitution to exclude the "constitutional right to property" in 1965, and the enactment of the Land Acquisition Act in 1966, which together gave the state sweeping powers to acquire large tracts of private land at below-market prices[6].

The strength of these reforms lay in the wide scope for acquisition "for any public purpose"; "by any person, corporation or statutory board, for any work or an undertaking which, in the opinion of the Minister, is of public benefit or of public utility or in the public interest". Further, any contestation of acquisition was handled by a quasi-legal Appeals Board, whose limited scope meant that the act of acquisition itself could not be legally challenged[7].

Conscious of the potential for speculation driven by large-scale acquisition, the government stated that "no private landowner should benefit from development which had taken place at public expense" and "that the price paid on the acquisition for public purposes should not be higher than what the land would have been worth had the Government not contemplated development generally in the area"[8]. To achieve this, land acquisition costs were pegged at a statutory date, whereby, for example, land acquired any time between 1973 and 1986 would be pegged to 1973 prices. These principles, while controversial, laid the ground for acquisition at below-market cost while highlighting the ideological conception of any uplift in land values as created by, and therefore rightfully accruing to the state for public redistribution.

Both scholars and politicians have recognised this system as a direct infringement upon liberal private property rights, an act justified in the name of the redistributive 'greater good' and the exigencies of nation-building[9]. In defending Singapore's severe land acquisition laws, Lee Kuan Yew, founding Prime Minister and a British-educated lawyer by training, explained:

> When we were confronted with an enormous problem of bad housing, no development, overcrowding, we decided that unless drastic measures were taken to break the law, break the rules, we would never solve it. We therefore took overriding powers to acquire land at low cost, which was in breach of one of the fundamentals of British constitutional law — the sanctity of property[10].

A final key component of Singapore's 'land regime' was the separation between ownership and use. To ensure the state remained the effective owner of acquired lands, it was decided in 1968 that all land 'sold' to statutory boards, developers, or private owners would be on the basis of long-term leaseholds lasting a maximum of 99-years, after which the land would revert to the state[11]. Paired with public land ownership, the 99-year leasehold system created sufficient incentive for private development, curtailed intergenerational accumulation of wealth through property,

provided a recurrent form of public revenue, and ensured long-term planning flexibility.

3. PUBLIC HOUSING – COMPREHENSIVE ACQUISITION FOR 'NEW TOWNS'

In 1959, Singapore faced a chronic housing shortage. *Laissez faire* planning by the British, absentee landlords, and a handicapped colonial public housing programme had created squalid living conditions for a large proportion of the population. Many lived in overcrowded and subdivided shophouses in the city-centre, while other lived in city-fringe *kampong* villages of freestanding timber dwellings. The PAP viewed these conditions as impediments to both moral and physical health[12].

Deeming housing "one of the gravest and most pressing problems" faced by the new nation, the Housing & Development Board (HDB) was founded in 1960[13]. Uniquely, the Housing & Development Board Act of 1959 vested in the HDB the total scope of public housing provision short of actual construction (undertaken by private contractors), including land acquisition, clearance and resettlement, town planning, housing design, estate management, and the provision of home financing[14] – an elevation of 'built environment professionals' to central roles in spatial policy characteristic of post-war welfare states[15].

In its first 'five-year plan', the HDB focused on emergency housing provision, completing 54,430 units by 1965[16]. By the end of its second five-year plan in 1970, 36% of the population lived in 117,000 HDB flats, a figure that had risen to over 80% by the mid-1980s[17]. As scholar Chua Beng Huat has argued, the HDB had by this point formed an effective monopoly and become the de-facto universal housing provider[18].

This mass provision of public housing was underwritten by comprehensive acquisition of land. Between 1959 and 1984 177km^2, or approximately 30% of Singapore's total land area was acquired by the state, of which half was used for public housing[19]. As Haila notes, large-scale public housing provision is contingent on the availability of affordable land and a commitment to using state-owned land for the 'public good'[20]. In the case of Singapore, state land for housing was not treated as a speculative asset for profit-maximisation, but a collective asset deployed toward direct provision of shelter for the resident population.

While early housing construction was undertaken on land already owned by the colonial government, inherited Crown Land, or acquired from fire sites, large-scale provision of housing and transformation of the built landscape began in earnest with the construction of centrally planned 'New Towns' on large tracts of land newly acquired by the state[21]. In Toa Payoh, Singapore's first post-independence New Town constructed between 1966-70, 35,000 flats housing up to 200,000 people were envisaged for a 600 acre site acquired and cleared of by *kampongs*, squatters and farmers[22] **(Fig.1)**.

In physical terms, comprehensive land acquisition enabled the state to undertake sweeping top-down redevelopment and author a total modernist

environment at all scales. The smallest 'cell' of urban form – the individual plot, shophouse unit, or freestanding *kampong* dwelling; products of fragmented private property ownership – had been amalgamated into the overtly collective modernist 'block'. This replacement of private dwellings with public housing blocks as the dominant 'figure' in the 'figure-ground' relationship of new towns was revealing of the shift toward centrally planned state (rather than individual) authorship of the built environment, contingent upon state ownership of land. Architecturally, this central authorship, together with an ethos of cost-efficient construction through economies of scale, led to a homogenous landscape of austere modernist slabs.

The creation of a top-down total modernist environment, enabled by state ownership of land, extended to the urban scale. The historically unplanned rural landscape, composed of clusters of freestanding buildings, agricultural lots, and swampland, was wholly erased and rationalised. Out of this, a new 'single urban entity' was created through the organisation of the 'New Town' as comprising a main 'town centre' and subsidiary 'neighbourhood centres', while roads, schools, amenities, public transportation, and workplaces were centrally planned and constructed by the state[23]. Thus, by facilitating sweeping powers of state authorship, land reform enabled the complete spatial restructuring of a large proportion of Singapore's built landscape, replacing fractured forms of private property with a modernist New Towns.

4. URBAN RENEWAL – PIECEMEAL ACQUISITION FOR PUBLIC-PRIVATE DEVELOPMENT

In contrast with the use of land for the 'public good' of state-provided housing, urban renewal was conceived of as a mixed public-private venture to support economic growth, project Singapore's image as a 'global city', and generate revenue. The development of state-owned land in city centre through urban renewal thus entailed heterogenous physical transformations as a product of both public and private authorship.

At independence, Singapore's urban core comprised a dense mix of low-rise shophouses, mid-rise offices, and colonial-era institutional buildings. In its most overcrowded quarters, many lived in cubicles within subdivided shophouse units with highly fragmented land ownership. Notably, post-war rent control had disincentivized upkeep and maintenance of buildings, causing a significant proportion of urban building stock to fall into disrepair[24]. After accounting for the most pressing housing needs through New Town construction, the state thus embarked on its city-centre 'urban renewal' programme, through the formation of the Urban Renewal Unit (later Urban Renewal Department; Urban Redevelopment Authority) in 1964.

The Urban Renewal Department's (URD) modus operandi involved piecemeal acquisition of sites, resettlement, amalgamation of plots to create more efficient parcels, clearance of existing buildings, and packaging sites for sale of leaseholds to private developers through public tender – a process known as the Sale of Sites and later Government Land Sales (GLS) programme[25] **(Fig. 2)**. Zoning, development intensity, and design

25. Centre for Liveable Cities, *The Government Land Sales Programme: Turning Plans into Reality* (Singapore: Centre for Liveable Cities, 2021): 41.

guidelines were stipulated by the state as tender conditions, while numerous incentives were provided to encourage participation from Singapore's nascent development sector, including tax breaks and in-house government designs for direct adoption[26].

As Haila has noted, 'sales' of leaseholds involve the state acting as an effective landlord, to which developers pay long-term market-determined land rents[27]. In Singapore, these revenues are channelled into the national reserves, which are in turn managed by Singapore's sovereign wealth funds, whose returns are partially used for public expenditure. Scholars have assessed this system as an approximation of the equity-generating 'single tax' form of land value capture proposed by social reformer Henry George[28]. As a testament to this, some estimate that land-related sources comprise upwards of 50% of total annual government revenue[29].

Unlike comprehensive acquisition for public housing, piecemeal state acquisition and sale of land for urban renewal produced diverse urban and architectural outcomes. For example, in the 'Golden Shoe' – comprising Singapore's financial district – numerous sites were acquired by the state and parcelled for sale throughout the 1960s-80s **(Fig. 3)**. These were purchased by private developers, each of whom enlisted emergent local architectural practices such as Tay Joo Teck Architect, Yan Tai Tye Architects and K K Tan & Associates, who in turn each grew extensive portfolios of Sale of Sites projects[30]. Notably, state land ownership was also used as a direct 'design control' mechanism, employed by the state to regulate these private architects and cultivate a specific 'global city' image[31]. Tenders for GLS sites thus considered design merit in a 'two envelope' process – through which 'design excellence' could lead to the realisation of lower-bidding projects – while conditions of land sales featured requirements to standardise architectural character through the adoption of a standardised 'podium-and-slab' typology and alignment of street-frontage height[32].

The product of these relations was an urban landscape that was heterogeneous, albeit invariably modernist, at the building-level but highly regulated at the urban scale through state control of plot sizes and design controls enabled by state ownership of land. These developments can thus be understood as products of complex authorship, with state land reform creating the *conditions* for large-scale development, while private sector actors (developers and architects) *realised* these projects within the bounds set by the state.

5. CONCLUSION – LAND AS METHOD

This paper set out to assess the role of land reform as an agent in the production of Singapore's post-independence built environment. In doing so, it was argued that the authorial role of state ownership of land was contingent upon the values ascribed to land, which in turn produced varied physical outcomes. Where land was seen as a collective asset for the direct provision of the subsidised housing by the state as a public good, land reform facilitated top-down design and planning of homogeneous total modernist

environments in the form of HDB new towns. Conversely, where land was seen as a revenue-generating asset for privately led urban renewal, state land sales functioned in a complex authorial relationship with private developers and architects to produce a new scale of modernist urban development that was both heterogeneous but regulated by state 'design controls'.

It is hoped that by highlighting the unique case of Singapore, this paper may illustrate the need for further work in understanding the relationship between land – as the dominant system of social relations that govern our collective engagement with the physical world – and its effects on the production of the built environment. As both the physical and social 'ground' upon which architecture is constructed, there is a strong need to reclaim land as the object of both historical study and architectural practice. In recognising the agency of land, we may be able to better understand, as well as act upon, the myriad social, economic, and political forces that produce the built landscape. ■

BIOGRAPHY

Jacob Meyers works at the intersection of conservation, research, and advocacy, with a specific focus on 20th-century modernism in Singapore. He a Research & Documentation Volunteer with Docomomo Singapore and was previously an Associate Architectural Conservation Consultant at Singapore's only architectural conservation and research practice Studio Lapis. As an independent researcher, he is interested in Singaporean urban and architectural history, critical heritage, and the political economy of the built environment. He is currently pursuing his Master of Science in Architecture at TU Delft as a recipient of the Justus & Louise van Effen Excellence Scholarship.

MODERNISM AND DIPLOMACY: PAYING IT FORWARD AT U.S. EMBASSIES

JORGE SALCEDO
OFFICE OF CULTURAL HERITAGE, BUREAU OF OVERSEAS BUILDINGS OPERATIONS,
U.S. DEPARTMENT OF STATE

#19

ABSTRACT

This paper examines the vital contribution of the U.S. Department of State's Bureau of Overseas Buildings Operations (OBO) to integrating cultural heritage into America's diplomatic missions. It underscores OBO's stewardship of culturally significant U.S. properties abroad and highlights how cultural heritage diplomacy bolsters international relations. The paper elucidates OBO's mission in ensuring these properties are not just functional and secure but also embody American values and architectural excellence, thereby serving as symbols of U.S. innovation and commitment to cultural heritage.

1. INTRODUCTION

OBO is essential in managing and preserving U.S. diplomatic facilities globally, ensuring their safety, security, and resilience while also safeguarding cultural heritage. This paper examines OBO's role in cultural heritage diplomacy and its support for the broader diplomatic mission of the U.S. Department of State.

2. OBO AND ITS CULTURAL HERITAGE MISSION

2.1 HISTORICAL CONTEXT: THE SHIFT TOWARDS GOVERNMENT SUPPORT

2.1.1 EARLY DIPLOMATIC ENDEAVORS

The inception of U.S. diplomacy lacked governmental funding, relying on the personal wealth of diplomats to fulfill their missions. This began to change at the turn of the 20th century, notably with the 1896 call for Congress to furnish diplomatic residences and the Lowden Act of 1911 that initiated the construction of embassies abroad. Despite these efforts, the focus on enhancing the cultural and architectural aspects of diplomatic facilities was minimal until after World War II.

2.1.2 POST-WAR EXPANSION AND CULTURAL APPRECIATION

The aftermath of World War II proclaimed a significant expansion of the U.S. diplomatic presence globally, accompanied by the acquisition of properties and the establishment of vast collections of art and historical artifacts. These collections, often acquired through war credits, began to embody the expanding cultural footprint of the United States overseas, though initially, their cultural value was underappreciated.

2.1.3 THE ROLE OF AMBASSADORS AND ADVOCATES

The late 20th century witnessed a flourishing awareness of the intrinsic cultural value of these assets, spurred by ambassadors and their spouses who undertook significant projects to restore and enhance their residences with historical and artistic treasures. This era underscored the critical need for a more structured approach to preserving these cultural legacies.

2.2 THE BUREAU OF OVERSEAS BUILDINGS OPERATIONS: A HISTORICAL PERSPECTIVE

OBO serves as the real estate and facilities management arm of the U.S. Department of State, with a mission that encompasses far more than the design, construction, and operation of buildings. OBO's history and development are deeply intertwined with the evolution of American diplomacy, reflecting shifts in architectural styles, diplomatic security concerns, and the U.S. government's approach to representing its values and presence abroad.

2.2.1 OBO FOUNDING AND EARLY YEARS

OBO traces its origins to the early 20th century, a time when the United States began to establish a more significant diplomatic presence around the world. Prior to this period, U.S. diplomatic missions often leased properties or occupied buildings that did not adequately represent the nation's growing

stature on the world stage. The need for a more coordinated approach to managing these properties led to the creation of the Foreign Service Buildings Commission in 1926, following the passage of the Foreign Service Buildings Act. This act was a pivotal moment, marking the first time Congress appropriated funds for the acquisition, construction, and maintenance of diplomatic facilities abroad.

2.2.2 OBO EXPANSION AND ARCHITECTURAL INNOVATION

The post-World War II era marked a significant expansion of the U.S. diplomatic footprint, fueled by the geopolitical realities of the Cold War and the Marshall Plan. During this time, the U.S. government seized the opportunity to acquire properties and construct embassies that would reflect American values and architectural innovation. Notable architects, including Eero Saarinen and Walter Gropius, were commissioned to design buildings that embodied the principles of modernism and represented a departure from traditional embassy architecture. This period saw the creation of iconic structures such as the U.S. embassy in New Delhi and the U.S. embassy in Athens, which combined functional design with aesthetic appeal.

2.2.3 THE EVOLUTION OF DESIGN EXCELLENCE IN U.S. DIPLOMACY: FROM THE ARCHITECTURAL ADVISORY BOARD TO THE INDUSTRY ADVISORY GROUP

The creation of the Architectural Advisory Board (AAB) in 1954 marked a transformative period in U.S. diplomatic architecture, aiming to integrate cultural sensitivity and design excellence into embassy construction. This was a response to the inadequacies of early post-war modernist designs that failed to consider the cultural and operational contexts of host countries. Under the leadership of Director Leland King, the Foreign Buildings Office (now the Bureau of Overseas Buildings Operations or OBO) established the AAB, which included notable architects like Henry Shepley, Ralph Walker, and Pietro Belluschi. The AAB's mission was to ensure that U.S. embassies were both functional and representative of U.S. cultural and architectural innovation, mindful of local traditions.

The AAB's work led to internationally recognized U.S. embassy projects in cities like New Delhi, London, and Athens, setting new standards for diplomatic architecture that were secure yet welcoming and respectful of host countries.

Building on the AAB's foundation, OBO later introduced the Industry Advisory Group (IAG) under the Federal Advisory Committee Act. The IAG, consisting of up to 35 experts in fields such as architecture and engineering, continues to guide OBO in integrating the latest architectural innovations and sustainable practices into embassy designs. This group meets annually in Washington, D.C., to discuss and enhance the design and functionality of U.S. diplomatic facilities, ensuring they meet high security and architectural standards. The evolution from the AAB to the IAG reflects OBO's ongoing commitment to architectural excellence, enabling U.S. foreign policy objectives through innovative building designs that embrace sustainability, art, and culture. This ongoing effort not only honors the rich

history of U.S. diplomatic architecture but also looks forward to the future, adapting to the evolving needs and challenges of global diplomacy.

2.2.4 OBO'S SECURITY AND RESILIENCE: AN EVOLVING CHALLENGE

Security has been a critical focus for the Bureau of Overseas Buildings Operations (OBO) given the high number of attacks on U.S. facilities from 1975 to 1985, highlighting the need for enhanced security measures. The 1983 Beirut embassy bombing was particularly instrumental, prompting the establishment of an Advisory Panel on Overseas Security to overhaul U.S. diplomatic security protocols.

Responding to escalating security challenges, in 1998, Congress significantly increased funding for embassy security, leading to a comprehensive capital construction program to upgrade and ensure new facilities met high security standards. The 1999 Secure Embassy Construction and Counterterrorism Act (SECCA) and the 2010 Embassy Design and Security Act established stringent security standards for embassy construction, embedding robust security measures into the infrastructure.

Today, OBO's commitment to security and resilience remains unwavering, with the Bureau continuously adapting to the evolving security landscape. Through rigorous implementation of SECCA, OSPB standards, and the principles outlined in the Embassy Design and Security Act, OBO ensures that U.S. diplomatic facilities worldwide are not just functional and aesthetically pleasing, but also secure fortresses that safeguard American personnel and interests abroad.

#19

2.2.5 OBO'S PRESENT AND FUTURE DIRECTIONS

Today, OBO continues to balance the dual imperatives of security and diplomacy in its operations. Its portfolio includes not only embassies and consulates but also residences, schools, and recreational facilities that support the U.S. diplomatic community worldwide. OBO's current mission emphasizes sustainability, resilience, and the integration of advanced technology into facility management and construction. Programs like the Excellence in Diplomatic Facilities initiative highlight OBO's commitment to creating facilities that are secure, sustainable, and reflective of the United States' diplomatic goals and values.

The history of OBO is a testament to the United States' evolving approach to diplomacy and international presence. From its early years focusing on establishing a global network of diplomatic facilities, through periods of architectural innovation and heightened security concerns, to its current focus on sustainability and technological integration, OBO has played a crucial role in shaping the physical landscape of U.S. diplomacy.

3. U.S. CULTURAL SIGNIFICANT PROPERTIES

3.1 U.S. CULTURALLY SIGNIFICANT PROPERTIES ABROAD: A LEGACY OF DIPLOMACY AND DESIGN

The U.S. Department of State oversees a unique and rich portfolio of properties around the globe, under the stewardship of the Bureau of Overseas Buildings Operations. These properties, encompassing embassies, consulates, official residences, and more, stand as living testaments to the United States'

architectural ingenuity and historical legacy. Central to the management and preservation of these properties is the Secretary of State's Register of Culturally Significant Properties, ensuring these landmarks continue to serve diplomatic missions while being preserved for future generations.

3.2 THE REGISTER'S FOUNDATION AND PURPOSE

Established in 2000 as a White House Millennium Project, the Secretary of State's Register of Culturally Significant Property plays a crucial role comparable to the National Register of Historic Places maintained by the Secretary of the Interior for domestic U.S. properties. This honorific listing includes a broad array of important diplomatic architecture and property that holds a significant place in the United States' international heritage, such as chanceries, official residences, office buildings, a museum, a national cemetery, and guest homes.

The creation of the Register is instrumental in promoting the preservation of U.S. history and architecture on a global scale. It underscores the Department's commitment to professional stewardship, preservation, and maintenance of buildings that are not only unique in their architectural significance but also pivotal in representing U.S. values and diplomatic efforts abroad. Through the Register, the Department commemorates and promotes U.S. architectural heritage and history, ensuring these symbols of U.S. presence continue to engage and inspire.

3.3 NOMINATIONS AND SELECTIONS

Nominations for the U.S. Department of State's Register of Culturally Significant Properties come from U.S. missions abroad and are supported by the Bureau of Overseas Buildings Operations' Office of Cultural Heritage. This selection process reflects the United States' commitment to cultural diplomacy and historical preservation, adhering to the principles of the National Historic Preservation Act of 1966.

The criteria for inclusion mirror those of the National Register of Historic Places, requiring properties to be:

A. At least 50 years old, commemorating international heritage;
B. Connected to historically significant events;
C. Linked to notable individuals locally or globally;
D. Representative of a specific architectural style or period, or possessing high artistic values;
E. Potentially informative about history or prehistory.

Properties meeting any of these criteria are acknowledged for their cultural and diplomatic importance. Inclusion in the Register mandates a review of any changes to these properties by the Office of Cultural Heritage, ensuring their integrity and continued representation of U.S. values abroad.

3.4 ARCHITECTURAL DIVERSITY AND DIPLOMATIC SIGNIFICANCE

The properties listed on the Secretary of State's Register of Culturally Significant Property represent a broad spectrum of architectural styles, from

the neoclassical to the modern, reflecting the United States' diverse cultural and historical influences. For instance, the U.S. embassy in Athens, designed by the renowned architect Walter Gropius, is a testament to modernist architecture, symbolizing democracy at its birthplace. Meanwhile, the U.S. Ambassador's Residence in London stands as a notable example of Georgian-style architecture, emphasizing grace and elegance adjacent to Regent's Park.

These buildings are not merely structures but symbols of U.S. values and diplomacy. The Palazzo Margherita in Rome, housing the U.S. embassy, and Villa Taverna, the U.S. Ambassador's residence, underscore the deep historical ties between the United States and Italy. Similarly, in the Asia-Pacific, the U.S. embassy in Manila, designed by Juan M. de Guzman Arellano, is a physical testament to the United States' commitment to the Philippines' independence.

3.5 HISTORICAL MOMENTS AND CULTURAL EXCHANGE

These properties not only have architectural significance but also historical importance, playing key roles in international relations. Villa Montfeld in Algiers was crucial during the Tehran hostage crisis, demonstrating how these locations support high-level diplomacy. Similarly, the former U.S. consulate in Alexandria, Egypt, and Villa Mirador in Casablanca, Morocco, illustrate the U.S.'s strategic presence in the Middle East and North Africa.

Truman Hall in Belgium, the U.S. Ambassador's residence, has hosted significant diplomatic events, including talks that bolstered NATO's peace and security efforts in Europe, emphasizing the importance of such properties in fostering diplomatic relations and maintaining international stability.

Cultural exchanges are another vital aspect of these properties. Hosting events and programs like exhibitions and dialogues, they enhance mutual understanding and strengthen ties between the U.S. and host countries. The George C. Marshall Center in Paris and Truman Hall in Belgium have been instrumental in advancing cultural and educational exchanges, thereby strengthening diplomatic bonds.

3.6 PRESERVATION EFFORTS AND FUTURE CHALLENGES

The stewardship of these properties involves continuous efforts to maintain their historical integrity while adapting them to contemporary diplomatic needs. This balance between preservation and functionality presents ongoing challenges, particularly in the face of environmental threats, urban development pressures, and the evolving requirements of diplomatic missions. The renovation and expansion of the Athens Chancery and the adaptive reuse of Palazzo Corpi in Istanbul into a hotel and conference center exemplify innovative approaches to preserving these buildings' cultural significance while ensuring they continue to serve diplomatic and community purposes.

3.7 CONCLUSION

The Secretary of State's Register of Culturally Significant Property highlights the U.S. Department of State's dedication to preserving America's architectural and historical heritage overseas. These properties represent

more than diplomatic venues; they symbolize U.S. ideals and serve as platforms for global engagement and cultural preservation. Essential to U.S. diplomacy, they embody the nation's values and history on the world stage. The key challenge remains ensuring these properties are maintained for future generations, continuing their role in diplomacy and cultural exchange.

4. CULTURAL HERITAGE DIPLOMACY & STEWARDSHIP

THE OFFICE OF CULTURAL HERITAGE: A COMPREHENSIVE APPROACH

4.1 LAUNCH AND MISSION

The Office of Cultural Heritage emerged as a pivotal initiative in the late 20th century, dedicated to preserving the architectural marvels and vast cultural collections housed within U.S. embassies and official residences worldwide. This marked a significant shift from earlier practices where diplomats like Thomas Jefferson, Benjamin Franklin, and John Adams were self-funded, highlighting a gradual but transformative approach towards supporting U.S. diplomacy through cultural preservation.

Established in 2015, The Office of Cultural Heritage, operating under the Bureau of Overseas Buildings Operations (OBO/OPS/CH), is tasked with a critical mission: to develop and implement stewardship programs for the care of the Department of State's culturally, historically, and architecturally significant properties and collections. This mission encompasses a wide range of activities, including research, conservation, educational programs, exhibit design, and the development of maintenance protocols, aimed at preserving both movable and immovable heritage assets of significant historic, cultural, architectural, archaeological, and ethnographic interest.

4.2 POLICY FRAMEWORK AND OPERATIONAL SCOPE

The policy framework guiding the Office of Cultural Heritage extends to all heritage properties and assets under the State Department's purview. This includes not only physical structures and items such as archaeological sites, buildings, and artworks but also intangible cultural heritage such as practices, rituals, and traditions valued by host nations. The guiding authorities for this office include several U.S. Code sections, executive orders, and the Vienna Convention on Diplomatic Relations, ensuring a comprehensive approach to heritage preservation that respects both U.S. standards and host country laws.

4.3 HISTORIC PRESERVATION AND STEWARDSHIP INITIATIVES

A cornerstone of the Office's work is the management and protection of significant U.S. government properties abroad, ensuring any work on these properties—from maintenance to new construction—adheres to the Secretary of the Interior's Standards for the Treatment of Historic Properties. This involves rigorous identification and documentation processes, maintaining a List of Significant Properties, and implementing stewardship programs aligned with international conservation standards.

The Office also plays a pivotal role in overseeing the impact of capital construction projects and major renovations on culturally significant

properties, emphasizing the need for mitigating adverse effects and ensuring compatibility with preservation standards.

4.4 EDUCATIONAL PROGRAMS AND COMMUNITY ENGAGEMENT

Central to the Office's mission is the development of educational programs and initiatives that engage both U.S. diplomatic personnel and host country communities. These programs aim to raise awareness about the value of cultural preservation and promote best practices in the stewardship of heritage assets. By fostering a deeper understanding of the role of cultural heritage in diplomacy, the Office contributes to the United States' soft power and strengthens international relations.

4.5 A PILLAR OF CULTURAL DIPLOMACY

The detailed responsibilities and activities of OBO's Office of Cultural Heritage highlight its integral role in the intersection of architecture, cultural heritage, and diplomacy. Through its stewardship of culturally significant properties and collections, the Office not only preserves important symbols of the United States' architectural and diplomatic legacy but also showcases the nation's dedication to cultural diplomacy and international cooperation. This enhanced understanding underscores the Office's contribution to leveraging cultural heritage as a powerful tool for diplomacy, building bridges between the United States and nations worldwide.

4.6 SECURING AMERICA'S DIPLOMATIC AND CULTURAL LEGACY

The Cultural Heritage Program stands as a testament to the United States' commitment to preserving its diplomatic history and fostering international cultural appreciation. By safeguarding these treasures, the United States not only honors its past but also strengthens its diplomatic relationships through shared cultural heritage, ensuring that the legacy of U.S. diplomacy continues to inspire and resonate globally for future generations. ■

Jorge Salcedo, a Historical Architect with a decade of federal government service, is a committed advocate for preserving the United States Department of State's heritage resources abroad. He specializes in selecting the most sensitive treatment for historic properties, ensuring strict adherence to preservation standards. Jorge advocates for using videography, photography, and virtual reality to engage a global audience and promote the U.S. Department of State's cultural heritage. His immersive virtual tours, featured on various platforms, effectively showcase exceptional craftsmanship and bolster U.S. cultural diplomacy. His dedicated work safeguards the past, strengthens cultural ties, and ensures the enduring legacy of the United States for future generations.

CASE STUDY: THE MAJOR REHABILITATION AND EXPANSION OF THE U.S. EMBASSY IN ATHENS GREECE, ORIGINALLY DESIGNED BY WALTER GROPIUS (1959-1961).

KATHLEEN GERNER
ANNUM ARCHITECTS | BOSTON, MASSACHUSETTS

#19

ABSTRACT

This paper will provide supporting information and context related to the Major Rehabilitation and Expansion of the U.S. Embassy in Athens, Greece, originally designed by Walter Gropius, U.S. Embassy Athens, Greece (1959-1961). This project ties directly to the influential Bauhaus School, with Walter Gropius as a key figure in its development. After World War II, the U.S. Department of State launched a program to promote diplomacy through the design of its new embassy buildings. The program, administered through the Foreign Buildings Office (FBO), tasked U.S. architects to design buildings that would relate to the conditions, culture, and customs of the host country but also establish a distinctly 'American' presence to the world; promoting the tenets of Modernism, democracy, and the values of freedom and openness. Several embassies were constructed in this period, designed by notable architects, including Edward Durrell Stone (New Delhi), Eero Saarinen (London), and Walter Gropius (Athens). Inspired by the architecture of the Parthenon, Walter Gropius' design for the Embassy in Athens, Greece, established a modern, welcoming, and inviting presence for the United States at its completion on July 4, 1961. Over the last 50 years, changes to the political climate and the resulting need for increased security resulted in several renovations, expansions, and new buildings added to the original compound, many of which interfere with Gropius' original vision. In 2014, Ann Beha Architects, now Annum Architects, was selected by the Department of State, Bureau of Overseas Buildings Operations, to consider this building, now listed on the Secretary of State's Register of Culturally Significant Property, for a major rehabilitation. Also proposed was an expansion designed to serve the needs of the State Department for the next century. While security was of primary importance, other project goals were to preserve the ideals of the famed landmark, its role in the local community, and its role in diplomacy. It is this balance between security, symbolism, and preservation that will define it as a landmark for the next generation.

This paper, and the supporting roundtable, will delve into specific aspects of the design that restore Gropius' vision, while expanding the Mission in a decidedly contemporary way.

1. VISION

GROPIUS' ORIGINAL VISION

Walter Gropius wanted the embassy in Athens to reflect Greek culture, with a design that "should abide by the classical 'spiritus loci'...but in contemporary...terms."[1] His selected materials included Pentelic marble from the same quarry as the stone used to build the Parthenon, and he modernized traditional Greek forms with a unique structural system that allowed the floors to float above grade. This approach created openness and permeability around the sides of the square-shaped building. The public could approach and access it from all directions, creating an embassy that was a welcoming symbol of not only U.S. culture and values, but the Greek foundations of democracy. The building, known as the Athens Chancery, is the main U.S. embassy building in Greece. **(Fig. 2)**.

Over the years, growth and security concerns required several renovations to the Chancery that undermined the original design aspirations. They restricted access to the site, relocated programs, and changed the circulation and flow of staff and visitors on the compound. **(Fig. 3)**.

As the mission in Athens continued to grow, an expansion in 2007 brought new buildings onto a newly expanded site. Staff were more spread out, working in different office buildings on the same compound, which reduced interaction and resulted in "siloed" workplaces. A lack of a clear main entrance to the compound stood out as a key deficiency for both employees and visitors.

2. DESIGN GOALS

PRESERVE AND AMPLIFY THE ORIGINAL VISION

In 2014, Ann Beha Architects, now Annum Architects, was selected by the Bureau of Overseas Buildings Operations (OBO) to consider this building, now listed on the Secretary of State's Register of Culturally Significant Property, for a major rehabilitation. Also proposed was an expansion designed to serve the needs of the State Department for the next century. While security was of the utmost importance, other key project goals were to preserve the ideals of the famed landmark, its role in the local community, and its role in diplomacy. It is this balance between security, symbolism, and preservation that will define it as a landmark for the next generation.

The third Boston-based architect to work on the embassy's structures, Annum considered ways to simplify an already complex, constrained urban site, seeking strategies for cohesiveness to regain the spirit of the original design while addressing today's concerns. Annum's design balances the scale of the Modernist 1961 building and the 2007 expansion project by Kallman McKinnell & Wood.

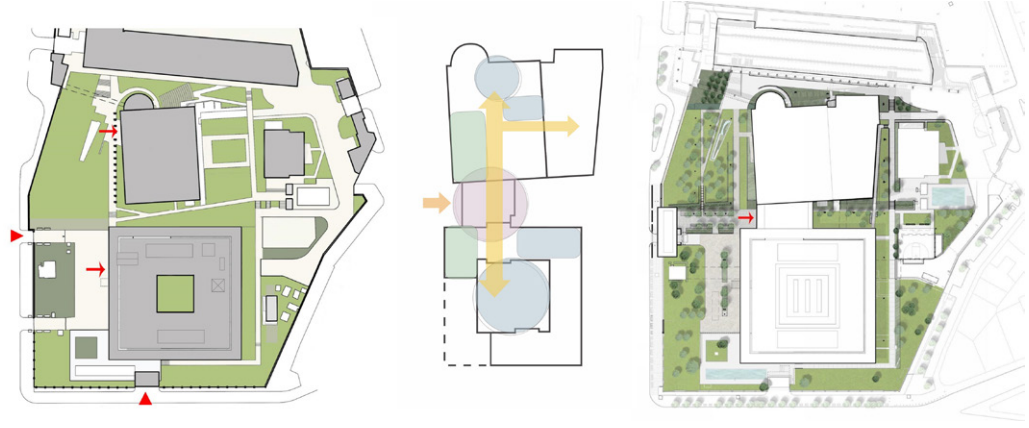

Figure 4. Diagrams of site. From (L) Site in 2014 (R) Site plan of major rehab and expansion project. (C) Diagram of Annum's conceptual approach to unify the compound.

3. KEY DESIGN MOVES

IMPROVE ACCESS AND CONNECTIVITY

Insights gained from archival research informed design concepts and site organization, improved staff connectivity, and created a new community space for the mission, restoring Gropius' concept in a decidedly contemporary way. A careful study of the entire site resulted in simplification and the reestablishment of order to circulation. A new main access pavilion, on axis with a new unifying entrance, allows for accessible entry by both pedestrians and select vehicles. The new main entrance connects the Gropius building to the recent 2007 Office Annex, allowing for clear passage for staff between the two. To those approaching the embassy from the outside, this configuration, signals connectivity with the community and promotes openness and interaction for users and visitors. **(Figure 4)**.

BUILD COMMUNITY

To restore Gropius' approach to cultivating community, Annum enclosed the central courtyard, converting it to an indoor gathering and community space. Programs for staff are now centrally located, with a community space that can accommodate larger events. The connector at the new entry makes it easy to navigate to the revitalized courtyard from workspace in either office building because of the new entry/connector. The courtyard now serves a hub, connecting staff from the ancillary areas on compound. Open workspaces and perimeter circulation optimize the narrow building floor plate, restoring daylight to the interior, and creating strong visual connections to the courtyard.

RETAIN KEY HISTORIC FEATURES

As part of the major rehabilitation project, several aspects of the building required upgrades to meet current seismic codes and OBO security requirements. Annum and its subconsultant team prepared a Historic Preservation Matrix that identified each historically significant component in the building (exterior and interior), and designated each with a level of significance, and condition. Each item was then evaluated for the most appropriate treatment, factoring in all requirements, the items condition, and the overall project goals.

One of these items is the exterior marble cladding that comprises the exterior of the building. The Pentelic marble, originally sourced from the same quarry as the Parthenon, was not available to the project for restoration efforts, as all marble from the quarry is reserved for ongoing Parthenon restoration efforts. Several columns required strengthening to meet current seismic codes, and a careful strategy was developed to remove the existing panels (approximately 4' x 8', and just over 1" thick), add the necessary strengthening with a thin fiber-wrap, and then replace the marble panels in their original position. OBO committed to testing this approach in the design phase, and a mock-up was done on site, to ensure that the work could be completed with local restoration workers, and without damage to the original marble. The strategy was successful and allowed for a large portion of the historic material to be maintained, with a building that will now meet current code requirements.

A second example that required mitigation of the historic material is at the exterior curtainwall. The single glazed original curtainwall required improvements to meet current security needs; as a critical aesthetic component of the original design, it was necessary for the new curtainwall to match the appearance of the historic to the greatest extent possible. The design creates a new dual-glazed system, with the security glazing behind, allowing for the exterior of the building to retain its original appearance. Where feasible, the original glazing is restored elsewhere in the building.

This highly technical and mindful approach to restoration results in design interventions that are fully reversible, meeting the U.S. Secretary of the Interior's Standards for the Treatment of Historic Properties. The approach and treatment plan resulted in an expansion that makes the property functional for the U.S. Government to remain in place in downtown Athens as a long-term strategy and demonstrates the U.S. Government's commitment to Athens and the original design.

4. CONCLUSION

When the opportunity to consider a comprehensive renovation of a historic building arises, how does the designer evaluate prior renovations and additions while addressing program goals and future needs? It calls for stepping back, researching the history behind the original design intent, and a thoughtful consideration of how those original goals may inform contemporary design thinking. For the U.S. Embassy in Athens, many of the goals for the major rehabilitation and expansion project remain aligned with the ambitions in 1961, including balancing an open and welcoming political philosophy with security needs for a highly functional mission. Contemporary design interventions must go beyond simply addressing a practical problem; in this instance, they need to preserve the character of the historic building and move toward a higher goal of amplifying Gropius' vision for what he hoped would become an iconic landmark. ■

Katie Gerner is an Architect and Associate Principal at Annum Architects (formerly Ann Beha Architects), based in Boston, MA. She holds Bachelor of Architecture and Master of Architecture degrees from Tulane University. Her leadership includes a comprehensive project focus on contemporary design and its relationships to existing buildings and context, working with mission-based organizations in historically significant settings, with a commitment and investment in renewal, aligning clients' goals with their resources. She led several projects for the Bureau of Overseas Buildings Operations (OBO), including the US Embassy in Athens. Her work at Saieh Hall/University of Chicago transformed the former Chicago Theological Seminary and the surrounding city block.

A CASE STUDY IN MODERNISM AND DIPLOMACY: THE MAJOR REHABILITATION AND RESTORATION OF THE BRUTALIST U.S. EMBASSY IN MONTEVIDEO, URUGUAY, ORIGINALLY DESIGNED BY I.M. PEI (1959-1969).

TROY THOMPSON
AIA, LEED AP, SMITHGROUP

#19

ABSTRACT

This paper will provide context for understanding the Rehabilitation and Modernization of the U.S. embassy in Montevideo, Uruguay. The embassy, designed by I.M. Pei, opened in November 1969 and SmithGroup's renovation will be complete in late 2024.

The embassy was built during the Cold War and completed near the end of the U.S. Department of State's mid-century embassy building program. The new embassies of this era were intended to introduce the United States' democratic ideals through architecture. While Pei did not initially acknowledge it as his work due to design changes made during construction, the embassy's prominent site and brutalist style were clearly serving the goals of the embassy design program and representing the aesthetics of the era.

This paper will illustrate how the SmithGroup's team integrated necessary life-safety, accessibility, and security upgrades, including a holistic renovation of the HVAC, electrical and plumbing systems, while modernizing the workplace and preserving the original character of the building. Discussion will also include the challenges of working across continents and over a lengthy period of time while maintaining occupancy during construction.

Pei's embassy, along with the other embassies in this panel, highlight several preservation solutions for mid-century buildings that share a common cultural philosophy while existing in quite different physical contexts.

1. THE EMBASSY BUILDING AND SITE

LOCATION AND ARCHITECTURE

Two of the goals of the U.S. Department of State during the post-World War II building boom were to use architecture as a "billboard for democracy" while locating and integrating new embassies into the existing urban fabric of the communities where they were built. The embassy in Montevideo does these two things very powerfully and these aspects defined the challenges and opportunities of modernizing such a building. **(Fig 1)**

The embassy is located along the Rambla on the Atlantic coastline of Montevideo. It anchors the western end of park that also runs along the oceanfront of the city and the southern and western views from within the embassy are of the ocean and palm trees. The other sides front the surrounding neighborhood and face mid-century apartment buildings. The original grounds of the embassy were not protected by the current wall and security perimeter, so the embassy was very much a part of the urban greenspace.

The brutalist architectural style was a progressive style of the 1960's and 1970's and affirmed the hopeful ideas of democracy while breaking from a century of stylistic revivals. It promised a more modern future. Brutalism often also utilized local building materials and substantial amounts of local construction labor.

1.2 HISTORIC SIGNIFICANCE

While the embassy was not officially on the Secretary of State's Registry of Culturally Significant Properties, working with Kevin Sarring, a Historical Architect at the Bureau of Overseas Buildings Operations (OBO), our team determined it was eligible for the registry and should therefore be treated as a historic structure. We then utilized standard U.S. practices for assessing significance, building condition and recommendations for treatments. The building did not have local landmark status but is considered a significant building in the architectural history of Montevideo. The building is also visible from the heritage district defined by the waterfront and therefore the citizens of Montevideo would be concerned with our efforts that would be visible.

Our team determined that the building was significant because of the global importance of its designer I.M. Pei; because it is an excellent example of Brutalist architecture; and, because it was designed and constructed as part of the Department of States' focus in the cold war era on the cultural and political role of diplomatic architecture.

1.4 BUILDING CONDITION

The physical condition of the embassy is, historically, very well preserved, and its character-defining features largely intact. Understandable alterations to the site and the building have occurred to improve the protection and safety of embassy staff and expansion of the buildings systems. Documentation indicates that these changes can be identified and treated appropriately during the renovation. There were changes made during construction that altered the original design intent of the embassy—mostly

cheaper and less natural materials like plaster substituted for wood, concrete for granite. Additionally, there are no changes or significant alterations that are not original that contribute to the significance of the building.

The final step was understanding the character-defining features and establishing preservation zones to determine the types of treatments for the site/setting and throughout the building. We utilized the U.S. National Park Service definition of zones: Restoration, Preservation, and Rehabilitation. Fortunately, the important features of the building mapped well with security needs and building use patterns so that the restoration and preservation zones largely occurred in the public portions of the building and the entire site. The primary character-defining features were the building exterior, site, the building atrium, and the public circulation areas within the building.

While the building was not officially recognized as a cultural property, Overseas Building Operations team concurred it should be treated as such, and the application of standard preservation practices has continued to shape decisions throughout the design and construction of the project.

2. SCOPE OF THIS MODERNIZATION

One of the most difficult challenges was that the building would remain occupied and functional during construction and that the construction would need to be phased. This also meant that additional swing space and building services would be needed on site and physically connected to portions of the embassy throughout construction which posed a particularly difficult problem for a brutalist concrete building. The phased construction thus affected every aspect of the design and in some cases was determinative of the chosen design solution.

Unique to cast-in-place buildings, the material palettes were often very minimal and the building systems for plumbing and electrical were often cast into the structure of the building. This creates a very difficult modernization and preservation situation because there aren't attics, plenums or other interstitial spaces to run infrastructure. The concrete is the structure, it is the ceiling, and it was the facades and many interior walls.

2.1 ARCHITECTURE, INTERIOR DESIGN, HISTORIC PRESERVATION & LEED

This modernization project involved extensive renovations of the office areas throughout the building. A new utility building was located away from the main building at the Northeast corner of the site in a visually discrete location. The design of swings space was accommodated by temporarily enclosing the ground floor arcade that encircles the building.

The remainder of the architectural renovations were driven by the integration of new building systems and in addressing life safety needs or the preservation of major interior spaces the building facades.

The building was in exceptionally good condition with regards to the exterior facades and the condition of the concrete. There was a notable lack of the typical types of concrete deterioration often found on cast-in-place concrete. Likely this quality was testament to Pei's understanding of how to design and construct brutalist architecture.

2.2 BUILDING SYSTEMS

As with most concrete brutalist buildings, most of the mechanical system infrastructure is cast into the building structure. The primary mechanical system originally was fan coil units under each window with the pre-cast will sill hiding the outdoor louvers of each unit. Given that all the conduits and pipes were in the concrete, the team could not fully assess the re-use of those systems, so all new systems needed to be designed according to meet new security and energy performance needs.

The original building was not sprinklered and fire & life safety codes have changed a great deal since the building was originally constructed. A new fire egress stair was required to meet code requirements in a way that also met security requirements for the building.

3. GREATEST DESIGN & PRESERVATION CHALLENGES

By far the greatest challenge of modernization was the concrete brutalist design of the original building. The limitations and inability to alter much of the building structure and walls made integration of new systems a particularly challenging effort.

3.1 INTEGRATING MECHANICAL, ELECTRICAL, PLUMBING

To accommodate the new systems, the design team creates two "plenums" where none had existed before. First, a new bulkhead was installed that runs along the current corridors and was carefully coordinated to be the width of a ceiling coffer. Its location reinforces the original corridor circling the building and minimized the need for vertical shafts and additional bulkheads. The other distribution systems accommodated by removing a floor topping layer everywhere except where the historic clay tile flooring marked the original corridor. A raised floor was then installed that allows various building systems to be routed horizontally under the office areas.

To accommodate new offices standards, daylighting, and flexibility needs, most of the walls around the atrium corridors were removed.

Since they were not originally made of wood as Pei intended, it was determined that removing them from a Restoration Zone was acceptable as they were not character defining features of the space the way they were intended. The only corridor walls that remained were those that defined the historically significant Ambassador's office suite. **(Fig. 2)**

3.2 FIRE PROTECTION & LIFE SAFETY

After extensive crawling around in the building and investigating every nook and cranny, the new sprinkler systems were installed via the new bulkheads and existing vertical shafts with minimal exposed piping and alteration of the concrete interiors.

The single most intrusive interior design element was meeting the need for an additional fire egress stair. The primary public space is a beautiful atrium that is open to every floor on three sides in the office area of the building. There are layers of concrete structure, planters, railings, and balconies that create a complex three-dimensional space. The atrium is then covered by a gridded series of skylights. The new stairs needed to serve this end of the building.

In the spirit of the brutalist aesthetic, the first studies focused on creating a new stair tower outside and a bit away from the current building – a standalone object or a campanile of sorts in the plaza. This would minimize impact on the atrium space and would be easier to build as part of the phasing. Several options were studied **(Fig. 4)**. In the end, primarily due to cost, the final solution became a new stair integrated into the atrium.

One of the design changes that Pei was not happy with was the elimination of wood paneling along all the corridors that would have brought warmth and a natural material into the atrium. The design of thew new stair reintroduced a significant portion of natural wood finish into the atrium that added a level of warmth that was deleted from Pei's original design vision. The new wooden stair tower also reinforces the complexity of the atrium by slipping behind and through the concrete structure of the space. **(Fig. 3)**.

3.3 DECADE-LONG PROJECT A CONTINENT AWAY

The process of working with embassies is a unique experience. These projects have requirements and design parameters unique to the client and typology that require much more significant coordinate of often competing criteria: building program, historic significance, security, availability of products and materials, differences in trade skills & means and methods, and on.

One aspect of this modernization was the unexpected additional soiling on the exterior concrete. As noted above, when the project started, the facades were in particularly good physical condition with a variety of superficial dirt, bird detritus, and algae. The conditions also varied by orientation. After over seven years of construction the degree of soiling on the facades presented the need for significantly different building cleaning regiment than originally planned.

This caused the need for much more testing and more extensive mock-ups utilizing a wider range of cleaning methods and materials. It has also necessitated the need to collaborate closely with local conservators and

preservation architects to assist with the additional effort to understand the conditions and to develop contractor training programs for the variety cleaning methods now needed.

4. IDEAS CONSERVED FROM THE EMBASSY PROGRAM OF THE COLD WAR ERA

In many cases, the ability to preserve the character of the original building was simplified by the lack of interventions and major renovations or alterations since the building was opened in 1969. This condition made it easier to focus the efforts on preserving what remained of the building's interiors and exterior, while integrating all the new systems and programmatic requirements.

Unfortunately, the setting and architecture worked very well together to integrate the original embassy and grounds into the surrounding urban environment. The arcaded first floor really made the embassy feel accessible and open to the community and was a successful design example of integrating landscape and architecture. The world has changed since the cold war ended and security has become a larger concern. The grounds were eventually enclosed by physical barriers that significantly altered the intended openness and integration of the stie into the Rambla public space and oceanfront.

So, the progressive image of the U.S. Department of State and their embassy building program are intact through the preservation of the embassy building and its architectural style. The project, when considered with the other embassies in the panel, provides an example of role historic preservation can play in preserving goals and missions of the client beyond that extend beyond simply protecting any one object as art. ■

Troy received Architecture and Philosophy degrees from Ball State University and an M.A. in American History from George Mason University. His career has focused on historic preservation, design of cultural facilities and the conservation of archaeological sites. Projects include the White House Visitor Center, National September 11 Memorial Museum Pavilion at the World Trade Center Site, and the Robert E Lee Memorial Arlington House in Arlington National Cemetery. Troy has been designing protective shelters, walkways, and interpretive signage at Harvard University's Archaeological Exploration of Sardis since 1988.

CASE STUDY: HISTORIC INTENT AND THE RENOVATION OF EDUARDO CATALANO'S U.S. EMBASSY IN BUENOS AIRES

JUAN M. VILLAFAÑE
PARTNER, KRUECK SEXTON PARTNERS

#19

ABSTRACT

The Argentine-born architect, Eduardo Catalano (1917 – 2010), operated out of Cambridge, Massachusetts, from 1956 through 1977 and was entrenched in the academic discourse which defined a certain type of brutalist modernism characterized by exposed concrete and overt structural expression. His 1972 design for the U.S. embassy in Buenos Aires drew on his principle to design flexible and long-lasting buildings that would endure, and not based on "individual whims".[1] After 50 years of continuous operation his thesis on longevity is being tested with a new renovation driven by the need to replace aged mechanical and electrical systems intertwined throughout a fully occupied embassy building.

This paper will first explore the context of Catalano's Cambridge-based practice, to better understand the rationale for the design of the Buenos Aires Embassy. The building's existing structural logic will be discussed and used to define the physical framework for the renovation designed by Krueck Sexton Partners in 2024. Catalano's concept for designing a building that would endure and avoid obsolescence was formed around the principle of designing for "constants", the permanent needs of the building, and understanding and deliberately avoiding over-designing for "variables", or those functions or components which are subject to change. By studying the structure and systems, the renovation design found opportunities for planning layout, systems design, and materials in careful dialog with the building and to allow for 50 more years of use.

1. CATALANO'S (AND MY) CAMBRIDGE

Every morning during my first year in graduate school I bicycled down Cambridge Avenue seeing the Cambridge Rindge and Latin High School campus. It was hard to miss because it was one hundred meters from my destination, and the building formed an unusual marriage of contrasting styles. I only learned this year that the addition was designed by Eduardo Catalano, the architect who originally designed the U.S. embassy in Buenos Aires, which Krueck Sexton Partners was tasked with renovating as a selective improvements project for Bureau of Overseas Building Operations (which manages U.S. governmental diplomatic and consular property outside of the country). The Catalano building marked the formal merger of the Latin school with the Rindge (trade) school. As the third oldest high school in the United States established in 1648 by the Harvard College president, it was a significant commission for Catalano. What is striking about the addition is that the brutalist building sat both independent and conjoined to a 1932 limestone-clad structure. Its trapezoidal, glazed connector bridge created a prominent gateway to the campus and the adjacent public library and park, effectively marrying multiple stylistic periods through deliberately connected yet separated structures.[2] At the time, I had not seen a brutalist building that left preceding buildings intact and minimally disturbed while making the contrasting styles profoundly apparent. The school was one of Catalano's last commissions prior to retirement from teaching in 1977.

#19

1.1 LEARNING AND TEACHING

Catalano moved from Argentina to pursue post-graduate studies at the University of Pennsylvania and Harvard University in Cambridge, Massachusetts – earning degrees from each in 1944 and 1945 respectively. While at Harvard he studied with the modernist masters Walter Gropius and Marcel Breuer.[3] Gropius was well known as the founder of the Bauhaus and would later be one of the first architects to work with the U.S. Government's Architectural Advisory Board (AAG), to design the U.S. embassy in Athens.

Catalano moved back to Argentina briefly, only to make his way back to academia in 1950, to teach at the Architectural Association (AA) in London. One year later, he was appointed professor at the architecture school at North Carolina State College (now North Carolina University, which now houses his archive of work), and within 5 years became head of the program. During his tenure, the design for his own residence known as the Raleigh House, was well published and named "House of the Decade", by House and Home Magazine, because of its massive 28m long hyperbolic paraboloid, post-stressed roof shell described as "potato chip" in shape.[3] [4]

1.2 A SMALL WORLD, A SMALLER CAMBRIDGE

Catalano returned to Cambridge in 1956, at the invitation of Pietro Belluschi, Dean of the School of Architecture at the Massachusetts Institute of Technology in Cambridge. Catalano's Raleigh House demonstrated his ideas on creating architecture that would avoid redundancy by moving away

4. "Most Talked About House of the Year", *House and Home*, Volume VIII, no. 2 (August 1955), 94-101.

from "skin and bones" architecture to a type of structural logic where the shell would serve as both façade and structure – as he demonstrated with this own house.[4] In Cambridge, Catalano was surrounded by like-minded contemporaries such as Walter Gropius, Josep Lluis Sert, Paul Rudolph, Marcel Breuer, and others exploring similar ideas through exposed concrete structures where skin and bone are one.[5] [6]

No contemporary architect of the time was more influential than the Swiss-French architect Le Corbusier, who came to Cambridge in 1959 for early meetings to discuss the Carpenter Center for Visual Arts on the Harvard Campus – his only building in North America. There is not a clear record of whether Catalano and Corbusier met. But Catalano was certainly familiar with Corbusier's concrete details. Corbusier's continuous, horizontal "ribbon" window appear in many of Catalano's municipal-scale buildings including the U.S. embassy in Buenos Aires. Corbusier's only other project in the western Hemisphere, Casa Curutchet, was in La Plata, Argentina. While Corbusier never went to La Plata, his local collaborator, Argentinean architect Amancio Williams, acted as his eyes and ears during the houses construction. Williams would visit Harvard at Gropius's invitation in 1951 and 1955, just missing Catalano's Cambridge return.

With two major graduate schools and internationally practicing architects coming and going, the small town of Cambridge was a hub of global architectural discourse, where Catalano was deeply entrenched.

1.3 A PORTEÑO-AMERICAN ARCHITECT

Catalano was born in Buenos Aires –a Porteño as the citizens of the port city refer to themselves. In hindsight, the decision to hire Catalano to design the U.S. embassy seems almost predestined. He was an able Architect working on ever-more complex projects such as the Stratton Student Center (1962) at MIT (which is currently being renovated and slated to open later this year). But Pietro Belluschi, who earlier recruited Catalano to teach at MIT, was part of the U.S. Government's Architectural Advisory Board (AAG), and this group was charged with "setting a new direction towards integrating cultural sensitivity and design excellence in the construction of U.S. embassies abroad".[7] Hiring a Buenos Aires born architect skilled in working with complex U.S. government projects was not only logical under the AAG's clear directive but a diplomatic win.

2. U.S. EMBASSY, BUENOS AIRES

While Argentina and the United States officially established diplomatic relationships in 1823, a U.S. embassy did not exist until 1915. An embassy contains mostly office space. Work at embassies has evolved similarly to that in the corporate world, with comparable requirements for open versus closed office space, conference and meeting space, computer and networking infrastructure, and amenities such as staff cafeterias and fitness centers. Embassy staff have conventional office schedules, and most staff are locals who are long-term hires who work in the embassy buildings for years. Just like

5. Catalano was certainly aware of his work as Rudolph actively designed major buildings in and around Boston including the Government Center Complex, and the Jewett Arts Center at Wesleyan.

6. Breuer and Catalano collaborated on a small project in Argentina, circa 1947. "Parador Ariston," *Nuestra Arquitectura*, no. 225 (April, 1948), 110-116.

7. Jorge Salcedo, "OBO And Its Cultural Heritage Mission," (Submitted for Docomomo Publication, pending), page 3, 2024.

in the corporate business office, the reliance on paper output, and the amount of required individual work-space has changed, making the modernization of embassies an ever-evolving process. The primary difference between an embassy and a typical office are rigorous security protocols to keep embassy staff safe. Most embassy buildings of the 1960's and 1970's were intentionally designed to be culturally contextual (although not necessarily by style) driven by President Kennedy's 1962 Ad Hoc Committee on Federal Architecture to "ensure that such architecture continued to represent American ideals—from dignity, stability and vigor to embodying the finest architecture of its time."[8]

2.1 SITE AND LOCATION

The site for the U.S. embassy in Buenos Aires, was originally part of the "Tres de Febrero" Parks and directly north of the La Rural Exposition center. The southwest quadrant of the park was ceded to the United States in 1963 by the Argentine government, which created a triangular site whose apex pointed north toward the network of urban parks that make up the 400 hectare Palermo Woods. At the time of the land acquisition, the Palermo neighborhood was already urbanistically dense, and with the proximity to the historic U.S. Ambassador's residence at the Park's northwest corner, the centrally located site was a boon for supporting the diplomatic mission. The building faces the park and its ceremonial, brick-paved entry piazza became an extension of the landscape.

2.2 STRUCTURAL FRAMEWORK

From the exterior, the embassy building forms a heroic cantilevered form whose floor plates increase in footprint as the building ascends (top-left, **Fig. 1**). The sides are flanked by exposed concrete fin-walls to conceal the sectional changes and emphasizing the frontality of the building (top-right, **Fig. 1**). The structural framework supporting the cantilever incorporates a series of deep, one-way beams to minimize the number of columns in the office interior (bottom-left, **Fig. 1**). In the original design the interior structural expression was exposed only at the three building entries, and the remaining one-way spans were concealed from view above ceiling tiles. The building's central core is composed of elevators, restrooms, and the main mechanical riser located to the rear of the building. This rear zone incorporates a tighter column spacing to eliminate beams allowing for the primary duct branches to run east and west from the core to the offices (bottom-right, **Fig. 1**).

Catalano studied planning concepts to address his concern over the long term use of large buildings, stating that "even today, when cultural, social, and economic forces lead to the rehabilitation of existing buildings, the new ones are being designed as inflexible as those of the past."[9] The structure of the embassy embodies Catalano's concept of buildings becoming "infrastructures", allowing for "societies time to master change".[10] He developed a planning principle where the building would emphasize "constants" based on performance needs and allowing for "adaptability

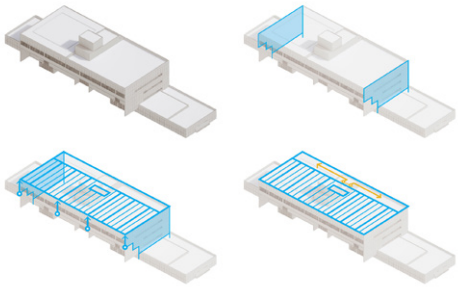
of use" and sought to eliminate or reduce "variables" such as custom construction that would only be used once and diminish function.[10]

2.3 MECHANICAL REALITIES

The structural principle was well developed for the architectural layouts, but the mechanical systems were much less flexible than Catalano's planning principles would suggest. The main mechanical room is within the sub-basement housing both air-handling units and the building's main electrical gear. A secondary mechanical penthouse located at the top of the building housed units serving upper floor levels. While the bifurcated (bottom and top) mechanical rooms were seemingly logical in their zoning, the actual installed network of ducts was not clearly defined, and the duct distribution entangled across floors. This distribution would impact any future system upgrades. A significant quirk of the original mechanical system is the air intake strategy. The building incorporated three discrete air snorkels (a term the renovation architect and engineering team coined) to describe the approximately four-meter-tall concrete, triangular-peaked towers located behind the building which allowed for make-up air into the building (his once-mentor Gropius employed similar details for his 1966 JFK Building in Boston). The snorkels were a clever way to allow for fresh-air into the building, and since the back alley included parking spaces – by raising the air entry above the car level avoid having vehicle exhaust polluting the building. The snorkels however, incorporated a circuitous path into the building, directing air through tunnels under the alley and into the sub-basement.



3. REDEVELOPING AN OCCUPIED BUILDING

The renovation scope was defined after a years-long building and functional-program assessment by the U.S. Government aided by a large team of subject-matter-experts led by Krueck Sexton Partners.[11] The primary driver for the extent of work is driven by critical electro-mechanical systems updates tempered by budgetary constraints precluding a full renovation. The original air-handling and electrical equipment had reached the end of their service life, requiring a holistic replacement of the patchwork improvements and repairs common for a building with fifty years of continuous use. Because of externally-dictated logistical requirements, the building occupants could not be moved out of the building requiring a phased renovation. Since the building would be continually occupied during construction, the original mechanical and electrical systems could only be removed once new systems were in place and operational.

3.1 MECHANICAL SYSTEMS AS DRIVERS

The sub-basement mechanical units require replacement but cannot be removed until new systems are installed (since the building will remain in use, equipment must continue to serve occupants). The phasing is to be performed incrementally from top to bottom, where in the final phase the lower-level mechanical equipment can be decommissioned. To accommodate this incremental replacement, a new penthouse houses replacement equipment.

11. The embassy project included a large team including: OBO team Claire Bedat, Cindy Chow, Curtis Clay, Lisa Kim, Douglas Noumbissi. A/E team leader, architect Krueck Sexton Partners with team members Michael Johnson, Jason Roberts (Project Manager), Gabe Vidal-Hallet, Juan M. Villafañe (Partner in Charge), Sarah Weiss; structural engineer Thornton Tomasetti with Timothy Mekaru, Nate Sosin; MEP engineer by WSP with Lisa-Marie Golja Tekovic (MEP Team Leader), Richard Siwek, Keith French; IT by Wiley Wilson with Jared McCoig. Local Architect BCG, Maria Paula Baez and Eduardo Carena.

#19

Although the existing roof had been cluttered with a mix of small additions from earlier work, the client and design team were concerned with introducing another mass to the roof structure, and how such a structure would read from the street. The design team considered two strategies to reduce the impact of the penthouse on the building – controlling setback distances and a screening element to conceal the mass. The only viable location for the penthouse is east of the original penthouse. However, a new rectangular structure would compete with the original symmetrical massing, and the existing structural grid had eliminated a structural column making one of the bearing points over an existing beam (instead of over a column). The project structural engineer, Thornton Tomasetti, evaluated the existing beam, which although deep in profile, was highly efficient meaning it could not carry additional load. This observation was true of many of the brutalist features on the building which were both highly efficient but with little redundancy to allow for modification.

The design team settled on the idea of creating a triangular-plan structure, which rationally connected-the-dots of structure down to existing columns (Refer to **Fig. 2**). A form generated by need and constraints, in line with Catalano's intent. The triangle reduced the visual mass from the street level, obviating the need for a screen. The form referenced the original air-snorkels and created an intentional and legible differentiation between the new and original massing.

3.2 SELECTIVE IMPROVEMENTS

Although the building is iconic from the exterior, most of the interior spaces were disconnected from the strong logic of Catalano's structure. The combination of the existing continuous ribbon windows which do not allow a lot of daylight into the building and the low (2.16m) ceiling height makes the space dark and feel compressed. The replacement of the electro-mechanical systems was an opportunity to reconsider how the building's infrastructure could be utilized not only for conveying services, but to take advantage of the volume of space for its occupants. The building mechanical engineer (WSP) proposed a distribution of overhead fan-coil units (FCU) to replace the original centralized Air-Handling Units (AHU's) allowing for more flexibility in the construction and affording an opportunity to reduce the number and volumetric density of ducts.

A conventional AHU system requires moving huge volumes of air from centralized units to the occupants, whereas fan-coils utilize chilled water distribution bringing relatively small cold and hot water pipes to distributed units which condition smaller volumes of air. The FCU system is not typical for OBO, but because of the reduced duct quantity creates flexibility.

With the large ducts out of the way, dropped ceilings could be selectively eliminated to open the volume and express the linear, concrete beams to occupants and fulfilling Catalano's vision of eliminating the distinction between skin and bones (Refer to **Fig. 3**).

3.3 ANOTHER 50 YEARS OF OCCUPANCY

Many of the significant brutalist buildings built in Cambridge during Catalano's life have gone through major renovations in the last decade – including Sert's Science Center and Holyoke Center at Harvard. Catalano's MIT Stratton Center is currently undergoing renovation with expected opening fall of 2024. His high school building was painted stark white during its 2011 renovation, removing its hallmark tactility. The Embassy was also painted by an earlier facilities manager - a beige color homogenizing the concrete mottling that once made the building part of its environment. Building mechanical system service life ranges from 25 to 50 years making the need for upgrades inevitable. An industry wide focus on building performance improvements along with building technology trending toward higher efficiency, means that renovations often require a reconsideration of their systems' original strategy. But if we believe Catalano's thesis on "constants" and "variables" these changes are not only expected but hoped for, in order to avoid creating "frozen buildings, without flexibility for growth and change". ■

BIOGRAPHY

Juan M. Villafañe, AIA, is a practicing architect and partner at Krueck Sexton Partners in Chicago. His career began as a custom metal fabricator, fostering a technical rigor grounded in making. This background informs his work which expresses craft to create tactile spaces. Juan is an active member of the Urban Land Institute where he currently co-chairs ULI Chicago's Public Policy committee. His experience working on architectural projects in Singapore, Buenos Aires, and Sri Lanka informs his approach to find the specificity of place.

MAINTAINING CULTURAL HISTORY AND MEETING 21ST CENTURY EXPECTATIONS – EMBASSY IN MONTEVIDEO AS EXAMPLE FOR MAJOR DIPLOMATIC RENOVATIONS

FREDERICK J POEHLER
U.S. DEPARTMENT OF STATE, OVERSEAS BUILDING OPERATIONS

#19

ABSTRACT.

For the U.S. State Department, it is a significant challenge maintaining our culturally significant buildings and places while continuing to make them relevant for their intended diplomatic contemporary uses. In the case of US Embassy Montevideo, how do we take a structure successfully built to its intended diplomatic representational function, standards, program, and expectations from the 1960s and turn it into a 21st century diplomatic representational facility that equally successfully meets the functions, standards, program, and expectations of the 21st century US State Department. A generic answer is 'carefully', 'diligently', 'gently', and/or any other word that implies a sensitive and protective approach. But the challenge is larger, complex, and more demanding.

1. INTRODUCTION

Around the world, maintaining our culturally significant buildings and places while continuing to make them relevant for their intended contemporary uses is a considerable challenge. In the case of U.S. Embassy Montevideo, how do we take a structure successfully built to its intended diplomatic representational function, standards, program, and expectations from the 1960s and turn it into a 21st-century diplomatic representational facility that equally successfully meets the functions, standards, program, and expectations of the 21st century U.S. State Department? A generic answer is 'carefully,' 'diligently,' 'gently,' and/or any other word that implies a sensitive and protective approach. But the challenge is larger, complex, and more challenging. If these challenges could not be addressed adequately, then the U.S. State Department would have departed this property and its historic architecture.

2. U.S. EMBASSY MONTEVIDEO

While there are accepted guidelines for best protecting and conserving our cultural architecture treasures, they often do not reflect how to make the structure meet its new program expectations. At the start of many cultural or historical preservation projects:

- We often know how to protect buildings and places, clean sensitive materials, repair damaged materials, restore or recreate lost history, and insert new materials. The toolbox of techniques is common knowledge among architecture historians and restorers. This is not to say that this work is easy. It does note that we often know the challenge we are facing.
- However, we regularly do not know how to re-program the building to give it a vibrant contemporary function while protecting its history. There is no standard toolbox. This has to be learned and determined on a building-by-building basis.

For Embassy Montevideo, we:

- Knew the structure as constructed met its intended functions, standards, program, and expectations of the 1960s.
- Mostly knew how to address and protect its materiality, primary spaces, and character. Furthermore, we know the level of effort would be significant.
- Had new functions, standards, programs, and expectations to meet without a path forward.
- Created a unique path to accomplish all our new functions and program goals while addressing our cultural history preservation goals.
- Made sure Embassy Montevideo's cultural and diplomatically important architecture continues with its new 21st century program.

3. U.S. EMBASSY MONTEVIDEO 21ST CENTURY CHALLENGES

What are the new functions, programs, standards, and expectations? There are many (too many to list here). But we can group them to gain a general understanding.

- Public Representational. At embassy opening, Embassy Montevideo represented the best of modern architecture from the 1960s. It is a brutalist structure, with the influence of Corbusier, a dynamic atrium, efficient floor layouts, natural light and views, located on major promenade, and warmed by local wood and clay material product. Diplomatically, it represented the confidence, optimism, technology, strength, and more of the United States.

    a. 2024. Modern brutalist architecture is only sometimes appreciated as initially intended by everyone. But the architecture of Embassy Montevideo remains appreciated. Its representational spaces now reflect the optimism of the 1960s with 21st-century updates. Its dynamic atrium, natural light and views, prominent location, and use of warm clay and wood are appreciated by all who work here and visit.

- Security. In the past and present, everyone expects a safe place to reside, work, socialize, etc. All expect a safe embassy to work at and visit. Security is a always a priority. How it is provided has changed significantly over time.

    a. Physical security. At the time of construction, a robust concrete brutalist structure, surrounded by a perimeter wall and fence, with secure doors and hardware, and with local police and guard force, was considered adequate.

        i. 2024. The original design remains valuable. However, physical security threats have evolved and are now more robust. To the original design, we have added bollards, glazing, stricter space segregation, and more robust doors and hardware. Physically, the security of the embassy has improved.

    b. Technical security. At the time of construction, technical security (in relation to today) was in its infancy. Phone and radio communication was common. Cameras were only selectively used.

        i. 2024. Technical security is now robust and constantly evolving. Cameras are standard everywhere and are continuously monitored. Communication takes place in many areas, including phones, radios, sensors, etc.

- Staff and Program. The staff and program that serve any U.S. diplomatic mission are not static. Their numbers, tasks, and talents change year to year. Embassy Montevideo's renovation effort included a staff program reset that informed our design team on how best to revise its interior spaces.

- Utility infrastructure. While many technological advances include devices growing physically smaller, the infrastructure to support technological advances continues to grow larger and more complex. The embassy's original utility infrastructure was close to what was typical of an office building of its time. It included conduits, pipes, ducts, and chases for typical utility services of this time - electrical, phone, heating, cooling, etc.

a. 2024. Since the embassy's inception, the technology that serves it has evolved, grown, and started new. It reaches every employee and visitor in more ways and has a higher volume yearly. To provide all the latest technologies, the embassy has to host more space, power, data, plumbing, heating, and cooling to support them. Furthermore, it needs to host them within an existing brutalist concrete architecture shell and framework that we wish to protect and highlight. In short, we provided more utility infrastructure space without losing diplomatic, representational, or staff space.

- Energy. Energy use and efficiency were rarely concerns in the original lives of most culturally significant properties. Embassy Montevideo did not likely open with significant energy use concerns, but they are a top concern now. When the embassy opened it was plugged into the local energy infrastructure. Concerns about heating and cooling costs are minimal. Efficient heating, cooling, lighting, etc was not a priority. Renewables were almost unknown.

a. 2024. The embassy remains plugged into the local energy infrastructure. But now, we monitor efficient heating, cooling, lighting, etc., along with our heating and cooling energy bills. All ME HVAC systems have been revised to maximize efficiency while providing individual comfort.

b. The U.S. State Department is embracing renewable energy everywhere possible. At present, the Embassy Montevideo site does not lend itself easily to renewable energy. But as technology evolves, renewable energy could easily be part of the embassy's future.

#19

- Environment and resiliency. In the past and present, most people want a clean environment, safety, and reliable utilities. In the past, this was often taken for granted. But today, it is an active priority. One can posit that this embassy was constructed for diplomacy and people, with some environmental benefits derived from local natural circumstances, while also positing that environmental protection was not a priority. Embassy Montevideo was born with some natural advantages. From its start it always had strong natural light and views. Being near the ocean along a major river, it always had clean air nearby, though maybe not always in the whole building interior. However, the embassy at this time paid little attention to water use, stormwater, and healthy interior air. Stormwater was discharged from the site, as was common practice. The embassy was plugged into the local water supply, and water was readily available for all uses. Healthy air was highly dependent upon how much exterior air made it to the interior spaces, including the subgrade levels.

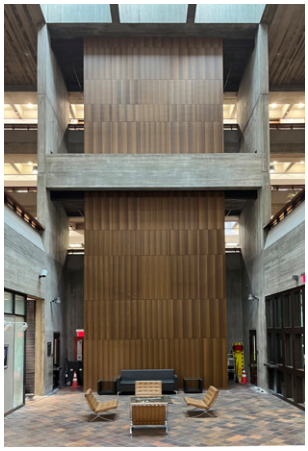
a. 2024. The environment is now a priority for general living and is part of our diplomatic efforts. Natural light now enters more interior spaces while strong views remain. Healthy air is provided throughout the structure with new ME systems that bring regular air changes to all parts

of the embassy. While remaining plugged into the local stormwater system, we now also store and reuse stormwater on site. Water use is now monitored and metered. Embassy Montevideo is now more cost-effective to run while being diplomatically friendly to the host country.

b. Resilience. Resilience is a word gaining importance worldwide as we face our environmental issues. Resilience is also now a primary driver of our worldwide embassy new construction, renovation construction, and maintenance efforts. As our world becomes hotter, wetter, dryer, stormier, etc., with bigger weather events, we need to create embassies that can withstand these developments. Resilience was of little concern when this embassy opened. However, its ability to withstand unplanned droughts, floods, power shortages, etc., will be a part of the embassy's life from now on.

- Life safety. Life safety, whether intentionally or not, is always a human concern. Over time, our expectations regarding life safety (protecting lives and property) have grown and continue to grow. At the time of construction, Embassy Montevideo contained all the life safety requirements of its time.

a. 2024. By today's contemporary life-safety standards, the original design has many shortcomings that need attention.



i. The most significant new requirement was a second enclosed fire stair. New stairs in existing structures are always challenging, but a new fire stair in an existing culturally important embassy takes on extra importance. In this case, our design team found a way to provide it with only minimal impact on the atrium. The dynamic quality of the atrium remains, and the scale of the stairs fits well and sensitively within it. Life safety has been improved, and this element meets our present requirements. While it would have been nice not to have to do this, overall, it should be considered a success story.

ii. The remainder of the life-safety systems required an overhaul that included new alarms, sprinklers, fire pumps, smoke purges, refined exiting systems, etc. If the embassy ever requires evacuation, we have made it possible to evacuate faster and easier.

- Communications. Communication systems from the 1960s to today are almost incomparable. Since Embassy Montevideo's inception, how we work and communicate with each other has evolved, and the embassy's telecommunications and interior design reflects the changes.

a. Diplomacy and embassy life depend upon interpersonal communication. It used to be practiced face-to-face, with typewritten documents, and regular phone calls. But today, face-to-face meetings are supplemented by (and sometimes dominated by) telecommunications technology and the interior

design of Embassy Montevideo. Open floorplans maximize use of staff space. Conference and team rooms support personal and group discussions. Private offices are few in number. Internet connectivity, with many hardware and software options, makes all these spaces work together. ■

BIOGRAPHY

Frederick J Poehler, AIA, ASLA, LEED AP. As a hands-on leader and proven architect, I have worked in many international locations creating innovative design, construction, and landscape projects. I have collaborated with diverse groups to achieve successful endeavors and develop projects that meet client's vision, design, and program needs, enhance security and safety, comply with all building codes and regulations, meet budgets and schedules, and fulfill all expectations. My time with the US State Department has blessed me with the opportunity to be design manager for the renovation of the US Embassy Montevideo (originally designed by I.M. Pei).

ABSTRACT

We are currently experiencing multiple crises that manifest themselves in our built environment and perhaps most importantly in the unravelling of the scissors between a small group of the super-rich and the rest of the world. Gentrification is inextricably linked not only with the construction of new architecture and urban development, but also with the displacement of populations, usually involving the demolition of buildings and entire urban structures. The victims of such urban development are mainly affordable housing, but also public infrastructure, buildings for culture, sport or services built with public funds. A significant part of this endangered building stock consists of architecture built in the three decades after the end of the Second World War, a period that in large parts of the world was influenced by the policies of the welfare state.

The aim of our research, and of the discussion in the conference session, is to explore the ways in which it has attracted the interest of civil society and engaged it in the debate about the preservation of the heritage of post-war modernism. We want to focus on uncovering the practices and strategies of protest against the destruction of the heritage of post-war modernism. We also want to draw attention to the key actors, experts in the history of architecture, who are initiating struggles to save this specific heritage. We have described the relationship between the initiators of protest and their opponents according to William Gamson's theory. This was done in order to critically highlight the precarious position of researchers. Researchers' active opposition to investment plans is seen as an abandonment of the objective scientific field, and their entry into the political arena is pejoratively termed 'activism'. We argue that the involvement of researchers in conservation should be seen as a legitimate scientific practice, applied research.

1. INTRODUCTION

In the dark times, will there also be singing?
Yes, there will be singing
About the dark times.
Bertolt Brecht, "Motto."

We are currently experiencing multiple crises ranging from collapsing ecosystems and the irreversible warming of the planet beyond the limits of the Paris Agreement[1], to the global retreat of democracy[2] and the associated rise of authoritarian regimes, nationalism, and the success of far-right parties, to the global increase in social inequality.[3] This dark age of global socio-environmental decline and inequality is most clearly materialised in our urban environment. From London, Dubai and Moscow to Mumbai, Rio de Janeiro and Lagos, the past three or four decades have witnessed an exponential increase in urban development owned by a dwindling number of private owners. High-rise commercial centres and luxury apartment blocks fill city centres and, together with the tourism that is part of the investment competition of metropolises, displace the poorer classes of urban population. Gentrification is intrinsically linked, not only to the construction of new architecture and urban development, but also, together with the displacement of the population, usually to the demolition of buildings and entire city structures.

The victims of such urban development are largely affordable housing, but also public infrastructure, buildings for culture, sports or services built with public funds. These are buildings whose commercial potential cannot compete with the profits that can be made from replacing them with new construction. A significant part of this endangered building stock consists of architecture that was built in the three decades after the end of the Second World War, a period that in large parts of the world was influenced by the policies of the welfare state.[4] As research on inequality shows, it was also during this period that the world was experiencing a reduction in inequality between different parts of the population. Today, these disparities are increasing, not only at the individual level, but also significantly in terms of the overall impoverishment of countries.[5]

It is not surprising that parallel to this developments interest of experts in postwar architecture heritage increased at the beginning of new millennium. This interest was motivated not only by the architecture qualities of post war modernism but also by the growing importance of environmental questions. At the same time it was exactly the evidence of social context of modernism, which was explicitly thematised by Jürgen Habermas in his 1980 essay Modernity – An Incomplete Project, that motivated the research. In our paper we will focus on public housing and public services which built the core of postwar modern architecture heritage.

5. "Rich countries, poor governments," *Our World in Data*, accessed May 31, 2024, https://wir2022.wid.world/chapter-3/.

2. "BOOM, BOOM, BOOM"

In the introduction to his book The Language of Postmodern Architecture, Charles Jencks celebrates the demolition of the Pruit Igoe housing estate in St Louis. His enthusiastic "Boom, boom, boom" was addressed not only to the technocratic monotonous architecture of modernist housing estates, but equally to the messianic position of the architect as the creator of a better society. His celebration of demolition thus paradoxically continued the radical modern paradigm of tabula rasa as pointed out by Vladimir Papernij.[6] Despite Jencks's predictions, the wave of demolitions of modernist housing estates did not occur until almost two decades later. However, compact urban structures did not begin to emerge in their place, and the architecture that replaced the modernist legacy of social housing is not an example of postmodern play and linguistic overlay. It is mostly the building production in the "¥€$ Regime" that at the end of the millennium "has turned architecture into a different art."[7] This regime requires architects to abandon ideas of a better world; their "political" role is to convince the public and politicians of the good design of public space, not of the actual content of architecture and its wider impacts on society or the environment.[8]

In his 2014 study Supplement to OMA's preservation manifesto, restoration theorist Jorge Otero-Pailos paraphrased Rem Koolhaas, who argued with a dash of self-criticism that "the three frothy decades between the early 1980s and the late 2000s were at the root of the transformation of "serious" and "necessary" architecture of the 1970s into starchitecture".[9] Today, starchitecture and its generic derivatives not only dominate building production in city centres across the planet, but, as Otero-Pailos points out „the deregulation of the market economy initially made it impossible to practice this sort of socially committed architecture, and now, more disturbingly, it is eliminating evidence that such architecture ever existed, as this legacy falls victim to development pressures to demolish it".[10]

However, the aim of our research is not primarily to analyse the global processes behind the erasure of the layer of post-war "serious" and "necessary" architecture. Nor are we interested in the demolition itself, but in the ways in which it has aroused the interest of civil society and engaged it in the debate on the preservation of the legacy of post-war modernism. We want to focus on uncovering the practices and strategies of protest against the destruction of the heritage of post-war modernism. We also want to draw attention to the key actors who are initiating struggles to save this specific heritage.

3. DEFENDING THE LEGACY OF THE WELFARE STATE: HOUSING

The Welfare State has primarily made its mark in the history of architecture through its efforts to provide quality housing for all classes, largely following the ideas and manifestos formulated by architects from the interwar period onwards in the CIAM congresses. Today, housing unaffordability is one of the most significant themes of urban conflict

around the world. There is an extensive theoretical literature on the "Right to the city" movements defending the right to housing and the right to use the city, fighting against the eviction of low-income residents. However, few works are devoted to the very topic of the protection of modern architectural and urban heritage as a form of urban mobilization. Wiliam A. Gamson, founder of social movement impact theory, divides actors involved in social struggle in two types: 'challengers' active citizens, who actively enter into decision-making of 'incumbents' politicians and experts in role of power-holding elites, who try to maintain the status quo.[11] Anna Domoradská specifies Gamson's theory to the field of Right to the city, considering challengers as those who "focus on contention of an existing order and resistance to mainstream rules, in search of an opportunity to reshape urban power structures or more generally the direction of urban development."[12] Architectural experts and conservationists, initiating many campaigns and protests, stand as "challengers" in cases concerning the preservation of architectural heritage, despite the fact that they are defending "conservation" positions.

It was architectural historians and architects who initiated one of the most famous struggles to save modern post-war social housing, Robin Hood Gardens. The 2007 call for the preservation of this iconic work of Brutalism was signed by major architectural figures such as Norman Foster and Richard Rogers, and the landmark declaration was supported by the RIBA. A review panel of the Commission for Architecture and the Built Environment also gave a positive opinion on the protection of the work. However, the Director of Heritage of England did not accept the assessment and did not grant protection to the complex. However, the public debate on Robin Hood Gardens has not been clear-cut. The failure of the architectural concept of 'streets-in-the-air' was the main argument against the preservation. The narrative of the complex's decay and dysfunctionality was confirmed by opponents of preservation with sociological surveys which claimed that the majority of residents were in favour of demolishing their housing and replacing it with better housing.

Architects and architectural historians have been left alone in the struggle for the protection of post-war heritage. However, the inability to accept the "beauty" of brutalism did not only manifest itself in the conservative part of society. Even Sir Rogers' capital response "Robin Hood Gardens is a great example of the best postwar architecture and deserves to be kept for future generations"[13] did not influence the decision, which was made at the beginning of the great economic crisis and was completed with the demolition of the complex in 2017.

Social movements for the right to housing or tenant protection only began to grow globally during the crisis, which was fundamentally rooted in the real estate trade. Linking tenant protection with property protection is proving to be an increasingly useful strategy and confirms that experts do not always have to stand on the side of the status quo. As more recent research in the Right to the City movement confirms[14], it is experts who

bring a new dynamism to advocacy for civic activities and interests. In Latin American countries, as the Brazilian example of Flávia Brito do Nascimento shows[15], the successes of monument protection are also helping in resisting evictions and gentrification.

4. DEFENDING THE LEGACY OF THE WELFARE STATE: COMMONS

An essential part of state-funded construction in the first three decades after World War II was the construction of public facilities for education, health, culture, and sports for the wider population. In particular, the architecture of cultural, social and educational buildings was an important part of the cultural policy of states. Attention was paid to it as much in liberal democracies as in authoritarian systems. Thousands of such buildings were constructed from the 1950s to the 1970s in some of the manifestations of the rich spectrum of opinion of post-war modernism under the welfare state or socialist state policy. Many were located in the immediate centres of towns and cities, and older structures often had to give way for their construction. In the mid-1970s, therefore, like modernist apartment complexes, they became the target of criticism not only by postmodern theorists but also by conservative politicians and parts of the public. This phenomenon manifested itself most massively in countries undergoing socio-political transformation in the last decade of the 20th century. The debate surrounding the Palast der Republik in Berlin (1973-1976), which resulted in the demolition of this modernist building in 2008 and its replacement with a copy of the historic Stadtpalast that originally stood on its site, is a case in point. The critique of modernism was combined there with a critique of the socialist regime and communist ideology, which not only had to be defeated but also had to be removed from the public space.[16]

The same strategy was applied in the demolition of the Bratislava House of Trade Unions, Technology and Culture - Istropolis (1959-1981). This outstanding work of post-war modernism was one of the most significant investments of the state in cultural and social infrastructure. It was characterised by a generous spatial concept and an extraordinary quality of construction design. In 2022, the building fell victim to privatisation and the exploitative setting of urban development financed by private capital. The new Istropolis, a multifunctional complex with a congress hall and a dominant residential and commercial function, was supposed to "conquer" "the original" "socialist monument" with its quality. It was with this aim in mind when the developer organised an international competition, the winner of which was the renowned Dutch studio KCAP.

As in the case of Robinn Hood Gardens, architectural historians and architects in Bratislava saw the rescue of the building in its listing as a monument. And in Bratislava, too, the advisory body to the Director of the Monuments Office recommended that the Trade Union House be declared a monument. In the sphere of political decision-making, however, they

15. Flávia Brito do Nascimento, "Housing Complexes in Brazil. A modern Heritage," in *Contested Legacies. Critical Perspectives on Postwar Modern Housing*, eds. Andrea Migotto and Martino Tattara (Leuven, University Press, 2023).

16. Recently, it has come to light that copies of the historic decoration of the palace were also financed by the radical right. So it turns out that this was not only an attempt to remove the legacy of totalitarian communist ideology, but also to reinstall another totalitarian ideology. F. Ottelmans. "'We are dealing with fundamentalist rightwingers': Berlin statues are latest battleground in Germany's culture wars," *Guardian*, accesed March 23, 2024, https://www.theguardian.com/world/2024/mar/23/we-are-dealing-with-fundamentalist-rightwingers-berlin-statues-are-latest-battleground-in-germanys-culture-wars.

were ultimately inclined to support business as usual. The Monuments Office alibistically issued no decision.[17]

The evasive responses from the authorities as well as the media campaign by the developer of New Istropolis to question the professional positions of the experts eventually led to the announcement of the Save Istropolis petition. The initiators addressed the petition to the representatives of those public institutions that have a direct impact on the development of the situation in the area. At the same time, the petition was intended to address the public and arouse their interest not only in this particular building, but in the architectural heritage of the second half of the 20th century in general. By the end of 2021, the petition had more than 10 500 signatories. It was also supported by a number of public figures from the cultural and social lifethe fate of Istropolis could not be reversed. The municipal authorities allowed the complex to be demolished, which happened in spring 2022.

In contrast, the fate of the Palace of the Republic was decided at the highest level in the national parliament, and it should also be remembered that while in Berlin the modernist Palace of the Republic has been replaced by the cultural institution Humboldt Forum, in Bratislava it will be a commercial development.

5. ACTORS

The claim that "landmarks are the buildings that have been recognised as such by elected politicians, most commonly on the basis of the recommendations of expert commissions"[18] presented an ideal vision of a scholar providing a service to society by handing over knowledge to be further decided by policy makers pursuing the needs of society. We could say that in this way scholars have fulfilled their role. However, the process of preserving architectural heritage is rarely this ideal. Scholars who present universal heritage values are often misunderstood by politicians, who have to reconcile particular interests and act in processes that are often beyond their control. The commons, built in the era of the welfare state, have in the past decades passed into private ownership and become a space for storing capital surpluses.[19]

The unequal position of experts in promoting the protection of architectural heritage in relation to owners and investors forces them to move from the position of advisors of politicians and officials to the position of direct advocates of heritage protection. The threat to the existence of the object of research motivates scholars to engage in the struggle for its preservation. Often it is architectural historians or heritage specialists who can provide arguments to the wider civic resistance. However, the direct involvement of scholars in protection, in contrast to their role as advisors to officials and politicians, puts them in a difficult situation. Actively opposing investment plans is seen as abandoning the objective scientific field, and their entry into the political arena is pejoratively referred to as 'activism'. Such a division of the architectural

historian's work into public, impartial publication of data and private engagement raises fundamental questions about the meaning and ethics of research? Isn't every scientific interpretation, in fact, an imaginary step out of the ivory tower of objectivity, and the dispassionate observation of destruction merely nihilism, contrary to the unquestioned goal of science to help make the world and society better? In this light, can't the committed involvement of researchers in conservation be seen as a legitimate scientific practice, applied research? ■

BIOGRAPHY

Henrieta Moravčíková is Professor of Architecture History at the Faculty of Architecture Slovak University of Technology, Head of the Department of Architecture at the Slovak Academy of Sciences, and chair of the Slovak DOCOMOMO chapter. Her field of interest is 20th and 21st century architecture and modern architecture heritage. Her book, Architect Friedrich Weinwurm (2014), was awarded the International DAM Book Award. Together with her team she prepared the first complex analytical monograph on modern town-planning of the capital of Slovakia Bratislava (un) planned city (2020). The International Creative Media Award recently awarded the monograph the Gold Award.

Peter Szalay is architectural historian. He works at the Department of Architecture of the Institute of History of Slovak Academy of Sciences and at the Department of Art History of Faculty of Arts of Comenius University in Bratislava. His research focuses on architecture of the 20th and 21st centuries from the art-historical, heritage, as well as broader social and environmental point of view. In 2021, he was the co-editor of the thematic issue of the scientific journal Architecture & Urbanism: The Heritage of Postwar Modernism: Engaged Research. He is executive editor of the scientific journal Architecture & Urbanism, and a member of DOCOMOMO International.

CONTINUITY AND TRANSFORMATION OF POST-WAR MODERNIST ARCHITECTURE: THE CASE STUDY OF THE FORMER COMMUNIST PARTY HEADQUARTERS IN KOŠICE, SLOVAKIA

MONIKA KICOVÁ
INITIATIVE FOR MODERN ARCHITECTURE NGO, KOŠICE

#20

ABSTRACT

The case study presented in this paper discusses the issue of the preservation and reconstruction of the former Slovak Communist Party headquarters in the city of Košice, which was designed under the lead architect Milan Motýľ and built between 1979 and 1984 (opened in January 1985). Although the building was initially intended to be a workplace for party members, it has been used as a municipal office following the political changes of 1989. This paper examines the non-problematic use of buildings of key political institutions from the earlier non-democratic regime through the lens of its architectural form. The study shows that through engagement with various actors in the public sphere, such as civic organisations, architects and local authorities, it is possible to develop a reconstruction plan that takes into account the architectural and historical value of the building.

1. INTRODUCTION

Designed in the 1970s and completed in the 1980s, the building of the former Slovak Communist Party headquarters in the city of Košice, also known as the "White house" (Biely dom) due to its distinctive façade, now serves as the city's municipal headquarters. By presenting the political context in which the building was created, its recent past and its potential future, I aim to demonstrate that buildings that once housed key political institutions during the non-democratic regime were easily repurposed for use by current public institutions, not only due to overall lack of interest among the architectural sector in the creation of new representative buildings for the democratic state in the years after 1989[1] but also because of their inherent architectural qualities. Initially intended as a centralised administrative building with ample public space, it would have been a relatively simple task to adapt the party headquarters into a municipal office at that time. In addition, I will briefly describe how engaged research and the involvement of various non-state actors beyond the scope of traditional monument care,[2] which still shows little interest in post-war modernist architecture from the socialist period, has helped to specify the conditions for its future reconstruction.

2. POLITICAL CONTEXT

Following World War II, Czechoslovakia became part of the socialist "Eastern Bloc". The leading position fell to the Czechoslovak Communist Party (KSČ), which had governed as a party-state since 1948. The period of power of the Communist Party in Czechoslovakia between 1948 and 1989 is divided into two phases: the initial period from 1948 to the invasion of the Warsaw Pact armies in 1968, and the normalisation period which lasted throughout 1970s and 1980s until November 1989. Unlike the first phase, especially during the 1950s, the period of normalisation, which came later, is characterised by a more selective application of state repression, targeting the public political, intellectual, artistic and religious expressions of its own citizens.[3] The consolidation of power by the highest authority, the Central Committee of the Czechoslovak Communist Party (ÚV KSČ), led to the assignment of new responsibilities to the party bodies across various aspects of political, economic and social life. After the Constitutional Law on the Czechoslovak Federation was adopted in 1968, executing these duties required the formation of an administrative structure that would operate within the two socialist republics.[4] The Slovak Communist Party (KSS) was a separate organisational unit subordinate to the central KSČ, and carried out these new duties in the territory of Slovakia. However, the orders and directives issued by the centre were implemented by the lower party structures – the district and municipal committees of the KSS, in addition to other organisations which provided facilities for the education of party members, propaganda activities and political-organisational work.[5] As a result, this extensive network of party organisations required appropriate material and technical support with which to carry out its duties, and new party headquarters began to emerge in the 1970s and 1980s in almost every regional and district town in Czechoslovakia. It might be expected that architecture from the late period of normalisation, especially projects for the administrative apparatus of

the authoritarian regime, would be inherently political works in an ideologically totalitarian way. In that sense, it refers to an architectural designs that embody the autocratic approach of the central authorities through their form, style and urbanism. Typically, these designs are associated with monumental forms or prominent locations in city centres that are intended to manifest the strength and hegemony of the ruling state power in the built environment.[6] This interpretation, which reduces all of the circumstances influencing the emergence of architecture to ideological purposes, is, however, unsatisfactory. Not only does it deprive us of a fuller understanding of the many other social, cultural, and political factors at play as well as the individual intentions of the architects that are reflected in their designs, but by framing this architecture as totalitarian there is a risk that we are ignoring the historical continuity of the uses of such buildings after the regime change in 1989 and, in many cases, undermining efforts to preserve them. As recent research on Communist Party headquarters in Czechia has revealed, this typological category represents a diverse spectrum of architectural structures.[7] Some of them showcase unique concepts by their creators. Others, in turn, reflect broader principles and trends that were prevalent in the construction industry of the time. From the perspective of architectural forms, the building of the Slovak Communist Party headquarters in Košice combines both of these aspects.

3. THE ADMINISTRATIVE BUILDING OF THE SLOVAK COMMUNIST PARTY

Prior to the construction of the Slovak Communist Party headquarters building, the secretariats of the various party bodies were located at different sites around in Košice, mainly in historical buildings. An integrated administrative building was intended to replace these separate buildings, in the aim of simplifying the organisational structure, saving on financial resources and ensuring greater centralisation. The first Stavoprojekt atelier, part of the state-run Stavoprojekt Košice design institute and led by the architect Milan Motýľ, won a non-public architectural competition with a design based on the graded horizontality of volumes. The new building was placed in the peripheral centre of the New Town housing estate (Nové mesto), which is a remarkable example of the socialist state's mass housing programme designed to serve as a counterpart to the historic city centre. The construction on the single building for various party bodies commenced in 1979. It was built on an exposed site with a slightly sloping terrain which was intended to be the visual focal point of a planned pedestrian route that would connect the new city centre with the historical one. The building as a whole was made up of several autonomous tracts and a distinctive mass of conference halls. **(Fig. 1).** The administrative sections, located in horizontal blocks with rectangular floor plans, consisted of functional units of municipal, district, and regional committees and the House of Political Education featuring a library, meeting rooms and a cinema. The conference hall complex, on the other hand, was conceived as a separate mass on an irregular plan which was connected diagonally to the main administrative part and almost entirely covered with travertine cladding. The

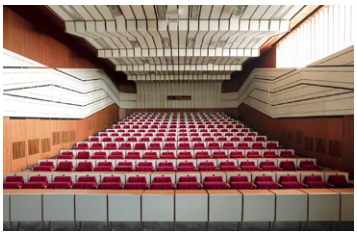
building's interiors feature a combination of standardised and original design elements. Representative spaces such as the conference halls, some meeting rooms and the cinema are dominated by decorative acoustic ceilings and a unified palette of red, white, and brown. **(Fig.2)**

4. POST-1989 CONTINUITY

Following the regime change in 1989, the former secretariat's buildings were transferred from Party hands to public ownership. Now that party headquarters buildings across Slovakia had lost their original function, the process of transformation began, and the structures gradually found use as sites of public infrastructure, such as municipal offices, university facilities or cultural centres. According to the architectural historian Miroslav Pavel, the fact that these buildings can be adapted for new purposes without the need for major structural changes shows that the majority of their architects did not necessarily design their projects as showcases of the power of the Party but instead did so with modern administrative architecture in mind.[8] I believe that this is also the case with the party headquarters building in Košice. Shortly after the 1989 Velvet Revolution, there was a proposal to transform the complex into a children's hospital, but this plan was later rejected due to significant dispositional and material challenges. Eventually, the building was repurposed as the administrative offices of Košice City Municipality (Magistrát mesta Košice) and serves this purpose until the present day. Nevertheless, the White house's post-1989 history is mainly linked to the city's efforts to dispose of the building. The ethos of economic privatisation in the 1990s and early 2000s, when many state-owned enterprises and other public assets were transferred to private ownership, is well illustrated by local daily press articles referring to the city's consideration of selling the building at that time.[9] It was widely expected that the sale of city land and the building, in this case referred to as a "*communist palace"*,[10] would quickly increase revenue for the city's budget. While the White house has remained in public hands, several other architecturally distinct buildings with a cultural or shopping function, located in the same area of the New Town housing estate, have been sold to the private sector. As a result of poor reconstruction works, the majority of them have lost their architectural and historical value. Nowadays, the city government recognises the importance of owning its headquarters. However, over the intervening years, only a handful of minor building modifications have been undertaken. The building currently requires a general reconstruction to ensure energy efficiency and thus reduce operating costs. How can a large-scale modernist structure that was built nearly four decades ago be modernised to match the current demands of sustainability while maintaining its architectural values?

5. ON THE ROAD TO SUSTAINABLE PUBLIC ARCHITECTURE



In 2021, the Office of the Chief Architect, which is also one of the public bodies housed in the building, proposed the idea of the general reconstruction. Since the building was not listed as protected heritage, it was outside of the scope of monument care authorities, but it was still necessary to define the criteria

and general framework of the building's transformation, together with the architectural elements that should be preserved and left unchanged. During this phase, engaged members of the public centring around the IMA collective[11] became involved in the process. Active efforts to preserve the building as a part of local and regional heritage consisted of photographing the current state of the building and archival research aimed at finding original design documentation. The outcomes of this research provided by IMA, were presented to the investor, the city of Košice, in the form of a final report which focused primarily on a formal analysis of the building. The importance of describing the characteristics of the architecture and the significance of the components that should be preserved was also emphasised. A list of atypical, original interior fittings with high quality architectural designs was attached, as well as an inventory of artworks. Some key recommendations included maintaining the current mass of the entire building, meaning that no building extensions or demolitions would occur. Others suggested retaining the area of the main square in front of the building as a gathering space, preserving the integrity of the entrance axis, retaining the characteristic travertine cladding on the perimeter walls of the conference hall complex and the administrative areas, and conserving unique interior features such as the decorative ceilings, doors, chairs and integrated fitted furniture items in the meeting rooms. While the research was being carried out by IMA, the investor commissioned a local architecture studio, DOXA, to create a conceptual design for reconstruction that would also reflect the potential of the building's architectural heritage. It is worth mentioning that the architect of the original work, Milan Motýľ, also took part in the consultation process. Almost all of the recommendations and suggestions for preservation were incorporated into the final project developed by DOXA architects. Their design demonstrates the change in the perception of the building from a symbol of the authoritarian regime, which some members of the public and professional community still perceive it to be, to a democratic public building which is defined by its openness and high-quality public space. As the architects noted in their final report: *"We choose an approach where our design is not clearly distinguishable from the original one. In doing so, we want to show that even this historically high-*

quality and genuine architectural language can, with a little adaptation, meet the current needs of a modern 21st century town hall."[12] Unlike, for example, a contrasting method that adds a new recognisable layer or a "radical" approach that replicates and develops the original ideas and patterns lying behind the physical form of architecture,[13] the DOXA design applies a "conservative approach" to the modification of the original structures. The main emphasis is placed on the building's surroundings. The creation of a new public pedestrian passage that leads directly through the complex helps to open the building from both sides of the central east-west axis and strengthens its role as a focal point of the area **(Fig. 3, 4).** Moreover, the design introduces new improvements, such as debarriering of the main entrance to the building, applying a new energy concept[14] and creating an open urban parterre with services. All of these interventions are particularly noteworthy because they are integrated into the existing volume of the building without compromising on the original architectural design.Other events held in cooperation with the Office of the Chief Architect, such as guided tours and public discussion on the building's future, have contributed to efforts to present this architecture as a vital layer of post-war modernism. Finally, the active work by the civic initiative and municipal authorities has resulted in a wider recognition of this architecture as a part of the city's heritage. This recognition has also been realised at the municipal legislative level through the inclusion of the building into the register of city monuments.

6. CONCLUSION

The purpose of party headquarters in Czechoslovakia was to provide a material and technological basis for the spread of the ideological agenda of the Communist Party. It carried out this aim directly, by functioning as a physical workplace for party members, but also indirectly, by serving as a distinctive landmark and symbol in the urban environment. However, as we have illustrated in this study, this architecture can function almost unchanged in the new post-communist political reality. Despite the fact that the plan for the building's reconstruction remains at the concept stage, it presents us with a potentially novel approach to working with the materiality of the socialist past. The use of this "conservative approach" aligns with the contemporary demand for healthy, sustainable public architecture. By taking into account and developing both the material architectural quality and the broader principles instilled in the design of the original building, its form can easily be adapted to current needs while maintaining its architectural-historical value. In addition to the reconstruction plan, engaged research undertaken by local activists has contributed to raising awareness and spreading knowledge of the building among the general public and other architecture professionals. Although the building is not currently listed, such "from below" care practices could lead to an acknowledgement of its heritage potential. ■

BIOGRAPHY

Monika Kicová (*1995) is a librarian, researcher and activist who is actively engaged in the preservation of modernist architectural heritage. She studied art history at the Faculty of Arts, Masaryk University in Brno. Since 2020, she has been working for the Initiative for Modern Architecture (IMA) civic organisation, where she investigates, documents and raises awareness of the architecture of the central and peripheral locations of the East Slovak region.

AWAY FROM NOSTALGIA: A NEW APPROACH FOR THE FORGOTTEN WELFARE STATE INDUSTRIAL FACILITIES

MAXIMIANO ATRIA
UNIVERSIDAD DE CHILE

#20

ABSTRACT

During the "glorious thirty years" European countries followed a development model that produced an expanded network of factories associated with the economic activity of the territories, closely related to the local communities where they were installed. Successive blows radically transformed this model, beginning with the oil crisis of 1972 and later with changes in the economic agricultural models caused by globalisation. Such changes resulted in an impact on land distribution and use, as well as a decline in national and local industries. This, in turn, led to the abandonment of structures in several cities and villages, which remain as testimonies of an industrial past.

What interests us in this paper is the relationship between what we would call non-activist preservation and effective adaptive reuse by involving the active local communities, promoting the heritage value of these structures not from nostalgic approaches but by boosting activities and interrelations between local actors, securing, at least for the upcoming decades, the protection of this modern heritage.

1. INTRODUCTION

The concept of the welfare state is traditionally associated with programmes of social security and protection policies from the State aimed at its citizens, in accordance with the social contract that regulates what Krieger has called the relationship between governor and governed.[1] This idea has been at the heart of a typical French territorial structure through a decentralisation of middle-sized industry, promoting the expansion of the workforce towards the provinces and increasing the economic and cultural networks into the territory, creating rich and dynamic work environments far from the large urban centres. During the "glorious thirty years" this model produced a system of factories associated with the economic activity of the territories, closely tied to the local communities where they were installed. Successive blows radically modified this model, beginning with the oil crisis of 1972 and later with changes in the economic-agricultural models caused by globalisation that impacted land distribution and use and produced a decline in national and local industries. This, in turn, led to the abandonment of structures in several cities and villages, marking the end of an industrial era.

With the progressive reduction of the traditional welfare state presence in communities, and a liberalisation of international commerce which brought with it the delocalisation of several industrial activities, a strong sense of detachment was transferred to these old and empty structures, and many of them were demolished to erase the memory of a past that no longer resonates with the new population **(Fig. 1)**. This has also conflicted with romanticised views of a "traditional" aesthetics associated with the countryside, leaving the industrial built environment out of the equation.

From a heritage point of view, and faced with a general lack of interest in these modern facilities, preservation of these structures was assumed at first both by the academic and the professional world, with Docomomo serving as a good example of this dual engagement. This involvement, which usually took the form of academic research and watchdog campaigns, could be described as "activist" and may seem as lacking in "objectivity" from scholars where objectivity should be expected. Over the past decade, there has been a shift in approach towards greater recognition of the importance of modern heritage and new research topics. This encompasses not only preserving the industrial heritage per se, but also its relationship with contemporary issues such as ecology, localism, circular economy and adaptive reuse.

2. THE MODERN INDUSTRIAL HERITAGE IN NORMAND VALLEYS

A good example of this situation can be found in the industrial valleys to the south of the River Seine in Normandy, France. Before modern times, these valleys profited from the presence of water power to drive several industrial facilities, like spinning mills, forges and woodcutting workshops. With the advent of modernity, larger and more complex industries emerged, requiring larger populations and intervening significant portions of middle-sized towns. In some cases, a single industry came to define a local community, such as sugar production in Nassandres-sur Risle. This network

1. L. Krieger, "The Idea of the Welfare State in Europe and the United States," *Journal of the History of Ideas* Vol. 24, no. 4 (October - December 1963): 553-568.

of integrated infrastructures and industrial facilities is clear in the valleys of the Charentonne and Risle rivers, which pass through several middle-sized cities and towns before flowing into the Seine waters.

If these industries thrived between the 50s and the 80s, they were progressively losing their appeal vis-à-vis foreign competition, and they eventually closed down. The social impact of these processes has been significant, and it has taken decades for these communities to reinvent themselves after the end of an activity that defined their identity and provided employment for most of the population.[2] From an urban perspective, the presence of these abandoned structures has been viewed as a problem to solve, and some municipalities have imposed a fine or a special tax on the owners of abandoned industrial buildings. This is due to obvious problems related to the existence of these places near residential neighbourhoods and the need to promote the re-occupation of these sites to revitalise urban (or semi-urban) life.

In some cases, the existence of these structures has reached a point of discomfort before before they have been recognized as subjects of heritage protection. This has led to a general lack of interest from both the population and the authorities.

One way to prevent the almost inevitable demolition of these structures is to find new uses for them and integrate them into current social, cultural, and economic trends. In recent years there has been a renewed appreciation for the past and the possibilities that large-span architecture can provide for new activities. However, sometimes the obsolescence of materials and construction techniques has made it impossible to adapt them to current standards, especially in a country where regulations demand high standards in thermal and habitability conditions.

3. LE TIERS-LIEU AS A MODEL OF ADAPTIVE REUSE

To allow for this update, in recent years a new model of adaptive reuse has emerged, lacking the suspicion of "activism" because it is not centred *only* on the idea of preservation. This model is known as "third place" (French *tiers lieu*): a place between house and workplace, where local communities can find a cultural and economic offer, recycling large abandoned industrial buildings and dedicating them to non-productive activities. Inspired by the concept of the third landscape by Gilles Clément,[3] these "third places" operate from the communities, and take the institutional form of local associations which allows them to apply to public funding for renewing facilities and run the programmes of their choice. While it may not be the most "scientifically" sound way to occupy these structures, as I have defined in a paper presented in a previous Docomomo Conference,[4] it promotes conservation by re-incorporating them into the dynamics of the current communities, regardless of some minor concessions to the restoration of the buildings to their original state. Hence, this approach aims to move away from the nostalgia associated with scientific restoration and instead breathe new life into abandoned industries with new uses and aesthetics.

This does not mean that what is being done goes against the most basic concepts of conservation. In a way, valorisation of the industrial aesthetics

2. The demographic evolution of the Eure department shows that the annual variation of the population lowered by half in the nineties, when several industries closed their activities, mainly due to the reduction of immigration. helps to avoid the disfiguration of the metallic and concrete structures, which is visible in the specific case discussed in this paper.

These efforts to update and adapt for new uses are a powerful tool also for promoting the value of modern industrial heritage to the population. This is achieved by making them acquainted with buildings and places that they would have never visited if they had remained in a state of abandonment or if they were to be restored to their original function as operating factories.

The last Europan competition focused on revitalising the damaged relationship between this industrial heritage and local communities, with the proposed intervention of 52 sites throughout Europe, three of which were in the Eure department. These sites encompassed abandoned industries along the Charentonne river with attractive concrete and steel structures waiting to be reused **(Fig. 2).**

4. THE SITE OF COURCELLES: A NEW MEETING PLACE FOR CULTURE AND THE ARTS

On the Charentonne riverbanks, near the town of Serquigny, lie the ancient buildings of an industrial site that has clearly seen better days. Originally established as a forge in 1603, it later became a linen spinning mill in 1830 and, after the Second World War housed a woodworking workshop specialised in building television and radio set cases. The concrete and metallic structure buildings that replaced the old brick eighteenth-century pavilions date back to this period. In the early 1960s, another fire led to a change of property ownership, and the site became the headquarters of an airplane construction company, Avions Mudry et Cie, which built the famous acrobatic planes of the CAP series. The company profited from the woodworking machines and the expertise of the previous workers to build the wooden structure of the planes, which were then flown in the nearby aerodrome of Bernay. As a side operation, under another brand, it built wooden furniture for Knoll. However, in 1995, a fire in the hangars of the aerodrome brought the company to bankruptcy, and since then the facilities have remained vacant **(Fig. 3)**.

The buildings feature a light construction technique with steel trusses and columns and prefabricated concrete panels, as well as undulated fibrocement panels for the roofing. Its present state is regular but healthy, with several portions having been stripped of the original materials. Additionally, a number of interventions have been carried out over the last twenty years to prevent total decay.

In the past, several initiatives attempted to occupy the site for new uses, capitalising on the large spans and open spaces left by the industrial activity, which were in rather good shape. Finally, in 2023 the site Les Nouvelles Coordonnées opened as a cooperative to promote cultural and social activities, renting space to artisans and workshops, as well as collaborating with performing arts companies to recycle stage props.[5]

In the aim of restoring the habitability of the different buildings, a conservation project was established. This project aimed to preserve the original architecture and its complex layout in different volumes. However, it

5. See "Les Nouvelles Coordonnées, C'est Quoi?," *Les Nouvelles Coordonnées*, https://lesnouvellescoordonnees.fr/recit/les-nouvelles-coordonnees-cest-quoi/

Fig. 1. Demolition of abandoned grain elevator (1950s) in Beaumont-le-Roger, France, 2021. Photo: M. Atria.

Fig. 3. Abandoned concrete structures in Courcelles, 2023. Photo: Les Nouvelles Coordonnées.

also took a more flexible approach to conservation, moving away from strict and traditional methods. The project was based on the idea that the activity and dynamism of the buildings are the best way to ensure their preservation as a living heritage.

In this specific case, conservation and restoration had to take into account certain conditions in terms of local ecology and landscape, as the site was listed as a Natura 2000 site, a European policy for the protection of biodiversity. With this in mind, conservation was an issue not only related to architecture, but to a larger and broader scope that included the river, the wildlife and the neighbouring forest. In this sense, the project considers the whole context, and architecture is only one of the elements that constitute the richness and diversity of the place: all these elements have to be incorporated into the efforts to adapt the site to new uses. Furthermore, the conservation plans included the possibility of recovering the flow of the

river to produce electricity and providing the surplus for the neighbouring community of Courcelles, in the municipality of Fontaine-l'Abbé. The original hydroelectrical station is likely obsolete and therefore it will be necessary to replace the machinery to make it operational again. Thus, the project works on a third level, with the aim of restoring the water force as a productive element in relation to the site and its new activities.

5. CHALLENGES AND OPORTUNITIES

This example of conservation as project —to paraphrase the title of my previous paper— shows that there are different levels of intensity in the tasks of restoration/conservation, moving away from nostalgic impulses. It's not only about architecture or the physical reality of the buildings, but also about the uses, the potential force of the river waters and the social relationships that need to be addressed in a comprehensive way.

Alongside the buildings and residual elements of the industrial production, like television set parts, plane cockpits and other paraphernalia, the current owners have found dozens of boxes with documents dating from the 1950s to the 1990s, covering all the recent industrial activities that occurred on the site. The project includes the organisation and the incorporation of these archives into the French national archives network, and the opening of the contents to proposals from artists and local associations to help build the collective memory of the site.

Taking this into account, this new understanding of comprehensive adaptive reuse can provide more certainties regarding the future of these facilities. They will no longer depend on an enormous effort to reconstruct or restore the buildings to their original state, and thus this will assure not only their material conservation but also their integration into the very social networks they were originally a part of. ■

Maximiano Atria (Santiago de Chile, 1972) is an architect from Pontificia Universidad Católica de Chile, and holds a Master's in Architecture and PhD in Architecture and Urban Studies from the same university. He also holds a PhD in History from the Ecole des Hautes Etudes en Sciences Sociales (EHESS). Founder of Docomomo Chile, he was its general secretary between 2004 and 2020. He is an associate professor at the Faculty of Architecture and Urbanism of the University of Chile and has been a visiting professor at the Ecole Nationale Superieure d'Architecture Paris-Malaquais, and at the Ecole Spéciale d'Architecture in France.

WIDER THAN WELFARE: INDUSTRY, INFRASTRUCTURE AND ERADICATION

RICHARD BROOK
LANCASTER UNIVERSITY

#20

ABSTRACT

Acting as an Advisor to the Modernist Society (Manchester, UK) since 2011, the threshold between historian and activist is one that I regularly traverse. Similarly, as a member of the Casework Committee of the Twentieth Century Society, my research frequently informs decision making in attempts to conserve architecture and landscapes of the post-war period. I am interested in expanding the discourse of state related construction 'wider than welfare' into territories of industry, infrastructure, services and more. In a period of nationalisation in Britain after 1947, vast swathes of the built environment were touched by the hands of the state in a modernisation programme that ran parallel to social reform. Where social housing is irrefutable evidence of 'socially committed architecture', I argue that forms of industry and infrastructure are also a demonstrable legacy of a political structure that favoured the citizen. The eradication of much of this built legacy has been drawn into issues of culture and class in the UK and, more than just subject to development pressures, its erasure may be viewed as politically calculated and deliberate.

In this paper, I reflect on a 'wider than welfare' state and collective efforts to establish a broader understanding of the state's role in the built environment of the post-war period. I will question the values of mainstream modernism in narrating these wider histories of the state's influence on the built environment. I shall present primary research concerning county council architecture departments, the design of infrastructural landscapes and higher education institutions to disclose how the research has led to various forms of protection and activism. The idea posited in the session outline, of 'eliminating evidence', will be discussed in terms of the UK's market economy and an apparent subjectivity within current governance that favours certain forms of built heritage and denigrates others.

In this paper I address three major concerns. Primarily, this is a call for understanding the activities of particularly the British state as expanding 'wider than welfare' – that, in the post-war period in Britain, during an intense period of nationalisation and amidst significant social consensus, most forms of physical change were influenced directly by the activities of the state. Secondly, I want to emphasise the impact that this has had in terms of attitudes and decisions in relation to the statutory protection of buildings, landscapes and structures. Finally, it is my aim to evidence that the hand of the state continues to shape ideas of value attached to architectural preservation in academic circles and to consider what this means in terms of objectivity and prevailing political binaries.

The post-war rebuilding of Britain has been described as, 'an era when the state – or, as we might express it more benignly, wider society through the instrument of the state – assumed direct responsibility for housing its people decently'.[1] However, in Britain the responsibility of the state went well beyond housing. Energy provision, transport, healthcare, industry and education were all part of the key reforms to secure 'fair shares for all'.[2] Historian, David Edgerton, developed the term 'warfare state' to describe the parallel activities of the British in service of the cold war, advancing an argument that military expenditure in the post-war period outstripped that spent on welfare.[3] Thus, through an array of policy means, including the major legislative programme of the Labour government from 1945-1951, the state had a guiding hand in vast swathes of social, industrial and military reform.[4] Reports published between 1940 and 1942[5] concerning planning and land-use, laid the ground for the 1947 Town and Country Planning Act, which was the foundation of modern planning in Britain. An intense period of nationalisation also created British Rail, British Gas, British Steel, British European Airways, the National Coal Board and the Central Electricity Authority.[6] Some observers even imagined the architecture profession as a branch of the civil service.[7] The far-reaching effects of this policy development and its passing into statute still resonate today.

At the close of the workshop, *Architecture and the Welfare State*, held in Liverpool in 2012, a series of questions were posed for the concluding discussion. 'Why do we only talk about housing?' was the most direct, but also asked was, '[h]ow are we to address the differences between the exceptional and the everyday productions of the welfare state?'[8] Henry-Russell Hitchcock similarly framed 'the architecture of bureaucracy' amidst 'large scale architectural organizations'[9] proposing that the critic would have 'to develop different tools to evaluate the built results of such practice'.[10] Scholars did not generally take account of Hitchcock's foresight. However, some acknowledge the utility of going 'beyond biographical and stylistic perspectives' to 'relate … more complexly to the history of the … welfare state.'[11] Here, I wish to expand existing norms - for example, housing is considered as symbolizing the 'collective interventions of the modern state'.[12] However, Pries and Qviström argue that an often singular focus on this aspect has obscured the understanding of the complexities of the state

architecture, planning and landscape architecture of the period.[13] Historians have begun to unpack both matters - the discourse around type has expanded beyond housing, schools and hospitals and considered the architecture and landscape architecture of industrial, infrastructural and civic provisions in the context of state production. Recent research also calls for a more holistic understanding of 'welfare geographies', where multiple perspectives can reveal the more diverse aspects and achievements of state planning.[14]

My own research over the last five years has focussed on the architecture and landscape of post-war British infrastructure. Most acutely that of the Central Electricity Generating Board (CEGB) in coal fired and nuclear power stations, the reservoirs of the publicly owned water companies and the development of the motorway system. Nuclear power stations were part of a hidden-in-plain-sight programme for the enrichment of uranium for the British nuclear arms industry.[15] These large infrastructural undertakings were intrinsic parts of the modernisation of Britain but were equally bound to society through the provision of 'amenity', enshrined in statute initially via Section 37 of the Electricity Act (1957), later dubbed the 'Amenity Clause'.[16] It required the minimisation of the impact of generating and transmission sites on scenery, flora and fauna, which created aesthetic value as well ecologically important assets, and resulted in the appointment of landscape architects on new power station projects. In the same period the 'public relation value' of the landscapes of power stations became a crucial part of government policy.[17] This safeguarded the needs of communities and added another layer of cultural value to these landscapes. In 1961, Michael Porter was appointed as the first Landscape Advisor to the Ministry of Transport. The 1973 Water Act also created a duty to promote 'amenity' by the regional water authorities.[18] Thus, the heritage significance of industrial and infrastructural sites extends beyond the value of the built objects, conventionally recognised as being designed (albeit ostensibly technocratic exercises), to the designed landscapes and to the idea of welfare intrinsic in the provision of public amenity. In these terms, infrastructural landscapes that were sponsored by the state expand the ascription of 'welfare' and its geographies. They are also bound to an ideology that saw the apparatus of the state situate social and cultural provision at the core of its industrial expansion through the policies of nationalisation.

As coal fired power stations are demolished in the UK, so too are the socio-cultural structures associated with amenity provision. The vanishing of an entire industry and the dissolution of its supply chains and attendant businesses (also state directed) is happening in places that have already witnessed one such decimation in the politically motivated closures of coal mines in the 1980s (**Fig. 1**). It has become hard to separate industrial heritage from ideology, particularly as political binaries are increasingly entrenched in contemporary culture wars. Currently, Historic England (a public body funded by the Department for Culture, Media and Sport) have no plans to afford statutory protection to any relics of the coal fired power industry, despite calls to preserve at least one cooling tower. The listing of post-war architecture is notoriously subject to the whim of government administrations

and, despite being framed as an objective rule-based system, is openly affected by subjective decision making at the highest ministerial level. Cynically, one might suggest that some of this decision making is ideologically compromised.

To explore this possibility is it worth considering the case of the Dorman Long tower in England's north-east. The tower was built between 1954-57 as part of a plant producing coke for steel production.[19] The building contained a coal bunker and handling facilities, control rooms and water tanks for emergency firefighting. Disused since 1970, other than retaining its water storage function, the tower was scheduled for demolition as part of a programme of works to establish a freeport on the site. A notice of demolition was submitted on 3rd September 2021. Following rapid campaign mobilisation, on 15th September the tower was spot listed by Historic England for its 'deliberate monumental architectural statement of confidence' as 'a rare (considered to be nationally unique) surviving structure from the 20th-century coal, iron and steel industries'.[20] The 18th September saw a government cabinet reshuffle whereupon Nadine Dorries was appointed as Secretary of State for the DCMS. Her first ministerial act, following lobbying from the Conservative mayor of Teesside, was to overturn the listing decision and the tower was subsequently demolished overnight on 21st September. In cases such as this, objectivity is rapidly obscured by political hubris and to search and locate a truth is largely impossible. Left wing media saw it as a debacle that, 'symbolised the evisceration of local industrial heritage in the name of profit-driven redevelopment – and proved the 'Conservatives' only conserve when it suits them.'[21] The same authors pointed out that heritage and employment had been set up as binary opposites by the local Conservative mayor, who argued that the retention of the tower prevented jobs being created in the onward development of the site. Apparently, the two were incompatible.

Returning to the case of infrastructure and their landscapes, as my colleague and co-researcher Luca Csepely-Knorr observes, 'motorways or power stations are also sites through which geographies of mid-twentieth-century British modernity – and the ideas of welfare can be assessed and explored'.[22] Rapid state driven modernisation in Britain after 1960 was supported by government organisations with responsibilities to various ministries. The Central Electricity Generating Board (CEGB, 1958-1990) sat beneath the Ministry of Power and, subsequently (1969), the Ministry of Technology. Similarly, the Ministry of Transport oversaw the construction and management of motorways that were delivered via county authorities. Much of the planning for power and mobility was associated with the British New Towns programme. Thus, ideas of the 'state' and 'welfare' become inseparable when considering the vital links between people, place and employment in post-war Britain. The CEGB were responsible for the provision of power and commissioned and oversaw the construction of large oil fired, coal fired and nuclear power stations.

The fact that these were state enterprises, with clauses on amenity and the environment enshrined in statute, meant that the power stations were part of civic structures alongside fulfilling their function. In all the interviews we have

conducted, former employees from every tier of the CEGB have expressed their pride in being part of a service with such responsibility. They recall fondly the leisure and recreation facilities of playgrounds, allotments, sports pitches, golf courses and nature reserves, as well as family days, festivals and fairs, sponsored by their employer. These were not the paternalist-capitalist models of earlier industrialists, more these were undertakings bound with the welfare state. Much of this social provision was lost at the point of privatisation in the 1990s and more was eroded as the post-carbon future beckoned, and sites were closed. Beyond a collectively inscribed socio-cultural value, several organisations are now drawing attention to the heritage value of twentieth century infrastructure.[23] This is in the face of Historic England's current advice that cooling towers, the very symbols of post war power generation, are too ubiquitous and numerous to receive statutory protection.

However, it is not exclusively the objects of infrastructure that are at risk, significant twentieth century designed landscapes (now understood as 'welfare landscapes')[24] are being lost at a rapid rate. Absent in any appraisal of decommissioned sites, is an appreciation of the heritage, social, recreational and environmental values of the landscape architecture, so much so that several pioneering and stand out landscapes have already vanished without record or recognition. Landscape architects were at the forefront of the development of our power stations, reservoirs and motorways. No other profession had the requisite skill and wherewithal to be able to address the scale and significance of these changes to our landscape. Of course, if a landscape architect did a good job, then 60 years later their impact and involvement in these infrastructural advances is invisible. Moreover, those leading the development of ideas, and the development of the profession were often women, whose histories, like many female designers, have, until recently, been obscured.

To landscape historians, influential figures such as Brenda Colvin and Sylvia Crowe are well known, but their designed works, significant in scale and highly publicly visible, are under-celebrated. Crowe stands out for her landscapes around nuclear power stations at Wylfa and Trawsfynydd (**Fig. 2**) in Wales and Colvin for her schemes alongside coal fired power stations at Stourport (from 1952), Eggborough (from 1961), Drakelow (from 1963), and Rugeley (from 1963). At 60-70 years of age, the planting in these schemes is at peak biodiversity, but neither this, nor the design heritage value is preventing the loss of the power stations themselves and their landscapes. Victorian industrial heritage is universally recognised as of value, but the ascription of value to artefacts of the post-war state is seemingly irreconcilable with demands for development in the UK. The only current exception to this general picture, is the preservation of a nature reserve at Drakelow. As historians and researchers bringing attention to the schemes and asserting their historical significance, as well as perceiving inconsistencies and subjectivity in statutory processes, it is hard not to be drawn into arguing for their protection.

To complicate the threshold between objectivity and subjectivity, the UK administers a quinquennial research assessment exercise to assess the quality

of work in universities. One of the key metrics is 'impact', defined as 'an effect on, change or benefit to the economy, society, culture, public policy or services, health, the environment or quality of life, beyond academia'.[25] My 'Impact Case Study' in REF2021 evidenced that I had 'impacted on the heritage sector through the statutory listing of post-war buildings'.[26] I made successful applications to list two buildings and a public sculpture. The listing was only part of the impact my research had, but nonetheless points to a value system that rewards forms of soft activism, such as raising public awareness and seeking to preserve the built environment. Now, as a member of the Twentieth Century Society's casework committee, the line between architectural historian and activist is blurred and objectivity potentially conflicted. The only conclusion I personally can draw to reconcile this is, that if I, as an academic with privileged access to the necessary resources, do not do this work, who will? ■

BIOGRAPHY

Richard Brook is an architect and architectural historian whose work focusses on the mainstream modern architecture of the post-war. He is Professor of Architecture and Director of Research for the School of Architecture at Lancaster University. He acts as advisor to the Modernist Society and is an active member of the Twentieth Century Society. In 2022 he co-convened the annual conference of the Society of Architectural Historians of Great Britain, for whom he also judged the Colvin Prize. This year sees the publication of his monograph *The Renewal of Post-War Manchester: Planning, Architecture and the State* (Manchester University Press).

THE AYLESBURY ESTATE: SHIFTING NARRATIVES ON URBAN RENEWAL

LUCIA CONCETTA VINCELLI
LA SAPIENZA UNIVERSITY OF ROME, IT

JAMES ASTON LANSBURY
UNIVERSITY OF BATH, UK

#20

ABSTRACT

In contemporary imagery, modern architecture's representation fractures from reality, yet it continues to exert a real impact on people's lives: the Aylesbury Estate represents this crisis inflicted upon London. Once a vast declaration of the social ambitions of modernism, its place within media and politics has been as a symbol of social decline, failed design and dystopia. Despite degradation and displacement, residents of one of Europe's largest public housing estates, mostly decanted by the council, persist in fighting for the Aylesbury Estate's future. Discourse on London's post-war social housing frequently neglects resident voices, prioritising abstracted architectural significance, distanced from its character as occupied and contested space, evident in the recent prominent campaign regarding Robin Hood Gardens. Architectural discussion surrounding the Aylesbury Estate focuses on the plans for its succession, immersed in neoliberal economics, minimal space standards and speculation.

Beyond its monumental legacy, modernist residential estates facilitated community growth, surpassing 'defensible architecture', through key design principles: highlighting common spaces, urban integration, and blending public and private areas. The lack of socially engaged architecture in London's modern public realm prompts a narrative on modernist estates navigating activism, debates surrounding heritage, economics, and politics. Discussions about retrofit arise as an opportunity to understand the intersection between environmental emphasis and socio-cultural dynamics. Recognising diverse attitudes to the architecture of post-war social housing, and activism in the campaign to save the Aylesbury Estate from creative destruction, it's crucial to amplify the vibrant working-class and minority ethnic community's story of spatial injustice to liberate the architecture of the welfare state from the environmentally and socially destructive process of 'regeneration'.

1. "THE ARCHITECTURAL SKULL FOR A NEW KIND OF BRAIN"[1]

The Aylesbury Estate, constructed between 1963 and 1977, and its fate uncertain, is a testament to the ambition of the welfare state, and its subsequent decline. Itself an object of urban renewal, it is at conflict with the same discourse, with perception for most of the estate's existence dominated by a new kind of brain. Its contemporary position has been shaped by demolition since 2009 in an effort to "obliterate entirely all physical and historic reference to the current Aylesbury Estate,"[2] and this ambition suffering defeat in the Royal Courts of Justice.[3] Reflection on the ideals of modernism and social housing in London, alongside the narratives of retrofit, environmentalism and heritage, are necessary to provide a vision for the architectural skull of the Aylesbury Estate. Renouncing the dominant portrayal of the estate, emphasis is placed on its material and social qualities, interpreting the forces that attempt to obscure working-class landscapes from the neoliberal city.

2. FROM THE WELFARE STATE TO NEOLIBERAL EXCLUSION

Built as a response to the fragmented inner-city landscape of Walworth, South London, the construction of the Aylesbury Estate articulated Keynesian social and economic planning, replacing a large swathe of overcrowded housing, semi-industrial sites, and bomb-damaged streets. Industrialisation and standardisation offered "a technological shortcut to social transformation,"[4] and produced a colossal modern monument to the aspirations of the welfare state, empowered by the vast energy wealth of the post-war period (**Fig. 1**). Traversed by 21 kilometres of walkways, interconnected by ramps, lifts and stairs, interwoven with communal gardens, open spaces and play areas, and provided with shops, a health centre and nursery, laundry rooms, district heating and hot water, a young peoples' centre, a children's home and three community halls as an inexhaustive list, it was described as a 'miniature town'. With 12,000 residents, inhabiting four to five story maisonettes and blocks of up to fourteen stories, it stands as the largest system-built estate in London, in sharp contrast to the surrounding streets of Victorian red-brick terraced housing.

Before the construction, the Aylesbury Estate's confrontation with the marginalised and precarious social condition of the urban working class was challenged by the collapse of industry in inner London. Walworth's borough of Southwark endured the highest rate of industrial decline, with 52,000 manufacturing jobs lost from 1966 to 1974.[5]

Before the 1968 Race Relations Act and more significant Housing (Homeless Persons) Act of 1977 social housing was "the prime element through which the provision of social assistance was politicized and racialized,"[6] and after housing provision was now attainable for ethnic minority groups, welfare recipients, single mothers and the homeless.

Ideological debasement of social housing in the United Kingdom gained traction by the mid-1970s. Hostility to high-rise housing from the partial collapse of Ronan Point in 1968, the impact of recession and

subsequent cuts in funding, changing demographics of council estates and the neoliberal governance of Margret Thatcher eroded political support for the welfare state and its architecture. Nationally, neoliberalism's ascendancy has diminished council housing from approximately a third of all households in 1981 to 6% in 2023.[7] The Aylesbury Estate suffered an increasingly abject decline - in 1990, caretakers of the estate were lost to budget cuts, cleaning staff finished their last shift in 1991, and beyond this, the Aylesbury Estate experienced virtually no maintenance.[8]

Tony Blair's symbolic speech after election victory in 1997 declaring that "all that is left of the high hopes of the post-war planners is derelict concrete,"[9] with the Aylesbury Estate as a backdrop, heralded the start of New Labour's 'Urban Renaissance', a term coined by Richard Rogers, chair of the government's Urban Task Force.

Since, the process of 'regeneration', resolute on the comprehensive demolition of the Aylesbury Estate has been pursued behind a façade of social improvement. The economic impetus for the demolition is articulated clearly by Lord Adonis, a former cabinet minister under New Labour, stating "there are particularly large concentrations of council-owned land in inner London, and this is some of the highest-priced land in the world."[10] And, as Aysen Dennis, a resident of the estate for 30 years, questions: "Who is occupying this invaluable land? Working-class, minority ethnic people."[11] The destructive creative power of neoliberal urbanism extends further than Modernism in erasing traces, with a complete *tabula rasa* contrasting the Aylesbury Estate's retention of red-brick social housing of the previous generation. The absence of the paternalism with which the Aylesbury Estate was built has been substituted by what David Harvey calls 'accumulation by dispossession',[12] extinguishing any engagement with social need.

3. MASS MEDIA, HERITAGE AND THE AYLESBURY ESTATE

Its vast scale and forcefulness dominating Southwark, the Aylesbury Estate was an immediate target for many journalists. In 1977, "living in the sky was nearer the Devil, in psychiatric terms, than Heaven"[13] was published in reference to the estate, and was later described as "the estate from Hell."[14] Media depictions rarely resembled reality, particularly in the naturalised "interpretation of the Aylesbury as a crime-ridden dystopia"[15] not reflected in crime statistics.[16] Anti-social behaviour and crime, nothing dissimilar from what proceeded, or what was experienced in other high-density residential areas, was projected onto the modernist architecture of the Aylesbury Estate.

The greatest influence on the interpretation of the estate's architecture was the politically expedient work of Oscar Newman, translated to the British context by Alice Coleman. Broadcast in 1974, Newman visited the Aylesbury Estate for a BBC Documentary, describing it as an environment that "facilitates the commission of crime" where "inhuman tragedies occur."[17] Modernist design, at the expense of socio-economic conditions and historical context, is overemphasised as responsible for behaviour. Physical impact of this belief is witnessed in an unavailing attempt to "design out

crime,"[18] with the removal of five "vicious"[19] overhead walkways between 1994 and 1996. However, the greater significance of these ideas has been in shaping public policy, empowering the demolition of modernist estates across the United Kingdom. Appeal to tradition, the village and street, in accord with Coleman's view that residents "could cope perfectly well with life in more traditional houses",[20] provided impetus to justify in a government-commissioned report the "restoration of traditional street patterns" and the replacement of modernist architecture "with traditional housing types, including terraced houses and mansion blocks."[21] This weaponisation of heritage, legitimising the reduction of social housing to history, facilitates the destruction of the rich social, cultural and architectural qualities of the Aylesbury Estate.

Architectural culture, possessing a dominant voice in the campaign to save Robin Hood Gardens, demonstrated a great severance to the concerns of residents, most impacted by its loss. Whilst showing variation to the hegemonic discourse of estate 'regeneration', reproduction of the injustice of demolition is clear, as middle-class appropriation was proposed to displace the occupants, approximately two-thirds of whom were from a Bengali background. One of several high-profile advocates during the campaign, Richard Rogers, stated how "Robin Hood Gardens has been appallingly neglected and, from the beginning, has been used as a sink estate to house those least capable of looking after themselves – much less their environment."[22] Whilst identifying degeneration caused by the council, blame is shifted to the residents for the condition of the estate. In the case of Robin Hood Gardens, as argued by Nicholas Thoburn, aesthetic merit is emphasised as heritage, excluding the social, disregarding the fact both are architectural features.[23]

4. SOCIAL AND URBAN FORMS OF THE AYLESBURY ESTATE

4.1. SPATIAL POLITICS FROM MODERNITY IN CRISIS

The crisis present at the Aylesbury Estate is also a crisis in spatial democracy, as neoliberal governance increasingly removes participation from urban politics. A ballot in 2001, proposing privatisation of the estate, was overwhelmingly rejected by 73% of residents with a 75.8% turnout, a resident-led campaign defeating one funded by public money. In contrast to this overwhelming popular mandate, Southwark Council, who in 2005 decided to dismiss the result and advance plans of redevelopment and privatisation regardless, was elected with a 26.2% turnout. Attempts to construct a consensus-based politics to "depoliticise the political"[24] have failed at the Aylesbury Estate, with dissent witnessed in protest occupation, marches, legal resistance, and at the offices of the council and architects of displacement. In the context of political neglect, the architecture of the welfare state became a spatial repository of socio-political exchange, demonstrated in the 'FIGHT4AYLESBURY' exhibition, celebrating more than 20 years of housing struggles on the estate, with Aysen's home a canvas to everyday resistance.[25] Moving between Anna Minton's presentation of her book *Big Capital* in the corridor (**Fig.2**) and the apartment, participants

could experience the crucial role of these collective areas in the community's resistance to demolition. As spaces of contestation and everyday use, the corridors and courtyards were a venue for democratic discussion during the protest occupation of the Aylesbury Estate in 2015. Film screenings, football matches, workshops and daily public meetings attracted participants from the estate and beyond, facilitating action to keep the architecture alive and the community together to protect it, with squatters and residents uniting to demand collective rights to the city.

The kilometres of pedestrian walkways fostering interaction on the Aylesbury Estate reflected a car-centred view of urban life and design: with a 130% provision for car parking,[26] the ground level was predominantly dedicated to cars, relegating human activities to elevated horizontal planes. Discussing the urbanism of housing estates, Matrix group's feminist interpretation of "an environment designed to enhance the norm of individual mobility […] a male, white, middle-class norm"[27] highlighted the hegemonic approach. This layout established a dual-level structure that has become divergent today: while the ground level is losing its functionality due to declining car dependency, the common spaces in modernist estates - walkways, corridors and open spaces- preserve the flexible identity of multiple uses, becoming the infrastructure of a new type of brain.

In contrast to Newman's analysis of the Aylesbury Estate, residents' stories, set within the daily blend of private and public areas, reveal the 'porosity'[28] of the estate. The echoes of children's voices playing in the corridor, the diverse smells and music from each apartment established "a very colourful, very rich community",[29] and descriptions of residents occupying the walkways in good weather with tables and chairs were demonstrative of habits "that refused to cede to the passage of time".[30]

At Robin Hood Gardens a common urban landscape was produced from the violence of demolition, the rubble of the condemned tenements creating a green mound between the two apartment blocks, as an example of topography remodelling. This process considered landscape as a "charged void"[31]: the garden hill shifted the rhetoric of green space alleviating the buildings' impact towards an open field in constant and unpredictable transformation, with vegetation growing in dialogue with people's uses, crossings and social gatherings, fostering identity formation. "It functions as a ship to carry people through time, house people through time"[32] as a resident expressed; here, the human footprint was the design unit of the Smithsons' sketches where buildings disappeared.[33] Space between buildings could be considered the true legacy of modernist residential estates, and failure to realise or maintain it became their greatest disadvantage.

4.2. URBAN LANDSCAPES OF RENEWAL

Burgess Park, also formed from rubble as part of post-war urban development, worked as the urban link to guarantee mixed communities and today it represents a reference in the context of residents' dispossession (**Fig.3**).

Considering the urban landscape legacy of the welfare state as part of architectural heritage and reinterpreting it within its socio-environmental importance allows one to better understand the opportunity of preservation.

The experiment of *Piano di Edilizia Economica e Popolare* of Bologna in 1973 seized the intuition to prevent the abandonment of Bologna's historic centre by reusing architectural heritage for social housing. The system was

also adopted in the proposal of *Piano di Recupero* for sections of the historic centre of Rome in the late 1970s by pioneering Italian female landscape architect Vittoria Calzolari: with new planning instruments, the construction of council houses started to be considered as a means of urban revitalisation, integrated with public services, libraries and shops.

Focused on a different historical built-up area, Bologna's effort provides an illuminated vision of the urban environment. For Bologna's Communist administration, "there was no clear division between the physical environment and the more ephemeral social and cultural qualities that were produced through the motions of everyday life."[34]

If in the Italian example the challenge was the depopulation of the historical centre, nowadays the environmental issue is added to the ongoing housing crisis, emphasising the need of readapting existing heritage.

5. ASPIRATIONS IN THE FORM OF A CONCLUSION: SOCIAL RETROFIT

As demolition of London's modernist estates has been the result also of a stigmatised narrative- where the technical-architectural contributions appeared weak- it's relevant to amplify marginalised perspectives. Rejecting demolition and demanding refurbishment, residents and communities have realised the inseparable link between the social crisis provoked by 'regeneration' projects and environmental urgency of the current climate breakdown. A combined action of architecture and activism as a new inclusive voice to interpret the heritage of the welfare state introduces the idea of *social retrofit,* questioning hegemonic narratives on the city.

In the context of required action, with community-led initiatives such as sustainable energy and food production systems, and adaptive reuse for a changing climate, housing becomes an ecological bastion, with direct action facilitating heritage to be seen as a new kind of environmentalism.

Agency for the Aylesbury Estate was rejected, with neglect leaving "an environment rigid in form, static in programme",[35] whilst, as Pablo Sendra proposes, inspired by Richard Sennett, it is necessary to welcome uncertainty in the design process as a tool to create narrative spaces of interaction.[36] In the words of the borough architects of the Aylesbury Estate: "a developing approach is required".[37] ■

BIOGRAPHIES

Lucia Concetta Vincelli is an architect and a PhD candidate in Landscape and Environment at La Sapienza, University of Rome. Her research is focused on temporary landscapes of dwelling in the context of urban transformations and demolitions of public housing in Europe. Graduated in Architecture with a Master's Degree's thesis in Restoration. As a co-founder of the artistic collective CALUMA, she studies alternative narratives for architecture through audiovisual projects and performances, with exhibitions at Museum MAXXI in Rome (2018) and Venice Biennale (2021).

James Aston Lansbury is a student, writer, filmmaker and activist, studying a Bachelor of Science in Architecture at the University of Bath. Developing film, writing and photography projects exploring estate redevelopment, contemporary urbanism, and cities, he has engaged in activism surrounding these issues and broader social and climate justice in London and the wider United Kingdom. Currently an editor and writer for the independent student magazine *Paperspace*, his contributions include *Copenhagen Harbour: Structures of a City, Navigating Battersea Power Station* and *Architecture in Crisis: The Aylesbury Estate*.

ARCHITECTURAL CONSERVATION AND POLITICAL RESILIENCE: THE 2023 ATTACK ON THE PALACE OF CONGRESS IN BRASILIA

DANILO MATOSO MACEDO
CHAMBER OF DEPUTIES, BRAZIL

ANA CAROLINA PELLEGRINI
FEDERAL UNIVERSITY OF RIO GRANDE DO SUL, BRAZIL

ABSTRACT

In the late 1950s, Lucio Costa and Oscar Niemeyer created the urban plan and civic buildings of Brasília, Brazil's new capital, giving rise to a modern symbol of democratic power. The Palace of Congress, with its unique design, embodied a new concept of monumentality in post-war architecture, characterised by transparency, integration with the landscape, and distinct structural elements. Brasília's urban ensemble, recognised for its architectural significance, was designated a UNESCO World Heritage site in 1987 and a national heritage site in 1989, and the Palace of Congress individually listed in 2007. On January 8, 2023, extremists attempted a right-wing coup by invading Three Powers Plaza's main palaces, including the Palace of Congress. The attack aimed to symbolically seize power, exploiting the building's openness and structural integrity. Although the coup failed, significant damage was inflicted on the palace, including mutilated artwork and destroyed furniture and cladding. Despite the destruction, the Palace's architectural resilience allowed for quick repairs, which were completed within three weeks. The attack targeted not only physical structures but a democratic political initiative, making the swift reconstruction a symbolic act of political resistance. Thanks to detailed documentation and financial resources, the restoration prioritised restoring the building's appearance and functionality, solidifying its role as a symbol of democratic and architectural resilience.

On the afternoon of January 8, 2023, a crowd of over 4,000 people broke into the main palaces of Three Powers Plaza aiming to perform a coup d'état. They demanded military intervention, the closure of the main democratic institutions, political persecution of all left-wing leaders, essentially calling for a dictatorship. Thousands of right-wing activists, who supported President Jair Bolsonaro, had been camping in front of army quarters all over Brazil for the previous two months, since the results of the presidential election, which was won by Luiz Inácio Lula da Silva, the leftist candidate of the Workers Party. Rejecting the results, they blocked roads, organised riots in some capitals, and placed a bomb close to Brasilia's airport. As Lula took office on January 1, they focused their efforts on spreading chaos in Brasilia through the invasion of the palaces that symbolise political power. As their highly destructive action was broadcast on TV and social networks, it became clear that the attempt would not gain widespread support from the public. The missing security forces then began to evacuate the area and arrest the invaders in the buildings. The coup attempt had failed.

Does the architecture of the Palace of Congress embody democratic principles that make it a preferred political target for defenders of a dictatorship? What are the specificities of that architecture as cultural (and political) heritage? What would the political meaning be of preserving those values? By answering these conceptual, historical, and practical questions through the case study of the background and response to the events of January 8, 2023, we aim to contribute to today's agenda of preserving modern architecture as a form of engaged research.

1. A POST-WAR DEMOCRATIC DREAM

Although it was long before envisaged as a political act, the definitive design and inauguration of the new Brazilian Capital were promoted by President Juscelino Kubitschek (1902-1976). Brazil had undergone a 15-year dictatorship (1930-1945) under the rule of Getúlio Vargas (1882-1954). In those tumultuous times, after an attempt at a military coup, Kubitschek's mandate was a breath of fresh democratic air to the nation. The president called for a national competition for the urban plan in 1956, which was won by Lucio Costa (1902-1996). This laid the foundation for the construction of the separated monumental core, the *civitas*,[1] which was built and inaugurated in 1960.

The projects by Oscar Niemeyer (1907-2012) for that ensemble not only subtly changed the urban setting,[2] but they also added to "Costa's rhetoric the representation of the Capital as balance, emphasizing the duality of the National Congress and the individuality of its constituent parts"[3] in a successful new classical and modern monumentality that strongly represented Brazilian democratic power. The key buildings in Three Powers Plaza were the Presidential Palace, the Supreme Court, and the Palace of Congress — with its domes and twin towers. This synthesis, a product of Brazilian Rationalism from the previous decade, was conveyed by the transparency of its walls, the integration between landscape and interior

1. In the text of the original plan, Costa explained: "Ela deve ser concebida não como simples organismo capaz de preencher satisfatoriamente e sem esforço as funções vitais próprias de uma cidade moderna qualquer, não apenas como URBS, mas como CIVITAS, possuidora dos atributos inerentes a uma capital" ("Memória descritiva do Plano Piloto, 1957" in: Costa, *Registro de Uma Vivência*, 283).

spaces, the dynamic interplay between structural order and free-forms, and the marble-clad clean-cut plans and surfaces. In that conceptually resilient building, "irregularities due to the imprecision of construction or due to the passage of time do not diminish the principle of original design."[4] It was Costa's intention to provide a "Versailles for the people" with the Plaza.[5] Niemeyer then explained that "from an architectural point of view, a building such as that of the National Congress should emphasize its fundamental elements […]. To give these greater emphasis has been our plastic objective, situating them on a monumental plane [sic] whereon their shape and form will stand out as **true symbols of the legislative power.**"[6]

At that time, the Brazilian Communist Party—of which Niemeyer was an engaged militant—was fully legalised, with elected congressmen and a tactical approach to the Brazilian bourgeoisie under the banner of a "unified front" and a "struggle for a democratic and nationalist government."[7]

That democratic dream was short-lived, as a military coup in 1964 plunged Brazil into a 20-year-long dictatorship. As the regime became more autocratic and brutal, the Congress would be closed on four occasions: 1965, 1966, 1968, and 1977. As the cry for democratic elections gained the streets in huge demonstrations in the early 1980s, that building would also house an elected Constituent Assembly from 1987 to 1988, when the new *Magna Carta* was issued.

2. THE DEMOCRATIC DREAM AS CULTURAL HERITAGE

The effectiveness of Niemeyer's conception of the Parliament was confirmed not only by its historical role but also by its cultural appraisal. In 1987, Brasília's urban ensemble—as an "urban creation of Costa and Niemeyer"—was added to the UNESCO World Heritage List. In 1989, it was listed as a national heritage site, and in 2007, the Palace of Congress was individually listed as national heritage.[8]

The team of architects and engineers at the Chamber of Deputies had a long-term collaboration with Niemeyer, whose office was constantly invited to design the three annex buildings and make some modifications on the original design — such as a 15-metre-wide enhancement of the main platform, and the complete renovation of the interior design of the main halls and assembly room in the 1970s. That approach, of course, changed in the original Palace in some ways, as the authors usually "approach the building as a new design challenge rather than a conservation project."[9] As the building was progressively considered a Cultural Heritage, a more systematic approach towards preservation was elaborated. In 2014, a Division of Built Heritage was created within the Technical Department, with the tasks of documentation and conservation.

Documentation would involve organising and preserving the 24-thousand-document large archive of drawings, as well as establishing a historical narrative that could determine the value of the many different parts that constitute the monument. In order to develop a comprehensive conservation plan, we have already established some guidelines for specific

interventions in the building, based on thorough historical research and material surveys. That extensive work, which is still ongoing, was only possible due to the deep spirit of dialogue and transparency embraced by the entire Congress.

3. AN "IMPERATIVE" ATTACK ON DEMOCRACY

On January 8, 2023, at 2:45 P.M., the security of the building was compromised when protestors overpowered external Security Forces, who offered little resistance. The protesters climbed the front ramps, broke the glass, took out the grills above the lightwells, and entered the building in every possible way. The tear gas thrown by the police spread through the foyer, and its burning shrapnel scorched the carpets. Some invaders used the fire to fight back spraying water from fire hoses, while others methodically targeted the electrical and video switches to disable them. Many others engaged in wanton destruction, damaging architectural models, sculptures, pictures, furniture, and other items within their reach, including, of course, the building.

During Bolsonaro's presidency, right-wing extremists in Brazil had two strategies for cultural policy. The first of which was to emulate the Nazi German government of the 1930s, with nationalist and theocratic slogans and a vague classical aesthetic. The Secretary of Culture Roberto Alvim, for instance, was dismissed after quoting Goebbels in a speech, where he advocated for a "heroic", "national" and "imperative" Brazilian art.[10] The second strategy, which was effectively implemented, was to dismantle cultural institutions, including those related to the preservation of cultural heritage, and cut public funding. Both strategies were evident in the attack on January 8, 2023. The choice of target—a modern monument designed by a communist during a democratic period—essentially reflected the effectiveness of these buildings as symbols of the Brazilian state and, specifically, of Brazilian democracy.

After the attack on the Congress, the preservation team used previous surveys to quickly map the damage in less than two weeks, while repairs had already begun. At that point, the leaders of the three powers were determined to restore the buildings and make them functional as quickly as possible, and restoring them symbolised the restoration of institutional order.

Over 200 panes of glass were broken on the facade, as well as in internal spaces. Many pieces of the marble cladding were ripped off and used as weapons. All the protective grills were twisted, the carpets were soaked with water and burned, the works of art were scratched, thrown to the floor, or simply broken. The cast aluminium angel by Alfredo Ceschiatti (1918-1989) was covered by a patina due to a reaction with tear gas. Most of the furniture was piled in the office space, along with the fabric blinds from the facade. Invaders also defecated and urinated in every office space they could enter, and they tried to set fire to the offices of the left-wing political parties. It was a genuine battlefield scenario.

10. See Alessi, "Secretário da Cultura de Bolsonaro imita fala de nazista Goebbels e é demitido", 2020. For an overview on those policies, see: Danilo Matoso Macedo, *Destruição da arquitetura: crônicas políticas de um país em demolição* (Recife: Ruptura, 2022).

4. THE URGE FOR DEMOCRATIC RECONSTRUCTION

The strength of Modern Architecture was put to the test. Every standard industrial material, such as glass, steel grids, and carpets, could be immediately replaced by new identical material. While cleaning personnel worked hard with the usual maintenance products, professional restorers from the Documentation Department focused on the works of art, while architects recorded the damage and replacement procedures. There was no time for careful restoration at that time since as legislative works were scheduled to begin on February 2—and they did. As further inspections were carried out in the following months, most of those swift early repairs proved they could be definitive, with the exception of the restoration of certain objects, such as sculptures or antiques.

The fast reconstruction of the building was just as symbolic as the attack itself. After all, the invaders aimed to destroy a democratic political project represented not only by the Congress as an institution but also by the building designed in the 1950s. As videos of the invaders emerged, it became clear that they were not only ignorant about the functioning of the political institutions they attempted to replace with an autocratic military dictatorship, but they also ignored that political power today is built not only upon fortified palaces but also on culturally and ideologically crafted organisations of which structured and open modern architecture is a part. Instead of walls and bastions, these organisations are represented by structural grids and glazed façades.

The political and cultural misconceptions involved were paradoxically expressed as solutions for the "problem of the attacks" after the raid, by Roberto Macedo, a columnist from the large conservative newspaper *Estado de São Paulo*. He stated that the buildings made the invasion as "they have glass walls on the ground floor, easily destructible by authentic or improvised bludgeons". According to him, the solution would be to replace the glass façades "with masonry walls and the doors with thicker iron or wooden ones to hinder the entry of undesirables. Another complementary measure would be to fence these palaces off, as sometimes occurs here and abroad."[11] The absurd proposal reflects the idea that consensus should be reached not through political dialogue and proper democratic institutions, but by force. It is the same autocratic view that motivated the invasion.

In the same sense, reconstructing the buildings immediately—both in terms of their appearance and use—was a form of political resistance. The speed of the intervention was facilitated in part by earlier thorough surveys and documentation, as well as the availability of financial resources. Furthermore, there was no doubt about how to proceed in terms of restoring the damaged or destroyed parts to their previous state, even if using different materials.

A conservative restoration approach to the problem would have involved the idea of somehow preserving the historically relevant event by retaining the "scars" of the damage—similar to the concept of preserving historical "patina" as a "mark of the passing of time," a long-cherished idea defended

11. Macedo, "Os vulneráveis edifícios envidraçados de Brasília."

12. For instance, the founding charter of Icomos (International Council on Monuments and Sites), the Venice Charter, states in its Article 11 that: "The valid contributions of all periods to the building of a monument must be respected, since unity of style is not the aim of a restoration. When a building includes the superimposed work of different periods, the revealing of the underlying state can only be justified in exceptional circumstances and when what is removed is of little interest and the material which is brought to light is of great historical, archaeological or aesthetic value, and its state of preservation good enough to justify the action. Evaluation of the importance of the elements involved and the decision as to what may be destroyed cannot rest solely on the individual in charge of the work" (Icomos, "The Venice Charter"). The careful reading of that important document makes clear that this approach must be balanced with others in the same text, such as the Article 9, that states that the aim of restoration "is to preserve and reveal the aesthetic and historic value of the monument and is based on respect for original material and authentic documents."

by Ruskinians and expressed in some articles of Icomos' heritage charters.[12] One can only imagine the time, work, and money involved in reassembling glass pieces or carefully documenting the scratches and burns on the floor to leave them as a record.[13] Extreme events such as this raid only highlight how fragile that seemingly rigorous approach can be. Conservation professionals must prioritise the broader political demand in each restoration case before adhering to dogmatic views of Heritage Charters.

A building as delicate yet robust as the Palace of Congress is, in itself, politically resilient. Documenting and conserving such a work in its democratic characteristics—structural order, visual openness, easy access, etc.—adds a political layer to its strength. ■

BIOGRAPHIES

Danilo Matoso Macedo possesses an undergraduate degree in Architecture and Urbanism (UFMG, 1997), Master's in Architecture and Urbanism (UFMG, 2003), is a Specialist in Public Policies and Government Management (ENAP, 2004), and holds a Ph.D. in Architecture and Urbanism (UnB, 2017). He has been an Architect at the Chamber of Deputies since 2004, working on the preservation of the National Congress Palace and the technical documentation of the building, and is also designer of various built works in Belo Horizonte and Brasília. He co-founded (2007) the Docomomo Brasília Chapter, which he chaired until 2011 and has authored numerous articles and books on architecture. He is also founder and editor of the Architecture and Urbanism magazine MDC <www.mdc.arq.br> (2006-2012).

Ana Carolina Pellegrini possesses an undergraduate degree in Architecture and Urbanism (UFRGS, 1999), Master's in Architecture (UFRGS, 2003) and a Ph.D in Architecture (UFRGS, 2011). She is a professor at the Federal University of Rio Grande do Sul (UFRGS), Porto Alegre, Brazil; and teaches both undergraduate and graduate courses and coordinates the Architecture Research and Graduation Programme – PROPAR; her research explores the themes "out of time architectures" and "design as heritage"; she has articles published in Brazilian and international journals and has participated in several seminars and conferences in Brazil and abroad; she has taken part in all International Docomomo Conferences since 2010.

TRANSDISCIPLINARY APPROACHES IN THE CONSTRUCTION OF THE MODERN: PERU AS A QUEST

PAULO DAM
PONTIFICIA UNIVERSIDAD CATÓLICA DEL PERÚ

#21

ABSTRACT

Significant cultural transformations, when observed without enough historical perspective, appear to be legible, coherent and transferable constructs applicable to different contexts and practices. However, cultural phenomena never are, especially when we approach their initial stages. Contemporary simplifications of modernity are excellent examples of this, whether used for their idealisation or critique. Each new state of the world would correspond to a progressive transformation of disciplines and practices, with each taking responsibility for their respective fields of knowledge.

However, things are often more complex, and these transformations are closely linked to interactions between individuals, specific circumstances that spark interests, and interdisciplinary exchanges that enrich processes, making them unique along the way. Modern Peruvian architecture and its recurrent interest in the pre-Columbian past seem an excellent case to question how interdisciplinary and intergenerational dialogues have contributed to constructing a project and imagination for architectural discipline.

Throughout the 20th century, the relationship between the avant-gardes, modernity, and the contemporary coexisted with the question of what it means to be Peruvian. Pre-Columbian images fuelled imaginations through archaeological discoveries and the photographs of artists such as Martín Chambi (1891–1973) and the Vargas brothers, Carlos and Miguel (1885–1979 and 1887–1976). Initially, these imaginations only led to academic variations in architectural styles. However, the connection between Peruvian identity and archaeology gradually became stronger, creating a synergy between both disciplines.

Architecture did not play a leading role in the early manifestations of the avant-gardes or the modernisms of the first half of the 20th century. Literature and art, especially poetry, were at the forefront of defining a vanguard horizon that engaged with the transformations in Western culture. Peruvian poet César Vallejo (1892–1938) was crucial in establishing the possibility of a universal dialogue from a local perspective, rather than merely adapting foreign avant-gardes to the local environment. His poetry collections became references for poetic avant-gardes in Spanish, with works as radical, universal, and local as *Trilce*.

Two magazines followed the path of the avant-gardes and modernisms in the Vallejo key during the first half of the 20th century: *Amauta* and *Las Moradas*. *Amauta*, directed by thinker and politician José Carlos Mariátegui (1894–1930), published 32 issues between 1926 and 1930. It covered all cultural manifestations and published both local and international avant-garde content. For example, it included texts such as "*Peruanicemos el Perú*" ("Let's Peruanise Peru") by Mariátegui alongside the publication of Marinetti's Futurist Manifesto and included a dedicated photo of him. Indigenist works by Julia Codesido and José Sabogal were also published. On the other hand, *Las Moradas*, directed by poet Emilio Adolfo Westphalen (1911–2001), published eight issues between 1947 and 1949. This group of intellectuals followed the writer and anthropologist José María Arguedas (1911–1969), who, through reclaiming Andean origin and the Quechua language, seemed able to embody, and simultaneously guide a future integrated with the predominantly rural Andean space, the urban areas of the coastal cities (especially the capital, Lima), and the international avant-gardes in which Westphalen actively participated.[1]

Although both magazines had a broad view of culture and invited participation from people of various disciplines and generations, architecture was not a focal point in their pages. Exceptions include an article by George Kubler in *Las Moradas* about his impressions of architectural transformations in Lima and photographic notes on traditional architecture. Architecture was considered outside the avant-garde cultural space, trapped in a conservative and traditionalist perspective.

This isolation of architecture from the cultural and avant-garde space inspired architect Fernando Belaúnde Terry (1912–2000) to launch *El Arquitecto Peruano* magazine in 1937. The magazine was published continuously until 1977, covering 40 years of production and the international

1. For a better understanding of the construction of the modern and contemporary in the first half of the 20th century in art, literature and the link with architects, see Luis Rebaza-Soraluz (2017). *De ultramodernidades y sus contemporáneos*. Lima: Fondo de Cultura Económica. See also: Luis Rebaza-Soraluz (2000). *La construcción de un artista peruano contemporáneo: poética e identidad nacional en la obra de José María Arguedas, Emilio Adolfo Westphalen, Javier Sologuren, Jorge Eduardo Eielson, Sebastián Salazar Bondy, Fernando de Szyszlo y Blanca Varela*. Lima: Fondo Editorial de la Pontificia Universidad Católica del Perú.

and local debate. It became an essential document for understanding the development of Peruvian architecture in general and modern architecture in particular. The magazine covered a broad spectrum in Peru, including focusing on active architects and builders in its early years. Its covers featured recent modernist architecture, traditional colonial architecture, interiors, and furniture, as well as powerful images of pre-Columbian architecture, especially Inca architecture. Being a Peruvian architect implied discovering Peru.[2]

The agenda for Peruvian architecture in continuity with valuable examples from the past has always been clear and explicit, as was its commitment to modernism in architecture, contemporary building materials, and the introduction and defence of urbanism and planning as essential tools for managing and developing our cities.

The magazine served as the platform for the ideas put forth by the architects who launched the "Expression of Principles" of the Agrupación Espacio in 1947. This document, which marked the explicit beginning of the modern movement in the country, was published in the newspaper *El Comercio* on May 15, 1947, and later in June of the same year in issue 119 of *El Arquitecto Peruano*. It was signed by architects and architecture students, along with a list of supporters made up of contemporary intellectuals, artists, and writers. The "Expression of Principles" referenced a series of artists described as specifically contemporary, including Picasso, Joyce, Gris, and Bartok, along with César Vallejo as the sole representative of the Spanish language. While the list was not intended to be exhaustive, it is notable that it insisted on Vallejo's horizon as a reference for the universality possible from a Peruvian context.

The Agrupación Espacio remained active until 1950, maintaining a presence in the media where they openly criticised the conservative attitude, considered by them to be pretentious, of styles that sought to return Peru to a Spanish essence via the neocolonial style, or hybrid via the neo-Peruvian. Agrupación Espacio proposed modernism adapted to a local reality understood in its time, aligned with international modernity and in sequence with the grand colonial and pre-Columbian architectures. At this point, they explicitly denounced developments from the 18th and 19th centuries for their merely arbitrary combinations and irresponsible alterations of ancient architectural essences.

Although neither *El Arquitecto Peruano* nor Agrupación Espacio explicitly reviewed the pre-Columbian and archaeological context to produce modern architecture, both aimed to include Peruvian identity as not only a variable to be considered but also as a goal to be achieved. The case of a collector architect and the visit of the Albers to Lima can help us understand how the connection with the pre-Hispanic began to take shape among architects.

Teodoro Cron (1921–1964) arrived in Peru from Switzerland in the late 1940s and quickly became part of Lima's social and cultural circles. Passionate about pre-Columbian art objects, he amassed a collection of textiles and ceramics that influenced his aesthetic reflections. Despite the

2. In its first two years, the magazine had two graphic sections entitled "Detalle peruano" (Peruvian Detail) and "El Perú incógnito". (Incognito Peru). The material in the first section was Emilio Harth-Terré's images collection on viceregal architecture, while the second documented vernacular architecture, becoming one of the first records of this architecture in the field.

fact that Cron had rigorous modernist and European training, his projects, especially his houses, integrated Peruvian-rooted traditions. The patios, proportions, and systems of solids and voids in his works reflected an organic adaptation to the local climate and building culture[3] beyond modernity and contemporaneity. As a collector architect, he consciously built a connection with the locals through his observation of reality and detailed, fascinating, and scholarly observation of the material culture of the past, marking a path for linking modernity and tradition in the local context.

Josef and Anni Albers were invited to Peru in 1953 by Fernando Belaúnde after spending two months in Chile. Josef Albers taught courses at the Catholic University of Santiago and the National Engineering School of Lima. Both were previously acquainted with pre-Columbian traditions and architecture, and indeed, Anni Albers had studied Andean textiles for decades, and both had made multiple study trips to Mexico since 1940. Mexico was considered "the promised land of abstract art, which has been there for thousands of years."[4] Thinking of abstract art as a constant presence over time must have produced a paradigm shift in the perspectives of many architecture students and architects, allowing them to view issues not in evolutionary terms or concerning their time but rather to place distant works differing in function, materials, and time, on the same plane of relation based on the abstract as a common substrate of art, design, and architecture. The Albers' conversations with architects like Barragán are well-documented. The work of the Mexican architect can show elements within the dense references, observations, and reflections condensed in his projects. Emilio Soyer Nash (1935–2017) was one of the architects influenced early on by these ideas, combining pre-Columbian themes, tradition, modernity, and abstraction. The Velarde House (1968) was awarded the Hexagon of Gold at the I Biennial of Architecture of Peru (1970). It marked the first public recognition of the discipline for a form of architecture clearly understood as Peruvian. Soyer and his contemporaries had witnessed the restoration of critical pre-Columbian sites on the coast, such as Puruchuco and Paraíso, in the coastal valleys of the Rímac and Chillón rivers, respectively. Soyer maintained links with artists, photographers, and archaeologists throughout his career, but his work in a modernist affiliation lasted until the mid-1970s.

The later work of Emilio Soyer and his contemporaries, as well as in subsequent generations, show a clear connection between archaeology and architecture, albeit in a context where territory and culture integrated a paradigm different from that of the modern movement, a paradigm that has continued to influence the present. However, the pioneers of the close link between architecture, archaeology, and territory are members of previous generations, pioneers of the modern movement, and members of the Agrupación Espacio.

In 1970, the newly formed National Institute of Culture called on architectural offices to work on archaeological sites. The Revolutionary Government of the Armed Forces undertook an ambitious project to

3. Pardo, Cecilia (2024). "El arte textil precolombino en la vida de Cron". In *Th. Cron*, edited by Stephan Schweig e Irene Arce. Lima: Mirada Libre, pp. 102-107.

4. Brenda Danilowitz and Heinz Liesbrock (eds.) (2007). *Anni and Josef Albers. Latin American Journeys*. Ostfildern: Hatje Cantz Verlag.

document and register the archaeological heritage. As Mariana Jochamowitz suggests, this "was an indirect result of the two major events of the time that initiated processes of improvement in the country's cartography: the 1970 Ancash earthquake and the Agrarian Reform,"[5] processes that required rapid redrawing of the territory.

At least three architectural offices that had signed the "Expression of Principles" of the Agrupación Espacio in 1947 participated in this process. These included Luis Miró Quesada Garland (1914–1994), Santiago Agurto Calvo (1921–2010), and Carlos Williams (1924–2004). All three were part of the Agrupación Espacio, and their works were among the emblematic projects of the modern movement in Peru.

Luis Miró Quesada was a teacher and a core promoter of the Agrupación Espacio. In 1945, he wrote the book *Espacio en el Tiempo (Space in Time)*, the main theoretical document of architecture of his time. In 1948, he constructed the Huiracocha House, an immediate reference of modernity in Lima, and in 1953, the Radio El Sol Building, included in the *Latin American Architecture since 1945* exhibition organised at MoMA in 1954, among many other projects. Santiago Agurto was a crucial figure in the projects the National Housing Corporation promoted. He participated, among others, in the Matute Housing Units (1951), Mirones (1952), Rímac (1952), and the Risso grouping (1953), as well as in the design of Ciudad de Dios (1955) and the El Agustino Urbanisation. The Matute Neighbourhood Unit was part of the MoMA exhibit. Meanwhile, Carlos Williams, along with Adolfo Córdova and José Polar, designed what can be considered the first building of the modern movement in Peru: The International Shooting Club (1946). Together with Adolfo Córdova, he developed the FAP Residential Complex in Chiclayo (1958) and participated in housing projects through the National Housing Corporation.

The case of these three architects is unique not only as they were pioneers of the modern movement architecture in Peru but also because, through the experience of surveying archaeological sites, they became references for archaeology and the history of pre-Columbian architecture in the Central Andes. Luis Miró Quesada expanded his pre-Columbian period studies by organising the first exhibition of pre-Columbian pottery with architectural representations. Carlos Williams wrote the chapter "Architecture and Urbanism in Ancient Peru" in 1980 for the significant project *Historia del Perú* by Juan Mejía Baca, and Santiago Agurto wrote the books *Lima Prehispánica* (1984) and *Studies on Inca Construction, Architecture, and Planning* (1987). Williams and Agurto continued researching and producing new knowledge, becoming essential references for studies of Peruvian pre-Columbian architecture. All three architects continued their work.

The case of these double pioneer architects challenges us regarding how we usually imagine interdisciplinary approaches. For a time, archaeology expanded the catalogue of the known routes of temporal depth in material culture capable of enhancing continuities and identities. The

5. Jochamowitz, Mariana (2023). "El arqueólogo de fin de semana". *Revista A*, No. 20, July, pp. 74-81.

experience of architect-archaeologists demonstrates that there is a field of intersection between the disciplines that enables a way of thinking that not only contributes to project work but also, from the perspective of project and drawing, illuminates the understanding of historical phenomena. In the specific Peruvian case, it returns cultural territory to the centre of architectural discipline and offers it as a laboratory for the future.

These architects seem to respond to Mariátegui's mandate to "Peruanise Peru" or to Belaúnde's *The Conquest of Peru by Peruvians*.[6] Although not explicitly directed at architects, these practices appeared to respond to a commitment to a geography, a territory, and an accumulated culture that was there to be recognised or discovered.

Approaching the history of architecture through questioning the relationships with other disciplines or incorporating them into broader approaches than strictly disciplinary ones leads us to a more relational and integrated knowledge of the world in which architecture practice participates. In the specific case of modern Peruvian architecture, the importance of the archaeological perspective in its development is evident and through survey drawing, a shared practice has emerged, benefitting both disciplines. In addition, it could be observed how Vallejo's poetic avant-gardism has had a significant impact on at least two generations of intellectuals and artists, and architects have progressively embraced this influence until becoming central figures in introducing the idea of the modern and contemporary in Peru. ■

6. Fernando Belaúnde Terry, *Peru's Own Conquest* American Studies Press, Lima; Stated First Edition (1965). This book was published initially in Spanish in 1959 by Ediciones Tawantinsuyu in Lima, when he was already well on his way to a career in politics. He became president of Peru in 1963.

BIOGRAPHY

Paulo Dam Mazzi was born in Lima in 1968 and earned his PhD in architecture from the Catholic University of Louvain in 2009. He is a senior lecturer at the Catholic University of Peru, specialising in design and theory. He has published as co-author of *Post Illusions. New Visions. Critical Art in Lima 1980-2006* and *Modeling the World. Images of pre-Columbian architecture*. He has also edited the book *Lacan. Architecture*. Additionally, he has served as curator of projects that relate art, architecture and thought. He is the coordinator of the Transversal project: Actions for the Integration of the Peruvian territory. Since 1995, he has combined university teaching with the critical practice of the architectural project. He is currently the Dean of Architecture at PUCP.

MARGARETE SCHÜTTE-LIHOTZKY'S INNOVATIVE SCHOOLS. THE MODERN REVOLUTION OF OBJECTS

MARA SÁNCHEZ LLORENS
UNIVERSIDAD POLITÉCNICA DE MADRID

FERMINA GARRIDO LÓPEZ
UNIVERSIDAD REY JUAN CARLOS

ABSTRACT

The Austrian architect Margarete Schütte-Lihotzky is recognised in the canon of Modernity for her Frankfurt Kitchen, designed to technify and compact household tasks within the home. The term ‘’“object” in her work spans beyond the kitchen as a replicable prototype to encompass furniture and architecture. These objects interact with their surroundings and transform everyday life rituals.

Notable examples of her work include kindergartens with a modular construction system, featuring cribs, changing tables, chairs, tables, planters, and other items. These elements create flexible spaces that serve as expressions of large-scale progressive education projects. Schütte-Lihotzky implemented these pedagogical pavilions in various locations, revolutionising educational environments with her modular and flexible design concepts. Her kindergartens seamlessly connect outdoor gardens with large halls where children can participate and celebrate together.

For Margarete, kindergartens were bridges between home and school life, guiding children from their family environments into the broader community. This study recognises her furniture and architecture as pieces of a playground that transform habitats. It connects her architectural designs with Maria Montessori's pedagogical principles and emphasises the importance of her innovative strategies for contemporary architectural education. Schütte-'Lihotzky's work remains relevant in both architecture and education, highlighting her enduring contribution to shaping educational spaces.

This study, based on Schütte-'Lihotzky's archives at the University of Applied Arts in Vienna, has two main objectives: to examine how Schütte-Lihotzky's furniture-objects innovated modern pedagogical spaces and to analyse her design strategies for kindergartens that enhance play and social interaction. The study underscores how her methods of designing, playing, travelling, and socialising are relevant for contemporary architectural education, offering a fresh perspective on the role of architecture in society.

1. INTRODUCTION

Margarete Schütte-Lihotzky (1897-2000) was Austria's first female architect, renowned for the Frankfurt Kitchen designed for Frankfurt's urban expansion and post-First World War housing needs. *Das Neue Frankfurt* magazine promoted an intensive social reform from 1925 to 1930, which Schütte-Lihotzky extended to the Soviet Union, China, Turkey, and Cuba.

Her interest in school and kindergarten projects began in this post-war period, she continued improving nursery schools in modular designs, inspired by Maria Montessori', and enriching children's experiences by linking both home and school life.

This communication aims to recognise objects and architectures in Schütte-Lihotzky's work as pieces of a playground that transform space. This understanding of architecture as play connects with her inspiration sources, including Montessori's pedagogy, allowing Margarete to transfer educational pedagogy into a design methodology. Her quasi-anthropological research during her travels, particularly in the USSR and China, identified vernacular technology incorporated into her furniture designs.

This research relies on a thorough investigation of Schütte-Lihotzky's archives at the University of Applied Arts Vienna in two parts: the first part explores how she experimented and created a catalogue of furniture objects that rejuvenated modern living. The second part delves into her modern design strategy for kindergartens, improving spaces for children's play and sociability.

'Schütte-Lihotzky's strategies for school projects and pedagogy included designing, playing, travelling, and socialising. This study concludes that these actions are relevant to contemporary architectural education and necessary to redefine the role of architecture in society.

2. OBJECTS OF MODERN REVOLUTION: CHILDREN'S ENVIRONMENTS

During the fifth Viennese Allotment Garden, Settlement, and Housing Exhibition, Margarete Schütte-Lihotzky showcased various Kernhäuser (core houses) at a 1:1 scale. Her type 7 core house, noted for its versatile built-in furniture, earned her the Silver Medal from the City of Vienna. She also exhibited a model of a kitchen and laundry core, designed based on an anthropological study of household and culinary rituals. This prefabricated concrete unit, measuring 2 x 2.05 metres, exemplified the concept of an endless object—a continuous form ensuring easy cleaning—and served as a prototype for future kitchen projects.

Schütte-Lihotzky's understanding of construction and furniture implied that when these elements gained independence and were conceived as objects, they made spaces multifunctional. These objects fulfilled various roles, such as a dresser doubling as a changing table, crib, or highchair, adaptable to different ages. This understanding extended to her buildings, where furniture transitioned from serving caregivers' individual needs to fostering a communal environment for children, as seen in her greenhouse designs for the Kapaunplatz Kindergarten.

2.1. WORK IN MOSCOW AND POST-WAR NURSERY SCHOOLS

From 1930 to 1937, Schütte-Lihotzky and her husband Wilhelm remained in Moscow, where she designed children's furniture in collaboration with medical and pedagogical institutes for The Architecture Academy of Moscow and The Institute of Mothers and Children. Her catalogues included multifunctional items like adjustable chairs, tables, a folding changing table, a child's bed, and a small adjustable table for children aged six to twenty-four months. She also designed a desk and worktable with a bookshelf and tool cabinet. In 1937, she created a notable drawing for a nursery school, with furniture prototypes tested and produced in series. She proposed an exhibition with children's corners to try out the furniture and experience the ambience.

After the Second World War, Schütte-Lihotzky continued her architectural work in Vienna and other countries, focusing on evaluating and improving nursery schools. Her designs, inspired by Maria Montessori's principles, featured a modular and flexible approach that transformed educational spaces. These designs emphasised the connection with nature through large windows, recreational terraces, and pergolas, aligning with Montessori's vision. Schütte-Lihotzky's work underscored the importance of creating an educational environment conducive to collaborative play, integrating art, culture, and ecological considerations, and helping children transition from home environments to public and community spaces.

2.2. GLOBAL INFLUENCE AND LEGACY

Influenced by the integration of women into the workforce and the restructuring of the communist lifestyle, communal responsibilities for tasks like food preparation and childcare emerged. Public community kitchens and kindergartens served about 17% of the population. Schütte-Lihotzky played a pivotal role during this period, overseeing standardised designs for childcare facilities and collaborating with builders and draftsmen. Her influence extended globally, including contributions to educational innovations in China.

Schütte-Lihotzky was a pioneering architect in constructing schools, childcare facilities, and multifunctional children's furniture. Her research on kindergarten design spanned across China, France, the Soviet Union, Bulgaria, and Cuba, emphasising clean, light, and airy spaces that stimulated children's imaginations while promoting learning and play. Despite challenges related to her gender and political beliefs, her lasting impact is notable, particularly through her innovative design of the Kapaunplatz Kindergarten in Vienna—a globally recognised model.

After the Second World War, Schütte-Lihotzky continued her work in Vienna and other countries, focusing on evaluating and improving nursery schools. Her innovative kindergarten designs featured a modular and flexible approach that transformed educational spaces. These designs integrated art, culture, and ecology, emphasising the architect's role in bridging home life and school life, helping children transition from home environments to public and community spaces.

3. KINDERGARTENS AS FLEXIBLE OBJECTS: MODULAR DESIGN CONCEPTS

Margarete Schütte-Lihotzky's design approach was deeply rooted in the idea of transformation, particularly in the context of children's environments. Her initial transformation of furniture involved a day and night systematisation, embodying the playful action and interweaving it with the concept of architecture for children. These objects were designed for action; the games or free actions they facilitated were activated by the participation of children. Inanimate objects became enablers of dreams and encounters, generating community life. Versatile and playful, these objects became integral to knowledge, recreation, and socialisation **(Fig. 1)**.

The spaces designed by Margarete could be understood as places that promote a pedagogy of autonomy. One of the most significant kindergartens built by her was *Städtischer Kindergarte in Kapaunplatz*. Many details of this project connect her thinking clearly with some of Rousseau's or Frobel's ideas, suggesting that "the kindergarten must be understood as a space that allows and reinforces selected influences deemed beneficial to children".[1]

3.1. FREEDOM OF CHOICE IN PLAY

The architectural design principles of Schütte-Lihotzky's kindergartens became evident from her initial involvement in this type of structure in Frankfurt, dating back to 1929, especially in the *Praunheim Project*.[2] The first principle revolves around a central space that serves as the hub for community life, fostering a unique transcendental tension for the activities that take place there. This space, when engaged voluntarily, embodies a sense of seriousness and the freedom of choice in play. The second principle emphasises a robust connection with the outdoors, perceived from this central location. The main design extends through various gardens interlaced with pergolas. The joy of play ranges from simple fun to the vital emotion elicited by participation. This active involvement in shaping and transforming these spaces empowers children to become co-creators.

The contemporary relevance of these buildings lies in the current global need to rethink educational spaces. Schütte-Lihotzky i pedagogical pavilions for children in numerous places, revolutionising educational environments with modular and flexible design concepts. Her kindergartens connect the surrounding garden with a large hall where children experience community and celebrate. Children could play everywhere. For Schütte-Lihotzky, kindergartens served as a bridge between home and school life, guiding children from their family environment into the broader community. Her modular construction system facilitated flexibility and adaptability, transforming daily rituals and the relationship between objects and urban environments, demonstrating the social impact of her work by influencing broad social reforms. Schütte-Lihotzky's work remains relevant in both architecture and education, highlighting her enduring contribution to shaping educational spaces.'

New Perspectives on Her Life and Work*, ed. Marcel Bois and Bernadette Reinhold (Vienna: AngewandteUniversity of Applied Arts Vienna, 2023), 297.

2. Peter Noever ed., *Margarete Schütte-Lihotzky. Soziale Architektur: Zeitzeugin eines Jahrhunderts* (Vienna: Böhlau 1996), 119.

3.2. PLAY AND TRAVEL

In 1930, the Schüttes travelled to Moscow as experts in the development of new cities in the Soviet Union. Grete led the group responsible for children's facilities, planning both individual and standardised projects for nursery schools and kindergartens.

Margarete Schütte-Lihotzky completed the Trans-Siberian Railway Car in April 1934 preceding her journey to Japan and China. During this trip, she used photograph to document the daily domestic chores performed by many women along the way. The entire experience left an unprecedented impression, highlighting the scale of industrial advancements in the region. Despite the country's challenges, significant progress was evident. She reflected on the construction of her educational projects, including a kindergarten and a nursery, and she noted the involvement of *Kyrgyz* men and women in the construction, despite language barriers that sometimes hindered communication **(Fig. 2)**.

Her observations of *Magnitogorsk* in the evening described the breathtaking view of the expansive landscape with glowing blast furnaces at its centre. She marvelled at the immense iron mountains, larger than Austria's Erzberg, noting the significant progress in their excavation.

After visiting numerous kindergartens across different cities in China, she determined that a comprehensive review of the organisation, construction, and establishment of kindergartens would be essential in the future by "systematically working through design schemes. Only through the systematic execution of all fundamental preparations will the construction of kindergartens with the existing means be truly economical".[3]

During 1936-37, she was involved in typification projects for children's facilities and the design of standard furniture for various People's Commissariats. Upon returning to Vienna in 1945 following her imprisonment, she focused on establishing a central building institute for children's facilities. In 1946, she established a department for children's facilities within the city's central building authority, planning multiple kindergartens and nursery schools in Sofia.

Schütte-Lihotzky faced challenges due to her gender and political beliefs. Despite this, she secured commissions, including the seemingly modest Kapaunplatz Kindergarten in Vienna during the early 1950s. It became a global standard due to its smart and sensitive design. Her past experiments in social design aligned with her vision for educational spaces.

Her kindergartens warrant serious pedagogical consideration. They embody both the material and organisational aspects of a progressive education initiative, beyond the theories of Maria Montessori or Rudolph Steiner. Following Ralf Koerrenz's perspective, they address the present state and facilitate a transition to a future state by impacting learners through reforms in pedagogical structures and practices.[4]

3.3. BAUKASTENSYSTEM

Schütte-Lihotzky's modular system, Baukastensystem, allowed for versatile, convertible kindergarten pavilions. Such pavilions featured flexible elements such as cribs, changing tables, and chairs, enabling

3. "Dear Comrade, or Exile in a Communist World: Resistance, Feminism, and Urbanism in Margarete Schütte-Lihotzky's Work in China (1934/1956)." ABE Journal, accessed June 21, 2024, https://journals.openedition.org/abe/7169#quotation.

4. Engelmann, "Margarete Schütte-Lihotzky's 'House for Childrens.' Pedagogical Reflections," 290.

efficient assembly using prefabricated wood or concrete components. The system emphasised adaptability and ease of reconfiguration. Alongside Ernst May's research team, she developed systematic and modular buildings that simplified the work of teachers and caregivers while providing ample space for children's play and leisure, as seen in the Kindergarten Siedlung Praunheim.

Her designs focused on creating clean, light, and airy spaces that stimulated children's imaginations while fostering learning and play. In the USSR, she built various kindergarten models that emphasised outdoor areas, walking spaces, and leisure. Her knack for simplicity and simplification ensured a thoughtful design for all projects, including the furniture used within the kindergartens **(Fig. 3)**.

In Turkey, Schütte-Lihotzky worked independently, focusing on rural school designs. Her project for the *Ankara Girls' Lycée* showcased a dialogue between exterior and interior spaces, emphasising classroom ventilation and building illumination with large windows and protective awnings. She underscored the importance of exterior spaces, including benches and walking areas, creating a functional and aesthetically pleasing intermediate space before entering the building.

Despite her involvement in European anti-Fascist movements, Schütte-Lihotzky's designs for the Turkish government reflected a paradox. Her village schools and teachers' houses were part of state politics aimed at defining a new national life, especially in rural areas. Influenced by her experiences in Frankfurt, her Turkish projects adhered to modernist architectural norms. Her designs featured south-facing classrooms, left-side lighting for right-handed writers, home economics spaces, and ample gardens for mental and physical health. The Turkish government often requested the integration of teachers´ housing into school buildings, reflecting urban teacher living spaces from literature.

A certain romantic view akin to Rousseau's influenced Schütte-Lihotzky's work in the Turkish countryside, despite her scepticism. The influential novel by Reşat Nuri Güntekin, Çalıkuşu, depicted a teacher from Istanbul who dedicated her life to educating children in Anatolian villages, highlighting the idealisation of the countryside as Anatolian heaven. This romanticism characterised the intellectual works of the period while preventing a realistic confrontation with rural poverty.[5]

Her research extended to China, France, the Soviet Union, Bulgaria, and Cuba, focusing on the importance of well-designed kindergartens. Her modular methodology typically featured a large central space and several smaller spaces with no set purpose, entirely at the children's disposal.

4. CONCLUSIONS

Margarete Schütte-Lihotzky's architectural innovations transcend mere functionality. They make substantial contributions to social reform and educational environments while preserving the modern architectural heritage through their educational initiatives.

4.1 IMPACT ON SOCIAL REFORMS

Schütte-Lihotzky's approach to design spurred significant social changes, particularly in education. Her kindergartens evolved from mere educational facilities into dynamic community hubs, promoting social integration and equity. By employing modular construction systems, she championed inclusivity and influenced global early childhood development policies. The relevance of her designs persists today as educational spaces continue to be reimagined. Her pedagogical pavilions, featuring flexible, modular designs, connected outdoor gardens with spacious halls, enriching children's lives and encouraging exploration, creativity, and collaborative learning.

#21

4.2 BRIDGING HOME AND SCHOOL LIFE

Her kindergartens acted as crucial bridges between home and school environments, easing children's transition into the broader community. Schütte-Lihotzky's holistic design approach went beyond academics to nurture social skills, creativity, and cultural awareness. Her flexible spaces facilitated seamless interaction among caregivers, educators, and children, fostering a supportive educational ecosystem. These kindergartens effectively guided children from their family settings into a wider social context, supporting their integration into the community.

4.3 LEGACY IN EDUCATIONAL SPACE DESIGN

The concept of "object" in Schütte-Lihotzky's work, from the replicable kitchen prototype to its broader urban implications, underscores her influence. She demonstrated how mobile artefacts could transform everyday rituals—both in homes with her kitchen and retractable furniture designs and in educational settings with modular elements like cribs, changing tables, and planters. These innovations created flexible, modular environments,

redefining architectural design as an everyday art that humanises society by extending the home into communal spaces. Her modular construction system revolutionised kindergartens, enhancing flexibility and adaptability. Schütte-Lihotzky's legacy continues to impact educational space design, embodying progressive education through adaptable and innovative structures. ■

BIOGRAPHY

Mara Sánchez-Llorens, an architect with a PhD in Architectural Projects from the Polytechnic University of Madrid, founded her studio COMA in Madrid in 2001. Her research focuses on Latin America, architectural grafts, and border studies. She curated Lina Bo Bardi: Tupi or not Tupi. Brazil 1946-1992 at the Juan March Foundation and has won several awards, including Arquia, Bienal Iberoamericana, Mujeres Artes Visuales, and FAD. She has collaborated with AECID and various international universities.

Fermina Garrido López also holds a PhD in Architecture from the Polytechnic University of Madrid and established her studio in Madrid in 2004. She engages in architectural projects, competitions, and theoretical research. Her work has been exhibited and recognised in Europan 7, 8, and 9, Quaderns, Arquia Próxima, FreshMadrid, Zoom IIT Chicago, Rehogar, Producto Fresco, and FAD awards, and published in Quaderns, Arquine, AV proyectos, MAJA, On Diseño, and Future.

LIBESKIND HOUSE: THE CONSTRUCTION OF A MODERN AMBIANCE THROUGH THE PROTAGONISM OF JOAQUIM TENREIRO'S WORK

LUCIANA TOMBI BRASIL
MACKENZIE PRESBYTERIAN UNIVERSITY, BRAZIL

#21

ABSTRACT

This article is about the Brazilian architect David Libeskind's house, built in São Paulo, Brazil, in 1961. It visited in two moments: the inhabited house (during the years 2000-2004) with the presence of the architect and the empty/uninhabited house (in the year 2016) after his death. The elaboration methodology presupposes the house visitation and the reading of the collection of images from different periods of the said house and a strategy to narrate the sensory experience of the visit, which instructs through the description as a way of looking and talking about the house today.

The biography of the house proposed in the article seeks to establish relations between the construction of modern architecture and its cultural environment in the 1950s and 1960s, from the inter-relationships suggested especially with one prominent interlocutor, the designer Joaquim Albuquerque Tenreiro[1] who contributed significantly to the house design process.

Description as a method was the chosen way of approaching and understanding this house, whether empty or inhabited, to construct a narrative about the experiences lived, and, therefore, perceived through contact with the world of things, material, and in this sense, the survey of pieces created by Joaquim Tenreiro is a fundamental part of understanding Libeskind's architecture.

It seeks to promote the construction of Brazilian historiographical criticism and aims to broaden the understanding of cultural diversity based on the past experiences of the Modern Movement in Brazil.

1. INTRODUCTION

The house of architect David Libeskind, in the Pacaembu neighborhood, built in 1961, in the city of São Paulo, is the focal point of his production that motivates the possibility of establishing an approximation with the field of design for this article, consolidating a language as a modern culture. It allows us to recognize in which dimension regional aspects are inserted in Libeskind's work – a modern Brazilian ambiance that complements itself beyond architecture. In this sense, like a sponge, the house absorbs what settles into it, and from there emerges a *Brazilianness* of restraint and rigor in design, modernism that combines functionality, technique, refinement, and balance. Thus, the relationship between architecture (defined as space designed and built) and lived environment, or place (filled with things) defines the very existence of the house and supports the understanding of the meaning of architecture and in this case, the reading is expanded to *"everything that is Architecture,"*[2] or in the extension of the human sphere itself and the meaning of the affirmation of the constructed building.

We thus have the unpredictability of life in the biography of the house and of things together with its architect-inhabitant, the creator of the original gesture. The dynamics of meanings are described, the path of the meanings of things, architecture, and life, in a strategy to narrate the sensorial experience through visiting the work and photographic records at different times as a method that instructs through looking and informing about the House.

From this point onwards, the central articulation point for this article unites design and architecture revealed through the participation of Joaquim Albuquerque Tenreiro in the house project.

Through significant theoretical references for the discussion of modernity in Brazil, this article aims to show the expressive, cultural, and material quality of this reference work for the study and understanding of Brazilian modern single-family architecture, placing as a presupposition the reading of images, the experience of visit to the work and the expertise built in previous work by the author on the complete work of architect David Libeskind.

2. MODERN CULTURAL EXPRESSIVITY

Comparing two moments of the house as an approach to research is based on photographic records of different moments in the house's existence, which allows us to remember the space that was once inhabited and proceed with a possible way of narrating that reiterates Argan's words: "reality of the narrated fact is indisputably different from the reality of the fact that happened, but the narration that is made today of facts that happened in the past has, for the life we ive today, a value that the fact that happened, as such, cannot have."[3]

Libeskind's production is part of the notable and recognized body of work of Brazilian modern architects, a place where cultural manifestations reached exceptional expressiveness in the first half of the 20th century, despite belonging to the context of an economically peripheral country.

The surprising period of just nine years from the end of the architect's training, in Minas Gerais, in 1952, to the year of completion of his house,

1. Joaquim Albuquerque Tenreiro (Melo Guarda, Portugal 1906 - Itapira SP 1992). Designer, sculptor, painter, engraver, and furniture designer.

2. Philp Ursprung, Diogo Seixas Lopes, and Pedro Bandeira, *Eduardo Souto de Moura: Atlas de Parede Imagens de Método* (Porto: Dafne Editora, 2011).

3. Giulio Carlo Argan, *História da arte como história da cidade* (São Paulo: Martins Fontes, 1992), 25-26.

the central object of this article, in 1961, presents a total set of forty-one works built that consolidated its language, essential for understanding the development of Brazilian Modern Architecture, which was also formed and refined in a very short period, approximately twenty-four years: from 1936, the year in which the Ministry building was designed of Education and Public Health, in 1960, the year Brasília was inaugurated.

Looking at Libeskind's production through his own home was a way to understand the political and cultural effervescence in the country's history, a new aesthetic standard "that we can say is sophisticated without being aristocratic."[4]

According to Martins[5], there are two antagonistic but somewhat complementary positions that enable a reading of the development, establishment, and subsequent dissemination of modern architecture in Brazil.

These two arguments are somewhat present in Libeskind's work. One hypothesis is that there is a connection between his work and the trajectory of organic development of Brazilian architecture, since the beginnings of the Colony, pointing to his capacity for acclimatization, for progressive adaptation of external models to the country's climatic, technical, material, and social conditions. There is, as the central character of this position, Le Corbusier, who drives "the narrative argument of a Brazilian architecture that had to become modern to become legitimately national again."

Another hypothesis, according to Geraldo Ferraz[6], modern architecture is above all an international fact, "a product of 20th-century ideas, given that its adjective (...) belongs to a state of mind restricted to the transformations taking place in the life of the man of our time".

Linked to this vision, Libeskind's work relates to recovering the tradition of constructive rationalism, synthesizing new socially raised programs, the new availability of technical and material resources, and the "modern state of mind". This stance, aligned with the international style and the search for a language that wanted to free itself from a past identified with the weight of a cultural tradition.

There is a clear intersection between the positions defended by Ferraz and the analytical approach of Libeskind's production, as the introduction of modern architecture in Brazil is based on the profound changes in the economic, political, technical, and social life of São Paulo, starting from the First World War.

Concerning the first stance, one can notice, especially at the beginning of his work, a strong influence from Lucio Costa, when Libeskind worked with SPHAN, carrying out graphic and historical surveys of Ouro Preto, under the command of Sylvio de Vasconcelos. This connection is still reaffirmed through contact with Oscar Niemeyer's work, during the Pampulha's construction, back in the 1940s.

This local tradition and climate-sensitive architecture, arising from this tradition, appears in the use of materials such as wood, as seen in the architect's house and other contemporary residential projects. The joinery, especially developed by Joaquim Tenreiro, highlights artisanal work, which

6. Geraldo Ferraz, *Warchavchik e a introdução da arquitetura moderna no Brasil: 1925 a 1940* (São Paulo: Masp, 1965).

in its design addresses issues of modern language, however, it distances itself from mass production.

3. TENREIRO AND LIBESKIND: THE HOUSE AMBIANCE

In the investigation into the genealogy of external references linked to Libeskind's production, Joaquim Tenreiro will represent the role of design in line with the house, the "finesse" of design through the complete carpentry project, not just the furniture, but several other elements as shown in the images.

The relevance of the presence of Tenreiro's furniture in the house reveals a kind of symbiosis between the design of the house and the furniture, an exchange of experiences between Libeskind and Tenreiro, as there is his effective participation in the design of the house. These are not, therefore, pieces of Tenreiro's furniture that were used as decoration by Libeskind, but pieces designed for this house as part of the discussions held between them to design the spaces in the house. **(Fig.1)**

The massive presence of furniture, lighting pieces, and ambient composition designed by Joaquim Tenreiro inside the house draws attention and leads us to reason about the aspects and criteria chosen by Libeskind to build the interior environment of his house, but, above all, reveals a moment of cultural effervescence in Brazil, in the 1960s, the originality of the national product and its receptivity inside and outside the country, as well as the greater emphasis on the relationships between aspects of popular culture and design.

The dynamism of the Brazilian artistic and cultural course of action in the 1960s experienced a crossroads of crises in the various sectors of artistic manifestations, which, according to Maria Loschiavo[7], corresponds to the constitution of a new aesthetic project, whose focus was the fight for an authentically national and of contestation.

Of all the designers of his period, Tenreiro is certainly the most representative, whether due to the vigor of his work, the high quality of his production, or because he takes us more deeply back to our Portuguese traditions in the common and elegant use of jacarandas and of braided straw, an outstanding example of traditional textile design. **(Fig.2)**

It is mandatory to remember that, in more than thirty years of activity as a furniture designer, Tenreiro managed to unite the artist with the technician, in a well-considered proportion, bringing solutions that were distinguished, above all, by flawlessness, technical refinement, and sobriety. Thus, interior decoration was no longer seen as "[...] a kind of vanity without justice, pride without logic. Momentary enthusiasm that does not come from any need for plastic expression, nor experience and constant work, assuming greater dignity, and can be considered [...] as an art movement, a creative movement, where new contributions can already be counted to decoration, creations with their character capable of establishing their foundations [...] Then, decoration is not a trick we use to hide an ugly corner, with artifice, with extra elements, but a force that shapes, and creates furniture that fulfills

7. Maria Cecília Loschiavo Santos, *Móvel Moderno no Brasil* (São Paulo: Editora Senac São Paulo/ Editora Olhares, 2017).

functional and aesthetic purposes, curtains that temper the light, and rugs that connect the composition."[8]

This national character, or acculturation process based on the enrichment of native elements, implements the absorption of international standards and is already present in Libeskind's repertoire. It can be said that this formulation is a kind of regionalism, attentive to foreign languages, but, as an aesthetic ideology, seeking Brazilian expressiveness, especially reinforced in the presence of Tenreiro as a partner in the construction of various spaces in the house.

The house is, in this way, a field of experimentation with the pieces recently designed and built by Tenreiro applied in the space lately idealized and materialized by Libeskind, which also allows us to observe, in a very succinct way, the character of marginality to which the furniture has always been connected is called into question by modern architecture[9], as from then on, the furniture starts to be seen as a complementary and essential element in the architectural project, having the same importance as it.

But Tenreiro's presence in the house is not limited to the furniture pieces, as there are other essential elements of the construction of the spaces designed by him.

Partitions, screens, railings, doors, cabinet closures, and lamps are an integral part of a set of pieces that relate to each other and the architecture. **(Fig.3)**

Libeskind could opt for iconic pieces from the renowned international design catalog to compose his architecture, but what is observed here is something that reaffirms the construction of the character of this architectural manifesto in the option for the use of national wood, weave and fibers Brazilians in Tenreiro's work that "reveals this familiar and almost loving proximity to wood: his fascination with the texture of the fiber, organicity, and tactility shines through in the game of volumes, shapes and colors that preside over his production".

Libeskind's option for a set of works of art – painting and sculpture, furniture, lighting pieces – in line with architecture (space) is inserted in this context or spirit of a time and brings together the whole that means architecture, the idea of a work of total art. It is also a way of building Libeskind's artistic legacy because the choice of those works consists of a form of self-representation, which is why an autobiography of the author in the form of an inhabited house makes sense.

4. ARCHITECTURAL MATERIALITY

The volume of the house allows an initial reading with the predominance of horizontality based on the geometric construction of the planes that define its limits. These horizontal and vertical elements receive treatments using different materials, such as stone, wood, and glass tiles, but are not restricted to a plastic-formal aspect of facade composition. When entering the house, it is possible to see that these treated plans form a continuity in the space and shape the interior voids.

8. Joaquim Tenreiro, "Decoração: sobriedade, distinção e acolhimento," *Módulo* 1, no.2 (August 1955): 58-61.

9. According to Mário Pedrosa, "The revolution in architecture is therefore not purely external. On the contrary, it is directed towards the exterior and interior of the building, where it allows us, for the first time, since prehistoric times, when primitive man lived inside the earth, to have a physical awareness of the interior space, of its physical existence." In: Mário Pedrosa, *Dos murais de Portinari aos espaços de Brasília* (São Paulo: Perspectiva, 1981), 253.

Figure 3. David Libeskind. House (1961) São Paulo, Brazil. Uninhabited House. Living Room, bar, and fireplace (glazed ceramics by Libeskind) star railing, bar, and main door panel by Joaquim Tenreiro. © Sissy Eiko (2005).

The construction and finishing materials used in the construction of the house point to the clear desire to offer a repertoire of different temperatures for the house's environments, to provide for each situation, not only the refinement of thermal technical resolution but the sensation of the place. Libeskind emphasizes, for example, the corner of conversation, coziness, and intimacy in the interactions that took place near the bar, resulting in an environment with lower ceilings, with indirect light, adjacent to the fireplace – place of the fire – taking advantage of the variations in the steps under the stairs.

Texture, color, light, shadow, height, width, and a collection of materials – tactile research present in the treatment of the different plans of this house – are also tributaries of Libeskind's investigations in the field of Plastic Arts in a deepening of the abstract, informal and material compositions of the 1960s.

5. THE CHARACTER OF ARCHITECTURE

Comprehending the construction of space that prescinds the hierarchy placed between architecture and decorative pieces - as items of lesser importance, Walter Gropius stated in 1923 that *"art and technique are the same things"*, and this represented, at the time, a change important in the way of viewing the production of objects for domestic use, where until then the opposition between utilitarian objects and decorative objects prevailed.

For Libeskind, the furniture and internal arrangements that were organized with canvases and sculptures – objects that were not only effective but above all representatives of artistic testimony and aesthetic manifestation – should match the strength of the modern architectural revolution, which was certainly not just external. Quoting Benjamin, *"For the private man the interior represents the universe. It brings together the distant and the past. Your room is the audience in the theater of the world."*[10]

10. Walter Benjamin, "Iluminaciones II," in *Luís Felipe or the interior* (Madrid: Taurus, 1952), 182.

There is a scenography, a visual appeal that manifests itself in this arrangement. And there is an actor for this stage, the metropolitan architect. In this theater, Libeskind creates his world surrounded by the visual and affective presences of his peers in the ideal construction of an artistic time. The house is closely related to this man, its configuration depends on the situation and way of life of its inhabitants; and when it gives it its character, the house takes on a vital dimension: the symbolic dimension.

Still going on about the inhabited house, one can see the remarkable approach of Libeskind's design process with the search for the construction of a modern ambiance. This places it in a unique place in the scenario of modern Brazilian production due to the specific quality relating to the character of this architecture.

This biography of architecture, of an inanimate object, reveals the story of its creation by the architect, the history of the things that the house housed and by housing them modified itself, in an eternal reconfiguration, or even, how things complement each other.

In this case, History is a power, an engine that drives another story, narrated by the house, and "the past, from then on, will not be a simple inheritance, but a construction."[11] ■

ABSTRACT.

This contribution outlines the outcomes of the comprehensive documentation of the Tarot Garden (Il Giardino dei Tarocchi) in Italy, a collaborative project between the Getty Conservation Institute (GCI) and the Carleton Immersive Media Studio (CIMS). The project aims to develop a long-term conservation plan in partnership with the Niki Charitable Art Foundation (NCAF) and the Tarot Garden Foundation.

The produced digital assets include measured line drawings, ortho-rectified images, a Geographic Information System (GIS), and a photographic record portfolio. These assets form the foundation for the holistic conservation of The Tarot Garden's physical and intangible aspects.

The Tarot Garden represents the most significant achievement of French-American artist Niki de Saint Phalle over two decades (1978-1998). The conservation plan incorporates condition assessments, archival research, interviews with collaborators and current caretakers, and detailed documentation of the sculptures using digital recording methods.

Additionally, the project emphasizes the importance of training local staff to utilize these digital assets. This capacity building is crucial for the site's maintenance, empowering local staff to continue the legacy of Saint Phalle.

1. INTRODUCTION

The Tarot Garden Conservation Project is the first field project of the Getty Conservation Institute's (GCI) ModCon Initiative, executed through the GCI Collections Department. The project is dedicated to comprehensively conserving the tangible and intangible attributes of The Tarot Garden, a sculpture garden in Tuscany, Italy, with a focus on building the capacity of the local team to contribute to the conservation management of the site using digital assets. The garden was designed and created by French-American artist Niki de Saint Phalle (1930-2002) from the late 1970s until the early 2000s, and features 22 sculptures inspired by the Major Arcana of the Tarot, nine other sculptures, and an entrance wall and café designed by Swiss architect Mario Botta. The site also includes four kinetic sculptures created by the artist's husband, Swiss sculptor Jean Tinguely.

The project's long-term conservation strategy integrates a multifaceted approach, including digitally documenting the sculptures' current condition, qualitative condition assessments, archival research, and interviews with site collaborators and caretakers. The documentation work involved the development of digital assets as well as training The Tarot Garden staff to work with the assets to facilitate the establishment of a maintenance plan for the site. The documentation and training involved the work of the Carleton Immersive Media Studio (CIMS) with the GCI and The Tarot Garden Foundation over a one-year period, including a field campaign in May of 2023 and a training campaign in November of 2023. The GCI's contributions in preparation of the maintenance plan encompass condition assessments of the sculptures, interviewing site collaborators and caretakers, and training staff on suitable maintenance activities. This paper focuses on the use of capacity building activities with digital documentation assets to facilitate the sustainable preservation and management of The Tarot Garden.

2. SCOPE OF WORK

The Tarot Garden presented significant challenges for digital recording due to the large size and irregular shape of its structures, substantial vegetation, and reflective surfaces of the decorative ceramic and mirrored tiles. To address these challenges, a detailed documentation approach was adopted to accurately capture the site's current state of conservation using appropriate technology.

The project involved meticulous planning and implementation of recording and mapping activities to produce measured records of The Tarot Garden at both the scale of the site and each sculpture. These records aim to facilitate conservation planning for the site's attributes and landscape. The activities included mapping the sculptures, topography, and standing structures, such as the entrance wall and café. Based on the recorded data during this project, as-found measured line drawings and ortho-rectified images were produced at various graphic scales. Terrestrial and drone photography generated a high-resolution geographically referenced photographic inventory of all site attributes. A Geographic Information System (GIS) was designed and

Acknowledgements: This manuscript was made possible through the significant contributions of the Carleton Immersive Media Studio team, led by researcher Elyse Hamp, and the expertise of Professor Luigi Barazzetti, Senior Geomatic Assessor at the Polytechnic of Milan, Italy. Additionally, we thank Damiano Aiello, a researcher at the Carleton Immersive Media Studio, for his integral role as a team member.

produced using open-source software (QGIS, 2024). The GIS hosts the digital assets of the site, including as-found measured drawings, aerial ortho-rectified images, digital elevation models, topographic contour lines, as well as archival ortho-rectified images and technical reports geo-referenced to their associated sculptures on the site. A photographic record portfolio was developed to support the GIS, providing a navigable database of high-resolution images of the existing condition of each sculpture.

The project's capacity-building activities focused on training the site staff to operate the digital assets produced from the site's documentation. The next sections discuss the documentation work and digital assets produced by CIMS, followed by a discussion of the capacity-building activities with the digital assets and the purpose and outcomes of the training.

3. DIGITAL SITE RECORDING

CIMS carried out digital recording during two periods, with comprehensive documentation work being completed in May 2023 and the supplementary documentation work conducted in November 2023 along with capacity building activities with the site staff. .

A geospatial positioning workflow was designed to integrate various data types, including laser scans and photogrammetry, into a Geographic Information System (GIS) with accurate geographic coordinates. GNSS RTK receivers were used to establish control points across the site. This data was processed to provide precise geographic coordinates, forming a robust geodetic network with a total station survey spanning across the site. The total station measured natural points on sculptures and targets for geo-referencing all the information collected.

The site was 3D-scanned using two FARO laser scanners working simultaneously with relevant surface resolution. Control points were established using targets and spheres for precise point cloud registration. Reflective surfaces presented challenges for the 3D Scanners, as they cause these beams to scatter in unpredictable directions, often reflecting away from the scanner instead of returning directly. This prevents the scanner from accurately measuring the geometry. Therefore, this was overcome by manually cleaning reflected points—the processed scans generated detailed point clouds for each sculpture, documenting interior and exterior geometries.

Terrestrial photogrammetry involved photographing all sculptures, pathways, and key structures using colour-corrected high-resolution mirrorless cameras. The photographs were processed to create high-resolution ortho-rectified images and photogrammetric models. Aerial photogrammetry was performed using off-the-shelf drones, capturing images of the sculptures and the site's layout. These images supplemented terrestrial data and were processed to create comprehensive 3D models. An appropriate Ground Sampling Distance (GSD) for terrestrial and aerial work was calculated to achieve an adequate graphic scale for photogrammetric data.

Overall, the documentation work resulted in a set of detailed digital visual and technical assets of The Tarot Garden, facilitating future

assessments and conservation efforts through the provision of data which is metric, geo-referenced, and high resolution.

4. PROCESSING AND DISSEMINATION OF COLLECTED DATA

4.1 MEASURED LINE DRAWINGS AND ORTHO-RECTIFIED IMAGES

The site's sculptures, structures, decorated pathways, and other details were meticulously documented through measured line drawings and ortho-rectified images. The drawings include elevations, section elevations, and plans tailored to each sculpture's specific scale and geometry. These assets formed the foundation of the digital records produced for the site. On their own, the set of drawings and ortho-rectified images provides detailed information about the recorded condition of the sculptures, including their geometry and true colour of the materials on each sculpture. As part of the comprehensive dataset developed through this project, the drawings and ortho-rectified images supported the development of the remaining digital assets – the GIS and the photographic record portfolio. The site plan and aerial ortho-rectified images of the site served as reference upon which additional data was geo-referenced in the GIS. In the photographic record portfolio, the elevations and plans of each sculpture were used to reference the location and orientation of high-resolution photographs at a close graphical scale.

The development of the measured line drawings involved using Computer Aided Drafting (CAD) and geo-referenced point clouds to trace the geometry of each sculpture. A point cloud was attached to its own CAD file for each sculpture, with a specific user coordinate system (UCS) defined around the sculpture. Despite the irregular orientations of the sculptures, UCS orientations were approximated to the orthogonal faces of each sculpture. Ortho-rectified images were generated using photogrammetric processing software. Each ortho-rectified image was generated using light balanced and colour corrected terrestrial and aerial images, with the resulting ortho-rectified image oriented to align with the geographic orientation of the associated measured line drawing. An example of the measured line drawings of The Empress is shown in **Figure 1**, with ortho-rectified images overlaid with the two elevation drawings, and the plan and section drawings shown in grayscale.

4.2 GEOGRAPHIC INFORMATION SYSTEM (GIS)

A Geographic Information System was developed using the open-source program QGIS to consolidate and manage data for the site, including archival aerial images, the geodetic control network for the site, aerial ortho-rectified images, digital elevation models, contour lines, site plan drawings, and intervention reports recorded for works on the sculptures up to the year 2022. Additionally, the photographic record portfolio was linked to each sculpture in the GIS, providing direct access for navigating to the high-resolution images. The different data sources were linked in the GIS using points and polygonal shapefiles, with hyperlinks provided in the shapefile metadata. All the data was geo-referenced in the UTM zone 32 (North) reference system.

The GIS was developed for this project with the initial purpose of providing a sole, robust, and comprehensive source for managing documentation, digital records, and technical information for the site through a geographic system. However, it was determined that the GIS limited the capacity for sustainable conservation practices on the site because of the requirement for advanced technical understanding of the GIS program to manage the system over the long-term. Based on an adaptive approach adopted for the project, a photographic record portfolio was additionally developed for the site, to support the GIS, which is discussed in the next section.

4.3 PHOTOGRAPHIC RECORD PORTFOLIO

The photographic record portfolio complements the Geographic Information System (GIS) and is a digital resource for managing, recording, and assessing the artworks' condition. It provides interactive navigation with embedded hyperlinks to high-resolution images stored on a cloud-based storage platform. A navigation page with a Site Map and a Sculpture Index listing all the sculptures on the site facilitates navigation through the digital portfolio. Drawing pages within the portfolio include elevations, section elevations, and plans indicating the location and orientation of detailed images of each sculpture. Hyperlinked frames and photo key symbols guide users to detailed pictures stored in a cloud-based platform to maintain feasible document size and prevent image compression, as illustrated in **Figure 2**. High-resolution images were organized by sculpture name in a dated folder structure, ensuring easy access and facilitating future updates. A convenient naming convention for the images was defined to keep the platform organized and accessible to provide a comprehensive and detailed record of the site's sculptures and artworks.

The concept of the photographic record portfolio was developed for the project grounded on the need to provide digital assets which are accessible and operable, based on the capacity of the team responsible for the long-term conservation of the site. The accessibility and operability of the portfolio was designed so that it does not require advanced technical knowledge to operate geographic or digital data processing programs. Rather, the portfolio is a static document used through a common open-source program, such as a PDF reader or web-based PDF viewer. The dynamic component of the portfolio, the database of high-resolution images, is hosted on a cloud-based storage platform, involving the regular addition and management of digital images to record the ongoing condition of the sculptures throughout stages of conservation work. As discussed in the next section, the use and management of the photographic record portfolio was a primary focus of the training activities on the project.

5. TRAINING

Central to this project was empowering local staff through targeted training, ensuring they can effectively utilize the digital assets and sustain Saint

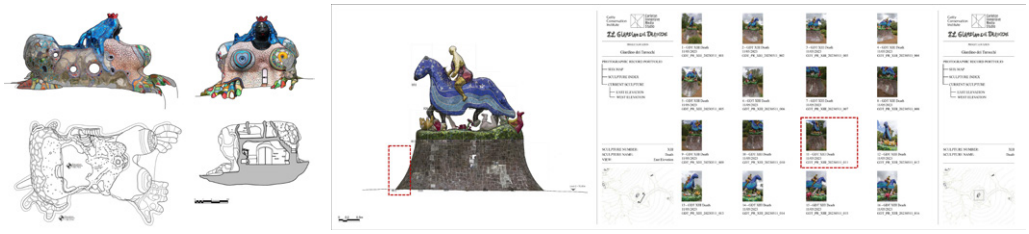

Figure 1: Measured line drawings and ortho-rectified images of The Empress by Carleton Immersive Media Studio for the Getty Conservation Institute, 2023.

Figure 2: Photographic record portfolio layout of The Death by Carleton Immersive Media Studio for the Getty Conservation Institute, 2023.

Figure 3: Capacity building activities with site caretakers by Carleton Immersive Media Studio for the Getty Conservation Institute, 2023.

Phalle's legacy. The team closely assessed the project's requirements and the local staff's needs to develop the best training approaches. Based on the preliminary processing of the digital assets, training sessions were designed to enable the staff to use digital photography proficiently, navigate point clouds, and manage the photographic record portfolio and GIS created for the site.

To facilitate hands-on learning, the staff was provided with a laptop preloaded with the necessary applications and project files. The training spanned four days in November 2023, with each day focusing on different digital asset aspects. Staff were introduced to the drafted digital assets and taught to navigate and manage the photographic record portfolio. With the objective of adding to the image database over time, the staff were briefed on the basics of digital photography and DNG image conversion and editing. The training also covered working with point clouds in Autodesk Recap, using measured line drawings on-site, and working with QGIS. The final day focused on testing workflows taught to the staff involving photography, the photographic record portfolio, and data management in the GIS. Written protocols were provided for image editing using Adobe DNG Converter and RawTherapee, navigating and manipulating point clouds in Autodesk Recap, and managing data in QGIS.

These training sessions were crucial for enabling the local staff to take an active role in the ongoing management and conservation of The Tarot Garden. By equipping them with the skills to use the digital assets, the project ensured that the legacy of Niki de Saint Phalle is preserved through the empowered and knowledgeable stewardship of those closest to the site. This approach not only supports the site's physical maintenance but also honors the collaborative spirit in which it was created, continuing the meticulous care and conservation initiated by Saint Phalle herself **(Figure 3)**.

Throughout the training activities, The Tarot Garden staff demonstrated an eager approach and high capacity to incorporate the use of digital assets

into regular site management and conservation activities. Following the training campaign, the site staff have continued to make use of the digital assets provided, including the cloud-based storage, for recording the conditions and progress of interventions on the sculptures subsequent to the documentation work conducted in 2023. Some discrepancies in the file management protocols have been observed, although consistent use of the digital assets has been seen overall.

6. CONCLUSIONS

Detailed digital records serve as invaluable resources for future conservation campaigns, providing a baseline to assess changes, guide restoration efforts, and preserve the sculptures' integrity for future generations. The Tarot Garden Conservation Project allowed the authors to implement the digital assets resulting from advanced digital recording methods for the capacity building of a local team, facilitating the long-term conservation of the site. The initial documentation methodology focused on the development of a sole digital asset – the GIS – for data management for the site, based on a geographic system. Through consideration of accessibility, operability, and capacity of the team responsible for the long-term use and management of the digital resource, the photographic record portfolio was conceptualized and developed to support the GIS.

The involvement of The Tarot Garden staff continues to be essential for the preservation of the site, and as such, the capacity building activities of the project focused on training staff to operate and manage the GIS and the photographic record portfolio. The training's objective was to provide digital assets to support the staff in their ongoing conservation activities on the site. ■

BIOGRAPHY

Mario Santana Quintero has contributed to conserving precious heritage places worldwide thanks to his innovative digital documentation methods. He is a professor at Carleton University and Carleton Immersive Media Studio Lab (CIMS) faculty member. Besides his academic work, he served as the immediate past Secretary-General of the International Council of Monuments and Sites (ICOMOS), and he is one of the Honorary Presidents of the ICOMOS Scientific Committee on Heritage Documentation (CIPA). He has collaborated on several international projects. In recent years, he was awarded a Doctorate Honoris Causa from the University of Liege (Belgium) and the Association of Preservation Technology College of Fellows membership.

Flavia Perugini is a Senior Project Specialist at the Getty Conservation Institute, where she works on the Modern and Contemporary Art Research Initiative. She holds a Laurea in Architecture from the University of Florence, Italy, and a graduate degree in Conservation and Restoration from the Guildhall University of London, UK. She worked as a conservator in the United Kingdom at the Wallace Collection and Tate in the sculpture department. In the United States, she was Head of Conservation at Historic Mount Vernon and conservator at the Museum of Fine Arts, Boston. She is a Fellow member of IIC and AIC and Assistant Coordinator for the ICOM-CC Modern Materials and Contemporary Art.

THE LINK BETWEEN ARCHITECTURE AND PSYCHOLOGY IN JAPAN: YOSHINOBU ASHIHARA'S LANDSCAPE THEORY

ZAHRA RAMEZANI

KENJI WATANABE
TOKAI UNIVERSITY - JAPAN

#21

ABSTRACT.

This paper will examine Japanese modern architecture and elements of traditional architecture from the perspective of neuroscience. Yoshinobu Ashihara (1918-2003), is one of the few Japanese architects who maintained a good balance between formulating architectural theory and practicing architectural design while focusing on the impact of design on the human psychology. Studying at Harvard Uni. GSD and being influenced by architectural theorists such as Christian Norberg-Schulz who studied with Ashihara during his time at Harvard Uni. GSD and conducting research in different countries allowed Ashihara to examine Japanese architecture from different perspectives.

1. INTRODUCTION

For the past few decades, architects have tried to improve on the modern architectural movement, leading to more sustainable designs, while giving color to the dry image of modern architecture. Japanese architecture is considered one of the most sustainable in the world, due to its use of natural materials, and nature itself to confront problems such as natural disasters. However, as Jun'ichiro Tanizaki mentioned in "In Praise of Shadow", in modern era cities, it is not possible to design with only traditional methods. Rather, a balance can be held between traditional and modern architecture. As James Maude Richards states in "An Introduction to Modern Architecture", architects gained the opportunity to find their own style in the modern era. However, as Donald H. Ruggles mentions in " Beauty, Neuroscience & Architecture: Timeless Patterns and Their Impact on Our Well-being ", some modern architects' designs were more functional, but didn't account for psychological needs. Yoshinobu Ashihara (1918-2003), is one of the few Japanese architects who maintained a good balance between formulating architectural theory and practicing architectural design while focusing on the impact of design on human psychology. After receiving his undergraduate degree at Tokyo Imperial University (1942), after WWII, Ashihara continued with his studies and became the first Japanese person to study at Harvard University GSD (1952-1953). Working as a staff member for Marcel Breuer for one year after graduating from Harvard GSD, being influenced by architectural theorists such as Christian Norberg-Schulz who studied with Ashihara during his time at Harvard GSD and conducting research in different countries allowed Ashihara to analyze Japanese architecture from different perspectives. In his writings, Ashihara compares Western and traditional Japanese architecture, while referring to Gestalt Theory and Edgar Rubin's Vase theory, and focusing on landscape, over-texture concept, sense of direction, imageability, the law of enclosure, and boundaries. Ashihara's interpretation of Gestalt Theory had a large impact on architectural and urban landscape designs, which he elucidates using some of his own works such as the Komazawa Olympic Gymnasium, Central Plaza (1964), Musashino Art University (1964-68) and The Sony Building (1966), which were all registered as important modern architecture by DOCOMOMO Japan. Therefore, the aim of this paper is to study Japanese modern architecture while focusing on Ashihara's ideas as elucidated in his writings and works, with the aim of understanding the link between architecture and psychology as described by different sources such as Gestalt Theory.

2. JAPANEASE TRADITIONAL ARCHITECTURE

As James Maude Richards states in "An Introduction to Modern Architecture", traditional architecture is created by craftsmen who, after gaining a lot of experience and using available materials, create a functional design that meets the needs of their clients. Therefore, appreciation of Japanese culture, along with traditional techniques, in order to gain proper understanding of the client's psychological needs, is the main purpose of this paper.

2.1 BOUNDARY IN JAPANESE ARCHITECTURE

As Yoshinobu Ashihara mentioned in "The Aesthetic Townscape" the purpose of boundary in architecture is not merely to divide space, but to find a way to create a sense of harmony in connecting different types of spaces. Culture determines the form and limits of the boundary in architecture. As Hiroyasu Fujioka points out in "近代建築史 (KINDAI-KENCHIKU-SHI)", due to the fact that Japan is an island and there is no risk of attack from overseas, boundary has a different definition in this region which can be seen in usage of thin and temporary wooden walls instead of thick stone walls in Japanese houses. As Yoshinobu Ashihara mentions in "The Aesthetic Townscape", a man's shelter is temporary, which is evident in the Shinto belief that just 4 bamboo sticks connected with a rope ("Shimenawa"), are enough to create a sacred area that is separated from the surrounding space.

Despite the temporary walls, there are clear differences between outside and inside culture. For example, as Ashihara points out in "The aesthetics of Tokyo", the culture of removing one's shoes before entering the home defines the boundary between inside and outside. As long as the space is one where shoes are not removed, it is considered an outside environment, which will determine the behavior of the people in that space.

Boundary isn't only used to divide the outside spaces but is also used to create borders inside buildings. In Japanese houses, these borders can often be seen with subtle design choices. For example, the level of the entrance area ("Genkan") is 3 to 5 centimeters lower than the rest of the house. This type of boundary can also be seen in defining the border between the bathroom and other rooms.

Another element that defines the boundaries inside the house is the use of different flooring in different parts of the house. The use of tatami in the living and sleeping rooms and wood for the kitchen and other rooms.

2.2 A FLOOR-ORIENTED ARCHITECTURE

Given that in Japan, as Ashihara mentions in "The Aesthetic Townscape", man's shelter is temporary and subtle demarcations are used to create boundary, Japanese architecture was pushed towards being floor oriented. Religious beliefs about being one with nature, inspired architects to externalize the interior design, instead of internalizing the exterior. One of the elements that blends the interior with the exterior is the beautiful Japanese garden, Tsuboniwa, which are usually designed in the back of the house to give the residence a pleasant private space.

2.3 TRADITIONAL MATERIALS

As mentioned earlier, Japanese architecture is considered one of the most sustainable in the world due to its use of natural materials such as timber, clay and tatami. Nature itself is used to protect man's shelter. Houses are built higher than the ground level, which allows air to pass easily from under the building, which helps in ventilation, prevents moisture and rotting, and

helps to control the rain during typhoons. This technique also connects to the religious belief that evil spirits can pass from under the building.

Another example of sustainable Japanese architecture is the Kumiki post and beam technique, in which pieces of wood are interlocked together and no nails are needed. This technique is used to oppose external forces acting upon the building during storms and earthquakes.

Furthermore, the use of tatami flooring not only absorbs air humidity and helps with sound insulation and air purification, but also helps people's peace and mental stability due to the presence of phytoncide. According to the National Institutes of Health (NIH), phytoncides revitalize the body and possess various effects, such as antibiotic and insecticides, and deodorants, which can enhance both mental and physical health. Tatami is used not only as a material for flooring, but also as a traditional Japanese unit of measurement used the design process.

3. GESTALT AND JAPANESE ARCHITECTURE

As Jun'ichiro Tanizaki mentioned in "In Praise of Shadow'', modern materials and techniques undoubtedly saved and developed traditional designs, however, as Stewart Brand mentions in "How Buildings Learn", modern architects focus more on the presentation of the building, and less so its psychological effects on people. As Donald H. Ruggles refers in the "Beauty, Neuroscience & Architecture: Timeless Patterns and Their Impact on Our Well-being", the emotions that the environment creates in humans is not only limited to the sense of sight, but it is the genetic memory that decides whether the design brings the sense of avoidance or pleasure. In Japan, Yoshinobu Ashihara is one of the few Japanese architects who focused on examining Japanese traditional architectures and people's needs while formulating architectural theory and psychology.

3.1 MODERN MATERIALS

In a country such as Japan where there is a large population with little space for construction, along with frequent natural disasters, the use of modern methods and materials has proven to be effective. However, these methods should be implemented in such a way as to meet the psychological needs of the people.

As mentioned in the article "Psychological and physiological effects of a wooden office room on human well-being: Results from a randomized controlled trial", when living in an environment made of natural materials such as wood, a sense of pleasure is brought to the subconscious mind, given that humans have adapted to nature through evolutionary processes. While concrete is one of the main materials in modern architecture, it does not provide the same effect, therefore Ashihara suggests a concept to use it in a more pleasant way.

In "the aesthetic townscape", he points out that concrete loses its "aliveness" with the passing of time. Therefore, he uses the over-texture concept which was inspired by Gestalt's theory, "the whole of anything is greater than its parts". In the design of the Komazawa Olympic Gymnasium Park, designed by Ashihara, in a 24 x 24-foot unit, the tiles are placed next to

each other with a special pattern, whereby placing these small units together, a general texture is created that can be seen from a higher level. It can be asserted that Ashihara's conceptualization of over texture was significantly influenced by his visit to Saint Mark's Square in Venice Italy **(Fig.1)**.

Furthermore, Yoshinobu Ashihara believes that the higher the sense of imageability, the better the environment. He points out that humans are generally interested in imagining and seeing from an angle higher than their level of vision which gives them a luxurious sense of privacy which can be seen in the flower arrangement of small bonsai trees, or model making. He believed that by using the over texture concept, when people see a certain design while walking in the park, they unconsciously try to imagine the whole ground view from the highest level possible.

The use of glass in the exterior design of the modern building is another point that Yoshinobu discusses in his books. He believes that since the interior of the building is hidden during the day, the building can be seen as a sculpture. However, at night, due to the lights and reflections, the interior is visible and creates designs opposite of the figure and ground theory. As Jun'ichiro Tanizaki mentioned in "In Praise of Shadow ‘’, in traditional Japanese houses, due to the wooden interior and lack of light reflection, the dishes have a shiny coating to reflect the light and create a more peaceful environment. It can be said that the reflection of light from modern glass buildings at night can be compared to shiny Japanese bowls that create a more spiritual atmosphere next to concrete finished buildings.

3.2 SENSE OF DIRECTION

In terms of external design, Ashihara believed that the exterior space is just the interior space without the roof and must be treated the same. In his book he referred to the yin and yang Chinese theory. By juxtaposing the positive spaces, the negative space between them becomes a positive space and "in order to become a yang (something), there must be a boundary which will form an entity". Furthermore, the design of this created positive space is different depending on the type of design.

As Christian Norberg-Schulz, mentions in" The Concept of Dwelling: On the Way to Figurative Architecture", how to approach the design and connect one point to another, depends on the type of area. For example, the way of approach in the design of Asakusa temple in Tokyo and Murou-ji temple, in Uda city, Nara prefecture, is different even though both are sacred places. He also points out that in traditional designs, religion and its beliefs are the main designers, and in the case of temple design, the higher the temple is built above the ground and closer to the sky, the closer a person feels to their gods.

The Murou-ji temple is located on top of the Mt. Muro. The design of the stairs and the positioning of the Gojyu Pagoda above them are intentionally crafted to enhance the visual experience as one ascends, the Pagoda becomes increasingly prominent, transforming the sensation of tiredness into excitement and anticipation upon approaching the main feature, the temple. The same technique was used in the design of the Komazawa Olympic Gymnasium

Figure 1 St. Mark's Square, Venice, Italy, (Photo by Yukio Futagawa, Exterior Design in Architecture)

Figure 2 Yoshinobu Ashihara, Komazawa Olympic Gymnasium, Tokyo, Japan, Right. (Photo by Zahra)

Figure 3 Muro-ji Temple, Nara, Japan, Left. (Photo by Yukio Futagawa, Exterior Design in Architecture)

Figure 4 Yoshinobu Ashihara, Komazawa Olympic Gymnasium, Tokyo, Japan, Right. (Photo by Shuji Yamada, Exterior Design in Architecture)

(Fig.2). The tower inside the park with the similar design as the Gojyu Pagoda has been designed according to the people's perspective, so that as people approach the higher stairs, the image of the tower becomes more complete for them, and the sense of achievement replaces the sense of tiredness.

However, in the Asakusa temple, the design of the path had to meet a different need. Asakusa Temple is located in the capital city, therefore the path to the temple had to be designed not only to bring the feeling of excitement, but also, needed to control the crowds during the ceremonies. Therefore, the Asakusa temple is located at the end of two lines of small shops.

A modern example we can refer to is the design of the Sony building in Ginza-Tokyo, designed by Yoshinobu Ashihara. The path to the building and the connection between the inside and outside of the building, was designed in such a way that people had access to the upper floors of the building by elevators from the entrances of the parking lot, the subway line and on the ground level. The interior space and the floors were designed in the form of large and consecutive stairs so that people could explore each floor while going down the stairs.

3.3 ORDER OF SPACES

Japanese temple has different sections with different purposes which are designed to be walked through in a certain order, and visitors encounter a more comfortable and pleasant space with each section they walk into. Visitors walk through the exterior section, which is the entrance of the temple, and move to the semi-exterior space which has shops and restaurants, and finally to the interior space, the temple itself. This space order concept can be referred to as the gestalt continuity concept, which states that the human brain tends to make connections between different objects, and therefore making connections between different spaces of different uses can bring a sense of pleasure. This concept can be seen in the design of the Ashihara's Musashino Art University in Tokyo design. In Musashino Art University, students first find themselves in the entrance area and the gate, the exterior space, which has rough flooring and no special lighting. After passing the stairs they enter the central plaza, the semi-interior space, where there are outdoor lighting poles, and refined materials are used for the flooring. Finally, after passing the stairs, students enter the premises of the building which has more delicate lighting and fine-grained finishing materials been used for the flooring.

4. CONCLUSION

Relying solely on traditional architecture is insufficient to address the complex and evolving demands of the modern world. Therefore, it is necessary to develop solutions that meets contemporary needs while also incorporating the evolutionary benefits that traditional architecture provides. One innovative approach is the over-texture concept, which allows modern materials such as concrete to mimic the pleasing effects of natural materials to which humans are inherently adapted. This approach not only maintains aesthetic and tactile appeal but also meets the functional requirements of modern construction.

A crucial aspect of the design process involves thoroughly understanding the project's societal context. This understanding helps in defining essential features such as paths of travel and boundaries, ensuring that the design is both functional and harmonious with its surroundings. Careful consideration of these elements can result in spaces that effectively meet the practical and psychological needs of individuals, promoting well-being and a sense of community. Even minor design decisions, when made thoughtfully, can have a significant impact on the overall success of the project. By integrating modern techniques with traditional sensibilities, architects can create environments that are both innovative and deeply rooted in human experience. ■

MODERN MOVEMENT AS A MEDIUM FOR EXPRESSION AND AS A DISSEMINATION TOOL IN AUDIOVISUAL MEDIA

SUSANA LANDROVE BOSSUT
FUNDACION DOCOMOMO IBERICO

SARA PÉREZ BARREIRO
UNIVERSITY OF VALLADOLID

#22

ABSTRACT

The popularity of series such as *Game of Thrones* and film franchises like *The Lord of the Rings* or *Star Wars* have contributed to a rise in screen tourism. Film location scouts will always look for a location to fit a plot and lately there has been a growing trend to use contemporary architecture as a backdrop. This trend has increasingly included buildings from the modern movement.

Heritage from that period 'looks very good on camera' as can be appreciated in many different productions, particularly those made in the last five years. In Spain, for example, many of these have been filmed in buildings designed by some the greatest architects of the modern movement, such as Francisco Sáinz de Oíza, Miguel Fisac or Javier Carvajal, to name just a few. Such productions take place in a wide array of buildings, such as single-family homes, apartment blocks, laboratories, churches, etc.

This might be the ideal moment to consider the use of audiovisual media as a means of disseminating the modern movement.

1. INTRODUCTION

Screen tourism is a relatively recent concept. It consists of promoting visits to certain locations that have been featured in series or films. At first glance, this may seem banal. We are used to a tourism that involves recognised heritage buildings. Notable cases include the fact that more than seven million people visit the Eiffel Tower annually, six million visit the Roman Coliseum and two million visit the archaeological site of Chichén Itzá. All of these destinations are associated with outstanding buildings belonging to very different periods and styles. However, modern tourists are no longer just interested in travelling to see historical sites; they are looking for a more personal relationship with the film characters they admire.

Digital television platforms like Netflix, HBO or Amazon Prime have become integral parts of our lives, providing a new model of entertainment. This new way of watching movies at home has changed our entertainment habits, and many prefer the comfort of home viewing rather than going to theatres.

Many of these platforms started out by acquiring the rights to broadcast films and eventually became film production companies themselves. In doing so, they not only screen films on their platforms, but also nurture them with high-quality content. In 2019, Netflix acquired the broadcasting rights to the film *Roma*, which was simultaneously screened in commercial cinemas and on Netflix. When Alfonso Cuarón's magnificent film won the Oscars for Best Foreign Language Film, Best Director and Best Cinematography, it became evident that a new model of film marketing had been established: digital platforms.

2. *GAME OF THRONES*

The television series *Game of Thrones* debuted on HBO in 2011, adapted from the book series written by novelist and screenwriter, George R. R. Martin. Its final season, season eight, premiered in 2019. In total, the eight seasons add up to 73 episodes, and almost 70 hours of footage filmed in locations as diverse as Croatia, Spain, Northern Ireland and Iceland.

The city of Braavos was recreated in Girona, Spain. Arya Stark begs for money in Obispo José Cartañà street, goes to the theatre in Plaça dels Jurats and embalms corpses in the Arab Baths. Girona also served as King's Landing, and the immense staircases of its Roman cathedral were the setting where Queen Margaery almost made the walk of shame.[1] These royal settings have become places of pilgrimage for the fans of the series, and companies such as Civitatis now offer tours to visit the filming locations of the series. The same happens in Seville, where the Alcazar was transformed into Dorne as well as other locations of the *Game of Thrones* world, and other film sagas such as *Star Wars* or *The Lord of the Rings*.

The economic impact of a film shoot in a city is difficult to quantify, as visits to these locations are maintained for many years. This is why the Spain Film Commission decided to promote the Spain Screen Grand Tour, an initiative to discover Spain through films, series and other productions. According to a study by TCI Research, in 2022 one in ten European tourists chose their destination influenced by series or films. With this data in mind,

1. Cersei does get to do the walk of shame, but that time it was filmed in Dubrovnik.

it would seem like a good initiative to enhance certain locations related to modern movement architecture as film sets in order to increase the number of visits to these enclaves and promote their recognition.

3. THE MODERN MOVEMENT AND ITS ENHANCEMENT

One of the most significant problems in the recognition of the modern movement's architecture by the public is its recent construction. While cathedrals or palaces are unquestionably important, buildings constructed less than a century ago, with 'not very noble' materials such as concrete or brick are often questioned. Our task is not only to enhance the value of this heritage, but also, in some way, to make it economically profitable. We can establish four phases in this process: registering and documenting modern movement architecture, promoting its protection, raising awareness of its importance, and, finally, providing for its conservation by searching for new functions that will guarantee its sustainability and allow for a new economic profitability.[2]

Movies and series can contribute to this process as they allow us to gain a deeper understanding and appreciation of heritage, and therefore help its conservation. At the same time, they are significant in strategic terms because they can allow for economic growth based on the relevance of the buildings as touristic assets.

The Carvajal house, built as his family home in 1966 by the architect Javier Carvajal in Somosaguas (Madrid), is characterised by a series of massive concrete volumes spread horizontally. The house is organised on a single floor around two courtyards, one of which separates the service area from the main living area.[3] The singer C-Tangana, winner of four Latin Grammys, filmed the music video of *Comerte Entera*[4] in 2020 in this courtyard with the company Little Spain. As of May 2024, the video has garnered over 21 million views on Youtube and was watched by more than 250,000 people on the first day it was uploaded. No other advertising campaign on a building would ever allow for such fast diffusion. The film *La Madriguera*[5] by Carlos Saura was also shot in this house in 1969. The current owners of the house now rent the house for filming and events, which helps in maintaining the property.[6]

Miguel Fisac also designed his own house on the outskirts of Madrid,[7] at the end of the 1950s. The house stands on a platform which rises over a hillside and is organised around a covered courtyard. It was built in several phases and extended according to the needs of the family. The architect masterfully uses different materials: concrete, brick and stone to create a cosy atmosphere. The entrance and the living room form part of the set in the series *Sentimos las Molestias*.[8]

In 1965, José Antonio Corrales constructed one of the most interesting housing complexes of the Spanish modern movement in Galicia, Neighbourhood Unit No. 3.[9] It consists of three parallel blocks that are staggered to adapt to the slope of the land. The blocks are connected by a series of walkways and corridors which also house shops, offices and, according to the original project, a nursery. The apartments follow different typologies, but all of them use the same module, 1 m long. In addition to the linear blocks,

3 towers and 10 semi-detached houses were also built. The use of concrete as a finishing material gives the complex a certain brutalist air. Sunlight was an important consideration in the layout of each of the parts and concrete brise-soleils were installed on the south-facing façades. All the dwellings have staggered interiors, clearly marking the uses of each room. These differences in level allow for greater lighting and the creation of storage spaces.

The open spaces between the blocks serve as recreational and leisure areas, especially in the large square, which was intended as a social and recreational area for the tenants. Nowadays it is rarely used, due, among other things, to the decrease in the number of children living in the building. The children's joy, that the architect was aiming for, is reflected in the film *Jump!* [*¡Salta!*].[10] The architectural virtues of this superb example of the modern movement are also on display in *The Summer We Lived* [*El Verano que Vivimos*].[11]

Another emblematic building belonging to the Spanish modern movement is Torres Blancas,[12] designed by Francisco Sáenz de Oíza. The building fits into the organicist trend with striking curved forms in its façade. The building is topped off with some overhanging forms that originally housed a restaurant. There is a swimming pool on the roof which maintains the organicist approach of the whole complex.

In 2009, Jim Jarmusch filmed *The Limits of Control*[13] in Torres Blancas. The entrance hall of this same building is easily recognisable in the music video by C-Tangana and Kiko Veneno *Los Tontos*.[14]

The top floor of the building, which used to be a restaurant, was connected to every apartment with a dumb waiter so that food could be directly delivered to the tenants. Neither the dumb waiter nor the restaurant are in use nowadays, and the floor has been abandoned for some time. This situation allowed for the floor to be rented for several movies and series such as *Bosé*[15] and *Holy Family* [*Sagrada Familia*].[16] The building is now included in the General Catalogue of Protected Buildings of Madrid, and has been granted level 1 protection, singular grade. Additionally, the City Council has just approved the project to carry out a refurbishment to convert it into eight dwellings.

The church of Nuestra Señora de Guadalupe[17] designed by Enrique de la Mora Palomar, Félix Candela Outeriño, José Torroja Cavanillas and José Ramón Aspizau Ordoñez was built between 1962 and 1965 in Madrid. The basilica has an octagonal ground plan circumscribed by a 55-metre circumference. The roof is made of a series of ruled surfaces: specifically eight hyperbolic paraboloids. Inside, the grey concrete roof contrasts with the coloured light filtering through the stained-glass windows. This is the perfect place to pay a heartfelt tribute to one of the protagonists of the *Holy Family* series.

This same series showcases one of the most interesting spaces of the Eduardo Torroja-CSIC Institute of Construction Sciences [Instituto de Ciencias de la Construcción Eduardo Torroja-CSIC],[18] the single-span ramp that connects the access to the first floor of the central building, turning it into an adoption agency. This complex consists of two main buildings: the office building and the cement and concrete laboratory building. Two very modern concepts were introduced in this complex:

10. Film by Olga Osorio that tells the story of two brothers who live in that block and one of them travels in time.

11. Film directed by Carlos Sedes in which he tells the story of his son's into the life of his father, a well-known architect.

prefabrication and modular repetition. Certain components, such as the windows and the floor tiles, were prefabricated in workshops on-site using the 1.60 module adopted in the general organisation. The use of this module made it possible to optimise costs and execution times.

The amazing circular dining room of this building features a garden area in the centre and a glass enclosure that can be obscured by means of movable elements. It serves as the headquarters of the family business in the series *Galgos*.[19]

Every Christmas a well-known sausage company makes a promotional video for its products. We are referring to the Campofrio company advertisement, which arouses great interest among viewers. Every year, the most important Spanish actors take part in it. The 2022 Christmas advertisement was recorded in this particular space.[20]

The architectural quality of this complex is undeniable, and in recent years it has become a set for numerous productions, appearing on the screens of millions of viewers.

Somehow, the heritage of the modern movement has become fashionable, and it looks good on camera. More and more of these types of buildings are being chosen as locations for all kinds of filming. Evidence of this is apparent in the fact that all the productions that appear in this text, with the exception of *La Madriguera* and *The Limits of Control*, have been filmed in the last five years. We should make the most of this and promote the modern movement through film.

4. CINEMATIC CATALOGUE

Different municipal, regional and national governments have realised the importance of supporting film productions. To this end, they have carried out various initiatives, such as the creation of Film Commissions or Film Offices. These are generally public companies, which function as technical agencies to assist production companies in the audiovisual sector, promoting the logistical, artistic, and professional information necessary to film in a given location.

The Valladolid Film Commission in Spain (VAFC) commissioned several members of GIRAC[21] (Daniel Villalobos, Sara Pérez, Iván Rincón and Eusebio Alonso) to write a series of location sheets. These locations were divided into three groups: classical, modern, and contemporary. The

goal was to identify architecturally interesting enclaves, large enough to set up a film shoot and where the owners were interested in providing the space in exchange for a financial donation.

A series of fiches[22] were compiled with photos, plans and a brief description of the importance of the building and its main characteristics. With this information, the VAFC can offer a location catalogue that includes a large number of buildings belonging to the modern movement.

We have centred on Spain, but the situations and actions analysed along these lines can be extrapolated to other geographical contexts.

5. CONCLUSION

The market for films, series and documentaries has significantly expanded in recent years, mainly due to the growth of viewing platforms. This shift in paradigm is coupled with the rise of screen tourism, which attracts more and more people every year. Therefore, film directors are no longer only looking for places to film, but 'places' are looking for directors to film in them.

This situation provides an opportunity for the dissemination of the modern movement, and its buildings are a resource that can be advertised through Film Commissions. Soon, these buildings will become places to visit, not only for architecture lovers but also for consumers of screen tourism. Let's not miss this opportunity: LIGHTS, CAMERA, ACTION! ■

STIMULATING HISTORICAL IDENTITY THROUGH ALTERNATIVE MEDIA

EMMA VERONESE
ALMA MATER STUDIORUM UNIVERSITY OF BOLOGNA, ITALY

ABSTRACT

This contribution is based on the topic of memory and the factors required to develop it. From this premise, it questions if visual media can be used to stimulate the formation of identity values in any audience and consequently contribute to spreading the culture of protecting and preserving Modern heritage.

A prior survey showed that there is a vast literature on the socio-emotional effects of using modern media to convey information: Films and TV series are two tools that have gained immense popularity in spreading culture.

Thus, to validate the actual potential of utilizing them as proper tools, the research first examined whether and how the so-called architect-educators - among them enumerated Bruno Zevi and Paolo Portoghesi - exploited visual media. A critical analysis was subsequently made of a selection of historical films and recent single and serial screenings that have had a beneficial impact on the consideration of certain architectures of the Modern.

Several common characteristics emerged from the investigated cases that led to the effective operation of the aforementioned means for teaching purposes. To name a couple of instances, the visual media must be part of a more structured project integrated by other media; it also turned out to be crucial for the subject of the architectural-urban focus of the film or TV series to be present in the narrative for a significant part of the plot, or at least during pivotal moments.

Therefore, through these exemplified expedients and others discussed in the text, the present study documented that a didactic-pedagogical exploitation of visual media not widely considered for this purpose is possible and advisable. This alternative use, while having to be appropriately synthesized from the knowledge of educators, sociologists and psychologists, can succeed in stimulating an identity-cultural recognition of cultural heritage even in ordinary people.

1. INTRODUCTION

In Italy, historical memory and identity are very heartfelt issues and are almost always accompanied by the concept of their preservation and enhancement.

This tradition is certainly linked to the Italian centuries-old culture of history and restoration, but also to the richness of cultural and natural heritage[1].

However, historical assets must be considered as dynamic resources to adapt their fruition to the wide development of society[2].

Indeed, even Italian popular culture recognizes historical monuments and architectures, but modernist and rational works have not yet been perceived as historical. This occurred undoubtedly because of the tardy identification from around the world, even by specialists, of the Modern as a relevant heritage to be preserved: this recognition can be dated to 1956, when the first reaction for the protection of a 20th-century building occurred. Specifically, the intervention concerned the Casa del Fascio of Giuseppe Terragni by Ernesto Nathan Rogers[3], even though other previous events had commenced the protection of modern heritage: UNESCO was formed in 1945, and in 1987 the first modern area was included in the list of World Heritage Sites[4].

Recently, two mediums of knowledge that are becoming increasingly popular and can be employed positively by educators to reactivate interest in modern architecture are films and TV series[5]. Indeed, from a first visual attraction, a beneficial interest in the cultural heritage can arise.

Several sociologists and psychologists, including McLuhan[6], have already advanced studies on the employment of visual media as a vehicle to intensify, enhance or promote specific initiatives.

More recently, psychologist and psychotherapist Giuliana Bruno has intersected architecture, visual arts and media in her research[7], demonstrating the power of emotions generated by an appropriately constructed visual media.

2. ARCHITECTS-DIRECTORS AND DIVULGATION OF CULTURE

As expressed by Wolfgang Schivelbusch[8], the birth of cinema appears to have influenced a shift in architectural styles during that time, which emerged to be both directed towards movement and more concerned with its aesthetic appearance.

This change is not accidental, not least because, as historian Sigfried Giedion[9] writes, with cinema arises an immediate awareness from the architect's perspective of its potential use.

Indeed, remaining primarily in the close sphere of architectural connoisseurs, several known architects have promoted the employment of visual media both for spreading knowledge, for self-advertising and as a medium for understanding reality[10].

An emblematic example is Bruno Zevi, who in his well-known writings repeatedly explained the potential of visual media, with a particular predilection for cinema to fully understand the fourth dimension of architecture[11]. Moreover, among the effective didactic methods to explain the history of architecture, in a *Bianco e Nero*[12] magazines' article, he again defined cinema as an irreplaceable medium.

12. Bruno Zevi, "Architettura per il cinema e cinema per l'architettura" in *Bianco e Nero*, 8, 1949, 60-63.

Architect Paolo Portoghesi perceived visual media with a different purpose: as an opportunity to disseminate his idea of architecture, but, at the same time, as vehicles to spread the word about politics and to emphasize the importance of knowing history[13].

Beyond that, the postmodernist architect encouraged the making of the film *Il Dramma della Gelosia* with director Ettore Scola in *Casa Papanice*[14], a villa he designed, which thus gained visibility and was also recognized as a cultural asset by the local inhabitants.

3. ORDINARY PEOPLE AND VISUAL MEDIA

The film *Il Dramma della Gelosia* shed light on the fact that popular cinema had, in the past, already influenced people's consideration of specific places in their daily lives. Therefore, to understand how to manage and re-propose this way to promulgate knowledge, it is necessary to analyse some historical and recent cases by focusing on certain useful strategies that emerged in these episodes. Furthermore, it is crucial to understand what image was conveyed in the analysed case studies, and what effect it had on the target audience.

3.1. HISTORICAL CASES OF EFFECTIVE VISUAL MEDIA

Beginning with a film by the previously appointed director Ettore Scola, namely *Una giornata particolare*, this masterpiece has provided visibility to Mario De Renzi's convention house in Viale XXV Aprile in Rome: in particular, architecture represents the archetype of social housing[15]. This is because the director wanted to emphasise the historical importance of this large complex of subsidized houses, which was the first example of partnership between the state and the private sector, realised as part of a strategic social housing plan in Rome.

The success of the film and the contribution it had in bringing the population to accept this atypical building are certainly linked to the presence of actors who were already famous in those years: in fact, Marcello Mastroianni had already received an Oscar nomination for *Divorzio all'Italiana* (1961) and Sophia Loren had starred in several films directed by De Sica[16]. Furthermore, De Renzi's house is always present throughout the narrative and almost the entire story takes place there, giving the building a starring role.

Another movie that represented modern architecture and made it an icon recognised everywhere is *Le Mépris* of 1963. Director Jean-Luc Godard combined some unbeaten characteristics and achieved a masterwork that made Italians and internationals alike acknowledge Villa Malaparte in Capri by Adalberto Libera **(Fig. 1)**. First, the film is based on the homonymous book by the writer Alberto Moravia, which ensured an initial common ground in the imagination of Italian people when they approached the movie[17]. Secondly, the presence of actress Brigitte Bardot at the height of her career[18] stimulated popular interest in the projection.

A final aspect that should certainly not be overlooked is that the turning point of the story is set in the villa, with shots carefully planned by the director to accentuate certain compositional features of the building.

13. Silvia Micheli, and La-Catherine Szacka, *Paolo Portoghesi: Architecture Between History, Politics and Media*, 55-88.

16. Two famous examples are *La ciociara* (1960) and *Ieri, oggi, domani* (1963).

17. Massimo Casavola, *L'attore di pietra: l'architettura moderna italiana nel cinema*, 69-73.

18. In fact, she had already become famous after the film *Et Dieu...créa la femme* (1956) by Roger Vadim.

Such a decision is mainly intended to bring out the symbolic sense of the conflicting relationship between "classical" and "modern"[19].

Moreover, paraphrasing Gaston Bachelard[20], the image of the house becomes a representation of the character of the story's protagonists: luxurious, but empty and isolated.

3.2. NEW CASES OF EFFECTIVE VISUAL MEDIA

Recently, perhaps considering the current impact of films and TV series on society's consciousness, the Nippon Foundation has pushed for the collaboration of the well-known film director Wim Wenders with the city of Tokyo, who, to give positive notoriety to the public facilities designed by famous architects such as Tadao Ando, made them co-protagonists of his new film *Perfect days* of 2023 **(Fig. 2)**. This film is one of the pieces that compose the more complex urban regeneration project called *The Tokyo Toilet*[21] and encompasses all the aspects that have emerged from the effective historical cases discussed: in fact, the entire narrative takes place around the small buildings in the foreground, a famous director was chosen and the lead actor, Kōji Yakusho, is recognised as one of the top talents among Japanese actors today.

Yet another modern-day instalment is Denis Villenueve's latest film, *Dune: Part Two*. In this case, the modern architecture presented is the famous Brion Memorial by Carlo Scarpa. The sacred image of the Brion complex, originating from Scarpa's multifaceted culture, is functional in representing the home of the emperor and the esoteric sisterhood group, both of which play a key role in the story.

Although the tomb has been represented extensively through videos and known photographic collections[22], the film event has encouraged a season of popular rediscovery of the Modern memorial. The reasons for this revival are linked to the presence of prominent actors on the current scene, including Timothée Chalamet and Zendaya Maree Stoermer Coleman. In addition, many notable online magazines published articles explaining the movie, but also giving specific historical overviews of Carlo Scarpa's architecture[23].

Regarding the TV series phenomenon, they are increasingly becoming a global cultural fact that should not be underestimated as a means to direct the spreading of culture, also due to their ability to create strong identity groups[24].

A recent series that brought some of Rome's buildings to the small screen is *Devils*, filmed between 2020 and 2022 during the Covid-19 pandemic. This work, which is structured in two different seasons, is filmed partly in the first season and largely in the second one in the Eur district of Rome, with several shots of the modern *Palazzo della Civiltà Italiana* and of the building dubbed "La Nuvola" of Massimiliano Fuksas[25].

Architecture once again co-stars on the scene and is functional to underline the megalomania of these businessmen who have lost their perception of the world around them.

The success and international spread of the series are surely linked to the presence of Alessandro Borghi in the lead role and Patrick Dempsey in the cast, both already well-known actors from television[26].

26. Since 2017, Alessandro Borghi has achieved success as the protagonist of the series *Suburra*, while Patrick Dempsey rose to fame with the series *Grey's Anatomy*.

4. EDUCATING THROUGH VISUAL MEDIA

It is essential to highlight potential methods that emerged from the analysed cases which can be used by cultural educators.

As Bruno Zevi pointed out[27], using movies to explain architecture to both ordinary people and professionals can be an excellent resource, but it must be guided by an explanation aimed at making the audience focus on the most important aspects of what is being displayed. Taking the screening of *Delta*[28] in 2023 as an example, the projection in several Italian locations was preceded by a short introduction and followed by a final discussion by the director Michele Vannucci, which was necessary to provide an exhaustive interpretation of the film.

In addition to this, the impact on the population of the historical films previously mentioned shows that the big screen is a viable way to spread knowledge about the architecture of the Modern, - more than documentaries - but it is also necessary to correctly structure this method of distributing knowledge.

First, as the symbolic initiative of *The Tokyo Toilet*[29] project shows, the film should be placed in a more organised system of culture dissemination, to provide both an initial visual-suggestive impact on the audience, and a further conceptual deepening beyond the mere viewing of the film. For this specific matter, the Nippon Foundation has set up a site dedicated to the regeneration project and conveyed the spread of the architecture through the notable channel of the magazine *Domus*[30].

For visual media to be effective in stimulating knowledge of modern and historical architecture, they must have certain characteristics that have surfaced in the present discussion, namely:

- being based on a book that is already established in the knowledge of the common public
- being managed by an experienced director
- to feature one or more famous actors
- within the footage, having the architectural elements to be highlighted by being showcased prominently.

In addition, further control must be made on the socio-emotional effects that images of architecture and their symbols will produce on the audience. This impact should be well-thought because every architecture has as its final aim the communication of a message, a symbol or a specific idea[31].

Moreover, TV series that present before each episode an initial part with the theme song and a recap of the previous episodes, are suitable for the possibility of introducing an initial screen with specific focal data of buildings and places where filming takes place.

The seriality and plot continuity in TV series stimulate the audience's collective identity and memory[32] and bond with the main characters and portrayed places: there is still untapped potential that needs to be explored to better implement these tools to enhance care and respect for heritage.

5. CONCLUSIONS AND POSSIBLE DEVELOPMENTS

This contribution is based on previous sociological studies that have seen the potential of visual media, but also the possible negative effects of the power to convey a certain image[33].

However, several past and recent cases examined demonstrate that visual media such as films and TV series can be used for educational-didactic purposes, without them becoming documentaries or lectures.

Using and displaying modern architecture are fundamental actions to set in motion an initial cultural recognition in people, but it must be carried out by educators who can foresee and control the possible impact of visualisation in society.

Considering studies that have linked architecture, visual arts and media[34], it is necessary to synthesise these within the visual educational product that is created and distributed. In this way, it will be possible to foster a sense of historical awareness in the community and achieve a first step towards universal protection of heritage.

To conclude, it therefore falls upon those educating present-day professionals, students, and individuals in society the responsibility to overhaul current methods of education in order to instil a rejuvenated appreciation and regard[35] for not just the Modern, but also our vast cultural and natural heritage. ■

BIOGRAPHY

Emma Veronese has been an Architect and a doctoral candidate in Architecture and Design Cultures at the University of Bologna since 2023 and she is interested in Architectural and Urban Composition. She graduated with honours in Architecture at the IUAV University of Venice in 2022 and her master's thesis acquired a special mention for the "Marina and Vittorio Gregotti Award" in the same year. After degree, she obtained the professional licence and from 2022 she is catalogued on the register of Rovigo, her birthplace. Here, Emma collaborates with her colleagues for coordinating educational activities and organizing cultural events.

TOWARDS A NEW METROPOLIS: THE MACHINIST UTOPIA IN URBANISM AND CINEMA

LUCIANO DE TOPIN RIBEIRO
PROPAR – UFRGS – FEDERAL UNIVERSITY OF RIO GRANDE DO SUL – BRAZIL.

ABSTRACT

The years between the two great wars of the 20th century meant to architecture — and to architects — assuming a leading role in thinking and proposing the cities. The intellectual avant-gardes of the early twentieth century, thrilled by a fast-changing world, saw mechanization as the catalyzer of transformations that would bring a new balance to the relation between humanity and environment, when reason would soothe the degenerating conditions of the industrial metropolis. The Machinist Utopia is metropolitan; the changes should take place within the metropolis and its future was the subject-matter upon which the modern movement structured its discourse. This paper reflects upon the Machinist Utopia rhetoric discourse in urbanism, through a parallel with selected fiction films of the same period. That discourse was based on the urgent demand for change ahead of the imminent catastrophe that would take place, either as consequence of technological advances or result of one's inability to adapt to it. Fear – a rhetoric fallacy — is the argument towards which the rhetoric tools that structure this study — pathos, ethos and logos — are applied. Through pathetic associations the avant-gardes instilled values to the image of "machine" to state its ideological standing-point and put it into practice. This new city, designed for a new man, would be the synthesis between rationalism and *spirit of the time*, the cause and the consequence of elevated human spirit, and the only possible alternative to extermination. And the modern architect would be the hero who helps humanity cross that threshold.

1. PRELUDE – "THE MACHINISM DISTURBED EVERYTHING"[1]

> *To 'let go of oneself,' to 'remove from oneself' a customary equilibrium and conditions, and to pass into a new condition—these are effective conditions of every work of art*. Sergei Eisenstein[2]

Contrary to the vision depicted in the dystopias of sci-fi cinema of the time, the avant-gardes of the modern movement saw in the discourse on the machinist metropolis an instrument to transform all systems linked to the past, which would lead to the consolidation of a modern, enlightened and just society. The discipline of architecture would be protagonist in modern society and the only possible choice for the future: "architecture or revolution."[3]

The parallels proposed here seek narrative convergences between urbanism and fiction cinema of the interwar period. We list productions that speculate about the future of the machinist metropolis, featuring the machine as agent of transformation, and tell stories about the radical social changes underway in the period of study. Likewise, the urban proposals studied are those directly involved in the discourse and action of the machinist utopia, object of manifestos and prototypes by the avant-gardes of the modern movement.

1.1 URBANISM

The inherent ideological character of the "science" of urbanism lies in the interdependence between sociological — and philosophical — thought and the possibility—and certainly the necessity—of action in emerging cities. Despite being rationally grounded on data, calculations, research and drawings, the urban formulations that sought to account for the industrial metropolis presupposed value systems of personal nature. They were "truths" rationally constructed on passions, polarized between enthusiasm for the new machinist reality and a fervent impetus to return to the past; both approaches being object of numerous proposals for the ideal city.

> *For Françoise Choay:*
> *The city, a cultural fact but semi-naturalized by habit, was for the first time the object of radical criticism. Such questioning could not fail to lead to inquiries about the foundations. The presence of the city was then replaced by its own idea. And, after having qualified the existing urban order as disorder, efforts were made to oppose it with ideal orders – models - which are, in effect, rationalized projections of collective and individual imaginaries*.[4]

Room is then opened for the arbitrary and for a passionate discourse, at first true pieces of utopian fiction but, soon after, turned into active and concrete propositions, supported by the due logical arguments and with practical consequences for the future of cities.

2. Sergei Eisenstein, *A Forma do Filme* (Rio de Janeiro: Jorge Zahar, 2002), 153.

3. Le Corbusier, *Precisões*, 191.

4. Françoise Choay, *O urbanismo: utopias e realidades* (São Paulo, Perspectiva, n/d), 50.

1.2 CINEMA

In spite of its origins as funfair attraction, where everyday actions - filmed with steady cameras in single shots - were projected in front of enraptured audiences, cinema was raised by the avant-garde intellectuals of the early twentieth century to the condition of artistic manifestation of the machine age: a radical change in the perception of reality resulting from the manipulation of parts — mediated by mechanical and technological systems — that could be edited, reproduced, manipulated and charged with pre-established meanings with convincing effects. Therefore, for Walter Benjamin the work of art, "(...) Instead of being designed based on a ritual, is based on another practice – politics."[5]

2. PATHOS

> *Pathos (…) shows its effect when the viewer is compelled to jump in his chair. When it is compelled to fall when standing. When he is compelled to applaud, to scream. When the eyes are compelled to sparkle with satisfaction, before shedding tears of satisfaction... In short, when the viewer is forced out of himself*. Sergei Eisenstein.[6]

For Eisenstein, a pathetic compositional structure is an effective means of portraying an attitude towards a fact to be displayed, how the author relates to this fact and how "(...) he wants the viewer to receive, feel and react to the fact portrayed. (...) The decisive factors that structure the composition are taken by the author from the basis of his relationship with the phenomenon"[6]. For him, the editing of isolated shots – with previous adjustments of angle, light and scale – is the main means for a creative transformation of the static rigidity of a frame into a narrative with intellectual content seeking empathy and persuasion.

2.1 PARS-PRO-TUTO

The modernist avant-garde architects, constructing this intellectual narrative, sought to manifest, in a single object, the rules of the new architecture; trying to make the modern metropolis perceived as a real and complete experience.

The filmography aligned with the artistic avant-garde, used symbol-objects that evoked its icons whenever necessary to represent the unknown, that key element of the future that introduces change into the plot. The extreme focus on details reveals the rhetorical force of these images, but also a lack of material of the present to represent the future as a convincing whole. By pathetically inserting elements of the machinist ideology in the filmic narrative the cinema of the period propagates its vision of the machinist metropolis.

2.2 FAST & FURIOUS

The Futurist city would be the ultimate victory over nature. Dynamos, towers, and power stations of monumental scale shaped the landscape. Despite the buildings in Sant'Elia's renders appearing gigantic and perennial, the city would last a generation to be annihilated, so that a new city could be built over it, in a permanent process of transformation.

5. Walter Benjamin, *Transcription of speech: The work of art in the age of mechanical reproduction* (UCLA School of Theater, Film and Television 1936; transcribed by Andy Blunden, 1998).

6. Sergei Eisenstein, *A Forma do Filme* (Rio de Janeiro: Jorge Zahar, 2002), 153.

The radical ideals of the Futurism, inspired by the speed and strength with which industrial elements claimed the urban landscape; turned the artistic avant-gardes to the aesthetic possibilities of the machine, be it the harbinger of a free and progressive society, in which "(...) nothing (...) is more beautiful than a power plant teeming with activity, retaining the hydraulic pressures of an entire mountain range and the electrical energy for an entire landscape (...)"[7] - or of man's total subservience to technology.

L'Inhumaine's[8] sets, designed by Mallet-Stevens, host the dispute between two rivals for the love of soprano Claire Lescot. On one side, Einnar Norsen, the engineer-hero; on the other, Maharajah Djorah. Clair is murdered by Djorah, and Norsen's supreme invention is revealed: a machine to revive the dead.

The characters are faced with dangers and uncertainties whenever they exchange modern paradises for the traditional city. The tension is given by superimposition, accelerated cuts of the sequences and panoramic shots show a steaming city as background for a speeding car; the very landscape of Futurism.

The engineer wins the dispute, modernity wins over the old, and Clair raves about a dynamic Paris of factories and fast trains. The maiden is saved, and sings broadcasted to the world. "For all mankind" — the film's final subtitle — the engineer took all the risks.

3. ETHOS — TABULA RASA AND RESURRECTION

World War I — and the numerous conflicts unleashed to accommodate the changes in the geopolitical order — turned into a real catastrophe the fear that had long been felt in the form of epidemics, famine, bankruptcies, urban violence, and moral degradation. This scenario of crisis, treated by the intellectual avant-gardes as a call for a rupture with the "old" aesthetic and values is essential for understanding the modernist idea of utopia. The modern urban vision is proposed in terms of an impasse between salvation or damnation[9], it's the very rite of purification that society must go through to carry out the great transformation that the modern era imposes.

In Metropolis[10] Fritz Lang films the machinist society and the tensions that would lead to proletarian revolution and transformation. The threatening future in a tragic mechanized world is avoided by the brain-capitalism united to proletarian hands with the intermediation of the heart - ideals of justice and freedom - moved by Freder's love for Maria.

Lang's visit to New York in 1924 brought him an enthusiasm for the skyscraper, an icon of the virtues and vices of industrial society. Although aware of the urban ideas of the modern avant-garde, he sets his story of forbidden love and proletarian revolt in a metropolis of decadence, fear and disappointment; an urban landscape dominated by a single massive skyscraper, ambiguous representation of both rapacious capitalism and the creative capacity of a weakened Germany.

Meanwhile, across the Atlantic, the future is bright. The metropolis in Just Imagine[11] incites opportunity and social ascension for an America in crisis. The film portrays an ultra-modern, healthy and happy metropolis. A typical American citizen of the recession years awakens in the future to find

10. *Metropolis*, dir. Fritz Lang, screenplay by Thea von Harbou, sets by Otto Hunte, Erich Kettelhut, and Karl Vollbrecht (Germany: Universum Films AG (UFA), 1927).

11. *Just Imagine*, dir. David Butler, screenplay by DeSylva, Brown, and Henderson, sets by Stephen Goosson (United States: Fox Film Corporation, 1930).

a radiant New York, with traffic on several levels and immense, spaced apart, skyscrapers, shining with electricity.

If Metropolis depicts the concerns of the European avant-gardes with the threats and opportunities in aesthetics and society, source of transformative content, Just Imagine is pragmatic and delirious. The machinist utopia in its North American version does not seek the transformation of society based on a collective and intellectual order. Rather, it's based on individual ventures according to the rigid norms of the market. The path to resurrection is through prosperity and profit, in the name of which all technological efforts must operate as parts of the spectacle of progress.

4. PATHOS, ETHOS AND LOGOS — TOWARDS A NEW METROPOLIS

> *Now we have reached the fatal moment in the historical cycle when our sentimental impulses must be seen as identical with the rule of reason*. Le Corbusier.[12]

The modern city would be the habitat of a new individual, freed from archaic pettiness and daring enough to overcome the necessary disruption the world had been exposed to. Efficient and sublime, this city would be a perfect symbiosis between humankind, its deepest desires, and the true, fair and unquestionable scientific facts.

While Gropius and Hilberseimer traced the lines of the city planned to maximum performance; for Le Corbusier the city of the machine age is pure manifesto, it goes beyond pragmatism. The individual who inhabits this radiant city finds fulfilment watching from the window the splendour of the modern world. In perfect coexistence with nature, walks in green fields, among geometrically harmonious buildings, exercises, works and lives in a pristine environment. The aesthetics of the machine is an efficient manifestation of what is simple and pleasing to the human eye. Buildings are clear plastic facts, things are in their place, and the individual is free to seek the sublime.

4.1 WHICH SHALL IT BE?

Things to Come[13] tells a story of war, transformation, and the conquest of nature through technology and science. Everytown, ravaged by a war, suffers with disease, poverty, and a degenerated society until the arrival of a stranger in his ultramodern plane. He leads an attack of the Freemasonry of Efficiency, dropping peace gas bombs, and Everytown is free and ready for reconstruction.

Although Le Corbusier turned down the invitation to design the film's sets, Korda used many of the ideas from Towards a New Architecture to set the Everytown of 2036. The enthusiasm for technology and reason is portrayed through an aesthetic that no longer refers to smoke and steel, but rather to the lightness of Dom-ino structures and glazed planes, hygiene and health. The machinery and architecture here are crystal-clear and, over the rubble of the historic city, the radiant future emerges.

12. Le Corbusier, *Por uma arquitetura* (São Paulo: Perspectiva, 1971), 37.

13. *Things to Come*, dir. William Cameron Menzies, screenplay by H.G. Wells, sets by Vincent Korda (UK: London Film Productions/ United Artists, 1936).

Figure 3. King Vidor, The Fountainhead, 1949. A building has integrity, just like a man. © Metrograph via https://www.thecollector.com/fountainhead-ayn-rand/

#22

5. EPILOGUE

(Architect)A building has integrity just like a man, and just as him it must be true to its own idea, have its own form, and serve its own purpose.
(Client)-But we can't depart from the popular forms of architecture.
- Why not?
-Because everybody's accepted them.
- I haven't.
-Do you wish to defy our common standards?
- I set my own standards.
- You intend to fight against the whole world?
- If necessary.[14]

The hero is the central figure of the founding myth, upholds the moral and ethical values and points the way. He personifies the rite of passage, takes the

risks and triumphs. Moved by the impulse to re-establish balance in the face of adversities of a new reality, salvation is revealed to him. He is not a demigod; the modern hero is an ordinary individual.

Freder selflessly fights the villain-machine with determination; Norsen's inventions bring back to life, out of love, the victims of the archaic world; a fearless John Cabal rebuilds Everytown from the ruins. In all cases, the hero's motivations lead the rhetorical structure in search for the audience's empathy.

The modern architect is a hero in service of the cause of architecture. In The Fountainhead he defies men of common sense using only his integrity, architecture and a handful of dynamite. For Howard Roark[15], architecture is not subject of negotiation; it contains the higher truths. Roark holds the key for transformation, fulfils the ritual of sacrifice, and triumphs. The script for The Fountainhead was written in 1934, with references to architecture and architects of the time and greatly contributes to the image of the architect as an indisputable artist, whose genius must be understood to unveil the mysteries of salvation through architecture.

5.1 THE END

The intellectual interwar avant-gardes saw, in that moment of transformation, the inadequacy of the physical and cultural structures of the city to deal with the machine age. The machinist city had its founding myth: in face of that decaying and threatening reality, transformation should come to make humankind and society egalitarian, healthy and free. The plots of the filmography presented here are structured on this same logic: an unbearable situation faced with the imminence of disaster requires urgent action: a rite of passage personified in the figure of the hero.

It's, therefore, possible to identify convergences in the rhetorical structure of the modern discourse on the future of cities: the pathetic linking of transformation and change to the image of the machine and the machinist city; a system of desirable values that would condition these transformations; and the logical developments the new condition would bring about.

If that discourse appealed to reason to justify the *tabula rasa* as necessary to make cities where humanity would reach plenitude, soon the world would face real need for reconstruction. In the years following 1945, modern urbanism would both, blend into the traditional European urban fabric, and arise worldwide in the form of *ex-nihilo* experiences. But that's another story. ■

14. *The Fountainhead*, dir. King Vidor, screenplay by Ayn Rand, sets by Edward Carrere (USA: Warner Bros., 1949), extract, 00:10:29–00:13:16.

15. Protagonist of *The Fountainhead*.

EXPERIENCES OF MODERN SPACE IN THE CENTRAL VALLEY OF CHILE

GLENN DEULOFEU
UNIVERDIDAD DE TALCA

ABSTRACT

The Central Valley of Chile, stretching from Santiago to the Biobío River in the south, is a region deeply rooted in rural tradition that has been fundamental in shaping the nation's character. Throughout the 20th century, various modern architectural works emerged in this area, revitalising living spaces to adapt them to the contemporary era, drawing from both global and local dimensions. This transformation led to innovative spatial experiences, particularly in how new architecture directly engaged the senses, breaking free from figurative and classical conventions. Consequently, the sensory nature of the human body became a fundamental concern for architectural conception and recognition, now essentially defined through an interplay of forms, dimensions, proportions, textures, colour combinations, luminosities, etc.

Different authors believe the emphasis on visual stimulation from early modern production also paved the way for a multisensory unfolding of spatial experiences. These arguments support the notion of sensory intellection as an appropriate method for gaining a deeper understanding of the works of modern architecture in this specific region of Chile.

The audiovisual record presented here is relevant to the topic at hand, as the inherent sensory intellection of these works has been captured, reproduced, and interpreted through fifteen micro-documentaries comprising the project "Experiences of Modern Space in the Central Valley of Chile." The digital format of this unprecedented audiovisual series has expanded the reach and dissemination of these works, allowing them to be shared beyond their ancestral locations.

This writing presents the main conclusions derived from the aforementioned sensory intellection process, which reveals at least five types of characteristic spatial experiences of modern architecture in this remote territory, demonstrating equally significant levels of consistency.

1. INTRODUCTION.

The Central Valley of Chile, a geographical area stretching from Santiago to the Biobío River, constitutes a territory steeped in rural tradition, which is even attributed with the foundational character of the country[1].

In the 20th century, modern architectural works began to emerge in various points of this unique geographical area, updating the way in which architectural spaces were experienced, engaging its inhabitants in a dialogue with a universal impulse and the local circumstances shaping the works[2].

This transformation of spatial experience, which began to unfold in this traditional region of Chile, brought with it a way of stimulating the senses that was very different to that provided by the rooted classical culture. Figurative associations and normative conventions regarding how constructions should be were giving way to a freer conception of architecture. This new approach recognised the sensory nature of the human body as a central factor in its configuration. As a result, architectural works became more of a system of interrelated forms, spaces, light, textures, colours, balances, etc.; all coherent with the sensory parameters common to all people.

The aforementioned theme and the primary works of modern architecture representing it have been showcased through the project "Experiences of Modern Space in the Central Valley of Chile." This project consists of a series of fifteen micro-documentaries that capture and interpret these spatial experiences, extending their influence beyond their atavistic physical locations[3].

2. SENSORY INTELLECTION AS A METHOD.

The realisation of the project has entailed the theoretical and empirical development of a methodology proposed here as an approach consistent with the intrinsic sensory condition of modern architecture.

The strong emphasis on stimulating the sense of sight, which became implicit with the advent of modernity, can be summarised in the words of Julius Lessing after visiting the World's Columbian Exposition in Chicago in 1893:

> *There we saw utensils created with the same spirit as our railways, ships, and cars, utensils whose form derives directly from the material and the technique, and developed with such clarity that they no longer address the calculating intellect, but speak directly to the eye and provide it with that pure and full pleasure that we understand as beauty*[4].

This emphasis on visual elements in the early stages of modernity is also endorsed by Helio Piñón, who in his writings elaborates on the idea of visual intellection, understanding it as "a very acute visual intuition that mobilises intelligence"[5], a concept that would be valid both for the artistic creation process and for the type of reaction that occurs when contemplating the result of such creation.

Juhani Pallasmaa, on the other hand, while recognising that predominance of the sense of sight and following the theoretical production of many other authors, particularly that of Maurice Merleau-Ponty, maintains

1. José Bengoa, "Central Valley of Chile: Imaginaries, Interpretations, Reveries," in *A Contracorriente*, ed. Andrea Griborio and José Luis Uribe (Ostfildern: Hatje Cantz Verlag, 2016), 35.

2. Glenn Deulofeu, "Universality and Its Circumstances: Three Maulino Dialectics," *Universum* 32, no. 2 (December 2017): 47-61.

3. Glenn Deulofeu, "Experiencias del Espacio Moderno en el Valle Central de Chile," Universidad de Talca, https://www.eemvcch.cl/#/.

4. Sigfried Gideon, *Space, Time, and Architecture: The Origins and Development of a New Tradition* (Barcelona: Editorial Reverté, 2009), 348.

5. Helio Piñón, *Theory of the Project* (Barcelona: Ediciones UPC, 2006), 86.

that "the eye collaborates with the body and the rest of the senses..." and therefore "... every moving experience of architecture is multisensory"[6].

Given the aforementioned, and paraphrasing Piñón, we have sought to implement a methodology that could be called sensory intellection, and therefore, enable a sharp sensory intuition capable of mobilising intelligence, producing a deep understanding that goes beyond words.

In this sense, the audiovisual format with which the fifteen works that compose the project are recorded and interpreted is consistent with the issue at hand, as it assimilates visuality, sound, and a wide range of movements, factors that, interrelated, make up the essence of the spatial experiences presented in the project.

This method encouraged the filming of works without a previous script, so as not to interfere with the spontaneous experience of the spaces. This allowed the architectural qualities that emerged in the moment to guide the shot selection. The same intuitive approach was applied to the subsequent editing of the audiovisual pieces, structuring them in coherence with the sensory intellection that developed as the fragments were presented.

Regarding the shots, we could say that they are connected to the visual tradition established by Julius Shulman. This includes humanising the image, emphasising frontal vision, the considering the formal axes of the work, accounting for various depth planes of the image, and using perspectives such as high and low angle without distorting the parallelism between the vertical delineations.

Below, the most essential aspects obtained through the process of sensory intellection delivered via the spatial experience of each of the works will be exposed. These aspects are grouped into five types that reveal an unprecedented and characteristic understanding of modern architecture in the Central Valley of Chile. These results are guaranteed by the selection of works, as they represent the most representative sample of the spatial and functional diversity that is still valid throughout this territory today.

2.1 BETWEEN FULLNESS AND EMPTINESS

Most of the modern spatial experiences depicted in the micro-documentaries[7] occur under the influence of the interrelationship between the clear definition of volumes, which we will understand as fullness, with open spaces that we will understand as emptiness.

The EMPART Building in Talca (1954) is noteworthy for its design as an extensive passageway under a longitudinal residential block that crosses and communicates a central block of the city from side to side. This route is flanked on either side by a series of smaller residential blocks, whose absence allows for a connection with small squares and gardens. The sensation of an intimate habitable world in the heart of the city is enhanced by the sound barrier produced by the volumes at the ends, which isolate the noise produced by vehicular movement, making the birdsong, rustling leaves, and the voices of neighbours inside the complex stand out all the more so.

6. Juhani Pallasmaa, *The eyes of the skin. Architecture and the senses* (Barcelona: Editorial Gustavo Gili, 2014), 52.

7. All the buildings named hereafter have been featured in each of the micro-documentaries in the project. Experiencias del Espacio Moderno en el Valle Central de Chile, directed by Glenn Deulofeu (Talca: Escuela de Arquitectura de la Universidad de Talca, 2017-2021), https://www.eemvcch.cl/

In contrast, the Fernando Lezcano High School in Curicó (1975) features a covered passage under a spacious horizontal roof, from which elongated classroom blocks hang towards one side, separated by pockets of vegetation where the sounds of birds and those typical of school activity prevail. This changes abruptly during breaktime, when students spill out into the schoolyard and fill the space, taking assertive possession of the voids that were on the opposite side of their classrooms.

The Talca campus of the University of Chile (established in 1967, now the University of Talca) was built on agricultural land outside the city, and completely detached from its urban fabric. The marked centrality of the square on which a series of university function volumes hang and rotate still offers a spatial experience rich in latent relationships that become evident when users circulate or stop there.

The smaller-sized Hotel Turismo (1960) is located in a bustling area of Linares. It enhances the surroundings of Plaza de Armas by featuring a small commercial plaza and pedestrian passages on the ground floor. It is possible at all times to appreciate how the network of elements provides a rich architectural pattern to those who pass by while also promoting the systematisation of more hermetic surfaces on the upper floors, in line with the original functionality of a hotel.

This collection of works is completed by a relevant building, as it meant the construction of the first tower in the city of Talca at that time: the Lircay Building (1975). Unlike the previous cases, the experience of inhabiting between fullness and emptiness is expanded to its vertical dimension. The commercial building's rooftop, typical of the slab-tower typology, originally functioned as a community plaza and now provides a rare vantage point to appreciate the city and its lively commercial life. The experience of the spaces deployed throughout the vertical axis of the building is constantly offered to whoever enters the building, as it is the volume of the tower itself that opens up to create a connection among all its common spaces, while at the same time it provides a panoramic view of the city's southern area.

2.2. PERMEABILITIES

This group of buildings reminds us of a very recurrent spatial experience in many modern buildings. It features three different versions of that dematerialisation on the ground level, where the row of pillars is left in front of the enclosure plane, creating a transitional space between the exterior and the interior.

The Cauquenes Municipal Building (1947) offers extensive corridors that open up to public space, breaking up the predominantly opaque constitution of the volume behind it, creating a stimulating connection between the built form and the citizens of Cauquenes. It offers shelter from the sun and rain, as well as providing a space for people to chat, or simply pass through the forest of white square pillars.

The CORVI Building in Talca (1964) on the other hand, offers a more refined and comprehensive design regarding the passage between the interior

of the building and its immediate surroundings. A row of pillars extends towards the street made up of thin tubular steel elements, alongside an independent, glazed enclosure plane in the upper section. All these elements perceived simultaneously by a body in motion, create a significant urban experience for Talca, as the linearity of the street is greatly expanded in multiple directions, juxtaposing various forms, planes, chromatisms, textures, sounds, etc. It is worth noting that the superimposition of the two housing blocks that exist above this interconnected space only serves to emphasise the spatial complexity outlined above.

To complete this group of works, the main building of the former FIAT facilities in Rancagua (1967) is now used for another type of industry. Despite the change in use, it retains the original design and layout. The administrative area building is particularly noteworthy, featuring two floors and measuring approximately arranged parallel to the road. Its design seems to complement the speed and linear movement of the passing cars. The row of free-standing pillars found on the first level leaves the upper floor seemingly suspended, creating a feeling of immateriality that is enhanced by the reflection of the road activity on the glass of its continuous horizontal window that unfolds uninterruptedly along its length. Additionally, two other volumes, the workers' building and the sculptural water tower, complement the overall design and interact with the road, completing this singular spatial experience.

2.3. HYBRIDISED SPACES

This collection of works offers a rather unique spatial experience, as they both share an urban setting and similar architectural characteristics. These are buildings composed by the encounter between what seem to be two different architectural works, while together they constitute a valuable city corner.

This is the case of the former Social Security Headquarters Building in Talca (1962) and currently the University Extension Centre of the University of Talca. The building features a structural grid of regular porticoes and it is situated in the corner with another solid volume. The exterior displays curves that are both spatial and delineated on the façade. On the inside, the characteristics of both volumes tend to blend into more diaphanous spaces, currently used for the exhibition of works of art on the first level, or for cinema and theatre in the auditorium on the second level. At the same time, a zigzagging staircase unfolds into a vertical opening that articulates these two worlds, which is emphasised by the suspended linearity of its bronze handrails.

The Linares Post Office Building (1966) does the same with what could be considered the encounter of two systematised volumes, one leaning towards opacity and the other towards transparency. The intersection of these opposing elements produces a third architectural feature in itself: an access portal framed by the emergence of a staircase, a large lateral plane enriched by the texture of numerous small mosaics, and an upper lattice.

2.4. AUTONOMOUS INTERIORS

In the following section, we will review the spatial experience offered by some works consisting of the definition of a volume with autonomous characteristics, both in its formal structure and in the vigour of its interior space.

The administrative building of the Talca Match Company (1960) is essentially a box that completely opens up in its centre to produce a spacious public reception area. The dense ribbed slab covering this space provides a sensation of texture inside that counteracts the visual openness towards the outside.

This sensation of texture created by the constructive grid of the upper plane of the space becomes even more intense upon entering the San Javier Parish (1964). A stereometric grid composed of fine tubular steel elements seems to hover above the interior space, even crossing over the glazed surfaces with which it intersects on the perimeters.

A very particular and intense version of these interior spatial autonomies is presented by the COPELEC Building in Chillán (1965), which at first approach could be understood as a prism altered by various formal actions, many of which are quite visible from the exterior, and have an impact on the light, form, and spatial characteristics of the experience inside the building.

Upon entering, a zigzagging ramp with two sections leads to a small platform that allows us to contemplate the space from an intermediate height, surrounded by abundant juxtaposed elements such as double-cone pillars, embedded cylindrical skylights, or convex curvature walls. This entire spatial experience is tied together by the characteristic chromatism of exposed reinforced concrete and the textured finish created by the intentional rusticity of the wooden-board formwork. The upper beams, which support the structure,

Figure 2. Frame from the micro-documentary about the COPELEC Building in Chillán, Chile (1965) © Glenn Deulofeu.

Fig. 3, Frame from the micro-documentary about the Church of the Divine Word of Los Angeles, Chile (1958) © Glenn Deulofeu.

intersect with the peculiar pillars as if they were moorings that also manage to unify that polyphony.

2.5. WAVY ENVELOPES

These works, in addition to possessing the interior spatial autonomy previously discussed, take the resolution of their envelopes to a formal exploration that results in the undulation of the surfaces that guide the experience of space.

The Cathedral of Chillán (1960) contains its visitors through a series of catenary arches that come together in a single nave, which in turn is fragmented in its length by the linear light inputs that occur at the meeting point between the arches. Visitors can experience a variety of visual perspectives as they move, combined with the background sounds of creaking wood furniture, quiet whispers of people seeking peace for their prayers, and the distant noises from the city.

The Church of the Divine Word of Los Angeles (1958) offers a truly unique spatial experience in the Central Valley of Chile. The church features a large continuous mantle woven with fine bars of smooth steel that ascends and descends to offer a diversity of curves, marking the spaces for religious rituals. These unprecedented hyperbolic paraboloids enhance the visual and tactile experience all the more so due to their texture, which is a dense filigree that captures a layer of air approximately a handspan in height on which the fibrous plates of the roof rest.

3. FINAL REFLECTIONS

Constructed primarily between 1942 and 1975, these buildings represent the establishment of modern architectural projects in the Central Valley of Chile through predominantly public or corporate initiatives. They showcase a wide range of alternatives for inspiring their inhabitants, enhancing activities beyond mere utility.

The sensory worlds portrayed in these works may appear simple at times, as if acting in the background, while at other times they reveal great complexity, vigorously enveloping us.

Despite being physically separated, this unprecedented series of fifteen micro-documentaries has enabled us to blend different spatial realities from a sensory perspective. Both commonalities and differences can be observed through a comparative lens. This overall interconnection of forms, spaces, textures, sounds, movements, luminosities, etc., acquires a sensory entity of its own that accounts for the consistency that modern architecture reached in this remote part of the world. ■

BIOGRAPHY

Glenn Deulofeu, Architect, Ph.D. from the School of Architecture of Barcelona. Deulofeu is Assistant professor at the School of Architecture at the University of Talca, where he has been responsible for modules within the areas of Technology, Media, Context, Research, Studio, Design-Build Studio, and Degree Studio. The diversity of these topics has allowed for the integration and application in the reality of both their research and their vision of the historical and contemporary development of architecture. In this pursuit, he has focused his studies, projects, and publications on modern architecture emerging in the Central Valley of Chile.

EXPLORING LATE-MODERNIST DOMESTICITY IN A WOODEN FLEXIBLE HOUSE VERSUS A CONCRETE BRUTALIST HOUSE

ELS DE VOS
HENRY VAN DE VELDE RESEARCH GROUP, FACULTY OF DESIGN SCIENCES,
UNIVERSITY OF ANTWERP

ABSTRACT

Modernism revolutionised residential architecture with features such as transparency, ergonomic layouts, and authenticity. Yet, these ideals often clashed with the desire for cosiness, tradition, and accommodating and storing everyday clutter. In the post-war era, authenticity and domesticity became central to housing design, raising questions about the lasting value of modernist key features for residents. How did they inhabit and appreciate their homes and what modifications did they make? This study delves into the housing narratives of two iconic modernist homes in Belgium, both protected monuments located in the same street in a Ghent municipality. One architect, Jean Van den Bogaerde's 1966 home and office, contrasts with the Van Wassenhove House designed by Juliaan Lampens in 1970. Despite their differences, both houses share architectural significance. Van den Bogaerde's inhabitants embraces openness with a flexible timber-frame structure, large windows and movable floor-to-ceiling walls, while Van Wassenhove's brutalist design, nicknamed "the bunker," consists of a massive concrete volume. Despite its sealed appearance, the latter offers spatial expansiveness through split levels and an open plan. A domestic life unfolds in both houses, but in a different way. Interviews reveal how both modernist houses require a specific commitment from their occupants, even in the flexible and open wooden house. This paper explores how residents inhabited and modified these houses, using a literature review, archival research, home visits and interviews with the original residents, shedding light on the interplay between architecture and lifestyle in the modernist era. Additionally, some videos, drawings and interviews with users (dancers) who lived in the Van Wassenhove house for a weekend support the findings.

1. INTRODUCTION

Modernism just before and after the Second World War was driven by a social mission. Modernist architecture aimed to create well-equipped affordable housing in order to emancipate the masses. Rationality, functionality, transparency and sobriety were the means to do so. Rationality and functionality were achieved through the inclusion of an ergonomic and labour saving layout combined with domestic technology, transparency by open floor plans. Furthermore, underused rooms, such as the bourgeois 'parlor' or 'best room' or attic, were done away with. The modernists believed that architecture should express developments in science and technology and was a way to free people from old hierarchies. However, these ideals slowly faded away during the sixties, and made place for an architecture that connected more with its environment, the needs of the people and authenticity was embraced as a central concept.[1] As Belgian Architectural historian Geert Bekaert explained, architects realised that "architecture can only stand up for itself and propagate its own value in the play of forces that define a society".[2] This shift is also reflected internationally, with Team X serving as a turning point.

This paper discusses two late-modernist houses built around 1970 (1966 and 1970) situated diagonally opposite each other on the same street in Sint-Martens Laethem, a wealthy village close to Ghent. These were both designed by architects who were alumni and former teachers of the Sint-Luke Architecture School of Ghent, Jean Van den Bogaerde and Juliaan Lampens. Both houses are considered the architects' main masterpieces and are featured in the overview book of Bekaert[3], 1995: 138, 140-141) and protected as heritage. However, initially there not known abroad. That changed for Juliaan Lampens when a themed issue was devoted to his oeuvre in the internationally respected journal *a+u*.[4] Additionally, the work of Van den Bogaerde was published in a retrospective book.[5] Another factor taken into account for choosing these houses, is their different relation with the environment and the varying degree of flexibility. While Lampens' home, known as the bunker, is very closed-off, fixed and even withdrawn from the street, the house of Van den Bogaerde is open to all its sides and very flexible. Finally, the fact that we were also able to visit the two homes in person and able to gather data about the homes as well as its inhabitants, meant we had a pragmatic reason to select these houses. The living biographies of these houses allow us to uncover and discuss some characteristics that are inherent to late-modernism, although they belong to another strand within modernism.

2. THE OPEN, FLEXIBLE HOUSE OF VAN DEN BOGAERDE

In 1966, Jean Van den Bogaerde designed his own house with architectural studio on a triangular plot. Flexibility was very important to him. The use of a timber-frame construction, a well-thought-out floor plan, and prefabricated sandwich-panels and roof scales **(fig. 1 middle)**, allowed for the construction to be completed in no more than seven months. Van den Bogaerde drew inspiration from Le Corbusier's La Tourette and L'immeuble d'Habitation de Marseilles, through their use of pilotis, open floor plans, curved vaults and

outdoor staircases. Furthermore, attention was paid to Mies van der Rohe's use of materials, skeletal construction, open spaces and light, and Frank Lloyd Wright, with his horizontality, and overhangs. Additionally, he was influenced by the Case Study House Programme in California. The use of floor-to-ceiling wooden sliding doors with translucent paper betrays his admiration for Japanese architecture. His house is on the first floor and includes space for a carport under the cantilevered upper floor **(fig. 1, middle)**. That was considered a more progressive solution than a closed garage. There is a central concrete core that houses the kitchen, bathrooms and staircase, and the rest of the space is open. To the right is the living area, and to the left the children's living area. Architect Van Den Bogaerde is particularly proud on the flexibility of his home. The walls between the children's bedrooms can be removed, and the master's bedroom is also only separated from the living room by sliding doors. Overall, the house could be completely converted. At one point, he even drew sketches of a design in which the house was converted with all elements into a single-story dwelling. However, in reality, he did not follow through with this transformation.

Interestingly, Van den Bogaerde eventually constructed a threefold garage in order to store the children's bikes, the garden equipment, the garden chair set, etcetera **(fig. 1, bottom)**. He considered the lack of a garage a shortcoming. Since there was no room in the transparent house to store various items, he was glad to have realised early on that he needed to install built-in cupboards to compensate for the absence of an attic. It is akin to Philip Johnson who built a fully enclosed brick house in the garden of his iconic 1949 open glass house because he also needed a place to receive guests in privacy.[6] Van den Bogaerde's garage also served a useful purpose when he was unable to climb stairs for a period and decided to live there.

The kitchen is a very small, laboratory kitchen with a counter where family members can have breakfast on bar stools. Van den Bogaerde's wife regretted some things, mainly in relation to the kitchen. Although it was a laboratory kitchen that was supposed to make work efficient and labour-saving, in practice it was not that convenient. When she prepared several courses, she had to do the dishes in-between because the kitchen was too small to keep them. She also used the children's living room to store some kitchen goods. Her husband later provided more cupboards because there was insufficient space for storing kitchen utensils. The distance to the garden also made it difficult to eat outside, as she explained: "Of course, we don't enjoy the garden as much because, if we want to eat outside we have to move everything. Surely that you think twice [before doing that]."

The interior is a mix of styles **(fig. 2)** Persian carpets, inherited from an uncle, cover the floor. Grandmother's antique rocking-chair stands next to a Bertoia Diamond Chair. The dining table and chairs are Italian, while the globe lamp is Japanese. Besides the modern art, there was also a medieval painting from 1633 inherited from an uncle 'Kanunik'. The sculptural fireplace had to be moved as a result. Architect Van den Bogaerde is against minimalist interiors. Referring to the neighbouring Van Wassenhove house

6. Alice T. Friedman, "People Who Live in Glass Houses: 'Edith Farnsworth, Ludwig Mies van der Rohe, and Philip Johnson," in *Women and the making of the Modern House* (New York: Abrams, 1998), 126-159.

designed by Juliaan Lampens, he says: "the inhabitant also has some works of art, but he is unable to hang them up. I can't understand that. No. A man has to live in his house."[7]

3. THE TRANQUIL, FIXED BUT CLUTTERED DOMESTIC INNER LANDSCAPE OF LAMPENS

Architect Juliaan Lampens clearly had another view of how to live in a modernist home. He once said in an interview: "There have been clients who at first could not endure this way of living, but who once accustomed to it, did not want anything else. I'm now building for a second generation, the children of my first clients who have grown up in these homes."[8]

The Van Wassenhove house was designed for a secondary school teacher, art lover and single, Albert Van Wassenhove. Lampens designed a concrete enclosed volume, that was hidden from the street and only open to one side **(fig. 1)**. The floor plan is a square with other geometric volumes, such as a square (for the office space) or circles for the bedroom, the dome above the cubic desk and the round pond that collects rainwater from the main roof **(fig. 3)**. Lampens (2014, 8) refers to the second period of Le Corbusier, and to Mies van der Rohe, Alvar Aalto, Oscar Niemeyer and Eero Saarinen, among others. He makes use of exposed concrete, wood and glass. His house is mostly categorised as Brutalist. The brutalist house of the Brazilian architect João Batista Vilanova Artigas is most similar to Lampen's houses. The sobriety and brutalist character can be understood as a way to resist the bourgeois and consumer culture attitude. As Angelic Campens explained: "The effect of this struggle contributed to a shift in the general situation, where entire groups of architects who built in the modern glass style switched to more protected and closed structures."[9] This is exactly what Lampens did. By means of powerful sketches he designed a very strong geometric composed house. As the surrounding suburb is full of bourgeois residential houses, Lampens created an inner domestic landscape enclosed by a concrete shell. The open plan of the house did not contain interior doors and walls never reached the ceiling. As such, Lampens encourages a basic togetherness within the living space. The client, Van Wassnehove, also had a say as he opted out of a fireplace as he found that unnecessary, but included a central office space, slightly elevated above the living room, overlooking the garden. Zenithal light through the round skylight illuminates the office. **(fig. 3 top left)**

Nevertheless, Lampens was insistent on precisely positioning everything in this house, including the fixed concrete table. When an architecture student asked him what to do if the resident wanted to move the fixed table, Lampens answered laconically: "The need to move the table to another place in the house is non-existent, since I have situated the concrete table in the right spot from the beginning."[10] However, today the house is a museum house that also serves as an artist's residency. Videos, drawings and interviews with temporary users (performers in dance, theatre and circus) who lived in the Van Wassenhove house for two days and nights in the framework of an experiment, confirmed the rigidity and the impact of the

fixed table on the movements in the home. Moreover, they found the table ergonomically inconvenient to sit at. They also experienced a coldness in the house, due to the abundance of concrete.

Unlike today, the interior of the house was once filled with the clutter of light, despite the architect's request for his clients to refrain from adding decoration.[11] Nevertheless, the formal language of Lampens' architecture is strong enough to preserve the sacredness of the spaces, even when filled with objects.

CONCLUSION

The glass house of Philip Johnson is in contrast to the enclosed brutalist house of João Batista Vilanova Artigas. Typologically, the houses discussed can be compared, providing a rich basis for examining the divergent architectural philosophies and spatial experiences embodied in each house.

Both inhabitants appreciated and praised their home, which still exudes timeless modernity. Albert Van Wassenhove granted it to the University of Ghent for further research, while Jean Van den Bogaerde offered his plans and archival material to the Sint-Lucas Architectural archive.

Neither of them adhered to dogma when it came to their lifestyle, as they both offered resistance. Van den Bogaerde kept older furniture in his home alongside designer furniture, against the advice of the modernist avant-garde architects who argued for freeing yourself from the past and arranging the home in a purely modern way. Lampens also had some design pieces, but there was also clutter everywhere.

Both houses have an open internal layout, although the bedrooms in the Van den Bogaerde House could be closed off, similar to the cells in Le Corbusier's La Tourette. The open character is valued in both houses. Lampens' architecture was robust enough, geometrically speaking, to overcome the mess and clutter. Additionally, the transparent structure of Van den Bogaerde's house was successful in maintaining order in the composite interior. However, Van den Bogaerde constructed an oversized garage to store all goods that did not find a place in the home or to provide temporary accommodation when he was unable to climb stairs. This space had to serve as an alternative to a cellar, attic, or enclosed built-in garage, all of which were considered unnecessary by modernists. Although Van den Bogaerde's house seems more flexible and, as such, easier to live in, other elements determined the residents' way of life. The rational kitchen didn't seem so practical and efficient, as his wife had more cleaning and washing to do. Furthermore, living on the first floor made eating in the garden more complicated.

Nevertheless, these factors did not diminish the tremendous quality of life the house offered. That quality was different in both houses. For Albert Van Wassenhove, his elevated office was the centre of his domestic life that was interwoven with work. Living alone meant issues of privacy or conflict between inhabitants were logically not a concern. In the Van den Bogaerde House the possibility for the children to retreat to their own living room, or even their own bedroom, was a major advantage. And despite the fact

11. Angelic Campens, "The sociological dimension of concrete interiors during the 1960s," 5.

that Lampens' houses were, in general, more imposing, even intentionally so, it did not prevent the children of the residents from commissioning the architect to design a house for them as well.[12]■

12. The author is grateful to Selin Geerinckx for the images she provided on the Van Wassenhove House designed by Juliaan Lampens.

BIOGRAPHY

Els De Vos, a professor at the University of Antwerp, chairs the interior architecture programme. Her research is situated in the field of history and theory of (interior) architecture, home culture, gender, and public space in the second half of the twentieth century. Her PhD on the architectural, social and gender-differentiated mediation of dwelling in 1960s–1970s Flanders is published by Leuven University Press (2012). She has published in several journals and is co-editor of several books and special issues. She has co-curated several exhibitions, most recently Living in Colour (Antwerp, 2019) and Female Symbols and Urban Space (Brussels, 2021).

PARAFICTIONS OF THE GLITCHED ESTATE IN CENTRAL HILL

ALESSANDRO COLUMBANO
BIRMINGHAM CITY UNIVERSITY

ABSTRACT

This paper discusses the context to a South London housing estate, Central Hill, as a 'parafiction' of the 'soft city' - two terms in cultural studies that describe alternate but familiar realities. Both are constructed from factual fragments that are unrelated, with their stories presented back to us in novel immersive film-based media.

Our postgraduate unit, Arena, at the Birmingham School of Architecture, has explored both terms through performative events. We use architectural data intertwined with archival artefacts to reveal tension between competing aesthetics and narratives, and in tandem with the socio-cultural conditions captured by pop culture today.

To coincide with a group exhibition, *Horror in the Modernist Block* at Ikon, an established international arts institution, the Arena unit responded to the curatorial theme presenting "new and recent works by contemporary artists that experiment in the aesthetics of architectural modernism and unpack the often-contested legacies of modernist buildings."[1]

The 'Glitched Estate' was presented as a docu-short film, with a performance alongside artists' video work, capturing the dual narratives between the local authorities, community residents and activists concerning Central Hill's ongoing conversation as at-risk of demolition. Designed by Rosemary Stjernstedt, a pioneering architect as the first woman to reach senior grade at London County Council.

The docu-short format becomes the element that enables the parafiction around Central Hill – juxtaposing competing ideas of the redevelopment of a well-loved but contentious landmark. The architecture provides the discussion of social context - and to read the building's legacy in today environment. This contemporary process is a new instrument in our information age to draw an indistinguishable line between fiction and reality, advocating modernism's significance to a broader audience in an unconventional gallery setting.

1. INTRODUCTION

As the camera pans across the entourage, the edit then cuts to a gritty aerial view. Amongst the borrowed light of the streets, you can faintly detect the tiered structure of the estate. Another cut makes no mistake in telling you where they are, with the sign with Central Hill Estate framed clearly. These scenes are taken from a music video of K-Trap's *Warm*[2] an example of UK drill - an emerging music sub-genre with its aesthetic culture heavily indebted to the urban qualities of inner London.

The video presents the estate as part a Soft City. Initially termed by writer and critic Jonathan Raban, it recounts narratives of human geography, blending fact and contemporary culture with the everyday fiction of people's lives. "Cities…we mould them in our images… The city as we imagine it, the soft city of illusion, myth, aspiration, nightmare is as real, maybe more real, than the hard city one can locate on maps…in demography and architecture."[3]

Soft City is a cultural study on the multiple versions a city can adopt in attempting to gather meaning and identity. But written in 1974, how we imagine 'it' has evolved with our continuous consumption of visual media today. We find ourselves in a hyper version of the soft city where there is no doubt that the image is significantly more real than the hard one with live in.

Parafictions, coined by art historian Carrie Lambert-Beatty, are an "artistic fabrication ventured outside the boundaries of the novel, frame or stage."4 As a combination of true stories combined with a fictional style, they are a useful theoretical device to help us navigate a post-truth reality experienced through performances. Applying a parafictional process to document contentious structures like Central Hill becomes a means to enlighten the drama of renewal, economy and political pressures being played out. This essay explores the parafiction of the Soft City with the use of a docu-short – a short form of a documentary-type video with archival content as factual connections interspersed with creative and fictional elements. The docu-short was presented at Ikon gallery's group blockbuster show, Horror in the Modernist Block5, **(Fig.1)**, in 2023 alongside video artists Ola Hassanain, Ho Tzu Nyen, Kihlberg & Henry, and NT.

From the curatorial synopsis the exhibition is introduced as:

> *Today, buildings constructed in the modernist style stir mixed reactions. For some, they are architectural icons. To others, they are haunting relics of failed concepts and bygone eras… The exhibition and publication look at how these artists unpack the often-contested legacies of modernist buildings through the lens of horror… highlighting how the design and features of a building can shape not only our movement and perception, but also our deepest fears.*[6]

Whilst the exhibition explores horror as a driving reference for the discussion of architecture today, the docu-short produced for the exhibition sought to capture the tensions our soft city holds under the forces of gentrification and proliferation of urban visual culture.

2. ESTATES IN THE NOW

The feature of housing estates in film and media are both practical and aesthetic. Practical in that, including in music videos, they document the reality of the artists' daily lives and their neighbourhood, captured with affordable, convenient technology. And so their estate (of where they live) becomes the incidental setting. Aesthetic in that the tonal qualities of the material and stratification of society in its internal planning, play out to act as metaphors like in JG Ballard's *High Rise* or enhance narratives like in Ken Loach's depiction of familial social mobility in *Poor Cow*.

2.1 ESTATES IN THE SOFT CITY

In earlier decades of their popularity, modernists estates represented aspirational ideas of progress for more equitable living or spatial catalysts for dystopian societies. In more recent recounting of life in estates, artist and documentary maker, Ayo Akingbade depicts current ways of living in her trilogy of films *Dear Babylon, Tower XYZ, In Ur Eye*. For Akingbade, her works were born out of necessity to avoid the visual tropes of "kitchen-sink style or depressing social realist depictions of London."[7] In *Unofficial Britain*, the urban rambler Gareth E. Rees takes the reader across unexpected landmarks in today's gritty urban environment. Chapter Demons in the Present, the implausible frequency of ghost apparitions in modern housing estates leads to a phenomenon of "spiritual occurrences caused by emotions of living beings in the here and now rather than ghosts of the past."[8] Concluding this unique take on urban exploration, "reality is a very fragile thing… so things you create in your own mind can develop a reality just as powerful."[9]

For both Akingbade and Rees, the view of the residents, the makers, the artists, community leaders captured on film, are used to construct a parafiction on the reality of the now.

So what would the parafiction be in content such as K-Trapp's *Warm*? The track is part of drill – a British music genre emerged from South London. Drill is a musical reaction to the "unchecked social inequality" prevalent in South London, just as grime music did the same for East London at the time of rapid gentrification surrounding the 2012 Olympic Park developments.[10] As hotspots of grime and drill, they centre specifically on the effects of gentrification, which, combined with the government's austerity policies since 2010 particularly affecting local councils' welfare programmes including maintenance of estates and its ability to house residents on long waiting lists are severely compromised in a process of managed decline.

2.2 ESTATES IN THE HARD CITY

Lambeth Council set up a housing subsidiary, Homes for Lambeth (HfL) in 2017 to accelerate the delivery of new homes for the South London Borough but has been beset by ineffective use of public funding and management, creating just 80 homes since its establishment.[11] One of its main remits was to manage the regeneration of post-war estates in London including Cressingham

Gardens, Fenwick and Central Hill. HfL came under significant pressure with its plans to regenerate Central Hill with partial demolition of the well-known architectural landmark with new builds to be sold at current market rates developed in conjunction with a private developer. Seen as a triumph of post-war planning with an innovative tiered graded structure nestled into a step topography of Gypsy Hill, the plight of estate was widely publicised in social media and in national news[12] due to a grass-roots campaign to help counter the narrative (from the council) of yet another declining housing estate.

The campaign to save Central Hill, also drew attention to its architects Rosemary Stjernstedt and Roger Westman under the directorship of Ted Hollamby. Stjernstedt was an English architect graduating from the Birmingham School of Architecture as one of its first female alumni in 1934, and then taking a town-planning course at the Architectural Association which led to her moving to Sweden in 1939 to work as a town planner. After World War II, she returned to England and began working for London City Council (LCC) Housing Division, later becoming the first woman architect to reach senior grade I status in any British county council division.

Sweden's strong culture of gender equality had a significant impact on Stjernstedt's career, giving her the confidence to take advantage of the progress made in the public sector in England. After the LCC was dissolved, she commenced work for Lambeth City Council, designing social housing projects including Central Hill.

Completed in 1975, the estate was one of the boldest additions to Lambeth, providing over 450 homes with gardens, play areas, large terraces, and open green spaces. It was designed to focus on the needs of residents and the community while taking advantage of stepped topography and the view over London. Its most notable building includes the tiered maisonettes **(Fig.2)**, undulating between historic trees on the hill. Stjernstedt's architectural ambitions derives from where the design is not only about the built fabric but also the community and individuals. Influenced by her time spent in Sweden, her designs advocate for a culture of equality, countering the spatial convention of 19th Century Georgian homes in the vicinity where the internal arrangement placed the dweller as a demonstration to their social status. In these houses, productive areas of a family home (kitchen, washrooms) were separated from affluent living areas (dining rooms, reception rooms). Central Hill however, represented a modernist approach incorporating technology as a solution to easing the domestic work of the working class. Stjernstedt prioritised the feeling of community with its open terraces, open plan living. The block was laid out efficiently to portray the landscape as a blurred threshold between labour and leisure for an egalitarian family. Architecture critic Rowan Moore describes the project as "creating both moments of drama and quiet enclaves…between its buildings… They give as much shelter and privacy as you could want but also help you feel part of the larger neighborhood, landscape, and ultimately, the city beyond. You feel enclosed more by a series of layers than opaque walls."[13]

13. "Housing estates: If they aren't broken…" The Guardian, accessed June 7, 2024, https://www.theguardian.com/artanddesign/2016/jan/31/council-estates-if-they-arent-broken-lambeth-council-central-hill-estate-social-housing-affordable

3. THE GLITCHED ESTATE

Campaigns to save the structure involved a statutory listing application for Central Hill to justify recognition of Rosemary Stjernstedt's designs. It states the need to "reappraise the work through the intersectional lens of representation, and heritage" with an increasing national and international level of significance to her work.

The campaign challenged the rejection of the listing application, claiming the estate isn't 'pioneering'. It notes how Neave Brown, working at a similar time to Stjernstedt on social housing projects, had "all of his work in the U.K. being listed by 2014". Listing more of her buildings would help to establish her status as a major post-war British architect and protect her work.[14]

There is a myriad of media sources building up a picture of the drama playing out along political lines. From news clips to architectural journals, to music videos, to local public forums to Facebook groups. The amount and variety of information crontributes significant confusion and tension between them all.

In the docu-short, opposing information, using the situationist techniques of the detournement, was reconstructed into playful pieces of truth of the now, generating a state of perseverance in a never-ending game. Existing archival content and anecdotal fragments is scripted as information, repeated, glitched out, then played over once again, **(Fig. 3)**. The glitch insinuates another possibility to occur from these glitched archival fragments.

3.1 GLITCHED NARRATIVES

Glitches between the media creates a dual narrative, uncovering all aspects of the Central Hill spectacle. Representation of both sides of the story (the community and Lambeth Homes) was important to spark further debate and help uncover the political reality while simultaneously letting the audience reflect on their own views about the fate of the estate. The performance of cast totems, abstracted components from the built forms, combined with an edited audio, produced a one-off performance at Ikon Gallery. The interplay of physical/digital mediums created an engaging story to bring an awareness to the current situation – a parafiction of truths and human emotions. The two sides of the docu-short:

DYSTOPIA: a brutalist modernist block, located in Gipsy Hill, presents a broken urban vision for residents, exemplifying a failed housing project forcing an antagonised community that requires the attention of Lambeth Council to dismantle and allow the decline of its social fabric for future political gain.[15]

[Or…]

UTOPIA: a modernist landmark designed by pioneering architect Rosemary Stjernstedt presents the ideal city living for its residents, exemplifying a successful housing project cultivating a close-knit community raising the attention of Lambeth Council as an exemplar to national and international groups, and to preserve and continue the legacy of Stjernstedt's designs.[16]

Figure 2. Graphical diagram of Central Hill Estate, Rosemary Stjernstedt, London UK, 1974. © Birmingham City University, Nicholas Morrison and Wiktoria Piotrowska, 2023.

Figure 3. Graphic composition of docu-short script. © Birmingham City University, Nicholas Morrison and Wiktoria Piotrowska, 2023.

What the docu-short, *The Glitched Estate* captures, is an antidote to the passiveness of news and culture in media today. Film has 'montage' as a physical quality that artists explore as a form of materiality. The Glitched Estate gives voice to Stjernstedt's ideas, and in her own words from a recording of *Pioneers: Women Architects and their Work* in 1986. Cut and edited with another recording of the community consultation with HfL, the political and economic reality of housing in this London Borough is played out in amongst the optimistic vision of Stjernstedt's modernism.

For the Save Central Hill campaign, the residents' and architecture critics promoted their work through targeted news outlets that circumvented the official narrative by the council of 'economic regeneration' via demolition. This form of digital activism has power of sorts. Cultural happenings (such as the Ikon exhibition), gives the campaigners the ability to be heard. Writer/curator Francesca Gavin highlights this opportunity with internet culture: "Owning the media means owning visibility." But this approach has limits as she describes how "the state is able to hide their operations while in public."[17] as the residents have claimed. Glitching competing news feeds in docu-short format provides a new narrative structure allowing multiple endings for ideas of the future while addressing contemporary issues of the estate.[18]

18. See Gavin's term of Slow Futurism in Francesca Gavin, *Watch This Space* (London: Pentagram, 2017), 197.

4. REVEALING THE RECENT PAST (CONCLUDING THOUGHTS)

In 2022, news arrived that HfL was to be subsumed by the council proper as a result of a damning Kerslake Review[19] recommending its closure - effectively halting the redevelopment plans of Central Hill indefinitely. A positive outcome for the residents and campaign group, but one with unanswered questions on the impact of the derelict properties and forced relocation of hundreds of residents. In 2023, K-Trapp release a remix of Warm, featuring additional artist Skepta. This time, recorded in a night scene on the Central hill Estate, it presented an alternate aspirational story, depicting a new sense of affluence with high end luxury cars occupying the streets. With scenes of almost identical sequence from K-Trapp's initial track, it plays out as a parallel fiction to the raw energy of the original.

Lambert-Beatty defines the scepticism we should be conscious of in our everyday lives with the implausible exposé by artists using parafiction as a mode of storytelling. The Glitched Estate provides a compelling reality to an architectural landmark representing the dichotomy modernism has found itself in today.

Additionally, art practice is a contemporary intervention to politically motivated moves in a city. Francesca Gavin observes that the production of images in digital activism doesn't necessarily mean you become free. Only through meaningful action does activism occur.[20] Whilst, *The Glitched Estate* is not activist in its intent, it is part of a growing concern of artists. Ayo Akingbade's Dear Babylon is part of a trio of films of London Life. It's fictional narrative of another housing estate, played by actors, voice real concerns and give a legitimacy to the parafiction. These works, alongside the Glitched Estate seek to "build solidarities in the fight against gentrification" in forming community participation to share "methodologies around activism in response to the UK's housing crisis."[21]

In support of Gavin's view on digital activism, the capture of architectural modernism must move beyond fetishising the aesthetics of its material quality on film. Central Hill only has a few cultural moments so its representation in the soft city is peripheral compared to other housing landmarks such as the Heygate or Haggerston estates that have been featured significantly in cultural media more widely. But *The Glitched Estate* provides a model for the archiving of architectural heritage that plays into the mood of the public consciousness of the soft city we see on our screens. ■

BIOGRAPHIES & CONTRIBUTORS

Alessandro Columbano is an Associate Professor at Birmingham City University, UK, and has been leading Arena, a postgraduate design unit for 5 years. He has presented work and curated exhibitions at Ars Electronica, Ikon Gallery, International Architecture Biennial Sao Paulo, MAC Birmingham and Eastside Projects.

This paper includes contributions from Nicholas Morrison, Wiktoria Piotrowska, and Andreea-Claudia Buzuloi, with the production of the docu-short and contextual reading of the estate's layout. All contributors are graduates from the MArch Architecture programme at Birmingham City University and work in the West Midlands.

BEYOND MODERNISM

LIDWINE SPOORMANS
DELFT UNIVERSITY OF TECHNOLOGY

ABSTRACT

Various trends and movements influenced architectural transcendence after Modernism. Well-known history includes European architects calling for human scale and variety and Anglo-Saxon architects adopting a visual language of archetypes, popular taste, and symbolism. In other regions, various emanations and terminology can be found, like Metabolism, Critical Regionalism or Late Socialism. Despite the fact there is a growing interest in this young legacy, many buildings from the 1970s and 1980s are threatened with demolition or drastic transformation. They are facing the same issues as the Modern Movement legacy, being camouflaged at the risk of vanishing. This conference session, therefore, aims to develop and share knowledge of architecture dating from the decades after Modernism. Documentation of various international cases, movements, and developments is considered a first step towards making comparisons, evaluations, and, finally, informing decision-making in regard to conservation.

This paper discusses several themes and theories, aiming to explore a framework for identifying and discussing similarities and differences in their underlying ideologies and contexts. The first theme addressed is pluralism, as defined by Charles Jencks. Pluralism is observed as a socio-political plurality, with various cultural, geographical and regime-related contexts. Additionally, on the building scale, the absence of a dominant ideology led to the combination of architectural styles. A second theme is nostalgia, relating, for instance, not only to classical references in post-modern buildings but also to the increased interest in heritage in the 1970s and onwards. The current interest in the 1970s and 80s legacy can once again be considered a nostalgic longing. In contrast to nostalgia, futurism is the last theme discussed. Metabolism and high-tech have created visions and solutions to current societal and environmental issues.

Although the themes discussed do not provide a complete or comprehensive representation of the building stock under discussion, they aim to foster discussion on its characteristics and underlying ideologies.

1. INTRODUCTION

Following the decline of Modernism, new architectural ideas and expressions emerged. Rather than adhering to a singular ideology, a range of possibilities and truths were embraced. European architects such as Aldo van Eyck and Team X rebelled against the concept of 'unliveable' cities[1]. They called for more coherence between people and things, leading to further emphasis on human scale and variety. In Anglo-Saxon countries, architects like James Stirling, Robert Venturi and Denise Scott Brown adopted the visual language of archetypes, classicist architectural elements, popular taste, and symbolism. Referring to Charles Jencks, this pluralism was perceived as the Post-Modern ideology as there was no dominant cultural style or ethos[2].

However, both Modernism and its turn-away should not be reduced to visual language or style. At the planning and programmatic level, for example, separating functions as advocated by CIAM's functionalism was abandoned and the intergration of different programmes in urban plots and at building level was promoted. These multifunctional hybrid concepts could be inspired by traditional or indigenous towns or grow into high-tech superstructures. Various other post-CIAM emanations and terms can be found, like Metabolism, Critical Regionalism or Late Socialism. There seems to be no abrupt end to Modernism, but rather a transcendence, an influx of various influences and movements.

The legacy of post-modernism has recently sparked increased interest in architecture, heritage practice, and academic circles. Already in 2008, the DOCOPOSMO project endeavoured to document the Post-Modern architecture of the 1970s and 1980s in Chile. In the Netherlands, the Cultural Heritage Agency initiated a programme studying and ultimately listing 'Post 65' heritage built after 1965. Academic interest is evidenced by the growing number of conferences, such as the recent Young Heritage Symposium in Brussels[3].

Despite this trend, buildings from the 1970s and 1980s are threatened with demolition or drastic transformation. Will they face the same issues as the Modern Movement legacy, being camouflaged at the risk of vanishing? In line with the goals of Docomomo, this paper aims to develop and share architecture dating from the decades after Modernism. Documentation of various cases and developments is considered a first step towards comparisons, evaluations, and, finally, informing decision-making in regard to conservation. It can give a broad insight into the characteristics of this transcendence from Modernism into other architectures across different countries and regions. Although this paper is written from a European perspective, influenced by the author's background, it seeks to provide themes and theories to promote the research in an international context. The three themes brought forward in this paper, pluralism, nostalgia, and futurism, do not provide a complete or comprehensive representation of the building stock under discussion. However, they are regarded as topical and relevant as a perspective for understanding the architecture 'Beyond Modernism'.

2. PLURALISM

As Charles Jencks wrote in 1977, while declaring the death of Modern architecture, "the present situation tolerates opposite approaches, and I hope that architecture doesn't prematurely crystallise around a single style and doctrinaire approach, as it has so many times in this century. I prefer (…) that it is pluralistic: the idea that an architect must master several styles and codes of communication and vary these to suit the particular culture for which he is designing"[4]. Did his wish come true, and did architecture become local and differentiated rather than an international style as promoted by the Modernists? Or can we also observe international similarities in the transcendence after Modernism? And is the architecture 'Beyond Modernism' understood as Late Modernism, Post-Modernism or any alternative -ism in different regions and countries?

2.1. SOCIO-POLITICAL PLURALITY

In Europe, Team X played a pivotal role in the transcendence of Modernism. Emerging from CIAM and Modernism, they declared CIAM dead as early as 1959 and advocated for 'The story of a different idea', focusing mainly on housing and habitat[5]. While many Western European countries followed the trend towards a more human architecture, there were also differences. From 1965-1985, new towns appeared in the UK, France and the Netherlands[6]. Although these national programmes shared the ambition to create a counterpart to the large-scale developments of the post-war years, they varied in their planning policies, cultures and the scale of the towns. This led to, for example, differences in the importance of the public domain and the separation of public and private space[7].

Expanding the scope to Eastern Europe, the influence of political regimes and socio-economic contexts plays a role. While Western Europe had already abandoned the ideals of Modernism, behind the Iron Curtain, state socialist buildings remained the norm up into the 1990s. However, even during this socialist time, counter-movements, such as the 'improvisation' building culture in former Czechoslovakia, resulted in local versions of architectural diversity[8].

Besides the political regimes at the time of their creation, later and current political developments also influence how buildings from the 1970s and 1980s are preserved and valued today. This applies, for instance, to the late modern building stock in post-Soviet countries. The German research project 'cities. building.culture' examined both the physical changes and attitudes towards the architecture after the Sovjiet period[9]. In addition to the bipolar post-war context, dictatorial regimes in several European countries determined the direction of architectural developments. These differentiations observed in become even more pronounced when considering global transcendence beyond Modernism.

2.2. ARCHITECTURAL PLURALITY

Pluralism is present in the wide collection of projects beyond Modernism, as well as in the visual language and spatial ideas of a single architectural

building or urban ensemble. The decline of modernist ideology gave freedom to create various styles and genres in architecture and arts. Post-Modernism, in all its guises, has also been referred to as 'the circus of prefixes'[10]. While Post-Modernism encompasses several movements, the term is often narrowed down to popular, historicising or symbolic formal language characterised by double coding, irony, parody, pastiche, hyperreality and hybrid language. Double coding seeks to make connections between the present and the past, between new techniques and old patterns, and between the elite and the people (Raaij 1993, 547).

This architectural plurality, both in the collection of neighbourhoods and in individual projects, is exemplified by Dutch residential neighbourhoods constructed between 1965 and 1985. These everyday living environments adopt characteristics of, on the one hand, a humanist approach of organic forms and diversity and, on the other hand, a rationalist approach of pragmatism and formal architecture[12] **(Fig. 1)**. The mixing of different spatial typologies and visual styles, showcasing pluralism, may occur on various levels. On an urban level, the neighbourhoods are planned as 'a city within a city', combining various functions and facilities. The public space is often designed as a sequence of enclosed spaces like squares, alleys, stairs and courtyards. On an architectural level, the complexes mix housing types to accommodate a variety of households and architectural archetypes such as gates, colonnades and towers to provide a familiar image and identity[13] **(Fig. 2)**. Expanding the scope to include other countries and regions, functional programs and timelines could either confirm or contradict the architectural plurality or add nuance to it.

3. NOSTALGIA

Jennifer Bloomer discusses the place of nostalgia and longing in contemporary Western architecture[14]. She writes that the desire for the new is a longing for something one cannot have because as soon as the new is materialised, it ceases to be new. Our persistent desire for the new is in itself a nostalgic longing. This circle of nostalgia and newness relates to the architecture after Modernism in its longing to break with 'old' Modernism that aimed for the 'new', while the 'new' Post-Modernism aimed for nostalgic identities.

Furthermore, from the current perspective on this architectural legacy, Bloom's 'new nor old' plays a role. While Modernist buildings in many countries have entered the heritage domain, such recognition continues to be very rare for younger buildings. Yet, we have seen nostalgic revivals of the 1970s, 80s, and 90s in music, fashion, and other areas of design. Could we anticipate that each new era of architecture will eventually be considered as heritage?

3.1. NOSTALGIA LOOPS

A closer look at the aforementioned pluralism in Dutch 1965-1985 residential neighbourhoods in the Netherlands, reveals a complexity of -isms and ideologies[15]. The humanist approach of small scale, organic growth

and mixed functions was inspired by traditionalism and 1930s Amsterdam School. The movement of structuralism (with Herman Hertzberger as its protagonist), aiming for adaptability based on highly systemised patterns, referred to post-WWII functionalism. The rationalist approach of pragmatism and formal cube-like architecture related to Modernism. And finally, the Post-Modernism of archetypes, as a symbolic formal language, relates to neo-classicism. Although the materialisation of these previous codes and symbols is referential rather than reconstructive, the longing for familiar historically based images is evident. In the book 'The Past is a Foreign Country', David Lowenthal warns against 'nostalgia for nostalgia' and notes that nostalgia is often for past thoughts, recalling a memory, rather than past things[16].

Besides referring to previous architectural movements in new constructions, the appreciation of heritage also grew after the Modernist era. The year 1975 was declared the European Architectural Heritage Year, which launched new ideas for the rehabilitation of monuments and cultural heritage in urban planning across Europe[17].

3.2. CURRENT NOSTALGIA

Generally, 1970s and 1980s buildings are beyond the status of 'new' but are not yet considered heritage. As stated by Kevin Lynch in 'What Time is this Place', "Preservation is fine for the past that is long past, but yesterday is thought of as something to dump"[18]. Does the growing interest in this stock, which is now half a century old, indicate a shift in our perspective, the beginning of longing for this recent past? Results of participatory research from Dutch neighbourhoods from 1965-1985 show that attributes inspired by tradition such as multifunctional city centres and masonry facades, are predominantly viewed positively by residents and professional stakeholders. However, then innovative attributes (e.g. separated infrastructure systems or elevated residential decks) are more contested[19]. Further research is required to confirm whether this phenomenon is widespread or not and how it will be affected by the passage of time.

4. FUTURISM

"How to build a city that can adapt to unknown information of the near future? How to build a city that is capable of accommodating the traffic of future times? (...) The scholar of tomorrow will find a solution that will further simplify the lives of the people of tomorrow"[20]. Although Friedman implied that the architect would become redundant in that process, constructing the future living environment is a task faced by every generation of designers.

Our contemporary challenges share striking similarities with those of the 1970s and 1980s. The 1972 report 'The Limits to Growth' by the Club of Rome already addressed the relationship between economic growth and its impact on the environment and the global challenge this implies. Today once again, affordable housing, land use, and collectivity are the main societal

issues. How can we continue to build the city of tomorrow? And what can we learn from the futurist ideas of the past?

4.1. UTOPIA

The utopia of absolute mobility and interchangeability of constructions and functions was an appealing futuristic vision whose origins lay in Modernism but which later found clear expression in built form. The metabolism movement, akin to the aforementioned structuralism, proposed new systems and technology to create a society for free individual movement and development. While previously, the built city and architecture regulated human existence in public spaces with social norms, architecture was now to become a means by which people could control technology and machinery[21]. These ideas from Kisho Kurokawa's Capsule Declaration were realised in, for instance, the Nakagin Capsule Tower **(Fig. 3)**, an icon completed in 1972 and demolished in 2022. Moveable and adaptable individual units with minimal footprint were one ingredient to create a future of high mobility. An elevated three-dimensional structure would be the integrating system, bundling traffic, services and public functions, providing citizen pedestrians with protection from pollution and allowing free movement[22].

The technological visions and innovations applied in superstructures with hybrid programs have various forms and identities. Raised megastructures can be identified as 'bridge-buildings', but extensive ground-bound structures as 'neighbourhood schemes' share the same concept of multifunctional programs in a utopian urban structure[23]. Their visual language can be brutalist, as in Japanese metabolism examples, or explicitly high-tech, as exemplified by the 1977 icon Centre Pompidou **(Fig. 4)**.

4.2. CURRENT FUTURE PERSPECTIVE

As addressed in the previous paragraphs, the legacy after Modernism contains a multitude of spatial concepts and visual styles, harking back to previous elements, symbols and styles as well as utopian ideas, new systems and technologies. How should we consider this pluralism, in an already multi-layered built environment? According to Kevin Lynch, "the best environment for human growth is one in which there are both new stimuli and familiar reassurances, the chance to explore and the ability to return"[24]. Faced with the many contemporary challenges in our living environment, such as sustainability, climate adaptation, densification, equality and affordability, we cannot afford to disregard the present stock. Lynch offers design directions to unite the old, the nostalgic, the new, and the future. Accepting and juxtaposing a plurality of histories, structures, and formal languages into a 'temporal collage' is a model we can adopt and continue in current times.[25]

5. DOCUMENT TO DISCUSS

This paper has emphasised the need to shift focus to the architectural legacy 'Beyond Modernism' because, despite the recent surge in interest, these buildings are now threatened with demolition or drastic transformation. To

prevent facing the same issues as the Modern Movement legacy, which is camouflaged at the risk of vanishing, the first step is documentation of international cases, movements, and developments. The themes and theories discussed in this paper aim to explore a framework for identifying and discussing similarities and differences in their underlying ideologies and contexts. This paper is also a call for action, inviting academics and practitioners to join the network and contribute to this urgent topic. ■

BIOGRAPHY

Lidwine Spoormans is a researcher and lecturer of Heritage & Design at TU Delft since 2011 and has a background in architecture practice. Her research fields include housing renovation, intervention methods, and young heritage. She organised a series of graduation studios on the topic of housing transformation. She is a board member of Docomomo international and MC member of the COST Action European Middle-Class Mass Housing. In 2017, she launched the digital platform www.love80sarchitecture.nl. Her PhD thesis titled "Everyday Heritage - Identifying attributes of 1965-1985 residential neighbourhoods by involved stakeholders" aims to bridge the gap between listed heritage and everyday architecture.

PORTUGUESE ARCHITECTURE IN THE 1980S: INTO A DREAMLIKE EVERYDAY LIFE

JORGE FIGUEIRA
CES, DEPARTMENT OF ARCHITECTURE, UNIVERSITY OF COIMBRA

ABSTRACT

Viewed by Fredric Jameson as an expression of "late capitalism", post-modernism is in Portugal delivered with a sense of something that is booming. Portuguese architecture was, in the aftermath of the 25th of April 1974 Revolution, trying to move beyond modernism. Its heart lied with the pop art culture, echoing Andreas Huyssen's "After the great divide", Sylvian Harrison's "Pop Art and the origins of post-modernism", or Marianne DeKoven's analysis of "the sixties and the emergence of the postmodern". Postmodernism in Portugal thrived in what was repressed in the 1960s and now has an opportunity to rise. It was the public expression of the democracy. Throughout the 1980s, post-modernism was the expression of a new emerging political state: a large number of schools, cultural centers, fire stations, libraries, were built. The epitome of that process was the Casa dos Bicos (1983) by Manuel Vicente and José Daniel Santa-Rita, the Matosinhos Town Hall (1987) by Porto's architect Alcino Soutinho, the Portuguese Pavilion for the Expo'92 in Seville (1992), by Manuel Graça Dias and Egas José Vieira.

These buildings are the figureheads of hundreds of designs. In magazines and catalogues we find a stream of plastically incorrect, hybrid architectures, which reflect the will to transport architecture into the public arena. The revolutionary commitment gave way to the commitment of the individual. The censorship to be abolished was the "censorship of pleasure".

This paper aims to reflect on how Portuguese architecture was, in the 1980s, a cathartic way of experiencing everyday life. Hence the stream of neo-vernacular collages, twisted classicisms, zoomorphic references, cartoon-like architectures, all children of the 1974 Revolution. They scream "l' imagination au pouvoir" or "sous les pavés, la plage". Into the heart of a dreamlike everyday life.

1. INTRODUCTION

Viewed by Fredric Jameson as an expression of "late capitalism", and frequently as a mix of childish whims with evil commercial goals, post-modernism was in Portugal discovered and delivered with a sense of something that is booming.

Portuguese architecture was, in the aftermath of the 25th of April 1974 Revolution, trying to move beyond modernism. Its heart lied with the pop art culture, echoing Andreas Huyssen's "After the great divide"[1], Sylvian Harrison's "Pop Art and the origins of post-modernism"[2], or Marianne DeKoven's analysis of "the sixties and the emergence of the postmodern."[3] More than reflecting big commerce, postmodernism in Portugal thrived in what was for political reasons repressed in the 1960s and now had an opportunity to rise. It was, in fact, the public expression of the democracy that followed the 25th of April 1974 Revolution. It captured the moment when Portugal aimed to reinvent itself, no longer the center of an Empire, but a small country with a lot to prove.

As we will see, throughout the 1980s, post-modernism was the expression of a new emerging state and municipality power: a large number of schools, cultural centers, fire stations, libraries, were built beyond modernism tropes, as a liberated, sometimes chaotic, architecture.

The epitome of that process was the intervention in Casa dos Bicos ("House of Spikes", 1983) by Manuel Vicente and José Daniel Santa-Rita, which was part of the official state program of the 17th Council of Europe Art, Science and Culture Exhibition and the Matosinhos Town Hall (1987) by Porto's architect Alcino Soutinho. The Portuguese Pavilion for the Expo'92 in Seville (1992), by Manuel Graça Dias and Egas José Vieira, ended this cycle. In magazines, catalogues and booklets of that time, we find a stream of plastically incorrect, hybrid architectures, which don´t translate market values but the will to transport architecture into the public arena.

This paper aims to reflect on how Portuguese architecture was, in the 1980s, a cathartic way of experiencing everyday life. I have done research at the archives of the architects that I have considered seminal for this paper, the personal ones and at the Fundação Marques da Silva (Porto) and Faculdade de Arquitectura da Universidade do Porto. I have extensively interviewed said architects, historians and critics. I have visited the buildings, studied the designs and researched all the literature that was published on this subject, in that era and after, on architecture and on relevant adjacent matters. The theoretical framework of this paper relies on the aforementioned works of Fredric Jameson[4], Andreas Huyssen, Sylvian Harrison, Marianne DeKoven, and Heinrich Klotz's *The History of Postmodern Architecture*, which I will refer later on.

In the research I was confronted with a stream of neo-vernacular collages, twisted classicisms, pop distractions, zoomorphic references, cartoon-like architectures, all children of the 1974 Revolution. They scream "l' imagination au pouvoir" or "sous les pavés, la plage". Beyond modernism, into the heart of a dreamlike everyday life.

This paper surveys these long-forgotten examples of very crude, in-your-face designs and buildings, a completely unchartered and unloved territory.

1. "Pop Art (…) is the key movement that starts the impulse towards the post-modern". Andreas Huyssen, *After the great divide: modernism, mass culture, postmodernism* (Indiana: Indiana University Press, 1986), xi.

2. "The critical consciousness generated by *pop* (…) guessed or represented a parallel with the formulations later on made by postmodernism". Slyvia Harrison, *Pop Art and the origins of post-modernism* (Cambridge: Cambridge University Press, 2001), 4.

3. Marianne DeKoven's main idea it's that the "radical movements" of the 1960s are the end of the utopian pulse of modernism then giving place to a "commercial, popular, populist, subjectivist, multiple and diffuse, egalitarianism" that defines postmodernism. Marianne DeKoven, *Utopia Limited. The sixties and the emergence of the postmodern* (Durham and London: Duke University Press, 2004), xvi.

4. Heinrich Klotz, *The history of Postmodern Architecture* (Cambridge, Massachusetts; London, England: The MIT Press, 1984), xiii.

They are children of the 1974 Revolution, not really of the market forces. Even though they mean a distancing from militant political commitment in favour of a mundane enjoyment of everyday life.

According to Samuel P. Huntington, with the 1974's Carnation Revolution, Portugal began the "Third Wave Democracy", a process which would be soon followed by democratic transitions in Spain, Latin America and Asia Pacific countries; and, with the collapse of the Soviet Union, Eastern Europe's countries. Democracy started happening in Portugal after the revolutionary period, and architecture couldn't afford to be a neutral vessel. As the dictatorship was ruled out, technocracy wasn't yet an option. Portuguese architecture in the 1980s was the wild expression of a new-born regime, in a very brief and full of certainties period, just like post-modernism itself.

2. CONTEXT

At the beginning of the 1980s, the option for a liberal democracy stabilized the political process. Traditional Portuguese expressions were rescued by the children of the Revolution, entangled with the desire to a cosmopolitan world. When the singer António Variações released, in 1982, "Povo que lavas no rio" ("People who wash in the river"), a mythical song by Amália Rodrigues, fado was reintroduced as popular music and the rejection of Portuguese traditional iconography, that was felt in the aftermath of the Revolution, ended. Architecture played a major role in this process because it enabled a physical experimentation of what was emerging in various cultural frameworks.

That was essentially the time of Lisbon, the capital of the Empire which in its last African configuration ended in 1974-75. In the aftermath of the Revolution, the "Porto School" was in the shadow, reluctant and defensive, even though some cracks were showing, as we will see.

Generations of architects that had worked during the dictatorship had then a sense of freedom, and a new generation was eager to mark its territory. Manifestoes, publications and exhibitions poured in, trying to capture the "new architecture" that would rise beyond modernism. The revolutionary commitment gave way to the commitment of the individual. The censorship to be abolished was the "censorship of pleasure".

The main event was Depois do Modernismo (After Modernism, 7-30 January, Sociedade Nacional de Belas Artes, Lisboa, 1983), encompassing architecture, visual arts, fashion, dance-theatre and music. It had a large public repercussion and unexpectedly projected architecture to the centre of the cultural debate.

This period of democratic and cultural rebirth was lived in a postmodern climate. Postmodernism allowed architecture to connect with the theoretical debates. Post-modernity was a lived, almost tactile condition. And what several practices had in common was the mixture of "high" and "low" cultural forms with local or international implications. In opposition to modern culture, the mundane was the pulsating element, the dilettante ubiquity replaced the political statement, pleasure was the ideology.

One of the unexpected consequences was that visual culture, architecture in particular, gained ground against literature, which is the cultural dominant in Portugal.

3. PUBLIC BUILDINGS: CASA DOS BICOS (1983) AND THE MATOSINHOS TOWN HALL (1987)

The cultural openness of the new democratic regime was all over the Casa dos Bicos intervention by Manuel Vicente and José Daniel Santa-Rita. The representation of democracy gained form in the Matosinhos Town Hall designed by Porto School's architect Alcino Soutinho.

The Casa dos Bicos rehabilitation was an experience on heritage that brought the Asian work of Manuel Vicente to the historical centre of Lisbon. Having worked in Macau since 1962 (and with Louis Kahn in 1968 and 1969), the Casa dos Bicos was a transposition of the theory and practice developed in Macau to a heritage building, which helps to explain the big controversy it created. The reconstruction of the Casa dos Bicos, ruined by the 1755 Great Earthquake of Lisbon, was proposed according to existent iconography. The reconstitution of the "spikes" façade did not reproduce, however, an historical truth but instead created an ambivalent, playful space. The new-old façade of the "spikes" was disrupted by the surreal design of the window frames, by António Marques Miguel, and by the introduction of eccentric elements such as the big stairway in the interior or the glass pane in the rear façade. It was neither a "reconstitution" following criteria of "authenticity", nor the Venice Charter tradition of distinguishing the old from the new. In the Casa dos Bicos – renovated in 2012 to house the José Saramago Foundation – we are at the heart of a Portuguese version of postmodernism; an elaborate game of mirrors, a dreamlike atmosphere.

By the mid-1980s, Porto's architecture was well established and had in Álvaro Siza a protagonist with a growing international presence. Porto remained "loyal" to the modern tradition and was within this culture that confronted the challenges of the new trend. However, in the Matosinhos Town Hall, with some scandal, Alcino Soutinho adopted classic and modern architectural devices in a Collage City manner, aiming to create a civic building. The façade – the term was again applicable – is characterized by a wavering portico of classical inspiration, although the atrium is an open space that expands horizontally and vertically. The building's neoclassical "mask" was contradicted by the modernist interior; the ochre density of the volume disappeared in the blue-tiled color of the pillars and walls of the atrium. The side façade was an exercise in textbook postmodernism: a fractured volume with a curving porch that "falls" over the stairs.

4. POST-MODERNISM IN THE MEDIA: A CHRONOLOGY TO DISINTEGRATION

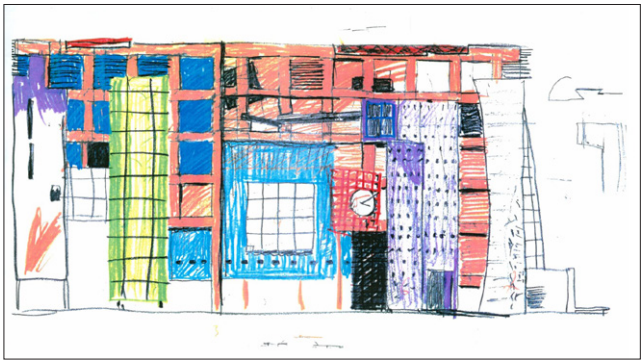
But beyond these "iconic" buildings, there was something deeper and spread-out going on. In the magazines, catalogues and booklets of that time, one can contemplate a long stream of very challenging buildings and

designs. They portrait a wild, "barbaric" period in Portuguese architecture, that is difficult to love or even to understand.

In these drawings and designs it is clear the eclectic surge, an epidemic of form, the joy of confusion, the use of the multiples resources of architecture. This expansion matches what was going on in the streets and in the daily life: the desire of freedom. Architecture was seen as a stage design for a liberated everyday life.

In the "Depois do Modernismo" catalogue, Michel Toussaint, the architecture curator of the exhibition, criticizes modern architecture, enumerates the postmodernism themes and concludes: "Against purity, against the morals of cleanness, against the anonymity we have been imposed". According to Luis Serpa, the chief curator of the event, the initiative started from the awareness that "the generational moment to take a non-aligned viewpoint with the dominant modernism had arrived"; the main objective was "to know where we can stay when everything suggests that we are no longer anywhere".

The projects displayed at "Depois do Modernismo" were therefore tentative but nevertheless confident in the flourishing state of architecture as an artistic expression. They were shown in a group of cardboard "little houses", echoing the "Strada Novissima" of Paolo Portoghesi's 1980 Venice Biennale.



The neo-avant-garde choreography of "Depois do Modernismo" needed opposition and the non-participation of the "Porto architects" played an essential role in the event's mythology. By sending a text analyzing "the evolution of Portuguese architecture" they rejected the concept of the event and refused to participate.

Some examples taken from the catalogue provide common themes of that era:

- In the "Architectonic Complex" in Viseu, by João Vasconcelos, the modernist elaboration of the axonometric model is undermined by the "baroque angel" that floats in the top of the building.
- The Fire Station in Ericeira, by José Santa-Rita Fernandes, is one of many designs of that period with that program. Strangely, it seems to be designed as the luxurious scenario for the "good life".
- Luiz Cunha, from a previous generation, proposes a "Non Bureaucratic Plan for the reconstruction of the City of Angra do Heroísmo, Terceira, Azores": a giant ring road for the rebuilding of the island. "Non-bureaucratic", as mentioned, but somewhat threatening. More than a utopia, it looks like a dystopia.
- In the "Project" by Tomás D'Eça Leal, the influence of Aldo Rossi and of the neo-rationalists is evident, as it was common in that years: "pure" forms rendered melancholic and festive at the same time.
- The "Architectural drawing (Macau)", by Vicente Bravo Ferreira, a wavy and monumental structure has some surrealist tones, not far from the Delirious New York-era projects.

The issue no. 149 of the magazine *Arquitectura* also published in 1983 and dedicated to the Novíssimos – the "very new" – has many participants in

#23

common with the Depois do Modernismo exhibition and shares the same goals. José Manuel Fernandes, the editor, wrote about a "lost generation (…) as a coherent and collective project" but stresses what he understands as "a greater attention to the formal, symbolic, vernacular, historical aspects of architecture".

Some examples displayed as a mosaic:

- In the "Urban Intervention in Castro Verde", by Victor Mestre, there is a recurrent emphasis on axial and monumental composition.
- In the "Housing in Chaves", by João Vieira Caldas, classical motifs by way of collage return to domestic architecture.
- In the piece "Columns" by Manuel Graça Dias, a collection of columns from Macau, Lisbon and Chaves aims to say that all is relative; all is beautiful.

Figure 1 Manuel Vicente, José Daniel Santa-Rita, Casa dos Bicos (House of Spikes), Lisbon, Portugal, 1981-1983. Archive: Fundação Instituto Marques da Silva.

Figure 2 Alcino Soutinho, Matosinhos Town Hall, Portugal, 1980-1987. Archive: Fundação Instituto Marques da Silva.

Figure 3 Manuel Graça Dias, Egas José Vieira, Portuguese Pavilion Expo'92, Seville, Spain, 1989-1992. Archive: Fundação Instituto Marques da Silva.

- In the set of proposals by Manuel Lacerda, we return to Rossian motifs of classical inspiration idealistically trying to recapture a lost urbanity.

In the issue no. 3 of the *Arquitectura* Portuguesa magazine (1985), dedicated to Arquitectos Pioledo and in the catalogue of the New Architecture in Trás-os-Montes, an exhibition of the same group of architects (with Graça Dias, Egas José Vieira and Júlio Teles Grilo), held in 1987, in La Coruna, Spain, we find a display of postmodernist architecture.

The Pioledo office, created in Vila Real by António Belém Lima, was a singular event in the history of Portuguese architecture. For the first time it reunited a collective of architects from the Porto and Lisbon schools working out of the main cities. This "experiment" is registered in these two publications. Some examples displayed as a mosaic:

- The Library in Alijó, by Graça Campolargo, crosses images of the classical tradition, a bold approach that is recurrent in the Pioledo group.
- Also by Campolargo, the "Pharmacy" in Mateus has a modern plan and traditionalist elevations in a "double coded" approach.
- The "Stage" in Sabrosa, by Carlos Baptista, is a postmodernist evocation of agitprop constructivist architectures, also recurrent in the Pioledo fashion.
- Sometimes these exercises take an almost cartoonish character as it happens in the "José Caldeira House", Vila Real, by Albino Teixeira, which looks like a locomotive made out of classical motifs.
- In the "Handicraft Centre", Chaves, Manuel Graça Dias shows no interest in classical imagery but instead tries zoomorphic models, not of pet animals but of wild animals of unknown origin.
- The work of Júlio Teles Grilo, like the "House" in Chaves, has this telluric expressionism, very far from modernist hygienism or any other canonical tradition.
- The drawings of the "Mirandela House", by Egas José Vieira, are a demonstration of a baroque use of modernist plans and imagery, in juxtaposed and intersected spaces, not really open or "libre".

5. THE PARTY IS OVER: THE PORTUGUESE PAVILLION FOR THE EXPO'92, SEVILLE

The "Depois do Modernismo" event as a generational project culminated in the Portuguese Pavilion for the Expo'92 in Seville, by Manuel Graça Dias and Egas José Vieira, two architects already mentioned. This building was a synthesis of the spatial and graphic research developed over the 1980s by its authors, combining erudite geometries with pop textures, architectural and decorative elements, without distinction or hierarchy. Being an ephemeral pavilion, the context was perfect for an experimentation that was understood as an opportunity to expose Portugal as a proud mixed and hybrid country. As Portugal is the result of many contradictory historical layers, so the building was full of fragments and accidents and "stories" to tell. Its anti-

monumentality also aimed to express a country without colonialist or imperialist residues but, in any case, and in its own way, European. The Seville Pavilion was also a singular appropriation of postmodernism: a patchwork of ideas, high-tech architecture made with poor materials, apparently improvised steel structures, and a chaotic decorative use of the traditional blue-tiles.

The Seville Pavilion expressed the idea of a modern country, soon after Portugal joined the CEE/EU (1986). A very revealing photograph show us the by then prime-minister Cavaco Silva rejoicing at the model display of the structure while the Spain prime-minister Filipe Gonzales looks at it very attentively.

6. CONCLUSION

Portuguese postmodernism was closer to the temporal ambivalence and fictional sensibility presented by Heinrich Klotz in *The History of Postmodern Architecture* than the taxonomic surveys portrayed by Charles Jencks. As Klotz wrote in its attempt to define postmodernism, "not only function but fiction as well"[5], or what he called the "fictionalization of architecture." This precept permeates his reading of the movement, and it's a crucial key to understand the Portuguese experience.

All the cases described or mentioned in this paper aimed to cross architecture with other artistic expressions, in an almost delirious state. They had a sense of urgency, an almost violent desire to intervene in the public and/or in the intimate arena. Frequently they are, at the same time, playful and sinister, festive and somber.

The body of architecture was subjected to mutilations, dissonances, reconstitutions, fragmentations. As a consequence, the human body was put to a test and architecture became a trial, an ultimate experience. Architecture dressed up for the night: with pediments, porticoes, arches, round openings, columns, flags, friezes, rainbow colors, accidental geometries, constructivist dilacerations, free-style traditionalisms.

The anxiety but also the playfulness of that era is expressed in the photograph of António Variações with "scissor eyes", and in the drawing of the "concrete gums" of Graça Dias, preparing to bite. The 1980s in Portugal were the stage of countless mundane, populist and turbulent buildings and designs, almost authoritarian in their will to communicate. Democracy was finally at work. ■

ABSTRACT

Sergio Jaretti (1928-2017) and Elio Luzi (1927-2006) were active in Turin, Italy, from the mid-1950s onwards. Their work, both praised and criticised over time, is today at the centre of a process of investigation and critical re-evaluation, which is leading to the recognition of its density of themes and meanings.

In one of their first buildings, the Obelisk palace (1954-59), the two architects express, in a provocative, ironic and surreal manner, a radically critical position concerning the orthodoxy of the modern movement. After having underlined their position, Jaretti and Luzi pursued their research between the 1960s and 1974 (when their professional paths parted), with an approach at times appearing uniquely analogous to certain northern European works. This paper, availing itself of archival and bibliographic research and of the direct analysis of the buildings, focuses on this phase of the architects' production, including outstanding works such as the via Curtatone house (1962-65), the Pitagora towers (1962-68) and the Mirafiori tower (1970-74). We aim to underline the experimental features of such works, which emerge both in discontinuity and continuity with some of the themes of the modern movement. Indeed, on the one hand, one can notice the adoption of a renewed *plan libre*, which leverages the enjoyability of living spaces, even in the relationship with the outside environment; and on the other hand, one can identify an expressive use of materials, which rejects any mythologization of technological innovation.

1. THE BEGINNINGS

"I am not a rationalist, but I am a functionalist": this statement by Luzi is emblematic of an attitude free of ideological or formalistic superstructures that accompanied the entire oeuvre of the architects from Turin Sergio Jaretti Sodano (1928-2017) and Elio Luzi (1927-2006). The careers of the two architects unfolded almost entirely in north-west Italy: after graduating with Carlo Mollino from the Faculty of Architecture at the Politecnico di Torino and some very early work carried out separately, in the mid-1950s Jaretti and Luzi formalised a partnership that would last until 1974, when their paths separated. Their work together was almost entirely dedicated to the theme of the residence and produced only a few, mostly unsystematic written reflections.

The work that ensured their immediate recognition at a local level and some resonance (and controversy) at a national level[1] was the Obelisk palace (1954-59)[2] in Turin. The building featured a tight articulation of interior spaces, flats organised on several levels or with double-height ceilings, and no repetitive floor plan. Staircases, mezzanines and perspectives from interior balconies, through to the rooftop "belvedere", multiply the viewpoints and the possibilities of enjoying the space, reinterpreting some recurring elements of the villa typology. These distributive features, however, took a back seat in the general perception of things compared to the completely unorthodox appearance of the building. An envelope "continuous and flexible like human skin"[3], made of artificial stone elements, characterises the building, evoking forms of Catalan modernism and aspects of Wright's research. It was a real virtuosic tour de force for both designers and construction companies. The architects openly stated their intention to move away from what was perceived as a stale and academic late-rationalism, with a touch of irony and a certain surrealism. They weren't alone: in 1957, the publication of the Bottega d'Erasmo and other works by Gabetti and Isola and Giorgio Raineri in *Casabella-Continuità*[4] gave rise to controversy over the "Italian retreat" from the modern movement[5] and introduced the term "neoliberty" (greeted with some annoyance by those involved) into the debate[6].

Considered in the context of Jaretti and Luzi's professional and cultural journey as a whole, the initial venture of the Obelisk palace seemed to be a demonstrative element, both for the architects and for the construction company (Manolino) with its craftsmen. The architects continued their unconventional research with relatively simpler solutions in other buildings during the 1950s (the Manolino house in Chieri, 1955-56; the house in via Pietro Cossa, 1956-57; the house in piazza Statuto, 1958-59[7]).

2. HOUSES, "STIMULATING DOMESTIC LANDINGS"[8]

In the 1960s, during the intense building activity that accompanied the Italian economic boom, the two architects continued their research into residential themes. It can be difficult, considering formal aspects alone, to establish links between the works of the first period and those of the decade that

followed: however, several lines of continuity can be traced in the pursuit of personalisation of living spaces and in the experimental tension focused on the technical and material dimension of design.

At the same time, however, we can see a decisive and highly original progression beyond that, in a direction that seems to find points of contact with certain experiences outside Italy. In addition to the houses in via Saluzzo (1960-62) and corso Orbassano (1961-62), and the "sister" villas that the two architects built for themselves (1963-65), among the works completed during this period, the house in via Curtatone (1962-65) and the Pitagora towers (1962-68) best highlight the most innovative features of this research, which also relies on an ironic and astute interpretation of building and town-planning regulations.

Exploiting the contradictions between the maximum volume allowed by building regulations and the smaller volumes actually permitted by the new Master Plan of Turin (1959)[9], the two architects organised the project according to what they called a "desirability diagram", emptying the buildings at the base and concentrating the habitable surfaces increasingly on the upper floors, with flats that were progressively sunnier and quieter, as well as more commercially attractive.

Certain themes typical of the Modern, from which the young Jaretti and Luzi seemed to have ostentatiously distanced themselves from the Obelisk palace, reappear in a manner revisited to the point of being almost unrecognisable, in the search for expressiveness and the humanisation of architecture: the pilotis plan, the distinction between structure and non-bearing enclosure, windows *en longueur*, the *plan libre*, the intensive building developed vertically.

Having abandoned the traditional bourgeois atrium of the multi-storey house, the ground floor became a unique pilotis floor, with cylindrical reinforced concrete columns flanked by a multitude of other brick columns, introducing an element of spatial complexity and at the same time functional ambiguity, as their actual reason for existing (they house the ducts for the systems, downpipes, rubbish chutes) was not immediately comprehensible. In the house on via Curtatone[10] this space is articulated, at different heights, around two circular water tanks. Their roundness is reflected in the walls around the staircase and the lift shaft. It is a joyful artificial landscape, rich in stimuli, which welcomes and accompanies the inhabitants, and was conceived in direct relation to the outdoors.

The "tree-like" structure of these buildings, expanding upwards, disintegrated façades, decomposed volumes and allowed for great freedom in the organisation of the plans of the different floors (there is no "standard plan"). In via Curtatone, the flats, which are all different, still seem to reflect the villa typology: inevitably side by side, but separate in their singularity; designed for unknown inhabitants, trying to guess their needs and desires; characterised by windows and large balconies, but generated by a centripetal plan which, seeking an intimate dimension of living, is organised on each floor around the distribution spaces and internal cloisters.

The same themes return with ever greater intensity in the Pitagora towers[11]; the designers adopted an isolated block type, ensuring ventilation and multiple views. The design envisaged the successive realisation of three tower buildings, linked by a continuous porticoed basement. In the tower at the corner with piazza Pitagora, in particular, the irregularly shaped plot required the design of a multi-faceted volume, ruling out all standardised composition of the façades. The construction system, similar to that of the building in via Curtatone and many other constructions by Jaretti and Luzi in the same years, also took on the role of defining a common language, flexible and adaptable to the different situations of a large building site. The load-bearing structure in reinforced concrete and the brick cavity walls are exposed, as they are in many other buildings of the time. But this current technology is reinterpreted here in an entirely original way: the circular columns adopted on the pilotis floor, slender and therefore paired two by two, produce a sort of fragmentation and intensification of the sightlines, and are connected to the square-section pillars of the upper floors with a DADO system. For the cavity walls, Jaretti and Luzi "invented" a solution that was both economical and capable of alluding to a masonry tradition well rooted in Piedmont, with the adoption, for the outer wall, of solid facing shiner bricks, with the frog (intended in the normal position to house the mortar) shown with a decorative function. In order to keep the roller shutter boxes flush with the interior walls, the thin cavity walls (30 cm) were thickened in correspondence with the openings and projected towards the outside, articulating the design of the elevations by means of subtle and continuous variations. This solution was complex to implement and, having initially been made possible by an artisanal organisation of the building site, was abandoned in the third and last tower, built almost in the Seventies.

Every solution chosen was adopted on the basis of functional reasons and incontrovertible, almost "natural" chains of logic, applying a "method [of design] of 'fighting collaboration' [...which] led us by painful but inexorable degrees to discard all solutions that, having only formal arguments on their side, failed to prevail over the enemy collaborator, and to accept, sometimes with repugnance, choices based on 'objective' arguments"[12]. A similar reasoning would later lead Luzi to highlight the need to dispose of every preconceived idea on both the "construction elements" and the "spaces" they delimit, abandoning the terms generally used to define them. In order to convey the idea, he stated: "not 'windows' but holes to catch the light, so never a 'window' (a done and standard idea) but something different in each specific case"; and "cancel labels such 'balcony', 'living room' [...] and reinvent 'space for being outdoors in the dwelling not at ground level', 'a place to see friends, or carry out activities in the home during free time, etc.'"[13]. Tracing human functions and activities has no "purifying" connotation here, on a formal level, but rather that of responding appropriately to the implicit demands of the inhabitants. In these ways, however, the two architects developed a figurative language that was to become their distinctive stylistic signature.

3. "TECHNICOLOUR FOR THE CITY WITHOUT QUALITY"[14]

In a later phase, between the end of the 1960s and the early 1970s, Jaretti and Luzi's confrontation with the demands of student protest and their reflection "on the limits of a professional activity that is increasingly perceived [...] as a place of mediation of decision-making processes implemented outside and above the field of expertise"[15], led the two architects to explore new approaches, as in the residence in via Ormea (1967-70), the residential and commercial building in via Breglio (1969-71), the residential complex in strada del Drosso (1970-74) or the Mirafiori tower (1970-74), the last of which was to be completed jointly. Despite a growing mistrust in the

architect's possibility to influence the city's growth processes, Jaretti and Luzi did not renounce the use of alternative and, to some extent defensive, strategies in the face of the rigidity of urban planning constraints and the decline in the level of skill possessed by the workforce.

The ironic attitude towards any ideological or bureaucratic superstructure seemed to transcend into, at times, bitter sarcasm: experimentation with the use of colour and "catalogue" materials took the place of elaboration "based on design". In the architecture built during these years, the distinction between the supporting elements and volumes supported becomes more and more evident, bringing to the fore a structural grid with a rigid orthogonality.

In the Mirafiori tower, in particular, the cylindrical pillars now almost adhere to the outer walls, highlighted by the chromatic contrast between the black-painted concrete and the concrete block façade walls originally conceived to shimmer in natural light. Unrestrained use of colour also characterises the balcony parapets, the shutters and, as a further pop element, the cylindrical coloured fibreglass cabinets highlighted on the balconies. The dense composition, set on a predefined floor plan, culminates in a paradoxical rooftop pool covered by a parabolic vault.

That of Jaretti and Luzi is a mocking approach that does not represent a formal rejection of the themes of Modernism (as upheld by most post-Modernist interpretation), but a last ditch attempt to humanise a context, both in terms of design and regulation, in which the degrees of freedom of the individual – designer and inhabitant – are increasingly reduced.

4. LOOKING AROUND

Jaretti and Luzi were never interested in a structured theoretical elaboration, which they always regarded with suspicion. Part of their own expressive research seems, instead, to be based on the careful and critical analysis of the day-to-day reality of the profession and of regulatory constraints, on the observation of changes in building production and construction sites.

They did not work within the academy, but for a brief, late exception in the case of Luzi, and their works were only partially published. This unabashed "splendid isolation" which, in retrospect, they proudly claimed[16], did nothing to facilitate the consideration of their works by critics.

The two Turinese architects have always moved with great freedom between the dogmas and anti-dogmas of modern architecture; their re-elaboration of some typical elements of Modernism poetics does not derive from a preconceived distancing, but from a profound critical and liberal spirit, and from an attitude that always places man's "pursuit of happiness" at the centre.

Some aspects of their work present similarities with the coeval research of architects such as Aldo van Eyck and, above all, Herman Hertzberger. There are no documented exchanges between Jaretti and Luzi and the Dutch group, whose architectures began to be published in Italy, apart from a few exceptions[17], in the second half of the 1960s, and no evidence that

the two Turin architects knew Habraken's seminal book[18], published in Italian only in 1974. However, it seems interesting to highlight a certain "evolutionary convergence" going beyond the Modern Movement, which was more methodical and "scientific" in the Dutch case, and more intuitive in the Italian. Besides the similarity of certain constructive and formal solutions (DADO-column system, exposed brickwork or concrete blocks), an expressive use of materials that rejects all mythologization of technological innovation and the idea of technical progress as a value in itself, as well as certain predilections in the organisation of space, it is the humanistic approach and faith in the possibilities of architecture to interpret changes in society and improve human life that seems to unite the work of Jaretti and Luzi and the Dutch architects.

Some research documents, following the separation of the two architects, still show the interest (at least of Jaretti) in an open design approach, with reference to the experiences – as well of Habraken – of Alexander, Erskine and Kroll[19].

The research conducted so far does not permit us, at least for the moment, to draw certain conclusions, but it opens up the complex question of placing Jaretti and Luzi's work in not only an Italian but a European scenario. At the same time, the research contributes to highlighting the complexity of the evolution of Modern themes, through non-obvious paths. ■

ABSTRACT

Parque Guinle is a residential complex in Rio de Janeiro, with its master plan and initial buildings designed by Lucio Costa. Despite the original 1948 master plan envisioning six buildings, Costa only constructed three blocks in the 1950s. The design for the remaining buildings was undertaken by the brothers Milton, Marcelo and Mauricio Roberto, over ten years later, between 1954 and 1963. The temporal gap between the two groups of buildings designed within the same complex allows for an intriguing comparative analysis. Roberto brothers' buildings incorporated a revision of modern paradigms, reexamining fundamental compositional elements under a new formal interpretation.

One aspect becomes clear and illustrates the transformation of a fundamental design principle into the identity of Brazilian architecture – the pilotis. The concept of pilotis was explored by Costa to its full potential in Parque Guinle, configuring these spaces as a flexible element, an articulator between the ground and the building, fullness and emptiness, and public and private. Costa had already interpreted Corbusier's lessons, incorporating the idea of free ground floor and advocating it as design strategy perfectly suited to tropical climate. Parque Guinle, with its rugged topography and abundant vegetation, constituted a modern experience of ideal implementation to test the conceptual and formal attributes of the pilotis as a space-configuring element and adaptation to the terrain.

This article aims to approach the differences between these buildings, focusing on the set designed by the Robertos' in this later phase of modern architecture. The work seeks to revisit the original concept of pilotis as established by Corbusier and as interpreted and applied by Costa. Goal is to identify the main points of mutation or deviation from these concepts in these works of Robertos'. Revision of concepts can highlight the timeless nature of certain strategic design principles that go beyond modernism.

1. INTRODUCTION

Located in Laranjeiras, Rio de Janeiro, and considered one of the icons of Brazilian modern architecture, Parque Guinle is a private urban park housing with a set of three buildings designed by Lucio Costa between 1943 and 1952. Known as one of Costa's major works, the original urbanization plan for the park comprised six residential buildings, of which only three were constructed. Subsequently, between 1956 and 1962, Marcelo and Milton Roberto completed the complex, occupying the land area originally intended for the other three buildings planned by Costa. Following the original layout designed by Costa, the Roberto brothers' project consists of six buildings composing an elongated flexed bar. The temporal gap between the two groups of buildings designed within the same complex enables a curious comparative analysis.

This article aims to explore the differences between the two projects, focusing on the complex designed by the Robertos', as they incorporated a revision of modern paradigms through their fundamental compositional elements under new formal interpretation. The research method includes a comparative analysis of drawings, site visit, original writing by architects and also recent theorist works. The creation of a drawing that unified the six buildings Roberto's buildings was also fundamental for this work's development.

The analysis begins by acknowledging that the second set of buildings shares common denominators with the first. However, whether these aspects are related to the author's formal commitment to some principles of modern architecture or simply working within the same site and program constraints is something this work seeks to clarify.

When Costa designed the buildings for Parque Guinle, his role as key figure in Brazilian modern architecture had already been established for at least a decade. Costa had already established significant experience working with elements and design strategies propagated by the avant-gardes of early 20th century. This role was solidified in 1936 when he simultaneously brought Corbusier to Brazil and led the team that designed the Ministry of Education and Health in Rio, a seminal work. The connection between Costa and Corbusier is a crucial point for understanding the early years of modern architecture in Brazil, but it is not, precisely, the endpoint. Costa tested the universality of some design principles canonized by Corbusier, giving them a local character and exploring the potential for formal mutation of each of these elements, especially pilotis and brise-soleil.

2. PILOTIS, LE CORBUSIER AND LUCIO COSTA

The origin of the term "pilotis" harks back to its very etymology before being incorporated into the terminology of modern architecture. In 20th century's second decade, a new concept was attributed to the word when Corbusier established a broader sense for it than its traditional definition. From that moment on, the word "pilotis" acquired status of a propositional formal configuration, a meaning that went beyond designating a structural construction element; it represented the recovery of the ground.

By elevating the interior of the house, the entire surface below it could be used for "recreation, parking, or continuation of the garden under the house[1]." In 1925, Corbusier published in the *Almanach d'Architecture Moderne* a first drawing in which he introduced the idea of pilotis. A parallel was drawn by placing side by side drawings of a traditional building with load-bearing walls and his modern proposal. In the latter, the independent structure freed the ground level from continuous foundations, eliminating the solid base to support the building.

In Brazilian architecture, the use of pilotis is directly related to typological transformation since the modernist movement, both as formal element and as organizing strategy for site layout and flow relationships at the base of the building, establishing new permeability relations. During the 1930s, Costa absorbed the ideas put forward by Corbusier, advocating for pilotis and independent structures as elements of Brazilian modern architecture. The multifaceted nature of pilotis usage and the analogies of this concept were frequently raised in Costa's texts and project memories, as well as the reference to Corbusier as author of these principles.

> "*...the adoption of the construction system advocated about twenty years ago by Le Corbusier and P. Jeanneret, and now, so to speak, incorporated as one of the fundamental principles of modern architecture – the 'pilotis'*[2]."

Such considerations are reinforced by Costa, referencing the construction traditions of Brazilian architecture and their connections to antiquity, emphasizing the feasibility of materializing these spatial attributes using reinforced concrete. Furthermore, the innovative sense of employing pilotis in Parque Guinle, as well as the influence of Corbusier's experiences, are highlighted by Costa:

> *I then advised for a contemporary architecture that was more suited to the park than to the mansion, suggesting that the elongated six-story buildings should be raised off the ground [...]. It was the first set of buildings constructed on pilotis and the harbinger of Brasília's superquadras*.[3].

The recurrence of pilotis in Brazilian modern architecture was evident in publications cataloging national production in the 1950s. In *L'Architecture Aujourd'hui*, from 1952, Giedion mentioned the use of this design strategy and the encouragement of urban legislation for the creation of pilotis: "In the tropical climate of Brazil, pilotis are entirely justified. Today, the use of pilotis has become so widespread in Brazil that regulations allow for an additional floor to be added to any apartment building project where pilotis have been planned[4]."

The number of works built from a vocabulary common to modern architecture expanded in the country from the 1940s onwards. Office buildings and apartments emerged in major urban centers, alongside the construction of complexes like Pampulha (1940), by Niemeyer. From the 1950s, the plastic

potential of reinforced concrete began to be explored in the design of structures with sculptural forms. Niemeyer increasingly gained prominence nationally and internationally and incorporated the use of pilotis in larger-scale housing projects, such as JK Building (1951) in Belo Horizonte.

3. LUCIO COSTA X ROBERTO BROTHERS

3.1. SITE PLAN RELATIONSHIPS

The Parque Guinle´s buildings are situated on a spacious plot that conceptually approaches the idea of city within the park, from the perspective of the lot itself. The terrain, with inclined edges and an oval depression in the middle, is bounded to the south by Gago Coutinho Street and to the west by the park and the mansion.

Costa's layout, in broken line, forms a section of an arc. Consequently, two of the buildings, Bristol and Caledônia, were positioned along the slope of the terrain, with their main facades facing afternoon sun, as well as towards the park and the unique view towards the mansion. The third building, Nova Cintra, the first to be constructed, was aligned with Gago Coutinho Street, establishing a transition between park and city. Unlike the others, which have ground floors with pilotis interspersed with gardens and access gates, Nova Cintra, due to its more urban condition, has shops and services on the ground floor, arranged slightly above street level and accessible through a garden.

The Roberto Brothers' buildings are situated at the highest part of the terrain, following Paulo Cesar de Andrade Street in a boomerang-shaped bar, in the area of greatest elevation change within the park. The terrain is configured as a large, elongated parcel, with significant slope from north to south, measuring approximately 210mx60m. The extreme topographic character of this implantation zone is reflected in the relationships between base and ground, delineating notable formal differences compared to Costa's blocks.

3.2. ABOUT THE BASE LEVEL

The first point that differentiates the volume of the Robertos' from Costa's buildings is the presence of a continuous solid base below the pilotis, which acts as leveling element, accommodating the condominium's basements. This stone-clad base is higher in the eastern half where the slope is steeper and gradually decreases towards the west, allowing direct access from the street to the last building, Guarapes, the only one of the six blocks with pilotis at ground level. Functionally, the use of pilotis in both projects is justified by a common reason – organizing accesses and establishing covered and open levels at the buildings' base, overcoming the site's topography. What differentiates each approach is the relationship between solids and voids, proportion, and design of the elements in the base and the body of the bars.

The solid base close to the ground plays a fundamental role in configuring the pilotis in Robertos' project. The open and covered spaces arranged along this platform are integrated and have permeable access between them, creating an elevated promenade relative to the street, amidst the treetops and with privileged views of the park. Visual permeability is not complete due to

the layout of the arc-shaped implantation and the elements arranged along this sequence of pilotis, such as entrance spaces, storage areas, front volumes of garages, and the structure's support planes. Access to the intermediate parking levels is provided by stairs and ramps positioned along the pilotis, similar to the arrangement in Costa's Bristol and Caledônia pilotis.

3.3. SHAPE OF PILOTIS

Another striking difference concerns the pilotis' shape and height, as well as their involvement configuring spaces at ground level – although, in both cases, the pilotis floors are equally responsible for accommodating the level differences caused by the rugged topography. In Costa's buildings, the Dom-ino system with flat slabs and pillars positioned set back from the facade plane reduces the structure to a minimum; pillars are lightweight and circular in section, therefore, punctual, with a diameter of 0.40m. They form a regular grid, with structural spans of 4.20mx6.20m in Bristol and Caledônia, with heights ranging from 6.00m to 2.50m; and 4.10mx4.40m and 4.10mx6.80m in Nova Cintra, with constant height of 5.00m. In Bristol and Caledônia, the double height of the pilotis occurs at the lower ends of the street, allowing the insertion of ramps and stairs and their plastic exploration as spatial configuration elements, as well as accommodation of semi-buried underground garages, while in Nova Cintra, the flat character of Gago Coutinho Street enables consistency in the height of the pilotis and the ceiling height of the lower floor.

In the case of the Robertos' buildings, the structural spans are varied, and the pillars are trapezoidal, with a rectangular section, with dimensions that can reach 1.50mx0.40m. Thus, they take on the form of blocks or support planes, which gives greater weight to the structure visible at ground level. The presence of these planes, as well as the double height of the pilotis, configuring a common base with two floors in all six buildings, gives the Robertos' buildings less spatial fluidity and less visual permeability than in Costa's design. Furthermore, the fact that the pilotis floor is significantly above the street level in Robertos' complex disconnects the building from the park and from the area´s urban context.

3.4. VOLUMETRY, SOLIDS AND VOIDS

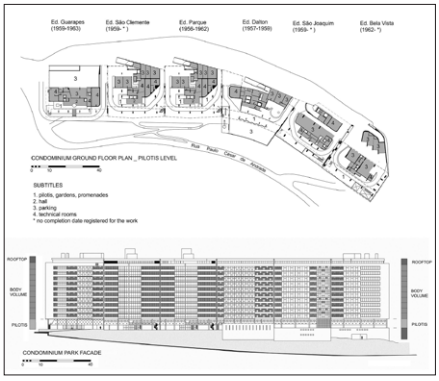
Comparing the project's volumetry, it is observed that the idea of isolated blocks was set aside in the six new buildings, but common concepts were kept in the bases´ configuration. While Costa designed six-story blocks on pilotis plus a roof, with prismatic geometry, the Roberto Brothers present an irregular ten-story bar plus a roof, designed with inflections that follow the terrain's shape. Despite the buildings forming a continuous bar, the lobbies and vertical circulations of each block are independent.

Analyzing the facade facing the park and its volumetric composition at the base and pilotis, in the Robertos' buildings, another element stands out – a continuous plane of perforated masonry, set back from the apartment volume. This plane establishes kind of intentional visual barrier, closing off the

parking areas present on all intermediate levels contained within the pilotis' double height. The design of this plane touches the upper slabs in a zigzag form. Its circular perforations evoke nautical hatches and are positioned in regular rhythm along this wall clad in ceramic tiles of green tone.

In Robertos' design, the use of more solid planes than voids are recurrent. There's the perforated zigzag, the stone-clad base with small ventilation openings in the sublevels, as well as other stretches of masonry arranged along the pilotis that function as dividers of open spaces. The design of these elements' further distances Robertos' buildings from the delicate and lacy lightness of the cobogós or brises of Costa's early buildings in Parque Guinle. The facade of the Robertos' complex facing the park lacks solar protection elements and lacks equivalence between the modulated rhythm and the structural grid, something clearly visible in Costa's design. At the detailed scale, the interest of the Robertos' was already moving in a new direction, more in line with the brutalism that was emerging from São Paulo school than with the lightness of Rio's school.

4. CONCLUSIONS

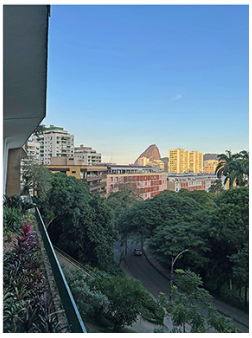


The study of the project developed by the Roberto Brothers for Parque Guinle clearly shows its origin in Costa's original plan. Like Costa's first buildings, the new set of buildings respects the location of the blocks and follows the same volumetric plan, with a tripartite organization in base, body, and crowning.

The mainly aspects that determine differences between the projects are interconnected by the base solution and its repercussion to the building volume and the global image of them. These characteristics are linked to the pilotis concept, its structural and space elements. It is possible to affirm that Lucio designed the pilotis in Guinle Park to accommodate the building base to the terrain, while Robertos' create a base to level the pilotis. Their project explores the idea of a base to accommodate topography and organizes the ground floor on pilotis under the apartment volumes, all with same height profile. The topography and the program with much more parking needs was probably decisive to make the solid base close to the terrain. Lucio`s projects demonstrate diverse ways to relate to the ground and the pilotis to the building body, which gives more lightness to the base.

Some Corbusier´s first projects brought the idea of creating a base to level the pilotis and organize an upper ground floor under the same concept, as in Stuttgart Weissenhoff (C2 house) or in Durand, Argel. But he also proposed the pilotis touching the ground under sinuous habitational buildings between the city mountains, in his utopic urbanism project for Rio (1929). Again, it is clear that the flexibility of the concept was captured by Costa, and later, by Robertos' going back to the Corbusier`s ideas.

However, the Robertos' design presents a more robust and heavy structure in the pilotis. This weight in Robertos' complex is accentuated by the use of ceramic tiles in darker colors than those present in Costa's buildings. Although the Robertos' didn't abandon visual permeability and



#23

accessibility of the pilotis, there is a notable expansion of solids in relation to voids. Part of this is due to the recurring presence of perforated colored masses and the multiplicity of geometries in the ground and intermediate floor masonry, both in plan and section.

The question surrounding the structure's form refers to a series of works that began to detach from Dom-ino system, with its first lightweight and circular-section pilotis, as initially explored by Corbusier, Costa and Niemeyer. These include Corbusier's Swiss Pavilion (1930-31), as example of an experimentation with more robust concrete structures as spatial configuration elements of the ground floors, with sculptural pilotis with rounded forms; or even buildings contemporary to the experiences analyzed here, such as

Corbusier's Unité d'Habitation in Marseille (1945-52), whose pilotis take the form of double trapezoidal planes with rounded edges, or Niemeyer's V-shaped pillars used on various occasions with various configurations, such as JK Building (1951) in Belo Horizonte, and Lagoa Hospital (1952-58) in Rio. Niemeyer's V-shaped pillars differ greatly from Corbusier's sculptural ones, but both are formally aligned with an idea of mutating from lightweight and punctual circular-section pilotis to more robust flat structures.

That said, although we can draw parallels in search of what was being built in Brazilian and world scenario in the 1950s, seeking a contextualization of the projects in question seems less relevant than highlighting their points of mutation towards brutalism and postmodernism. The recognition of this gradual abandonment of punctual supports in favor of planar ones brought losses in terms of fluidity and permeability of spaces in pilotis at the housing scale. On the other hand, these mutations demonstrate a clear commitment to specific constraints of this project, which, while remaining aligned with the typology of the bar on pilotis, explores a formal freedom related to its structural and programmatic demand, without fear of seeking sophistication in the robustness and a more exuberant plasticity of architectural elements. ■

FRENCH NEW TOWNS: LAST "AVATAR" OF THE WELFARE STATE OR AVANT-GARDE PROPOSALS?

CATHERINE BLAIN
IPRAUS/AUSSER (UMR 3329 CNRS),
ÉCOLE NATIONALE SUPÉRIEURE D'ARCHITECTURE DE PARIS-BELLEVILLE

ABSTRACT

At the end of the 20th century, nine new towns were developed in France: five on the outskirts of Paris (Évry, Melun-Sénart, Marne-la-Vallée, Saint-Quentin-en-Yvelines, Cergy-Pontoise) and four located near other major metropolitan areas (Le Vaudreuil/Rouen, Villeneuve d'Ascq/Lille, L'Isle d'Abeau/Lyon, Rives de l'Etang de Berre/Marseille). These new towns, which were intended to accommodate 100,000 to 500,000 inhabitants, were planned between 1965 and 1969 by France's Welfare State in order to cope with metropolitan growth. However, projects likely to meet this objective had yet to be defined. While the State provided new planning tools (*Land Orientation Act*, 1967), the issue was handed over to multi-disciplinary design offices created on each construction site. How was their ambitious mission brought to life, and what did it achieve? These questions have remained largely unanswered due to a lack of expert knowledge and inquiry into this matter. Literature on the history of urban planning in France has already dismissed these new towns as failed experiments, considering them to be the last "avatar" of modernism (Roncayolo, 2001) — in line with mass housing projects, seen as symbols of the Government's failure to provide adequate living environments. Nonetheless, research is underway to gain better insight into the recent past. In furtherance of this research, the aim of this paper is to reassess the place of French New Towns in urban history and urban planning. My hypothesis is that these projects were the result of a productive marriage between 20th-century urban planning expertise and the post-war CIAM debate on "Habitat," which led to the birth of new avant-garde proposals. To develop this idea, I will draw on my ongoing analyses (based on a review of current literature, archival research and field surveys), comparing the first urban and architectural experiments carried out in three new towns: Le Vaudreuil, Évry and Villeneuve d'Ascq.

1. INTRODUCTION

Until now, there has been no comprehensive publication on the history of French new towns. Parts of it can be grasped by cross-reading various historical sources on Paris, which usually present the new towns as the final stage of the Government's continuing efforts to enhance the Capital's living conditions. Indeed, following Henri Prost's regional plan (1934), which provided the suburbs with public infrastructure (roads, railroads, waterways and sewers), a new study was carried out in the 1960s, leading to the idea of stemming the chaotic development of the suburbs by creating five new towns: Évry and Melun-Sénart in the south-south-east, Cergy-Pontoise and Saint-Quentin-en-Yvelines to the west-south-west, and Marne-la-Vallée to the east. This idea was also taken up in four other French regions, intended to balance the national development: Villeneuve d'Ascq in the *Nord* region (Lille), Le Vaudreuil in the Seine Valley in Normandy (Rouen), L'Isle d'Abeau in the Rhône-Alpes region (Lyon) and Rives de l'Etang de Berre in the Provence region (Marseille). Even if this recent past has yet to be understood, French historians have already consider these new towns as the last 'avatar" of modernism[1], in line with mass-housing projects seen as the Welfare State's failure to provide adequate living environments. But today, we are invited to re-evaluate this interpretation in light of recent research, such as the analysis of the urban and architectural qualities of the Parisian Garden cities (Pouvreau[2]) and of the great variety of housing typologies built in Dutch new towns (Spoormans[3]). Through this lens, my hypothesis is that French new towns should be considered as a result of a fruitful marriage between 20th century urban planning know-how and the post-war CIAM debate on Habitat (Avermaete et al.[4]), which led to the emergence of avant-garde proposals. To explore this hypothesis, the purpose of this article, which relies on an ongoing analysis (based on literature and archival and field surveys), is first to shed light on the common conceptual framework of French new towns, and then to compare three projects, from their urban design to their first experimental housing units: namely, Le Vaudreuil, Évry and Villeneuve d'Ascq.

2. A COMMON CONCEPTUAL FRAMEWORK

Intended to accommodate between 300,000 and 500,000 inhabitants in Paris, and 100,000 to 250,000 in the other regions, the French New Towns had two characteristics in common. Firstly, due to their large scale, they were classified as projects of national interest. This was a common procedure at the time, involving public funding and extraordinary land procedures (where parcels were either bought or expropriated) as well as the creation of a public administrative agency in charge of implementation. For the new towns, two hierarchical levels were created, each with specific duties and responsibilities: an Urban Design Office on each site, and a governmental Secretary, monitoring the nine projects. The second common characteristic of these new towns was their four main objectives: 1° to offer "new clusters" of employment, housing, equipment and public services; 2° to "facilitate" the resolution of traffic and transport issues; 3° to be "real cities", with

"living urban centres" and a jobs-housing balance; 4° to "constitute, by their experimental nature, landmark operations of contemporary urban planning"[5].

Apart from these objectives, which referred to a number of quantified program indicators (to be reached in 5 years), there were no real guidelines for project conception and implementation. On the contrary, there was an obvious intention to allow the definition of each project according to its on-site conditions. This was the task of the Urban Design Offices, placed under the responsibility of a civil engineer, assisted by a multidisciplinary team of architects, geographers, economists, sociologists and other experts, each of whom contributed a specific set of knowledge and experience. These team members were well aware of the social demands of the time, concerning the need for better environmental and urban conditions, as embodied in Henri Lefebvre's clarion call to create "with the new city a new urban life"[6]. The architects came from a range of backgrounds. Some were familiar with the French urban tradition (linked to colonial experience) and/or were acutely aware of the post-CIAM debate on Habitat and the contemporary modern architectural and urban research. Furthermore, the new town teams could rely on a wide range of references and theoretical or practical publications, including recent assessments of new towns abroad; some of these assessments were carried out during field trips, notably in Harlow and Lelystadt[7]. This know-how, relying on the 20th century planning methods dealing with different scales (ranging from outline plans to residential units), inspired the French projects, even though their scale and programs were not comparable. As defined by the *Land Orientation Act* (1967), three main operational documents would be used: the *master plan*, the *land use plan* and the *concerted development zone plan*, all of which were coordinated with one another.

In this context, the French teams were less utopian than pragmatic, attentive to existing conditions. In any case, the selected project sites were not barren lands: they extended over several municipalities, each having its own heritage of historic villages, existing public facilities and recent residential developments. As a result, there was no uniform method for designing new town projects. The first step always consisted in determining the circulation network, adapted to the practical realities of the site. Then began work on major public facilities, such as regional *Préfectures*, town halls or educational buildings, along with some housing estates. Within the new urban centres, whose progress was closely monitored, many projects were developed as experiments into the new research trend of the time, exploring the potential of a three-dimensional architectural and urban approach to enhance social environments, beyond the traditional opposition between individual and collective spaces. In the early 1970s, the State was to encourage this line of research by creating the new *Plan Construction* public entity, whose mission was to facilitate experimentation into open industrialization, in order to foster the advent of flexible and modular housing solutions that would be "better adapted, in the present and for the future, to the needs of society"[8].

3. BUILDING "LANDMARK OPERATIONS"

The three new towns of Le Vaudreuil, Évry and Villeneuve d'Ascq are representative of the design and implementation conditions described above. In the early 1970s, they were the stage of competitions which, organized with the advice of *Plan Construction*, were opened to construction teams comprised of architects, engineering offices, industrial firms and real estate developers.

3.1. LE VAUDREUIL: A THEORETICAL "CITY SEED"

This regional new town was intended to accommodate the industrial growth anticipated for the Seine Valley, from Paris to Le Havre (**Fig. 1**). The chosen site, located 25km upstream of Rouen, was a vast agricultural plain dotted with a few traditional villages and boasting a landscape with two impressive natural features: a cliff face and a great sand-pit lake connected to the Seine River. These "as found" conditions, crossbred with ecological concerns, offered the opportunity for theoretical research, inspired by Lefebvre's invitation to build "experimental utopia"[9]. Thus, instead of a master plan, the design team proposed the image of a "multifunctional urban organization for approximately 15,000 inhabitants", made up of four overlapping "networks": 1° *circulation*: a grid of primary roads and partially raised pedestrian paths; 2° *built volumes* (of variable heights, up to 5 levels), that could accommodate a variety of programs; 3° *open and natural spaces*; 4° *public facilities*, often grouped together to constitute "nodes" of social life. This study served as guidelines for the housing competition, launched in March 1971. The objective was to build the first "fragment" of the city, dubbed "City Seed", consisting of an "experimental programme" of 4,000 collective and individual dwellings and public facilities. The challenge was to define a construction system which, using standardised and flexible components, could be easily "assembled" and "disassembled" to meet the "changing needs of the urban society".

The competition was won in 1972 by the building team of architect Henri Beauclair, who had developed an innovative construction system. Based on a metal grid functioning like a Meccano set, and using prefabricated floors, façade panels and dry walls, it was able to generate a wide range of built typologies, ranging from individual houses to collective blocks of flats. The French press immediately celebrated this project as the advent of multipurpose constructions allowing future residents to configure their own apartments.

Implementation of this project did not live up to expectations since, for economic reasons, the Meccano-type system was replaced by concrete construction methods which, contradicting the flexibility intentions and used for the entire housing programme, generated a relatively monotonous built landscape. Nevertheless, the environmental quality of the project remained tangible, mainly through the public spaces, offering views over the natural panorama.

3.2. ÉVRY: A METROPOLITAN "URBAN CORE"

Open landscape was also a determining factor behind Évry's design (**Fig. 2**). Situated to the south-east of Paris, on a site that included a number of urbanized

9. Archival papers quoted in Blain, Catherine. "A Tangible Utopia: The Genesis of Built Experiments in French New Towns". In *Lessons from the British and French New Town: Paradise Lost?*, edited by B. Colenutt, S. Coady Schäbitz, D. Fée (Croydon: Emerald, 2020), 183-195.

areas, the project benefited from the presence of an expansive agricultural plain, allowing for a new urban configuration. Set in the shape of an X, representing 4 districts separated by 4 public parks, the master plan proposed a new multiple-use centre that was fully served by a train station. The main public buildings and facilities included a new regional *Préfecture* building and a university campus, along with several mixed housing and commercial complexes, a regional cultural centre and a shopping mall (named "Agora"). Intended as a bustling, mainly pedestrian "living urban core", it allowed for an overlapping of "open spaces and built volumes of varying heights"[10].

In May 1971, while the construction of certain public buildings was underway in the centre (notably, the *Préfecture* and Agora), a competition was organized for designing a first neighbourhood named "Évry 1". The construction site, located to the north of the centre, was an open space surrounded by four main roads (one facing a public park). Here, unlike in Le Vaudreuil, the guidelines were very precise. The project called for mixed-use development, including 7,000 dwellings (for rental or purchase), public facilities and commercial offices, all of which were to occupy the centre of the site, leaving the rest free for public spaces and gardens. The key themes were "openness", "continuity" and "complementarity" (between built and natural spaces), and "rhythm and contrasts." The project would also remain faithful to the reality of "the growing interest in the quality of the environment" and "the search for more space, flexibility and possibilities for personalizing the accommodation," while offering "a living environment favourable to the development of a new urban society."

The winning proposal was put forward by a multidisciplinary team: architects Michel Andrault & Pierre Parat, Paul Sirvin, Jean Macary and André Molle, and artists Bernard Lassus, Gérard Singer, Vincent and Yvette Aleaume. Revisiting a terraced-house project by Andrault & Parat using concrete posts and beam and slab elements (1966), the proposal featured a variety of building types following two principles: unity and diversity at different scales, and the integration of visual arts. Indeed, a "colour chart" was used to guide the arrangement of dominant, accentuating features (vegetation, building materials, light, and colours), and artwork was proposed to enhance public spaces (squares, streets, passages, etc.).

Only the first phase of the project was completed (2,500 dwellings). But the result met the promise to deliver coloured buildings in a variety of heights and dimensions (including pyramid-shaped collective units ranging from 3 storeys in height to larger 5 to 12-storey versions) and to provide diverse "effects of contrasts, redundancies, transitions or oppositions" of "visual sequences," ultimately creating "varied urban spectacles".

3.3. VILLENEUVE D'ASCQ: A "CAMPUS CITY"

Originally dubbed Lille Est, this new town demonstrates the effectiveness of using an institutional framework to build up an area that had previously been earmarked for large-scale public facilities. Indeed, its creation was approved in 1967, following a government decision to build two university

10. Quoted from *Cahiers de l'IAURP*: vol. 15 (1969) and vol. 31 (1973).

campuses in the eastern suburbs of the city of Lille: one for Sciences (Lille 1, opened in 1966), and the other for Arts, Literature and Law (Lille 3, slated for completion by the early 1970s) (**Fig. 3**).

The designated site was already occupied by several villages and new developments of terraced or detached houses (some built alongside a luxurious golf course) as well as many social housing estates. The main goal was to draw up a master plan allowing for the harmonious development of new urban clusters within the existing urban fabric. That was mainly achieved through the creation of the dual network for vehicles and pedestrians and a vast system of public spaces, encompassing a linear park with a chain of lakes and sports areas.

In January 1972, while the town hall, theatre and commercial centre were being built in the new urban core (Hôtel-de-Ville district), a housing competition sponsored by *Plan Construction* was launched to accompany the construction of the Lille 3 campus in the northern district of Pont-de-Bois. The project included 1,000 social housing units (one-third reserved for students), a 250-room university residence hall, and multi-purpose facilities (for social, educational, sports, and commercial uses), public areas and car parks. For the new neighbourhood, several design elements were to be respected, regarding: 1° the layout, flexibility and grouping of the "housing units"; 2° the environmental quality of the surroundings (including the vegetal and mineral spaces, street furniture, etc.); 3° giving precedence to the concept of "intermediate housing" by creating solutions allowing a single-family housing lifestyle within the collective complexes.

Alexis Josic won the competition with a project designed as a "system integrating and articulating spaces, solids and voids," in which housing units of various volumes could be "stacked and nested"[11]. As in the case of Évry 1, two building typologies were developed: 2 to 6-storey terraced housing groups that were accessible through a central circulation area, and large 10-14-storey collective units of flats (mostly duplexes) accessible through internal walkways located at every third level. In both typologies, a broad range of visual landscapes were created via the articulation of volumes through the interplay of recesses and the colours of the façades. This project was completed, albeit with a slightly greater number of dwellings. Large units lined the wide public space which, intended as an "urban theatre," included a variety of public amenities and shops, along with works of art installed in open-air meeting spaces and gardens.

4. CONCLUSION

Designed by architects who had closely followed the CIAM-Team 10 debates on Habitat, these three experimental projects were intended as "landmarks" of a new urban and architectural approach, offering an adequate environment to the needs and expectations of the new society. The success of such projects, largely financed by public funds, obviously depended to a large extent on political commitment. The advent of the oil crisis (1973) had a dramatic impact on their achievement. While their first housing projects were still

under construction, a barrage of criticism declared them too complex if not too expensive. From that moment onwards, neighbourhood projects conceived as a whole, offering a wide range of housing types and including vegetal or mineral, private or public spaces, were declared unrealistic.

This turnaround was evidenced in the 1974 government circular, favouring research into a new type of dwelling: "intermediary housing". The objective was to select building systems that combined the advantages of individual and collective housing by meeting three criteria: individual access to each unit, each having a private outdoor space (equal to a quarter of the total surface area) and measuring up to 3 storeys in height. Focus on this smaller scale research, closer to the traditional way of creating urban spaces, left French new towns on the wayside, their development finally taking place in the shadow of political concerns. Suffering from a lack of maintenance, the initial housing units have already been largely renovated and, in some cases partially or totally, demolished. Mentalities are nevertheless changing, as shown by the Ministry of Culture's recent recognition of a small private co-ownership building in Évry 1 as "Remarkable Contemporary Architecture" (ACR label, 2019). It is up to us to delve deeper into the history of new towns to bring to light their contribution to 20th century heritage. With the growing interest in the environmental and ecological dimension of cities, they might be reconsidered as significant research for the future. ■

BIOGRAPHY

Catherine Blain is an architect with a PhD in Urban Planning. She is a research fellow and lecturer at ENSA Paris-Belleville (IPRAUS/AUSser UMR 3329 CNRS). Her research, publications and contributions to the academic community deal mainly with the history of architecture and urban planning in France since 1945, with particular focus on projects and theories of the Modern Movement, new towns, the industrialization of construction and experimental housing programmes, heritage issues and building components. An active member of DoCoMoMo-France (scientific committee), she is also a member of various scientific associations, including the European Architectural History Network (EAHN) and the Société Française d'Histoire Urbaine (SFHU).

MODERNISM AND COUNTERCULTURAL ARCHITECTURE: NOT EXACTLY A NEAT CUT-OFF

ABSTRACT

Designers who have been influenced by counterculture in the 1970s were committed to countercultural principles at different levels—from the foundation of alternative communities to the adaptation of industrial technologies towards more sustainable alternatives. Their architectural production diverged from the International Style because it implemented more ecological construction technologies, promoted more sustainable lifestyles and reduced energy demands and waste. Existing literature suggests that the architecture of the counterculture, often developed by designer who were trained during the boom of the International Style, was not always completely set apart from Modernism. However, the correspondences between countercultural architecture and Modernism have not yet been systematically investigated. This research study aims to shed some light on the transcendence of Modernism into countercultural alternatives by examining the works of three figures: Paolo Soleri, Steve Baer and Martin Wagner. The comparison of their production from the 1970s allows to debate on the links between Modernism and countercultural ideals in architecture at various scales. Representative projects are discussed considering their characteristics in terms of spatial organization, construction methods and materials. Ranging from typological principles to material qualities, the identified links between Modernism and countercultural ideals highlights that certain sustainable design concepts have been developed in continuity with some Modern ideals.

1. INTRODUCTION

In the 1960s and 1970s, industrial growth and urbanisation were scientifically revealed to be responsible for the degradation of the ecosystem[1]. In this framework some architects were influenced by countercultural ideas and attempted to develop alternatives to an architectural production which was intertwined with industrialization and fossil fuel consumption. Recent studies consider countercultural architecture a relevant trend of architectural history[2]. Existing literature highlights the links between Modernism and countercultural utopias[3].However, the impact of Modern architectural principles on the development of countercultural architecture has not yet been systematically debated. This research investigates the transcendence of Modernism in the architecture linked with counterculture by examining the work of three representative figures from different backgrounds: Paolo Soleri (active in Arizona, US), Steve Baer (active New Mexico, US) and Martin Wagner (active in Switzerland). The analysis of their production reveals Modern elements in terms of spatial organization, construction methods and materials. Furthermore, their comparison allows to identify, despite the diversity of contexts, few Modern correspondences.

2. FROM WRIGHTIAN ORGANICISM TO ECOLOGY: PAOLO SOLERI

In 1965, Italian architect Paolo Soleri (1919-2013) founded the Cosanti Foundation in Arizona, a self-built, ecologically aware settlement, sustained by income from its ceramic production. This experiment shared some of the ideals expressed in Wright's *The Natural House* (1954) and was influenced by Soleri's working experience at Taliesin West. Previously educated in Turin, Soleri was also inspired by the model of the European city[4]. He distanced himself from the Wrightian concept of the diffuse city[5] because he believed in the potential of compact self-sufficient communities, based on sustainable activities. Building on his experiences in Cosanti, Soleri codified his vision by inventing a new research field called arcology, a portmanteau word formed from architecture and ecology.

In the framework of the ecological concerns which spread in the US from awareness of environmental disasters, Soleri looked at the ecological equilibrium achieved by native populations in the Southwest[6]. He proposed new cities dictated by rational use of resources, deep knowledge of biology and natural science and organic connection with local environment. In 1970, he began to work on the construction of Arcosanti, Arizona. This experimental settlement is an ongoing process; it includes workshops, dwellings and facilities.

Arcosanti's buildings are complex and organically connected structures which house multiple functions. Most of the structures are built of prefabricated concrete elements, which were often earthcast locally. The appearance of the concrete surfaces and the shapes designed by Soleri (apses, vaults, domes or semi-domes) are far from the typical aesthetics of International Style (**Fig. 1**). However, Arcosanti's layout was obtained combining effective use of resources, structural optimization, functionality and climate adaptive solutions for indoor comfort. In the buildings, orientation

maximised thermal performance and roofs were shaped to capture the energy of the sun in winter and provide shade in summer. In addition, Soleri integrated passive solar devices. The revolutionary architecture he proposed represents a significant attempt to identify solutions to the cultural and ecological crises created by a consumerist society[7].

3. MODERN TECHNOLOGICAL APPROACH FOR SUSTAINABLE DESIGN: STEVE BAER

In 1960, a group of art students established an alternative community for artists near Trinidad, Colorado. This settlement was meant to be a live-in work of Drop Art and accordingly was named Drop City. For the construction of their buildings, the founders were inspired by Buckminster Fuller's Geodesic Dome as their ideal was the efficient use of resources in construction and climatization. However, the Fullerine domes erected in Drop City were works of bricolage; constructed from irregular salvaged elements and finished with stucco, they were far from the precision standards of Fuller's award-winning structures[8].

The building experiments in Drop City captured the interest of American inventor Steve Baer (b. 1938), who was recently back in the US after a few years spent working as welder and studying at the polytechnic in Zurich[9]. Interested in polyhedral structures, Baer found in Drop City favourable conditions to experiment with Zomes, post-geodesic structures with irregular volumes (the name "Zomes" combines "zonohedron" and "dome"). The Zome was suitable for Drop City as its irregularities allowed the use of salvaged elements for construction. The first Zome in Drop City was completed in 1966 with metal cladding made from the body of cars. In Drop City, Baer also experimented with passive solar energy.

In 1971, Steve Baer and his wife Holly realized their own house in Corrales, New Mexico (**Fig. 2**) The house is made of 11 connected single story Zomes of different size. The disposition of Zomes (containing usually one room each) in a U-shaped plan limited thermal losses on the northern side and formed a patio towards the east. The house was equipped with "Drum Walls" composed of water barrels stacked behind a glazed exterior surface and adjustable reflective panes. This structure allowed to collect and store solar heat for indoor thermal comfort. To avoid heat losses in the absence of sunshine, the drum wall was closed off by the outer moveable reflective panes, which acted as insulators. The Zomes were built with adobe walls and aluminium sandwich panels glued onto a cardboard honeycomb structure and injected with polyurethane foam to improve insulation[10]. The Baers developed their house to test the application of inventive technology to achieve sustainable solutions.

4. FOSSIL FUEL FREE AND HIGH TECH ARCHITECTURE: MARTIN WAGNER

In 1978, Swiss architect Martin Wagner (b. 1947) designed two solar houses in Switzerland – one in Bigorio (Ticino) and one in Hofstetten (Solothurn) – which were built in the following year (**Fig. 3**). In the framework of the energy

austerity which followed the 1973 Oil Shock, buildings' oil dependency for indoor heating was questioned in Europe. When Wagner started developing these projects, he was establishing his own architectural firm in Switzerland. With a degree from Higher Technical School in Windisch (Switzerland), he had previously worked in the studio of Dolf Schnebli in Ticino. In 1973, Wagner had enrolled at the Southern California Institute of Architecture in the US, where he obtained a master's degree and worked as a teaching assistant while collaborating with the studio Morphosis. He moved back to Switzerland in 1975.

Given the environmental and energy crisis of the 1970s, Wagner's solar houses were designed to use solar-powered heat instead of oil-powered mechanical systems for indoor thermal comfort. The architect proposed this radical alternative because both sites were located in sunny spots with south-facing slopes. Despite the favourable locations, the use of solar thermal systems for heating still required that the buildings' energy demands be lower than those which were standard at the time.

Wagner developed for both houses layouts which maximised passive solar gains and reduced energy losses by exposing living areas to the south with large windows; sighting service rooms on the northern side of the buildings; limiting glazing on the western, eastern and northern façades; and including winter gardens and perimetral buffer spaces. Furthermore, Wagner used more insulation compared to the standards of the time and designed energy-conserving windows. The energy-efficient design and construction solutions were used without abandoning the spatial and aesthetical qualities favoured at that time. Wagner implemented Modern architectural features (open floor plans, flat roof, large windows, double-height floors and concrete structures) as well as High Tech elements (visible technical components, aluminium sheet cladding and colourful steel structures).

5. MODERN CORRESPONDENCES

The examined architectural projects have been developed in different contexts. Soleri's designs for Arcosanti materialized within the architect's own work-in-progress community which refused the model of the metropolis and aimed to achieve an equilibrium between human society and the natural ecosystem. Similarly, the concept of Baer's Zome house originated from his involvement in the construction of the alternative settlement of Drop City, which motivated the inventor to apply advanced technology in sustainable design. Instead, Wagner's solar houses, were designed to define a fossil-free alternative for architecture at the time of the energy austerity in Europe, when established architectural practice was facing a complex challenge.

Recent studies on countercultural architecture[11] have shown the pioneering environmental awareness of architectural designers involved in countercultural movements. Classifying the examined projects as "countercultural architecture" positively conveys the rebellious spirit of an architectural approach which challenged conventional practice of their time, pushing boundaries both aesthetically and conceptually. However, such a definition suggests a neat boundary between Modern architecture and these pioneers of sustainable design,

and eventually leads to overlook the correspondences between them. Despite their ecological engagement in the 1970s, the examined representatives were partially or completely trained during the previous architectural decades—when the International Style became dominant in Western architectural production, driven by faith in the progress of technology. The transcendence of Modern architecture in the examined works is clearly identifiable by comparing the characteristics of the designs focusing on spatial organization, construction methods and materials.

Arcosanti's structures combine complex volumes to improve the synergy of indoor space with the natural context, so as to benefit the functionality of indoor space beyond the rational layout of plans. The irregularity of the volumes and the implementation of archetypical shapes allowed him to optimize the use of resources. A functional design process can be observed in Baer's house: rooms are shaped and distributed to ensure the best indoor condition in relation to outdoor climate and environmental-aware construction methods. Despite the rational principles behind their conceptions, both these projects appear radical in terms of typology and aesthetics. Their irregular plans and elevations are very far from the typical geometries of Modern architecture. Instead, a Modern organization of indoor space is clearly identifiable in the houses designed by Martin Wagner. The Swiss architect arranged the plans according to the principles of functionalism in terms of proportions and distribution of rooms. However, he distributed spaces adopting a climate adaptive approach: living areas are located in the most thermally advantageous parts of the building to increase comfort and—therefore—reduce energy demand.

All the examined projects were realized implementing groundbreaking construction techniques, based on the upgrade of Modern ones. Soleri's concrete earthcasting on site allowed him to achieve optimized precast structural elements in concrete by limiting material waste. Similarly, Baer's prefabricated elements used to build the Zomes, were designed to be energy-efficient and allow a low-tech and dry assembly process. In both these examples, design of the assembly method plays a crucial role in the optimization of construction process. This attitude was also partially adopted in Wagner's solar houses. Built primarily of

cast concrete (Bigorio) and concrete blocks (Hofstetten), both houses were provided with continuous insulation layers within the building fabric. Prefabrication was ingeniously implemented by Wagner when choosing to design the solar collectors as structural elements of the roof to be assembled on site.

Most of the materials used in the investigated projects belong to the Modern tradition: reinforced concrete, painted steel and glass. However, their implementation is customized for functional needs (space dimension) and resource-effectiveness (energy-efficiency and economy of construction). For the same reason, classical Modern elements are combined with High Tech components (aluminum skins, in both Baer's and Wagner's buildings) and preindustrial ones (adobe walls, in Baer's house; silt forms, in Arcosanti).

These comparisons highlight major correspondences between the examined examples and Modernism. First, each project was designed by rationally organizing space in relation to functional criteria. Second, the buildings were realized thanks to optimized construction process involving methods and materials linked to Modern architecture.

6. CONCLUSION

This study allowed us to identify the transcendence of Modernism in the work of three environmentally aware designers active in the 1970s. Although we have focused on a small number of examples, the analysis of works constructed in three different contexts made it possible to identify recurring correspondences. The comparison of the examined cases suggests that the pioneering results achieved by the designers in terms of resource and energy savings were linked to the critical development of Modern design principles and Modern construction methods in light of the environmental crisis.

The introduction of environmental concepts implied an alternative vision of the concept of buildings as machines for living in. Major typological and aesthetical variation compared to Modern architecture are tangible in Soleri and Baer. The latter were active in the framework of US countercultural movements; therefore, they were committed to proposing alternative life styles. Wagner's solar houses, instead, are typologically integrated within their contemporary Swiss architecture. However, despite their Modern appearance, these buildings have been developed to be free from fossil fuel dependency.

The implementation of climate-adaptive choices in the buildings' spatial organization can be seen as an evolution of functionalism. Furthermore, the integration of renewable energy systems represents a continuation of the Modern commitment to ensure indoor comfort levels, also reducing the environmental impact of buildings. The construction methods used to realize all examined works include rationalised prefabrication techniques—a recurring process in Modern production.

Even if their environmental character distinguishes the examined cases from Modern architecture, their correspondences with Modern design and construction principles support the idea of a less neat cut between Modernism and environmentally-aware architecture. Thanks to this study, countercultural architecture appears to be not an abrupt reaction to Modernism, but rather a rational and critical development of it in light of the environmental crisis.

Additional studies on other representative figures of countercultural architecture may deepen the understanding of the influx of Modernism within the development of sustainable design in the 1970s and onwards. ■

MONUMENTAL MODERNISM: LEGACY OR WASTE?

CLÁUDIA COSTA CABRAL
UNIVERSIDADE FEDERAL DO RIO GRANDE DO SUL

FERNANDO DIEZ
UNIVERSIDAD TORCUATO DI TELLA

#24

ABSTRACT

Massive modern buildings, sometimes monumental in size but ordinary in function, may not always fit into the masterpiece category. Nevertheless, they represent a built heritage, which, for cultural and sustainable reasons, would be better to understand and transform than to replace. The session seeks case studies addressing the challenge of giving new life to a modern heritage of outdated large buildings in decaying urban centers. The questions at stake are: How much change do they require? Does that change allow it to preserve its architectural values? How can contemporary society balance the economic effort of maintaining and the need for reuse, adaptation, and sustainability? These questions present the challenge of moving towards broader shared criteria on transformation and reuse.

1. A LEGACY OF URBAN PROPORTIONS

The post-COVID migration to increasingly frequent remote work deepened the crisis of office buildings already with very low occupancy dramatically threatening the already decaying life of old urban centers. Even newly built office buildings remain vacant in large cities like Buenos Aires or São Paulo, giving little hope of revitalizing their original office programs.

The obsolescence of downtown areas is today a global phenomenon. Population decline, lack of private investment and fierce competition by suburban new developments like office parks or shopping centers are sucking energy, workers, and clients from old central locations.

Even powerful economic cities such as Chicago, Los Angeles, Mexico DF, Bogotá, São Paulo, or Buenos Aires are witness to physical degradation, vacant spaces and insecurity. Extreme cases, as the almost complete disappearance of Detroit's central area, a city that filed for bankruptcy after losing two million residents, reveal the depth of such crises.

A great part of these urban centers' building stock consists of modern buildings from the early years of the second part of the 20th century, which, as a whole, constitute a valuable legacy that embodies the aspirations of renewal of modern architecture. The size of this modern legacy as a whole is in itself a problem of urban proportions, both in practical, economic and cultural terms. The large scale of many of these modern buildings makes their presence and worrisome deteriorating condition even more evident. Their fate is increasingly put in doubt as they become vacant, useless, and ultimately shut down or squattered. They thus need physical updating and programmatic redirection to attract new tenants and foster new uses. A challenge that won't be addressed unless innovative, converging new criteria can be agreed among the architectural discipline, practicing architects, investors, and the general public that would allow to reconcile the need for conservation of their cultural legacy and their radical transformation to new programs, activities, and environmental standards.

2. THE LARGE-SCALE MODERN BUILDING

The emergence of the Modern Movement coincided with the changing of a mostly rural world into an urbanized one. In 1948, the General Conference of UNESCO, guided by Julian Huxley, pointed to population growth as one of the three major problems of the postwar world.[1] The urban explosion affected both the old, historic European cities and the newer American ones. After the Second World War, even in the so-called "third world," countries faced rural exodus and internal migrations to the cities. After the mid-1950s, most of the population of Latin American countries like Uruguay, Chile, and Venezuela lived in urban centers, and México DF, Rio de Janeiro, and São Paulo were already world-scale metropolises.[2]

Since the 1920s the increase in scale had been a long-lasting feature of modernity, altering the traditional relationship between the building and the urban block and the dynamic of urban centers. Unsurprisingly, in 1968, the theme of the XIV Milan Triennale, curated by Gian Carlo De Carlo, was "Il

grande numero" addressing what had constituted a critical motif for practicing architects. Mirko Zardini observed that the "greater number" was a typical Team X theme, and Paola Nicolin traced its roots from the early CIAM meetings to the ongoing debate on working-class dwelling and experimental social programs.[3] The "Greater Number" controversial exhibition, interrupted by student protest, also marked a turning point. Nicolin noticed the emergence of the notion of "environment" in the critique proposed by the exhibition, reflecting the dilemma of modern industrial society, "which at the close of the 1960s was confronted by two distinct options: one, its apotheosis as mass consumer society; and two, its complete collapse."[4]

The challenge imposed by the large scale generated a wide range of architectural responses, constituting a quite heterogeneous legacy. Increasing the building scale would sometimes be part of a broader effort to comply with social issues, providing housing or workspaces for a growing urban population. Other times, it would be just an opportunity for bigger profit margins through the overexploitation of urban land. Sometimes, it would be a fertile field for new typological and technical experimentations, others, it would only result in unimaginative and insipid replication. As a whole, this heterogeneous legacy motivated equally heterogeneous critical appraisals.

Many iconic works celebrated by the historiography of the Modern Movement could easily belong to the category of large-scale buildings. Unlike the *Siedlung* experience, which referred mostly to suburban expansion, these large-scale buildings were part of a process of urban densification. They can be acknowledged as modern architecture's efforts to rework the compact city centers.

Henri Sauvage's housing flats on Rue des Amiraux in Paris were built in 1922 on almost the whole block. It is flanked by three streets, has an inside swimming pool, and a terraced façade to allow sunshine to reach the street. Fritz Höger's impressive *Chilehaus*, a massive, brick-faced ten-story office building completed in 1924, occupies a full block of Hamburg. The *Rockefeller Center* (1928-1940), a mixed-use complex designed by a collaborative team of architects that included Raymond Hood, Wallace Harrison, and Harvey Corbett, renewed no less than four blocks of the Manhattan grid. The Rockefeller slogan of the "city within a city" could also be applied to Oscar Niemeyer's *Copan Building* (1952) in São Paulo, designed as a huge structure 32 stories high, which encompassed distinct types of apartments, shops, cinema, and a public gallery on the level of the street. Arne Jacobsen's *SAS Royal Hotel* (1958-60) stretches over the full head of an urban block, and so does the *Conjunto Nacional* (1952-1955) by David Libeskind in São Paulo. Even Alison and Peter Smithson's *Economist Building* (1959-1964) responds to the dialogue between the large-scale and the urban block, splitting the built area into three separate volumes.

Expecting to impact the traditional grid by presenting a contrasting fragment of the modern city, modern building programs grew to a larger scale. Occupying no less than a full block became the ideal for a program that would gain expression through the plastic contrast between its different

4. Nicolin, "Beyond the Failure: Notes on the XIVth Triennale," 91.

components. Many buildings from the 1950s, 60s, and 70s gained urban importance through an atrium or public space that preceded the building and allowed for generous perspective views. The continuous built tissue of the traditional corridor street worked as a frame for the vitality and novelty of these buildings, which took advantage of their prominent locations.

From Alan Colquhoun's criticism of the superblock in the seventies to the vaticination of Rem Koolhaas on "bigness" as something on way to extinction, "like the dinosaurs," antipathy towards huge buildings has not been an uncommon feeling.[5] More contemporary sustainability concerns, might consider them as a testimony to a failed model of waste and unwarranted reliance on technical ability to manage whatever the consequences of developmentalism.

Nevertheless, large-scale modern buildings are facts of the contemporary city that can hardly be ignored. The purpose of the session *Monumental Modernism: Legacy or Waste?* is to establish a provisional inventory of the different situations of the "large modern buildings" and the strategies already enforced to make them useful again. The questions at stake are: How much change do they require? Does that change allow to preserve its architectural values? How can contemporary society balance the economic effort of preserving and the need for reuse, adaptation, and sustainability?

3. REUSING THE LARGE-SCALE BUILDINGS

In the last decade, Docomomo has moved from its former commitment to the documentation and preservation of the architecture of the Modern Movement to a more profound recognition of the environmental challenge.[6] This shift led to the amendment of the Eindhoven Declaration, which expressly mentioned the pledge to a sustainable built environment (Eindhoven-Seoul Statement, 2014) and invited us to review the modern legacy with wider lens. In that sense, the issue strongly engages with what Ana Tostões has called "the broad meaning of reuse," which shall encompass the conventional maintenance actions and the spatial and functional transformations required to update buildings to contemporary needs and technical standards.[7]

Many massive buildings, sometimes monumental in size but ordinary in function, may not fit into the masterpiece category, nevertheless, they represent a built heritage, which, for sustainable reasons, would be better to understand and transform rather than replace. This situation presents the challenge of how to pay respect to their architectural quality and at the same time, reuse them, radically transforming them into useful structures for contemporary needs and sustainable standards.

Preservation disseminated as a culture based on the knowledge and maintenance of monuments. Its intellectual and technical apparatus was conservative and mostly targeted at restoring buildings to their original state. The value of usage, in its most pragmatical sense, was considered secondary.

Yet, dealing with modern heritage in a broader sense demands a very different perspective. First, it seems important to recognize the heterogeneity of the modern legacy. Beyond the iconic masterpieces stand many good

modern buildings that deserve to be preserved, allowing us to "situate the conservation of modern architecture within the framework of the circular economy as part of a global effort to reduce energy consumption" – as Tostões has put it.[8] This effort is unlikely to be successful if we treat them as monuments. On the contrary, the value of usage must be seriously considered if we aim to save them.[9]

The size of this large-scale modern building legacy and the radical intervention needed to make it useful again asks for a new sensibility that would recognize the intrinsic value of the building's original architectural expression without surrendering to paralysis. As conservation is now both a matter of preserving architectural values as well as an environmental principle, in many cases, the visible aspect of the buildings would be put in a second term; in others, the original expression of the buildings would be put in the first term. But, it seems the answer will no longer be the same when establishing these priorities. It may even be a matter of design sensibility to measure which parts or aspects of a building would allow for one or the other priority to prevail.

Established criteria for older heritage accept adaptation and change of use as long as the original parts of buildings are differentiated from the new interventions and additions. It has become a standard of those interventions to adopt contrasting materials and forms to make sure that the new and the old can be easily distinguished. But in the case of this large modern legacy, typically buildings of the 50s, 60s, 70s, and even 80s, this strategy cannot be easily followed since their materials and shapes are not that different from those of contemporary architecture.

In some cases, the intervention will only consist of renovating elevators, curtain walls, and hidden installations, but even then, high-performance double glass windows require different frame widths, larger than those intentionally narrow frames typical of the 50s and 60s.

Programmatic renewal demands even more changes, often involving a more radical shift in façade treatment, inside distribution, and rearranging lower ground floors and entry schemes, which means establishing a different relation to the streets. Because of a wider strategy in terms of reuse, it is also frequent to alter the whole profile of the building, adding new volumes or changing the shape of existing ones.

In cities like Buenos Aires, programs to revitalize the urban center through tax incentives promote the conversion of old office buildings into apartments. The *Mercado del Plata*, an iconic modern piece of the late 50s occupying a full central block, is a large office building once owned by the city government that has now been sold to the private sector to be transformed into a hotel and apartments.

The *Cooperativa El Hogar Obrero* (Fermín H. Bereterbide, Wladimiro Acosta y Alfredo Felice, Buenos Aires,1941-1954),[10] a large apartment block occupying the whole length of a block, has been in relatively healthy conditions. Still, the mostly public programs of the lower levels have been transformed into a shopping center in recent years, adding a whole floor,

completely changing its lower façade and relation to streets, and radically transforming the interiors to achieve the required commercial standards.

The intervention on an old department store building on a large corner plot of central São Paulo and its adjacent buildings by Paulo Mendes da Rocha and MMBB Arquitetos, produced the SESC 24 de Maio (2017). The successful project effectively activates the already compromised urban center with intensive public community programs. The rearrangement of the original building took advantage of their existing concrete structures but kept little, almost nothing, of its identity features.[11]

Either pushed by abandonment and decay or by powerful economic forces already transforming the large modern buildings of our threatened urban centers, the trend is already moving forward, even if we do not yet have clear disciplinary guidelines. There is no consensus on the criteria to which extent the identity of the original buildings should be preserved or if it can be covered by new envelopes as has been done by Lacaton & Vassal in many interventions on residential buildings.[12]

A recent academic exercise made by Sabastián Adamo and Marcelo Faiden at Universidad Torcuato Di Tella[13] proposed a radical way to give back life to a list of prominent buildings in Buenos Aires and São Paulo. The list of the chosen buildings reveals an interest both in their architectural qualities, their central location and threatened fate, and their potential for radical transformation.[14] Notoriously, the goals of the exercise look for a radical programmatic redirection, an increase in built surface, a better relation to public space, and an enhancement of their environmental behavior. Transforming built volumes, façades, and interior distribution sometimes leads to a completely new identity for the intervened buildings, but always preserving something of its spirit, a remembrance of what existed. Adamo-Faiden's academic exercise on signed office buildings with radical interventions asks the same questions we already presented at the beginning. We do not have yet the answers, but they should be flexible enough, since for the large-scale modern buildings in decaying centers, it is not a matter of taste but a matter of survival. ■

HOUSING PROBLEM IN ITALY AND LARGE-SCALE BUILDINGS IN SECOND HALF OF THE 20TH CENTURY. A FRAGILE HERITAGE

FRANCESCA ALBANI
DEPARTMENT OF ARCHITECTURE AND URBAN STUDIES
POLITECNICO DI MILANO, ITALY

ABSTRACT

From Fifties to Seventies the "housing problem" had emerged with particular gravity in Italy. It appeared essential to find new ideas for dealing with an issue that, though present for some time, had been greatly aggravated by the migration of population from South to North of the country. The Ministry of Public Works engaged some public programs to solve the problem and many architects experimented new typologies, architectural solutions and strategies to build large-scale housing buildings. There was also explicit discussion of ways of rationalizing the construction site, but most importantly there was an increasing grasp of the concept of partial prefabrication, namely the use of prefabricated elements only for certain parts of a building. An example is the IACP building for 100 dwellings, built by Gino Valle as part of the 1971 Plan for Economic Housing of the Municipality of Udine (PEEP) for the new development areas in the eastern part of the city. The complex, over 150 meters long, forms as a sort of wall between the green courtyard area and the road axis, with the ground floor acting as a filter between the street, the green area behind and the longitudinal pedestrian path. The distribution floors are open areas, designed as spaces where the inhabitants can gather, with a wealth of paths that differ markedly from those of a simple walkway. As in many other Italian examples of the time, the provision of semi-public communal spaces never worked, in the face of the desire to privatize them, sometimes discreetly but much more often decisively, with elements being inserted to separate them and use them to store personal belongings. The building IACP has consequently been showing its fragility for some time now, not so much in its materials and construction techniques as in spatial terms and the ways it is used.

1. INTRODUCTION

"The Italian construction industry has an absolute and urgent need to review and perfect the conceptual and technical processes that underlie the design and implementation of construction," wrote Pier Luigi Nervi in 1945 in an article published in "Metron."[1] This was at a time when the "housing problem" had emerged with particular gravity after the war and it appeared essential to find new ideas for dealing with an issue that, though present for some time, had been greatly aggravated by the wartime destruction.[2] The Ministry of Public Works engaged some public programs to solve the problem and many architects experimented new typologies, architectural solutions and strategies to build housing complexes.[3] It is hardly surprising, in the debate over the need to plan for reconstruction and in an economic situation when industry was undergoing far-reaching changes, if many began to believe the solution lay in industrializing the construction industry. They trusted to the potential of technological development and its applications to architecture[4], in Italy previously based almost entirely on traditional and artisanal methods.[5] The goal was to increase productivity while lowering costs and speeding up building work by standardizing the key elements that constitute a building. The concepts of "prefabrication", "standardization" and "industrialization" were confusing to most architects, who often misunderstand the terms of the question that related to a process affecting design and construction.[6] The contribution brings out the transition from the theoretical studies of the new construction systems to the experiments conducted after the war[7], down to the construction of the first housing estates to use prefabricated components in the early fifties, when it was widely understood that the themes of prefabrication and the industrialization of construction had to be correlated with those of architecture, economics and urban planning. There was explicit discussion of ways of rationalizing the construction site and industrialization, but most importantly there was an increasing grasp of the concept of partial prefabrication, namely the use of prefabricated elements only for certain parts of a building. The focus shifted to the whole production process, highlighting the profound shortcomings with regard to standardization, project planning and execution and the simplification of construction procedures. In Fifties the problem of social housing became harder because of the immigration from South to North Italy. The central moment of this phase was the experimentation conducted in the suburbs of the principal Italian cities (Milan, Turin, Rome, Naples) by Social Housing Institute (Istituto Autonomo Case Popolari, IACP) about the large- scale buildings. For examples in Milan from Fifties to Seventies new housing estates were built with French patents for prefabricated building systems to be used for the construction of new housing estates (Camus system, Balency system and Barets system) concentrating the energies on interpreting the building of between 5 and 10 storeys high in many typological, distributional and constructional variants. The mid-rise building characterized many of the settlement models presented by the urban plans.

2. IACP BUILDING FOR 100 DWELLINGS BY GINO VALLE (1975-1979)

2.1. PROJECT AND CONSTRUCTION

The project for this large-scale residential building was part of the 1971 Plan for Economic Popular Housing of the Municipality of Udine (a town in the north-east of Italy near to Slovenia and Austria lines) for the expansion areas in the eastern part of the city. The urban plan envisaged two different strategies: the first was to complete the residential areas built by the IACP in previous projects; the second was to build on the vacant sites.[8] The project was commissioned to Gino Valle, an architect born in Udine in 1923, who was well known (also abroad) for his works, for his desire for experimentation beyond the purpose of creating specific links and paths of research between the different works.[9]

Gino Valle's building was part of the first group of works and was intended to complete an area in which various IACP buildings, constructed in different periods, would form an open courtyard. The project clearly sought to impose order on this disjointed situation, and his building, 184 m long, was meant to form a sort of continuous wall between the two parts, defining a real courtyard that could only be crossed on foot.

By concentrating the vertical communication points outside the residential building, he freed the ground floor to create a public pedestrian path that would serve as a connection between the western part of the complex and the bus stops, so that the building did not form a wall between the green courtyard and the road axis. The basement level was open on its two main sides, so being transformed into a sort of lowered courtyard, with the function of a filter between the street, the green area behind and the longitudinal pedestrian path spanned by the access bridges leading to the staircases.

The theme of prefabrication was also embodied in the construction of a large social housing complex. Underlying the surface in many of Valle's works is a theme that in some cases proved fundamental, namely modularity. Almost all of Gino Valle's projects are structured on the basis of a geometric grid that unifies and governs the composition and sometimes becomes modularity and prefabrication. In the case of IACP building the grid is 3,64 m that articulated 3 typologies of dwellings. This theme was common to many leading architects in the debate between the wars, but Valle never wished to design a prefabricated architectural element, unlike Angelo Mangiarotti[10] or Marco Zanuso, who were also highly active in industrial design. Gino Valle mainly interpreted the concept of seriality in its application to design, using construction systems already on the market or variations designed by himself and therefore focusing his research into composition and design on the potential for variation, participation, and experiments with new formal solutions.

2.2. SOCIAL SPACES

The key of the project could be found in the study of cross-section: an open ground floor and six storeys divided in two groups of three served by two alternate distribution floors providing access to different dwellings served by internal staircases leading to the upper and lower floors. The distribution floors

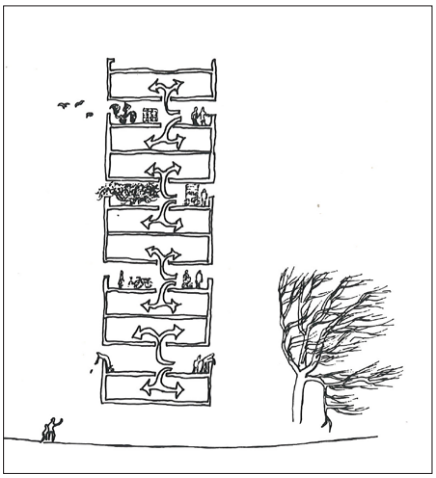
are open areas designed to be spaces where the inhabitants would gather, with a wealth of routes that differed widely from simple walkways. These spaces were inspired by British examples, including the work of the Smithsons in the 1950s. These floors are accessed by three distribution towers with elevators, located outside the volume, to which they are connected by bridges.

3. FAILED UTOPIAS

3.1. THE FRAGILITY OF ARCHITECTURE

The fragility of the architecture is sometimes also due to the level of experimentation that the designer chose to adopt. This is the case of the building for 100 IACP housing units in Udine. The complex forms as a sort of wall between the green courtyard area and the road axis, with the ground floor acting as a filter between the street, the green area behind and the longitudinal pedestrian path. The distribution floors are open areas. An idea borrowed from Anglo-Saxon examples, which, however, has never been reflected in the way the inhabitants experience these spaces. As in many other Italian examples of the time, the provision of semi-public communal spaces never worked, in the face of the desire to privatise them, sometimes discreetly but much more often decisively, with elements being inserted to separate them and use them to store personal belongings. The same process appears in the Housing complex in Giudecca in Venice[11] and Buja housing complexe,[12] revealing the inhabitants' explicit purpose of not wishing to experience these spaces collectively, instead trying in every way to expand the private spaces to the detriment of those designed for different uses. The IACP building has consequently been showing its fragility for some time now, not so much in its materials as in spatial terms and the ways it is used. The distribution corridors, which were supposed to play a central role in the social life of the inhabitants, soon became a problem in the management of the apartment building. It was therefore divided into three compartments, but by reducing these long walking spaces, one of its fundamental aspects of innovation and architectural research was lost. In addition, with the change of users from young large families to an elderly population, the internal distribution of the housing with entrance stairs is now inadequate and makes access difficult. Finally, the decision, during recent maintenance work, to change the colours of the façades, originally characterised by the colour green with the distribution areas painted red, has dealt it a fatal blow. The new colours (grey and red) are not compatible with Gino Valle's reflections on the use of colour in architecture. This large-scale housing building needs new strategies to make them useful again.[13]

3.2. CONCLUSIVE REMARKS



Gino Valle's buildings are well known and celebrated everywhere, but in his own land, Friuli, there is a passionate affection for and pride in this character with an international profile. Historiography, the local and international community, know and appreciate his extensive work, the subject of numerous studies and cultural initiatives that describe and celebrate the logic that led to the creation of some of the most interesting Italian architecture

in the second half of the 20th century. But if we examine the state of his works, focusing on the way they have stood the test of time, we cannot fail to register a dichotomy between what is celebrated and their state of preservation. Many of the buildings by Gino Valle are also exemplary in this respect. Some have received careful maintenance, but others are in a state of disrepair. The change in the social and cultural contexts for which they were built, the inevitable aging of materials and methods of use or, more simply, occasional needs, have led to alterations that, to varying degrees, are affecting the significance and the values embodied in these architectures.

The great built heritage that Gino Valle has left us, extremely articulated and firmly anchored in the places and the time in which it was produced, is an important testimony not only to the achievement of one of the most versatile and refined architects in the second half of the 20th century, but also to the societies that produced him, whose cultural, economic and political requirements he expressed. Today, a review of the work of one of the architectural firms that continuously created some of the most important works in the period should foster an awareness that their permanence represents an important phase of Italian culture and a vital presence for the multi-layered

contemporary city. Raising awareness of the conservation of this heritage is therefore an important objective that contemporary architectural culture needs to undertake to ensure its transmission to those who come after us.[14] ■

Designer of restoration works, she is author of numerous essays on materials, construction techinique and conservation of 20th century architecture.

MENDING WALL – CONTINUITY IN THE MODERNIST CITY: INTERPRETING SMALLBROOK RINGWAY CENTRE, BIRMINGHAM

MICHAEL DRING
BIRMINGHAM CITY UNIVERSITY, UK, BIRMINGHAM MODERNIST SOCIETY,
LEAD CAMPAIGNER FOR 'SAVE SMALLBROOK'

ABSTRACT

Before I built a wall I'd ask to know
What I was walling in or walling out,
And to whom I was like to give offense.[1]

The title of this paper and the excerpt are from Robert Frost's poem *Mending Wall*, written at the onset of the First World War. Here, the seasonal and mutual upkeep of a rural dry-stone wall becomes a metaphor for the contested nature of national and domestic borders, as well as what constitutes our sense of identity at a moment of profound global change. Similarly, Sennett's[2] notion of the open "edge-as-border" proposes an urban dimension to Frost's rural prose, locating the building and street as a place of civic participation. Together, these frame important questions about the nature of the building as a wall, and the maintenance and renewal of such structures.

Conceived as gated city wall, Smallbrook Ringway Centre (James Roberts, 1962) was one of the first buildings to line Birmingham's Inner Ring Road, addressing the changing patterns of life and mobility, and representative of the power of city governance. That representation is now at risk, the locally listed building condemned by its developers as a wall and recently approved for demolition after a nationally fought campaign for its renewal[3].

Through a critical analysis of Smallbrook Ringway Centre and interpretation in the form of a counterproposal, this paper explores the dynamic relationships "between the old and the new, the temporal and the timeless, innovation and quotation"[4].

The analytical and interpretive dimensions of the paper contribute to a unique understanding of this modernist building which remains at risk, offering a framework for thinking about heritage concerned neither with preservation nor progress, instead calling for what St. John Wilson[5] describes as 'a paradoxical interpretation of tradition as the springboard for innovation'.

1. INTRODUCTION

Built in 1961 as part of the post war renewal of Birmingham, James Roberts' Smallbrook Ringway Centre stands as a testament to civic ambition and architectural intellect. Roberts saw the Ringway Centre as a 'counterpart of the old town wall, […] and the Rotunda as the equivalent on the skyline of the cathedral of the old town'[6]. Birmingham never had a defensive city wall, growing from a market economy to become a global centre of industrial production. Roberts' scheme therefore offered an interpretation of the setting, the wall-like nature of the Ringway Centre locating the place culturally and temporally. Yet it's monumental scale and perception as a wall has contributed to its demise, with the building currently at risk of demolition.

Through the exploration of the wall as civic praxis, critical analysis of Smallbrook Ringway Centre, and interpretation in the form of a counter proposal, this paper explores the dynamic relationships "between the old and the new, the temporal and the timeless, innovation and quotation"[7]. Together, these foreground the role of architectural interpretation in heritage activism, challenging conventional modes of historical research and conservation practice.

2. BUILDING AS WALL

Written at the onset of the First World War, *Mending Wall* is a narrative of the seasonal rebuilding of a drystone wall and metaphor for the violently contested state of national boundaries. The title articulates the cooperation required in maintaining the wall, bringing neighbours into active dialogue. Human endeavour is pitched against the climate, flora, fauna, and the metaphysical presence of the place, revealing Frost's doubt as to the longevity and ultimately need for such delineation. Nevertheless, the presence of the wall reminds us of our common ground, marking a threshold through which we pass, and the passage of time.

Although modern construction means seasonal restoration is no longer necessary, Frost's poem reveals important questions about architectural form, maintenance and conservation. First, that counter to negative connotations of division, the wall-like nature of Smallbrook Ringway Centre emplaces it within the city. Sennett's notion of boundary and border articulates this difference; 'The boundary establishes closure through inactivity, by things petering out, not happening; to say that the edge-as-border is a more open condition means it is more full of events in time'[8]. Second, that buildings remain contingent on renewal. As Ingold[9] notes, building, as in the case of Frost's wall, is an activity – *a* building brings that activity to a close showing signs of permanence and solidity, meaning its inhabitation is distinct from, and consequential upon, the processes by which it becomes manifest.

3. HISTORIOGRAPHICAL CONTEXT

The debate over how best to reconstruct Birmingham in the post war period divided professional opinion, particularly on the role of the street. City engineer Sir Herbert Manzoni referred to the Inner Ring Road as 'a city street

of novel character – it is not an urban motorway, nor principally a traffic street or a shopping street'[10]. John Madin[11], architect of the city's now-demolished Central Library, took a more radical approach, believing that the pedestrian-oriented precinct was superior to linear development along the street.

Smallbrook Ringway Centre was almost unique in its orientation to the street yet responded to the monumental nature of infrastructure. The assembly of land by the city Corporation began in 1917 at the inception of the Inner Ring Road. At Smallbrook Street this required the purchase of around ninety buildings and bomb-damaged ruins, and closure of historical passages and yards (shown in red in **figure 2**). Despite an intentionally laissez-faire approach to planning, Roberts was able to 'join up a series of discrete proposals for extensive, mixed-use complexes, [managing] to pull off what the council had failed to accomplish: an integrated architectural approach to the Ringway'[12]. Its monumentality is a result of civic ambition delivered through private means and Roberts' ingenuity and influence.

According to Ian Nairn, the 230-metre sweep of Smallbrook Ringway Centre presented 'a wall with gates in'[13], the latter formed by 'the delicate yet strong details of the concrete piers and beams that carry the Centre over Hurst Street'[14]. The upper floors of the building cut a dynamic line along the ring road, those below mediating the variable ground conditions, with the covered shopping parade offering civic decorum **(figure 3)**. Two levels of subterranean car park serviced the offices above, with the Locarno Ballroom, nightclub and nearby Scala Cinema adding further civic depth. At the grade-separated crossing of Hurst Street and Smallbrook Queensway, a pedestrian subway provided opportunities for retail. At Dudley Street, a vehicular underpass was formed, providing a balcony overlook, optimistically described by the Birmingham Post as adding 'a Venetian touch'[15].

The façade contributed to the building's civic presence, reflecting wider practices in art and architecture. Roberts was no stranger to contemporary sculpture having visited Barbara Hepworth at her studio in St. Ives. Here he specified a completely steel and glass façade referencing William Crabtree's Peter Jones store on London's Sloane Square, subsequently substituted for precast concrete mullions, sculptural spandrel panels and light sconces by Laing's own architect Sydney Greenwood[16]. Despite this change, Harwood likens the 'ribbon-like' building to a work of 'op art'[17]. The subtle layering of the façade contributes to the overall composition: the glazed wall split horizontally by the abstract sculptural panels reflecting the floor levels; the vertical mullions which divide the spandrels and give a closely-spaced syncopation; the larger staccato of the diagonally spaced light sconces. The resulting façade is a public work of art, as if it is woven from cast materials each reflecting the rhythm and tempo of the city, further articulated by the dramatic curve of the building.

4. PLACING SMALLBROOK RINGWAY CENTRE IN A BROADER THEORETICAL AND PRACTICAL CONTEXT

Art critic and curator Lawrence Alloway discussed two ways 'to put art *in* architecture'[18], the second of which, with its origin in Constructivism,

was concerned with 'the 'artistic' use of modern materials, of engineering and architecture'. Such origins found form in Britain in the fifties through sculptors working at an architectural scale. In the exhibition publication for 'This is Tomorrow' curated by Alloway, Richard Matthews wrote of the ways in which painting and sculpture were breaking down conventional form, with architecture next where 'the wall at least is beginning to go'[19]. At Smallbrook, it could be argued that the sculptural nature of the façade contributed to a dematerialisation of the building as wall.

Such common ground was also promoted between the building and the city. Writing in the Team 10 Primer, Aldo van Eyck declared that 'the time has come to conceive of architecture urbanistically and urbanism architecturally […] to arrive at the singular through plurality and vice versa'[20], proposing an affective reciprocity as witnessed in contemporary art, science and philosophy. This was deemed more pressing by the presence of architecture in everyday life, a concept explored through the Smithson's competition entry for the Golden Lane deck housing upon which their 'Grille' was based.

The shift towards the monumental and infrastructural presented new spaces of appearance[21], Frampton's architectural 'megaform' describing 'an element which due to its size, content and direction has the capacity to inflect the surrounding landscape and give it a particular orientation and identity'[21]. The challenge for architects was in making human associations in the new urban landscape. Just as Frost suggested in *Mending Wall*, Frampton too believed that such monumental structures return us to a time when architecture was concerned with the marking of ground, serving as 'civic microcosms [that] function as identifiable spaces of public appearance'[22]. This was arguably the case at Smallbrook Ringway Centre, where civic ground was evident in the individual shop front, animated street façade, and dynamic massing as much as it was in the hinterland of entertainment establishments and industry and engineering of the ring road.

5. CHALLENGING VALUE SYSTEMS

The limited protection afforded to Smallbrook Ringway Centre as a locally rather than nationally listed building has implications for embodied carbon and embodied memory. Historic England's listing refusal narrowly defines what is and what is not deemed worthy, their advice report[23] acknowledging that the Ringway Centre is 'impressive in both its scale and the way it responds to the topography of the site', yet critical of;

'the sheer length of the structure [which] means that there is […] an element of monotony in the design. The executed design also differed from architect James Roberts's intended scheme. […]The section over Hurst Street is the only part that somewhat resembles Roberts' original intention.'

This overlooks the ways in which art, architecture, the street and highway coalesced as advocated by Alloway and van Eyck, deferring to obsolete notions of individual architectural genius. Their evaluation seems at odds with the contemporary context. As Pendlebury et al note, 'a particular fabric, object or environment […] acts as the bearer of cultural and historical

meanings which are projected onto it by individuals and groups in society at different times.'[24] The persistence, coherence, persuasiveness and reach of those projections or arguments can have a major bearing on the longevity of the built environment and how heritage is considered.

The search for continuity in a city in pursuit of progress is an underlying tension of this paper with implications for civic life. In discussing a controversial retail scheme on London's Oxford St, Henley argues that the debate is about embodied carbon as well as embodied memory, and that 'the shift in reading the city as urban-space to built-form will have a hugely detrimental effect on our understanding of […] *the place,* and bring with it a dramatic loss of embodied memory'[25].

Together with a concern for embodied and whole life carbon, embodied memory has formed the basis of a public campaign for the adaptive reuse of Smallbrook Ringway Centre, promoting dialogue as a form of fruitful resistance.

6. DESIGN AS ACTIVISM

In 2022, Save Smallbrook, a coalition of Brutiful Birmingham, Birmingham Modernist Society, Zero Carbon House, and Twentieth Century Society, published a counter proposal for the adaptive reuse of Smallbrook Ringway Centre. Rather than a passive response to the planned scheme, which proposes the demolition of the existing building to be replaced with 1800 apartments in towers of up to 54 storeys, the coalition proposed the retention of and addition to the concrete structure for retail and residential use.

At ground level, the counter proposal reanimates the commercial frontage of the building through new shop fronts and four residential entrances, contributing to the everyday life of the street. Previously lost passages and streets are remade, extending traces of the historical street pattern through the lower levels. The main body of the building is converted to residential uses, the refined facade incorporating winter gardens that provide an environmental and social threshold between interior and exterior. At roof level, further apartments are provided in a three-storey addition using the structural capacity of the existing frame. Over, three towers rise to twenty storeys reflecting the massing of Roberts' nearby Rotunda, their form an enlarged version of the lozenge-shaped escape staircases to the rear. Around 450 apartments are proposed in a mix of sizes to meet city planning requirements, balancing the existing building and context with an appropriate density.

These illustrations formed part of a report[26] with commentary by the group, issued to Birmingham City Council along with an open letter signed by Stirling Prize-winning architects and other prominent stakeholders. It was also the subject of several articles in the Birmingham Post and a documentary film, a public meeting, public engagement at Birmingham Pride and at Extinction Rebellion housing demonstration, as well as meetings with the West Midlands mayor. The counter proposal placed design at the centre of civic and heritage activism, reinforcing Wainwright's plea that 'the

Something there is that doesn't love a wall,
That sends the frozen-ground-swell under it,
And spills the upper boulders in the sun;
And makes gaps even two can pass abreast.
The work of hunters is another thing:
I have come after them and made repair
Where they have left not one stone on a stone,
But they would have the rabbit out of hiding,
To please the yelping dogs. The gaps I mean,
No one has seen them made or heard them made,
But at spring mending-time we find them there.
I let my neighbour know beyond the hill;
And on a day we meet to walk the line
And set the wall between us once again.

city could become a model of creative post-war conservation'[27]. It offers a framework for thinking about heritage concerned neither with preservation nor progress, instead calling for what St. John Wilson describes as 'a paradoxical interpretation of tradition as the springboard for innovation'.[28]

In September 2023, the Planning Committee voted 7 to 6 to approve the submitted scheme, a decision that was successfully challenged by the campaign group on shortcomings of the process with regards heritage and climate impact. The scheme was returned to the committee in January 2024, once again approved by a margin of 7 to 4. At the time of writing, the campaign group are considering their options for further legal challenge.

7. CONCLUSION

In contrast to conventional historical research which defers to the intention and authority of the author of the work (of art, architecture, literature) in question[29], the making of the counter proposal offers a way of looking at the building and context 'in time' rather than 'through time' diachronically[30]. Architectural design for adaptive reuse can be viewed as a form of critical activism.

This raises important questions about renewal, not as a technical process usually associated with regeneration but 'with the nature of a refoundation'[31] in favour of the intensive continuity of the city. If conservation and progress inhabit either end of the same spectrum, then too great a concern for either risks flattening the possibilities of creative interpretation. The renewal of Smallbrook Ring Centre offers the potential for the reconciliation of differences between society, the environment and technology, resistant to the autonomy of modernist architecture. The unification of art, architecture and infrastructure contributes to its monumentality, yet ultimately contributed to its demise, deemed by heritage experts as 'monotonous' and 'repetitive', dismissing the complex sculptural dimension of the work.

The collaborative (and compromised) design and construction process involved in making buildings such as Smallbrook Ringway Centre ought to foreground the found condition over and above the architect's original intention. The fact that Roberts and members of his team disagreed with the contractors change of specification is of course relevant, yet the conservation, interpretation and renewal of modernist architecture demands an updated set of criteria and broader imagination, particularly where heritage value is often negotiated despite standards that suggest otherwise – to conserve or not is a political act.

The lifecycle of the building including its maintenance and adaptation ought to be considered in a much longer temporal dimension for reasons of embodied carbon and memory. Mitigation of climate change through re-use adds further weight to the heritage position, yet the empirical nature of this argument must not be allowed to overshadow equally important arguments concerned with the coherence of 'remembered space'[32] [33] and our civic life. ■

NEW OLD LONDON: MODERN LARGE-SCALE HOUSING FOR THE TRADITIONAL CITY

JAIME SILVA
UNIVERSITY OF LISBON – IST, CITUA

ANA TOSTÕES
UNIVERSITY OF LISBON – IST, CITUA

ABSTRACT

Like many other European systems, in the aftermath of WWII (1945-1975), England's welfare state had a tremendous role in the provision of large-scale housing for its citizens. Following the path set by the Barlow Report (1940), not only were entirely New Towns built, but also existing urban areas refurbished. London will be no exception in the latter case. However, unlike what could be expected from the Modern spirit, its interventions will not normally follow the tabula rasa principle. Architects and city councils will embark on an adventurous and almost paradoxical marriage between standardized modern mass housing and the contextual specificities of the existing urban fabric. In other words, the fusion of new and old, resulting in monumental objects that can be both alien and familiar. Using the paradigmatic examples of the Claredale Street scheme (1954-1959, London, Denys Lasdun) and the Brunswick (1960-1974, London; Patrick Hodgkinson) as case studies, this paper aims to provide an in-depth analysis of the two moments that characterized this fusion. In addition to the design analysis, the paper also aims to draw valuable lessons from these case studies on the question of "legacy or waste". Although both schemes are now listed and recognized for their exceptional architectural qualities, they were once run down and considered 'waste.' By documenting the buildings' life and with the support of first-hand testimonies by its residents, the paper shows how issues of management, maintenance, and community involvement can work for or against the recognition of a building's valuable legacy. In sum, our goal will be threefold: firstly, to demystify the idea of Modern Architecture as exclusively "un-contextual"; secondly, to identify the characteristics that make these particular buildings monumental; and thirdly, to reveal the important role played by the inhabitants in the uplifting of the architecture's legacy.

This work is part of the research activity carried out at the research Centre for Innovation in Territory, Urbanism and Architecture (CiTUA) and was funded by the Fundação para a Ciência e a Tecnologia (FCT) in the framework of 2020.08517.BD and UIDB/05703/2020 (CiTUA).

1. TRIUMPH OF THE LIVING: TERRITORY AND PLANNING IN ("PRE") POST-WAR BRITAIN

In Felix Nussbaum's (1904-1944) "Death Triumphant" (1944) the impact of World War II screams its visceral presence. In truth, unlike the first, the second was to have a heavy told on the everyday lives of ordinary people. Now, war did not only reclaimed our loved ones, but also our buildings, our streets, and our own lives.

Concerned about the devastation caused by the war, the British began planning for the improvement of their territory long before the fighting was over. Instead of a series of piecemeal measures, they tackled the problem with a holistic and top-down approach. The publishing of the "Barlow Report" (1940), the establishment of the Ministry of Town and Country Planning (1943), and the implementation of the "New Towns Act" (1946), were some of the milestones which paved the way for a structured decentralisation through the creation of new and self-sufficient towns, capable of promoting a more balanced occupation of the territory.[1] Within this "meta" concept, London would be no exception to the rule.

In 1943, Patrick Abercrombie (1879-1957) and John Henry Forshaw (1895-1973) would develop the "County of London Plan" – limiting the residential densities for what is now known as inner London – and a year later, in 1944, the same Abercrombie would publish the "Greater London Plan" – establishing the New Towns around it.[2] As far as the existing fabric was concerned, both plans recognised the opportunity to promote new housing by redeveloping areas that had either been affected by air raids or identified as insalubrious.

2. HIGH-RISE WITH A TWIST: DENYS LASDUN CLAREDALE STREET SCHEME

Before going any further, an important detail of the "County of London Plan" needs to be pointed out: not only did it set densities, but also heights. The fervent and profound fascination for high-rise buildings of the CIAM III (1930) would spread like wildfire and also have here an impact. The plan would establish the construction of 7-10 storey housing blocks in the inner zone of London,[3] and the institution responsible for its implementation – the London County Council (LCC) – would have some of its members enthusiastically defending it.[4]

Cherished by some within the LCC, the concept of the "mixed development" – i.e. estates in which high-rise blocks of flats for smaller families coexisted with low-rise blocks of maisonettes for larger ones – was to become the "norm" for the first 20 years or so after WWII. It was within this fascination with mixed developments – however, with a twist – that Denys Lasdun's (1914-2001) Claredale Street scheme (1954-1959, London) was designed.

2.1. BEGINNINGS

Originally consisting of two bars and a tower,[5] the Claredale Street scheme was planned as a council estate set to occupy an area of Bethnal Green

5. The two bars were demolished after the year 2000.

partially destroyed by air raids.[6] Following the typical approach, its 160 dwellings were divided into 96 larger ones in the bars (54 three-bedroom and 42 four-bedroom maisonettes) and 64 smaller ones in the tower (8 bed-sitting-room flats and 56 two-bedroom maisonettes).[7] It is in the tower – named as Keeling House – that the architect's genius was stronger.

Despite its imposing presence in the landscape **(Fig. 1)**, this 16-storey tower stemmed from a desire to connect with the surrounding context. Knowing that it would house families from the nearby terraced houses – with its small backyards and communal street life – Lasdun decided to give them an emulation of that same reality through the perfecting of his "cluster block" idea:[8] the apartments were mainly designed as maisonettes, optimising the sense of the traditional terraced house; the access to the apartments was provided by exterior galleries, planned to replicate the spirit of the street; intermediate "drying platforms" were created to replicate the backyard, where clothes could be hung to dry, children play and neighbours chat; and its shape was divided into four, slightly rotated, smaller volumes, in order to reduce the noise and augment the sunlight in the apartments whilst diminishing the impact of the building in the landscape.[9]

2.2. TROUBLED TIMES

Although Lasdun's famous "cluster blocks" were published in several architectural periodicals – suggesting a certain recognition – their reception by common people was less warm: almost immediately after their completion, some of the apartments began to have infiltrations;[10] the galleries and the drying platforms were too windy for any conversation to be pleasantly held;[11] and, more importantly, despite the architect's best efforts to emulate their former homes, some of the tenants were not pleased with its look.[12]

As time went on, the structural problems increased, and in 1984 the council was forced to carry out major renovation work. Still, from then on, the downward spiral only accelerated. The open circulation system was prone to mischief, and, more importantly, the structure continued to deteriorate, calling into question the effectiveness of the refurbishment. The external cladding began to fall, and by 1992 tenants were required to vacate.[13] In 1993 the Council was planning its demolition.[14]

2.3. AFTER LIFE

Nonetheless, despite some of its problems, it seemed that the tenants had grown fond of the building.[15] The maisonette layout was much appreciated, and the drying platforms functioned in part as a useful communal multifunctional space.[16] Furthermore, people recognised themselves as a community.[17] In the end, it seems that the main criticisms to the building had more to do with its deterioration – consequent of the lack of maintenance – than with the hatred for its architecture. Fortunately, the demolition was prevented in that same year of 1993 due to the building's listing as Grade II*.[18] In 1999 it was bought by a private promoter, and in 2000 its renovation was completed with the aim of selling the apartments.[19] This is where a new cycle begins.

First, came a fresh middle class mainly seduced either by the views, the apartments layouts, or a mysticism emanated by the building.[20] Later, as the value of modern architecture became more recognised, a wider group of people arrived desiring to be part of Lasdun's legacy.[21] As for the initial communal goal, it has now been established through a common cherishing of the architecture and a tireless concierge, who passionately links contacts and supervises the building **(Fig. 2)**.[22]

3. URBANITY FROM WITHIN: PATRICK HODGKINSON'S BRUNSWICK

But it was not all roses in the mixed development's department. As soon as high-rises started to pop in the British landscape, their reality began to contradict the initial aspirations of architects and planners. As early as 1955, at a RIBA symposium, a survey presented by Margaret Willis – a sociologist at the LCC – revealed that two-thirds of high-rise tenants would prefer to live in a single-family house with a small garden.[23] As testified in Stephen Willats (1943) documental work of art – "Living with Practical Realities" (1978) – a sense of isolation, loneliness and anonymity seemed to torment the residents' psyche.

Faced with this reality, the new generation of architects, educated after WWII, began to question this solution. Contrary to the prevailing tabula rasa, they felt that the new housing should be even more connected to the traditional models to which people were accustomed. The intricate, low-rise, high-density solution was now the answer.[24] Patrick Hodgkinson's (1930-2016) Brunswick (1960-1974) would become one of its prime examples.

3.1. BEGINNINGS

However, unlike the Claredale Street scheme, the Brunswick would be commissioned by a private developer and the design process would be anything but straightforward. The plot had been purchased in 1958 with the intention of creating a mixed-use development to replace its derelict and partially war-damaged Georgian terraces.[25] After several unsuccessful attempts, in 1960, the promoters hired the office of Leslie Martin (1908-2000)[26] – the former chief architect of the LCC – probably in the hope of speeding up the process. Patrick Hodgkinson was working for Martin at the time and put in charge of the part of the plot that was to become the Brunswick. In 1963, Hodgkinson was given full responsibility for the project.[27]

The proposal was radical, though not new to Hodgkinson: an interlocking low-rise and high-density system with aspirations to be both building and urban ground. Two stepped volumes for housing – stopping at the height of the surrounding buildings in its exterior – faced each other and created, in the middle void, a long commercial public plaza set above a cinema and parking lot. Although Hodgkinson originally planned it as a classless "liner",[28] its apartments were to be designed, at one moment, for an established middle class, and at the end, as social housing.[29] The final planned solution[30] comprised 560 apartments (mainly raging from the bed-sitting-room to

the two-bedroom flat).[31] Interestingly, as in the case of Keeling House, its contextual aspirations were far from serene. Although low in height, its massive scale and contrasting materiality was inevitably at odds **(Fig. 3)**. While Keeling House's monumentality was established through a vertical imposition, at the Brunswick, it was a horizontal one.

3.2. TROUBLED TIMES

Unfortunately, as with Lasdun, there were many problems that began to emerge as soon as it was completed: the poor construction led to flooding in the apartments;[32] the slightest noise from the elevated terraces was amplified by the architecture and echoed unpleasantly throughout the entire complex;[33] and the success of the commercial plaza was more than short-lived, with moments when many shops were closed.[34]

31. Neave Brown, "Brunswick Centre, Bloomsbury, London: Criticism by Neave Brown," *The Architectural Review* 152, no. 908 (1972): 214.

32. Clare Melhuish, *The Life and Times of the Brunswick, Bloomsbury* (Camden History Society, 2006), 20.

In addition to these problems, until the early 2000s the building was a constant target of vandalism, deviance, and homelessness. To deal with it, access to the elevated terraces and upper galleries was closed to the public in 1991.[35] Furthermore, in line with this concern, the grand staircase and bridges that connected the plaza and the elevated terraces were demolished. As it became increasingly dilapidated, there were many times in the 1990s when its disfigurement was planned with unsympathetic projects.[36]

3.3. AFTER LIFE

Fearing the destructive changes these plans would bring, the 20th Century Society fought to have the building listed. Neck-and-neck with the imminent disfigurement threatened by a redevelopment scheme approved in 2000, the building was finally granted Grade II listing in that same year.[37] However, its value was not only recognised by the experts, but also by the inhabitants. For them, the main problem was not the architecture *per se*, but the dilapidation into which it had fallen. Thus, around the time of the listing, its inhabitants were also fighting on the public front. Under the chairmanship of Stuart Tappin, the Tenants and Residents Association organised a major art event with the dual purpose of demonstrating their love for their building and denouncing the state of disrepair it had been left in.[38] Finally, in 2005-2006, the commercial plaza would be completely renovated, and the building at last painted, as originally intended. This was the great turning point in the life of the Brunswick.[39]

Today, almost 20 years after its renovation, the vibrancy of this once empty plaza has contributed greatly to the enhancement of the entire building. Far from the days of dodginess, it is now recognised by the general outsider as one of Bloomsbury's vibrant commercial centres. Although infiltration and dampness continue to persist, both the residents and tenants seem content with their peaceful and restrained existence as an operative community.[40]

4. LEGACIES DISGUISED AS WASTE: CONCLUSIONS

Both the Claredale Street scheme and the Brunswick confirm that not all Modern attitudes are autistic. In the case of London, far from the Corbusian tabula rasa, there were many architects who, in the post-war period, rehearsed the fascinating marriage between new and old, between modern and traditional. In the particular situation of our case studies, this marriage can be seen in both their spatial and formal attitudes. Spatially, they recognise the value of the urban milieu as a communal setting *par excellence*: Keeling House with its galleries and drying platforms; and the Brunswick, through its more ambitious plan to create a larger urban landscape, relating a plaza, elevated terraces, and galleries. Formally, they value both local volumes and finishings: Keeling House, with its broken tower and punctual claddings in brick; and the Brunswick, with its low height and the originally planned, but not executed, painting in the traditional white cream of Regent's Park.

However, regardless of these harmonisation attempts, it is inevitable to note that, paradoxically, both buildings have a monumental presence. Despite their contextual features, the contrast created by the Modern spirit

39. Swenarton, "Politics, Property and Planning," 219.

40. Stuart Tappin interviewed by Jaime Silva.

is too visceral to remain unnoticed and seems to be the direct cause for the monumentality. The reason might be twofold. First, the Modern attitude to scale. The need to build as many dwellings as possible, recurring to standardisation, prefabrication and repetition, results in buildings with dimensions and rhythms rarely seen before. Second, and no less important, the use of exposed/painted concrete. An amorphous material by nature, it has the power to create "objects" with almost infinite continuous surfaces. While the terraced houses have a thigh texture – in a dance between windows, doors, and small bricks – the one of the case studies, due to their employment of concrete, is way looser: the Keeling House, with its large and primordial structural grid running through the whole building; and the Brunswick, with the infinite and continuous surface of its heavy balconies.

Finally, some brief comments must be made on the question of legacy or waste. It is our belief that, for a moment in their lives, these buildings existed as legacies disguised as waste. Today, they are recognised as milestones of Modern housing in London. But one can't help wondering, what led to their momentary disregard? In truth, lack of maintenance and the resulting state of disrepair seem to have been the key. In the contradiction of this path, a huge acknowledgment must be given to the people who inhabit them. In these two cases, they are a great example of how dwellers can have a meaningful impact on the recognition of a building's legacy, either after or before its refurbishment. At Keeling House, it is the sense of community growing around Lasdun and his unique apartments that has contributed to the building's increasing cultural and monetary value. And, at the Brunswick, it was in part the activist attitude of its inhabitants that ultimately led to the building's partial refurbishment and larger recognition of its legacy.

Waste? Not at all. Legacy? Without a doubt.[41] Fascinating mutations between old and new, flavoured by the love of the ones who inhabit them.[42] ■

BIOGRAPHIES

Jaime Silva is an architect and PhD student currently conducting research on collective housing at IST-University of Lisbon (IST-UL) with a scholarship from FCT. He obtained his Master's degree at IST-UL, complemented with an exchange program at EPFL. In 2019, he was awarded the Álvaro Machado Prize and in 2021, together with Manuel Alves Campos, he won a special mention in the ReUse Italy competition. He has worked as an architect in the office of Eduardo Souto Moura and as a teaching assistant for the Theory of Architecture classes at IST-UL. He is a member of the CiTUA research group.

Ana Tostões is an architect, architecture critic, and historian. She is Full Professor at Técnico – University of Lisbon, where she serves as the Chair of the Architecture Scientific Board and is responsible for the PhD program. She is the leader of the Heritage research line at the Center for Innovation in Territory, Urbanism, and Architecture (CITUA). Invited professor at the University of Tokyo, the University of Navarra, FAUP, and KU Leuven, among others. She was the President of Docomomo International and as the Editor of the *Docomomo Journal* (2010-2021). She has been distinguished with the Commander degree of the Order of Infante Dom Henrique.

IBIRAPUERA GYMNASIUM: RENEWAL OF USE, PRIVATE CONCESSION AND PRESERVATION IN SÃO PAULO

RENATO ANELLI
PROGRAM IN ARCHITECTURE AND URBAN PLANNING,
MACKENZIE PRESBYTERIAN UNIVERSITY, SÃO PAULO, BRAZIL

ABSTRACT

The renewal of use of large modern architectural complexes in São Paulo faces new challenges arising from the concession processes to the private sector. Unlike the selection of projects for public buildings through competitions, bidding for concessions in Brazil does not judge the quality of architectural intervention projects in these assets, whether listed or not. The development of projects, programs and works are the responsibility of the concessionaire, being guided by the economic-financial balance of the winning proposal in the bidding. This paper presents the case of the Ibirapuera Gymnasium (São Paulo, 1954), where the concession was blocked through a social movement for its preservation, after the listing was denied by the Council for the Defense of the Historical, Archaeological, Artistic and Tourist Heritage of São Paulo State - CONDEPHAAT in 2020.

Initially, introductory historiographical and documentary research will be presented on the project, work, author, and the context of the IV Centenary of São Paulo. Next, the denial process by CONDEPHAAT and the subsequent social movement for listing will be discussed. The conflict between the adopted model of economic sustainability and preservation of the Gym will be discussed, following the Conservation Plan method.

1. INTRODUCTION

This paper deals with the dispute over the preservation of the Ibirapuera Gymnasium, a Sports Complex located in São Paulo, Brasil. Between 2020 and 2021, the State and Municipal governments attempt to make possible its concession to the private sector, without commitment to the preservation of its architecture and sporting uses. The paper is structured in three parts. The first deals with the assessment of the cultural value of the complex and the debate held at the Council for the Defense of the Historical, Archaeological, Artistic and Tourist Heritage of the State of São Paulo / Condephaat due to the request for its listing. The second part contextualizes the project proposed to the Complex by governments, identifying there the hidden reasons for Condephaat's refusal of listing and reporting on the movements of sectors of society that managed to block the project at the end of 2021. The third part discusses the new parameters of use based on the concession of public equipment to private companies, in Brazil and abroad, which change preservation and adaptation practices for new uses.

2. HISTORY AND VALUES OF THE IBIRAPUERA SPORTS COMPLEX

The Constâncio Vaz Guimarães Sports Complex, known as Ginásio do Ibirapuera, was built for the commemorative events of the IV Centenary of the City of São Paulo, on a plot of vacant land municipalized in 1891 and destined for the construction of Ibirapuera Park in 1926. Two decades then the Organizing Committee of the IV Centenary was created, headed by Ciccillio Matarazzo, a businessman committed to modern art and architecture (founder of the Museum of Modern Art and the São Paulo Biennale).

The Commission was responsible for the projects of the permanent pavilions, for which it hired Oscar Niemeyer, while the sports equipment consisting of the Gym, Swimming Pool and Velodrome were under the responsibility of the Department of Sports of the State of São Paulo DEESP, which commissioned the architect Ícaro de Castro Mello for the project.

The Commission's project occupied most of the land designated for the park, while the Sports Complex was concentrated in the northeast sector. Its belonging to Ibirapuera Park is clear, despite today being separated from it by Avenida Pedro Álvarez Cabral and constructions built later. However, this condition was not recognized by the Park's listing in 1992 (Condephaat, process 257/87), which was limited to the sector south of the avenue.

Only in 2017 did the analysis to start the process of listing the Sports Complex by Condephaat begin, resulting in a Preliminary Dossier prepared by architects José Zagato and Silvia Wolff and presented in 2020 to the council. It highlights the qualities of the Sports Complex as a memory of social groups and a landmark in the architecture and engineering of sports facilities, which would justify the opening of the listing process.

On October 20, 2020, the request to open the process received a contrary opinion from the Reporting Councilor, architect Pedro Taddei Neto, who considers the arguments presented by Zagato and Wolff insufficient to justify the opening of the listing process, due to "the lack of uniqueness of

its architecture and its obsolescence for current functional parameters. When discussing this opinion, architect Renato Anelli, author of this communication, Counselor representing the Institute of Architects of Brazil (2019-2021), requested views of the process and issued a favorable opinion on the listing.

Anelli structured his opinion based on the opening statement of the 1964 Venice Charter, analyzing the Sports Complex "for the intrinsic value of its architecture and its urban insertion; for the testimony of the historical moment in which it was produced and for the cultural significance it acquired over time".

It argues that the buildings designed by Oscar Niemeyer and his team, and by Ícaro de Castro Mello, were built at a time of strong international projection of Brazilian Modern Architecture and interpreted the monumental purpose of Ibirapuera Park for the IV Centenary in a monumental key, following the principles of the new monumentality of Giedion, Sert and Léger. The structural boldness and formal clarity of the buildings constitute ways of highlighting monumentality in the urban landscape, a common procedure for public facilities of that period.

The opinion interprets the spatial and aesthetic unity with Ibirapuera Park: the prominent role that the circular shape and domed roof of the gym play in the horizontal set of rectangular pavilions and marquee, in counterpoint to the dome of the Palácio das Artes and the verticality of the Obelisk.

The third argument explored its significance for sport and culture. With the celebrations of the IV Centenary and the construction of the gymnasium, swimming pool and athletics track over, the complex became a reference for São Paulo's sportspeople, especially due to its role in public programs to train athletes for high-performance sports. The tip of a network of public, state and municipal facilities in the main medium-sized cities in the state of São Paulo.

Regarding the argument of obsolescence, Anelli recalls that since the Charter of Athens of 1931 until more recent documents, there are criteria for the recovery and adaptation of historic buildings to new parameters of use, with several successful Brazilian examples. He also recalls the national public competition for projects for the modernization of the Sports Complex held in 2003, where the winning project by Hector Vigliecca's team respects the cultural characteristics of the architectural complex while adding 45% of the built area.

Presented at a meeting of the Condephaat board on November 30, 2020, Anelli's opinion was defeated in a vote by 16 votes to 8. A public campaign was immediately launched in defense of the preservation of the Ibirapuera Gymnasium and Sports Complex.

3. THE PROPOSAL OF PIU GINÁSIO DO IBIRAPUERA AND THE SOCIAL PRESERVATION MOVEMENT

Even though it was hidden from the opinions and debates held at Condephaat, the main reason for blocking the listing is found in the Urban Intervention Project PIU Ginásio do Ibirapuera, being prepared by the City

of São Paulo since February 2020. Urban instrument created by the Zoning Law From 2016, the PIU began to be used to grant public equipment to the private sector, a subject that will be analyzed in the third part of this communication. Despite being an equipment built and managed by the State Sports Secretariat, the Sports Complex is Municipal property.

In February 2020, the State Government expressed interest in developing a PIU in this area, initiating a series of studies and public hearings to debate the proposal prepared by a Technical Group of representatives from both governments. The proposal presented at the hearings aimed to allow the concession of the project to the private sector, which would be led by the State Government, where the proposed uses were incompatible with the preservation of existing buildings.

An architectural design carried out "solely for the purpose of evaluating the viability of the project" showed that the volume of the gymnasium would remain intact, but without maintaining its sporting use. On the remainder of the land, a multi-purpose arena for 20,000 spectators would impose itself on the landscape as its main use. At the hearing on September 21, 2020, the concession notice was publicly presented, modeled without the requirement to preserve any building.

The opening of the listing process by Condephaat was defeated to make this project viable, using a majority of votes obtained by changing the composition of the board in April 2019, by decree of governor João Dória. The representation of universities was drastically reduced from 14 representatives to 4, leading institutions and advisors that guaranteed a majority to impose the government's will.

Anticipating the defeat that would occur, based on the request for views by counselor Anelli, the IAB, Docomomo and representatives of the universities on the Council's collegiate body looked for other actors to mobilize in defense of the Sports Complex. Among several of them, the Sports for Democracy group stands out, which fully joined the movement. Even before the vote, on November 26, a request for listing was filed with Conpresp, the municipal body for the preservation of historical heritage.

When the vote that prevented the listing was over, posts were sent out on social media, Olympic medal-winning athletes spoke out in the media, and journalists from the group opened up space to reach public opinion. In mid-December, on the eve of Christmas, sportspeople, architects and teachers filed a Popular Action to prevent the opening of the Sports Complex concession process, obtaining an injunction from judge Liliane Keyko Hioki on the 17th, before the forensic recess.

In her order the judge states:

"The danger of damage is shown by the definitive loss of the entire Complex, with all its history and architectural and urban values, if the bidding process is allowed to continue, especially because, as said, if the structure is demolished, the history will be lost."

In November 2021, one year after the defeat at Condephaat, the National Institute of Historical Heritage IPHAN decided to provisionally

list the Ibirapuera Sports Complex, initiating studies for its definitive listing by its Advisory Council.

On April 30, 2024, the Court of Justice of the State of São Paulo condemned the current president of Condephaat and another group of public agents for administrative improbity, in the second instance, for the demolition of a listed property in 2010 (TJSP case 0047489 -60.2011.8.26.0224). Before assuming the presidency of Condephaat, architect Carlos Faggin signed a report justifying the demolition, which allowed the demolition of the property to expand a shopping center parking lot in the city of Guarulhos.

4. NEW PARAMETERS OF USE BASED ON THE CONCESSION OF PUBLIC EQUIPMENT TO PRIVATE COMPANIES: PRESERVATION AND ADAPTATION

From 2017 onwards, the concession of large public facilities to the private sector in São Paulo adopted the PIU urban planning instrument to establish the terms of reference for the bidding. Despite establishing that the concession has a limited term and the assets granted return to public assets when it ends, the concessions defined flexible limits for interventions, including allowing demolitions and new constructions.

The proposal for a PIU is composed of Urban Regulation, Economic Modeling and a Democratic Management Model. A Reference Project accompanies the proposal, which will not be the final project since the winner of the bid has the autonomy to prepare their project and change it in accordance with the Economic Modeling. The importance of the latter is given by Brazilian legislation, where the execution of concession contracts must maintain the economic-financial balance of the notice or rebalance it in the case of justified changes. The Pacaembu Stadium and Anhembi Park concessions illustrate the treatment of equipment architecture by the concessionaires.

Pacaembu is a sports complex consisting of a football stadium, swimming pool, gym, and courts, opened in 1940 and was listed at municipal (1988 and 2002) and state (1998) level.

The concession was made due to the underutilization of the equipment, which occurred after the inauguration of the Arena Corinthians Stadium, used for the 2014 World Cup. New uses, especially cultural and commercial ones, were encouraged, as long as the protected heritage was preserved. The reference project suggested replacing a grandstand built in the 1970s with a horizontal building with multiple uses, a volume that was respected by the concessionaire. However, the concessionaire decided to build event halls under the original listed stands, which required their demolition, excavation of the ground and reconstruction with a new structure. Project approved by preservation bodies, although subject to criticism by experts in the field.

The Anhembi exhibition pavilion was less fortunate. Opened in 1970, the aluminum space structure covering around 70 thousand m^2 was an innovative work that placed Brazilian engineering and architecture at the forefront in the

#24

world. In 2015 it was already considered outdated, as it did not allow flexible subdivisions, compatible with contemporary use parameters.

In 2017, before the opening of the concession bidding, Conpresp decided not to list the complex, contradicting the opinions of the body's technical area that defended the list. After the bidding was carried out without the limits of listing in 2021, the winner presented a proposal that incorporated the Pavilion adaptation and preservation project carried out by MMBB in 2016 (illustration). However, the concessionary abandoned this option in 2023 when he reviewed the project and decided to demolish it. A similar fate to that intended for the Ibirapuera Gymnasium.

Architect Pedro Moreira used the example of Anhembi at the Docomomo Germany conference, held in Berlin, in March 2024, whose theme was "Sustainability and Large Structures of the Modern Movement". Showing photos of the mountain of scrap formed by the aluminum tubes, Moreira discussed the threats of demolition of the SEZ sports complex (East Berlin,

1977-1981), where the same privatization policy adopted here is repeated, combined with the postponement of its listing to eliminate barriers to the entrepreneur's freedom to carry out his business.

It is clear that the main problem lies in the radical change of program that implies the transfer of these complexes to private management, whether by sale or concession. These are not just technical aspects of conservation or adaptation to new uses, as proposed by the bibliography on historical heritage preservation, but rather the viability of a business that imposes itself on the public interest. ■

REVISITING MERIHAKA'S PARKING STRUCTURES P1 AND P2

KARITA RYTIVAARA
ARCHITECT SAFA AALTO UNIVERSITY

ABSTRACT

In the Merihaka residential area (a Finnish Docomomo site in Helsinki built 1973–1986), planning work is currently underway. Individual landowners, alongside the city, seek space for new residents and revenue to cover increasing repair costs. There are efforts to identify buildings suitable for demolition. Parking structures P1 and P2 have been assessed as being in poor condition and are being considered for demolition.[1] The garages are situated at the edges of Merihaka and were designed by Peter Bieber, a member of the planning trio Bieber–Ilonen–Savolainen, between 1975 and 1983. A historical survey (conducted as part of the ongoing zoning project) supports the notion that, compared to other buildings in Merihaka, the parking facilities hold lesser architectural significance. It describes the parking garages as 'non-buildings'.[2]

Further examination of the historical building survey, as well as new interviews and studies on-site, reveal that the matter is not straightforward. The parking structures are integral to the Merihaka area and reflect ideas of its time, system structures, and separation of functions.

In this text, I revisit the historical survey, evaluate parking buildings on-site and the system thinking of their time. I examine parking garage P1 via a scale model I built in 2022. The scale model was part of a project titled "Stripped Frame," executed together with architect Kaisa Karvinen and funded by the Kone Foundation.

Merihaka parking garages connect to a broader conversation on preserving modern everyday buildings. Not seeming as refined architecturally, they are part of their context. The parking halls serve as parking space for the residents and, in addition, as occasional temporary cultural use. People are drawn to their harsh but interesting brutal architecture. The criteria for evaluating the architecture of modest and monotonous modern buildings are still being determined.

1. INTRODUCTION

The Merihaka residential area was built in Hakaniemenranta, the eastern part of Helsinki city centre, during 1973–1986.[3] A modern concrete fortress of blocks of flats covered the hitherto nearly uninhabited industrial waterfront. By separating pedestrians and cars in Merihaka, the architects *Bieber–Ilonen–Savolainen* sought to create a safer and more pleasant traffic environment. On the edges, attached to the car deck, the separate parking buildings, P1 and P2, are located.

Merihaka has remained unchanged until now, but many parts of it are in need of repair. Private landowners and the City seek solutions to accommodate new residents to fund refurbishments. Parking buildings P1 and P2 face demolition, making room for residential structures.[4]

Examining the historical survey –a guideline for city planners– is particularly interesting, as it aligns architectural perspectives with those of the City and private landowners. Some buildings are seen as having architectural value, but the parking buildings are not considered to be of any significance. The survey states that the idea of a noise barrier is outdated and, as buildings, they are "non-buildings" and even frightening. These statements are based on the belief that spaces below the deck and the parking buildings are unpleasant and an architectural failure. Yet, it is stated that the measurement system that defines the whole area starts at the south-west corner of the parking hall P1.[5] The survey assessed buildings differently depending on the time of completion–which is part of the reason why the parking buildings were considered of lesser significance, having for the most part been completed in the 1980s. One might wonder about the criteria of worthy and inferior buildings in a case of such a unified area.

2. ON ORIGINS OF MERIHAKA AND THE PARKING BUILDINGS

The early sketches depict Merihaka as a dominant and modern "island" on the shoreline of Hakaniemi. In the 1950s the industrial sector freed the land to new use.[6] In 1965 the Finnish Architectural Review featured a plan which resembled the present-day Merihaka (Architects Erik Kråkström, André Schütz and Kirmo Mikkola assisted by architecture student Juhani Pallasmaa). The traffic was separated into two levels; above the deck office high-rises and below car decks. The plan was based on a rectangular measurement system.[7]

The plans of Kråkström et al. were never executed, and in 1969 design for present-day Merihaka started. In 1968 Haka, building developers, bought the land and invited Architect Sulo Savolainen to put together a group of architects, and in 1969 Savolainen invited architect Arvi Ilonen, whom he knew from university, and Peter Bieber from Berlin. Bieber had won competitions earlier and was therefore deemed competent by Savolainen and Ilonen.[8] Office towers were traded for residential buildings to provide homes and services for ordinary city dwellers. The architects negotiated the deck's elevation to be high enough for the sub-deck parking space not to turn into a low-ceilinged cellar.[9] Additionally, the plan included two separate parking

halls attached to the high deck structures and with lower storeys, situated as noise barriers between the heavy traffic of Sörnäisten rantatie.[10]

The work of the three original architects was interrupted by the recession of the 1970s, and in the 1980s, they were too busy to return to the project. The work was eventually completed by Architect Unto Toikkanen of the Kulutusosuuskuntien Keskusliitto (an association of cooperative movements).

2.1. ARCHITECT PETER BIEBER AND THE PARKING HALLS

Of the original designers, Peter Bieber was the principal designer of the parking halls. The first part of the P1 was completed in 1975 in accordance with his plans. Unto Toikkanen continued the work in the 1980s, and the second part of the P1 was completed in 1980, and the P2 in 1983. Toikkanen followed Bieber's designs fairly accurately.[11]

2.2. THE 7,5 M COORDINATES

The measurement grid, starting from the southwest corner of parking building P1, spans 7.5x7.5 meters and fits within three 2.4-meter parking slots with the required structures. This modular measuring system extends throughout Merihaka.[12]

3. ON SITE: THE PARKING HALLS IN THE CITYSCAPE

The parking halls P1 and P2 are located at the perimeters of the area, and they are a significant part of the public space when approaching Merihaka, located between the heavily trafficked Sörnäisten rantatie and the sea. The parking halls act as an urban barrier, and as one ascends onto the deck, one will find it much more peaceful than at street level.

3.1. EXCLUSIVE ELEVATIONS AND SYMPATHETIC SQUARES

The pedestrian is meant to enter Merihaka via an overpass (Näkinsilta), from the west, where the P1 west façade is visible from a long distance away. The overpass takes one to the upper deck, and not far from where the pedestrian overpass leads is a square in front of the red and green façade from which one can enter P1.

Parking hall P2 is located facing the visitors coming from the north-east. There is a small green area in front of the concrete building that resembles an entrance square. Trees provide shelter from the traffic, and on the eastern side lies the sea. The façade looks closed off from the ground level, but it can be accessed through the car park below the deck or by ascending the stairs to the deck. On the deck it can be observed that the façade of P2 looks concordant with the outside of the commercial pavilion. They were both designed by Peter Bieber. The door to P2 from the deck is presently closed off.

The parking buildings can be found when following Haapaniemenkatu (the car lane running under the area) that leads below the deck. To locate the separate parking buildings, one needs to navigate toward the edges of the area.

12. Okulus Oy, "Merihaka: Kaupunkirakenne- ja ympäristöhistoriaselvitys," 93.

4. ON SITE: THE ARCHITECTURE OF P1 AND P2

There is no visible distinction between the phases of the parking buildings built in the 1970s and 1980s. Everything is built according to Peter Bieber's original plans. The outside of the buildings, adhering to the deck, does not necessarily imply that behind the rigidity of the modular appearance, there is lots of daylight, patina, details, and raw space.

4.1. ON DAYLIGHT

Once inside the parking halls, there is daylight. From the outside one would not expect such interesting direct and indirect natural light inside the halls. There is a light shaft inside each parking hall and there are large openings in the façades, elements which only cover the lower part of the wall, while the upper part of the wall is open. The buildings are uninsulated, and light enters freely, reflecting indirectly from the surface of the concrete or through the façade, creating graphic shadows. Underneath the high deck structure, there is not nearly as much daylight as there is inside the parking buildings.

4.2. THE HORIZONTAL VIEWS

The ceiling height is low, and the free headroom reaches only 2,2 m, while at openings only 2 m. Furthermore, the dimensions have been optimised for car park use. Every floor consists of two levels, allowing the car ramps to ascend one half-storey at a time. This kind of variation can be seen as a challenge when planning the reuse of a building. Even so, one could see it as part of the nature of the building. There is variation because of the half-storey mounting ramps cooperating with daylight. These qualities make horizontal views an integral part of the architecture, and the lack of vertical space is copiously made up for by the horizontal. There is a rhythm created by the repeating walls and elements.

4.3. THE DETAILS, MATERIALS, COLOURS AND THE PATINA

The buildings adhere to a 7.5 x 7.5-metre system, but when applied in reality, slight deviations at the joints persist. In parking halls P1 and P2, these are indicative of the restraints of the system and the execution; some of which are perhaps unintentional. In P1, small pieces of concrete are found beneath each ceiling joist, while in P2 there is a beam running perpendicular to the joists. This may have been added during the construction itself. The floorplan of P2 is not entirely rectangular. It slopes at the corner where it aligns with Sörnäisten rantatie. From the same spot, it can be observed how the elements on the west side do not abut, but there remains a small crack through which light filters in. Concrete, the predominant material, has developed a weathered appearance with varying patinas under different lighting conditions. Its colours have faded to different extents. It could serve as an ideal backdrop for galleries or short-term cultural events.

5. COMPACT CITY AND SYSTEM ARCHITECTURE

Architect Sulo Savolainen believed the segregation of cars and pedestrians to be a necessity due to the unprecedented amount of floor area available. By

placing cars under the deck, more space was made available in the courtyards for pedestrians.[13] The increase in car numbers was a major factor and the decks were intended to reduce their negative impact. Yet architect Peter Bieber commented in Helsingin Sanomat, in 1992, that the solution followed compact city ideas.[14]

Additionally, structural systems did influence Merihaka as they are most clearly visible below the deck and in the parking halls, where structures are uninsulated and therefore in plain sight.

Anonymity was vital to the new generation of architects at the end of 1960s and 1970s. It was considered that the architect's moral obligation was to find minimal solutions and employ structural systems which would act as a neutral backdrop to human activity. Reinforced steel was seen as the ideal material for this purpose. For instance, in Finland, the so-called Constructivists[15] took these principles seriously. In 1968, the heating plant designed by Architect Erkki Kairamo was featured in the Finnish Architectural Review as an example of design born out of sheer function. The building was described as a *non-building*; there only to protect the factory process.

So, one non-building in Hyrylä, and another in Merihaka. Systems and the respect for function were part of the ideals of the era. It is also significant that members of the first planning team, led by Architect Erik Kråkström, included the constructivists Juhani Pallasmaa and Kirmo Mikkola.

6. P1 IN CONCRETE SCALE MODEL

In 2021–2022, I worked on a research and exhibition project titled "Stripped Frame" with my colleague, Kaisa Karvinen. The exhibition entailed creating concrete scale models of 1960s and 1970s buildings, which revealed the architecturally essential concrete frame beneath the layers. The P1 scale model was unique in itself as it, in reality, exposed its frame, resulting in a cold building. At the same time, the model highlighted its form, normally inseparable from the deck, and the concept of a 7.5x7.5 structural frame containing the function, a "non-building," transformed into an object. A scale model reveals how concrete is not a neutral material. In the model, the system and the material forge an object with unique characteristics.

The scale model helped me to understand the parking halls' materiality, structural monotony, and connection to the Merihaka area as a whole. For an architect conducting a historical survey, a scale model could be a useful tool for analysing an existing structure.

7. THE CONCLUSIONS

As I revisited the material of the Merihaka historical survey on the parking halls, as well as the area today and the scale model, it became evident that the parking halls are an integral part of the Merihaka area and their quality is architecturally significant.

In the historical survey, it is stated that the parking halls are "non-buildings"; only serving to block the noise and act as the starting point for the abstract, systematic dimensioning. Regardless of whether this is true, it does not mean they are inferior, but rather that they were typical buildings of

that era. Considering how well preserved the Merihaka area is as an original entity, the arguments are not strong enough to categorise garages as inferior.

7.1. VALUES IN CITYSCAPE

Merihaka is a landmark in the citycape of Hakaniemenranta. It is challenging to separate the various buildings according to their designers and the time of completion.

The area is not easily accessible on foot from Sörnäisten rantatie direction, where parking halls close Merihaka off from the rest of the city. In the words of the historical survey, "the principles for these are understandable, but they make for abominable non-architecture".[16] It is, however, this barrier that makes Merihaka a typical area of its time. The

16. Okulus Oy, "Merihaka: Kaupunkirakenne- ja ympäristöhistoriaselvitys," 91.

separation of functions is characteristic and makes the courtyards peaceful. Parking halls P1 and P2 do still act as noise barriers. In the historical survey, the areas designated for cars are deemed inferior, yet demolishing these would destroy an intact ensemble. Parking areas are an integral part of Merihaka. What will remain of Merihaka, if these are subtracted?

7.2. ARCHITECTURAL VALUE

Looking at P1 and P2 as individual buildings, one observes a relation to the surrounding Merihaka at every angle. The design is based on the separation of functions and the 7,5-metre dimensioning. The shopping centre's façades continue the green and red colour scheme of the garage façades on the deck. It is noteworthy that the commercial pavilion has been classified as architecturally significant, unlike the parking halls, but they are connected in their architecture and were both designed by Architect Peter Bieber.

As buildings, the parking halls are sparse and raw. This does not make them architecturally inferior, but in fact, surprisingly fun once you find them in the "underworld". Daylight from different directions creates beautiful shadows and photogenic spaces. The structures are mostly cast on-site, but for instance, the intermediate floors and façades are made of elements. The seams between different techniques give the buildings an original look. Time has given them a patina. Different shades of concrete and painted areas between car bays have a weathered, visually captivating aesthetic. Even though the buildings were made for cars, they offer an experience.

The parking halls were, for the most part, completed in the 1980s, but the more recent parts adjoin Peter Bieber's original design effortlessly, and it is virtually impossible to discern the difference.

7.3. THE REUSE OF THE EVERYDAY MODERN

Architect, Professor Wessel de Jonge describes in his article "Sustainable Renewal of the Everyday Modern", that modern building heritage deserves to be seen, even if not listed. Architectural quality typical of a particular era should be considered in evaluation.[17]

Breaking down ensembles like Merihaka and separating their parts is challenging. One may consider in-fill construction, if it is done with true respect to the existing heritage.

Turning parking halls for instance into housing would be challenging as they are unheated concrete structures with little headroom. Reusing them would be more feasible if the horizontal views and the quality of the material were considered assets. Answers may be found in the previous temporary use of the parking halls. where parties, photo shoots and exhibitions have taken place without requiring significant alterations to the existing buildings.[18] Sulo Savolainen states how colours could be used to help orientation below the deck, and more daylight could be introduced through new lightwells.[19]

Furthermore, it is significant that the residents value the area highly and that according to an ethnographic survey, they enjoy living there, and do not wish for demolitions, for example.[20]

17. Wessel de Jonge, "Sustainable Renewal of the Everyday Modern," *Journal of Architectural Conservation* 23, no. 1–2 (July 2017): 62.

18. The original entrances from the deck could be reopened since they are locked.

19. Sauli, "Politiikkaa, betonia ja leijonan karjuntaa," 10-18.

20. Ylitalo, "Poikkeuksellinen kokonaisuus," 20.

It is important to ask ourselves, *what will we gain after the building is demolished*? Regarding Merihaka, the demolition of the parking halls and replacing them with new buildings would disrupt the perimeter[21], and the new houses would conflict with the existing ones. Not to mention the ecological impact. The newbuild would be situated next to the heavily trafficked Sörnäisten rantatie, where there is, now, the so-called noise barrier. There is also the risk of a chain reaction. The next time there are buildings in disrepair, and in need of resources, it would become increasingly easy to demolish something of "lesser significance". ■

21. Architects have reacted to the new plans in Merihaka since 2022. For instance, architect Kaisa Karvinen featured in Finnish broadcasting company YLE Kulttuuricocktail (a cultural programme), commented on how the demolition would make the characteristic perimeters "leak".

BIOGRAPHY

Karita Rytivaara is an architect, university teacher and researcher concentrating on restoration, renovation, post-war modernism and historical surroundings. Modern everyday architecture has been at the centre of her research, and on her latest project, she collaborated with Architect Kaisa Karvinen to produce "Stripped Frame", exploring 1960's and 70's buildings, which was funded by the Kone Foundation. She constructed scale models studying the concrete frames and published a peer-reviewed article "Layers of the Invisible" at the 5th Alvar Aalto Researchers' Seminar. She has also worked on projects at the R Schnitzler architecture office. She has been teaching architecture history at Aalto University since 2019.

BEYOND CIAM: TRANSNATIONAL NETWORKS OF LATE MODERNISM

MARTA GARCÍA CARBONERO
UNIVERSIDAD POLITÉCNICA DE MADRID

BRETT TIPPEY
KENT STATE UNIVERSITY

#25

ABSTRACT

This session aims to gain a better understanding of the forums of reflection and discussion of late modernism and the transnational networks that made them possible. The new generation of architects that graduated after World War II questioned the utilitarian approach of the founding members at CIAM, leading to its dissolution in 1959. Along with this process of dismantling modernism's core institution, other networks of discussion emerged to address the changing needs of the postwar world. Team 10 followed the steps of CIAM with a whole new format and different aims that included the users' social and psychological demands. Almost in parallel, other associations such as the International Union of Architects and the Union Internationale des Femmes Architectes somewhat diluted the technical content of their meetings to better connect professionals from all over the world. Also, the geopolitics of the postwar period fostered the emergence of transnational networks beyond Europe that helped address architectural issues from a specific local and regional perspective. Mapping the conferences, journals, and academic and editorial networks that followed the end of Ciam will provide a more comprehensive account of late modernism and the cross-connections between countries, institutions and individuals that contributed to a richer, more complex approach to architecture in the postwar period.

1. INTRODUCTION

CIAM conferences came to an end in 1959, after the meeting in Otterlo, which the group's founding members did not attend. Eventually, the younger generation grouped around Team 10, self-defined as "a small family group of architects who have sought each other out because each has found the help of others necessary to the development and understanding of their own individual work."[1] Thus, the quest for a universal design method underlying the CIAM ethos was slowly replaced by an ad-hoc approach that took into account the cultural and physical particularities of the site as well as the social and psychological needs of its inhabitants. But besides the Eurocentric Team 10, other exchange networks fostered architectural debate, incorporating a wide array of regional and local approaches.

In line with subtheme 8: *Modernity and Diversity*, this session analyses the ways conferences, journals, and personal and educational networks fostered exchange between architects and regions and nurtured the architectural debate beyond central Europe. It explores the networks and forums for reflection on the future course of architecture that proliferated once the unifying patronage of CIAM disappeared. While CIAM and Team 10 have been extensively researched, further channels and events through which avant-garde ideas evolved and disseminated in late modernism have yet to be explored and incorporated into the historiography of modern architecture.[2] This session expands on the topics explored by the research project RETRANSLATES_Redes transnacionales de la arquitectura española. Lecturas críticas de su difusión y recepción desde el exterior, sponsored by a Spanish Ministry of Science and Innovation three-year grant (2023-2025).

2. CONNECTING THE POSTWAR WORLD

Even before the end of CIAM, the post-war debate demanded a reconsideration of design methods, means and aims. As early as 1951, the *Darmstädter Gespräche* summoned creatives in devastated Germany to reflect on 'Mensch und Raum'. Architects such as Willem Dudok and Hans Scharoun delivered schemes for schools and dwellings to support the social and psychological needs of human beings.[3] Here, broadminded humanism replaced myopic functionalism.

A few years later architects of the post-war generation began to question CIAM's earlier solutions for architecture and the city that were based primarily on efficiency, industrialisation, and technology, for what these younger architects perceived as CIAM's failure to address basic human needs. Against this backdrop a group of young architects organised the 10th CIAM conference in Dubrovnik, Croatia, in 1956. Le Corbusier, Gropius, Van Eesteren, and other members of the old guard refrained from attending, easing the way to a more democratic organisation based on individual contributions rather than on CIAM's previous country delegations. According to Aldo van Eyck, the goal was a more plural approach to "the archaic principles of human nature".[4] Eventually, this generational shift

spelled the end of CIAM as announced at the following meeting in Otterlo, held in September 1959.[5]

Team 10 was a loose organisation characterised by fluctuating membership that aimed to address the architectural problems of the post-war period: the reconstruction of cities, large housing schemes, or new campuses designed to democratise higher education. Lacking an executive committee and formal membership, an 'inner circle' quickly emerged to set the agenda for the meetings that took place between 1960 and 1981. This core group included Alison and Peter Smithson, Jaap Bakema, Aldo van Eyck, Shadrach Woods, Georges Candilis, and Giancarlo de Carlo. Other architects, mainly European, came and went. Larger meetings were held at Bagnols-sur-Cèze, France (1960), Royaumont, France (1962), Berlin (1965), and Urbino, Italy (1966) around the social, cultural, and environmental aspects of the human habitat specific to the location.

Along with the reconsideration of urban design through the lens of Patrick Geddes's design methods and theories, new viewpoints emerged that had not been central to CIAM discourse. During the early 1970s, topics such as introducing modern infrastructure in historic city centres or citizen participation in the design process eventually permeated both Team 10's theoretical debate and the projects presented in the meetings. Team 10's predominantly European membership, the rise of postmodernism, internal tensions between the Smithsons and Aldo van Eyck, and the premature death of Jaap Bakema led to the dissolution of Team 10 before its last meeting could occur in Lisbon (September 1981). Nonetheless, Team 10 inaugurated transnational networks that sensitised modernism to qualities of place, climate and culture. In his paper for this session, Guido Campi discovers one such reorientation in Horst Rittel's concept of Design Methods, and its impact in the 1960s and 1970s on Cornelia and Eduardo Vargas and Raúl Di Lullo, three young architects working collaboratively and transnationally in Central Europe and South America's southern cone.

Parallel to—yet less militant than—CIAM, the Union Internationale des Architectes (UIA), was founded in 1948. The UIA was a non-governmental, democratic association that welcomed architects' associations from all countries without distinction of nationality, ideology or architectural doctrine.[6] Held in Lausanne in 1948, its first General Congress reflected on real and present post-war problems. The organisation met every three years, mostly in Europe, and its pan-professional nature excluded ideologically driven approaches, even as Cold War tensions persisted. Pierre Vago –a pupil of Auguste Perret and the organisation's first Secretary– helped expand the UIA towards Eastern Europe, securing the collaboration of Bulgarian architect Luben Tonev and Polish CIAM member Helena Syrkus.[7] This eastward reach bore fruit in many projects such as the winning entry for the Palace of Youth and Sports, designed in 1970 by Ljerka Lulić, Jasno Nooso, and Dinko Zlatarić for a site in

Prishtina (Yugoslavia), which Edmund Drenogllava discusses in his paper for this session.

The urgency of city reconstruction after World War II fuelled an initial consensus under the patronage of Patrick Abercrombie, who was the UIA's first president and the author of London's post-war master plan. However, this same urgency endowed urban planning with new political dimensions and the debates were quickly coloured by Iron Curtain tensions. The East-West dispute centred subsequent meetings in Europe, which mainly debated the role architects should play in post-war society.

But the tenth conference in Havana in 1963, titled "Architecture in Developing Countries" shifted the focus away from Europe.[8] It also helped to expand the UIA network beyond Europe and North America to include Latin American membership. US-Cuba relations following the Bay of Pigs invasion in 1961 and the presence of Fidel Castro at the speaker's podium confirmed the political dimension of the meeting.[9] But the conference's focus on an architecture of limited resources transformed CIAM's celebration of high technology and functionalism. With 2000 professionals and 500 students in attendance, along with many critics and writers of the architectural press, the conference fostered regional and transnational networks.[10] Latin America would soon gain momentum within the organisation, with subsequent conferences in Buenos Aires (1969) and Mexico City (1978) and several presidents hailing from the region: Héctor Mardones-Restat (Chile, 1957-1961), Ramón Corona Martín (Mexico 1969-1972), Sara Topelson de Grinberg (Mexico, 1996-1999), Jaime Lerner (Brazil, 2002-2005), and José Luis Cortés (Mexico, 2021-2023).[11]

Also in 1963, female professionals founded the Union Internationale des Femmes Architectes (UIFA) "to establish friendly relations and exchanges among women architects and town planners in all countries; consolidate their efforts to ensure that careers in these fields are opened to women; collect information concerning their status and professional life; provide opportunities for women architects to express and diffuse their ideas".[12] Not officially connected to the UIA, the UIFA was largely the result of the efforts of Solagne d'Herbert de la Tour, a Romanian architect who had suffered gender inequality in Paris.[13] In 1960 she founded the Union Française des Femmes Architectes (UFFA) following previously established models in Finland (1948), Japan (1953), and Italy (1957). From the beginning she engaged women around the world working in the design professions to centre their specific needs and perspectives. The association's first international congress, titled 'Women Architects in the World", was held in Paris in 1963, and it was attended by some 100 architects from 22 countries.[14] Since then, around 20 more meetings have taken place every two or three years expanding the initial women-centred themes to topics such as society, identity, heritage and environment preservation, or climate change.[15] Although initiated in Paris, they soon expanded to the East, when the third congress was held in Ramsar, Iran

(1976) as part of the Pahlavi rulers' efforts to modernise the country.[16] *Shahbanu* Farah Diba, the empress, who had left her architectural education in Paris unfinished, attended and promoted the conference.[17] Influenced by the UIFA, the UIA gradually included more women on their working commissions and representative bodies and addressed gender-related problems.

This trend of transnationalism also pervaded the architectural press in the 1970s and 1980s. Some older, more established publications such as the *Journal of the American Institute of Architects* (*JAIA*) and *RIBA Journal* attempted, with limited degrees of success, to internationalise their content by incorporating examples of what *JAIA* simplistically branded as "World Architecture". But parallel to developments in Team 10, the UIA and the UIFA, newly established periodicals were more meaningfully transnational and collaborative. Such was the case of New York based *Oppositions* (1973-1984), which depended on pan-national participation. Moreover, *Oppositions* collaborated regularly with *Arquitecturas Bis* (1974-1985), based in Barcelona. Both journals broadly emphasised architectural theory and criticism more than reporting on discreet buildings or topics in professional practice. The Indian journal *Design* (1957-1988), as Pappal Suneja highlights in his paper for this session, followed these same tendencies, even though *Design*'s scope was more *intra*-national than *inter*-national.

3. TRANSNATIONAL RELATIONS IN REGIONAL CONTEXTS

On a regional scale, transnational networks had already thrived even before Eurocentric institutions expanded to include other parts of the world. Founded in 1920 in Uruguay, the Congresos Panamericanos de Arquitectos provided a forum to debate issues in Latin America.[18] Although initially a grouping of professional associations from 32 countries in South America, in 1965 they also included all North American countries to become a fully Panamerican Federation of Architects' Associations. Their conferences occurred regularly and often focused on professional topics, such as university campuses or the architecture of health, but they also discussed questions related to collective American identity.[19] The need for a 'national architecture' fully emancipated from European trends was already at the core of the debate when these meetings were launched in the 1920s—years before CIAM's inauguration—and it permeated discussions throughout the 20th century. Hosting the conference in different cities across the region exposed participants to the continent's collective architectural heritage and the diversity of its landscapes, building traditions and current practice. Together with the Panamerican Exhibitions of Architecture and Urban Planning held in parallel with the meetings, they disseminated American architecture and nurtured a nuanced, multifaceted continental identity.[20] In his paper for this session, Óscar Andrade Castro explores one such instance, architect Alberto Cruz's and poet Edison Simons' transnational

journey in the late 1960s from Valparaíso to Vancouver in search of a unified, pan-American identity that they called, poetically, "Amereida".

A similar transnational network was that of the Commonwealth Association of Architects, which emerged from the meeting of Commonwealth architectural institutions, held in London in 1963.[21] Since then they have met every two years in cities in former British colonies. Organised in five regions, Africa, Asia, Europe, America, and the Pacific, they operate through a council and two working committees dealing with education and practice. Although their main aim is to work for the advancement of architecture, they have been especially active in architectural education, where they have carried out extensive surveys and have committed to raising the standards of professional training in the field.[22]

On a far smaller scale, the Pequeños Congresos, which is the focus of Ana Esteban Maluenda's paper for this session, were small meetings in Spain, initially intended to connect professionals working in Madrid and Barcelona who were in search of a modern approach to architecture that would be sufficiently potent to contest the heavy-handed academicism that prevailed during the early years of the Franco regime. These "small conferences" took place between 1959 and 1968 almost every year in different locations. Their initial aim was to visit and discuss contemporary architecture and to address specific themes related to these visits, such as architecture and tourism or affordable housing. Initially, these conferences attempted to connect professionals based in Madrid and Barcelona, Spain's primary cultural centres, but they soon expanded to other regions such as the Basque Country and Andalusia, thereby painting a multifaceted portrait of Spanish modernism. Portuguese colleagues also participated in the Spanish meetings, and in 1967 the conference travelled to Portugal.[23] These connections later expanded to include the rest of Europe and North America. In order to frame these discussions within the international debate the organisers invited Georges Candilis, Giancarlo de Carlo, Aldo Rossi, Peter Eisenman, and Vittorio Gregotti to discuss the challenges facing Spanish architecture from an outsider's perspective.[24] These invitations facilitated further connections between Europe and North America, and many of these foreign architects later collaborated with Rafael Moneo, Ignasi de Solà-Morales, and Antón Capitel (among others) in venues like *Oppositions*.

4. CONCLUSION

While CIAM was dominated by a focus on issues specific to the context of central Europe, and the solutions it proposed tended to emphasise formulaic and functionalist approaches to the interface between people and technology, it opened the door for Team 10's more nuanced and place-based ad-hoc approach. In turn, the grassroots and informal collaborations that characterised Team 10 laid the groundwork for the development of other transnational networks across the globe during the 1970s and 1980s. Organisations such as the UIA, the UIFA, the Congresos Panamericanos

24. Nuno Correia. "Los Pequeños Congresos, 1959/1968, Tras los pasos del Team X" in *Destino Barcelona, 1911-1991, Arquitectos, viajes e intercambios, ed*. Josep Maria Rovira, Enrique Granell, Carolina B. García (Barcelona: Fundación Arquia, 2018), 207-219.

de Arquitectos, the Commonwealth Association of Architects, and Spain's Pequeños Congresos transcended both regional and national borders, and opened new forums in which ideas could be exchanged fluidly and openly. In print format, new publication venues such as *Oppositions, Arquitecturas Bis* and the Indian journal *Design* paralleled the collaborative nature of these congresses. Not only did these collaborations move beyond the geographic confines of central Europe, they also made room for women and other minorities to express their voices, especially those working in geographic regions outside of central Europe and North America. These transnational networks of late modernism took advantage of the collaborative models established by CIAM and Team 10, and they found innovative ways of implementing these ideas in an increasingly pluralistic world. ■

BIOGRAPHY

Marta García Carbonero holds a Master in Architecture and a PhD from the Universidad Politécnica de Madrid, and a Master in Garden and Landscape History from the School of Advanced Studies, University of London. Her PhD thesis on 20th Century European cemeteries was awarded the Universidad Politécnica de Madrid Prize for outstanding dissertations. She is an Associate Professor of architecture and landscape history at UPM's School of Architecture. She has edited the books *Heterotopias* (2012) and *Plant Architecture* (2018) and is secretary of EAHN-European Architectural History Network.

Brett Tippey holds a Doctorate in History and Critical Analysis of Twentieth-century Spanish Architecture and a Master of Architectural Design, both from the University of Navarra (Spain), and a Bachelor of Architecture (2001) from Ball State University (Indiana). Currently, he is Program Coordinator for Architectural Studies and Associate Professor at Kent State University. His research focuses on the work of Richard Neutra and twentieth-century Spanish architecture, and it has been published in scholarly venues such as *JSAH* and *Architectural History* (Great Britain). He also serves as co-chair of the Architectural Studies Affiliate Group of the Society of Architectural Historians.

SITUATED AND CREATIVE. TWO ACTS ON HOUSING DESIGN, PARTICIPATION, AND METHODS IN LATIN AMERICAN LATE MODERNISM

GUIDO CAMPI
BAUHAUS UNIVERSITY WEIMAR

ABSTRACT

In this presentation, I analyse two histories of designers influenced by the Design Methods discourse, active in the post-CIAM Long Sixties. Cornelia and Eduardo Vargas and Raúl Di Lullo applied methods in housing design in Latin America. Influenced by systems, operations research, and cybernetics, Design Methods aimed at systematising the design process. One relevant advocator of this discourse was Horst Rittel. He taught in academic contexts attended by the Vargas and Di Lullo: Ulm and Berkeley, respectively. Both cases represent the shift from a pure "systems approach" to what Rittel would call second-generation Design Methods. Here, design would be an argumentative activity, where designers were part of a broader set of stakeholders. This is visible as users of these housing projects are directly involved in the design, construction, and sponsoring of their homes. Firstly, I will show the Vargas's massive cooperative housing project in Valparaíso, Chile. From 1960 on, future dwellers built their homes, working side by side with the architects, using a cooperative system. Secondly, Di Lullo designed, from the 1970s on, models of evolutionary housing in Argentinian context. Using a geometrical tool based on the semi-lattice, he proposed a system for the dwellers to expand their homes as their lives change, choosing between different growth alternatives. In the 1970s, methods figures such as Rittel responded to the critique of the universality and rigidity of the discourse. Therefore, he differentiated between design and science, stating that design deals with Wicked Problems. These are ill-defined and malignant and rely on the good political judgment of designers. The analysis of sources and oral interviews evidences how the Vargas and Di Lullo acknowledged the *wickedness* of housing design, proposing contextually situated and creative solutions. This reflects their belief in a scientific, but principally politically committed and participatory *other* Late Modernism.

1. INTRODUCTION

If there are reasons to talk about the Design Methods Movement, I suggest that one of them is the dissemination of its ideas in Latin America. This loose assembly of international researchers[1] lasted from the late 1950s to the late 1970s. They wanted to optimise the design process with techniques from systems disciplines such as operations research and cybernetics. Nevertheless, in the early 1970s, it was already evident that design problems were not science problems. Horst Rittel, mathematician, physicist, and leading defender of Design Methods, had to learn that design was more complex than what he had imagined.[2] From this realisation emerged his concept of Wicked Problems: design offered "ill-defined" and "malignant" problems[3] that relied on the designer's good political judgment. These could not be solved with conventional methods of sciences. How to *tame* them would be achieved by second-generation Design Methods.[4] With this notion, Rittel described the task of designers who acknowledged that they were part of a broader societal group making design decisions. This opposed the bird-eye view of traditional design and planning, where architects monopolised decisions.

The object of this presentation is the work of architects who applied such methods to social housing design, which shows two moments of the expansion of this Late Modernism discourse. Cornelia and Eduardo Vargas studied at the HfG Ulm in Germany. There, they had contact with post-war scientific design methods, whose advocators were Max Bill and Horst Rittel, among others. In Chile, in the early 1960s, the Vargas led the construction of a massive cooperative housing project. In turn, architect Raúl Di Lullo developed housing design methods with an approach of a later phase of the methods discourse, when Rittel and Christopher Alexander were disseminating it in the context of the "Berkeley Bubble."[5]

The Vargas's and Di Lullo's trajectories did not intersect. However, both stories depict how the architectural thinking advocated by the CIAM was contested. After the dissolution of the prestigious congress, housing theories moved away from early rigid functionalism towards a more nuanced and socially aware design practice. The Vargas and Di Lullo are examples of the structuralist line of thought in post-Team X architecture.

Systems sciences contributed, during the Long Sixties,[6] to the formation of a new object of reflection in architecture, the design methods. Later, this was criticized for its claims of objectivity and universality. How did systems designers in Latin America counter this by addressing local complexities? What are the resonances of design methods figures such as Rittel or Alexander in these territories? Are there thematic networks based on these ideas?[7] Published and unpublished sources and oral interviews expose how the Vargas and Di Lullo tackled the *wickedness* of housing design, proposing context-situated and creative solutions. This reflects their belief in a scientific, but principally politically-committed and participatory *other* modernism.

7. Some designers active in Latin America criticised, developed, or rejected Rittel's ideas. Ulmian graduate and professor Gui Bonsiepe refers to his work in some of his first articles on industrial design and later distances himself. See, for example, Gui Bonsiepe, "VI/VI/SEC/CION del diseño industrial (Part 1)," *AUCA* 24-25 (1973): 7–12). In Berkeley, some Latin American pupils continued Rittel's lines of thought. For instance, Venezuelan designers Enrique Vila Planes, Teresa Guevara, and Domingo Acosta, in fields such as planning, seismic architecture, or sustainable design, respectively. See Enrique Vila Planes, *Planificar/Diseñar (P/D) tecnopolítico: La "Teoría de P/D" de Horst Rittel* (Caracas: 2017); Teresa Guevara Pérez, *Arquitectura moderna en zonas sísmicas* (Barcelona: Gustavo Gili, 2009); and Domingo Acosta, *Diseñar en el Antropoceno: La arquitectura más allá de la sostenibilidad* (Editemos: 2020).

2. COOPERATIVE HOUSING: THE VARGAS

German designer Cornelia Koch and Chilean architect Eduardo Vargas met at the HfG Ulm, Germany. They were both "Billists", a group of students who kept meeting Max Bill after his resignation as head of the school.[8] Concrete art,[9] scientific design, the re-democratization of Germany, internationalism, and mass production are just a few of the keywords that characterised the intellectual climate at the post-war school of design. Cornelia was studying at the Information Department, and Eduardo had just finished the preliminary course when they got married and left for Zurich to work at Max Bill's office.[10]

In 1960, the Vargas settled in Valparaíso, Eduardo's city of origin. They embarked on the enormous project of cooperative and self-construction housing in Los Placeres Valley. Within four years, and working side by side with future dwellers, the young couple built 1,200 housing units. This piece of land was purchased by the Chilean state and it became the home of 11,000 people. The cooperative system was inspired by similar ones in Switzerland, which Max Bill was an advocate of.[11] Significantly, the construction had the support of many local and international stakeholders.[12]

Many of Max Bill's principles are evident in the cooperative villages. In the building site, cooperative members constructed prefabricated elements such as polyester sheets reinforced with fiberglass, fences, and furniture.[13] The modular geometry of the whole emerged from its prefabricated nature. Bill's modernism established a coherence between artistic products and mass production, an idea that differed from Modernisms propagated in Latin America, based on the synthesis of arts. Moreover, the cooperative villages are also a concrete design visually. In the macroscale, they resemble a concrete composition, such as those of paintings. In the microscale, the image is dictated by the *unmistakability* of architectural elements: a wall is a wall, a roof is a roof, and a door is a door.

In 1965, Eduardo travelled to Ulm to a debate about low-income housing in the so-called Third World. In Zürich, he designed with Bill a communal centre for the cooperative villages.[14] Located in the centre, it would provide infrastructure to secure the communal autonomy at a regional level. This cybernetic idea of self-management reveals how urbanism was an analogical precedent of collaborative networks such as the internet.[15] However, in 1973, the socialist democratic government of President Salvador Allende was overthrown by a military coup. In this context, the villages lost their cooperative status, and a significantly more modest version of the communal centre was built.[16]

Regarding Rittel's ideas, the cooperative villages manifest a new modernity whose warhorse was the *method*. Postulated years later, second-generation Design Methods are already visible here. The Vargas were stakeholders of a broader set of actors. With them, future dwellers took design decisions, and self-constructed their homes. The expanded productive apparatus of funding institutions and cooperatives reveals design as an argumentative process, probably one of Rittel's most important contributions to design theory.[17]

Chilean architect Andrés Weil also references Rittel's thinking.

17. Eduardo acknowledged Rittel's influence on his work. He had, according to his daughter Sofía, "received a

The further planning, design, and teaching trajectory of the Vargas reflects their commitment with collaborative design systems. Eduardo was appointed to the State Housing Office, where he spearheaded the construction of 30,000 houses and led the reconstruction after a violent earthquake. Later, as head of the biggest Chilean television channel, he sextupled the signal scope and implemented an educational approach in mass media. As professor of Architecture and Urban Planning at the Universidad de Chile, he transferred design methods into active pedagogy, where students were immersed in real-life problems.[18]

Unfortunately, Chile in dictatorship was no longer a safe place for designers of such critical and socially committed visions. From 1975 on, the Vargas lived in exile in Hannover, Germany, where Eduardo taught Theory of Architecture with a focus on Design Methods in the Global South. Following Alexander, he urged students to work, for instance, with local dwelling patterns of their countries of origin.[19] Cornelia, in turn, worked as interior designer, photographer, and painter. In the 1990s, they returned to Chile to teach architecture and urge students to create a "South that does not exist yet."[20]

3. EVOLUTIONARY HOUSING: DI LULLO

In 1963, Rittel and Alexander were recruited as professors at the College of Environmental Design in Berkeley.[21] Here, Argentinian architect Raúl Di Lullo enrolled as a master's student in 1970,[22] when the "systems approach" was at its peak. He engaged in design methods, and he started developing them to include dwellers in the process of evolutionary housing. Back in Argentina, the 1976's dictatorship fired him as head of his Architectural Studio at the Universidad Nacional de Tucumán, possibly due to the participatory and social approaches he was implementing there. He settled in the Netherlands and started teaching and researching at Bouwcentrum International in Rotterdam.

For Di Lullo, housing was a dynamic organism within a *plastic* environment. This countered static modern housing based on imposed universal typologies where designers and sponsors monopolised decisions. He proposed a system to incorporate users and time in the design process. Concerned with the unsolved question of modern housing, he wanted to improve the two most frequent housing environments: individually designed houses and modern collective housing schemes. Both models allowed only *linear* growth, if any at all. Di Lullo's proposal of evolutionary housing offered users the possibility of choosing alternative courses of action to expand their dwellings, for them to be part of the decision-making process. Also, this would result in a more varied and complex housing environment, which could change as the needs of people would change.[23]

Di Lullo's method is based on the semi-lattice, a generative graph used to decompose design problems. With it, the architect could design a housing core unit and a repertoire of growth possibilities. From it, dwellers would choose how to expand their houses over time. With this approach,

clear methodology based on new scientific research that influenced his work." She relates the planning and participation aspects of his work with Rittel's writings. She also informes that Rittel's theories were relevant to Eduardo, to the point that he gave each of his children the book "Planen, Entwerfen, Design", which compiles Rittel's writings (Sofía Vargas Koch, Personal communication, September 11, 2023).

Figure 4. Raúl Di Lullo and Edgardo Martínez, Conventillo, Argentina and Uruguay, 1980. © Raúl Di Lullo, *Evolutionary housing design. An instrumental contribution.* Rotterdam: Bouwcentrum International Education, 1981.

Di Lullo designed public housing competitions, single-family homes, and prefabricated housing schemes, and developed robust theoretical and implementation material.

Di Lullo tried some of his methods explorations in a proposal of a *conventillo*, historical tenement typology common in Latin American cities. Located in dense, central, and dilapidated areas, families used to live there in small rooms surrounding a communal courtyard. Di Lullo's reinterpretation would improve the low environmental quality of the type, but maintaining patterns[24] such as the semi-public patio, verandas, galleries, or the bright sunny exteriors opposing the shady interiors. From a "container unit", families could expand it to the sides, upwards, or to the front, for example, to build a small shop as an extra source of income.[25] This project also references John Habraken's methodological proposal of *zones and margins* for the formulation of agreements in housing participatory design.[26]

Di Lullo disseminated his systems-oriented design approach in his low-income housing Studio at Bouwcentrum International and in international workshops organised by this institution in Indonesia and in African and Latin American countries. In the 1990s, he settled in Tucuman, Argentina, where he taught in his Architectural Studio, led the Architectural

Theory chair and founded an interdisciplinary research laboratory.[27] For him, the central component of what he calls the "habitat drive" is the adaptation of the *shelter* to the user's needs over time.[28] This is visible in his pedagogy, research, and practice. In 2005, he and his team won the national competition for their project for the rehabilitation of the historical centre of Jujuy, Argentina.[29] This *system of urban objects* reflects his ideas of change and flexibility, focused this time on public space, as a vital collective container.

4. CONCLUSIONS

The Vargas's cooperative villages became a paradigm of design for people's autonomy, also due to pre-existing social and political conditions.[30] This case unveils a critical digestion of design methods, the search for a participatory design and construction process, and the awareness of the political responsibility of designers.

As opposed to the Vargas's cooperative villages, Di Lullo's proposals of evolutionary housing remained unbuilt. Probably its sophisticated implementation methods ended up reaffirming mechanist approaches that they were a critique of. Nevertheless, both stories correspond to a Late Modernism that opposed universalising methods and considered the *wickedness* of Latin American territories. The creative treatment of context in these examples challenges centre-periphery narratives, apart from providing insights, operational tools, and inspiration for a much-needed re-democratisation of design. ■

BIOGRAPHY

Guido Campi graduated as an architect at the Universidad Nacional de Tucumán (Argentina) and worked in architectural offices and low-income housing programmes. He obtained a master's degree in architecture at Dessau International Architecture (Germany). Since 2021, he is a Ph.D. candidate at the Bauhaus University Weimar, working on systems design and participation in the context of Latin America in the 1960s. He is a scholarship holder of the Friedrich Ebert Foundation and participated as a speaker in international conferences presenting his work on systems design in Latin America, oral history in architecture, and history of queer spaces.

EXPLORING BEYOND BORDERS: THE SIGNIFICANCE OF PEQUEÑOS CONGRESOS IN THE VALUATION OF SPANISH ARCHITECTURE

ANA ESTEBAN-MALUENDA
UNIVERSIDAD POLITÉCNICA DE MADRID

#25

ABSTRACT

The *Pequeños Congresos* (Small Congresses) were pivotal meetings held by Spanish architects during the 1960s to address contemporary issues in Spanish architecture and to foster professional connections in an era when communication was far more challenging than today. Initially, these gatherings had a national focus, but they soon evolved to include keynote speakers who introduced cutting-edge international topics.

The development and impact of these meetings are recorded in the archives of Carlos de Miguel and Oriol Bohigas, as well as periodicals from that era. Rather than presenting the *Pequeños Congresos* merely as an effective means of international engagement, this paper portrays them as the genesis of a network of global contacts that Spanish architects would later cultivate, eventually establishing themselves as international leaders in the field.

Building on earlier research that has explored the content and context of these meetings, this paper seeks to further examine the critical role these congresses played in building a global network, ultimately elevating Spanish architecture to a prominent position on the world stage.

1. INTRODUCTION

Shortly after the Otterlo meeting, which led to the dissolution of CIAM, Oriol Bohigas, a prominent figure in the Catalan architectural community, wrote a letter to Carlos de Miguel, editor of the Madrid College of Architects (COAM) magazine, expressing his disappointment in the lack of communication between architects in Spain's two main cities. As Bohigas later recalled, Catalan architects

> *did not have many relations with architects in the rest of Spain, who were moving along other paths of promotion and self-training. During the summer of 1959, taking advantage of a visit to Madrid, I had a conversation with Antonio Perpiñá, a Catalan architect who lived in Madrid and had been in demand by the new waves of official town planning, and with whom we had been collaborating since '55 on the housing complex in Calle Escorial. I told him about the lack of contact between Barcelona and Madrid and proposed that we organise some meetings or other ways of getting in touch. Perpiñá suggested that I talk about it with Carlos de Miguel.*[1]

On his return to Barcelona, Perpiñá suggested Bohigas write a letter to Carlos de Miguel expressing his admiration for Madrid's architectural works. Above all, Bohigas expressed his concern about the disconnect between architects in Madrid and Barcelona. He proposed organising a meeting in Madrid to visit and discuss the latest projects.[2]

It seems likely that as soon as he received the letter, De Miguel invited fourteen architects to a dinner at the Gambrinus restaurant.[3] The very next day, he sent Bohigas a proposal drafted during that dinner.[4] Within barely a month, the two instigators had encouraged 30 and 40 architects from both cities to participate, giving birth to the *Pequeños Congresos* (Small Congresses, P.C.).[5]

This paper delves into the significance of these meetings, based on documents from Carlos de Miguel and Oriol Bohigas's archives, as well as periodicals from the era.[6] Rather than presenting the P.C. as merely a means of international engagement, this paper argues that they were the genesis of a global network that ultimately positioned Spanish architecture on the world stage.

2. THE MADRID-CATALAN BINOMIAL (1959-1960)

The first *Pequeño Congreso* in Madrid (1 P.C.) aimed to discuss contemporary architectural works presented by the architects. Over the course of three days, participants visited peripheral housing developments, university projects, and other notable sites in the surroundings of Madrid, such as the recently completed Valle de los Caídos.[7] Debates focused on urban planning, social and economic data integration, and adapting to new living standards.[8]

The success of the meeting was evident from Oriol Bohigas's comments after the meeting, who defined it as one of the "most important meetings

in our professional circles."[9] Rafael Echaide noted that the *Pequeños Congresos* were a meeting point for two generations of Spanish architects united in finding solutions to contemporary challenges.[10] At the end of the second meeting, which was held in Barcelona, Carlos Flores emphasised that one of its main objectives was "to ensure [...] that architects from the different Spanish regions coordinate their efforts and acquire a broader and more complete vision of the different problems related to the profession."[11]

The 2nd P.C. in Barcelona followed a similar format, with visits to recent and historical buildings, including some of which were examples of GATCPAC and Catalan modernism. According to Bohigas,[12] it is noteworthy that that meeting saw attendance from architects outside Madrid and Barcelona, such as those from the Basque Country and Córdoba. As soon as the meeting ended, Carlos Flores highlighted the expanding interest in *Hogar y Arquitectura*, stating that one of the aims of these meetings was to "achieve [...] that architects from the different Spanish regions coordinate their efforts."[13]

3. PENINSULAR EXPANSION (1960-1961)

Years later, Bohigas recalled that, although the proposal was launched from Madrid and Barcelona, from the beginning they had had a peninsular network of architects in mind: "We immediately attempted a peninsular expansion: in October 1960 in the Basque Country, in October 1961 in Córdoba and in the spring of 1963 on the Costa del Sol."[14]

The 3rd P.C. was held in the Basque Country for several reasons, including the presence of architects from the region at the 2nd P.C., the inclusion of Gonzalo Vega de Seoane on the newly appointed committee of the meetings and because San Sebastián was a city associated with the tradition of the modern movement.

As a novelty, during this congress the number of site visits was reduced and, at the proposal of Federico Correa, a session was introduced in which an architect presented his project followed by a discussion, following the method used by Team 10.[15] The building analysed was Coderch's Torre Valentina, presented the previous year at CIAM. This allowed for debates addressing specific Spanish issues but aligned with contemporary forums.

Rafael de La-Hoz Arderius, who would lead the 4th P.C. in Córdoba, was another member included in the P.C. Committee. In line with La-Hoz's latest work, the congress was devoted to affordable housing and industrialised construction,[16] anchoring national and international debates.[17]

4. INTERNATIONAL EXPANSION AND DECLINE (1963-1968)

In February 1963, the board was convened to discuss the urban planning issues related to tourism at a meeting to be held between various locations between Seville and the coast of Malaga. Although there is no record of foreign architects attending, inclusivity was in the spirit of the organising group. They invited people to obtain "slides of works done in Spain and abroad on these problems, for the proper documentation of all and to make

7. The itineraries of the visits are described in detail in two articles published by César Ortiz Echgüe in the Portuguese journal *Binário*: César Ortiz Echagüe, "40 anos de arquitectura espanhola," *Binário*, no. 25 (October 1960), 325-330. César Ortiz Echagüe, "40 anos de arquitectura espanhola (Conclusão)," *Binário*, no.27 (December 1960), 437-444.

17. Arquitectura had just translated and published in its pagues Reyner Banham's well-known article: "Stocktaking" as: Reyner Banham, "Balance 1960: la tradición, la tecnología," *Arquitectura*, no.26 (1961), 2-18.

the best use of them."[18] Even the President of the Consejo Superior de Arquitectos advocated for the promotion and regulation of "the influx of foreign architects and technicians [...] [since] it would be good to take advantage of these meetings to gather more opinions."[19]

The programme followed a similar pattern to that of previous meetings: the first day, to go through the interventions before the tourist boom; the second, with a tour of the entire coast to observe recent architecture; and the third, to study the plans and interventions that had been planned and draw a series of conclusions based on the findings.

That same winter, the Catalan group expanded these discussions on the urban impact of tourism at a new meeting which took place in Tarragona. Bohigas recalled this P.C. as a clear turning point: "From this fifth P.C. onwards, the expansion had more international pretensions: we began to invite our foreign friends; I am referring, of course, to Correa's friends and, secondarily, to my own."[20] Thus, the usual series of lectures, with interspersed visits, was rounded off with the lecture by Georges Candilis on his project for the coast of Languedoc-Roussillon.[21] In addition, the following also attended:

> *Aldo Rossi [who] enlightened us with a preview of what was to be his book L'Architettura della Città, which would not be published until 66 [...].*
> *From England came Colin St. John Wilson with his two enormous and almost eternal projects: the Liverpool Town Hall and the British Library [...]. From Portugal came Nuno Portas, who discovered for us [...] the magnificent and then practically unknown work of Álvaro Siza Vieira.*[22]

Precisely this congress would give rise to a monographic issue of *Arquitectura* on Tourism, which began with a comment by Juan Antonio Ridruejo: "Today's Small Congresses are less spontaneous than the first ones and less informal. But perhaps that is why they are more articulate because it is well known that architects, whose profession is the discipline of forms, usually lack discipline in verbal communication." He goes on to explain the underlying theme of the meeting: "Tourism was discussed, as tourism had also been discussed at the previous congress, held in Malaga [...] And why was tourism discussed? [...] Firstly, because it gives us a lot of work."[23] The issue was addressed in several of the sessions that were held,[24] as Bohigas commented that Candilis devoted an interesting paper to "The Tourist Organisation of Languedoc," in which he asked his colleagues to collaborate from their position as architects in "this normal act of evolution of a Society" that constitutes tourism.

In the following meetings, Bohigas continued by saying:

> *For the seventh PC, in December '65, it was Segovia's turn with Giancarlo de Carlo as the main guest. The theme was the conservation and rehabilitation of ancient cities [...].*

This article led to an interesting discussion on the necessary balance between tradition and technology in architecture, published as: Antonio Fernández-Alba et al., "Para una localización de la arquitectura española de posguerra," *Arquitectura*, no.26 (1961), 20-32. Bohigas remembered that he attended a similar discussion during the 6th Conference of the International Union of Architects in London: Oriol Bohigas, "Rogers i "Casabella", un nou camí de l'arquitectura? / Actualitats," *Serra d'Or* III, no.9 (1961), 27.

> *In the winter of '67, the Small Congresses crossed the border and we went to Portugal to review all the works of Álvaro Siza, which had a great impact on all of us and made this architect, still little known abroad [...]. In February '68 I wrote a review of the congress [...] From this outline later came a longer article which, according to what Siza himself told me, was the first to be published outside Portugal,25 with very complete documentation and an attempt to situate him in the most advanced European culture.*[26]

He also mentions another instance in 1968 "in Vitoria, with the presence of Peter Eisenman," and a last mention "in 1972 in Sitges, at the Hotel Calípolis," of which no documentary trace has been found beyond this sentence.[27] When Bohigas gave a lecture at the Barcelona Conference 'La arquitectura española en los años sesenta (Spanish architecture in the 60s)' in 2002, he also referred to another in Platja d'Aro, which would have been held in 1971.[28]

5. THE INTERNATIONAL P.C. NETWORK

In summary, beyond individual initiatives, the *Pequeños Congresos* (P.C.) played a key role in establishing one of the first somewhat global international networks that connected Spanish architecture with international counterparts. The inclusion of a foreign keynote speaker at each meeting from the 5th P.C. onwards facilitated the successive participation of notable figures, whose contributions enriched the discussions.

Originally initiated in Barcelona and Madrid to unite Spanish architects scattered across the country, the network gradually expanded to include well-established figures such as Georges Candilis, Giancarlo de Carlo, and Aldo Rossi, as well as emerging architects like Álvaro Siza and Peter Eisenman. The subsequent career path of Spanish architects who gained unquestionable international prestige, such as Rafael Moneo, became intertwined with the Italian and American circles with whom they shared discussions and forged early friendships, eventually taking their influence beyond Spain.

Although the P.C. lasted only a decade, it served as a crucial meeting point for both Spanish and international architects, laying the foundation for future collaborations and solidifying the prominence of Spanish architecture following the country's transition to democracy. ■

25. Carlos Flores had already devoted a large part of the January-February 1967 issue of *Hogar y Arquitectura* to describing the work of Álvaro Siza Vieira.

BIOGRAPHY

Ana Esteban Maluenda is Tenured Associate Professor at the School of Architecture of the Universidad Politécnica de Madrid from 2008, where she currently serves as director of the Department of Architectural Composition. For more than two decades, she has been publishing research on the dissemination and contacts established by modern architecture in the Ibero-American sphere. General Editor for the Global South at Architectural Histories (2018-2021) and Chair of the 7th EAHN conference, held in Madrid in 2022. She has been involved in different research projects funded by governmental, institutional and private sources.

FROM VALPARAÍSO TO VANCOUVER: PAN-AMERICAN NETWORKS AND POETIC VISIONS OF A UNIFIED AMERICA

OSCAR ANDRADE CASTRO
PONTIFICIA UNIVERSIDAD CATÓLICA DE VALPARAÍSO

#25

ABSTRACT

Between November 1968 and February 1969, architect Alberto Cruz and poet Edison Simons embarked on a Pan-American journey from Valparaíso to Vancouver to proclaim "Amereida," a poetic vision of the American continent formulated in the early 1960s at the Valparaíso School of Architecture. Travelling along the Pacific Coast, they activated a transnational network, inviting others to contribute and participate in their continental poetic project. The paper examines their journey, spanning stops in Bolivia, Peru, Colombia, Panama, Mexico, the United States, and Canada, engaging with architects, artists, poets, and thinkers of diverse disciplines. The paper aims to understand how Cruz and Simons established cross-connections through unique encounter practices, including the "Phalène," the "Entreacto," and the "Hunting of the Poet." Likewise, the paper identifies the Amereida Review and the Amereida Workshop as channels of collaboration for inviting others to participate in their poetic project. By examining the journey to Vancouver, the paper sheds light on an attempt to catalyse a Pan-American network, transcending institutional frameworks, fostering interdisciplinary dialogue among poets, architects, educators, and artists, and disseminating their ideas from a distinctly poetic perspective.

1. AMEREIDA: A POETIC VISION OF THE CONTINENT

Alberto Cruz and Edison Simons formed part of a group of artists based at the Catholic University of Valparaíso (UCV) in Chile.[1] In 1952, this group established the UCV Institute of Architecture, a space in which they formulated an artistic position based on the relationship between poetry and architecture.[2] UCV Institute of Architecture members lived in Europe and formed significant connections. Godofredo Iommi, in particular, connected with poets, artists, and philosophers around the Revue de Poesie in Paris. In Germany, Iommi's dialogue with Italian philosopher Ernesto Grassi led to the formulation of Amereida, a poetic vision of the American continent. Echoing Mexican historian Edmundo O'Gorman's ideas, this vision questioned America's origin, challenging the notion of discovery and understanding the continent's appearance as a finding.[3] This distinction marked a condition of openness and gratuitousness to construct a relationship with the continental expanse different from those of conquest and dominion. Iommi proposed introducing the Latin poetic tradition to American soil, conceptualising Amereida as the Aeneid of America, interpreting Virgilian pietas as pure openness, a sign of America's origin and possible destiny.

Amereida marked a turning point in the Valparaíso group's artistic project, triggering a series of events during the 1960s, including the first Travesía of Amereida and the journey to Vancouver. Iommi proposed carrying out the first Travesía of Amereida in 1965, a poetic journey traversing South America from Punta Arenas to Santa Cruz de la Sierra.[4] Cruz and Simons were part of the group that set out on this journey, conducted under the rules of the Phalène (moth) or poetic act. The Phalène is a mode of poetry in action proposed by Iommi where the poet invites —through his present body and lively voice— to participate in an open poetic game to unleash poetry made by all.[5] (**Fig. 1**) As in the first Travesía, the Phalène became a central practice in Cruz and Simons' journey years later.

Two years after the first Travesía, the question of America became central to the UCV School of Architecture, leading the professors and students to write a manifesto and initiate a university reform movement in 1967. At the core of their proposal was a new understanding of the university as a community beyond institutionalism in the unity of life, work, and study, alongside a focus on the American continent.[6] To bridge the gap with the Latin American reality within the university, Godofredo Iommi created the Amereida Workshop, a seminar open to the entire university, fostering debates around the themes of Amereida. These events culminated in the foundation of Ciudad Abierta (Open City) in 1970, a community where the group explored the unity of life, work, and study in light of the poetics of Amereida. Like the Phalène, the Amereida Workshop became integral to Cruz and Simons' journey.

2. A JOURNEY WITHOUT DISTANCE AND THE POSSIBILITY OF AN AMERICAN EPIC

During this vibrant period for the Valparaíso group, Cruz and Simons organised their journey to establish a Pan-American network focused on Amereida. Cruz points out alongside Simons, "they set out to invite the students of architecture

1. Alberto Cruz (1917-2013) was a Chilean architect, a founding member of the UCV Institute of Architecture, the UCV School of Architecture, and the Ciudad Abierta of Amereida. Edison Simons (1933-2001) was a Panamanian poet and translator who participated in many actions of the Valparaíso group around the poetic proposal of Amereida.

2. The UCV Institute of Architecture was formed by the poet Godofredo Iommi, the architects Alberto Cruz, Miguel Eyquem, Francisco Méndez, Fabio Cruz, José Vial, Arturo Baeza, Jaime Bellalta, and the sculptor Claudio Girola.

3. Edmundo O'Gorman, *La invención de América* (México: Fondo de Cultura Económica, 1958).

4. Participating in this journey were the architects Alberto Cruz and Fabio Cruz; the poets Godofredo Iommi, Edison Simons, Michel Deguy and Jonathan Boulting; the sculptor Claudio Girola; the philosopher François Fédier, the painter Jorge Pérez-Román and the designer Henry Tronquoy.

5. Godofredo Iommi. "Lettre de l'Errant," *Ailleurs* I (1963): 14–24.

6. Godofredo Iommi, "Voto propuesto al Senado Académico 1969," in *Fundamentos de la Escuela de Arquitectura Universidad Católica de Valparaíso 1971*, (Viña del Mar: Escuela de Arquitectura UCV, 1969).

schools, those from Lima to Vancouver, to come and build this Ciudad Abierta."[7] The journey reveals the group's intentions to activate intercontinental and interdisciplinary connections across the Americas, inviting them to participate in the poetic project of Amereida. Consequently, the journey raised a broader question about the entirety of the American continent.

While Amereida draws from the Latin poetic tradition, the inquiry about America is more encompassing, spanning the continent from pole to pole. Regarding this, the poet Manuel Sanfuentes notes:

> *To speak of America as a unity in which North and South coincide in the same experience of colonial "discovery" highlights the joint factors, both favourable and unfavourable, of the "discovery" of the New World. [...] This imprint, for both North and South, constitutes for the whole of the Americas a radical irruption from which all the cultural and institutional structures that today make up Latin America, the Caribbean and North America —the United States and Canada— are derived.*[8]

The poem Amereida raises the question of American continentality in a series of theses later developed in a historical study titled Towards a Latin American Perspective of the Pacific Ocean. The Thesis of the Inland Sea asserts that American continentality is bound to the Pacific Ocean, stating that "a projection and an oceanic conception presuppose dominion of the continental inland sea. The term 'inland sea' refers to the area between the two great oceans surrounding Latin America."[9] The relationship between continental interiority and oceanic projection distinguishes North America from South America. The study argues that while "North America advances from its Atlantic edge and gradually dominates an immense territory to the Pacific edge, conquering a continentality," Latin America -inhabited on its edges around a great inland sea- has not gained its continentality and the Pacific Ocean "manifests itself as a lack."[10] For Iommi, the conquest of continentality goes hand in hand with the constitution of an American epic, highlighting from the notion of myth a crucial distinction between Anglo-Saxon America and Latin America:

> *Among the American languages, only in Anglo-North American does the Pacific Ocean shine and in a very particular way, especially in the famous epic novel 'Moby Dick' by H. Melville, to the point of constituting [...] a real word or myth. [...] In contrast, the Hispanic-American language lacks an authentic poetic word that becomes myth […].*[11]

Under these poetic premises, Cruz and Simons embarked on their journey facing the Pacific Ocean by travelling along the continental edge between November 20, 1968, and February 15, 1969. They aimed for "a journey that is not a going towards / a journey without distance," proposing an itinerary where each place was visited twice, making the route cyclical.[12] Their route included Valparaíso, La Paz, Lima, Bogotá, Cali, Panama, Managua, Mexico, Cuernavaca, Tula, Los Angeles, Laguna Beach, Irvine, San Francisco, Seattle, and Vancouver.

11. Escuela de Arquitectura UCV, "Para un punto de vista".

Although the Pan-American highway was not an apparatus that made such a journey possible, as they mainly travelled by plane, this infrastructure strongly resonates with some of the group's ideas. The highway is an infrastructure that sought to unify the Americas, comprehending its continuity from pole to pole. Moreover, the Pan-American highway somehow verifies the poetic thesis of the Interior Sea, as it crosses North America through its axis in two roads, denoting the dominion of its interior continentality. While in South America, this route runs along the Pacific edge, transversally crossing the Valparaíso-Buenos Aires axis to continue south along the Atlantic coast without truly entering the continent's interior but rather clinging to its edge.

3. PRACTICES OF ENCOUNTER: THE PHALÈNE, THE ENTREACTO, THE HUNTING OF THE POET

Cruz and Simons structured their journey around three practices to foster encounters with others: the Phalène, the Entreacto, and the Hunting of the Poet. A primary practice was the Phalène, triggering collective festive and unforeseen poetic events along the route. Cruz and Simons conducted approximately twenty-four Phalènes. The chronicles of the Vancouver journey depict diverse participants, including students, professors, poets, artists, friends, and chance encounters. Photographic records portray the use of masks and readings of the poem Amereida in diverse settings. During their journey, Cruz and Simons conducted over 70 gatherings under a format they termed the Entreacto, which were oral presentations of Amereida.[13] (**Fig. 2**) They organised these sessions with professors and students from various faculties and schools, including the National University of Colombia, the University of Los Andes, Javeriana University, the National Autonomous University of Mexico, the University of San Marcos, the University of Managua, the University of California, the University of British Columbia, the University of Washington, and the Universidad Mayor de San Andrés. (**Fig. 3**) The tone of these gatherings centred on the exposition of Amereida, as exemplified in an invitation to members of the Department of Letters at the University of Washington: "Is there epic poetry in America? A group of poets, architects, painters, sculptors, philosophers are celebrating this possibility in South America. Two of them, Alberto Cruz and Edison Simons will explore the meaning and range of this experience."[14] Other Entreactos occurred during personal visits to architects, philosophers, historians, poets, anthropologists, and artists.

Two significant Entreactos occurred with poet Robert Duncan and philosopher Ivan Illich. The meeting with Duncan in San Francisco represented the convergence of two distinct experiences in architectural education, Black Mountain College and the Valparaíso School of Architecture, advocating for a sense of community, alternative institutional perspectives, and redefining the boundaries of architecture through interdisciplinary projects. The encounter with Ivan Illich, Valentina Borremans, and Tarcisio Ocampo at CIDOC (Centro Intercultural de Documentación, Cuernavaca, Mexico) channelled the interest in the university reform initiated at the Valparaíso School of Architecture in 1967. CIDOC's interest in the reform

stemmed from understanding how a regional movement could impact upon the entire country's university structure due to the "radicality of the positions" and comprehending why the movement garnered broad support from students, professors, workers, and the general public.[15]

The third practice Cruz and Simons conducted was the Hunting of the Poet, "searching for an unknown poet from any point in the city."[16] While not all attempts were successful, notable encounters that did materialise include those in Mexico City with Héctor Olea G., Vancouver with Edwin Varney, and Seattle with Paul Hunter and Tom Parsons.

4. CHANNELS OF COLLABORATION: THE AMEREIDA REVIEW AND THE AMEREIDA WORKSHOP

Cruz and Simons utilised two collaboration channels to foster the network: the Amereida Review and the Amereida Workshop. They articulated the invitation to collaborate in a brochure produced during their stay in Vancouver: "Bring word to the review of Amereida, bring work to the workshop of Amereida, bring and sing, in the round, that is bound, from Alaska to Cape Horn, renew what is torn."[17] (**Fig. 4**) The Valparaíso group published the Amereida Review in collaboration with the Revue de Poésie, the project Godofredo Iommi carried out with his network in Paris. The first issue of the Amereida Review, containing chronicles of the journey to Vancouver, was published in February 1969.

Documents from the journey describe that "the Amereida review comes to inaugurate a void so that everyone can approach the action of life in a round that extends its American invitation to those who believe in the demand for a public language."[18] The idea of the "round" refers to a characteristic collective dimension of the Valparaíso group, which crystallised in Ciudad Abierta as a collective working format where multiple disciplines converge around a work originated after a poetic act.[19] In this sense, the Valparaíso group determined that "this journal engages in the responses that each person sends, based on what is most intimate to them, according to their profession, occupation, or activism, in any colour of life [...]."[20] Cruz and Simons provided an address in Viña del Mar to receive contributions.

Regarding the Amereida Workshop, Cruz and Simons organised this seminar at the School of Architecture of the University of Los Andes, together with architects Jaime Valenzuela and Carlos Avendaño. During the event, they carried out a public debate on the ideas of Amereida, together with readings of poems by Godofredo Iommi. The Amereida Workshop continues to be present at the UCV School of Architecture. Organised by school poets, the workshop addresses the themes of Amereida and invites architects and designers to present works created in light of this poetic vision of the continent. All students and professors of the school attend this workshop every Wednesday in Ciudad Abierta.

5. POETIC JOURNEYS ACROSS AMERICA AS AN EPHEMERAL NETWORK

The journey to Vancouver traversed America, delineating a significant segment of the Pacific continental edge. This trajectory is part of a larger drawing

that encompasses the routes of preceding journeys, such as that of 1965, and subsequent journeys, like those conducted by the School of Architecture UCV from 1984 to the present. The routes of these journeys can be read as a whole, as they are all poetic actions that answer to a call in common: Amereida. In this sense, the journey to Vancouver cannot be understood as an isolated experience but rather as an event linked to a broader string of poetic journeys across the American continent undertaken by the Valparaíso group.

Comprehending these journeys as the iteration of the same action allows us to extend the essential characteristics of the journey to Vancouver to the set of journeys carried out by the Valparaíso group. As a means of traversing the American expanse, these retain the collective sense of the round, engaging in open and multifaceted dialogue across disciplines and trades. Moreover, this action is heterogeneous in its constitution, escaping institutional categories to involve educational institutions, individuals, and anyone else interested or coincidentally involved in the poetic act that reveals the expanse of the Americas.

The poetic journeys of the Valparaíso group unlock the gateway to understanding a network that extends beyond the mere concept, revealing a form of circumstantial or ephemeral interconnection. Considering that these poetic journeys are fulfilled in the action of departing rather than in the act of remaining, the encounter occurs anew on each journey. Thus, each journey entails its cartography of personal encounters around the poetic endeavour of Amereida. While on the road, the network becomes a state of encountering the American expanse and its people to sustain the open invitation to think, experience, and construct a poetic America. ■

BIOGRAPHY

Óscar Andrade Castro is an architect and academic at Pontificia Universidad Católica de Valparaíso, where he teaches, researches and carries out creation projects at the School of Architecture and Design. His research addresses the collective production of architectural knowledge in communities of practice. His PhD dissertation was titled *Ronda: Architectural Education and Practice from the Construction of a Milieu in Common* (TU Delft, 2021). Currently, he is conducting a research project (Fondecyt 11231173) focused on studying natural light and communities of knowledge in Chilean religious modern architecture.

UNVEILING POST-INDEPENDENCE DISCOURSE OF MODERN INDIAN ARCHITECTURE: INSIGHTS FROM *DESIGN MAGAZINE* (1957-1988)

PAPPAL SUNEJA
BAUHAUS-UNIVERSITÄT WEIMAR, GERMANY

ABSTRACT

The Indian journal *Design* (1957-1988) emerged during a period of political transitions and a burgeoning awareness of the quest for a new cultural identity. Its scope encompassed discussions on architecture, interior design, landscape architecture, furniture design, textile design, and industrial design. India endeavored to reconcile traditional and modern architectural approaches, driven by its status as a nascent democratic nation eager to both showcase and develop its evolving identity. This era witnessed the emergence of a nuanced discourse that exemplifies the evolution of Indian modernity. *Design* served as a vital platform for these discussions, ultimately shaping mid-20th-century Indian architecture and design. Since its inception in 1957, *Design* being a path-charter marked a departure from previous architectural discourse for a ten year old young India. It catalyzed a fresh interpretation of tradition, drawing inspiration from millennia of artistic achievements across various Indian civilizations. In the post-independence era, there was a collective impetus to preserve the tradition of creativity that had characterized Indian culture. While India had previously produced stupas, sculptures, architectural marvels, and entire cities, alongside remarkable treatises on aesthetics and beauty, there was a palpable sense that contemporary endeavors should strive to surpass these historical benchmarks.

This paper delves into the historical significance of *Design* as a vehicle for critical discourse in Indian architecture and the shaping of the built environment during the postcolonial era. Through the lens of *Design*, this analysis examines how these channels of communication fostered cross-cultural dialogue, enriching the architectural debate. However, the focus is expanded to explore how Indian cultural diversity was expressed in the journal content, aligning with networking across cultures and identities.

1. INTRODUCTION

In 1952, a small office in Bombay's Ballard Estate became the site of a new publishing unit. This literary venture initially focused on the field of construction, architecture, urban forms, environment and art. First, on 1st January 1953, *The Indian Builder* was launched, covering construction and civil engineering. Next, four years later, *Design*, "a review of architecture applied and free arts"[1] — appeared (eventually, it was called the magazine of arts and ideas). This initiative, of producing a magazine dedicated to architecture, was the brainchild of Patwant Singh (1925–2009). The son of a builder, Singh gained experience working on construction sites, but his "urge to communicate his thoughts, and influence things around him, led [to the beginning of] a career in writing and publishing."[2] Besides being trained as an architect and builder, he also was an "architectural journalist, writer, editor, historian, publisher, conservationist, political commentator and philanthropist."[3] Patwant served not only the publisher, but also the editor of *Design* for three decades, until the journal was discontinued in 1988.

From its inception, *Design* played a crucial role in connecting architecture with other disciplines, fostering both 'intranational' and 'international' networks. The editorial policy emphasized that designers cannot work in isolation from practitioners of other arts, "[acknowledging] architecture's pre-eminence in the arts, its editorial policy was based on the belief that designers cannot work in isolation from practitioners of the other arts."[4]

Though a hardcore architecture magazine, it raised awareness about allied disciplines such as "interior, landscape, furniture, textile and industrial designing as well as painting, sculpture, crafts and weaving etc."[5] According to the editor, this overlap and cross-connection was essential for creative experiences to be shared and absorbed holistically.

2. A TRANSNATIONAL AGENT

Design resonates very well as a transnational architectural co-producer. For this, I refer the international correspondence by architects, artists, art historians, critics, etc. as transnational agents in co-production, perception, and interpretation of architecture. The Editorial Board members included both national and international names. Indeed, it was a 'transnational network' of people across the globe. Some big names associated included Eero Saarinen, Siegfried Giedion, Richard Neutra, Charles Fabri, Isamu Noguchi, Walter Gropius, Achyut P. Kanvinde, Habib Rahman, Marcel Breuer, Piloo Mody, and Peter Blake, amongst others.

This diverse panel facilitated a cross-cultural exchange of ideas, helping to integrate global architectural practices with Indian traditions. Such "networking was crucial for developing a modern [Indian] architectural identity that was inclusive of the country's multicultural heritage".[6]

This case of an Indian architecture magazine, *Design,* in a national context supported by a global network tends to engage professionals and their associations in this process of transnationalism. Architecture, being considered as the mother of all arts, encompasses no boundaries. Shawhin

Roudbari, in her study about transnational transformation of architectural practice, argues that:

> *an understanding of the globalization of the field of architecture cannot operate under any single (nation-based) definition of the architecture profession, a multiplicity of national definitions of the architecture field must be considered in order to grasp the myriad of ways a globalizing profession is shaped by the professionals participating in the process from other countries.*[7]

It can be argued that it is a unique moment in history for a newly independent nation to explore other practices globally.

The editor of *Design* can be credited with choosing great stalwarts of national and international backgrounds.

3. CULTURAL DIVERSITY & NETWORKING

Design was instrumental in expressing and celebrating the rich cultural diversity of India. The content of the journal frequently highlighted various regional architectural styles, indigenous materials, and traditional craftsmanship. This was evident in articles and editorials that explored the fusion of modern architecture with traditional Indian elements. The journal emphasized how local cultural diversity influenced architectural practices and design philosophies, promoting a unique Indian modernity distinct from Western trends.

For instance, *Design* often featured pieces on vernacular architecture, which showcased the traditional building techniques and styles from different regions of South India. One such example is of Laurie Baker from February 1974 *Design* issue. This issue initiated a debate on "Architecture and the energy Crisis"[8], and featured a stirring dialogue by Baker himself on 'Building at a Low-Cost'. These articles underscored the importance of adapting these indigenous methods to contemporary needs, thus maintaining cultural continuity while fostering innovation. Additionally, the journal's content included contributions from various regional architects who brought their local perspectives and expertise, further enriching the discourse on Indian architecture and design.

4. SOCIOPOLITICAL CRITIC

Design sought to explore the role of architecture and design for the public, engaging deeply with sociopolitical issues. It can be viewed as an example of creating its own audience through articles about creative fields and the built environment, rather than solely focusing on designing and executing structures. Its multifaceted role as a sociopolitical critic can be understood through several dimensions:

4.1. CRITIQUE OF POLITICAL DECISIONS AND PRACTICES:

Design did not shy away from critiquing political decisions, particularly those impacting the urban and architectural landscape of India. The journal

7. Roudbari, Shawhin, "The Transnational Transformation of Architecture Practice: Iranian architects in the new geography of professional authority (1945-2012)," Ph. D. Thesis (University of California, Berkeley, 2013), https://escholarship.org/uc/item/66b418vp

8. Laurie Baker, "Building at a Low-Cost," *Design*, vol. 18, no. 2 (February 1974): p 38-39.

addressed issues such as the selection of sites for major events, like the Asian Games of 1982, and the design and construction of five-star hotels, affairs of the Delhi School of Architecture, Le Corbusier's modernist principles, and other controversial decisions of the government. It often critiqued these decisions, framing them within broader sociopolitical contexts. For instance, the journal fearlessly stated, "The glass-fronted skyscrapers and other such grotesque, expensive embellishments are inappropriate and disturbing symbols of a sick society."[9] This type of commentary highlights how *Design* "intertwined [architectural] discourse with a critique of societal values and government policies".[10]

4.2. ADDRESSING CORRUPTION AND BUREAUCRACY:

In its editorials, *Design* frequently tackled the issues of corruption and inefficiency within governmental bodies such as the Public Works Department (PWD). An editorial (India in the mid-Sixties – The Curious years) from May 1965 strongly questioned the corrupt practices within the PWD, suggesting that corruption will only cease if "one-sided contractual conditions are changed whereby engineers and petty officials can legitimately coerce and intimidate contractors into giving bribes in exchange for waiving coercive rules."[11] This direct approach underscored the journal's commitment to advocating for transparency and accountability in public infrastructure projects. (See **Fig 2.** below to read more about this feature)

4.3. PROMOTING PUBLIC WELFARE THROUGH ARCHITECTURE:

Design took a strong stance on the role of architecture in public welfare, often critiquing the neglect of urban maintenance and public amenities. The journal's discussions on the New Delhi Municipal Committee's projects (1966), for example, emphasized the need for high standards in civic design and maintenance. The journal argued that "New Delhi [had] not only failed to set any standards, but had also destroyed [the] existing ones through its cynicism and indifference."[12] This criticism extended to the broader implications of poor governance on the urban environment and public life. (See **Fig 3.** below to read more about this feature)

4.4. CHAMPIONING INNOVATION AND CREATIVITY AGAINST IMITATION:

The journal consistently advocated for innovation and creativity, opposing mere imitation of Western trends. It emphasized that contemporary architectural endeavors should strive to surpass historical benchmarks, drawing inspiration from India's rich cultural heritage. This perspective is captured in the journal's broader mission to "maintain cultural continuity while fostering innovation."[13] By doing so, *Design* encouraged a uniquely Indian approach to modernity, one that respected tradition while pushing boundaries.

To summarize, *Design*'s evolution into a sociopolitical critic can be attributed to several factors: a) Interdisciplinary Approach: The journal's editorial policy emphasized the interconnectedness of architecture with other arts and social sciences. This interdisciplinary approach naturally expanded

its scope to include sociopolitical issues. b) Editorial Vision: Under the leadership of Patwant Singh, an architectural journalist with a broad vision, *Design* embraced its role as a platform for critical discourse. Singh's diverse background as a historian, writer, and commentator enabled the journal to navigate and critique various societal issues. c) Global and Local Networks: The inclusion of both national and international figures on the editorial board facilitated a wide-ranging discourse that transcended purely architectural concerns. This network helped position *Design* as a critical observer and commentator on broader societal trends.

By integrating these elements, *Design* effectively utilized architecture as a lens through which to examine and critique the sociopolitical fabric of post-independence India.

#25

5. CONCLUSION

On a concluding note, The Indian journal *Design* (1957-1988) significantly influenced both architects and the broader architectural profession in India during a transformative period in the country's history. Its role extended beyond merely documenting architectural trends to actively shaping the discourse on modern architecture through its interdisciplinary and critical approach. The editorial policy of *Design* emphasized the interconnectedness of architecture with other arts and social sciences, encouraging architects to collaborate with professionals from various disciplines. This cross-disciplinary approach not only enriched architectural practice but also broadened the scope of architectural education and training. By featuring contributions from artists, historians, and critics, it helped architects to adopt a more holistic perspective in their work, integrating diverse elements into their designs. *Design*'s fearless critique of sociopolitical issues, including corruption, urban planning, and public welfare, positioned the journal as a critical voice in the architectural community. Its editorials often challenged

architects to consider the broader social and political implications of their work. For instance, the journal's critique of the Public Works Department's (1965) corrupt practices and its emphasis on accountability and transparency influenced architects to advocate for ethical practices within the profession.

Design facilitated the creation of a transnational network of architects, designers, and intellectuals, both within India and internationally. By including prominent figures such as Eero Saarinen, Richard Neutra, and Walter Gropius on its editorial board, the journal fostered a cross-cultural exchange of ideas. This network not only enriched the architectural discourse in India but also positioned Indian architectural innovations on the global stage.

The journal profoundly influenced the architectural profession in India by promoting regional diversity, encouraging cross-disciplinary collaboration, critiquing sociopolitical issues, shaping architectural education, and fostering a transnational network. Through its multifaceted role, *Design* helped to shape a uniquely Indian modern architectural identity, one that respects tradition while embracing innovation. ■

PRISHTINA SHUNNING CRITIQUE: YUGOSLAVIA'S ENCOUNTER WITH THE RADICAL ARCHITECTURE MOVEMENT

EDMOND DRENOGLLAVA
UNIVERSITY OF CINCINNATI, COLLEGE OF DESIGN, ARCHITECTURE, ART AND PLANNING – SCHOOL OF ARCHITECTURE AND INTERIOR DESIGN

#25

ABSTRACT
Architectural visions, whether built or not, stand as visual and cultural symbols of a country's aspirations and identity. In the contradictory and ambiguous territory of the Yugoslav microcosm, Prishtina, Kosova's capital, attempted to establish a distinctive architectural character. This research investigates the influence of the Radical Architecture Movement in Prishtina, focusing on the unbuilt proposal for the Memorial Youth Centre *"Boro i Ramiz"* ("Boro and Ramiz") by Ljerka Lulić, Jasno Nosso, and Dinko Zlatarić in 1970. Interrogating Prishtina's case, the central research question explores the permeability of utopic ideas in the European architectural scene of the 1970s. The hypothesis suggests the project embodies a rebellious avant-garde spirit, challenging established socio-political and aesthetic norms. Moreover, this project maps out a more expansive transnational Radical Architecture network of individuals and projects that conceived this philosophy as a global tendency. Despite documentation limitations for "Boro and Ramiz," the research adds another layer to the country's architectural ambitions – concluding that, if realized, might have paralleled other European radical architectural endeavors.

1. INTRODUCTION

In January 1970, a futuristic, *à la* Archigramesque proposal approached the competition for the Memorial Youth Centre "Boro and Ramiz" **(Fig.1)**. That same month, the jury announced the design by the trio Ljerka Lulić, Jasno Nosso, and Dinko Zlatarić with the code "Mosor," as the winner of the contest. This project prompted important questions on the permeability and ease of circulation of utopic ideas in the European architectural scene of the 1960s-1970s, and the transnational exchanges among architects in Yugoslavia.

From this perspective of exports and imports of design rules, state borders become porous, and beyond central and tangential international tradeoffs, the peculiar "intranational" micro-histories within countries such as Yugoslavia, point to unlocking additional contact zones. International knowledge transfers were made possible thanks to the country's in-between political and geographical position. This enabled foreign policies to achieve bilateral accords, while internal affairs to regulate and expand that development.

How architecture was practiced, who and what influenced whom or what, and why, it is a wave that would naturally include Yugoslavia. It is particularly the internationalization of Yugoslav architecture that registered the country as a hotspot, a playground of modern architecture and all its ramifications and exclusively its contradictions that come along. With the downfall of dogmatic design principles, Yugoslav functionalism was highly criticized by Team X at the 10th CIAM meeting held in Dubrovnik in 1956.[1] The Serbian-French architect, Alexis Josic's involvement in the X's meetings and his visiting professorship endeavors, indirectly speak for a broader, yet underexplored transmission of these philosophies into the Yugoslav architectural discourse, indicating that, to some extent, such ideas were in the air at the time.

This is also reflected in Arbër Sadiki's brief description of the architectural and constructive elements, for the envisaged, yet, unbuilt Prishtina's landmark. He places "Boro and Ramiz" in the same historical frame as other radical architectural projects, setting the stage for a deeper examination. This is considered a starting point for the study to explore the emergence of a potential new paradigm in the architectural landscape of the country, inviting further scrutiny of the evolution of architectural theory in the Kosovar context.

2. SURROGATIVE ARCHITECTURE

The after-World War II, Josip Broz Tito's Socialist Federal Republic of Yugoslavia was a confederation of culturally and nationally diverse ethnicities comprised of six republics and two autonomous provinces.[2] As a multi-ethnic, multicultural, multi-linguistic, and multi-religious state, for the "Yugoslav cultural space,"[3] one may speak of there being a diverse territory for cultural, economic, and political exchange among its distinctive ethnicities.[4] This diversity ushered and influenced drastic transformations that were reflected in all spheres of life, including architecture.

1. Congress Materials: CIAM (1956: 10th.: Dubrovnik), 1954-1956, DES-1982-0002-000603297, Box 1, Folder B009, The CIAM Collection, Frances Loeb Library Special Collections, Graduate School of Design, Harvard University, Cambridge, Massachusetts, United States.

2. Noel Malcolm, *Kosovo: a short history* (London: Macmillan, 1998), 327.

3. Ješa Denegri first proposed the term noting that culture and the state were distinct entities.

4. Miško Šuvaković, "Impossible Histories," in *Impossible Histories: Historical Avant-gardes, Neo-avant-gardes, Post-avant-gardes in Yugoslavia, 1918-1991,* ed. Dubravka Djurić and Miško Šuvaković (Cambridge, Massachusetts, London, England: The MIT Press, 2003), 3.

In this game of cultural give-and-takings, Kosovo became a fertile ground for transnational exchanges, partly owing to the absence of The Faculty of Architecture in the country. Until 1978, graduate local architects received diplomas from other universities around Yugoslavia, mostly from the University of Sarajevo, Belgrade, or Zagreb.[5] These architects, Bashkim Fehmiu, Skënder Këpuska, and Sali Spahiu to mention a few, upon their return to their homeland, solely or in tandem with Yugoslav ones, took the opportunity to contribute to the development of Kosovar cities, especially that of Prishtina. This was materialized by the party's ordering to use the Federal Fund of Yugoslavia which was the core catalyzer for granting several supplemental investment resources to promote economic development.[6] This included the financing and the construction of *spomeniks*, public institutions, and cultural and sports centers toward a modernist spirit.

However, it should be noted that this deployment of modernist design as a surrogate cultural agent, allowed Tito to strengthen and disseminate his ideology through architectonic form, creating the professed "socialist modernism." This model became *le grand récit* resulting in the erection of multiple worth-mentioning public modernist structures such as the National Library of Kosova or Press Palace "Rilindja." The modern mentality ingrained in the minds of both professional circles and citizens, shunned the way for the alternative, experimental, and cosmopolitan art of the 1960s and 1970s, pushing these tendencies to exist only in the margins of official culture. The avant-garde projects such as the "Boro and Ramiz" proposal, opposing a unified state-run artistic orientation, risked being treated as "extreme expressions" of Western bourgeois or political subversion.[7]

This project-proposal coincides with the avant-garde movements of the 1960s-1970s, showing Prishtina's need for reorganization, and expression of liberty, as well as a demand for a new alternative and uncensored thought. Such qualities of public institutional architecture, and a more liberal attitude towards programmatic, morphological, and technological experimentation, allow this project for an evaluation of an alternative architectural approach – that of the Radical Architecture Movement – highlighting the potential conception of a new paradigm in the discourse of Kosovar architecture, all of which will be discussed in the subsequent chapter.

3. NOT JUST AN ARCHITECTURAL ABORTION

During the 1960s-1970s individual authors had the necessary space to pursue original and personal architectural beliefs. The "in-between" world of Yugoslavia was interchanging several ideas with the East,[8] however, it leaned more toward Western art.[9] The Yugoslav architects were no longer expected to present only possible socialist realities but could venture into autonomous aesthetics. Here, Vjenceslav Richter's *Sinturbanism*, Andrija Mutnjaković's *Endemska arhitektura*, and Radovan Delalle's *Urbarhitektura* emerge.[10]

This is not surprising considering that the celebrated works of Archigram were not unheard of. The Croatian architectural magazine *Covjek i Prostor* started distributing translations of its homolog *Aujourd'hui*. Firstly in

10. Rilind Cocaj, *Between Neo-Avant-Garde Art and Biourbanism. Andrija Mutnjaković: National Library Of Kosovo*. PhD. Diss. (Venice: Università IUAV di Venezia, 2022), 13-14.

1965 with *"Čudesni Archigram"* ("Wondrous Archigram"), and later in 1973 came "*Kontroverze oko Archigrama"* ("Controversies surrounding Archigram") by Darko Venturini. Such alluring new ideas for the younger generation of architects have brought to the forefront personalities, among them the Croatian woman architect, Ljerka Lulić. For the latter, and her compatriot collaborators Jasno Nosso and Dinko Zlatarić, the architect and art critic Antoaneta Pasinović has given them the highest distinctions as the most innovative and experimental young architects in Yugoslavia.[11] Their approach far from earlier Yugoslav concrete utopia, was a clear signal to many architects all over Yugoslavia that a new era had begun.

In fact, in Yugoslavia and elsewhere, such radical ideas mainly originated among students and young practitioners and had a later effect on the views of other generations. As Tzonis and Lefaivre argue, 1968 was the year when such initiatives were conceived.[12] The so-called radical architects of Europe, Superstudio, Archizoom, 9999, and Ettore Sottsass, among others, launched the self-styled Radical Architecture.[13] Inspired deeply by Rossi's fundamental worldviews,[14] this movement consisted of opposition to the sterility of Modernism by proposing a "moderate utopia."[15]

The Croat architect, Andrija Mutnjaković, places the proposal of Lulić, Nosso, and Zlatarić, in the framework of a movement that explores the ideas of futuristic and unconventional architecture.[16] His description makes it evident that the architect is referring to the Radical Movement in Architecture which hypothetically anticipates possible utopic scenarios. Waving the banner of Loosian functionalism, the trio's architectural endeavors show openness and potential primarily in the sphere of experimental-research, revolutionary, and utopian-visionary spirits.[17] The expressive channeling of their desires and necessities within the heart of urban life shows how tangible the ideas of radical architecture were.

Although it never managed to mature, the Radical Architecture Movement was conceived and remained as such to tackle certain values toward the anti-modern aesthetic expression, and the avant-garde aspirations that address the fundamental needs of Prishtina. The proposal of "Boro and Ramiz" acts within the socio-cultural zeitgeist of this movement providing the city with a visionary, youth-centric architectural approach. But even more significant than the philosophical aspect of the building, is its programmatic content, which projects a completely new way of life, and which will be discussed in the following sub-chapter.

3.1. SPATIAL AND COMPOSITIONAL EVALUATIONS

Taking into account its role as a polyfunctional center, a careful approach to the issues of space, flexibility, modular coordination, new construction materials, and construction procedures is seen as of great importance. The public space proposed by Lulić, Nosso, and Zlatarić that takes place in front of the building shows the youthful spirit of the capital through an inviting dynamism **(Fig.1)**. This can be associated as a form of representation of Prishtina's flamboyance and its forward-looking commitment.

12. Alexander Tzonis and Liane Lefaivre, "Between Utopia and Reality", in *Architecture in Europe: Memory and Invention since 1968*, ed. Alexander Tzonis and Liane Lefaivre (London: Thames & Hudson, 1997), 10-23.

13. Simon Sadler, *Archigram: Architecture without Architecture* (Cambridge: MIT Press, 2005), 183-189.

14. Aldo Rossi was a major inspiration on radical architecture groups. The latter were particularly struck by "exalted rationalism" that Rossi's had identified in 1967 in the work of Boullée. For Boullée's influence on Rossi, see more: Pier Vittorio Aureli, *The Possibility of an Absolute Architecture* (Cambridge: MIT Press, 2011).

15. Superstudio, "Discorsi per immagini," *Domus* 481 (1969): 44–45. This concept is further deconstructed in Dominique Rouillard, "Superarchitecture: The Future of Architecture, 1950–1970," *Journal of Architectural Education* 67, no.1 (2013): 119-121.

16. Saša Šimpraga, "55 prištinskih kupola: O arhitekturi Prištine prije i poslije izgradnje Nacionalne i sveučilišne biblioteke", Zarez, May 28, 2014. http://www.zarez.hr/clanci/55-pristinskih-kupola.

17. Pasinović, "Trenutak sadašnjosti i trenutak suvremenosti," 34-46.

In terms of programmatic content, the proposal of "Boro and Ramiz" is a hybrid structure that embodies different functions within itself. For a project in Kosova, won by Croatian architects, the jury composed of Vojislav Damjanović (Serbian), Tomislav Petrović (Croatian), Danillo Fürst (Slovenian), Ljuben Najdenov (Macedonian), Zdravko Čuk, and Andrija Šrek (Serbian), did not spare the type of comments that exalted the structure's "nobility in content and free creativity."[18] This not only confirms the "intranational" character of architectural competitions in Yugoslavia but also underlines the collaborative exchanges in a unified ambition for its built environment.

According to its program plan, the center included three main halls, which in the floor plan, span through a rhomboid-shaped modular system. The sports hall, the music, and the theater hall, all of which were located in the center of the structure provided greater flexibility. These rooms could be utilized independently or could be merged into one large auditorium by sliding the retractable partition walls.[19] Such concepts of versatility in floor plans are on par with, or even precede radical proposals similar to the Centre Pompidou which came a year later, in 1971.[20]

The metallic structural bars show spatial fluidity in both, horizontal and vertical directions, and a strong sense of transparency and diversity in general **(Fig.2)**. Yet, four massive vertical blocks, with the appearance of menhirs, create an effect of stability and determination **(Fig. 3)**. Built on the principle of a combination of square and triangular coordinate modules in floor plans, and in the third dimension built on the concept of a tessellate rotated in space, this architecture bases its plastic effect and effectiveness on constructing a spatial grid composed in a constructivist plastic expression.[21]

The least that can be said about the stylistic influence of "Boro and Ramiz" is that it gave the country the missing archetype of ultra-technological aesthetics. This opposed the stylistic interests of the rival architectural camp of the time, that of modernism, and the historical referencing of postmodernism. This structure stands in the middle, as representative and advocate of socio-political issues, leaning towards experimentation as a utopian visionary solution. However, the most that can be said about its influence was the reincarnation of the visual culture and the rebellious and youthful spirit of the capital to which it belonged, as a sign of the rebirth of national optimism, and as a monument to its time, and no less.

4. CONCLUSIONS

The examination of the transnational and transcultural context of Prishtina during the 1960s and 1970s reveals the impact of shaping factors on architectural development. Based on these factors, the research asserts that this structure shares the same rebellious avant-garde spirit as the ones from both, the East and West sides of the Iron Curtain. This study is one of the possible histories of the radical philosophy in the chronicles of Yugoslavia which suddenly reintroduced the long-dormant theme of Radical Architecture into socialist architectural discourse, that has been

present in Prishtina, but never really flourished. This is why the problem of this movement can be defined as a problem of (im)possible histories and (im)possible transnational transfers of architecture to culture in historical Yugoslavia. Architectural efforts such as "Boro and Ramiz" strengthen the role of architecture as an interpreter and creator of social narratives. But most importantly, this structure shows a defense of the right to an architectural experiment in the social community of Prishtina. A defense of the understanding that the constitution of the societies in its essence needs an architectural experiment. ■

BIOGRAPHY

Edmond Drenogllava holds a faculty position and is pursuing a Ph.D. in Architecture at the University of Cincinnati, College of Design, Architecture, Art, and Planning – School of Architecture and Interior Design. He also extends his teaching efforts through online lectures at South East European University, Faculty of Architecture and Design, in North Macedonia. Drenogllava's research focuses on the Radical Architecture Movement, specifically its experimentation, innovation, and subversion of traditional architectural conventions and hierarchies. This work aims to explore its historical, cultural, and socio-political contexts, as well as their contemporary relevance in architectural discourse.

AUTHENTICITY IN THE FACE OF CLIMATE CHANGE

FRANCE VANLAETHEM
UNIVERSITÉ DU QUÉBEC À MONTRÉAL, CANADA

ÈVE MICHELLE WERTHEIMER
ERA ARCHITECTES, MONTRÉAL, CANADA

#26

ABSTRACT

Authenticity has been a central notion to conservation since the Venice Charter of 1964 and even before. Docomomo International (DI) has rarely published doctrinal positions. As part of a consultative program agreed with ICOMOS, in 1997, DI published "The Modern Movement and the Word Heritage List. An Advisory Report Composed by the Docomomo's International Specialist Committee on Registers". In its report, DI asserts that all WH criteria apply to modern heritage, with the exception of the criterion of authenticity. In the case of modern heritage, it recommends favoring conceptual authenticity over material authenticity, namely the architect's concept (idea) rather than the fabric. However, whether material or conceptual authenticity, this principle is undermined by the major challenges posed to deal with climate change. We take advantage of this introduction to recall the importance of authenticity in the theory and the doctrine of conservation and to examine to what extent this notion which dominated its practice in the second half of the 20th century is still valid. To better understand the challenges posed by climate change, we will examine three recent projects from the ERA Architects established in Toronto, Ottawa and Montreal.

The severity of climate change as a threat to cultural heritage was first brought to the attention of the international community in 2005. At the outcome of the World Heritage Committee's 29th Assembly, it was resolved to encourage state parties and to set up a working group to begin predicting climate impacts and anticipated their management on both natural and cultural heritage.[1] Since this first efforts, initiatives from various international heritage organizations have continued this work at an accelerated pace, and clearly demonstrated that climate change challenges many of the fundamental underpinnings of our field.

In 2019, the work carried out by the ICOMOS working group on climate action culminated in its publication *The Future of our Pasts: Engaging Cultural Heritage in Climate Action*. The document is the first attempt at systematically and exhaustively listing the means through which cultural heritage can support climate action, and the impacts of climate change to heritage places and their values. Though the document does not delve into the implications of the crisis on established conservation theory, it does however recognize that:

> *climate change will have unprecedented impact on what is now considered to be good Conservation practice. […] Many conservation management and assessment standards, such as the constructs of authenticity and integrity will need to be rethought.*[2]

The World Heritage committee reiterated similar concerns in the 2023 update to its World Heritage and Sustainable Development Policy, stating that:

> *Even with best efforts, real and perceived tensions may develop between proposed climate action pathways and obligations of States Parties under the Convention and their commitments to preserve the Outstanding Universal Value of World Heritage properties, including the conditions of integrity and/or authenticity at the time of inscription.*[3]

Authenticity has been a central notion in architectural conservation since the 1964 *Venice Charter* and even prior to it. Docomomo International has rarely published doctrinal positions. In 1997, the International Specialist Committee/Register (ISC/R) submitted the report entitled "", drawn up in the context the program established in collaboration with ICOMOS, to compensate for the low number of World Heritage List inscriptions representative of the Modern Movement. Rather than establishing an indicative list, the ISC/R examined the validity of the selection criteria recommended by the Intergovernmental Committee for the Protection of Cultural and Natural Heritage. It concluded that all could be applied, except that of authenticity. In the case of the architectural legacy of the modern movement, it recommended favoring conceptual authenticity rather than material-based one. It is important to acknowledge that, over the past thirty years, the concept of heritage as well as the main threats to it, have

considerably changed. In addition, the heritage movement has become decisively globalized.

We take the opportunity of this introduction to recall the importance of authenticity in the theory and the doctrine of conservation and to examine the ongoing validity of this notion, which has dominated the field during the second half of the 20th century. To better understand the challenges posed by climate change, we will examine three projects which have involved the participation of ERA Architects, a leading-Canadian firm specialized in heritage conservation.

The concern for the authenticity of heritage and its early beginnings can be traced back as far as the last decades of the 19th century. At that time, the practice of architecture was professionalized, and the conservation of historical monuments institutionalized in most European countries, supporting national state constructions. It is particularly well expressed by the Italian architect Camillo Boito (1836-1914) who warned his readers against restorations where the old and the new blur:

> *It is shameful to deceive one's contemporaries, but it is even more shameful to deceive posterity.*

He adds:

> *Let's say the monument is a book; well, I want to read it without cuts, without additions and without rearrangements. I want to be sure that everything written there came from the pen or style of the author.*[4]

Boito wanted to ensure that once restored, the monument was always an "original" document and that no confusion could exist as to its "attribution", with contemporary interventions being distinguishable from it. Though he did not specifically refer to the term, he wanted to ensure that the monument remained "authentic"[5].

In 1964, concern for authenticity became the primary ethical principle for architects and technicians of historic monuments meeting for a second time, on an international scale, in Venice. Their first congress, organized in Athens in 1931, had preceded by two years the IVth CIAM held on Patris II in the Greek capital. In its preamble, the Venice Charter establishes that their first duty is to transmit to future generations the monumental works of the past in "all the richness of their authenticity". Although the word is used, no precise definition is given as to the quality it is intended to designate. Nevertheless, Article 9 indicates the fundamental attitude required to "conserve and reveal the aesthetic and historical values of the monument": "respect for the ancient substance and authentic documents"[6].

According to Robert Pane, one of the two authors of the initial proposal for the Venice Charter, the aim was to ensure the survival of the "primitive image" of the monument. Such a goal echoes the restoration theory established for works of art, by art historian Cesare Brandi (1906-

1988) for whom "we only restore the fabric"[7]. However, the transition from theory to doctrine lead to a simplified understanding of the principle by focusing on the material object. The point of departure for Brandi's thinking is the phenomenological conception of the work of art as a double individual spiritual experience, that of its creation and that of its temporally distant recognition / recreation / reception. Furthermore, Pane justifies the need for updating of the Athens charter by the emergence of new preservation issues, arising mainly from the existing conflict between urbanization and the conservation of monuments and their surroundings.

Authenticity becomes the discriminating criterion following the recognition of the universal value of heritage by UNESCO, with the adoption of the World Heritage Convention in 1972. It is among the benchmarks set in 1977, by the World Heritage Committee, to guide the selection of cultural properties to be inscribed on the World Heritage List. Unlike the six criteria put forward to judge the universal value of monuments, groups, or sites, each of which is considered a sufficient, but not compulsory condition, authenticity is essential: all cultural property must pass the " test of authenticity".

Many authors have observed the vagueness, if not the polysemy, of the notion of authenticity. The pitfalls and difficulties encountered during the application of the authenticity test raised little debate as long as the heritage was above all monumental and Western, and only ancient.

Unease grew as, in the 1980s, the field of heritage experienced an unprecedented expansion, including in time, and increase in the number of signatory countries to the World Heritage Convention.

In the late 1980s, the preservation of innovative 20th century architecture had become an international concern. In June 1987, a first large-scale European conference on the subject was organized by the French Ministry of Culture. In August 1988, the first newsletter of the International Working-Party for Documentation and Restoration of Early Modern Architecture was published calling for the creation of an international working-party[8]. The organization of a first international symposium was also announced in September 1990, at the University of Eindhoven. During this meeting, representatives of 20 countries decided to found Docomomo International, adopting its constitution[9].

In 1990, with a view to clarifying the criterion of authenticity, the World Heritage Committee opened a research project on the subject. Furthermore, following the ratification of the World Heritage Convention by Japan, a meeting was convened in 1994, in Nara, at the initiative of Japan, to bring clarity to the question.

The Nara Document adopted at the end of the meeting reaffirms authenticity as "an essential qualifier regarding the credibility of available sources of information" to establish heritage values. It nevertheless notes the notion's cultural variability in a globalized world where cultural identity has become an issue[10].

However, over the past thirty years, the concept of heritage has changed significantly. In addition to its diversification, as a reflection of the growing involvement of citizens, it has become dematerialized. The

growing role of non-Western countries in the international debate has also led to the adoption of the Convention for the Safeguarding of the Intangible Cultural Heritage by UNESCO in 2003.

Moreover, still in the 1990s, considerations were further transformed through research initiated by the Getty Conservation Institute, based on the realization of the weight that economic, monetary, and abstract values have on the future of heritage assets. At the basis of this research is the acknowledgement that heritage is a construct, rather than an immutable message from the past, as suggested by the Venice Charter. As a social construct, it is specific to a given place and time[11]. Such a conception, which places emphasis on the meanings invested in heritage rather than on its materiality was not new, far from it. In 1903, Aloïs Riegl wrote about the modern cult of monuments: "We modern viewers, rather than the works themselves by virtue of their original purpose, assign meaning and significance to a monument."[12]

For two centuries, heritage has most often been defined by the aesthetic and documentary value of artifacts embodied in their physical reality. Preserving the authenticity of the latter was the major conservation challenge. However, this concern is undermined by the unprecedented challenge posed by climate change, the evidence of which has become evident with the new century, the climate change, as an end in itself, but also in the means deployed to achieve it. On one hand, the need to decarbonize our built environment is now acknowledged as a moral obligation, through mitigation strategies that can both optimize the intrinsic carbon of existing structures and reduce their energy consumption. On the other hand, the necessity to adapt to climate impacts is becoming ever more obvious, with the increased vulnerability to gradual and insidious forces, such as erosion, rising waters, acceleration of freeze-thaw cycles, or new invasive species, as well as sudden and sometimes recurring natural events: flooding, storms, wildfire, and so on. These impacts undermine the physical fabric of places, as well as the longstanding relationship of communities to them.

For the better and for the worse, our built environment is now confronted with the need for unprecedented change to both mitigate and adapt to climate change. Most obviously, mitigation often means modifying the building envelope to increase its performance and limit energy consumption. This very often results in some level of visual transformation. Though this remains a design challenge, it is an accepted fact and a type of intervention that our profession has developed at least some level of comfort with.

Over the past 15 years, ERA Architects has been engaged with a large-scale initiative aimed at rehabilitating housing towers of the 1960s and 1970s, which constitute a significant percentage of the existing housing stock in southern Ontario, particularly in and around the city of Toronto. The Tower Renewal Project's aim is twofold: to improve the energy performance of these buildings, and to update comfort levels for their occupants. While the respective architectural value of these towers is variable, it is nevertheless a consideration of its work.

More ambitious upgrades do however almost necessarily mean more radical physical transformations. One of ERA's most recent Tower Renewal

12. Riegl, A. "The Modern Cult of Monuments : Its Essence and Its Development". In *Historical et Philosophical Issues in the Conservation of Cultural Heritage*, directed by Stanley Price, N, Kirby Talley Jr., M., Melucco Vaccaro, A., 72. Los Angeles: The Getty Conservation Institute, 1996

projects has been the rehabilitation of the Ken Soble Tower in Hamilton **(Fig.1)**, completed in 2020, the first Passive House housing tower retrofit in North America. This 18-storey tower, built in 1967, had fallen in disrepair, and several options had been contemplated, including its demolition. Its retrofit is EnerPhit certified and has achieved a 94% reduction of greenhouse gas emissions. In addition, the building can also maintain adequate interior temperatures for several days in the event of power outages, building in resilience to increasingly unpredictable climate events[13].

While of modest architectural interest, the building nevertheless constitutes a significant local landmark, and these upgrades have involved extensive visible alterations to it. Original balconies were removed to limit thermal bridging, and the original glazed brick cladding entirely replaced with panelized high performance insulation cladding, considerably altering its original aesthetics. This is considered to be largely offset by the gain of 147 renewed affordable senior housing units. There is value in comparing this example to another recent building envelope rehabilitation, at an opposite end of the spectrum in terms of architectural value, where the original design intent and authenticity warranted exceptional levels of care, time and expense. Mies Van der Rohe's Toronto Dominion Centre in Toronto is considered to be his last major commission before his death in 1969 and epitomizes many of the celebrated characteristics of his work, including bronze-colored glazing set into a matt black steel structure. In 2012, the owner undertook a major renovation of interior spaces combined with a building envelope rehabilitation which spread over several years, reducing the complex's energy consumption by half and achieving LEED Platinum certification for Operations and Maintenance.

The approach to this designated building is considered to embody best practice in terms of its sensitivity and commitment to maintaining the authenticity of Mies's original design and has been described in the Getty Conservation Institute's 2021 Publication: *Managing Energy Use in Modern Buildings: Case Studies in Conservation Practice*[14]. This included, for example, scrupulous efforts to accurately replicate the matt black paint finish of the structure. While this level of rigor, care and cost is laudable for an iconic structure such as this, it is hardly realistic for the mundane buildings that make up most of our building stock.

At a much larger scale, climate change mitigation also means modifying car-centric midcentury urban fabric in favor of more efficient and denser models of transit-oriented development. A case in point is another project ERA has been engaged on for the past few years, to support the development of a Master Plan for the federal Campus of Confederation Heights, in Ottawa **(Fig.2)**. Developed in the 1960s and 1970s as a suburban office campus for several federal departments, following the vision of French planner Jacques Gréber for decentralization of the booming civil service from the urban core, Confederation Heights sought to provide workers with a bright and airy work environment, through modern headquarters set within wide expanses of carefully manicured parkland. Leveraging ideals of infinite resources of space and wealth, this model was entirely reliant on private vehicle access,

celebrated through a network of scenic drives that magnified the aesthetic qualities of the sculptural office buildings and of their surroundings.

The mandate now at hand is to convert this single-use low density campus into a high-density complete community centered on active mobility and public transit. This paradigm shift forces us to question where balance lies between conserving the qualities of a modernist landscape and providing sustainable densification models for the suburban midcentury form. Here, the morals of climate change mitigation appear to unquestionably outweigh those of authenticity.

While mitigation is something that we have accustomed to incorporating in our work, climate change adaptation is something that our profession is not yet as adept at tackling. Perhaps our discomfort rest with the need to contend with unknowns and anticipate phenomena that may not be completely predictable. Perhaps it also lies in the fact that adaptation will likely entail an even greater degree of physical transformation that we have yet to come to terms with.

Adaptation will warrant even more radical levels of physical transformation to avoid total loss: from modifying existing assemblies and details to accommodate unprecedented climate events, reinforcing structures to ensure resilience against storms, to altogether raising or moving buildings to protect them from erosion or raising water levels. Faced with such existential threats, the notion of authenticity may be destined to become an outdated and irrelevant construct. ■

BIOGRAPHY

France Vanlaethem, Ph.D, graduated as an architect from La Cambre, in Brussels. Professor Emeritus at UQAM and founding chair of Docomomo Québec, she curated the exhibition "Montréal métropole 1888-1930" at the Canadian Center of Architecture and has published extensively: *Art Deco and Modernism in Belgium* (Lannoo, 1996, 2006), *Conservation de l'art contemporain et de l'architecture moderne. L'authenticité en question* (MultiMondes, 2010), *Place Ville Marie : Montreal's Shining Landmark* (Québec-Amériques, 2012), *La sauvegarde de l'architecture moderne au Québec, au Canada et ailleurs* (PUQ, 2012, 2014), and authored *Patrimoine en devenir : l'architecture moderne du Québec* (Publications du Québec, 2012).

Ève Michelle Wertheimer is a conservation architect and associate with ERA Architectes, based in Montreal. A graduate of the Raymond Lemaire Center for Conservation, she has been involved for over 20 years in the conservation of buildings and landscapes, on a range of projects throughout Canada. Prior to joining ERA, she has held various positions in the public sectors linked to heritage policy development and implementation. Through these multiple lenses, she has been able to explore the relationship between theory and practice as it manifests itself through heritage policy and conservation projects.

PRESERVING AUTHENTICITY AFTER SEISMIC RETROFIT AND REUSE IN JAPAN

TORU AJISAKA
AJISAKA ARCHITECT OFFICE

ABSTRACT

#26

Earthquakes occur frequently in Japan, and seismic retrofit is necessary to reuse modern architecture. In this study, we analyze the impact of functional improvements and seismic retrofit on the authenticity of modern reinforced concrete buildings selected by DOCOMOMO Japan. The aim is to clarify desirable earthquake-resistant design and design for functional renewal in order to inherit the authenticity of architecture and space.

Methods for seismic retrofit of reinforced concrete modern buildings in Japan include seismic resistant structure, seismic isolation structure, seismic response control structure, improving earthquake resistance by reducing building volume, and improving earthquake resistance by expanding building volume.

Among these methods of seismic retrofit, this study reports on the National Museum of Western Art (DOCOMOMO Japan Selected Building No.059 as an example of seismic retrofit through seismic isolation structures. It also reports on Hibiya Library (DOCOMOMO Japan Selected Building No.117) and the International House of Japan (DOCOMOMO Japan Selected Building No.047) as examples of seismic retrofit through seismic resistance structures. From the analysis of these specific cases, I consider design methods that have little impact on the authenticity of architecture and space.

1. INTRODUCTION: SEISMIC RETROFIT IN JAPAN

There are several methods for seismic retrofit of reinforced concrete buildings in Japan. Seismic resistant structure is a method of countering horizontal earthquake forces by increasing the strength of the building by installing earthquake-resistant walls and earthquake-resistant steal braces. It is a cheaper method than seismic isolation structure and is commonly used. Seismic isolation structure is a method of preventing earthquake forces from being transmitted to buildings by installing a seismic isolation layer, but the construction costs are expensive. Seismic response control structure is a method of absorbing seismic forces and reducing their impact by installing seismic dampers in the structural frame. Seismic retrofit by reducing building volume is a method of improving seismic performance by removing part of the building to reduce its weight. Seismic retrofit by expanding building volume is a method of improving the earthquake resistance of the entire building by adding new, stronger structural parts.

In Japan, the earthquake resistance standards of the Building Standards Act were revised in 1981 due to the impact of the 1978 Miyagi Prefecture offshore earthquake (magnitude 7.4, maximum seismic intensity 5). As a result, buildings built before that time do not meet the current building standards and are called existing non-conformed buildings.

When expanding or changing the Reuse of a building in Japan, it becomes necessary to improve earthquake resistance to current standards. Under Act on Promotion of Earthquake-Resistant Renovations of Buildings, earthquake reinforcement is mandatory for schools, hospitals, inns, gymnasiums, nursing homes, etc. that are used by an unspecified number of people and are above a certain size.

2. REUSE THROUGH SEISMIC ISOLATION STRUCTURE

Among the 290 DOCOMOMO Japan selected modern architectures, improved seismic performance through seismic isolation structures has been adopted in Hiroshima Peace Memorial Museum (DOCOMOMO Japan Selected Building No.014 1955), Kagawa Prefectural Government Office (DOCOMOMO Japan Selected Building No.016 1958), Sagae City Hall (DOCOMOMO Japan Selected Building No.089 1967), National Museum of Western Art, Ministry of Foreign Affairs (DOCOMOMO Japan Selected Building No.059 1959), NCR Building [Nippon Foundation Building] (DOCOMOMO Japan Selected Building No.069 1962), and other buildings.

At first the paper report on the example of the National Museum of Western Art.

The National Museum of Western Art was completed in 1959, based on the design documents sent from Paris by Le Corbusier, with architectural design by Junzo Sakakura, structural design by Kunio Mayekawa, and facility design by Takamasa Yoshizaka.

In 1964, Junzo Sakakura indoord some of the pilotis and added an auditorium and office building. In 1979, after Junzo Sakakura's death, a new wing was built based on a design by Kunio Mayekawa. In 1997, the

National Museum of Western Art not only isolated the main building by excavating underground, but also added a new space (special exhibition room) underground and above ground, which was functionally necessary. Since this was the first seismic isolation method in Japan, the design was done by the Ministry of Land, Infrastructure, Transport and Tourism and Kunio Mayekawa. Unfortunately, at this time, Junzo Sakakura's lecture hall and office building were demolished. This plan added the large volume of the special exhibition room, which was needed, underground in the front garden connected to the seismic isolation layer, and the above-ground extension was also built at a low height behind the main building, minimizing the impact on the exterior. In addition, since the seismic isolation method requires little intervention inside and outside, the authenticity in architecture and space was guaranteed at the National Museum of Western Art. Although the construction costs of excavating underground are enormous, it was an appropriate plan considering that the museum was later registered as a World Heritage Site. This became a pioneering example of improving the earthquake resistance of buildings of the authenticity in architecture and space was guaranteed at the National Museum of Western Art. through seismic isolation structure.

3. REUSE THROUGH SEISMIC RESISTANT STRUCTURE

Of the 290 DOCOMOMO Japan selected modern architectures many have been reused through seismic resistant structures, including the Kanagawa Prefectural Museum of Modern Art (DOCOMOMO Japan Selected Building No.010 1951, Kanagawa Prefectural Library and Music Hall DOCOMOMO Japan Selected Building No.012 1954), The World Peace Memorial Cathedral (DOCOMOMO Japan Selected Building No.045 1953), The International House of Japan, Nanzan University (DOCOMOMO Japan Selected Building No.077 1964), and The Ueno City Hall (DOCOMOMO Japan Selected Building No.183 1963). Among these, we report on the International House of Japan (1955) and Hibiya Library (1957).

The Tokyo Metropolitan Hibiya Library was built in 1957 to a design by Tokyo Metropolitan architect Takeshi Takahashi. In 2002, steel braces were installed to reinforce the building against earthquakes. After that, in 2009-2010, architect Yoichi Hosaka redesigned the building, and construction was carried out in 2010-2011. The steel sashes were replaced with aluminum sashes using a cover method, and the sashes were made thicker than the originals because they needed to be used as smoke exhaust windows. The braces of structure have intervened the interior, and the delicate exterior has been lost, and part of the authenticity has been lost.

The International House of Japan was completed in 1955, jointly designed by three architects: Mayekawa Kunio (1905-1986), Sakakura Junzo(1901-1969), and Yoshimura Junzo(1908-1997). Since its completion, it has been frequently renovated due to its high usage. Yoshimura Junzo designed and expanded the basement restaurant, while Mayekawa Kunio designed and converted the void and the light courtyard into living space, and both have been utilized since. Sakakura Junzo passed away in 1969,

and in 1975 Mayekawa Kunio drew up a detailed design for a complete rebuild and was about to start construction, but due to rising prices during the oil crisis, the main building was renovated and the new building was downsized and expanded. Although it continued to be used after that, due to reasons such as its earthquake resistance not meeting the new standards, the lack of bathroom units in the guest rooms being cramped, a complete rebuild was planned again around 2000. However, following a request from DOCOMOMO Japan, the Japan Institute of Architects, and the Architectural Institute of Japan, and a proposal from the Architectural Institute of Japan to renovate the building using the methods of seismic isolation structure, the plan was changed in 2004 to preserve and renovate the building. However, it was discovered that the foundations of the Iwasaki Koyata House (1930, designed by Oe Shintaro) on the International House of Japan's grounds were on the grounds, and the decision was made to reconstruct it using the methods of seismic resistant structure. Architect Sakata Seizo, who was the supervisor at the time, set the concept that "Preservation is not the goal. Preservation is through renovation to update functionality." Following that policy, we began designing the regeneration. As a result, multi-story shear walls that were necessary for functionality, such as elevator shafts for barrier-free access and partitions between guest rooms. The International House of Japan was reinforced against earthquakes by adding a new, stronger structure for the auditorium, which was added underground. The walls and frames required for the building's function were used as effective earthquake-resistance elements. The building's earthquake resistance was improved without exposing the earthquake-resistance reinforcement elements to the outside or inside.

4. CONCLUSION

In order to continue using modern architectures, it is necessary to improve its functionality. In Japan, further seismic retrofit is necessary. In seismic retrofit through the seismic isolation structure, since no seismic elements (walls, braces, etc.) are needed other than the seismic isolation layer, it is possible to preserve the authenticity of the interior and exterior. However, in the case of the National Museum of Western Art, instead of simply seismic retrofit using seismic isolation structures, the authenticity of the exterior was maintained by creating new spaces and new viewing routes required for functionality underground and behind the original building.

As in the case of Hibiya Library, seismic retrofit through seismic resistant structure involved earthquake-resistant walls and steel braces inside and outside the building, which had a significant impact on the authenticity of the architecture and space of modern architecture. On the other hand, functional renewal is essential to continue using modern architecture. It is very important to utilize the walls and extensions that arise from functional renewal as effective seismic elements. As in the case of the International House of Japan, by combining functional renewal with seismic elements, it is possible to reduce the involvement of exposed structural materials. Unfortunately, in Japan, seismic retrofit through seismic resistant structure,

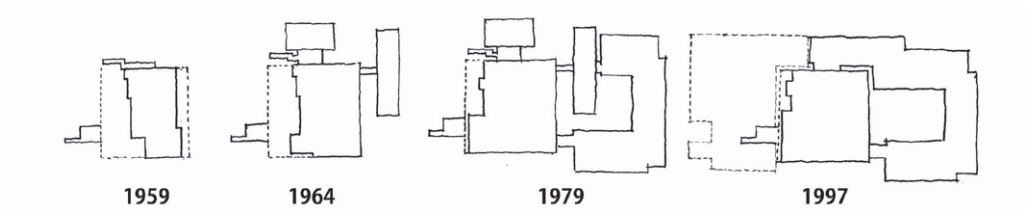

Figure 1. History of renovations at the National Museum of Western Art.

Figure 2. Comparison of Seismic resistant structure and Seismic isolation structure.

including for school buildings, is often only carried out with earthquake-resistance reinforcement design, and steel braces are exposed to the outside.

In order to inherit the authenticity of the architecture and space of modern architecture, architects must first simultaneously design seismic reinforcement and functional renewal, solving both problems. ■

ABSTRACT

How can we retain the cultural significance of a 20th-century architectural masterpiece while protecting it from the increasing risks due to climate change? Is climate change protection an ultimate challenge or an opportunity to retain the building's authenticity of 20th-century architecture? This paper discusses this question by comparing two iconic masterpieces of 20th-century architecture, awarded with a "Keeping It Modern" by the Getty Foundation for developing Conservation Management Plans (CMPs). This paper aims to address the relationship between cultural significance and risk assessment through the compared analysis of the CMPs for two emblematic 20th-century masterpieces: the Ocean Swimming Pool in Portugal (Álvaro Siza, 1960-1966) and the National Art Schools of Cuba (Ricardo Porro, Roberto Gottardi and Vittorio Garatti, 1961). The Ocean Swimming Pool is an exposed concrete building with an exceptional setting over the seaside rocks, whose authenticity is now strongly threatened by hazards such as coastal erosion and chloride explosion determined by the sea level rise. In turn, the National Art Schools of Cuba is a unique complex with organic brick shapes. Since the complex is next to the coastline, it has been threatened by the risk of flooding since its foundation, and such risk has been continuously increasing due to the climate change scenario. Both the CMPs are supported by a values-based approach, and comparative analyses will focus specifically on i) cultural significance assessment, ii) risk assessment, iii) policies and actions for climate change adaptation. Hence, the discussion of two case studies on distinct continents will allow us to further reflect globally on how to preserve cultural significance in the face of the growing threat of climate change.

1. INTRODUCTION

The concept of authenticity has seen major developments in the last century, following its germination in the 19th-century theories of restoration. The Venice Charter[1] consists of one of the most important documents of consensus until the present day. However, its doctrinal tradition favors the material authenticity of the buildings, ensembles and sites. The Nara Document on Authenticity[2] argues against this perspective, claiming for the preservation of intangible values[3] and expanding the concept of authenticity towards several attributes: (i) form and design, (ii) materials and substance, (iii) use and function, (iv) location and setting, (v) spirit and feeling, (vi) traditions, techniques and management systems.

The conservation of modern architecture poses new challenges to the concept of authenticity. While recent decades have seen a greater trend towards restoring the original design appearance, prioritizing "formal authenticity"[4], of which the intervention in Le Corbusier's Ville Savoye is an example, recent cases demonstrate an evolution, favoring the "progressive authenticity", according to Pamela Jerome[5] for the conservation of the Guggenheim Museum in New York.

Cultural significance, intended as the result of the attributes (what) and the values (why) is directly related to authenticity. Hence, the preservation of tangible and intangible attributes determines the authenticity of a site, being the basis of heritage listing and the definition of conservation strategies[6].

However, these concepts have not always evolved in a curated and rational manner. They are entangled in a dialectic between processes of selection, losses, and transformation of society. Climate change, as a contemporary growing threat, is determining how humanity is going to live in the next generations. The safeguarding of modern architecture should not be absent from this debate, especially in preparing adaptation measures and risk management.

There is a vast literature addressing the cultural significance of heritage sites, as well as climate change adaptation. However, very few studies interrelate cultural significance and risk assessment, briefly addressing the vulnerability of local people, the values threatened[7], and the importance of disaster preparation under cultural significance framework[8] to monitor and reduce their negative impacts.

In this context, this paper aims to foster the relationship between cultural significance and climate change adaptation through a compared analysis of the Conservation Management Plans (CMP) of two 20th-century masterpieces **(Fig. 1)**: the Ocean Swimming Pool in Portugal (Álvaro Siza, 1960-1966)[9] and the National Art Schools of Cuba (Ricardo Porro, Roberto Gottardi and Vittorio Garatti, 1961)[10].

2. METHODOLOGY

The case studies are framed within the "Keeping It Modern" (KIM) initiative, promoted by the Getty Foundation, dedicated to globally safeguarding and preserving modern architecture and focused on the

preparation of CMPs to improve research and develop best practices for a still-emerging field.

Conservation Management Plans are a multi-staged process anchored in the Burra Charter[11], allowing and promoting active preservation of buildings and places[12]. They provide a cyclical framework in which heritage conservation is carried out by evolving communities' values (values-based approach) into integrated management (holistic approach). The closer the relation of the various rights-holders in assessing significance and developing policies for achieving common agreements on maintaining it, the more efficiently conservation is attained[13].

The Burra Charter methodology for Conservation Planning is supported by the following steps i) understand the place; ii) assess cultural significance; iii) identify all factors and issues; iv) develop policy; v) prepare a management plan; vi) implement the management plan; vii) monitor the results, and review the plan[8]. This paper will focus on steps ii) and iii), namely on cultural significance and risk assessments, and on their possible relations.

3. COMPARATIVE ANALYSIS

3.1. CULTURAL SIGNIFICANCE

The Ocean Swimming Pool (OSP) was designed by the Portuguese architect Álvaro Siza between 1960 and 1966 (with later additions until 1973) for the coastal town of Leça da Palmeira, north of Porto, Portugal. In this early work, Siza adopted expressively modern technology and abstract neoplastic language, building a succession of walls in reinforced concrete over the seaside rocks. The building is listed as National Monument since 2011 and is included in the "Ensemble of Álvaro Siza's Architectural Works" serial property in the World Heritage Tentative List (2017).

The OSP is one of Álvaro Siza's most internationally recognized works, expressing a tectonic shift in his career, from regionalist inspiration towards more abstract design and innovative constructive solutions. The building has been in full use for almost sixty years, becoming a social and cultural landmark for local communities.

Methodology for cultural significance assessment of the OSP resulted from the cross-analysis of different methods and tools: i) document analysis, ii) archival research and literature review; iii) participatory strategies (surveys, interviews, workshops, webinars, social media analysis); iv) fieldwork. These activities engaged a wide spectrum of actors (visitors, staff, managers, users, experts, children, students, virtual community), retaining different values and attributes of the site and allowing the definition of categories of cultural significance (social, economic, political, historic, aesthetic, scientific, age and ecological) and a map of levels of significance (exceptional, high, moderate, some) **(Fig. 2, above)**.

Cuba's National Art Schools (NAS) were built just after Castro's revolution (1961-64) on a design by architects Ricardo Porro, Vittorio Garatti, and Roberto Gottardi in Havana's former golf course. NAS

translated the will for social renewal into innovative architecture as a synthesis of art, construction, and landscape. The five buildings have hosted original models of education, integrating different forms of art to which each building is devoted: visual arts, drama, music, dance, and ballet. Although independent, these iconic buildings were all made using the same materials (bricks, concrete, ceramic tiles) and techniques (domes and vaults).

The NAS was included in the 100 Most Endangered Sites by the WMF (2000), in the World Heritage Tentative List (2003), and in the National Register of Monuments (2010). However, NAS is yet mainly studied from critical and social points of view, lacking studies aiming at sustainable preservation and management.

Methodology for cultural significance assessment of the NAS resulted from the cross-analysis of different methods and tools: better understanding of constructive history and conservation needs, and comparative discussion among different stakeholders (national/international designers, owner, users). The results (value map, **Fig. 2**, below) have allowed the team to overcome persistent misunderstandings in the historiographical approach to the NAS and to better assess the complex's significance on solid foundations[14].

3.2. RISK ASSESSMENT

The methodology that was followed for risk, vulnerability, and hazard identification for the OSP considers that risk is the potential negative impacts on the asset under assessment due to the occurrence of a threatening event (hazard), which can be of natural or anthropogenic classification. These negative impacts can be seen as the result of the dynamic interaction between the hazard and existing vulnerabilities (e.g. physical, social, economic, or environmental) which represent the susceptibility of the asset to the damaging effects of the hazard, combined with a lack of ability to cope with it.

Given the location of the OSP, the more relevant natural hazards were storm surges and chloride action. In addition, due to climate change, events such as sea level rise were considered.

A storm surge is an abnormal rise of seawater over the predicted astronomical tide level provoked by storms and low atmospheric pressure, already visible over time, **(Fig. 3, at left)**. Due to their morphology, low and sandy coasts are sensitive to this extreme hydrodynamic phenomenon, causing coastal erosion processes.

In the context of climate change and its effects, the world's oceans will warm, and ice melting will continue, leading to a likely sea level rise of 0.19 m and 0.23 m until 2050. Beyond 2050, it is estimated a likely rise between 0.44 m and 0.77 m. The specific sea level rise projections for the west coast of Portugal **(Fig. 3, at right)**, point to permanent tide submersion of 0.44 m in 2050 and of 1.15 m in 2100. The specific tide submersion scenarios for 2050 and 2100 indicate that OSP is likely to be submerged for 9 hours a year.

Given the location and history of the OSP, vandalism, incorrect or improper use, and neglect or lack of maintenance were the three types of anthropogenic hazards considered in the risk assessment.

14. M. Wesam Al Asali, Dania González Couret and Michael Ramage, "Beyond the National Art Schools: Thin-Tile Vaulting in Cuba after the Revolution", *JSAH*, 80, 2021: 321-345.

Regarding the NAS, after documentation and before conservation, the CMP focused on protection from the main risk affecting the complex, that is the flood risk due to river Quibù crossing it and frequently flooding its modernist buildings.

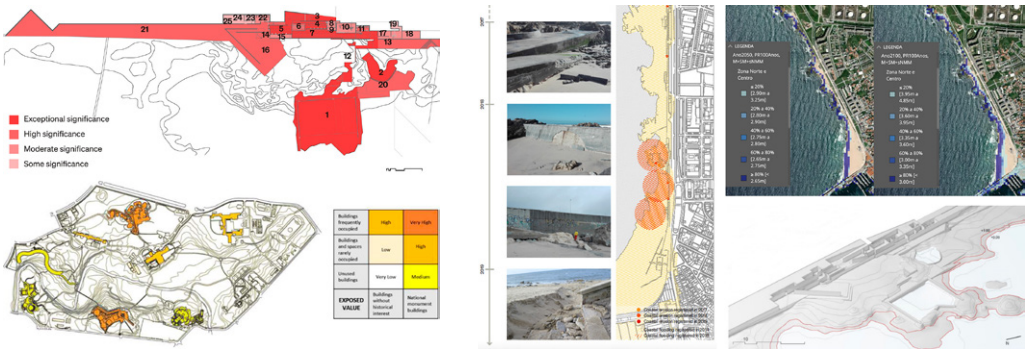
Given these premises, defining the hydraulic risk assessment and mitigation was a priority for the CMP far before any concerns about stability, preservation, or reuse. The risk assessment process involved a multidisciplinary team including conservation architects and hydraulic engineers from Politecnico di Milano and the National Institute "Recurso Idraulico". Given the striking dimension of the complex, the research was based on a GIS platform and a large and multi-scale database[15].

The research focused on Vittorio Garatti's Ballet School as it is the building of the complex at most risk. The result is a digital model predicting the risk of flooding affecting each building by means of different flood scenarios with return periods of 5, 10, 20, and 100 years **(Fig. 4)**.

The model also sets solutions to mitigate such risks, both in short and long-term perspective, taking into account three levels: vulnerability, exposed value and damage[16]. Whether temporary, lightweight, or permanent, affordable flood protection structures can be equally effective.

The project shows that conducting a relatively inexpensive hydraulic investigation can assist flood modeling and risk assessment for conservation projects involving historically significant sites. This information can guide the selection of adaptation and risk reduction measures across Cuba's coastal areas, addressing the impact of rising sea levels and extreme storms due to transient climate change.

3.3. BRIDGING CULTURAL SIGNIFICANCE AND RISK ASSESSMENT



Both Cultural Significance and Risk Assessment cannot be inert operations in a management plan. Their cross-examination is an important step to prevent different "loss scenarios", with permanent deterioration of cultural heritage. This procedure helps to engage managers in visualizing vulnerability states and prompting risk preparedness measures.

In the case of the OSP, hazards were associated with cultural significance values identified in the early stages of the CMP preparation, according to **Table 1**. The table presents a summary of the previously described vulnerability scenarios along with a severity classification using three levels – LOW, MEDIUM and HIGH – considering both the severity of damage and the severity of impact on the cultural values.

A severity level classified as LOW means that damage is either negligible or small enough to be easily reparable, while the impacts to cultural values are also negligible. A severity level classified as MEDIUM means that damage is not negligible and repairing will also involve non-negligible costs. This damage will also have relevant impacts on cultural values, but recoverable after damage repair. A severity level classified as HIGH means that damage is significant and may not be fully repairable. In this case, unfortunately, impacts to cultural values may not be recoverable.

Affected cultural values	Hazard	Vulnerability	Severity
All	Sea level rise	Permanent submersion	HIGH
Aesthetic	Increase of atmospheric carbon dioxide	Acceleration of concrete carbonatation and rebar corrosion	MEDIUM
Aesthetic	Chloride action	Acceleration of rebar corrosion	MEDIUM-HIGH
Economic Aesthetic	Storm surge	Building damage Infrastructural damage	HIGH
Economic Aesthetic	Vandalism	Graffiti Copper theft	MEDIUM-LOW
Economic	Misuse	Equipment damage	MEDIUM-LOW
Economic Aesthetic	Lack of maintenance	Acceleration of asset's degradation	MEDIUM-HIGH

Table 1. Summary of the vulnerability scenarios9, p. 16. © CEAU-FAUP, 2023.

Sea level rise is a high-risk hazard affecting all values because it implies the permanent submersion of the OSP. Climate change is, thus, a permanent issue of concern.

As the table also shows, different hazards may affect aesthetic, aesthetic and economic, or only economic values.

In the first case, the increase of atmospheric carbon dioxide from climate change will accelerate concrete carbonation, leading to the corrosion of steel rebars and causing cracking, spalling and weakening of reinforced concrete elements.

In the second case, the moving force of storm surge may result in building damage. Direct exposure to seawater will seriously compromise

the normal operating conditions of infrastructural networks due to direct contact with water, chlorides or water-suspended sediments clogging the hydraulic and filtering systems. In turn, graffiti harms the asset's image and may be difficult to remove from exposed concrete. Copper theft affects the normal operating conditions of the asset and might lead to serious consequences if not promptly addressed.

Finally, misuse of facilities might lead to equipment damage, unexpected repairs and additional costs, a consequence also of inappropriate maintenance, accelerating degradation.

The discussion between cultural significance and risk assessment of the NAS contributed to the overall reassessment of this modernist masterpiece, highlighting some design fragilities. **Table 2** reflects about potential damage today.

Targets (today)	**Exposed Value**	**Vulnerability**	**Damage (today)**
School of modern and folkloric dance	Very High	Medium	Substantial
School of plastic art	Very High	Medium	Substantial
Student house	High	Medium	Considerable
New school of music	High	Medium	Considerable
Rectorate	High	Medium	Considerable
School of ballet	Medium	High	Considerable
School of music	Medium	High	Considerable
School of dramatic arts	Medium	Medium	Considerable
Warehouses and archives	Low	Medium	Minor
Technical networks, road and infrastructures	Low	Low	Minor

Table 2. Damage ranking (today)10, p. 442. © POLIMI, 2020.

Analysis has highlighted that fragilities in the face of climate change derives from choices made during the twentieth century, at different scales: 1) the modern embankments built to urbanize the mouth of the Quibù river near the coastline, prevents the water from flowing freely into the ocean when the tide rises; 2) in the 1930s, the designers of the golf course modified the natural course of the river within the complex, diverting in three points to create scenic meanders; 3) Vittorio Garatti was fascinated by that landscape and wanted to romantically "hide" his masterpiece in that depressed meander so that the building is only visible from above, entangling the promenade under large brick domes, imitating the shape of the Algarrobo trees. As a result, the Ballet School is surrounded by the river like a peninsula and has been exposed to the risk of flooding since the time of its construction.

The high exposure of the NAS to the risk of flooding is due both to the growing threat of climate change (increasing hazard) and to the high vulnerability of the buildings (especially the Vittorio Garatti Ballet

School) which was determined by past design choices. The challenge for conservation will therefore be to increase the level of protection, without damaging the architectural and landscape qualities that make this iconic complex unique **(Fig. 5)**.

4. CONCLUSIONS

This paper intended to demonstrate that, according to the Burra Charter Conservation Planning methodology, there must be an assessment of the vulnerabilities affecting the cultural significance, to prioritize policies and retain values within a careful management of change.

However, the lack of literature about specific frameworks for risk assessment of the 20th-century heritage relating to cultural significance remains a gap in the field.

The cases presented distinct geographic, geomorphologic, typological and technological features, which have determined different hazards and impacts on built heritage. Future works may compare common frameworks and relate different typologies, construction technologies and geomorphological contexts. ■

BIOGRAPHIES

Teresa Cunha Ferreira holds a degree at the Faculty of Architecture of the University of Porto (FAUP) and a European PhD at the Polytechnic of Milan (2009). She developed her professional experience in heritage public offices among other design, management and consultancy works in interaction with teaching positions at the University of Minho (2009-2017) and FAUP (since 2012). In 2009, she joined the Centre for Studies in Architecture and Urbanism (CEAU) of FAUP (Principal investigator since 2021), where she coordinates a UNESCO Chair and funded research projects such as '*Keeping It Modern*: Ocean Swimming Pool', funded by the Getty Foundation.

Davide Del Curto is an architect and Full Professor of architectural preservation at Politecnico di Milano, Dept. of Architecture and Urban Studies, where he coordinates the Analysis and Built Heritage Diagnostics Laboratory. His research focuses on preventive conservation and 20th-century architecture. He was responsible for national and international research projects conserving and managing historic buildings. Within the Keeping It Modern initiative, he contributed to the CMP for Giancarlo De Carlo's "Collegi" of Urbino University (2015-18) and coordinated the CMP for the National Art Schools of Cuba (2018-20).

Pedro Freitas has a professional degree in Architect and Urbanism from the University of São Paulo (2000-2006) and a Master (2010-2012) and PhD (2014-2018) from the University of Campinas. From 2018 to 2024, he was an Assistant Professor in the Department of Architecture and Urbanism of the Federal University of Sergipe (UFS). Since 2022, he has collaborated with the Center for Studies in Architecture and Urbanism (CEAU) of FAUP (Assistant Investigator since 2024), developing research on education of contextual methods for architectural intervention and participating in different projects related with the preservation and safeguarding of modern architecture.

Andrea Garzulino has a PhD in Architecture, Urban Planning, Conservation of living places and landscape (2015) and is a Research Fellow at the Polytechnic of Milan (since 2014). He has held research grants and collaborates with the TeCMArcH laboratories (since 2009) and LADC (since 2019) of the Department of Architecture and Urban Studies of the Polytechnic of Milan. He has participated in international (Keeping it Modern, Getty Foundation 2019; EuropeAid Eritrea 2017) and national (Castelseprio 2016; Milano Archeologica 2015) research groups, and is the scientific director on the analysis, documentation and management of archaeological areas (Tarquinia Project 2014-2019; Myanmar 2014).

Rui Fernandes Póvoas is a Full Professor at the Faculty of Architecture of the University of Porto (FAUP), where he teaches since 1986. He has habilitation in Architecture from the University of Porto (2014), Ph.D. in Civil Engineering (1991), Master in Structural Engineering (1985), and Bachelor in Civil Engineering from the Faculty of Engineering of the University of Porto (1977). He participates in many professional and scientific societies in the areas of Conservation, Rehabilitation and History of Construction, focusing research on the study of Porto's structural systems of housing from the 17th to 19th century among other subjects.

A COMPREHENSIVE FRAMEWORK TO INCREASE MODELLING CREDIBILITY IN MODERN BUILDINGS ENERGY SIMULATIONS. THE CASE STUDY OF CHAUDERON COMPLEX FAÇADES BY JEAN PROUVÉ IN LAUSANNE (1969-1974)

ABSTRACT

The urgent need to retrofit the existing building stock is a well-known theme, abundantly dealt with in the scientific literature. Thermal simulations have a key role, assessing the effective energy performance of buildings. At the same time, researchers frequently outlined significant discrepancies between real and simulated outputs, questioning the credibility of the obtained results.

In this context, the present contribution introduces a comprehensive framework for the building energy simulations, ensuring the necessary model reliability. The overall approach is structured into six phases: building audit; initial model definition; initial model validation; sensitivity analysis; model calibration; and calibrated model validation. The validated model is the design premise to propose well-balanced retrofitting scenarios, improving the energy performances, enhancing the internal comfort, and preserving the architectural values.

As operative case-study, Chauderon suspended building in Lausanne (1969–1974), by the Atelier AAA and Jean Prouvé, has been selected. Today, the complex is well-preserved in its original materiality and represents an iconic example of the modern aesthetics, with an expressed need for retrofitting. A focus on the architectural, engineering and technical features that made of Chauderon a unicum in the Swiss panorama allowed to identify the intrinsic value of this object, assessing the pertinence of its preservation.

The final aim of this study is to minimize the risk of inappropriate interventions. The presented workflow is thus intended as a practical guideline, promoting reduced energy demand; higher thermal comfort; heritage preservation; architectural authenticity. A new way for reconciling the aspects of energy saving and architectural preservation is outlined, reconducting these two aprioristically opposed issues as two complementary parts of the same rehabilitation agenda. For high-quality post-World War II building stock, the use of a calibrated and validated model is finally justified and recommended over the simplified modelling approaches still commonly employed today.

1. INTRODUCTION

Today, the extensive energy efficiency of the existing building stock is worldwide recognized as one of the most urgent need to face climate change[1]. Following the current regulations, the retrofitting design primarily targets modern buildings, adopting tools based on thermal modelling and simulations. Generally, the overall aim of the process is to assess the heat flows through the façades, the global energy balance and to reveal the critical elements of the envelopes to be improved or replaced.

As a result of this renovation approach, the integrity of modern buildings is at risk, at a time when their recognition as heritage objects is the topic of an exciting debate around the world[2]. It becomes crucial to recognize their cultural and historical values, avoiding disruptive energy conservation measures and integrating energy efficiency with heritage preservation aims[3]. It is a challenging goal since in modern architecture fully glazed façades or wide curtain walls are at the same time the most iconic components and generally considered - rightly or wrongly - the main sources of heat losses, with thermal transmittance values which are often up to three times higher than those recommended by the current standards.

In addition, researchers are increasingly concerned about modelling credibility and recognize significant discrepancies between simulated and measured energy use in buildings, reaching up to three times the predicted consumptions[4]. Among the main causes there are a widespread preference for simplified models based on static simulation tools and the presence of inputs uncertainties. Effectively, this fact can lead to consistent performance gaps, which are extremely dangerous in the preservation field, where material authenticity and minimal intervention are two leading concepts, as recognized by the international scientific community.

Although the accurate assessment of the energy performances is highly recommended, the performance gap remains today a significant issue and methods for achieving a high accuracy in thermal modelling have not been systematically explored yet.

To fill this gap, new and appropriate workflows are needed. This contribution aims to present a comprehensive modelling framework to control performance gaps in thermal simulations, mainly addressing modern architecture. The method includes dynamic simulations, modelling calibration and validation. The calibration is based on monitored data and sensitivity analysis. The validation follows international standards, to ensure the necessary model credibility. The proposed approach helps in calculating reliable energy performances, minimizing the gaps, and allowing to predict more realistic retrofitting scenarios. A final validated model is in fact the design premise to propose a well-balanced retrofitting solution, improving the current energy performances and reducing the operational costs, while enabling the preservation of the historical values of modern architecture.

2. A SUSPENDED BUILDING WITH LIGHT FACADES

As operative case-study, Chauderon administrative complex in Lausanne (1969–1974), designed by the Atelier des Architectes Associés AAA in collaboration with Jean Prouvé, has been selected, **(Fig.1)**. Today, the complex is well-preserved in its original materiality and represents an iconic example of the modern aesthetics. In terms of legal protection, the building is recognized and listed for its cultural interest, but still not protected[5], raising the issue of its authenticity preservation..

Meticulous archival research[6] allowed to identify two main features that make of this complex - which in the architects' intentions was supposed to represent the «idea of the architecture of tomorrow»[7] - a unicum in the Swiss architectural panorama.

First of all, its structural scheme is based on the rare suspended principle[8], representing the sole case of a totally hanging construction in Switzerland[9]. It means that an entire office volume, consisting of five stories, is suspended by means of steel cables to a huge roofing structure. This last bearing part, which is about two meters high, is composed by two main longitudinal steel beams and a series of transversal secondary trusses, from which the cables are hung. The main beams rest on four concrete cores, allowing the charges to finally reach the foundations[10]. The thin steel bars are hidden behind the façade system, being invisible and repaired from weather events. As it appears, thanks to this principle, the charges are firstly carried upwards, meaning that the usual gravitational load-path is completely subverted. A traditional structure was immediately discarded by the architects, because «incompatible with the program»[11]. Effectively, suspended buildings allow to obtain a pillar-free ground floor for pedestrians, flexible underground levels for car parking, and continuous open plans for the offices, as strongly desired by the designers and the client.

On the other side, the façade, which is still in its original materiality, has been conceived in close collaboration with Jean Prouvé. The modular envelope consists of a series of light prefabricated panels, capable to support maximal deformations at the building's corners up to +5 cm[12]. In terms of materials, the panels are formed by an internal metal sheet, an intermediate insulation layer in polyurethane foam and an exterior aluminium sheet. Most panels are finally completed by a transparent portion consisting of a double insulating and bronze reflecting glass with a neoprene joint[13] **(Fig. 2)**.

It results that both this features, which strongly characterize the architectural and technological values of Chauderon complex as well as its material authenticity value, need to be preserved in the event of future retrofitting design.

3. A COMPREHENSIVE MODELLING FRAMEWORK

To ensure the necessary model credibility a comprehensive framework for the building energy simulation is thus proposed. It is structured into six phases consisting of: (1) building audit; (2) initial model definition; (3) initial model validation; (4) sensitivity analysis; (5) model calibration; (6) calibrated model

validation[14]. Steps 4, 5, 6 are iterative, until the final model validation is achieved. This framework is conceived as a general tool to be applied in a case-by-case approach, being able to cover the different buildings' features, **(Fig. 3)**.

CHAUDERON COMPLEX ENERGY MODELLING

The building audit is the first step, aiming to provide a precise building description. In the presented case-study, it helped in overcoming preconceived ideas about the performance of lightweight façades, which are generally considered to be very inefficient. The audit involved several site visits, historical and archival research, as well as interviews with technicians, engineers, and facility management personnel, allowing to define the main building features and the thermal model inputs. Among the different components, particular attention was paid to define Prouvé's façade thermal properties. The thermal transmittance of the envelope, including the prefabricated panels, windows, roof components, and first-floor slab, as well as the linear thermal bridges have been calculated by means of wufi2D and Flixo. The thermophysical properties were derived both from archival documentation and on-site surveys. Also, technical data about the air flows rate and the building occupancy were considered in this phase.

The gathered information constituted the inputs to create the initial model in WUFIplus. Dynamic simulations allowed to define the energy demand for space heating, resulting in 125 KWh/m^{2}y. For a comparative purpose also, quasi-static simulations were performed, leading to an energy demand of 187 KWh/m^{2}y[15]. These results were finally compared with the average of the effective consumptions coming from the owner's bills, equal to 154 KWh/m^{2}y. Consistent performance gaps were found in both cases; the dynamic model was selected to be further implemented.

Due to the consistent deviation from the real energy consumption, the initial model did not represent in a reliable manner Chauderon's energy behavior. In fact, following the ASHRAE 14 guidelines[16], the initial model did not respect the expressed criteria, meaning that the model was not validated.

To validate the model, a calibration phase was necessary, performed by means of sensitivity analysis. The sensitivity analysis generally allows to evaluate the influence of the input parameters on the model predictions. In the present case-study, five uncertain parameters were selected and screened to be improved[17]. They were indoor air temperature schedule for heating; indoor air temperature schedule for cooling; occupant schedules and behavior; fresh air supply; unheated attic temperature. As a result, the sensitivity analysis allowed to assess the major importance of the indoor air temperature schedule for heating, which need to be carefully defined. Following, also air temperature for cooling and fresh air supply play an important role, as well as their conjugate effects.

The subsequent calibration phase allowed to create a first calibrated model, only based on the improved indoor air temperature schedules for heating (annual energy demand for space heating of 145 kWh/m^{2}y) and a second calibrated model based on the improvement of the other screened

14. Wider description about the workflow has been published in: Giuseppe Galbiati, Franz Graf, Giulia Marino, Jean-Marie Fürbringer, "A modelling framework for modern heritage buildings energy simulation", *Journal of Building Engineering*, no. 80 (2023).

15. Static or quasi-static tools are not recommended for historical building thermal modelling, since they often overestimate the effective energy consumptions. The present case-study is in the same trend. See also: R.S. Adhikari, E. Lucchi, V. Pracchi, E. Rosina, "Static and dynamic evaluation methods for energy efficiency in historical buildings", *Proceedings of PLEA2013 - 29th Conference, Sustainable Architecture for a Renewable Future*, Munich (2013).

16. ASHRAE Guideline 14, *Measurement of Energy and Demand Savings, American Society of Heating,* (Atlanta: Refrigerating and Air-Conditioning Engineers, Inc, 2002). The criteria adopted by ASHRAE for assessing the model validity are the MBE (normalized mean bias error), and the CV (RMSE) (coefficient of variation of the root mean square error).

17. Between the different SA approaches, design of experience by means of factorial matrices was used. For details see: Jean-Marie Fürbringer, Claude-Alain Roulet, "Confidence of simulation results: put a sensitivity analysis module in your MODEL: the IEA-ECBCS Annex 23 experience of model

parameters (annual energy demand for space heating of 149 kWh/m²y). The precise set point temperatures, usage times, and the operation tables of the heating system were defined starting from onsite measurements in the different seasons. Thanks to this data the model inputs were completely based on the real profiles, without considering any recommended value expressed by the norms. To be representative as much as possible, tests were performed at three different levels of the building and in offices with opposed expositions, looking toward north and south.

The two calibrated models were finally analyzed in the last step of the framework. Among them, only the second calibrated model was fully validated according to ASHRAE 14.

4. A VALIDATED MODEL FOR FUTURE RETROFITTING SCENARIOS

As a result of the process, the second calibrated and validated model realistically represent Chauderon's thermal behavior. The performance gap between the simulated and the real values is finally reduced to -4%, meaning that this model is suitable to be used as a reliable basis for proposing future retrofitting scenarios. The energy simulations are completely based on dynamic calculations, capable to represent the building as a complex system of several and interdependent interactions.

In a retrofitting perspective, a precisely calibrated and validated model reduces the risk of inappropriate interventions, permitting to preserve the most valuable features of modern realizations. In a panorama still characterized by the difficulty in the legal recognition of the qualities of modern architecture, the proposed workflow offers encouraging results, promoting reduced energy demand; higher indoor thermal comfort; architectural authenticity. In addition, the described tool can be also integrated as a further step into already existing retrofitting methodologies[18].

In the case of Chauderon complex, where invasive solutions for energy savings have been already proposed[19], the workflow application is crucial in supporting future conservative scenarios, aiming to the preservation of the original structure and the façade in their historical materiality, in other words, in its material authenticity. The pertinence of this choice is confirmed by the archival research, demonstrating the uniqueness of the building. At the same time, decisive improvements in reducing the energy needs can be reached[20].

A new way for reconciling the aspects of energy saving and architectural preservation is thus outlined, reconducting these two aprioristically opposed issues as two complementary parts of the same rehabilitation agenda. For high-quality or recognized post-World War II building stock, the use of a calibrated and validated model is finally justified and recommended over the static or simplified modelling approaches still commonly employed today. ■

BIOGRAPHY

Giuseppe Galbiati is an engineer and architect. He studied at the Politecnico di Milano, where he graduated in Architectural Engineering and later at the École polytechnique fédérale de Lausanne and the UCLouvain, where he earned - in cotutelle - his PhD. Galbiati is currently postdoctoral researcher and teaching assistant at the Accademia di Architettura di Mendrisio, USI and UCLouvain. His interests deal with the fields of construction history, architectural preservation, and energy efficiency of existing buildings, developing and testing interdisciplinary methodologies for the thermal retrofitting of the second post-war building stock.

Franz Graf, graduate in architecture at the École Polytechnique Fédérale de Lausanne; Full Professor of Technology at the Accademia di Architettura di Mendrisio in 2005; Associate Professor of Architectural Theory and Design at the École Polytechnique Fédérale de Lausanne in 2007, as head of the Laboratory of Techniques and Preservation of Modern Architecture. His research focuses on modern and contemporary systems of construction and techniques of preservation of 20th-century heritage. Since 2010 he has been President of Docomomo Switzerland and member of the ISC on Technology, and since 2012 member or the "Comité des experts pour la restauration de l'oeuvre" of the Le Corbusier Fondation.

Giulia Marino graduated in architecture from the University of Florence and PhD in science from the École Polytechnique Fédérale de Lausanne. She is professor at UCLouvain, LAB Institute Brussels, and EPFL Lausanne. Her scientific interests are centred on the strategies for the conservation of the modern and contemporary heritage, and on the history of construction techniques and twentieth-century building services. She is Vice President of Docomomo Switzerland since 2015 and ICOMOS Member.

THE SUSTAINABLE SHINE DOME: TOWARD A SUSTAINABILITY PLAN FOR THE NATIONAL HERITAGE LISTED AUSTRALIAN ACADEMY OF SCIENCE BUILDING

MICHAEL JASPER
UNIVERSITY OF CANBERRA

TRACY IRELAND
UNIVERSITY OF CANBERRA

ABSTRACT

This paper presents an account of a two-year investigation 2019-2021 into the challenges and opportunities for introducing cultural, economic, and environmental sustainability measures into the protection and promotion of the National Heritage listed Australian Academy of Science building, Canberra. The study sought to develop elements of a sustainability plan for renewal and replacement of building fabric and environmental systems to ensure progressive energy and emissions reductions as a pathway to a net-zero carbon future. Alongside stratagems quantifiable, the study also sought to mimic the ambitions of the Academy for the building to continue to express 'the national urge to innovate'. To that end the project pursued world leading strategies and innovative approaches from a range of individuals and disciplines including material scientists, futurists, building engineers, heritage consultants, architects, and scientists. The Shine Dome, as the building is currently known, was designed by Roy Grounds in 1954 and the building and interiors completed in 1959. Listed interiors include formed plywood seating reflecting the circular auditorium chamber. In 2019 the Shine Dome was 60 years old and while maintaining basic operating conditions, Academy resources were being challenged to implement strategic capital investment. Expansion of the existing Heritage Management Plan to include a sustainability plan was also deemed critical to guide management of the Shine Dome and to foreground a response to the climate crisis. The project team, consisting of University of Canberra, Australian Academy of Science, GHD, and GML Heritage was awarded an Australian National Heritage grant to undertake the study. This paper contributes to the conference theme of sustainable development and is aligned with the session Authenticity in the face of climate change, telling the story of a modern movement listed building seeking to respond to climate change. The paper also touches on the duality of conceptual and material authenticity.

1. INTRODUCTION

1.1 THE OPPORTUNITY

In the monograph celebrating the 50th-anniversary of the building conceived to house the Australian Academy of Science, Alan Roberts provides a useful setting to the project considered in this paper:

A group of leading Australian scientists commenced discussions in 1952 that led to the foundation by Royal charter of the Australian Academy of Science two years later. Five years on, they opened their headquarters in Canberra, now known as the Shine Dome. Both the formation of the Academy and the building of the Dome were remarkable acts of faith, made against the odds, that would prove themselves totally justified.[1]

This dual ambition at the origin of the Academy - promoting Australian scientific research and giving it expression in a purpose-built headquarters – found translation in the building's concept and realisation. Designed by Roy Grounds in 1954, the building was completed in 1959. **(Fig. 1)**. A national icon ever since, the building has received numerous awards, is on the Register of Significant Twentieth-Century Architecture compiled by the Royal Australian Institute of Architects and was added to the Australian National Heritage List (NHL) in 2005.[2]

Its significance as described in the NHL citation can be summarised as follows: - It is the headquarters of the Australian Academy of Science established to promote Australian scientific research within Australia and globally; - The dome, designed by one of Australia's most noted 20th-century architects, Roy Grounds, is the largest concrete dome in Australia and a rare 20th-century example of a dome; - It is an exceptional example of structuralism with a purity of form and geometry that is rare and is expressed in its layout, interiors and furnishings; - It is directly related to the life and work of scientists instrumental in the establishment of the Academy.

In 2019 the Shine Dome was 60 years old and while maintaining basic operating conditions, Academy resources were being challenged to implement strategic capital investment. In the same year the Academy was host of the Australian node of Future Earth,[3] a global sustainability initiative. It was thus also important to the Academy to foreground a response to the climate crisis using their headquarters as a showcase of scientific innovation.

To this end, a research team was formed to expand the existing Heritage Management Plan to include a sustainability plan. Led by University of Canberra, it included Australian Academy of Science, GHD as lead technical consultant, and GML Heritage as lead heritage consultant. The team was successful in its application for an Australian National Heritage 2019-20 grant to fund the study.

The Sustainable Shine Dome project, as the study was called at the time, aimed to provide pathways for the Academy to conserve, protect and sustainably manage the Shine Dome. Project outcomes were to contribute to meeting Australia's Environment Protection and Biodiversity Conservation Act national heritage management principles.[4] Project completion would contribute to meeting grant program objectives of

'improved recognition, conservation and preservation' of place values and 'enriched appreciation of the values'[5] through expanded community engagement and communication of project activities through a social media strategy and a dedicated section of the Academy website.

Alongside technical and material investigations, the research team sought to explore diverse interpretations of the concept of heritage conservation broadly. To that extent, consideration of the study process and findings can contribute to debates such as that promulgated in the DOCOMOMO International 1997 publication "The Modern Movement and the World Heritage List" (WHL) seeking to add nuance to WHL criteria and the test of authenticity.[6]

1.2 THE APPROACH

The study was delivered in overlapping phases. In Phase 1 Analysis, the team researched best current approaches for the conservation and management of heritage values, reviewed the condition of the fabric, examined intangible heritage including the 'scientific urge to innovate' and assessed the sensitivity or tolerance for change. In Phase 2 Options, the team worked to link heritage values to sustainable development principles and assessed heritage value impacts and potential mitigation strategies. Phase 3 Planning included descriptions of progressive staged systems upgrades and order of implementation cost estimates for identified elements.

Public communication and promotion activities ran across all phases from project initiation. Three public symposia were key events in the strategy.

2. PROCESS OF SUSTAINABILITY PLANNING

Though in reality all activities and phases were intertwined, for ease of telling the story of the study the following is divided into summary descriptions of technical and heritage investigations and promotion activities.

2.1 TECHNICAL

The overall goal of the study from a technical perspective was to review the environmental performance of the Shine Dome and consider how this heritage building could shift towards a more sustainable, net-zero carbon emissions future.

To achieve this aim in Phase I Analysis the team began by investigating existing environmental systems. This included site inspections, and review of electrical, HVAC, lighting, and building envelope elements. The team also developed target improvements to be modelled in subsequent phases.

In Phase 2 Options the project team established a base case model of existing energy performance by reviewing metering data and as built documentation. The team tested 8 different energy improvement initiatives against the base case model to understand the relative saving in kWh/year, $/year and kg/CO2e-. Wider precinct scale sustainable design initiatives such as electricity generation were also considered.

The technical objective for Phase 3 Planning included a staggered implementation plan for identified works. A multi criteria analysis was used to prioritize design and system initiatives established in earlier phases.

5. "Australian Heritage Grant," Australian Government, Department of Climate Change, Energy, the Environment and Water, accessed 15 March 2024, https://www.dcceew.gov.au/parks-heritage/heritage/grants-and-funding/australian-heritage-grants

Advisory Report to ICOMOS composted by DOCOMOMO's International Specialist Committee on Registers" (Zeist: ISC/Registers, 1997), see in particular discussions on pages 8-10 and in Appendix III. The authors thank session organisers for reference to this document.

2.2 HERITAGE

The investigation into heritage matters was led by GML Heritage. Detailed studies and findings were documented in a series of internal reports.[7] From a heritage conservation perspective, the study can be characterised as fulfilling dual purposes: to achieve ongoing conservation of the Shine Dome's National Heritage values; to ensure progressive energy efficiencies as a pathway to a net-zero energy future for the place.

As a third, collateral purpose, the team early postulated that the research undertaken could contribute to the production of a reference document for innovations in environmental and cultural heritage sustainability in both listing policies and conservation practices.

As a complement to the technical review, the project team determined that the building had several elements that could be addressed to improve thermal performance as well as protect and promote cultural values including the intangible heritage of the Dome as a site of innovation. To give a sense of the aspects considered, elements identified included: - single glazing in aluminium frames may be upgraded but not replaced; - gaps between the curtain wall and the dome may be infilled but must remain flexible to maintain structural separation between the two; - the vermiculite lining of the auditorium should not be removed or replaced, and should remain exposed as the ceiling of the auditorium; - heritage lights in theatre and other significant rooms must be retained though may be upgraded for LEDs and ease of access. **(Fig 2)**.

2.3 PUBLIC ENGAGEMENT

As part of the public engagement strategy, three public symposia were held bringing together a wide range of disciplines and specialists to broaden the thinking and its dissemination.

The first was held on 4 December 2020. "Envisioning Sustainable Futures for Heritage" served to begin conversations on sustainable heritage futures and project parameters and ambitions. Speakers included Tai Hollingsbee on steps toward zero, Hans Bachor, on the Dome as an iconic home for science. Case studies were presented by Catherine Forbes, Rachel Jackson, and Emma Gwynn and Susan Macdonald led a round table on session ideas.[8]

On 26 March 2021 the symposium "Planning Sustainable Futures for Heritage" was held, with speakers asked to consider approaches to theorising, measuring and approaching environmental, social, and cultural sustainability and conjecture on how we might plan for and promote sustainable heritage values. Deo Prasad spoke on developing credible science-based benchmarks for a net-zero carbon future, Philip Oldfield discussed a research project to measure operational and embodied carbon 1990-2050, and Caroline Pidcock advocated for a feminine approach to systems analysis as a contribution to a regenerative future.[9]

"Possible Futures", the final symposium held on 14 July 2021, focused on challenges in the Australian response to climate change, lessons for a carbon active future, and specific findings for the Shine Dome. Speakers included Peter Doherty who spoke to urgencies in Australia's response to

climate change. Ross Harding considered the potential for future carbon active buildings and cities. Catherine Forbes and May Ngui reported on discoveries, recommendations, and next steps arising from the study.[10]

3. FINDINGS, RECOMMENDATIONS, PATHWAYS

3.1 FINDINGS, RECOMMENDATIONS

While the initial outcome for this study was to develop a pathway for a net-zero carbon future for the Shine Dome, through collaboration with external stakeholders and a multi-disciplinary approach in the project team, it became clear that actual project outcomes were broader. This meant that while improving energy performance was important, there were other factors that emerged to have equal or more weighting than the energy efficiency of the building in isolation.

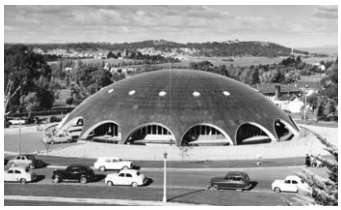
Whole of team workshops were held to debate and agree criteria for use in prioritising recommendations. In ranking and weighing approaches, heritage conservation benefits were a clear main preference of the project team. Six key criteria were agreed for the multi criteria analysis and then their relative value weighted. The agreed criteria and weighting at the time: heritage value (42%), user experience (12%), capital costs (12%), operational costs (12%), and embodied carbon (10%).[11] Consequently, any design initiative which could have an adverse impact on the heritage value of the Shine Dome would not be rated highly by the team.

Twenty initiatives were analysed and then grouped into categories rather than an ordered list to provide more flexibility in implementation. Discussed in detail in internal reports these were coded as follows: Red to be implemented in the long term, Yellow to be implemented in the medium term, Green to be implemented in the short term. An excerpt of the final report illustrating this coding and elements considered is provided at **(Fig. 3)**.

Following a review of the heritage constraints and opportunities, and the clustered ranking resulting from the multi-criteria analysis, recommendations were made in relation to heritage values to guide implementation of a sustainability plan. The recommendations included public promotion of the research undertaken as well as future investigation of potential applications of the approach to other national heritage listed sites. Detailed recommendations were made in related to the curtain wall, the moat, internal walls, roof space, floors, stairs, skylights, and light fittings and room specific recommendations. An especially innovative section of the final internal report included proposals to improve sustainability broadly defined as well as recommendations to improve the user and visitor experience, and to promote the sustainability goals of the Academy.[12]

3.2 WHAT NEXT: PATHWAYS FORWARD

Completion of the study in mid 2021 set the Shine Dome on a trajectory to a more sustainable future. As recognised at the time, much more was still to be done and, in this regard, the research project can be seen to open several pathways. For the purposes of this paper, the following can serve as initial formulations of three such pathways.



10. The Sustainable Shine Dome: Possible Futures Symposium, unpublished program, 14 July 2021.

11. As internal project team reports note embodied carbon was weighted slightly less than other criteria as the ability to assess each initiative against embodied carbon was deemed to be too subjective.

Figure 2. Roy Grounds, Australian Academy of Science building, known as the Shine Dome, Canberra, Australia, view of the auditorium chamber from the upper gallery, circa mid 1970's © Australian Academy of Science collection, Irene Dowdy photographer.

Figure 3. Roy Grounds, Australian Academy of Science building, known as the Shine Dome, Canberra, Australia, excerpt from the multi criteria analysis developed during the Sustainable Shine Dome research project © GHD.

For the Shine Dome itself, the initial study proposal ambitiously suggested that the study process itself and resulting recommendations should seek to mimic the founding motivations and seek to express a national urge to innovate. To that end, the study was to be highly compatible with the objectives of the Australian Academy of Science, that of promoting scientific research to the Australian community. By what means and in what form this would transpire is still to be pursued in subsequent studies.

For national policy and procedures, the study only just began to explore by what means and in what forms a sustainability plan might inflect the conservation policies and priorities of the existing Heritage Management Plan. Nor did it examine what this might mean for other listed places. The team hopes to progress both aspects in future work.

For the field as intimated above, the study might provide another lens to further reflect on the DOCOMOMO International 1997 position paper and perhaps inflect listing and conservation practices to embrace more diverse and critical applications of the WHL test of authenticity. This might include considering how authenticity is constituted through the experience of values, relationships, and intangible heritage rather than solely through materiality as tends to be embedded in modern conservation practice.[13] In an era of the biodiversity/climate crisis this is more important than ever and perhaps for modern movement places in particular. By what means and in what forms might the Shine Dome and other modern movement places positively contribute to more nuanced characterizations of authenticity? This might include a notion of authenticity focused less on the patina of age and more on the promise of a positive future for humanity through science and innovation.[14] ■

Tracy Ireland is Professor of Cultural Heritage, Associate Dean Research of the Faculty of Arts and Design at the University of Canberra, and President of Australia ICOMOS. Tracy is known internationally for her research which has influenced public policy and heritage practice in Australia and abroad in the areas such as ethics, social value, Indigenous historic heritage and archaeological sites conservation. She has prepared innovative conservation plans for World and nationally recognised places.

CURATORIAL NARRATIVES: RETHINKING THE ROLE OF THE EXHIBITION

MARIA CRISTINA CABRAL
FEDERAL UNIVERSITY DO RIO DE JANEIRO

ANA ESTEBAN-MALUENDA
UNIVERSIDAD POLITÉCNICA DE MADRID

ABSTRACT

This article deals with the exhibition of architecture as a category for architectural culture dissemination, understood as a possibility of defining limits and contours of architecture as a disciplinary and reflexive practice. For this purpose, we initially seek to reinforce the construction of the history of the exhibitions, starting from studies of the great Eurocentric and North American international narratives to the inclusion of other non-canonical and unknown contexts and manifestations. To this end, we seek to reflect in a contemporary way on the complex nature of architecture and urbanism exhibitions from the historiographic and epistemological perspective of narrative constructions.

Institutions such as Moma-NY, Centre Georges Pompidou, International Confederation of Architectural Museums, Canadian Center for Architecture, and Cité de l'Architecture et du Patrimoine, in addition to the Architecture Biennials through their exhibitions, actions, and publications, played a central role in disseminating of the agendas of the disciplinary and theoretical field, validating agents and professionals through their collections. The objective is to point out the diachrony and specificities of historiographic construction (understood as the history of history) in non-hegemonic contexts, especially in Latin America and its institutions.

1. INTRODUCTION[1]

Since the late 20th century, the history of art and architecture exhibitions has been a newly developed field of research that has redefined the role and nature of exhibitions and raised problems. Of course, architecture exhibitions play an important role in the history of the discipline, as well as in the formation and dissemination of architectural culture. Architectural exhibitions are a means of thinking, part of the construction and dissemination of new historical narratives and theories, as well as the most famous exhibitions in the twentieth century, such as MoMA-NY, Georges Pompidou Center, the Canadian Center for Architecture and the World Architecture Biennial.

The collection of a society's primary sources of architecture, i.e. buildings, is out in the open. An architectural "object" is the city itself, with its social, historical and cultural practices, whose historicities overlay complex layers of meaning and understanding. Since its beginnings in the 18th century, the architectural exhibition has questioned the place of the presentation and representation of architecture, through its means of representation (drawings and models, and later photographs, videos, installations from panoramas), and more recently digital immersion in various forms of digitality, including augmented reality. Since the second half of the 20th century, the problematisation inherent in architectural exhibitions has transcended the issue of the representation of the architectural work and the realisation of the building, to the extent that the very understanding of the discipline has been transformed, incorporating social, technological, and artistic issues that were previously restricted to other fields of reflection and action.

However, by their very nature as an experiential vehicle, exhibitions can attract a wider and more eclectic audience, especially when they come from large cultural institutions. Consequently, they form and inform public opinion, unlike other media such as books and periodicals, which tend to be restricted to specialised audiences.

This paper deals with architectural exhibitions as a category for disseminating architectural culture, which has been increasingly studied, just as publications have been in the last decades of the last century. The exhibition is understood to define the limits and contours of architecture as a disciplinary and reflective practice. To this end, we initially seek to reinforce the construction of the history of exhibitions, suggesting the inclusion of noncanonical and unknown manifestations of the great international narratives, still unknown outside their contexts. To this end, the aim is to reflect on the complex nature of architecture and urbanism exhibitions in a contemporary way from the historiographical and epistemological perspective of narrative constructions.

2. HISTORY OF ARCHITECTURE EXHIBITIONS

Architecture exhibitions date back to the 18th century in Europe, promoted by architecture institutions, and intensified in the 19th century, the golden age of museums.[2] In 1932, the Museum of Modern Art in New York

established a department dedicated to architecture and design, followed by many other museums of modern art around the world. However, few institutions dedicated to architecture were created between the 1930s and 1970s. From the late 1970s onwards, a series of architecture museums, archives, and libraries emerged, not only in the European context but also in Latin America, which exhibited architecture and urbanism more frequently.[3]

The discussion about collections, museums, and exhibitions of architecture and urbanism went into great depth from the 1980s onwards, in response to the common problems of these institutions that came to light at the end of the 1970s. The International Confederation of Architectural Museums (ICAM) was created in 1979 as an international exchange forum for museum, centre, library, and archive professionals.[4]

Despite the increase in architectural and urban planning institutions, the historicisation of exhibitions is recent and has emerged as a field of post-modern studies. Stéphanie Dadour and Léa-Catherine Szacka pointed to three milestones in the conception of architectural exhibitions: 1979, 1999 and 2007, which, as the title of the article reveals, comprise the transformations of challenges, institutionalisation, and historicisation.[5] For the authors, 1979 marked the creation of the Venice Architecture Biennale and the Canadian Centre for Architecture in Montreal, as well as the Centre de Creation Industrielle (CCI), which included architecture as part of the Centre Georges Pompidou (1977). In the 1980s, important institutions such as the Museum of Architecture in Frankfurt (1984), the Arsenal Pavilion in Paris, and the Netherlands Institute of Architecture in Rotterdam (1988) were created, among a few others of equal or even smaller size. Architecture exhibitions are becoming increasingly numerous as a part of the culture and entertainment industry. The institutions also aimed to raise awareness of architectural issues, promoting guided tours of buildings and urban routes.

Dadour and Szacka identified a more reflective phase from 1999 onwards, in which the exhibition is not limited to a motor tool for building a collection "but is presented as a subject for thinking and as a source of understanding of the discipline and the writing of architectural history".[6] Based on Jean-Louis Cohen, they list the variety of objectives of exhibitions, such as giving visibility to a little-known work, presenting a theme to a wide audience or a new generation, defending a certain position, denouncing, or showing a set from the archives, but always revealing something still unexplored from a new perspective. Many architecture sections have been created at Biennials in the 21st century (among them, Oslo, Rotterdam, Shezhen & Hong Kong, Lisbon, or Moscow), raising awareness among the general public. At the ICC, little by little, towards the end of the century, the object of the exhibition shifted from the building to the conception and the design process. However, at the CCA, the exhibitions moved away from the built object toward the possible debates surrounding the discipline as a contribution to social, political, and environmental issues, etc. In this broader perspective, which is expanding even further in the face of the incorporation of the digital world, what is at stake are collection challenges, such as

selecting, classifying, and legitimising objects and authors, integrating them into history, within a general context of increasing collections and exhibitions. The central issue is what possible relationships exist between archives, exhibitions, and history. The didactic value of the exhibition is also called into question, as the general public has different interests from architects and students, who focus on the architectural challenges presented through a narrative that deals with the design and conceptualisation process.

From 2007 onwards, when the Cité de l'Architecture et du Patrimoine opened in Paris, the authors report that a third phase of theorisation and historicisation of architectural exhibitions began, which they call "constitutive and comparative"[7]. Colloquia on architectural exhibitions and some publications appear in special issues of journals. Interest in exhibitions shifts to expography, institutions, and the history of exhibitions, and training programmes are created at the CCA at Columbia University. Unlike the previous milestones, which identified the interest in the building (1979), and in the design process (1999), from 2007 onwards, the interest is in the exhibition itself, "as the writing of the history of the discipline", as it emphasises the change in paradigms, and is itself a vector for new discourses.

3. NON-CANONICAL NARRATIVES

Ten years have passed since the publication of Dadour and Szacka's article (2014), in which we can globally see the milestone established in 2007, which reorientates interest in the exhibition of architecture as a historiographical construction, capable of incorporating new epistemologies and revisions of history. Despite the consistent research condensed in the enlightening article, the universe described and organised by the authors is practically restricted to the Eurocentric world and North America. In this sense, we would like to take up the reflections of Marina Waisman, who emphasises the importance of creating new categories for thinking about Latin American architecture.

For Waisman, the universal validity demanded by the historical units defined for the European world cannot be demanded for the American world, since there is no synchronic correspondence. There was no American scholastic Middle Ages or a Mayan Empire since there was no emperor. The stylistic criteria that characterise each period of European architecture are consistent with a continuous type of development. In Latin America, there was no coherent stylistic development based on the continuity of architectural ideas. Architecture was based on cross-cultural ideas, which were modified and interpreted locally and historically, with anachronisms abounding until the nineteenth century. At the beginning of the twentieth century, the theoretical debate took hold with local nationalist positions, establishing guidelines even though they differed in different cultures, even within the same country.[8]

Of course, the concept of historical time has not been understood as linear or continuous for a long time, but in the very creation of the idea of Latin America, discontinuities prevail. As far as architectural exhibitions

7. Dadour, Szacka, "Exposer l'architecture: enjeux, institutionnalisation et historicization", 9.

8. Marina Waisman. *O interior da história: historiografia arquitetônica para uso de latino-americanos*. (São Paulo: Perspectiva, 2013).

are concerned, there is no institution in the Latin American context with the scope and permanence of those mentioned by Dadour and Szacka.

Even in the context of universalisation and later globalisation in the twentieth century, Latin American institutions are similar in that they follow the international debate guided by Eurocentric and North American centres of reference and differ due to their local and historical circumstances. It is rare to find a large cultural institution working in the field of architecture that combines the functions of collection, exhibition, and library, as we find at the ICC, CCA, MoMA-NY, Cité de l'Architecture et du Patrimoine. As a result, exhibition records are scattered, and few events have had catalogues.

However, we do see a leading role for educational institutions, such as universities such as the University of São Paulo, the Autonomous University of Mexico, the University of Buenos Aires, etc. In addition to private institutions such as CEDODAL in Argentina, the Oscar Niemeyer Foundation, the Lina Bo and Pietro Maria Bardi Institute, and the former Casa de Lucio Costa are among the most significant Brazilian cases.

Also in Brazil, the Research and Documentation Centre (NPD) was created in 1982 at the Faculty of Architecture and Urbanism of the Federal University of Rio de Janeiro (FAU/UFRJ) to conserve, exhibit and publish the output of the disciplines, teachers, and professionals trained by the institution.9 This creation was a pioneering effort in Brazil in terms of collecting, systematising and analysing architectural documents, and today it is one of the largest national collections in the field within a university, with around 500,000 documents with the latest acquisitions.[10]

In the Iberian Peninsula, some institutions for the dissemination of architecture have also emerged in recent years. Without being specifically orientated towards the deposit of personal archives, the Casa de la Arquitectura opened its doors in Madrid just a few months ago with a purely publicising spirit towards the general public and very much orientated towards contemporary production. Created already in full twentieth first century, Casa de la Arquitectura offers a dual exhibition system, with an offline space in the Arquerías de los Nuevos Ministerios in Madrid, which houses the permanent collection, travelling exhibitions and research or meeting activities, and an online space, currently under development, which will house a virtual archive and library dedicated to the masterpieces of 20th and 21st-century Spanish architecture, a georeferenced map with buildings, itineraries, collaborative tools, and a virtual platform for collaboration and content exhibition.

Casa da Arquitectura (Portuguese Architecture Centre) was created in 2007 to collaborate in the dissemination and affirmation of architecture at national and international levels. Among its fundamental activities is the archiving, recovery, and exhibition of private collections of architects deposited or handed over to the institution for its care. Contrary to most international museums that have been returning objects and works to the countries of origin from which they were removed, Casa de Arquitetura has been systematically incorporating collections from important architects, especially from Brazil. This anachronistic colonialism has been interfering

Maria Cristina Cabral has been an Associate Professor at the Faculty of Architecture and Urbanism at the Federal University of Rio de Janeiro since 2008 and at the Graduate Program in Urbanism, where she has been supporting several doctoral studies and was Vice Chair (2016-2018). President of the Council of the Documentary Archive Center in Architecture. Researcher and fellow at the National Council for Scientific and Technological Development (CNPq) and at Carlos Chagas Filho Foundation for Research Support in the State of Rio de Janeiro (FAPERJ). Co-author of the book Foreign Presence: Architecture in Rio de Janeiro (1905-1949), awarded by the Institute of Architects of Brazil.

Ana Esteban Maluenda is Tenured Associate Professor at the School of Architecture of the Universidad Politécnica de Madrid from 2008, where she currently serves as director of the Department of Architectural Composition. For more than two decades, she has been publishing research on the dissemination and contacts established by modern architecture in the Ibero-American sphere. General Editor for the Global South at Architectural Histories (2018-2021) and Chair of the 7th EAHN conference, held in Madrid in 2022. She has been involved in different research projects funded by governmental, institutional and private sources.

PRESENTING ARCHITECTURE, THE ARCHIVE AND MICROHISTORIES: THE OPENING EXHIBITION OF THE NEW HOME OF HUNGARIAN ARCHITECTURE

ÁGNES ANNA SEBESTYÉN
HUNGARIAN MUSEUM OF ARCHITECTURE AND MONUMENT PROTECTION
DOCUMENTATION CENTER

ABSTRACT

A new exhibition and event space opened for architecture in May 2022 in Budapest, Hungary: the Rózsi Walter Villa. The modern villa, which was built in 1936 and designed by the architect and structural engineer couple József Fischer and Eszter Pécsi, became the first permanent exhibition venue for the Hungarian Museum of Architecture and Monument Protection Documentation Center. Although the museum was founded in 1968, it has never had a permanent building.

The opening of the Rózsi Walter Villa was a result of a two-year period of reconstruction between 2020 and 2022, which proceeded parallel with the planning of the opening exhibition entitled "Stages and Spaces: Modern Houses in Hungary 1928–1945", curated by Pál Ritoók, Fanni Izabella Magyaróvári and Ágnes Anna Sebestyén, curators of the museum. The rehabilitation of the villa had to take into account the fact that the house is a modernist landmark, an exhibition venue, and a place with a turbulent history – all at the same time.

The major topic of the exhibition was modern housing in interwar Hungary, but the curators had to consider different historical layers and multiple goals while creating the exhibition. This paper focuses on how the show navigated between the demands of introducing the villa, presenting the museum's archives, and involving the family histories of the villa's designers and first owners, the opera singer Rózsi Walter and her family. I highlight how the villa functioned as a 3D-exhibition object and a starting point for the curatorial concept. I underline how the broader topic of modernist housing contextualized the villa and how it was elaborated using the rich archival materials of our museum. I also emphasize the contribution of the families of the designers and the original owners to the exhibition.

1. INTRODUCTION

In May 2022, a new exhibition and event space opened in Budapest for architecture: the Rózsi Walter Villa (**Fig. 1**).[1] The modern villa, which was built in 1936, became the first permanent exhibition venue for the Hungarian Museum of Architecture and Monument Protection Documentation Center (HMA MPDC). The museum was established in 1968 but has operated only as an archive and research centre. Failing to have a permanent exhibition space, the shows curated by the museum's staff members were always presented in different host institutions across Budapest and occasionally in other cities of Hungary and Europe. This constant pursue for an exhibition space reached its conclusion in 2018, when the Hungarian government bestowed the building complex of the former Hospital of the Ministry of the Interior to the Hungarian Academy of Arts, the founder of the HMA MPDC, in order to create the new home of the museum there.[2] The first step of the property development was the rehabilitation of the relatively small Rózsi Walter Villa between 2020 and 2022. The villa opened with a temporary exhibition on modern housing entitled "Stages and Spaces: Modern Houses in Hungary 1928–1945". The show ran for two years (between 18 May 2022 and 17 March 2024) and was curated by Pál Ritoók, Fanni Izabella Magyaróvári and Ágnes Anna Sebestyén, curators of the museum.

This paper considers the challenges of creating the exhibition and focuses on the different historical layers we wanted to uncover. The villa was the prior exhibition object and the starting point for the curatorial concept. The museum's archives provided the basis for elaborating the topic of modernist housing in interwar Hungary. The personal histories of the designers and the former owners of the villa created an added value concerning the issues of political changes in Hungary, migration, and identity.

2. THE VILLA – A SHORT HISTORY

The Rózsi Walter Villa was built in 1936 in a period of half a year. It was designed by József Fischer (1901–1995), who was one of the leading modernist architects in interwar Hungary. He was an activist, an architectural writer, and the deputy head of the Hungarian group of CIAM. Fischer was well-connected in international professional circles, for example, he maintained a friendly correspondence for decades with Marcel Breuer. Breuer was living in London when Fischer mentioned the construction of the Walter Villa to him in a letter dated to 26 April 1936.[3] The structural engineer of the villa was Eszter Pécsi (1898–1975), Fischer's wife, who was a prolific engineer during the interwar period and she was also the first woman who obtained an engineering diploma in Budapest.

The villa was designed for a family of three: the celebrated opera singer Rózsi Walter (1899–1974), her husband, Géza Radó (1899–1965), who was a banker and textile merchant, and their daughter, Marika Radó-Walter (1929–). The Radó-Walter family lived in the villa for thirteen years. They survived World War II and the siege of Budapest in this house, thanks to an air raid shelter built below ground. After the Communists seized power in Hungary

2. Kornél Almássy and Dániel Kovács, "Otthont emel az építészet múzeuma: Az Építészeti Múzeum múltja, jelene és jövője (The architecture museum builds a home: The past, present, and future of the Museum of Architecture)," *Magyar Művészet* 10, no. 5 (2022): 26–35.

3. See the letter in the Marcel Breuer Digital Archive of the Syracuse University Libraries (ID: breuer_m_2616). The archives incorrectly dated the letter to 16 April 1926, its content clearly dates it to the year 1936.

in 1949, the villa was nationalized, and the family had to move out. Marika had been studying abroad, in Switzerland, by that time and didn't return after Hungary had fallen behind the Iron Curtain but emigrated to Argentina. Rózsi Walter and Géza Radó lived in Budapest throughout their lives. After 1949, the villa was heavily altered as it was converted into a nursery and later into a children's clinic adjacent to the Hospital of the Ministry of the Interior. The hospital operated in the building complex around the villa until 2009, and then all its former buildings stood vacant for a decade.

The rehabilitation of the Rózsi Walter Villa was carried out between 2020 and 2022, and it was supported by a team of experts, who performed physical building research, did archival research, and consulted on museum technology. The goal of the rehabilitation was to reconstruct the 1936-state of the villa and to create a contemporary museum and event space. The vintage photographs by the architectural photographer Zoltán Seidner served as the major sources for the reconstruction.[4] Due to the demands of the new museum function, a few compromises had to be made. The original ground floor plan wasn't restored to welcome visitors in a well-functioning space, an elevator was installed to make the building partly accessible by wheelchair, and new insulated windows were built in. Upon its completion, the villa was named after Rózsi Walter in honour of its first owner, acknowledging the fact that the house was referred to as "the villa of an opera singer" in its early days.[5]

3. THE EXHIBITION – CHALLENGES OF UNCOVERING MULTIPLE HISTORICAL LAYERS

The opening exhibition with its focus on modern housing in interwar Hungary seemed to be an evident choice of subject matter considering the venue. The curatorial team articulated three major goals. Firstly, we wanted to introduce the villa as a rehabilitated modernist landmark and to put the spotlight on its architectural features. Secondly, we wished to accentuate that the villa is the first permanent exhibition space of the architecture museum, and the intention is to showcase the museum's collections including especially the rich archival materials – drawings, photographs, pieces of furniture, and documents – that represent the interwar period. Thirdly, we aimed at highlighting that the life stories of the people connected to the villa's turbulent past mirror the fate of many in twentieth-century Hungarian history.

These manifold goals and the complex historical layers of the villa challenged our curatorial team. The architectural features of the villa were inspiring and restricting at the same time. Ca. 200 square meters exhibition space is available with limited wall surface, because the villa opens to the outside with huge windows and discloses in the inside with folding doors according to the principles of modernism. The limited wall surface and the abundance of light characterize a modern living space but contradict to an ideal exhibition space. Even so, we wanted to highlight the characteristic architectural features and to use them to our advantage.

Due to the clients' upper-middle class lifestyle, the spatial arrangement of the villa is a mix of the spatial organization of an old-fashioned villa and

4. The photographs were taken right after the Walters moved in the villa in 1936. The original glass negatives and vintage positives are held in the Photographic Archives of the HMA MPDC, inv. no. 92.961–92.966.

5. See its first appearance in the Hungarian architectural press: "Operaénekesnő villája Budapesten a Bajza-utcában (Opera singer's villa in Bajza Street in Budapest)," *Tér és Forma* 10, no. 1 (1937): 8–11; or e.g. from the international arena: "Town house for an opera singer", F. R. S. Yorke, *The Modern House* (London: The Architectural Press, 1937), 184–86.

a modern living space. On the one hand, the owners lived their life as public figures who entertained guests and required a staff to manage the house. On the other hand, they cherished modern ideas about private spaces. The arrangement of the rooms mirrors these requirements: the majority of the ground floor was the staff's quarter, there were two inner staircases – an elegant one for the family and their guests and a hidden spiral staircase for the staff –, the first floor was a huge open space for living and entertaining (a reminiscent of the *piano nobile* of traditional villas), the second floor comprised of the private spaces with three separate rooms for each family members and two bathrooms, one for the parents and the other for their daughter. The original use of the villa was the inspiration of our exhibition title "Stages and Spaces", which refers to the two-fold use of the house as a stage for public life and a space for privacy.

The exhibition featured the villa and the archival materials in a coordinated way. The spatial arrangement of the house served as the starting point for the curatorial concept: we linked the original functions of each room to selected catchphrases of modernism. The catchphrase for the spacious area of the first floor was 'openness'. Openness referred to the open-plan space, the high exposure to light by the huge windows and its original function as a space for social life. On the second floor, the child's room stood for 'play', Géza Radó's study was linked to 'work', Rózsi Walter's bedroom evoked 'comfort', and the main bathroom represented 'hygiene and health'. The exhibited archival materials and objects gave an architectural historical context to the villa highlighting what openness, play, work, comfort, hygiene, and health meant in architecture and design in the interwar era.

Organizing the first floor of the exhibition around the keyword 'openness', we consciously let the striking architectural features of the villa shine **(Fig. 2)**. We used the limited amount of wall surfaces and digital applications to keep the huge windows uncovered. Because of the abundance of light, sun protection film was applied to the windows and only copies were exhibited instead of original drawings and vintage photographs. We also kept the space clean to host events in accordance with the social relevance of openness. The chosen archival materials represented openness in modern architecture. Flexible spaces, moveable walls, huge glass surfaces were featured in the exhibited works designed mostly by members of the Hungarian CIAM group: József Fischer, Farkas Molnár, József Körner, and Máté Major. Via the exhibited drawings and photographs we underlined that this young generation of architects set the standards of modern living in interwar Hungary, representing an openness to new ideas.

In the former child's room on the second floor, the keyword 'play' evoked the topic of designing for children. As it was an important imperative for modern designers to tailor furniture to the children's size, we wanted to communicate this idea via both the exhibition design and the featured objects. Thus, a part of the exhibition materials was placed lower, to the eye level of children and the central piece of furniture – a modern nursery

Figure 1. József Fischer, Rózsi Walter Villa, Budapest, Hungary, 1936 © photo by Gábor F. Tóth, HMA MPDC, 2023

school cabinet from the 1930s – demonstrated the perfect measurements and arrangement of the appropriate children's furniture.

The former bedroom on the second floor was originally the most lavishly decorated room in the villa. The Walters had quite a traditional taste in interior design, so they furnished the house with their old Neo-Baroque furniture. To translate this into the language of the exhibition, we used the catchphrase 'comfort' to illustrate how design features, new technologies, and the entertainment industry turned bare modern interiors into homey spaces in the interwar era. We featured household fabrics, ergonomic furniture, and modern appliances. Using a wallpaper on one of the walls, the exhibition design also reflected on the topic of hominess.

While choosing the archival materials we were also guided by our intention to tell the stories of the people whose life were closely or loosely connected to the villa. It was a conscious choice to involve these people's descendants into the making of the exhibition and to represent their family histories via those objects that were either on loan from them or donated by them to the museum's collection. These microhistories represent the third layer of the exhibition that reflect political changes in Hungary, migration, and identity. Several such stories are known via memoirs and oral histories, which made the selection difficult, so we decided to stick to those materials that represented a network of persons and objects, in which the ties led directly or indirectly to the Rózsi Walter Villa.

An example is another modernist villa designed by József Fischer, the Járitz Villa (1940–1943), which was represented by a photograph and a rendering on the first floor of the exhibition. The house had a similar fate as the Walter Villa: it was built as a luxury villa for a wealthy family but was nationalized under the Communist era and converted into a healthcare institution, which led to its current derelict state. In this way, it also evoked the fates of those people who suffered due to the practices of nationalization in Communist Hungary. At the same time, in the framework of the major topic of the exhibition, Járitz Villa corresponded to the topic of openness with its characteristic architectural features: large terraces, huge windows, and its connectedness to the garden.

Also on the first floor, visitors were introduced to the Walters' weekend house in Lupa Island along the Danube. Archival photographs represented the designer and first owner of the house, the architect Lajos Kozma, who, being Jewish, considered emigrating from Hungary to Australia in the late 1930s, when Anti-Semitism reached its peak. Kozma sold the weekend house to the Walters', so we exhibited additional photographs of the weekend house representing the times when the Walters used it (from 1939). Kozma's fate was also shared by Géza Radó's – also a Jew, as both had to hide during World War II to escape persecution during the Holocaust.

Migration is a topic that joins the life of the designers and the owners of the Walter Villa. Although Rózsi Walter and her husband stayed in Budapest for the rest of their lives, their daughter emigrated to Argentina, where she started a family and became a successful businesswoman. Her three sons

living in Buenos Aires and Santiago de Chile cherish the history of their ancestors and made the family photo albums, the correspondence, and Marika Radó-Walter's memoir available to us while curating the exhibition. They even visited us upon the opening of the villa as a kind of pilgrimage in honour of their grandparents. Exile also became a necessary step in the lives of the designers of the house. After the political changes in Hungary in the postwar era and József Fischer's participation in the Hungarian Revolution of 1956 against the Soviets, Eszter Pécsi and then Fischer also emigrated. They lived in New York, where Pécsi started her career as a structural engineer all over again, with the support of such friends as Marcel Breuer. The former study in the Walter Villa labelled with the catchphrase 'work' was dedicated to the work of Fischer and Pécsi performed during the interwar period in Hungary **(Fig. 3)**. The exhibited objects included drawings and photographs from the 1930s and a tubular steel furniture set used by Fischer and briefly Breuer. The two cantilevered tubular steel chairs (models B33 and B34) exhibited here were designed by Breuer, who ran an architecture office together with Fischer and Farkas Molnár for a few months in 1934–1935 in Budapest, before his emigration to London and then to the USA. This tubular steel furniture set in the exhibition represented Fischer's ties to the international professional arena and Hungarian émigrés. The exposition of these furniture created an opportunity to involve the current user: Fischer's granddaughter, a structural engineer herself, in the making of the exhibition. She also donated Fischer's architectural drawings that were shown in this room of the villa.

The limitations of the space prevented us from elaborating each of these stories in greater detail in the exhibition texts. The texts usually helped visitors to orient themselves in the villa and to see its architectural features in the greater context of the modern architecture of interwar Hungary. However, guided tours, talks, and roundtable discussions addressed this third layer of the microhistories that directly or indirectly penetrated the exhibition.

4. CONCLUSION

#27

Many visitors believed that the exhibition would be a permanent show in the villa as it succeeded in centring the archival materials around the architectural features. Over the two years of its opening, we managed to spread the word that the house is a modernist landmark in Budapest. It is, however, still a challenge to associate the villa with the Museum of Architecture. This will be facilitated by the development of a new museum complex adjacent to the villa under the name Hungarian Architectural Center and Museum. ■

BIOGRAPHY

Ágnes Anna Sebestyén (b. 1987) is a Budapest-based art historian and curator at the Hungarian Museum of Architecture and Monument Protection Documentation Center. She studied art history at Eötvös Loránd University, Budapest, and Leiden University. She is currently a PhD candidate in Design Culture Studies at the Moholy-Nagy University of Art and Design in Budapest. She has curatorial experience in twentieth-century architectural history and research expertise in the history of modern architecture and architectural photography with a special focus on interwar Hungary. She has published several essays in Hungarian and English, and lectured at international conferences on related topics.

A NEW PERIOD EYE: LEARNING TO SEE VENEZUELA'S MODERNITY WITH DOCOMOMO VENEZUELA EXHIBITIONS

FRANK ALCOCK
DOCOMOMO VENEZUELA

ABSTRACT:
Since 2006, when Docomomo Venezuela (2010) began to fight for the preservation of Modern Heritage, there was little editorial production on Architecture and Urbanism in Venezuela. Due to the political situation and the museum crisis, exhibitions on these topics practically stopped, reducing the contemporary review and spread of Venezuela's Modern Heritage to a minimum.

Docomomo Venezuela chapter members found in Photography the perfect resource to record with new eyes the eclectic, transatlantic and multicultural Urban Memory of the capital, embracing it as the best reflection of modernity in the country. With the group's didactic program, Architecture students and professors also participated in successful academic internships.

In the seven exhibitions done between 2007 and 2022, the emphasis was to bring the public closer to the history of the Modern city with a museography that facilitates a simple and direct reading, and -more importantly-, to incorporate the International History of Modern Architecture, Urban Planning and Art, so present in Venezuelan modernity but usually poorly mentioned in the local historical architectural discourse.

Docomomo Venezuela's '*Colectivo fotografico*' embarked in every new exhibition project traveling through the urban fabric with a perceptive eye, an active memory and a very personal perspective, collecting old and new sites, and producing multiple varieties of views, remapping Modern Caracas.

As a result, these exhibitions have broken all attendance records, published five well-documented catalogs, promoted social media interaction, multiple lectures, won the AICA awards for best catalog and exhibition (in 2013 and 2022), produced an unvaluable research and photographic archive and, most importantly, have made everybody more aware and value the important Modern Heritage in the country.

As backward prophecies long buried in the country's Modern Heritage, all exhibitions are just in fact building one major exhibition, that retells Caracas Modern History with a New Period Eye.

1. INTRODUCTION[1]

"To drown in the abyss, Heaven or Hell, who cares?
Through the unknown, we'll find the new!"
Charles Baudelaire. Le Voyage, 1857.[2]

In 2006, when the group that in 2010 founded the National Working Party of Docomomo Venezuela started their journey for the preservation and conservation of Modern Heritage in Venezuela, they were in a country with little editorial production on Architecture, Design and Urbanism. Due to the long unstable national political situation, museum exhibitions and events on these topics had practically stopped, reducing the contemporary review and spread of Venezuela's Modern Heritage to a minimum.

In order to start their public activities, they decided to present a fresh point of view that would bring a new wave of storytelling into the National History of Modern Architecture. Docomomo Venezuela thus developed a clear politic line: to put a great deal of their efforts in producing a series of medium-scaled exhibitions that would address both the architectural community *and* the general public. A collection of illustrated publications was also a *sine qua non* and major objective, with the crucial goal to achieve a greater -and lasting- impact on the local and global cultural scene about Venezuelan modernity.

Being fully aware of the general current state at the time of poor public knowledge on the saga of Modernism in the country, Docomomo Venezuela's exhibitions spanned from the *grandeur* of urban landscapes to the intricacies of small decorative artifacts, wishing to attract multiple and diverse audiences. With a keen eye on photography, they brought the masterpieces shown to life, by creating newly-made models exhibited along with works of art, original documents, plans and drawings as well as period pieces.

As André Malraux, France's Minister of Cultural Affairs stated in 1962 in his famous Loi Malraux, cultural goods only begin to exist when they are first named. And he was *so* right. History that is not known cannot be valued. Like unidentified orchids in the jungle, what is unknown cannot be wanted. Therefore, this was their premise and mission: to showcase -in many opportunities for the first time-, the most unvaluable examples of Venezuelan and International modernism to the world, inviting people to not just discover, admire and truly understand the works shown, but to foster awareness for their protection and preservation. After all, what remains hidden in the shadows cannot spark admiration.

Since the beginning, Docomomo Venezuela chose to house their exhibition projects at the Sala TAC (Trasnocho Arte Contacto) -a medium-sized private gallery which is the most important stronghold where cultural activity took refuge since 1998-, and which became the space for the best exhibitions on Art, Architecture and Criticism in the country. A place that also provided within the cultural center where it is nestled, the Centro Cultural Trasnocho, many venues and spaces of different scales to

accompany the exhibition displays with talks, thought-provoking forums, guided tours, photography contests and even food tastings.

Along the very successful exhibitions there was always a cultural program with something for everyone, making the experience as enriching and enjoyable as possible, beating every time with every opening all of the center's previous records of attendance. But also, having published to date five well-documented catalogs, promoting social media interaction and multiple lectures, winning the AICA (International Association of Art Critics, Venezuelan Chapter) awards for Best Catalog (2013) and Best Exhibition (2022),[3] producing new research and a new photographic archive and, most importantly, having made everybody more aware and value the country's Modern Heritage.

2. THE NON-*DÉJÀ VU*: A CURATORIAL STRATEGY

A story of previous experiences helped to shape the curatorial strategy of Docomomo Venezuela for its own saga of exhibition projects. First, there was the Lecture Series "Las Ciudades Invisibles de Caracas", organized from 2005 by Docomomo Venezuela's founders -and actual chair and vice president-, architects Hannia Gomez and Frank Alcock, with their experience at CENTRO de la Ciudad, a foundation they started in 2001.[4] Then, the Urban Memory of four heritage-rich neighborhoods of Caracas, Las Mercedes (The Cantabric-Mexican City), Bello Monte (The Belmontinian City), Campo Alegre (The Garden City) and Los Chorros (The Chorrigueresque City) was reviewed with new eyes, digging into their untold past to unearth projects, designers, and many long-forgotten urban, landscaping architectural concepts and unforeseen references. From these events emerged the need of a richer and wider history of the city, which with time turned into the necessity of rewriting its story anew, as the official version had many unanswered questions and lagoons, seemed extremely local, too nationally-focused and generally forgetful of the participation of the international cultural world in its construction.

On the second hand, from 2001 on, Gomez also started her role as House Curator of Gio Ponti's landmark work in Caracas, Villa Planchart (1957).[5] Therefore, Ponti's experience as editor and promoter of all sorts of architects, artists and designers -i.e. as Curator of the Design World-, became an influence and an example to be emulated and applied to the fantastic Modern experience that took place in Caracas, one of the most important Modern capital cities of Latin America. In fact, that was what Ponti actually did himself when he first visited Venezuela.

Of the seven exhibitions done to date (six in Sala TAC and one in Villa Planchart) by Docomomo Venezuela members, the first two first, "Gego, arquitecto" (2007),[6] and "El Jardineiro de América: Roberto Burle Marx Centennial 1909-2009 / Parque del Este 50th Anniversary 1959-2009" (2009),[7] announced the forthcoming profile of the future Venezuelan Working Party.

6. Hannia Gómez, *Gego arquitecto*, (Caracas,Sala TAC, 2006) May 5, 2024: https://icaa.mfah.org/s/es/item/1148288

7. "El Jardineiro de América: Roberto Burle Marx Centennial 1909-2009 / Parque del Este 50th Anniversary 1959-2009", (CENTRO de la Ciudad), May 5, 2024: http://centrodelaciudad.blogspot.com/search/label/El%20Jardineiro%20de%20Am%C3%A9rica

In *Gego, arquitecto*, the exhibition explored the academic roots and German cultural and architectural influences of Gertrude Goldschmidt, a major German/Venezuelan artist who was trained as an architect in Hamburg but developed her career in Caracas as an artist since 1939. Gego, being a professor at the School of Architecture and at the Instituto de Diseño, influenced many generations of modern Venezuelan architects and designers and left an *oeuvre* full of architectural knowledge. Later on, in 2009, the Centennial of Roberto Burle-Marx's major landscaping achievement, the Parque del Este (Caracas, 1959),[8] brought the occasion to call the attention on this work of modern landscape architecture with a new exhibition. At that time, the park was being threatened by disfiguring works and ever-growing decay. In fact, from this initial exhibition project emerged Docomomo Venezuela's national working party, with the same group of activists who were defending it, who gathered and registered the park photographically to compare it to its status when it opened, by the Mid-Century. The exhibition "El Jardineiro de America" was shown with an installation based on a long wall in real size that recalled the tile-covered walls designed by Burle-Marx for the Patio de los Azulejos in Parque del Este, holding screens that told the story of the park's design, its landscape artist and his work in Venezuela.

After these exhibitions on the influences of important personalities like Gego or Burle-Marx, both a contribution to the global dialogue of modernism, the next step was to start organizing the same kind of contemporary research around what happened in Caracas during the Twentieth-century. Having chosen the capital of Venezuela as the makor leader of modernity that the rest of the country mirrored for its construction, Docomomo Venezuela, officially operating since 2010, continued delving into the heart of the Modern city, to explore the foreign influences that left an indelible mark on its 'artistic' landscape.

From 2010, nevertheless, their academic research aimed to be more accurate and scientific, aiming to dig deeper into the lives of the authors, shedding light on their global impact and how their local legacies would compare with international ones. It was a tribute to their vision and dedication, reminding us of the power of architecture and art to transcend borders and unite cultures. Also, the exhibition projects included artists, but only with their urban or architecturally integrated works.

Step by step, Docomomo Venezuela started guiding visitors through a journey of discovery, unraveling the narratives behind each work. Just like Gio Ponti discovered his authors from all over the world and showed them through his own designing vision to DOMUS global audience, the group unraveled the major architectural and cultural influences that Caracas received in the past century: Italy in "Las Italias de Caracas" (2012);[9] Spain in "Suite Iberia: la arquitectura de influencia española en Caracas" (2015);[10] the United States in "Our Architects en Caracas: arquitectura norteamericana en Caracas 1925-1975" (2017),[11] and France in "La Ville Neuve: los capítulos recobrados de la arquitectura francesa en la capital 1900-1975" (2022).[12] Even Ponti's Caracas was a subject of an exhibition

held at Villa Planchart: "Arlecchinia: Nostalgia de Venezuela y de la Grecia Antigua" (2018).[13]

3. A NEW *COLECTIVO FOTOGRAFICO*

Docomomo Venezuela's members, being of different backgrounds: architects, artists, professional and amateur photographers, urban and architectural activists, landscape and graphic designers, lawyers, art and antique dealers and many people from the art and cultural world, but all sharing the same love for the Modern city and Modern Architecture, found in Photography the perfect common resource and language shared by all to record with new eyes the eclectic, transatlantic and multicultural Urban Memory of the capital, embracing it as the best reflection of modernity in the country.

Thus, a new type of 'colectivo fotografico' was born. Not a *fotoclubismo*, as in the similar experience that spread in the world among photography lovers, like Sao Paulo's Foto Cine Club Bandeirante.[14] This was the Working Party of Venezuela working on the streets of the capital, with the mission to register its Modern Heritage, watching it as if it was for the first time. But besides that common and clear objective, the group embarked in every new exhibition project with no further restrictions, solely to register what was out there in the townscape, traveling through the urban fabric with a perceptive eye, an active memory and, above all, a very personal perspective, collecting old and new sites, and producing multiple varieties of views to remap the endlessly Modern Caracas townscape. Every personal approach and point of view was unique, every shot was valuable and important: this was the way and the key to the richness of the visual material produced on their urban expeditions. Sometimes it was an architectural detail, or certain atmosphere, usually unseen fragments of stairs, windows, balconies, doors, works of art, ornamentation, urban typography, unexpected spaces or architectural shapes. Caracas spoke differently to each photographer. Many times, a single architectural element had dozens of photos to describe it, thanks to which its true essence was finally revealed for the curatorial work. So, the eye of the *colectivo* lead the way on what each exhibition came to be.

Through the lens of color photography, the group bridged the gap between past and present showing black and white images to depict the original design of a building or site, thus offering a glimpse into the past, and color images to show the evolution and actual status of these timeless works. A very useful way of making a photographical archive to complement the original photographies of bygone eras. A new way of DOcumentation for the COnservation of the MOdern MOvement.

4. A MUSEOGRAPHICAL JOURNEY

The emphasis of these exhibition series was to bring the public closer to the history of Modern Caracas with a museography that facilitated a simple and direct reading, and -more importantly-, to incorporate and emphasize

13. Docomomo Venezuela, *Arlecchinia: Nostalgia de Venezuela y de la Grecia Antigua*, (Caracas, Villa Planchart, 2018).

14. "Fotoclubismo: Brazilian Modernist Photography, 1946–1964", , MoMA, May 6, 2024: https://www.moma.org/calendar/exhibitions/5245

the International History of Modern Architecture, Urban Planning and Art, so present in Venezuelan modernity but usually poorly mentioned in the local historical architectural discourse.

Caracas owns a very eclectical modern panorama, as decades of successive immigration waves from different countries arrived in the city in the Twentieth-century, contributing directly in its construction and leaving behind the artistic and professional traces of their memoires and personal experiences from their lands of origin. There is no such thing as one Modern Caracas, as there are many: the Italian Caracas, the Spaniard Caracas, the American Caracas, the French Caracas… even a German Caracas exists within its urban fabric, on which Docomomo Venezuela nowadays is working for a forthcoming exhibition.

This modern palimpsest demanded a museography that could transform each time Sala TAC's spaces into a different place. With every exhibition, the group strived to create an immersive experience of a different kind, where visitors could not only see but also feel the essence of every cultural layer of the city's multiple modernisms. From video installations to photo murals, the museographers transformed the spaces into living canvases, sparking curiosity and igniting the imagination. The use of environmental and punctual color was not only an aesthetic resource, it was used to reinforce the exhibits' different thematics: ornamentalism and artistic integration in *Las Italias de Caracas*; sound construction skills, flamboyant typographies and bold volumetric expression in *Suite Iberia*; Avatars of American architectural and urban typologies in *Our Architects in Caracas*; the importance of Planning and Urban Design in *La Ville Neuve*…Imagine stepping into a time capsule of modernism, where every corner whispers countless untold stories of innovation and creativity. That's what these exhibitions aimed to encapsulate and preserve –the essence of Caracas eclectically modern richness.

As the public wandered through these spaces, they noticed that every detail was meticulously curated –from the typography chosen to the literary quotes that open each author story, meant to guide the public in their journey as a celebration of creativity, inspired by the words of Gio Ponti, Miguel de Cervantes, Ayn Rand, Victor Hugo, and now Baron Alexander von Humboldt.

In addition to this, Docomomo Venezuela opened each time in the Facultad de Arquitectura y Urbanismo of the Universidad Central de Venezuela a new academic internship (once also with the Master of Historic Preservation at the Graduate School of Architecture, Planning and Preservation in Columbia University), to include architecture students and professors, which led to much richer results. They were the creators of experimental models that made all the difference, capturing the attention of the general public as well as the experts. The didactic program was also in charge of obtaining the graphic documentation, like old plans and drawings. For the objects, private collectors, and the group's team of antique gallerists helped in obtaining the works of art and decorative objects that illustrated

#27

better the spirit of each show. The final result became influential on the local architectural community, who celebrated -and rapidly made theirs- all the new findings and data.

But there were some difficulties, too. Sometimes, architectural history had to be overly simplified in the displays in order to be better explained to the general public; some other times, the difficulties laid in how to include the vast amount of material and documents gathered by the group and the research without making the exhibitions too overwhelmed by information.

Finally, a collection of videos showed every time: the woks of Venezuelan authors trained abroad in the specific countries discussed, the lists of lost works of architecture, engineer and art, and a collection of

the main examples of interior design. Gradually, the exhibitions evolved to become more digital, in order to be more easily able to travel abroad.

5. ONE GREAT EXHIBITION

As a backward prophecy long buried in the city's Modern Heritage, Docomomo Venezuela's exhibitions are in fact the construction site of one major exhibition that retells Caracas Modern History. Thus, Urban Memory performs as a Contemporary *belvedere* from which Venezuela's Modern Panorama is contemplated, cataloged, reviewed, reinvented, retold… and rejuvenated.

Studying the city's major architectural influences during the past century makes possible to grasp the great cultural diversity of Venezuelan modernism. It is also a mirror of the country itself, which welcomed so many immigrants, from whose cultures and work it was nourished at a time of great development. A moment in which Venezuela was avant-garde in all areas, producing works of a high quality in technical and technological development, as well as in aesthetic and artistic values.

Venezuelan modernism is very broad and has elements that some might consider as impure, but which at the same time gives it a quality which perfectly reflects the country, speaks of its originality and authenticity, and constitutes an adaptation to the physical, economic and socio-cultural conditions of the moment.

Venezuela was undoubtedly fortunate during the past century, placed at the vanguard of modernism while enjoying a multicultural modern heritage. This is the heritage that is important to document and spread, in order to guarantee its correct understanding and conservation in time.

With these objectives, Docomomo Venezuela works towards the re-engineering of all the exhibitions into a single one, a major travelling show where the world will learn to see Venezuela Modern Heritage with a New Period Eye. ■

BEYOND MODERNISM: CURATORIAL CLASHES AND TRANSFORMATIONS IN 1983 PORTUGUESE ARCHITECTURAL EXHIBITIONS

ANA NEIVA
CEAU-FAUP - CENTRO DE ESTUDOS DE ARQUITETURA E URBANISMO
UNIVERSIDADE DO PORTO

ABSTRACT.
The exhibitions "Depois do Modernismo" and "Onze Arquitectos do Porto: Imagens Recentes", held at Lisbon's Sociedade Nacional de Belas-Artes in 1983, marked a significant turning point in Portuguese architectural curatorial practices. These exhibitions clashed in their curatorial narratives, shaped future approaches to exhibiting Portuguese architecture, and influenced ongoing architectural discourses.

"Depois do Modernismo", curated by Luís Serpa, presented a cosmopolitan exploration of Post-Modernism, featuring various art forms. The architecture section, directed by Michel Toussaint, introduced an innovative concept where architects showcased their projects in symbolic 'little houses'. However, dissent arose among Porto architects who expressed their disagreement with the exhibition's values, leading to their abstention from participating. In response, they organised a counter-exhibition titled "Onze Arquitectos do Porto: Imagens Recentes", featuring drawings that emphasised the essential role of drawing in the Porto school's methodology and highlighted differences between Porto and Lisbon architectural approaches.

The presence of processual drawing continued to be a distinctive element in subsequent group presentations by architects from Porto. Its centrality, showcased in exhibitions like "Architectures à Porto" and "Arquitectura Portuguesa Contemporânea. Anos 60, Anos 80" contrasted with the vibrant expression of communication drawings favoured by Lisbon architects in "Tendências da Arquitectura Portuguesa". This divergence persisted in subsequent international representations, amplifying the core ideas that emerged in the 1983 events.

Our paper critically reflects on these transformative moments, shedding light on the details of the division between architects from Porto and Lisbon and the curatorial and display options that have had a lasting impact on subsequent Portuguese architecture exhibitions.

1. SPACE TO FEEL: POST-MODERN EXHIBITIONS

The proliferation of architecture-related events, such as exhibitions and publications, has propelled architecture into the public sphere. These platforms not only served to showcase architectural achievements – buildings – but also to reveal their processual dimension, recovering interest in architectural drawings and ephemeral installations while offering opportunities for plural and individual expressions. When expanded into a post-modern sensibility, characterised by a rediscovery of architecture's "poetic" dimension, the exhibition space became a site for exploring the unreal and the paradoxical.

1.1 DEPARTURES FROM MODERNISM

Post-Modernism emerged around 1960, gaining momentum through various exhibitions[1], notably the Venice Biennale of 1980. Curated by Paolo Portoghesi, "La Presenza del Passato" was the inaugural International Architecture Exhibition, in Venice, and aimed to explore effective ways to engage a wide audience while sparking intellectual discourse.[2]

We will examine three key aspects of the 1980 event, drawing connections to later Portuguese exhibitions, to reflect on the discourses surrounding Post-Modernism, the related innovative display techniques, and the role of drawing in display strategies.

"La Strada Novíssima" section featured twenty façades, constructed within the Arsenale colonnade to delineate an interior street space. Each façade represented the interpretation of twenty invited architects concerning their relationship with the past. Through these façades, none of which depicted existing architecture, visitors could access twenty distinct rooms spanning a 42-square-meter area, where the authors presented their projects, encompassing traditional representational drawings, scale models, and spatial installations.

After Venice, the show travelled to Paris, to the octagonal central room of the Saint-Louis Chapel at the Salpêtrière Hospital. It underwent a content and title revision, becoming "La présence de l'histoire. L'après modernisme", emphasising the focus on history as a solution for moving beyond Modernism. As revealed by Szacka's research, several title options were already considered for the Italian exhibition: 'The Architecture of Postmodern', 'Dopo l'architettura moderna', 'Postmodern Architecture', the very simple 'Postmodern', 'La Mostra sul Postmodernismo', and the more emphatic: 'POSTMODERN'".[3]

Meanwhile, other events promoted alternative approaches to imaginative and historical perspectives, such as "La Modernité, un projet inachevé: 40 architectes" (1982). Paul Chemetov's exhibition, which included Álvaro Siza, delved into the ethics of Modernism, addressing social and urban issues. A year later, at the Institute of Contemporary Arts, in London, another group exhibition titled "Ten New Buildings", featured Siza among nine other architects who questioned the radical positions of Rationalists and Post-Modernists, emphasising the importance of acknowledging and referencing the past without excluding Modernism.[4]

2. PORTUGUESE POST-MODERNISM

The debate on Post-Modernism in Portugal stemmed from the differences between the Porto and Lisbon schools, which emerged from contrasting responses to the legislation of 1957 known as the *Reforma de 57*[5], separating architecture from Fine Arts schools.

While Lisbon school remained closer to the Beaux-Arts philosophy, largely due to political pressures, the Porto school underwent a transformation under an experimental administration shared by teachers and students. Here, the ethical principles of Modernism were adapted to the practical constraints of the city, leading to a structure more akin to a university system. This antagonism was stressed by two exhibitions occurred in 1983.

2.1 CLASHING CURATORIAL OPTIONS

"Depois do Modernismo" (After Modernism) was organised by Luís Serpa (1948-2015). It was held at the Sociedade Nacional de Belas-Artes (SNBA) in Lisbon from January 7th to January 31st, 1983. "Onze Arquitectos do Porto: Imagens Recentes" (Eleven Architects from Porto: Recent Images), was also hosted at the same venue from April 15th to April 30th of the same year.[6]

The first exhibition, titled similarly to the 1980 Venice event, encompassed fashion design, music, theatre, visual arts, and architecture "to discuss the problematics of the so-called Modern movement (…) to know whether Portugal has room for forms of artistic expression which can include the breadth and ambiguity of a notion like that of Post-Modernity."[7]. It sought to present diverse and simultaneous perspectives on art aligning with "international and global contexts as opposed to the nationalist views, whether of history or the art made in Portugal"[8].

The executive and consulting team for the architecture section was led by Michel [Toussaint] Alves Pereira. They aimed at uniting Portuguese architects who, disillusioned with international functionalist puritanism, were exploring new paths and solutions to overcome prevailing sadness, hoping that it could become "a manifesto against gloom".[9]

According to Toussaint, despite acknowledging the diversity among all the participants, there was a belief in shared directions, which led the curatorial choices. In the catalogue, he asserts: "Against purity, against the moral of cleanliness, against the anonymity they have wanted to impose on us, for the survival of individualities and differences, the various attitudes following the bankruptcy of Modern and Progress appear. Only this can be called Post-Modern."[10]

Diversity and plurality, along with the ambition of internationalisation[11], summed up the main intentions of this exhibition. However, the invited architects from Porto declined to participate in the initiative due to a "healthily discordant to the organisers' approach".[12] Nevertheless, the group of seven architects – Adalberto Dias, Alcino Soutinho, Alexandre A. Costa, Álvaro Siza, Domingos Tavares, Eduardo Souto de Moura and Sergio Fernandez –submitted a manifesto text accompanied by illustrations of significant twentieth-century Portuguese buildings. The text asserted the

Modern movement had minimal influence on Portuguese architects, who consistently adopted an eclectic approach and integrated local constraints with international influences. Therefore, Post-Modernism was deemed an unsuitable concept: "the evolution of architecture in Portugal presents very specific aspects that we can characterise by the inevitability of eclectic individualism (...) this is why the controversy surrounding what is vaguely referred to as post-modernism cannot cause more anxiety than the desperate conditions of practising the profession in Portugal."[13]

Following that decision, the Porto architects presented the counter-exhibition titled "Onze Arquitectos do Porto: Imagens Recentes", at the same venue.

2.2 PLURALITY AND DISPLAY STRATEGIES

"La Strada Novíssima" affirmed "the ephemeral representation of architecture as architecture itself"[14], blurring "the boundaries of the real and the unreal"[15]. Through its expansive scale and display, it aimed to create an illusionary effect, merging content and container. This immersive strategy, quite unprecedented in architecture exhibitions, prioritised the experience of the exhibition space, and one can affirm its impact to subsequential events, notably the architectural section of "Depois do Modernismo," where similar principles are evident.

In Lisbon, Michel Toussaint proposed individual "little houses" **(Fig. 1)**, that each of the fifty architects could freely manipulate and use to exhibit drawings, texts, photographs, or scale models. Within the symbolic houses, which visibly defined a personal space, the architects explored their surfaces as walls, while interacting with their interiors. Some adhered to conventional approaches, such as organising drawings on the walls, described as "arranged according to the discredited poetics (?) of 'top-down, bottom-up,' 'text blob here, drawing blob there'; sad, demotivating, unloving, uninterested, uncreative, old"[16]. Others, like Vitor Mestre **(Fig. 3)**, introduced new elements, such as a curtain to display drawings from Castro Verde's G.A.T., while Luiz Cunha framed his perspectives of the "Non-Bureaucratic Plan for the Reconstruction of the City of Angra do Heroísmo" with a classical façade reminiscent of Portoghesi's show, featuring two columns supporting a pediment.

The counter-exhibition, by Porto architects was a collection of thirty-three panels exclusively dedicated to drawings – from sketches to sections and plans. These panels presented the works of Adalberto Dias, Alcino Soutinho, Álvaro Siza, Domingos Tavares, Eduardo Souto de Moura, Fernando Távora, Jorge Gigante, José Pulido Valente, Nuno Ribeiro Lopes, Pedro Ramalho and Rolando Torgo.

The eleven architects self-organised this exhibition to present ongoing projects emphasising "the process of forming a project and the role of drawing (…) in each individual process"[17]. Nuno Portas, the author of the opening text for the catalogue – "A half dozen questions about a certain architecture, the best, that of Porto" – clarified that the exhibition that was "not intended to be didactic, polemical, or thematic from the outset", establishing a deliberate departure from the previous show in Lisbon. "It appears that what brought

these gentlemen to present their works in a gestational phase or, at least, unrealised and uninhabited, was simply the fact that they worked in Porto and considered themselves symptoms - more than representatives - of a cultural activity of professionals who, despite ranging in age from 25 to 60 years old, are part of a group centred on the architecture department of ESBAP".[18]

Nuno Portas also examined shared characteristics among the works that could unveil "a set of attitudes, a distinct northern condition from that of other sectors or trends in architecture in Portugal".[19]

For Portas, the Porto school diverged from existing academic models and resisted the adoption of international codes. Instead, it drew inspiration "from the site, existing morphology, and local tradition (…) related] to tradition not at the level of surface and cosmetics but at a deeper, though less apparent level of morphology". Additionally, he identified a notable emphasis on the importance of drawing, seen as a tool to acknowledge pre-existing reality and to envision the architectural object within the project: "drawing as a place of invention, much more suggestive and globalising than the common dualism of plan + facade study that prevailed for many years".[20]

The consistent organisation of panels **(Fig. 4)** highlighted the coherence among the exhibited works: each trio of panels represented a distinct project. Measuring 1x1m, these panels contained a 50x50cm drawing encased within a large white frame.[21]

While this "celebration of drawing" was intentional and acknowledged, as highlighted by Pedreirinho – "what you can feel here is precisely the drawing as an element of creation, which has to do with the very practice of the profession of architects"[22] –, it was also questioned for its difficult communication with the public and its excessive autonomy. Portas pointed out its "gestural or pictorial sensuality that seeks the book or the exhibition panel instead of remaining as a discipline of space representation and construction capable of enabling communication in the design process"[23], while José Pulido Valente, one of the participants, coincidently born in Lisbon, expressed his disbelief in exclusively focusing on drawings, arguing that "an exhibition (…) should be for communicating to those not in the profession, and it should not be closed off only to specialists. With only drawings, this exhibition is akin to a collection of specialised texts on law, economics, sociology (for example) that the uninitiated cannot access".[24] For that reason, Pulido Valente presented a sample of three of his projects through axonometries.

Processual drawing, fundamental to the recognition, exploration, and contemplation of reality, served as a central tool in the Porto School of Architecture methodology. However, Lisbon architects have approached drawing differently, incorporating colour and three-dimensional representations such as axonometrics and perspectives. Figures such as Luiz Cunha or Tomás Taveira were particularly adept at illustration and comic-style representation, demonstrating architecture's artistic nature and serving as a personal expression of the author.

The dichotomy between Porto and Lisbon architectural approaches persisted in subsequent presentations of Portuguese architecture. Initiatives

like "Architectures à Porto" (Clermont-Ferrand, 1986) and "Tendências da Arquitectura Portuguesa" (Barcelona, 1986; Rio de Janeiro, São Paulo, and Buenos Aires, 1987; Lisbon, 1989; Strasbourg, Macau, and Bombay, 1990; New Delhi and Beijing, 1991; Tokyo, 1992), launched in 1986, alongside "Arquitectura Portuguesa Contemporânea. Anos 60, Anos 80" at Casa de Serralves, or "Points de Repère. Architectures du Portugal" at Europália, Brusssels, both held in 1991, expanded on the fundamental ideas developed in the contrasting events of 1983 in a more extensive and discursive manner.

3. EXPANDING DRAWING IN ARCHITECTURE EXHIBITIONS

The emergence of the architectural drawing market coincided with the ascent of Post-Modernism. In Portugal, following its central role in discussions at the II National Conference of Architecture in 1981, where it was emphasized that "the drawing must be recognised as the architect's privileged field of activity and their primary mode of intervention"[25].

The prominent role of drawing in architecture exhibitions, particularly within the art gallery circuit[26] and demonstrated in solo presentations by architects like Álvaro Siza[27] and Manuel Vicente[28], remained also a distinguishing factor in group exhibitions between Porto and Lisbon architects in the 1980s. This difference was evident in exhibitions such as "Arquitectura Portuguesa Contemporânea. Anos 60, Anos 80" at Casa de Serralves (1991) which contrasted with the display strategies employed by Carlos S. Duarte in the itinerant exhibition "Tendências da Arquitectura Portuguesa" (1987-1992).

In the Serralves exhibition, curated by Nuno Portas and Manuel Mendes, square boards[29] had up to two-thirds of their height dedicated to drawings **(Fig. 3)**. Photographs, if available, were displayed on the lower stripe.

In contrast, the A0 panels of Carlos S. Duarte aimed for graphic coherence throughout **(Fig. 4)**, showcasing photographs and technical drawings. The inclusion of artistic drawings[30] was introduced later in the itinerant exhibition as supplementary material, displayed separately.

Portas and Mendes' exhibition primarily reflected the theoretical framework of the "Escola do Porto", focusing on showcasing a quite large selection of projects, through original drawings, that highlighted "the internal process and of the representation techniques of the authors"[31].

On the contrary, Duarte's selection showcased five distinct personalities, with a considerable array of their projects, to "illustrate the main trends that intersect in the field of architectural production and the controversy that accompanies it"[32]. While initially seeming Lisbon-centric, the inclusion of internationally lesser-known architects like Tomás Taveira, Luís Cunha, and even Manuel Vicente, who was based in Macau, alongside figures like Siza, an already acknowledged and appealing name, could have been instrumental, to convey the idea of a Post-Modern ambience in Portugal. However, these curatorial options can also be interpreted as a will to assert *individuality*, a Post-Modern attitude regardless.

Álvaro Siza's international recognition, evidenced by his international solo exhibitions since the mid-1970s, triggered a resurgence of group

exhibitions on Portuguese architecture, centred on discussions on Post-Modernism and Modernist revisionism. In addition to the previous considerations, it is essential to consider Siza's assessment on "drawing as the desire for intelligence"[33], particularly evident in his methodology strongly based on sketches and processual drawings. This perspective also played a defining role in his solo exhibitions, influencing not only the selection of projects but also the emphasis on the display of artistic drawings.

To conclude, one can revisit the question posed by Nuno Portas in 1983: "Can architectural drawing serve to democratize architecture rather than mystify it?"[34]. The 1980s saw a shift towards more curated selections and narratives, alongside the internationalisation of Portuguese architecture, aided by the removal of borders among CEE members in 1986. Despite advancements in exhibition formats and curatorial strategies during this period, the centrality and fetishization of drawing persist in architectural exhibitions today. There remains a pressing need to transcend disciplinary boundaries, engaging the public and affirming architecture's cultural value in society. ■

BIOGRAPHY

Ana Neiva, Ph.D. architect, researcher, and curator, teaches at FAUP and at FCAATI U. Lusófona, where she serves as the vice-director of TERRA.ID. Her research work focuses on the expansion of architecture into the realms of art, society, health, and well-being, as well as architectural curation. She was a deputy-curator of "Fertile Futures" - Official Portuguese Representation at the 18th International Architecture Exhibition of La Biennale di Venezia 2023.

WAR'S TOLL OF ITALIAN HERITAGE: UNVEILING ITALY'S POSTWAR RECONSTRUCTION THROUGH TRANSNATIONAL EXHIBITIONS

JIAYAO JIANG
UNIVERSITY OF CAMBRIDGE

ABSTRACT.
In 1945, the National Association for Italian War-Damaged Monuments organised 'The Italian Art Exhibition' at Palazzo Venezia, Rome, marking a pivotal moment wherein artistic heritage was framed as a primary instrument for rebuilding new and democratic relationships between national culture and society. Collaborating with the American Committee for the Restoration of Italian Monuments, another exhibition, the 'War's Toll of Italian Art' took place at the Metropolitan Museum of Art in New York in 1946.

The significance of these exhibitions on war-damaged monuments in the first years after the war was external to the hegemonic context and continues to remain under-explored. Through analysing the political-social background of these exhibitions, this article aims to investigate the Italian post-war responses from a transnational perspective. In the USA, presenting the breadth and significance of national heritage destruction visually was crucial for eliciting the emotional impact relied upon for successful fundraising. The exhibition bestowed universal value and meaning upon the represented historical monuments, and outlined a tribute paid by a traditionally resource-scarce nation to the dramatic global wartime situation.

In addition, the article highlights the increasing diplomatic value of such exhibition projects. In the post-war era, such exhibitions of Italian art and architecture were often promoted by foreign agencies, and this transnational interest in Italian heritage aligned with the 'cultural cooperation' proposed by the Christian Democracy and the Italian Foreign Ministry at the time. These exhibitions, therefore, served the objective of mutual understanding, peace safeguarding, and international solidarity, in clear opposition to the imperialistic nationalism of Mussolini's regime. In this vein, the article argues that these post-war exhibitions exemplify early transnational financial aid for heritage, document the evolution of conservation guidelines, and illuminate the intricate facets of post-war Italian national identity in a transnational dialogue.

1. INTRODUCTION

In the early post-war era of the 1940s, Italy faced significant financial difficulties as it grappled with the immense costs of reconstruction and the burden of war debts. This period was characterised by austerity measures, political instability, economic uncertainty, and the arduous task of rebuilding a nation from the ruins of war. Notwithstanding the devastation, Italy emerged as a leader in cultural heritage and conservation, with efforts to safeguard historical sites, artworks, and traditions, the rich Italian heritage played a significant role in shaping national identity and fostering resilience. Additionally, the influx of transnational flows enriched Italy's heritage landscape.

During this time, several transnational exhibitions in Italy and the US highlighted international efforts to safeguard Italian heritage. The significance of these exhibitions on war-damaged monuments in the immediate post-war years was external to the hegemonic context and remains under-explored. This article analyses the political-social background of these exhibitions to investigate Italy's post-war responses from a transnational perspective. How did exhibitions after the war construct the international image of Italian art and heritage? How was the artistic heritage from the fascist period integrated into the new post-war context through these exhibitions?

2. TWO TRANSNATIONAL EXHIBITIONS

2.1 'MOSTRA D'ARTE ITALIANA' IN ROME, 1945

In 1945, the National Association for Italian War-Damaged Monuments (Associazione Nazionale per il Restauro dei Monumenti Danneggiati dalla Guerra, ANRMDG) organised 'The Italian Art Exhibition (Mostra d'Arte Italiana)' in Rome, marking a pivotal moment wherein artistic heritage was framed as a primary instrument for rebuilding new and democratic relationships between national culture and society.[1] This initiative, the first of its kind to be conceived and set up by Italians, served to recognise the artistic heritage as one of the main tools for rebuilding a new and democratic relationship between culture and society, disrupted by the fascist regime and the war. The ANRMDG, founded in Rome in the summer of 1944, aimed to collect resources for restoring Italian monuments and artworks damaged during the war.

Inaugurated on 16 May and finished on 31 October 1945, 'The Italian Art Exhibition' was held at Palazzo Venezia. Palazzo Venezia, once occupied by Benito Mussolini as the representative seat of the fascist government, now opened its doors to the public, showcasing the heritage saved from the war with multifaceted efforts. As ANRMDG president Zanotti Bianco noted in the Foreword of the exhibition's catalogue **(Fig.1):** 'This Art Exhibition constitutes the first major cultural initiative organised and carried out entirely by Italians since the beginning of the war and aims to direct the thoughts of the entire Nation, through the vision of the works of art, to serious urgent problem […]'[2]

2. Umberto Zanotti Bianco, *Mostra d'Arte Italiana a Palazzo Venezia* (Rome: Associazione Nazionale per il Restauro dei Monumenti Danneggiati dalla Guerra, 1945).

Figure 1. Cover of the catalogue of 'The Italian Art Exhibition', 1945 ©Associazione Nazionale per il Restauro dei Monumenti Danneggiati dalla Guerra.

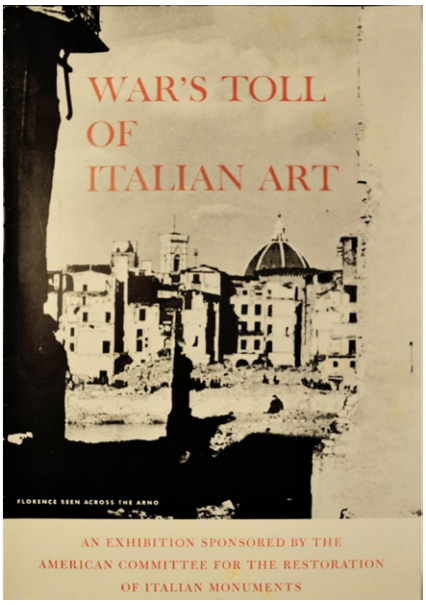

Figure 2. Cover of the catalogue of 'War's Toll of Italian Art', 1946 ©American Committee for the Restoration of Italian Monuments.

Divided into two sections, the exhibition included works from both State Galleries and private collections. The first section, located in the Barbo Apartment and in the three monumental halls, displayed 117 paintings primarily from northern Italy, some of which were initially deposited in the Marche, Umbria, and Lazio before subsequently being transferred to the Vatican. The second section of the exhibition, in the Cybo Apartment,[3] presented privately owned works from various schools and eras, sourced from the most important Roman collections, 'so that even the private individuals could contribute, with their treasures that remained intact, to the salvation of those of the whole homeland, tortured by war.'[4]

The exhibition's purpose was to raise funds for restoring monuments destroyed by Anglo-American bombing. To attract visitors, the entry fee also included potential membership in the Association, with annual fees of one thousand lire for ordinary members or ten thousand for the meritorious members.[5]

2.2 'WAR'S TOLL OF ITALIAN ARTS' IN NEW YORK, 1946

The effort to safeguard Italian heritage extended beyond Italy, attracting transatlantic interest. In collaboration with the Directorate General of Fine Arts and the American Committee for the Restoration of Italian Monuments (ACRIM), a series of events—including exhibitions,

3. See Archives of Associazione Nazionale per gli Interessi del Mezzogiorno d'Italia (ANIMI).

4. Zanotti Bianco, *Mostra d'Arte Italiana*.

5. Luca Ciancabilla, "La Guerra Contro l'Arte. Dall'Associazione Nazionale per il Restauro dei Monumenti Danneggiati dalla Guerra alla Ricostruzione del Patrimonio Artistico in Italia", in *Bologna in Guerra. La Città, I Monumenti, I Rifugi Antiaerei*, ed. Luca Ciancabilla (Bologna: Minerva Edizioni, 2010), 23-40.

publications, conferences, and films—were organised to raise awareness of the state of Italian monuments. Such initiatives sought to foster collaboration and secure financial aid from international supporters who recognised the importance of preserving cultural heritage that belonged not only to Italy but to the whole of civilization.

The ACRIM was established in 1946, with many of its members having been involved in protecting European art and heritage during the war, including the Monuments Men.[6] In preparation for the exhibition, a substantial amount of documentary material had been sent from Italy to New York.[7]

From 18 October to 24 November 1946, 'War's Toll of Italian Art' was hosted at the Metropolitan Museum of Art in New York **(Fig.2)**. The exhibition featured photographs, drawings, graphics of various types, and several works of art previously restored by the Central Institute of Restoration (Istituto Centrale del Restauro, ICR) and the Superintendency of the Galleries of Florence. Approximately eighty panels with large-format views served as 'visual monographs' with detailed captions focusing on the value and state of the individual works.8 The exhibition highlighted that 2,500 buildings, along with some frescoes and sculptural decorations, had suffered from serious or irreparable damage during the war.

Moreover, the extensive network between American art history departments and ACRIM members facilitated the exhibition's dissemination to various venues. Some of the photographic panels were transported by rail across the United States as part of an itinerant exhibition managed by the American Federation of Arts that lasted over a year. Several lectures accompanied the exhibition, delivered by active ACRIM members. Notably, Fredrick Hartt delivered a lecture on 'Toll of Italian Art' at Taylor Hall, Vassar College on 26 November 1946,[9] and Ernest T. De Wald presented at the Cleveland Museum of Art on 28 March 1947.[10]

3. EXTERNAL GAZE AND NATIONAL IDENTITY

3.1 FUND RAISING FOR HERITAGE

During 'The Italian Art Exhibition' in Rome, efforts were made to build cooperation between public and private sectors in the organization of exhibitions and in the reconstruction of the war damage heritage. The 'War's Toll of Italian Arts' exhibition in New York demonstrated transnational concern and cooperation, relying on private 'patronage' for monuments, predating the launch of governmental aid programs to Europe, including the 1948 Marshall Plan. They provide an opportunity to observe the marketing operation implemented in the first years of post-war reconstruction. One journalist remarked, 'We, in America, can only contribute an initial sum out of the total 9 million. Without our aid, however, the inevitable loss of time which would ensure, would result in even greater loss and deterioration. We cannot help but feel a responsibility.'[11]

Several strategies for cultural patronage toward Italian heritage were implemented in the United States. First, a fund-raising campaign launched

through paid advertisements in American press outlets regularly solicited tax-deductible donations, channelled to a company based in New York. Foreign, extra-budgetary donations reserved for exemplary monuments are financed through a series of minor repairs initiatives. There were also contributions from corporate entities, such as the Samuel H. Kress Foundation, whose contribution to the reconstruction of the Tempio Malatestiano in Rimini, the Santa Trinità Bridge in Florence, and the Campo Santo in Pisa caused great social impact. In the spring of 1948, ACRIM identified among its beneficiaries the Bramanate portico of S.Ambrogio, the Palladian Basilica, Villa Falconieri in Frascati, and some monuments of Pompeii and Faenza. The Committee requested that the Italian government make the donations public, announcing the new contributions alongside the previous ones at the Malatestiano, the Campo Santo, and the Santa Trinità bridge. This practice demonstrates the significance of media coverage for promoting the United States' image as a patron of Italian art.[12]

3.2 EXHIBITION NARRATIVES

These exhibitions addressed a heterogeneous audience, invoking a narrative force to persuade supporters, scholars, lovers of Italian art, collectors, and individual donors to contribute to the preservation of artwork and heritage belonging to all civilizations. As stated, 'the restoration of its monuments is being shouldered by Italy to the utmost extent of that stricken country's resources. But these monuments belong to the common patrimony of Western civilization, and the civilised nations of the West cannot but feel some share in the responsibility of preserving them from further ruin.'[13]

These exhibitions mirror the tentative initiatives of constructing a new Italian national identity in the post-war era from a global perspective and reflect an external gaze on Italian heritage. The exhibition narrative emphasises how Americans and other Allied countries were involved in safeguarding Italian heritage. The memory of facts experienced first-hand by these special witnesses enriched the mere documentary dimension, enhancing its communication aspects. For instance, there are materials on display at the Metropolitan Museum that were produced by Americans in Italy, including Frederick Hartt and Albert Sheldon Pennoyer.

The photographic language then serves a very specific function in constructing this delicate operation: it must confer value and significance of universal scope to the represented art heritage, persuasively depict the gravity of the current state of Italian monuments and capture the attention of American visitors to encourage their participation. The exhibition emphasises the contrast between the 'before' and 'after' status of a series of Italian monuments that suffered damage during the war, as well as pictures of their temporary protection and permanent repair. Notably, panels depicting the 'before' status were placed at the front of the 'after' status, with an intention to demonstrate the beauty and grandeur of those monuments, highlighting the strong determination to restore and reconstruct the beauty through donations.

3.3 DIPLOMATIC VALUE OF TRANSNATIONAL EXHIBITIONS IN POST-WAR PERIODS

The exhibition methods of these two exhibitions were distinctive, with the overseas exhibition having been primarily organised by American agencies. In fact, most early post-war transnational exhibitions, including the 1946 'War's Toll of Italian Arts' and the 1949 'Twentieth Century Italian Art', were predominantly promoted by American associations with minimal Italian government involvement.

In the aftermath of its military defeat, Italy lacked the political or economic means for an effective foreign policy,[14] and this was coupled with concerns about nationalistic propaganda that arose immediately after the end of the Fascist governance. The Italian government made significant cuts to the public budget and closed major institutions for cultural activities overseas, with such exhibitions of Italian art and architecture often being promoted by foreign agencies, leading to 'not only the reduction but even the total suppression of any cultural activity abroad.'[15] According to the State Archives of Macerata, the public budget dedicated to 'cultural activities abroad' was reduced to 137 million lire, one-fifth of the pre-war amount,[16] and some major institutions formerly responsible for Fascist cultural diplomacy were abolished, such as Istituto Nazionale per le Relazioni con l'Estero.[17]

The cultural diplomacy of the Italian Republic was characterised by its effort to promote cultural cooperation based on multilateral cultural diplomacy. This represented a new direction, compared to the foreign cultural policy promoted during the Fascist period, characterised mainly by public diplomacy with a propaganda-oriented approach. Therefore, these exhibitions showed the 'multilateral initiatives' or 'cultural cooperation' that were proposed by the Christian Democracy and the Italian Foreign Ministry as a political tool to promote mutual understanding, safeguarding of peace, and international solidarity, in stark contrast to the imperialistic nationalism of Mussolini's regime. This strong commitment to interpreting art as a universal value for all mankind aligned with the general discourse of that time.

4. ECHOES: POST-WAR EXHIBITIONS AS VEHICLES OF TRANSFORMATION

In the 'War's Toll of Italian Arts', the work carried out in the Central Institute of Restoration (ICR) in Rome was shown to American visitors. Some original fragments of frescoes bombed during the war were sent from Italy to the United States during the exhibition. Additionally, for the launch of the New York exhibition, an illustrated journal, *Life*, published photos of two technicians from the ICR working on the desolate puzzle of 20 thousand pieces, showcasing the remarkable work carried out by Italian experts. In fact, these exhibitions celebrated Italian professionalism in a highly specialised field at an international level, functioning as a catalyst for the development of post-war conservation guidelines.

The 1946 New York exhibition and its catalogue had a lasting impact on the '1950 Rome Reconstruction Exhibition (Mostra Della Ricostruzione Nazionale Roma 1950)'. The latter was organised and held at Palazzo delle Esposizioni from 27 January 1950 to 26 July 1951. It was accompanied by a publication, *The Reconstruction of the Italian Artistic Heritage (La ricostruzione del patrimonio artistico italiano)*, which was released on the occasion of the V General Conference of UNESCO in Florence in 1950. Unlike its predecessor, the Rome exhibition of 1950 represented a point of reflection and fine-tuning of the value, methodology, and operational methods that reconstruction and restoration had in the five years following the end of the conflict.[18] The 1950s exhibition shows the progress and positive image of Italian reconstruction with a stronger sense of national pride.

These post-war exhibitions played multifaceted roles in raising awareness, promoting diplomatic endeavours, and fostering nation-building for Italy on a global scale. They exemplified early translational financial aid for heritage, documented the evolution of conservation guidelines, and illuminated the intricate facets of Italian post-war national identity in transnational dialogues. Acting as conduits for cultural exchange and renewal, these exhibitions symbolise Italy's journey from devastation to renewal in the aftermath of war and dictatorship. They stand as testaments to the resilience and creativity of the Italian people, serving as a bridge between the past and the future.

In conclusion, these post-war exhibitions served as powerful tools for transnational connections, contributing to fundraising, shaping conservation guidelines, and influencing national identity. They mark a significant chapter in Italy's cultural and diplomatic history, reflecting its emergence as a global leader in art restoration and heritage preservation. ■

BIOGRAPHY

Jiayao Jiang is a PhD student in Italian at the University of Cambridge in the UK. She received the AHRC Collaborative Doctoral Award for her research project on the post-war urban heritage of Rome. She has been awarded full international grants for academic research programs in the USA and Belgium for cultural heritage studies. As a dedicated member of ICOMOS-China, she has participated in several restoration projects for modern heritage. Moreover, she has enriched her expertise through working in the ICCROM in Rome for World Heritage and Capacity Building, and in the UNESCO Amman office in Jordan for World Heritage management.

CONTESTED MODERNITIES: ARCHITECTURE AND PROPAGANDA IN THE *EXPOSIÇÃO NACIONAL DO ESTADO NOVO* (RIO DE JANEIRO, 1938)

CATARINA FLAKSMAN
HARVARD UNIVERSITY

ABSTRACT

In 1938, Rio de Janeiro became a stage for the *Exposição Nacional do Estado Novo*, a propaganda exhibition intended to present Getúlio Vargas' project for a "New Brazil" to the masses. The exhibition showcased the work of various government agencies through photographs, graphics, drawings, and scale models. Architecture was particularly mobilized, through built and unbuilt projects, to materialize a national identity aligned with the interests of the state. No other project would attempt to represent the ideological aspirations of the new regime as much as Cidade Universitária do Brasil (CUB), the country's first national university. Prominently displayed inside a pavilion dedicated to the work of the Ministry of Education and Health, the university was, at the time, the flagship project of Minister Gustavo Capanema. Drawing from archival materials, this paper questions the political function of the presentation—and representation—of architecture in the context of Brazil's incipient state-led project of modernity. The exhibition's installation photographs expose a moment of tension within the regime, when conflicting projects coexisted as if part of a harmonious whole. Expanding beyond a traditional architecture exhibition, this paper explores the intricate relationship between architecture and politics through mechanisms of display. Materializing the "culture wars" taking place within the new regime, as historian Daryle Williams put it, the exhibition points to the involvement of architects—including Lucio Costa, Oscar Niemeyer, and Marcello Piacentini—in the construction of the Estado Novo's ideological project. An analysis of the *Exposição Nacional do Estado Novo* reveals the entanglement of architecture exhibitions and state propaganda at a time when fascism, modernization, modernism, and mass media converged. Yet, despite its authoritarian context, the exhibition reveals the disputes, negotiations, and uncertainties that defined the political moment of Brazil and the world on the eve of the Second World War.

1. INTRODUCTION[1]

On December 10, 1938, the capital city of Rio de Janeiro became a stage for the display of Brazil's new authoritarian, nationalist regime with the inauguration of a large-scale exhibition. The *Exposição Nacional do Estado Novo* showcased the work of various government agencies in a series of pavilions located amid the ongoing modernization of the city center.[2] Architecture was particularly mobilized, through built and unbuilt projects, to materialize a national identity aligned with the interests of the state. One of the exhibition pavilions was dedicated to the work of the Ministry of Education and Health.[3] Inside, architectural models, drawings, photographs, and graphics introduced its activities to visitors, encompassing education, culture, health, and social assistance. Prominently displayed within the section dedicated to education was the Ministry's flagship project, Cidade Universitária do Brasil (CUB), which would become the country's first national university.

A photograph of Minister of Education and Health Gustavo Capanema showing the model of the university campus to President Getúlio Vargas during his visit to the exhibition's inauguration is telling **(Fig. 1)**. Published in the widely-circulated magazine *O Cruzeiro*, neither the photograph nor its caption revealed details of the project, pointing to the tension and uncertainty that characterized the design process at that time, but also revealing the mobilization of architecture as propaganda.[4] The model represented the only architectural project on the magazine's pages, and its politically charged function was reinforced by images of Vargas, military men, and nationalist symbols surrounding it. Architectural representation was seen as sufficiently concrete to give form to Vargas' regime, materializing its ideological project. Centered on Vargas as the embodiment of the state, the photograph suggests the intertwining of nationalism, militarism, and education, a mark of the regime and the basis of the *Exposição*. As a result, the university project was shaped by, and intended to give shape to, these same concerns.[5]

Despite the centralizing tone of the propaganda exhibition, a closer look at the display of CUB unveils a moment of tension within the regime, when two competing architectural projects for the future university were displayed side by side. At a time marked by ideals of national unity and authoritarianism, their presence reveals contested visions of modernity coexisting within the recently established Estado Novo.

2. THE EXHIBITION AS A SITE OF NATION BUILDING

The period between 1935 and 1938—which coincides with the conception and design of CUB—was characterized by a search for direction that included the embrace of fascism as a model of nationalist modernization and cultural regeneration.[6] In power since 1930, Vargas cancelled the elections and instituted the Estado Novo as a dictatorial regime on November 10, 1937. To craft a new, modern, and unified identity for the country based on the incipient notion of *brasilidade*, or Brazilianness, the state became both arbiter and promoter of cultural production.[7] The Ministry of Education and Health, created in 1930, inaugurated the

2. The exhibition reused structures on the fairgrounds of *Feira de Amostras*. Hugo Segawa, "Cenário de modernidades: a Feira Internacional de Amostras do Rio de Janeiro," Resumos: Arquitetura Moderna Brasileira. 25 anos do Docomomo Brasil, 2019.

3. Other pavilions included labor, war, justice (with an anti-communist exhibition), treasury, roads and public works, agriculture, foreign affairs, and the navy.

4. "O Brasil no Novo Regime," *O Cruzeiro*, December 17, 1938: 30-31. The image caption reads: "Minister Gustavo Capanema explains to Mr. Getúlio Vargas details of Cidade Universitária in the Pavilion of the Ministry of Education."

5. Religion and anti-communism were complementary fields of action within the regime, also shaping CUB's pedagogical project. See Renato Amado Peixoto and Cândido Moreira Rodrigues, "O catolicismo no Brasil do período Vargas: imbricações entre religião, política e espacialidade (1930-1945)" and Rodrigo Patto Sá Motta, "O anticomunismo católico e a ditadura de 1937," in Leandro Pereira Gonçalves and Maria Inácia Rezola, *Igrejas e ditaduras no mundo lusófono* (Lisboa: Imprensa de Ciências Sociais, 2019).

6. With Mussolini's rise to power, the fascist regime sought a more active influence on the Italian population overseas, and between 1923 and 1942 it established international cultural policies targeting the Italian-Brazilian community. Italian influence faded when Brazil joined the Allies during World War II. Although not state-sponsored,

state's interventionist approach to culture, which would intensify under Capanema's leadership between 1934 and 1945.

Historian Daryle Williams introduces the notion of "culture wars" to define the fight for nationhood present within state-sponsored cultural institutions and projects supposed to represent *brasilidade* as the imaginary promoted by the state. As a political strategy, Capanema's emphasis on the collective construction of a national cultural project provided space for some degree of intellectual and aesthetic experimentation within the state apparatus. Bringing together artists, intellectuals, educators, and architects who understood that "managing culture could be a powerful weapon in managing Brazilianness," Capanema embraced culture and education as vehicles for state-controlled ideologies and, at the same time, negotiated with groups from both ends of the political spectrum.[8]

This fight for national representation materialized in space, through the many government buildings emerging in the center of Rio. The inauguration of the Ministry of Education and Health headquarters (1938-1945) consolidated Capanema's image as the progressive patron of modernism and contributed to establish modern architecture as the national style. However, in parallel with its construction, and only a few steps away, buildings such as the art-déco Ministry of Labor (1938) and the Ministry of Finance (1943), with its neoclassical entrance portico, emerged as competing visions of modernity.[9]

Despite Vargas' goal to create a unified national image, the culture wars taking place in the city would be staged once again, through architecture, but now in the space of an exhibition. Aware of the power of exhibitions as sites of nation building, the state's emerging propaganda machine inaugurated its vision for "a New Brazil" with the 1938 *Exposição Nacional do Estado Novo*, organized by the Ministry of Justice—then led by Francisco Campos and his chief of staff, Francisco Negrão de Lima. Campos, one of the most vocal supporters of fascism within the regime, and with strong ties to the Catholic Church, played a fundamental role in the conception of the Estado Novo and its repressive policies, taking charge of the state's propaganda.[10] In an inauguration speech for national daily radio transmission *Hora do Brasil*, Negrão de Lima laid the objectives and strategies of the *Exposição*:

> *(…) Having a doctrinal orientation, the Estado Novo exhibition will be an exposition of ideas, seen through their objectification in concrete works and facts (...) It will be grandiose and will surprise those who see, in the simplicity of its eloquence, the pictures, maps, models and illustrations that represent, in a panoramic cut, the results of the construction operated in national life by the founder of Estado Novo*.[11]

As clearly stated, the exhibition was mobilized as a medium to indoctrinate the masses, ultimately serving as a propaganda tool to strengthen the new regime, embodied in the figure of Vargas. The use of exhibitions as a political tool cannot be dissociated from other contemporaneous exhibitions, including the 1937 Paris International Exposition, but particularly those

cultural exchanges with Italy marked the development of modern architecture in Brazil. Piacentini had a direct impact on the training of architects including Rino Levi, Gregori Warchavchik, and Lina Bo Bardi, all of whom studied in Rome during the 1920s and 1930s. See Renato Anelli, "O mediterrâneo nos trópicos" (1999), in Abilio Guerra (org.), *Textos Fundamentais sobre história da arquitetura moderna brasileira - parte 2* (São Paulo: Romano Guerra, 2010), 219-235.

10. Emerging in 1934 as the Department of Propaganda and Cultural Diffusion, it became the National Department of Propaganda before being replaced by the Department of Press and Propaganda (DIP) in 1939, active until the end of the regime in 1945.

11. "Inaugura-se, hoje, a Exposição Nacional do Estado Novo," *Jornal do Brasil*, December 10, 1938.

of fascist Italy: from the seminal 1932 *Mostra della rivoluzione fascista*, celebrating the tenth anniversary of Mussolini's regime, to the 1937 *Mostra Augustea della romanità*.[12] These "political exhibitions," as cultural historian Jeffrey Schnapp defines them, represented a shift from nineteenth-century museums to twentieth-century temporary exhibitions as sites for nation-building. The historicism of museums, based on a positivist view of scientific knowledge addressing educated elites, gave way to populist calls to mass mobilization through impermanent exhibitions "where myths of origins could be created, disseminated, and venerated, and genealogies linking the present to the remote or recent past be forged."[13] Exhibitions became an important site for the creation and dissemination of what political theorist Roger Griffin identifies as the palingenetic myth of national rebirth, which underpinned not only Mussolini's fascist regime but also Vargas' Estado Novo.[14]

The role of *construction* was fundamental to the narrative of renewal promoted by fascist Italy as well as by the *Exposição*, as revealed in its inauguration speech. Architectural and infrastructural projects—represented by drawings, photographs, maps, and especially scale models—served as "concrete" proof of the regime's actions, physically transforming the territory and giving shape to the new nation, even if restricted to the realm of imagination. As with the architectural projects on display, the exhibition itself—and the mythical narratives it constructed—helped legitimize the ideological project of the new regime. With wide national coverage in the radio, newspapers, and magazines, the *Exposição* served as a public display of nationalist strength.[15]

3. CULTURE WARS AT CIDADE UNIVERSITÁRIA DO BRASIL

Educational reforms were key for the construction of a unified identity based on *brasilidade* and included the creation of a national university.[16] The pedagogical and architectural project for Cidade Universitária do Brasil, a new city within the city, would serve as a model for the country. Its process, however, was marked by conflict from the start. Although unrealized, the project mobilized a network of local and foreign architects, engineers, government officials, educators, and intellectuals who oftentimes negotiated personal, national, and international agendas. For the Brazilian state and its broad array of collaborators, drawing from foreign ideological and aesthetic models required strategies to translate, interpret, and construct a "Brazilian version" able to represent a new imaginary of *brasilidade*. This was the task that, each in their own way, the three unbuilt projects for CUB, designed for a site at Quinta da Boa Vista, attempted to undertake: the first, a 1935 commission to Italian architect Marcello Piacentini with Victorio Morpurgo, approved in 1938; the second, an arguably unsolicited 1936 proposal by French-Swiss architect Le Corbusier that was immediately rejected; and, finally, an alternative project by Lucio Costa and a team of Brazilian architects presented in 1936 and officially rejected in 1937.[17]

Despite its rejection, a year later the Brazilian project was displayed, through three perspective drawings, side by side with Piacentini's models and

detailed drawings inside the Ministry of Education and Health pavilion in the *Exposição*, as if part of a cohesive plan **(Fig. 2)**. Emblematic of the period's culture wars, the display of CUB sheds light on the tensions within Capanema's Ministry and the regime at large at a time of political instability on the eve of World War II. While the Ministry's modernist headquarters broke ground a few blocks away from the *Exposição*, Capanema was still fully invested in the construction of the university campus modelled after Piacentini's classicist Città Universitaria in Rome, inaugurated in 1935 for Mussolini's regime.[18]

Occupying a corner of the pavilion, the display of CUB prominently presented Piacentini and Morpurgo's project. Sent from Italy after being displayed in the Brazilian Embassy in Rome, three large wooden models showed a general view of the campus, a detail of the central rectory plaza, and a section of the stadium and its connecting bridge. In addition to a masterplan, rendered drawings on the surrounding walls showed detailed views, including the rectory plaza and the "Beacon of Latin Civilization" **(Fig. 3)**.[19] The Italian project was marked by classicism in its connection to Roman Imperial tradition through a sense of order, symmetry, and solidity. The Brazilian project, on the other hand, was presented through three line drawings prominently displayed on one wall, showing views of the central avenue filled with palm trees; the auditorium facing the rectory and library tower; and the entrance portico accompanied by a larger-than-life sculpture of a standing figure.[20] Led by Lucio Costa, the Brazilian team included Affonso

18. Flavia Marcello and Paul Gwynne, "Speaking from the Walls: Militarism, Education, and Romanità in Rome's Città Universitaria (1932–35)," *Journal of the Society of Architectural Historians* 74, no. 3 (September 1, 2015): 323-343.

19. Marcos Tognon, *Arquitetura italiana no Brasil: a obra de Marcello Piacentini : história, catálogo, documentos* (Campinas, SP: Editora da Unicamp, 1999).

20. Their project had been rejected on March 12, 1937, in accordance with Capanema. Otavio Leonídio, *Carradas de razões: Lucio Costa e a arquitetura moderna brasileira, 1924-1951* (Rio de Janeiro; São Paulo: Editora PUC ; Edições Loyola, 2007), 192-194.

Eduardo Reidy, Oscar Niemeyer, Fernando Firmino Saldanha, Jorge Machado Moreira, Ângelo Bruhns, José de Souza Reis, and engineer Paulo R. Fragoso.[21] Aligned with Le Corbusier's modernist principles, especially the use of *pilotis* to raise the buildings from the ground, the Brazilian project envisioned the establishment of the "new architecture" Costa advocated for since as early as 1934.[22] Although adopting different strategies, the Italian and Brazilian projects shared a monumentality that could explain their presence in the *Exposição*.

4. CONCLUSION

Despite their formal differences and impossible reconciliation, the two projects for CUB displayed side by side suggested alternative directions for the materialization of a national imaginary that was still under construction. Their coexistence in the propaganda exhibition could result from the regime's efforts to conceal its reactionary, authoritarian politics through images of integration, freedom, and collaboration, mobilizing architecture—and its representation—as a mediator. Alternatively, the display could be a consequence of the continuous resistance and persuasion of Brazilian modernist architects, especially Oscar Niemeyer, who might have gained agency to include their project in the exhibition pavilion.[23] While the reasons for the display of the two projects remain unknown, their presence reveals the efforts, by both architecture teams, to negotiate foreign ideological and aesthetic models in the crafting of a national identity that could represent the future nation envisioned by the Vargas regime.

In the context of the *Exposição*, the architectural images on display represented the aspirations of the state, producing a collage that was perhaps unnoticed to most visitors. The fragmented images of select views and buildings allowed the exhibition to entice the audience to imagine Cidade Universitária do Brasil as a representative of the regime's modernizing and ambitious agenda, which included the construction of a "new Brazilian man." Whether drawing from the classical tradition of Imperial Rome and the idea of a Latin civilization or from international avant-garde modernism aligned with a Brazilian colonial tradition, the representations on view emphasized the project's monumentality, dominance over nature, and European roots. While Piacentini's design evoked the strength and discipline sought by the Estado Novo by mostly dismissing local particularities, the Brazilian project negotiated the monumentality of its central axis and entrance portico with more open and intimate spaces, creating a somewhat welcoming and familiar environment. Together, the two visions for the project provided an ambivalent image of both the "eternal" and the "Brazilian character" that Capanema sought from the start to represent the "grand intentions" of the government.[24] ■

23. In a letter from January 30, 1939, Capanema thanked Niemeyer (and his team) for his "technical cooperation" in the organization of the Ministry pavilion. Arquivo Gustavo Capanema, FGV CPDOC. This could also explain the pavilion's modernist ethos, visible in the wrapping of the existing art-déco building, the addition of a marquee, and biomorphic graphics.

24. Capanema expressed these intentions in an early meeting of Escritório do Plano da Universidade, a group responsible for determining the program and structure of CUB. Meeting report, July 22, 1935. Arquivo Gustavo Capanema, FGV CPDOC.

BIOGRAPHY

Catarina Flaksman is a PhD candidate in History of Art and Architecture at Harvard University. Her research explores the intersection of architecture and media in the construction of cultural and political imaginaries of twentieth-century projects of modernity. Her dissertation focuses on the mobilization of architecture exhibitions in Brazil's cultural politics from the 1930s to the 1960s. Flaksman holds a master's degree in History of Art and Design from Pratt Institute, New York, and a bachelor's degree in Architecture and Urbanism from Pontifícia Universidade Católica of Rio de Janeiro.

REMAPPING MODERNISMS: CONTEMPORARY DEBATES

RUTH VERDE ZEIN
MACKENZIE PRESBYTERIAN UNIVERSITY, SÃO PAULO, BRAZIL

PATRÍCIA SANTOS PEDROSA
UNIVERSITY OF BEIRA INTERIOR + CIEG-ULISBOA, PORTUGAL

ABSTRACT

This text discusses the need to redefine modern architecture, considering expanded global knowledge and contemporary perspectives, challenging outdated canonical narratives. It highlights the exclusionary nature of current definitions, which overlook contributions from diverse social frames, such as geographies, gender, and race. Authors advocate for a post-colonial approach, emphasising the cultural subjugation inherent in colonial narratives and the necessity of de-hierarchizing Eurocentric knowledge. Expanding research data on modern architecture prompts a revaluation of teaching and research methodologies, advocating for inclusivity and critical awareness. The text questions the feasibility of creating an all-encompassing compendium of knowledge and suggests adopting new, more collaborative approaches rooted in neural network-like structures rather than hierarchical taxonomies. It emphasises the need for a paradigm change and explicit scrutiny of canonization processes to foster a contemporary understanding of modern architecture. The session aims to contribute to this effort by proposing non-hierarchical, non-patriarchal, and non-racist perspectives rooted in post-colonial and feminist critiques, fostering international collaboration to support the valorisation and conservation of modern architectural legacy.

1. INTRODUCTION

An International Docomomo conference in Latin America presents an opportunity to reflect on the very definition of modernity and modern architecture from diverse points of view. In the last decades of the previous century and the first decades of this one, international knowledge about 20th-century architecture has been significantly expanded, following in-site and archival research held by scholars worldwide. This recognition makes it increasingly clear how canonical history books, written decades ago by prestigious authors and used worldwide as references to the situate Modern Architecture are outdated. Albeit very important and still very useful, these narratives are incomplete, of insufficient temporal and geographical range, and blind to the debate of gender and race issues, which are indispensable from a contemporary point of view. Yet – perhaps for lack of other options –we still rely upon them to define our current conceptual definition of "Modern Architecture". It is an uncomfortable situation that must be questioned. It is necessary to expand our awareness, to remap, reframe, and perhaps re-date what should be defined and comprised as "Modern Architecture". Revising the established propositions, reframing the habitual debates, and rethinking our teaching and research studies' scope and focus is unavoidable.

On many levels, a broadened basis for understanding what we should consider as full-status "Modern Architecture" is of utmost importance. We need to repropose its theoretical and technical study as a fundamental trait to establish a proper basis for the reconnaissance of its heritage status, thus ensuring its importance as a meaningful cultural legacy, on the worldwide stage. Modernity in Architecture must no longer be understood as primarily belonging to a given place, assuming a secondary role to any other different places. As stated by philosopher Agnes Heller, for good and evil, "Modernity is general; it steamrolls over the entire Earth"[1]

2. FROM CANONICAL TO POST-COLONIAL

After the enormous efforts of research being prompted everywhere, during the last decades' knowledge expansion, it is becoming increasingly anachronistic to keep working on a fixed and restricted definition of Modern Architecture. Especially when its canonical version only considers and includes, in its "mainstream", some chosen social frames and their built examples, whose characteristics and descriptions only conform to the deeds that may be found in some given places, countries, regions, or continents. The current canonical definitions of "Modern Architecture '' are exclusionary and restrictive, seldom considering the often-hidden contribution of women architects, engineers, and learned clients. Its structure and boundaries are not tuned with contemporary post-colonial challenges, and it is not wise to keep ignoring the necessity of de-contaminating our field, and any heritage studies, from their (often unconscious, but still present) colonial mentality, which we now realize are imbued in the previous century canonical definitions.

That challenge has been considered, for example, by authors such as UNESCO-Heritage specialist, Maria Pia Guermandi, in her book "Decolonizzare il Patrimonio":

1. Agnes Heller, *A Theory of Modernity* (Oxford: Blackwell Publishers, 1999), 4.

> *Colonial domination was not only exercised as military and political possession, and exploitation of the resources and men of the colonies, but it implied, more profoundly and more lastingly, a cultural subjugation functional to the pursuit of such domination. […] The colonial project can be interpreted as a project of cultural control through which colonizers transformed colonized societies. […] The creation of new categories and oppositions – modern/traditional, civilized/primitive, Europe/Asia – was not a unidirectional process, but produced permanent cultural changes in the colonizing societies.*[2]

Her position suggests that the expansion of Modernity (as in Heller's definition) did not exclusively affect the so-called "periphery" but also, with the same intensity, the supposed "centres." If that is so, a contemporary redefinition of "Modern Architecture" is not only necessary for the "inclusion" of "others": the necessity of repurposing it is for the benefit of all parts involved—which are, literally, the whole world.

Within the colonial system, cultural heritage will take on a dual role, both as a testimony to the superiority of the white man, and as heir of the great civilizations of the past, and as regards the cultural heritage of colonised populations, as a form of knowledge for more effective management of colonial power. And it will continue to be used as an instrument of symbolic power […] In the cultural sphere, Eurocentric knowledge, with the resumption of universalism, imposed the canon that regulates the understanding and controlling of the heritage of the "other"[3].

In that light, the so-called "universal" definitions are shown their true colours: they stem from former colonial powers and their institutions. In a post-colonial world, they must be reconsidered and de-hierarchized, if they are to be able to survive another generation.

The accumulated research data, brought forth by scholars working on all continents, in the last decades of the 20th century and the first decades of the 21st century, on Modern architectural features – buildings, sites, entire cities, parks, neighbourhoods, furniture, objects, etc. – should not be added as marginalia, or to "update" existing canonical books. As it often happens, neither should it be relegated to a secondary chapter, or an appendix, to a consolidated (and thus, supposedly untouchable) history handbook. It must be carefully considered and accepted as a fundamental basis to broaden our understanding of Modern Architecture, what it entails, and what it is about.

The attitude of accepting the change is not only for the benefit of the "others". We should be enlightened by the expanded knowledge about Modern Architecture to reconsider what needs to be encompassed in its content. To be effective, it must affect our conceptual ideas, worldwide, to activate the establishment of new revised enlarged boundaries that are expanding our field. Such endeavour is – or must be considered as – an essential basis to debate and propose more adequate definitions of Modern Architecture, apt and in tune with 21st century best expectations.

2. Maria Pia Guermandi, *Decolonizzare Il Patrimonio. LÉuropa, LÍtalia e un passato che non passa* (Roma: Lit Edizzione, 2021), 33.

3. Guermandi, *Decolonizzare Il Patrimonio*, 33.

Modern Architecture, its definition, is still limited by 20th-century canonical narratives definitions. Changing that situation is a complicated task, as has already been discussed by several authors, since at least the 1990s.

> *The construction of canonical narratives is a dated historical event, but as its prevalence is still ubiquitous today, they are also a present-day issue. This historicity/present-day dual condition makes it a complex subject to deal with comprehensively and systematically. The pervasive nature of the canon renders us unaware of its presence, and due to its virtual invisibility, we tend to lean on its mandates and boundaries, perhaps for the lack of something else to rest on.*[4]

3. RECONSIDERING GENDER ISSUES

The reconsideration of the prestigious pioneering canonical histories is a most important debate. It will also reveal, expose, and review women's contributions, and our role in the establishment, propagation, and consolidation of Modern Architecture, worldwide.

Recent global events have highlighted a special emphasis on a worldwide awareness of women's rights status. Its critical reflection claims a place in all fields of knowledge. It regards fundamental human rights and opens tensions, contradictions, uncertainties, possibilities, and discussions in architecture and related disciplines.

> […] Architecture operates at the intersections of various elements *depending on contingencies, and contexts at a particular place and time. This field deals with a wide set of power and production relations and must face a complex set of cultural, political, and economic factors, representation systems, objects, forms, and meanings. […] The International Conferences on Gender and Architecture (ICGA) have created a pioneering space for meeting and debating about this need to question hegemonic positions and to meet unattended challenges.*[5]

According to the reflections of geographer Linda McDowell, it is crucial to be aware of power relations prevalent in knowledge creation. It is vital to reconsider methodologies that must be more collaborative, in some way open-source, and capable of extending beyond academia. Given that there is no neutrality in pursuing meaning in the narratives we build, it is necessary to question the power dynamics behind those who create the narratives and how they choose to present them. Narrators, narratives, and the narrated embody complex dimensions of power, and therefore, a dynamic and critical dialogue between "committed knowledge" and assumedly "positioned" and partial knowledge, with its critical dimension, is fundamental[6].

The new data that has been recently gathered tends to expand and accumulate exponentially, prompting the necessity of addressing some pressing theoretical questions. On the other hand, the existing, so-called "consolidated" data should not be kept as a fixed standpoint. The debate should be extended

into the canonical realm, reviewing it from an essentially critical standpoint. The (un) desired effect of the expansion of the field – and its critical awareness – is a general destabilisation. Not even supposed fixed data – like the names of authors, and the dates of the buildings – are not completely safe from that. The data expansion is putting forth an important conceptual pressure, making us acknowledge that nothing may be as it seems. Keeping our eyes "wide shut" to avoid the pain of dealing with this debate is not an option anymore.

4. DEALING WITH CHANGE

All that opens some important issues. The first would be – how is it possible to include "everything"? How would it be possible to create a comprehensive, all-inclusive compendium to amalgamate every knowledge possible? Wouldn't it be doomed to be incomplete, even before it is published? This is a quite common question. It is frequently addressed by professors, who are rightly concerned about Architectural History teaching. To try and answer these questions, one must first question the (implicit) premises.

Agnes Heller proposes that "The universal history (grand narrative)", or "the one single history, written with a capital H – namely, the world history of the human race as such" is a characteristic type of narrative from a stage she denominates as "historical consciousness of reflected universality", where "the universalization of man is the universalization of history (or civilization), or a so-called "consciousness of world-history". It seems correct to identify such stage with what we call the history of "modernity" in architecture on the 19-20th centuries, as it complies with Heller's considerations when she states that at this stage "all human histories are unified under a universalistic concept which contains past, present and future". It is also quite evident that the perfected device to consolidate such "universalistic unification", in architecture, is the general treatise, the supposedly "all-inclusive" History compendium.

Thus, the question of the difficulties in creating a unified "history" encompassing "everything" stems not from an unavoidable challenge but from such a precise (and perhaps outdated) conceptual frame of mind.

> The general treatise on any given scientific or artistic field is neither a natural nor a neutral thing. It is a device created to control and dominate the overwhelming vastness of knowledge opened to Europeans during the "Age of Discovery", from the late Middle Ages onwards. It emerges in the context of Europe's mercantilist and imperialist efforts to extract or mine all kinds of natural and cultural goods from every culture they encountered around the world. These treatises display a conceited attitude. They are the product of a "learned" person, located in a supposed geographical or Cartesian centre (an axis mundi if you will), from a position of power and distance, who believes to be entitled to freely appropriating any information available. Information that he would subsequently process, hierarchize, and organize, purging and pasteurizing all the data randomly received into a "scientific" way of thinking, dealing with all that knowledge in an almost disembodied way. […] We have been educated to believe that "treatises"

and "general compendiums" represent the most learned and "civilized" way of dealing with the incommensurable complexities of all aspects of the natural world, humankind included. Thus, it is easy to deem a book that is large enough a bona fide way of understanding everything there is to know about everything. By using them uncritically, we consent to and accept as normal, their way of reducing the world's cultural knowledge, diversity, and complexity in a fundamentally arrogant way[7].

The contents of what we teach in Architectural History classes and books have always been an editorial clipping. Many of us have been grounding our teaching on general treatises that were fundamentally biassed, genre and race-exclusionary, and geographically limited. Accepting and including the new worldwide data on Modern Architecture will not change our teaching. But it will make us aware that our teaching is not an absolute. From now on, we are rendered aware that we are not, and cannot, try to make sense of and teach all knowledge there is – as we have never done that.

A second question that is raised, when considering how to handle the increased amount of data concerning 20th-century Modern Architecture manifestations is how to hierarchize it. Should any information be treated as having the same importance as anything else? In this newly enlarged field, is it possible to define a new "taxonomy" – a scheme of classification, especially a hierarchical classification, in which things are organised into groups or types according to their importance? Or is the expanded critical awareness of the new research data on Modern Architecture incompatible with 18th-century biological metaphors and tree-like classifications (taxonomy, for instance)?

As a suggestion, perhaps we – professors, researchers, scholars, students, and book authors – should try using new (albeit imperfect) biological analogies. Like for example, neural networks – a novel idea whose translation to Architecture will certainly create other problems and perks. But at least it abandons positivistic vertical patriarchal hierarchic structures of understanding in favour of a more complex system, more apt to describe complex life and environmental crises, that the 21st realities are making us forcibly learn about.

Besides, every historical event is unique and contingent. According to Heller, when she analyses the contemporary postmodern frame of mind, "As far as human creatures and actors are concerned, there is no aim, no goal, no general direction, no necessity in the events which we normally sum up with the term 'history'"[8]. The taxonomic hierarchization of facts tends to be exclusionary following a "hidden teleology". The selection of facts to be used for a given purpose – a course, a text, a research study, a theoretical debate, etc. – is an unavoidable trait. No book, no class, and no article could feasibly include all that is already known on any given subject. All teleology, all the (subjective and objective) choices on what is or is not important to this or that situation – needs, at least, to be clarified.

5. CONCLUSION

There are certainly other difficulties and questions that will be opened by the expansion of our knowledge of Modern Architecture – and its corollary, the

7. Ruth Verde Zein, "It's not the canon, it's how you use it". *Dearq* no. 36 (2023): 39.

8. Agnes Heller, 1999, p. 6.

9. Ruth Verde Zein, 2023: 41.

revision of the supposedly already-known facts about it. The easiest and worst way out is to include new facts as appendixes, as secondary information. That precludes us from construing a contemporary understanding of what should be considered, from a 21st-century point of view, as "Modern Architecture".

> *If we want to open our field up to the possibility of a "paradigm change" we need to raise the awareness level about the canonization processes, make the processes involved explicit, and explain what they are and how they work. […]. If current canons are to change, they must be explicitly declared, questioned, criticized, and undermined*[9].

The use of established, settled, antiquated, patriarchal, and imperialist canonical narratives inherited from the 20th century, defining which examples merit being called "architecture" (especially, but not exclusively, in its modern and contemporary forms) hinders our understanding of the complexities, variety and vast array of methods used in architecture and urban environments around the world. It needs to be questioned, even if it will mean the necessity of taking a painstaking path with lots of work ahead.

Our session aims to contribute to a much more ample effort in pro of change. It is neither an individualistic nor easy task. Its goal is to take into serious consideration the diverse situations and challenges that the valorisation and conservation of Modern Architecture legacy demand on a worldwide basis. For that, we must question many a priori assumptions and skip the use of statical and outdated definitions that are in use in our field.

It may be wise to take our time, consider, and deeply debate the many aspects demanded by such a truly contemporary quest.

To contribute to fostering this debate, this session selected a few of the many interesting studies, all of them proposing some possibilities of devising non-hierarchical, non-patriarchal, non-racist, sustainable ways of remapping modernism+s, rooted in post-colonial critical and feminist perspectives permeating contemporary research efforts. The session hope is that they would convey fundamental devices and propositions, and be able to cooperate in collective, intercontinental, international collaborative ways to support Docomomo's present and future efforts and challenges. ■

THE NARRATIVE TRIAD OF NIKOLAUS PEVSNER: RECOGNIZING THE CONTENT PROFILE AND STRUCTURE OF THE BOOK *PIONEERS OF MODERN DESIGN*

TAÍS OSSANI
MACKENZIE PRESBYTERIAN UNIVERSITY, SÃO PAULO, BRAZIL.
SOUTHERN CROSS UNIVERSITY, SÃO PAULO, BRAZIL

ABSTRACT

The past, as the subject of historical writing, is textually represented in the form of narrative, where events are organized based on common elements of human understanding, even though the content varies in each case. It is simultaneously grounded in real evidence from the past in conjunction with imaginative aspects, as it is a construction of connections not set in the past but proposed in each present, by each author. In this reflection, it is possible to consider that a narrative textual shaping of the past presents a form constructed by the individual who shaped it, and its structuring is therefore a necessary action for understanding the content. It organizes the theme, values, and omits facts, proposes continuity to diverse elements, beyond the simple uncritical memorization of content. In this article, we intend to analyze the narrative structure of the book 'Pioneers of Modern Design' by Nikolaus Pevsner's, as well as the content design proposed by the author, with textual and graphical arguments, in the construction of a textual plot composed of three elements: originality, repetition, and validation, a triad of fundamental components in supporting canonical historiographies, especially panoramic ones. Therefore, this article aims to elucidate the narrative aspects of constructing this historical plot, based on the organization of the parts in which the content is divided, and the relationships proposed by the author through the selection of past events. This aligns with the bias of literary theories developed after the 1960s, which mythical views and revealed truths of authoritative historical discourses are questioned.

1. INTRODUCTION

Nikolaus Pevsner's book titled "Pioneers of Modern Design" was originally published in 1936 by the British publisher Faber and Faber. As the author states in the preface of the first edition, the book was prepared in the early 1930s when he was teaching a course on architectures of the 19th and 20th centuries at the University of Gottingen.

In addition to the original publication, were two other editions in the same language, as well as various translations and their respective editions. The second edition, in original idiom, was done in 1949 by the Museum of Modern Art in New York (MoMA), and the third edition in 1960 by Penguin Books, which included significant content additions. The second edition of 1949, added 53 illustrations (from 84 to 137 images), as well as corrections and suggestions provided by Philip Johnson, Edgar Kaufman Jr, Henry-Russell Hitchcock, and Alfred H. Barr Jr. The third edition, carried out more than 20 years after the original publication, received additions, corrections, and highlights to personalities, previously addressed in footnotes, mainly regarding topics outside the English and German context.

The narrative constructed by Pevsner (1936;1949;1960) comprises an argumentation composed of three elements: originality, repetition, and validation, in that order, a triad of fundamental components in the support of panoramic historiographies. Based on a bibliography well-known in the academic field of Architecture courses and continuing to be published, this article analyzes graphically and textually the structure and profile of the narrative plot, approaching the field of digital humanities, with the aim of understanding more pragmatic issues related to the movement of narrative time and its inclusion as an element of verifiability of the content presented[1].

2. THEORICAL APPROCHES

In the construction of narratives about the past, despite the various cuts and a certain movement in inclusion and omission of events[2], there exists a particular relationship between subject and object. Certain narratives, pseudo-collectives, are formed from a process of validation and acceptance of canonical readings, which include works and "mythical" personalities, legitimized by history itself as a disciplinary field. The field of study itself invariably chooses to reiterate the canons in panoramic narratives, while the inclusion of more specific themes and cuts appears in publications that deal with parts rather than the whole.

The historian, as responsible for this construction, selects and omits facts by establishing, from their point of view, the guiding thread of historical evolution, a *mainstream*. The *mainstream* uses devices such as precursors, pioneers, prophets to consider architectures in their contexts (Tournikiotis, 1999). The positioning of the architectural object in the narrative also adapts to these devices by considering it chronologically inserted from its origin, either by the period of construction or by the date of inauguration, as well as its derivations of influence and evolution.

The past, as the object of historical writing, is represented textually in the form of narrative, in which events are organized based on common

1. This article derives from the studies of the author's doctoral thesis: Ossani, Taís. Structuring Historiographical Elements: the subject that positions and the numerical markers that move seven narratives of architectural history. 2022. Thesis (Doctorate in Architecture and Urbanism) – Mackenzie Presbyterian University, São Paulo, 2022. Conducted under the guidance of Professor Dr. Ruth Verde Zein and co-guidance of Professor Dr. Ana Esteban Maluenda with an academic mobility period at the Polytechnic University of Madrid (CAPES-Print scholarship, process number: 88887.583996/2020-00)

2. Hayden White, La ficción de la narrativa. Sobre historia, literatura y teoría 1957-2007 (Buenos Aires: Eterna Cadencia, 2011)

elements of human understanding, although the content varies in each case. Stone[3] refers to narrative as a mode of organizing material in a sequential chronological order, focusing on the content of a single continuous story and its secondary entries. The events that compose the selected content of the narrative are facts present in the consideration of past realities, but the order in which they are exposed in each text does not necessarily represent any kind of "truthful connection," but rather possible modes of interpretation adopted by the subject organizing the text.

Time is one of the common elements that structure human understanding in historical narratives, as it is through it that the past begins to be understood consciously. This use is not restricted only to an operation that the narrative, seen as a linguistic structure, favors. In a way, it also attributes a credible condition to the discourse by presenting the architectural object as an entity closer to the condition of "fact in itself," and not only from a circumstantial interpretation of it.

Thus, it is possible to understand that, despite the narrative (written) being constructed from a selection of facts, the act of constructing it is not only about memory, knowledge, and inclusion. It is mainly about how to organize them in an operation of a mental instrument for constructing reality, even if this representation or instrument only achieves verisimilitude[4], by saying that the truthfulness of the narrative is not a result solely of its verifiability condition. The acceptance of a narrative does not necessarily depend on its correct reference to reality, but rather on the status of verisimilitude, by the apparent true relationships it establishes and by whom the speech is made.

3. PROFILE: SKETCHING THE CONTENT

The book "'pioneers of modern design" is organized into seven thematic chapters divided into the following titles: "Theories of Art, from Morris to Gropius", "From 1851 to Morris and the Arts and Crafts Movement", "The Painting of 1890", "The Art Nouveau", "Engineering and Architecture of the 19th Century", "England: from 1890 to 1914", and "The Modern Movement before 1941". Pevsner sketches his narrative based on three elements: originality, repetition, and validation. In this configuration, he establishes, with each chapter entry, the personalities or events that will conform as origins or pioneers within the argument presented. Although he repeats this procedure in each chapter, these symbolic figures or events return in the narrative at other times to configure other relationships in this plot, thus, the plot goes back and forth several times in relation to content and time.

The pioneering personality of Pevsner's narrative centers on the figure of William Morris, a localized and English action. He is presented in almost every chapter as a direct influence on thematic events or as a reminder of a pioneering role that enabled developments in the actions of other artists or architects. Detaching again the meaning of narrative, according to Stone[5], the repetitive presence of Morris could give the book a focus in a continuous and unique story, with secondary entries, which in this case is the partial universe

5. Stone, "The Revival of Narrative: Reflections on a New Old History"

of modern design that revolved around Morris, always and exclusively in the context of a section of Europe, with few entries of American content **(Fig1)**.

A mental construction of reality in a narrative has imaginative steps, that combine real events with a good or believable story. White[6] remind us that a "narrative might well be considered a solution to a problem of general human concern, namely, the problem of how to translate knowing into telling". In how to put a human experience into a center importance of collecting knowledge and get consciousness of humanity. White (1980) continue his argument introducing that is difficult to understand some specify traces of other culture but is less difficult to understanding a story coming from another culture. Which suggest that "far from being one code among many that a culture may utilize for endowing experience with meaning, narrative is a metacode, a human universal on the basis of which transcultural messages about the nature of a shared reality can be transmitted"[7]

In Pevsner's narrative, highlighting the pioneering human creator in the figure of Morris, even within an English context and restricted to a few European countries, determines that from him, an entire repertoire of modern design becomes possible. At the time it was written, and perhaps even today, this way of storytelling symbolizes a deterministic human need to believe in another as a mythical figure, a savior, and a break from reality. Believing in doubt, resilience, and in process does not create a good story. It opens a space for uncertainty and chance — difficult words for the vocabulary of human belief, which is secure and often inert. Narratives about the past, in addition to dealing with issues of credibility, also involve moments of editing, acts, and choices that favor certain subjects and contexts. This goes in the opposite direction of what knowledge is — independent, diverse, and never fully satisfied.

White[8] presents that "narrative becomes a problem only when we wish to give to real events the form of story. It is because real events do not offer themselves as stories that their narrativization is so difficult". The past events are loose in a tangle of chronological time, and the human experience is looking for true story instead of a real story.

The profile of Pevsner narrative can be considered like a chronical[9] which events are not simply listed in a chronological sequence but are listed to tell a story. An imaginary one, with no end. "More specifically, the chronicle usually is marked by a failure to achieve narrative closure. It does not so much conclude as simply terminate. It starts out to tell a story but breaks off, it leaves things unresolved or, rather, leaves them unresolved in a story-like way"[10] . To construct a book about "the pioneers", Pevsner elected an origin and continue his narration with a lot of "breaks" in time, the argument only continues to get voice of the origin, reinforcing their importance with a selection of followers.

4. STRUCTURE: PARTS OF A WHOLE

Understanding the book through its organization, three moments are identified. One of them is introductory, where the characters of the plot are presented, the second is composed of the central chapters of the book where the plot of the argument unfolds, although dispersed, and the third, is

represented by the two last chapters, in which is a path of advancement of the pioneers in the modern movement.

The introductory moment (composed by the first chapter) present theoretical insights on the surface of the content, identifying the key pioneers addressed throughout the narrative, something that, from the interpretation of this article, could be configured as an introduction to the theme that will compose the content corpus of the book.

The second moment is composed of the following four chapters. From the second to the fifth chapter, all address different themes, which approach the three lines of progress highlighted by Pevsner. It is also possible to identify a fourth line of progress, highlighted by painting treated as a separate chapter, distinct, but at the same time primordial, in the transformations of architecture and design.

The third moment begin with the sixth chapter when several of the contents are repeated, scattered throughout the previous chapters to reinforce the country's pioneering role in the actions that composed the beginning of the modern movement, which could be scattered in the second chapter as a possible "continuity"/repetition of post-William Morris, since progress is something desirable within his argumentation. The end of the sixth chapter, which advances on urban aspects, draws a very promising parallel regarding Germany, Austria, the Netherlands, France, and, of course, England. If expanded and more detailed, this part could consolidate another theme. The seventh chapter exemplifying the representations that, fifteen years before World War I, contributed to progress, identified in the United States, France, Germany, and Austria, in the architectures of Peter Behrens, Frank Lloyd Wright, Josef Hoffmann, Adolf Loos, Hans Poelzig, Walter Gropius, and Mies van der Rohe, in the engineering of Robert Maillart, and in the industrial city of Tony Garnier. In the end, there is an indication for a possible direction within the Modern Movement from the works of Le Corbusier.

Objectively, there is a "natural" sequence present in the book, as a complete published object composed of pages, one after the other, which determines the sequential positioning of events. But there are also minor connective sentences, either in sequence or distributed throughout the book, that reinforce this proposition, positioning correlations through vocabulary – for example, the words origin, influence, copy, etc.

Causal relationships, partially constructed throughout the narrative content, are also circumstantial due to issues of editing, memory, knowledge, among others. However, there are also linguistic resources that represent accumulation[11], repetition, and ruptures. Repetition presents elements of the same group of functions, conforming a validation or a cultural construction of what is proposed. The succession of events in chronological time creates a certain perception of sequentiality, generally ascending, which relativizes the chronological value and its progression. In this logic, there is a positioning and an attribution of meaning to events, placed at the beginning (origin), in the middle, and at the end (consequence) of the books, in actions that symbolize a mental construction of the past towards the future.

11. Bruner, "The narrative construction of reality", 18

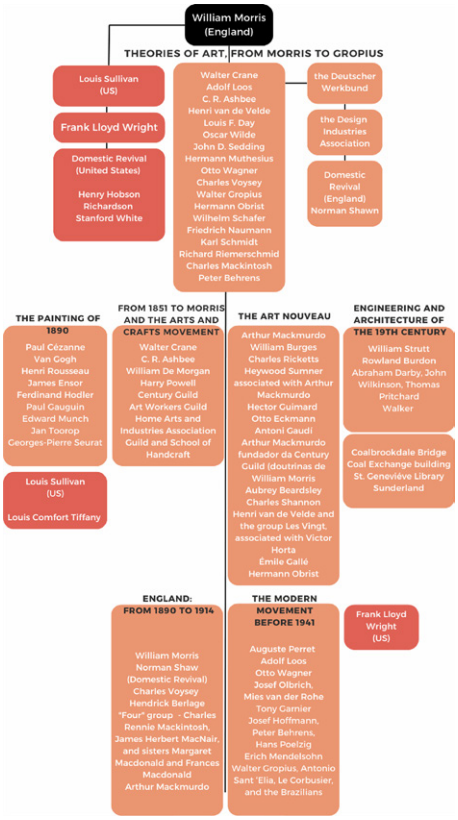

Figure 1. Diagram of a unique story, with secondary entries. Created by the author

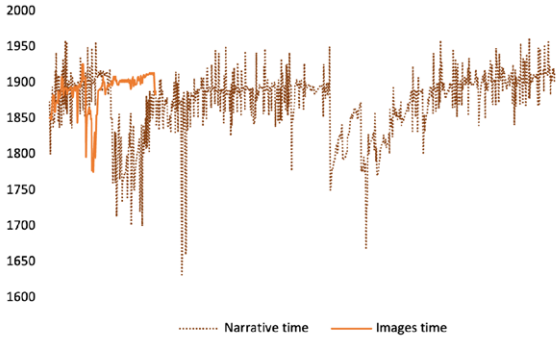

Figure 2. Chronological movement of time in Pevsner narrative. Created by the author.

Chronology, as a linguistic convention of writing and drawing, performs the supposedly linear computation of time, normally increasing, emphasizing this possibility. The idea of the ascendancy of chronological time linked to the progress of the central theme of the narrative becomes more clearly perceived. These partial connective actions only work and fit into the perception of verisimilitude because there is not, in fact, a single constantly ascending line in narrative time: different movements **(Fig. 2)** are necessary for the possible construction of the perception of what, on the surface and in appearance, might be accepted as true. Narrative time is sequential and oscillating, and it is not constantly ascending.

In the narrative triad of originality, repetition, and validation, Pevsner's story benefits from the back-and-forth movements in time, establishing dependent relationships among the selected personalities, forming a single continuous line with temporal movements that do not create a continuous ascendancy. On the contrary, like in a chronicle, it presents various thematic openings that, although included as arguments, can be replaced by others. The idea of constructing causal relationships even if they do not exist a priori brings the book closer to a believable story, easily memorable.

5. FINAL CONSIDERATIONS

Pevsner's persistence as the subject-author of his bibliographic work, even with the content review of the subsequent editions, sustains the line of reasoning

that affirms his own ideology regarding the written theme and how this textual discourse was constructed. The relationships drawn feed the evolution of the narrative, tying and stitching the content into a truthful transmission of the past. He truly represents the subject-author of his own narrative.

Looking back over the years, certainly many other architects and works have been studied, beyond those Pevsner knew and initially included in his narrative. Also, regions and themes that, up to that moment, were not areas of interest aroused curiosity or the "need" to be included because they had been addressed by authorities within the field of history validation. But even with these numerous inclusions, Pevsner mentions that the main point of his narrative has not changed, namely, the argument that Frank Lloyd Wright, Tony Garnier, Adolf Loos, Peter Behrens, and Walter Gropius were the ones who initiated the 20th-century style, and these later inclusions, such as the works of Gaudí and Sant 'Elia, were merely fantastic inventions of that time. Indeed, Pevsner's argument does not change throughout the book, the certainty that he was an authority on the subject due to his pioneering spirit, and possibly the circle of his peers that validated this achievement, allowed him to see his book as a compilation of statements on the subject, rather than an interpretation of the theme.

Thus, as the subject-author and a professor, Nikolaus Pevsner owns the affirmations that belonged to him. In the narrative constructed by him, his bias, the subjectivity of the textual construction of the content, and even the possibility of the veracity of the discourse are not evident. Pevsner holds certainty, originality, and the history told as an existing corpus. And thus, despite not presenting the method by which he selects the works and architects that would enter his discourse, throughout the book, the argumentation proposed by him is quite clear. ■

LINA BO BARDI: THE BAD AND THE UGLY -CONTEMPORARY FORMAL PROBLEMS

PATRÍCIA PEREIRA MARTINS
MACKENZIE PRESBYTERIAN UNIVERSITY, BRAZIL

ABSTRACT
Lina Bo Bardi has described the building of the São Paulo Museum of Art (MASP) as "bad and ugly", almost as an excuse for the real concern she had at the time in the search of an "architecture of freedom" rooted in daily life. In her words, "most people find the museum bad. And it really is. I wanted to do a bad design, I mean, formally and architectonically ugly, but a usable space. Something to be usable for people. And the free spaces could be created by the collective." Lina's refusal of the form is totally in tune with her fellow contemporaries, in a context that Argan has described as "the crisis of Art as European science" (1993). Jean Dubuffet, Eduardo Paolozzi, Asger Jorn, Smithsons in Europe and Helio Oiticica, Glauber Rocha and Marta Minujin in South America have all developed spatial experiments exposing the failure of abstract (modern) form to cope with the complexities of contemporary contexts. In her statement, Bo Bardi brings to light a deep concern about the making of architecture in post-modern scenarios, that exposes in bright colors the contingencies of her environment. Responding to the "Remapping modernism+s" session request, this article proposes to investigate Lina's choices and attitudes towards form, such as the ugly, the bad, the popular, and the primitive in some referential projects as powerful tool to broaden the concepts of modern architecture beyond the European canons and categorizations.

1. INTRODUCTION

Lina Bo Bardi has described the building of the São Paulo Museum of Art (MASP, 1957-1968) as "bad and ugly", almost as an excuse for the real concern she had at the time in the search for an "architecture of freedom"[1] rooted in daily life. **(fig.1)** In her words, "most people find the museum bad. And it really is. I wanted to do a bad design, I mean, formally and architectonically ugly, but a usable space. Something to be usable for people. And the free spaces could be created by the collective."[2] Lina's refusal of the form is totally in tune with her fellow contemporaries, in a context that Argan has described as the crisis of Art as European science (1993). Jean Dubuffet, Eduardo Paolozzi, Asger Jorn, the architects Smithsons in Europe, and Helio Oiticica, Glauber Rocha and Marta Minujin in South America have all developed spatial experiments exposing the failure of abstract (modern) form to cope with the complexities of contemporary contexts. In her statement, Bo Bardi brings to light a deep concern about the making of architecture in post-modern scenarios, that exposes in bright colors the contingencies of her environment. Crossing theoretical approaches with the analyses of some referential projects, this article proposes to discuss Lina Bo Bardi's unique approach to form as an outcome of a complex architectonic formation, profoundly connected with her time and place, producing a body of work that opened other paths to develop the modern canon as rich experiences resulting from the confrontation with contemporary contexts and the need to connect with different realities.

2. THE ROOTS OF FORM

Lina Bo Bardi's European architectural formation was a complex process from the start, considering the challenge of studying architecture immersed in Rome's daily drama: the clash between the historical city and the building of contemporary life. This condition would be mirrored in different pedagogical proposals present in her formation years, that were trying to cope with the unstoppable modern wave coming from the northern countries and the need to preserve and develop historical heritage. There were also the setbacks of war and the massive destruction of the cities and historical monuments and buildings.

During the years in the Facoltà di Architettura in Rome (1935 -1939), Lina Bo Bardi trained under the director Marcelo Piacentini, who advocated a rather conventional proposal based on the academicism of classical formal principals to alleviate the radical rationalist ideas coming from the Bauhaus. Bo Bardi frequently quoted the importance of the city of Rome "as a great architecture school"[3] because of the unavoidable presence of the historic buildings and their constant transformations that would build, in her own eyes, an education more oriented to historic preservation than to innovative projects. These facts attest to Bo Bardi's hybrid compositive sensibility[4] which resulted from the strict Italian moral codes under which she was brought up, the affection for country life, rural architecture, and the love for art and a humanist architecture formation, all of which was to be transformed

1. The expression "architecture of freedom" was used by John Cage when visiting MASP for the first time. Lina Bo Bardi was very proud of that and used to repeat it frequently. Silvana Rubino and Marina Grinover (Org.) *Lina por escrito* (São Paulo: Cosac & Naify, 2009), 166.

by the war and the rising of fascism in Italy. It is worth mentioning the impact of the wide use of the new modern abstract forms by the fascist architecture in Italy, that may have added another layer of symbolism to the already complex context of Bo Bardi's architecture formation. There is a political aspect already present since her early years as an architect that would expand with the ordinary confrontations of the professional practice when she was valuing the creative aspects of daily life in the vernacular and popular creations of the common citizen. This hybrid sensibility would develop and flourish during her professional life, in her architectural practice as well as in her activities as a critic, curator, educator and public figure in Brazil. I would argue that the most basic aspect of such a hybridism is the empathetic openness to deviations of all norms, present in her personality since the early years[5] and her eagerness for alternative solutions to rules and patterns externally imposed as a strategic way to cope with her own dilemmas. A practice that, ultimately, would make her – and her designs and architecture – closer to the common citizen's dramas, to anonymous popular life.

3. THE UGLY

The artistic production after the Second World War was radically affected by the human and material losses of the war. Argan says that

> *In the origin, there is a moral revolt: in a society that accepts the genocide, the extermination camps, the atomic bomb, it is not possible that, simultaneously, creative acts are produced. The war is the culminating aspect of the organized and systematic destruction, of the to-do-to-destroy of a society that defines itself as "of consumption".*[6]

So, an alternative to think about art and to produce art after the abyss of the war is beginning again, going back to the basic principles of art and its processes of signification, a way to strengthen a society that needs to be reborn. This idea was proposed by Walter Benjamin as a "positive barbarism"[7], a possibility to pave a new road towards a possible future. Hal Foster, analyzing some expressive artists of the period, Bo Bardi's European contemporaries, argued that a "brutal aesthetic" was a response to that, a quest for the "zero degree of art" found in the works of Jean Dubuffet (1901-1985), Asger Jorn (1914-1973), and Eduardo Paolozzi (1924-2005) among others.[8] The human-animal, the monstrous, the metamorphosis, the child and the insane as aliens to culture, the transgression - were all themes explored by these artists with materials such as sand, dirt, junk, thick layers of ink, formalized as childlike scratches, informal and denatured figures, monsters, all seeking a "ground in brute materiality"[9]. It can be said that none of these works could be considered according to the classical principles of beauty, so remain under the categorization of the ugly. This can be a possible reading of Bo Bardi's definition of MASP as "ugly and bad": the brutality of the building's concrete, the blunt abstraction of the pure form floating in space,

the monumentality of the structure, characteristics that lend the object the monstrosity of an oversized object.

Mark Cousis defends that ugliness has little to do with beauty, and in fact, beauty and ugliness belong to quite different registers:

> *Since antiquity, beauty has been regarded as possessing a privilege relation to truth. From this it follows that an ugly representation, or an ugly object, is a negation not only of beauty, but of truth. The category of beauty plays an epistemological role; it represents the truth of an object. Ugliness belongs to whatever negates that truth. It belongs to a series of categories which similarly distort the truth of objects. It belongs to what is contingent, for contingency cannot admit of the truth of objects.*[10]

Contingencies are always "bad" in the way that they prevent planned idealized perfection from happening, and Brazilian culture was (is) all about contingencies, a permanent struggle to accomplish a designed plan. So, MASP's ugliness and badness are an intentional welcome statement, for there is no absolute truth or perfection to be pursued, but truths to be questioned and tensioned by unpredictable contingencies. MASP expresses this principle quite clearly: "it is ugly (it is modern), *but* it is usable" Bo Bardi says – so there is the justification, that reveals the idiosyncrasies of her formation in the hybridism of her own architectonic language at play. MASP is a modern transparent prism elevated from the ground, only to be questioned in its modernity by the oversized porticoes that suspend it in the air, excused again for its modernity because it frees the ground for what is worth in Bo Bardi's eyes: the valorization of the landscape and the occupation of the urban ground by the people. She recognizes that modern abstract forms do deliver fluidity and functionality, but she needs them to be collectively appropriated, even to be subverted, in order to achieve the "real modern culture".[11] Maybe the need for a monumental form to host a new modern program such as "a museum of modern art" was the key to explain her formal choice. Anyway, it is from this desire that she was to perform rich architectonic experiments later on, deeply tensioning abstract forms to their contingencies' realities, as to be presented here.

4. BRAZILIAN UGLY

As a young architect in Brazil, Lina Bo Bardi was gladly open to add to her pluralist architectural formation all the complexities of the Brazilian cultural scenario: a country rich in popular traditions and practices that she had the chance to know deeply as curator, editor and critic and at the same time a country desiring to reach the promised progress of modern technology, as deceiving as this promise appears now.

Her first project in Brazil was the Casa de Vidro (1951), her home in São Paulo with Pietro Maria Bardi, where the modern form was already tensioned: the glass volume hosting the social program, flying above the

11. Lima, *Lina Bo Bardi – O que eu queria era ter história*, 229.

landscape as a modern welcome invitation, attached to a rural like house's service program: the big kitchen and the service's rooms opened to a backyard and garden. **(fig.2)**

The Valéria Cirell house (1958), built in the same neighborhood as the Casa de Vidro, and confronting it frontally, is one that Jean Dubuffet and Eduardo Paolozzi would enjoy knowing. The brutality and roughness of the materials such as roundwood columns, fragmented ceramic and thatched surfaces, that invites mosses, small plants and animals to invade the cracks and transform the textures and colors, are characteristics that make the house really mingle as one with the surrounding landscape. In the black and white photographs of the house one is reminded of the existence of a building only because of the straight lines of the regular volumes that bravely resist the landscape, even though crossed by the irregular thatched plane that protects the veranda and the tropical plants on the roof's garden. In this building, where the regularity of the square plan evolves into a cube, the abstract form is confronted to the limit of turning the discovery of abstract forms among all the textures, surfaces and shadows into a complete surprise. "The ugly house" would be an expression easily heard about this house in the middle of being new and old, modern and popular, questioning the very truth of what is, after all, a house.

It becomes clear that Bo Bardi's freedom to challenge the modern language of forms and spatiality, crossing the modern canon with local traditions, comes from a deep sense of social purpose and political conscience,[12] that granted her an aesthetic sensibility to cherish the great potential of innovation present in the artisanal production of humble people.

What strikes the eyes of those familiar with the modern lexicon is the apparent ease Bo Bardi had to "corrupt" regular abstract forms, an operation that abrades the moral codes of the modern language, eventually resulting in "bad and ugly" objects. In the project for the church Espírito Santo do Cerrado (1976-1982) three round forms overlap one another with little concern about their physical integrity: placed on a gentle slope, the circumference occupied by the altar and the space for the religious ceremonies in the higher quota are left intact, with a conic roof of tiles forming a peak where a small Christian cross would be placed. Attached to that, the circumference devoted to services and cloister has a roof that surrounds the circular wall, throwing the rainwater onto the center patio. Its circular form is cut in both sides by the adjacent circles and these cuts are intentionally made visible by a curved wall that connects the forms on one side and a wall that extends itself beyond the cut both in height and in elevation on the other side. The third circumference, the lower one in the plot, has a round roof covering a patio with earth floor for festivities, without walls. The ensemble of three round forms made of cheap and reused materials and the intense participation of the community almost looks like a ruin in the outskirts of the city. **(fig.3)** The construction detail of the gutter in the roof as a plant bed, open to receive all kinds of plants strong enough to resist the tropical weather, accelerates the domain of

time over the architecture, building the character of the form, another "ugly" attempt to refuse the truth of the abstract form. Knowing about the deep commitment Lina had to this particular design process, opens up speculation as to whether this was the real beautiful building in her eyes. "Arquitetura pobre" – poor architecture, a term coined by her, can be applied here about a humbleness from which popular and primitive building methods and materials conjure ethical concerns as potent sources of creativity and imagination.

Another example that would please her contemporary artists working under a "brutal aesthetic" is the new buildings designed for the Sesc Fábrica da Pompeia complex (1977): a clumsy cyclopic monster all confused with too many arms to grab its service partner. The cave-like apertures reminding the war holes on the walls, the brutality of the thick concrete everywhere, all characteristics that blur the scale of the architecture, that in its turn becomes repellent. Bo Bardi would refer to ugliness again regarding this building when talking about the purposeful drained concrete of the water tower. But she believed that it is by *using* the architecture and relating oneself to the spatial and formal propositions that stops it being ugly, bad and scary, to become special, unique and friendly. An absolute public success up to these days, Sesc Fabrica da Pompéia houses countless art exhibitions, music performances, theater and sport activities. Bo Bardi ensured the appropriation of architecture by producing innumerous exhibitions, developing expographic designs that responded to the architecture inwardly. One of these events would attest, with

capital letters, to Bo Bardi's crusade on behalf of the ugly as a true expression of the excluded and less fortunate. The exhibition "The Beauty and the right to Ugly" (1982), curated by her, carried in its poster:

> *The expression Kitsch appeared in Germany at the end of the XIX century when the Industrial Revolution had taken the power once and for all. It is the cultured high bourgeoisie stigma against the sectors of the same class less fortunate that, through industrialization, began to have access to the "Treasures of Art" and "Beauty". This little show is not an Integration of the Kitsch, it is only a small example of the "RIGHT TO UGLY", an essential base of many civilizations from Africa to the far Orient that has never met the "concept" of Beauty, an obliged field of the occidental civilization. Those excluded from this process are the ones less fortunate: the People. And the people are never Kitsch.*[13]

5. CONTEMPORARY FORM

The most powerful aspect of the argument Lina Bo Bardi developed around the ugly and the bad was the unnecessary rupture between tradition and innovation, that she otherwise believed could be united in the pursuit of a national identity. She believed that the modern language of architecture did not have to exclude the local and the traditional, that the architects should search ideas not only in "cultured" modern education but also in the creative aspects of popular solutions for mundane life.[14]

She has collaborated closely with the young Brazilian filmmaker Glauber Rocha, among others, who were fighting for the socialization of culture, in their own way contesting the modern canon in the search for forms in a true dialogue with contemporary contexts. This was the source of her originality, in many ways the culmination of a personal trajectory of cutting across the norms, rules and closed fields to put together extremities that would reveal alternative potent logics of transformation, deeply connected with different realities. Bo Bardi's enthusiasm with popular culture was a testimony of "a new era that is starting, in which the totality of human values and its concrete expression are related to a kind of critical clarity and autonomy that do not give way to closed categories".[15] So "bad" and "ugly" were indeed a critical provocation to the "enlightened" voices structuring the culture field, against the ones historically apart from it, a battle that she would bravely fight with architecture and design, as architect and public figure in the highly polarized political scenario in Brazil. ■

ABSTRACT

The interpretation of what modern ideas and modern architecture mean varies significantly across different regions and historical contexts. At the same time, definitions of modernity and modern architecture evolve over time, reflecting cultural, social, and political contemporary challenges. This paper explores the architectural project of the professional school and headquarters of *L'Union Féministe Egyptienne* (UFE) in Cairo, to reflect on how modern articulations of architectural design programs intersected with ideals of first wave feminism and their local expressions. Founded by Egyptian feminist Huda Sha'arawi and her peers in 1923, the UFE successfully established its headquarters and a vocational school on Kasr-al-Aini street in Cairo by 1932, realized through the designs of Egyptian architect Moustapha Fahmy. Based on archival information from the UFE mouthpiece, *L'Egyptienne* – a monthly on feminism, sociology and art – this paper primarily investigates the rationale behind the design and construction of the union's headquarters. As a journalist and a member of the UFE, Ceza Nabarawi, described the building in 1932 in *L'Egyptienne*: "For it is not only the purely artistic monuments that should hold our attention, but everything - ancient or modern - that has been erected with the noble purpose of alleviating human suffering and contributing to the enrichment and progress of civilization". From this particular case study, the discussion seeks to contribute to remapping modernisms from a feminist and postcolonial perspective that considers, makes visible, and values women's contribution to the history of the built environment, also in North Africa. Lastly, this paper traces the recent history of the building and its transformations over the preceding years, adding to the discourse on the public perception of modernist landmarks in the Middle East and beyond, as well as the challenges of maintaining historical narratives for these structures to ensure their conservation and preservation for future generations.

1. INTRODUCTION

> *"For it is not only the purely artistic monuments that should hold our attention, but everything - ancient or modern - that has been erected with the noble purpose of alleviating human suffering and contributing to the enrichment and progress of civilization"*[1]

The notion of modernity and what it means to be modern, has been interpreted differently across various regions and historical periods. The exploration of the story of the construction of the headquarters of the Egyptian Feminist Union [*L'Union Féministe Egyptienne* (UFE)] in Cairo during the 1930's contributes to documenting the architectural representations of social movements which often claimed to promote "modernization" — especially the women's movement. Founded by Egyptian feminist Huda Sha'arawi and her peers, the UFE building in the center of Cairo stands as a symbol of both architectural innovation and feminist ideals in the early 20th century. From the intimate gatherings where revolutionary ideas took root to the relatively opulent scale of the UFE's building, this research traces the journey of feminist thought and its spatial manifestation within Egypt in the first decades of the 20th century, aiming to make visible the often-overlooked contributions of women to the built environment in the Middle East, while also contemplating the challenges of preserving these landmarks for future generations in the face of changing social values, surging real-estate market prices and inefficient heritage preservation policies. To achieve this, the research firstly presents the spatial transition of emancipatory ideas from private salons to the metropolis, towards the activism of Huda Sha'arawi and the proposal to establish the UFE headquarters, as a social and architectural response to the need of bringing feminist issues on a public scale. The second part focuses on the architectural project designed by architect Moustapha Fahmy, aiming to explore the notions of modern society and architectural ideals within the Cairene society at that time. All in all, the research emphasizes the necessity of broadening the notions of modernity to reveal the histories of visionary women in architecture and society.

2. THE [SPATIAL] TRANSITION OF IDEAS: FROM SALONS TO THE PUBLIC

2.1. HUDA SHA'ARAWI AND L'UNION FÉMINISTE EGYPTIENNE

Egyptian feminism after the 1919 Revolution represented a continuation of actions undertaken in earlier decades, setting the basis for the formation of women's organizations in the 1920s.[2] In this context, Huda Sha'arawi (1879-1947) occupies a central position, being strongly influenced by her mentor, French intellectual Eugenie Le Brun in the 1890s. Sha'arawi was a significant figure practicing salon culture, where Egyptian upper-class women organized lectures and discussed public matters in the private sphere.[3] In the early 1920s, the meetings became more massing. Her influential leadership led her and her peers to establish the UFE in 1923.

1. Ceza Nabaroui, "LÉcole Professionnnelle et Ménangère de l'Union Féminsite Egyptienne." *L'Egyptienne* 8, no. 77 (February 1932):5-10.

2. Beth Baron, *The Women's Awakening in Egypt* (New Haven & London: Yale University Press, 1994), 3.

Despite the accomplishments of the UFE, as Liina Mustonen has written referring to the work of Sania Lanfranchi, Huda Sha'arawi faced difficulties in bridging the gap between her privileged status as an upper-class Egyptian woman and the broader societal issues faced by the working class.[4] However, contemporary feminists perceive their historical legacy as an intrinsic component of the nation's identity since Sha'arawi resisted appropriation by both the hyper-masculine authoritarian state and sought transnational feminist alliances with women from the global North.[5] As a prove, in March 1919, she led the largest women's demonstration against the British colonial state and the success of the march prompted the establishment of the Wafdist Women's Central Committee (WWCC) in 1920.

On the other hand, the UFE was criticized for attempting to impose Western-style modernization on Egyptian women,[6] who were influenced by pacifist feminist western figures such as Margery Corbett Ashby, Germaine Malaterre-Sellier, Christine Bakker von Bosse or Rosa Manus. However, it could be argued that even if Huda Sha'arawi did not initially emphasize the differences between Arab and Western women with the aim of establishing female networks of alliance, she anchored her feminist discourse in a progressive Islamic voice to articulate a new feminism within an Islamic context.[7] This is evident in her subsequent activism beyond the establishment of the UFE. In 1938, Sha'arawi organised the Eastern Women's Conference to bolster connections between Palestinian women and the broader Arab feminist movement. In 1944, Sha'arawi led the Arab Women's Congress in Cairo, and in 1945, she became the founding president of the Arab Feminist Union.[8] She died in 1947, without observing how Egyptian constitutions of 1956 and 1962 guaranteed equal opportunities to all Egyptians –at least in a theoretical sense.[9]

2.2. FROM SALONS TO THE UFE HEADQUARTERS

The UFE was established for both international and national reasons, aligning with women from around the globe in their advocacy for equality, social and political rights, moral upliftment, the protection of children and the abolition of "houses of tolerance".[10] In its first years the UFE participated in international congresses held in in Rome,[11] Graz, Paris, Amsterdam, Geneve and Berlin between 1923-29. The UFE demands included equality in education, setting the minimum age for marriage at 16 years and reforming marriage and divorce laws. In 1925, they established their monthly magazine *L'Egyptienne*, and twelve years later, in 1937 its bimonthly "younger sister" *Al Masria*, published in Arabic.[12] The UFE headquarters building stood in 1932 as the culmination of nine years of effort. Yet, the UFE also lacked consistent broad-based support and sympathy, facing instead, "the hostility of certain circles to the ideas of progress and emancipation."[13]

Members of the he UFE operated through other buildings before establishing its headquarters in Kasr-al-Aini Street.[14] Once the war ended and the nationalist movement became strong, Egyptian women that had fought together with men for peace and equality, finally funded the UFE on the eve of the International Congress in Rome in March 1923, affiliating

to the "Alliance Internationale des Femmes pour le Suffrage". To fulfil its aim of assisting the masses of women they located a "modest" space in Al-Sayeda Zeinab in Cairo: a dispensary, to assist sick women and children, and a workshop, where both female and male teachers taught basic notions of Arabic, French, arithmetic, hygiene, dressing, religion, sewing, manual works, tapestry work and "tricotage". Although the UFE claimed to the government for the acceptance of young women in all grades of education,[15] this remained distant from becoming a reality in the academic realm where in 1922 enrolled boys were still four times more than girls.[16] The transformation of the workshop model into a professional school was therefore one of their pivotal goals, leading them to name their headquarters building *L'Ecole Professsionelle et Ménangère de l'UFE*. In the meantime, at the dispensary, the amount of voluntary work was commendable; treating a total of 18,830 women and children during the years 1927 and 1928.[17] Thus, this space was not enough to fulfil the UFE ambitions.

The aim of the UFE with this new building was "to reinforce the feminine solidarity that must exist between the different class societies."[18] However, the classes were still segregated between affluent and non-affluent young women. They secured the collaboration of the Ministry of Public Instruction to ensure that the future school would be tuition-free and provide free books and materials[19] and got granted a plot. Architect Moustapha Fahmy, who had experience in working with civil organisations, was offered the project. After nine years of fund-raising in a context of huge international crisis, in Spring 1931 Huda Sha'arawi placed the first stone.[20] The building was built in 10 months, and "feminists from diverse careers" such as "men of letters, journalists, lawyers, doctors and notables" gathered during the opening ceremony on April 7th, 1932, in what the media named: "La Maison de la Femme."[21] The UFE had intended to engrave this message on the facade of the building, but due to significant public objection, ultimately did not do it.[22], Sha'arawi stated: "This day is one of the happiest of our association as it marks a new page in the annals of the national evolution of the Egyptian women."[23]

3. MOUSTAPHA FAHMY, THE UFE'S HEADQUARTERS AND BEYOND

3.1. MOUSTAPHA FAHMY AND THE UFE'S HEADQUARTERS (1932)

As researched by Mercedes Volait,[24] the Fahmy family, spanning four generations and multiple continents, has left a notable mark in architecture. Mahmoud Fahmy (1856-1924) received one-year training in France and developed a unique position following an itinerary of technical expertise and political function in engineering career. His son, Moustapha Fahmy (1886-1972), followed a similar path, with a career primarily focused on public works but with broader international engagements. Having graduated from the Special School of Public Works of Paris (ESTP) in 1912, Moustapha was one of the founding members of the Society of Egyptian Architects in 1917 and became the first Egyptian professor to teach architecture at the Polytechnic School of Cairo in 1923. In 1948, he contributed to establish the Egyptian section of the International Union of Architects (UIA), which established itself

to represent the profession in the Middle East. His architectural works ranged from public buildings to buildings developed by civil associations, such as the hospital for the Muslim Benevolent Association (1932) and the headquarters of the doctor's syndicate (1940) as part of Egypt's alleged "modernization process".[25] The UFE headquarters was also designed in this context.

Following Fahmy's designs, the UFE headquarters was built on Kasr-al-Aini street in Cairo by 1932 (**Fig. 1**). This move signified a transition from their former model of working-class districts' workshop and clinic to an architectural symbol of the movement. The school, envisioned by wealthy class women for their working-class peers, aimed to train them in feminised manual jobs such as cooking or sewing, while also offering spaces for public encounter, including conferences and annual parties. The two-floor building also included multiple offices and "salons", as well as a grand conference hall with a podium, an exhibition shop and childcare facilities for working women.

The main two floor plans were published in *L'Egyptienne* in February 1932 (**Fig. 2**). The first floor included two magazines in the two corners of the front facade, and the main spaces of the school including offices, rooms for sports, toilets, and the biggest room, the refectory. The second floor hosted the "grand conference hall" and its podium, more offices, classrooms, and toilets, with two salons on both sides of the main entrance, facing the front facade. The entire setup represented the tangible realisation of spaces designed to contribute to women's emancipation in line with the UFE's main concerns.

3.2. "MODERN" ACHIEVEMENTS AT THE UFE'S HEADQUARTERS

At the UFE's Headquarters, the private became more explicitly political, and public achievements in relation to "modern" civilization were constantly highlighted. Notably, students' works were showcased and sold at exhibits in Cairo in 1926 and 1931, as well as at the International Exhibition in Liege in 1930. By 1933, the school boasted a total of 150 students over the age of 12, with a preparatory class dedicated to orphans aged 10. Additionally, significant strides were made in the fight for women's admission to universities. That year, the UFE celebrated the first female laureates from the University, recognising them as the "names of modern Egypt" across faculties such as Humanities, Sciences, Medicine, and European Universities, literally marking a "joyful effect in the evolution of the modern Egypt".[26] It is clear that for their members, the UFE represented Egyptian modern ideals, as did their building. Thus, what constituted modernity in Cairo in the 1930s?

As James L. Gelvin has written, the concept of "modernity" has been a fixture in the lexicon of social sciences for centuries. Originating in the eighteenth century, European and North American scholars distinguished between societies deemed "civilized," having achieved modernity, and those perceived as lagging on the path to civilization. Modern societies were characterized by a replication of the European experience, assuming that the trajectory of European society and its form of modernity could serve as a universal model. In this context, throughout the nineteenth century, the Middle East experienced significant socio-economic, and cultural

26. Nabaroui, "A l'Union Féministe Egyptienne."

Ecole professionnelle et ménagère de l'U.F.E.

transformations, often through defensive developmentalism, such as rulers adopting European governance methods alongside the influence of (in this case, both British and French) imperialism.[27] Yet, as the history of the UFE Headquarters demonstrates, along with the lives and work of Moustapha Fahmy and Huda Sha'arawi, Egyptian modernity transitioned from an intellectual movement to a socio-political project, with anti-imperialist ideas permeating its very establishment by local elites—the same elites who constructed architecture as the material embodiment of modernism.

Still, the prevailing notion of [European] modern heritage might have influenced the recent history and preservation of the UFE's building, shaping its transformations over the preceding years (**Fig. 3**). Presently, the discourse on the public perception of modernist landmarks in the Middle East and beyond might overlook buildings like the UFE Headquarters. However, its significance is probably greater than commonly thought.

4. BEING MODERN, BUILDING MODERN

Huda Sha'arawi's transition from private salons to the public arena represents a spatial transgression of feminist concerns in Cairo. In this context, examining the history and narratives surrounding the UFE Headquarters not only prompts us to reconsider the notion of modernism through feminist and decolonial lenses but also invites reflection on the diverse manifestations of modernity across geographical contexts, particularly in discussions regarding the preservation of historical spaces.

In the process, the experience of researching the history and stories surrounding the UFE Headquarters reveals the current urgency of documenting buildings that have actively been built to pursue the ideals of social justice, prosperity, and peace. ■

María Novas Ferradás is an architect and researcher specialised in exploring the intersections of social and political history and cultural studies with the built environment. Novas has published and edited articles and books that delve into how feminist movements have shaped architecture and urban design. Her book "Arquitectura y género: una introducción possible" (2021) received recognition at the 16th Spanish Architecture and Urbanism Biennial.

THE VALUE OF THE MATERIAL. AN ECONOMIC RE-READING OF THE MODERN IDEAL IN CHILE

PAULA ORTA CAMUS

PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT
Modernity in Chile has been historicised mainly from stylistic and technological perspectives, which sought to establish its kinship and ruptures with its European parentage. This work offers an alternative interpretation in terms of how the local modern ideology was conformed, placing emphasis on an economic perspective by distinguishing how criteria such as efficiency and economy of resources were instrumental in constructing its image, exceeding, in many cases, the mere translation and local adaptation of the original modern principles.

The international debate on style and function was challenged in much of Latin America, and especially in Chile, due to the scarcity of financial resources and the critical need for housing and equipment. This disconnect between modern principles and local circumstances quickly shifted the focus to the search for efficiency in construction time and cost. In other words, the economic aspect of the problem took precedence over functional and stylistic issues.

This economic perspective was nurtured by the need for a material expression that better suited the nation's process of modernisation from the 1940s to the 1960s. In this context, Chile's concrete boom can be explained by its unparalleled structural features that could be implemented by an industry dependent on unskilled and very low-cost labour, which allowed for its use to become widespread with the construction of numerous large-scale buildings. This phenomenon enables a re-evaluation of Chilean modernity by assessing the design and construction processes in light of the particular state of technology, economy, and society in three paradigmatic large-scale housing complexes. It might be argued that these buildings helped cement an ideal of modernity firmly subordinated to the local reality —seismically, technologically and economically— with buildings that were massive, serialised, and efficient in the use of resources, thus challenging the received notion of the will of the architect alone as being responsible for defining modernity.

Modernity in Chile has been historicised mainly from stylistic and technological perspectives, which sought to establish its kinship and ruptures with its European parentage. However, for most of Latin America, particularly Chile, the international debate on style and function was challenged by a scarcity of financial resources and a critical need for housing and equipment. Owing to the seemingly unaffordable new technologies in materials such as steel and concrete —as reported in the editorial of the *Técnica y Creación* magazine no. 2[1]— as well as the accelerated processes of urban expansion and densification between the 1940s and 1960s, the focus quickly shifted from the rational use of material to the search for efficiency in construction time and cost. In other words, it became a fundamentally economic problem. Material thus became a commodity, part of a precise financial equation where its expenditure depended on costs, speed of production, and quality of labour, among other technical variables outside functional and stylistic issues.

The economic perspective of developmentalist Chile during that period was nurtured by the search for a material expression that better suited the nation's modernisation process. In this context, the country's great concrete boom can be explained by its unparalleled structural features that could be implemented by an industry dependent on unskilled and very low-cost labour with no ties to guilds or unions,[2] which allowed for its use to become widespread with the construction of numerous large-scale buildingsin a short period, and had great impact on the creation of jobs. Paradigmatic large-scale housing complexes cemented an ideal of modernity firmly subordinated to the local reality —seismically, technologically and economically-— with buildings that were massive, serialised, and efficient in the use of resources. Re-evaluating Chilean modernity by assessing the design and construction processes in light of the particular state of technology, economy, and society at that historical period allows us to challenge the notion of the will of the architect alone as being responsible for defining modernity.

1. DERNITY AND DEVELOPMENTALIST STATE

The period from the mid-1930s to the early 1970s in Chile was characterised by a focus on development, known as "developmentalism." It was driven by the 1939 Chillán earthquake and the subsequent series of social democratic governments that focused on implementing an incipient welfare state. A crucial development was the establishment the same year of the Corporación de Reconstrucción y Auxilio (Corporation for Reconstruction and Assistance) and the Corporación de Fomento de la Producción (Corporation for Production Development - CORFO). These, alongside the Caja de la Habitación Popular (Popular Housing Fund, 1936), provided the state with the initial financial and operational structures required to modernise Chile.

Regarding the state as a promoter of development and material welfare, three key variables helped shape modern Chilean architecture.

2. Adrian Forty, "Concrete and Labour", in *Concrete and Culture. A Material History*, (London: Reaktion Books, 2012), 225-235.

1.1. STRUCTURAL ISSUES

Chile's unique seismic conditions have restricted construction possibilities throughout the country, significantly affecting the use and expression of materials structurally and constructively. Major seismic events and their subsequent regulations have shaped the quality and aesthetics of modern architecture, establishing specific requirements for vertical support elements and restrictions on building height.

The Chilean standard NCh433 of.1972-Earthquake Resistant Design of Buildings marked a milestone as it introduced structural calculus as a method for determining the elements of a structure. At the same time however, it also established requirements for the layout plan of structural elements, possibly as a safeguard against future massive seismic events. Designed in 1972, only ten years after the devastating Valdivia earthquake, this code emerged when the seismic behaviour of modern materials such as reinforced concrete still needed to be fully understood. Despite this, reinforced concrete demonstrated better seismic performance than other materials, especially in medium and large-scale buildings, rising to prominence during Chile's decades of developmentalism.

1.2. HOUSING DEFICIT

Between 1930 and 1952, Santiago doubled its population due to internal migratory movements, resulting in a critical housing deficit, which was the most visible issue in the national modernisation effort.

In this regard, the creation of the Caja de la Habitación Popular in 1936 would provide the initial momentum for large-scale housing construction, boosted by the 1939 Chillán earthquake, which "was the perfect opportunity to start a housing re-planning process integrated with urban planning."[3]

Although the *Caja* was the first government organisation to address the national housing deficit, it was its successor, the Corporación de la Vivienda (Housing Corporation - CORVI), created in 1952 and operational until 1976, that introduced the rational concepts of serialisation, speed, and standardisation both in construction processes and in the development of typologies suitable for modern families based on hygienist principles and the communalisation of the ground level. CORVI was responsible for consolidating vast territories within Chilean cities through larger scale, height, and urban complexity projects that delivered a solid and recognisable image –that of reinforced concrete– to Chile's new technological and cultural social housing standards.

1.3. HIGH-RISE CITY CENTRE

By 1965, the belief that extensive urban infrastructure projects had the potential to revitalise the city and boost the economy was embodied in the creation of the Corporación de Mejoramiento Urbano (Urban Renewal Corporation - CORMU), whose pursuits included "urban renewal, improvement of areas in the city, densification, inclusion, control of sprawl, and the recovery of deteriorated areas."[4]

3. L. Valenzuela, "Mass housing and urbanization", 278.

4. Patricio Gross, "Testimonios", in *Vamos p'arriba. La Remodelación San Borja y la vivienda vertical en Chile* (Santiago: Ediciones ARQ, 2022), 20.

In economic and cultural terms, the solution that best represented the aspirations of a modern society was the tower. Even when forced to adapt to the local reality and thus detached from the stylised paradigm of steel and glass of cities like New York, the tower was the only typology distanced enough from the colonial city's foundational grid and continuous façade. Finally, in technological terms, the tower made it possible to serialise and professionalise the construction industry, as it demanded updated construction standards, which had to be adopted by architects, engineers, builders, and workers.

These three conditions make up the particular context in which modernity was implemented in Chile, which, although based on modern principles, especially those related to hygienism and the communalisation of space, took forms that were largely determined by the efficient use of resources, particularly material cost.

2. REVALUING MODERNITY

2.1. HEIGHT STANDARDS: TORRES DE TAJAMAR

Chilean seismic regulations have historically favoured the development of structural systems that provide great rigidity to the building, minimising deformations and generating highly resistant structural elements. The material that best meets this requirement is reinforced concrete. However, for it to achieve the desired performance, substantial quantities are required, both because of the preferred use of rigid wall and slab systems and because of the thickness of these elements. These two aspects are backed by the relatively low economic cost of the system in terms of material and labour, as well as by its non-dependence on highly industrialised factories or complex work sites.

The reinforced concrete wall and slab system has been dominant in the construction of high-rise buildings up to the present day, particularly in residential ones, where the wall is pertinent for the division of housing units in response to the requirements of acoustic and fire insulation. As a result, the design of these buildings has been conditioned by this constructive logic, limiting spatial freedom, large spans, and, in particular, the free floor plan of the ground level where the most significant stresses are expected as an effect of earthquakes. This conditioned the implementation of modern ideals of spatial flexibility and large openings, taking into account the context. In addition, the problems resulting from eccentricities between the dynamic loads and the resistant elements have led to the design of perfectly symmetrical floors to ensure a homogeneous distribution between the loads and the supporting elements.

A clear example of these constructions is the main tower of the Torres de Tajamar residential complex (**Fig. 1**), designed by architects Bresciani, Valdés, Castillo, and Huidobro. It was completed in 1967 and measures 84 metres in height. The architect Fernando Castillo described the technical and structural challenges encountered in the design of the building, which led the team of engineers to develop an elastic structural system, never before implemented in Chile.[5] The system was based on

5. Fernando Castillo & Humberto Eliash, *Fernando Castillo: de lo moderno a lo real*. (Bogotá: Escala, 1990), 75-77.

a perfectly symmetrical floor plan with only two sets of perpendicularly opposed main structural walls that separated the residential units. (**Fig. 2**). This configuration frees up the façade to a considerable extent, allowing for a great deal of freedom in its composition, which is only interrupted by the heads of the supporting walls. Consequently, the structural system of reinforced concrete walls and slabs defined the formal and spatial possibilities of modern collective and high-density architecture in Chile.

2.2. PUBLIC POLICIES: REMODELACIÓN SAN BORJA

Reinforced concrete technology made it feasible to build a 'solid' nation that could grow in height while withstanding the country's seismic condition without incurring unreasonable costs. These three characteristics of concrete helped to evolve the ideal of the modern city to one of high-rise, large-scale densification that would require centralised, resource-efficient renovation programmes.

This vision was consolidated with the creation of the CORMU in 1965, whose most ambitious and relevant project was the Remodelación San Borja (RSB) (**Fig. 3**), which started in 1967 and was abruptly ended by the military dictatorship in 1976. The slogan with which it was publicised at the time, *Ahora vamos p'arriba* (Now we are moving up), reflects upon the state's intent to link the idea of modernity with both new high-rise buildings and the country's general development.

The RSB was conceived as a metropolitan-scale intervention that formed part of the "new models of urban growth based on a greater densification of the central areas of the city"[6] oriented particularly towards the middle classes, exceeding the mere provision of housing by acting upon the re-articulation of the urban fabric, installing public space –open to all of society– as a central component of the new urban life of a country that was 'moving upwards.'

Although there was already previous technical experience at hand with Torres de Tajamar, whose maximum height reached 28 floors, the extensive nature of the RSB project required, according to Gonzalo Carrasco, the re-articulation of the traditional practices of architecture, engineering, and the private sector, the latter being significantly boosted by these large housing projects promoted by the social democratic and socialist governments of those years through CORVI and CORMU.[7]

Such a reconfiguration required not only the collaborative –and indeed virtuous– work of the state and the private sector but also the design of a centralised plan sufficiently well structured to safeguard the integrity of the urban vision pushed by CORMU. At the same time, this design had to be flexible enough to support the materialisation of the entire structure from fragments devised by various teams of architectural firms and construction companies.

Despite the formal variations introduced by each team, the overall vision is reflected in the use of the tower typology as the most modern possible approach to densification and reactivation of the centre of Santiago. By freeing up the ground, destined here for public use and enjoyment, this

offered a completely different image to that of the city's foundational centre, in which the density of the continuous façade concealed the non-existence of a collective life inside the block beyond the old shopping arcades.

In this sense, the RSB can be regarded as a resignification of the large-scale housing project in Chile since it brings real high-rise densification to Santiago for the first time, reorganises the relationship between the inhabitant and public space by almost completely liberating the ground level, and proposes a series of urban artefacts that will enrich collective life in the city.

At the same time, it delivers an image shaped by reinforced concrete as the most capable material for tackling the challenge of building the modern city.

2.3. MATERIAL TECHNOLOGY: UNIDAD VECINAL PORTALES

Chile's seismic conditions and the precarious construction technologies used in most of the 20th century led to a strong preference for "solid construction." This involved using materials such as reinforced concrete and masonry over flexible options like wood or steel, which were culturally associated with poorer quality or emergency buildings. The scarcity of resources and the high demand for construction prompted the use of low-cost, low-complexity materials and techniques that made it possible to employ masses of unemployed workers. Reinforced concrete became the primary construction material for medium and large-scale projects as it possessed three highly valuable characteristics. First, it was perceived as a solid material by the public. Second, it was an economical alternative that could be used in quantities far exceeding the structural needs to compensate for the low quality of its execution. Lastly, it allowed for profitable technical formwork processes based on large-scale standardisation.

The use of concrete was encouraged during the 1940s and 1950s by the new national cement companies with local and readily available materials. This period also saw the creation of the Instituto Experimental de Edificación *of the* Universidad de Chile (1952) and the publication of two technical journals, *Revista de la Construcción* (1962-1972) and *Revista IDIEM* (1962-1983), which favoured active dissemination of structural and construction systems on reinforced concrete.

A paradigmatic case in the use of reinforced concrete was the Unidad Vecinal Portales (**Fig. 4**), built between 1954 and 1966 by the Caja de Previsión de Empleados Particulares (EMPART) in its first phase and by CORVI in its final phase, based on a design by the renowned architectural firm BVCH. The complex consists of housing blocks up to 6 storeys high made of an exposed structure of reinforced concrete walls and slabs that define the spaces while simultaneously serving as the finishing touches. The bare structure is completed by masonry elements such as partition walls and brise-soleils. Here the concrete allowed the construction to be systematised with standardised measurements of the formwork, which was made with 5" planks, leaving an imprint on the concrete. Umberto Bonomo[8] points out that the first phase used more material resources than the second, when CORVI took control of the project, reducing costs and giving more dominance to concrete as the primary material.

By deploying its particular features to their full extent, concrete made itself indispensable, much to the detriment of other materials and elements that, in the face of the cost-efficiency equation, were promptly deemed as luxurious accessories, thus making the formal expression of large-scale modernity take on a rather ethical austerity.

3. CONCLUSIONS

Modernity found fertile ground in the state's developmentalist pursuits between the mid-1930s and early 1970s. Despite the fact that the Chilean economic

8. Umberto Bonomo, "Las dimensiones de la vivienda moderna : la Unidad Vecinal Portales y la producción de viviendas económicas en Chile, 1948-1970", PhD diss., (Pontificia Universidad Católica de Chile, 2009): 239 – 248.

context imposed significant restrictions on the modernisation process[9], the widespread interest in shaping a modern nation, coupled with the housing shortage and the incorporation of concrete construction technologies, led to the establishment of a series of official agencies and plans. These initiatives utilized reinforced concrete to give physical form to the modern city.

This is especially relevant considering that a significant part of modern architecture in Chile consists of large-scale housing complexes and urban infrastructure developed primarily by the state and, in some cases, in partnership with the private sector. Thus, the resulting modernity was closer to one of serialisation and maximisation of resources rather than to the pure expressiveness of stylistic principles, a subject that remained active in the private domain and generally on a smaller scale. Concrete, bare and austere, shaped the image of Chilean modernity thanks to its low economic but, paradoxically, very high use value. ■

9. Among the most pressing restrictions were the post-earthquake reconstruction efforts and the state's limited financial and operational instruments at the time.

She is an Assistant Professor at PUC and her primary area of research examines the production of value and social capital in the architectural field through contemporary cultural devices such as competitions, exhibitions, galleries, and biennials. She is author of "Cultura, teoría y crítica en arquitectura", "Vida y muerte de una galería de arte: el espacio de arte como espacio de consumo", and "El lugar del material".

Cristian Muñoz Díaz Architect, Universidad de Chile. He holds a Master in Architectural Design from the Universidad de Santiago de Chile and is currently a doctoral student in the Ph.D. programme in Engineering Sciences at the Pontificia Universidad Católica de Chile. He is an Associate Professor at the Universidad San Sebastián and Assistant Professor at the Universidad de Chile. His academic work focuses on construction technologies and structural systems, delving into their impact on the aesthetic dimension of the built environment. He has led academic and research projects and has presented his academic work in Chile and Spain in congresses, articles, and academic documents.

TOWARDS A TRANSIENT UNDERSTANDING OF MODERN BUILT HERITAGE DOCUMENTATION AND RESEARCH

ADINA HEMPEL
ZAYED UNIVERSITY DUBAI, UNITED ARAB EMIRATES

ABSTRACT

Modernism is defined for most Western contexts, much of it applies far less to the Arabian Peninsula. Here so-called modern build architecture and the understanding of heritage are largely impacted by nomadic traditions and transience. In the United Arab Emirates (UAE), knowledge was handed down for generations through intangible practices, such as poetry or 'hakawati' from common gatherings of the Bedouin council in the characteristic 'majlis' space. Here the spatial hierarchy, societal protocols, trade, and conflict negotiations could be observed by the younger generation present in *majlis* sessions. Following the discovery of oil in 1958, the UAE experienced a period of rapid growth and mass construction catering to a growing population. Many structures were built by foreign or regional architects, planners, or engineers who trained in universities overseas. However much of what was built between 1960 to 1990, the period of modernity in the UAE, was significantly influenced by contextual aspects of privacy, spatial division, climate, and culture. Many of the resulting built structures advanced from the local understanding of the environment as well as the social protocols. Hence, as we aim to develop a more global understanding of modernism, it is important to consider approaches to modern built heritage rooted in its context impacting the research and documentation methods. In the UAE the memory of a space or preservation of it is far more about the concept of a space rather than the actual space as an artefact itself.

1. INTRODUCTION

Following the oil discovery in 1958 in Abu Dhabi[1] the built environment of the UAE underwent a period of extensive growth and transformation. This has been perhaps the most significant change and growth in terms of scale, impact and global reach in the UAE's history. Catering to the growing demand for housing, public buildings, and important infrastructures, the UAE garnered a name as a place that intended to implement new ideas and large-scale visions, thus attracting architects, planners, and engineers from abroad. Those newly built structures were constructed using a concrete prefabricated system. As a result from the 1960s onwards, numerous concrete factories had been established in the UAE. Most recently, the architecture in the UAE between the 1960s leading up to the 1990s has officially been titled *Modern Architecture of the UAE*:[2]

> *The architecture during this period shares many of the characteristics of work of the Modern Movement; however, the particular response to context, climate, and culture meant these buildings and/or sites departed from the main considerations of Modernism, resulting in place-specific adaptations*.[3]

The published definition of this period of architectural history in the UAE supports ongoing efforts in systematic documentation and research on the built environment while it also enables the development of a more regionally centred analysis and understanding of the architecture of this time. Despite many similar aspects to various global locations associated with Modernism, it would be limiting to refer to the architecture of this time in the UAE as modernist buildings and disregard the role the local community and context had in the development and growth process.

The architecture of this period particularly in the UAE merely represents a continuation of its traditional predecessors that characterised the years before the 1960s. Unlike Modernism in the West, these structures did not represent a stark departure from its traditional forms, but rather a transformation in their construction methods, scale, and typologies. The new architecture continued to respond to regional-specific aspects of privacy, cultural sensitivities, and the arid climate and geographical specifics. Importantly the development at this time was driven by the country's leaders, who not only commissioned but also were heavily involved in the development and conceptualization of these buildings or grand plans. This paper questions how we can challenge and inspire different ways of understanding and documenting modern heritage, one that considers the evolution of the built environment, rooted within the socio-cultural and historical development of a place.

2. LIVING IN TRANSCIENCE

The Arabian Peninsula has long been a place of mirage for adventurous travellers, characterised by the presence of an ever changing and varying landscape ranging from a mountainous to desert geography and shaped by

3. "Modern Architectural Heritage of the UAE Initiative," United Arab Emirates Ministry of Culture. Accessed June 8, 2024, https://mcy.gov.ae/en/modern-architectural-heritage/#.

its hot and arid climate. Deeply entwined with this history is the presence of the numerous tribes across the peninsula, their seasonal migrations, and the unwavering bond to their lands. The seasonal migration, specifically in the UAE, saw tribes move between the coastal and inner country regions, namely desert drylands or mountain terrain. Original living structures were made from locally accessible material such as the goat hair for the Bedouin tent, *Bait al Sha'ar* [4], or palm fronds for the *Areesh* huts [5]. The modular and ingenious dismantled construction system allowed for movement of the house and easy replacements if the weather impacted the construction material. Structures could then be orientated towards or away from the winds depending on the season and would be characterised by specific regional patterns representing the land and its people. The transient life between various locations meant personal belongings were kept at a minimum or reduced to daily living necessities, resulting in a strong intangible heritage, many of which have been inscribed into the UNESCO intangible heritage listing [6].

2.1. A COMMUNAL SPACE BECOMES A 'SCHOOL OF LIFE'

The importance of community and the desire for the representation of the tribal identity has remained strong until today. The gathering and sharing of knowledge in communal spaces whether on a family, neighbourhood, regional, or national level remain a key pillar of this region and take place in the regionally specific *majlis*[7] typology. Those spaces function both as tribal councils and spaces of hospitality, coming together, and sharing knowledge and practices to serve as a 'school of life' for the younger generations. In these 'majalis; (pl. of *majlis*) gatherings stories of past experiences were shared, and experiences or opinions were given to topics discussed or presented. Here the youth and out of tribe guests in attendance were able to learn more about the identity of the tribe and community.

The majlis is mainly known as the male reception room for guests to the house owner, often evoking the most prominent picture of 'Arabia' and orientalist interpretations: a grand room filled with men casually sipping coffee, while sitting relaxed on patterned cushions placed along the edge in u-shape. However, the majlis is more than simply a reception room to a family house, it holds an important social, cultural, and political role in the Arab world. As the public interface in a mostly domestic setting, the majlis encourages the participation of the community in affairs of the neighbourhood, city, or state, simply through an open-door policy. The majlis serves as a space for dialogue between community members and national leaders. The strict separation of the majlis from the rest of the house also allows for maximum privacy in the tribe. The spaces were divided between family and external guests in a tent, areesh, or even later coral stone houses, and until recently concrete build structures. The separation 'wall' served both as protection of the private from the public and allowed members of the family to observe affairs, therefore, being informed of the developments.

7. "Majlis, a cultural and social space," UNESCO Intangible Cultural Heritage. Accessed June 8, 2024. https://ich.unesco.org/en/RL/majlis-a-cultural-and-social-space-01076

2.2. A SPACE FOR STORYTELLING AND COMMUNAL PRESERVATION

The spatial composition and orientation of these spaces were carefully crafted based on the understanding of geography, privacy, and cultural aspects. The *majlis* remains a cornerstone for community gatherings, sharing stories and memories of past times. Stemming from the absence of excessive material possessions in the past, originally spaces and the concept of those were often described through intangible means such as poetry, or storytelling.

The *hakawati*[8] is one such form of storytelling and is derived from the word *'haki'* meaning to talk. A storyteller holds immense importance in Arab nomadic culture, as they become the wisdom keepers of bygone times often describing scenes vividly using movement, music, gestures, and even costumes. The listener and observer become participants as the stories unfold with many famous *hakawati* holding memories of shared spaces, thus offering a description of spatial memory at the time. The *hakawati* is then not only a story that is told to entertain guests but rather a cultural-specific tradition to preserve and hand down knowledge to the next generation. While this cannot be quite understood as oral histories, such oral traditions often can shed light on processes of building communities, their values, motivations, and ultimately the reason for spatial decisions that impact the built environment.

3. ARRIVAL OF MODERNITY

The architecture of the UAE between the 1960s and 1990s is not only characterised as the period of Modern architecture but also the period in which the formation of the UAE took place and as such the structures built during this time play a significant role in the nation-building process. The huge effort undertaken by the rulers to offer housing and a new urban life to their communities was made possible through the invitation of numerous international planners, architects, and engineers.[9] Those building experts came from abroad many of whom had also received an education and training abroad, even those from the region, therefore bringing to the UAE architecture approaches from elsewhere. Though being a source for many imported ideas, it is important to understand the role that rulers and communities had in the planning process.

3.1. A COMMUNITY APPROACH TO MODERNITY

Even though planners would bring foreign ideas to the region, those ideas ultimately were merged or adjusted to the regional sensitivities and local climate, hence displaying a stronger adaptation to the local context. This process of adaptation and consultation with the country leaders took place in previously discussed *majlis* in the presence of community members, therefore allowing for immediate feedback. Being faced with the local climate, cultural sensitivities, and limited resources at the time as well as the desire to preserve and continue communal traditions and spatial practices projects developed between 1960s to 1990s are often characterised by a strong adaptation.

Additionally, it is important to note that the time of major urban development, and architectural experimentation in the UAE took place at the time when 'Western' countries witnessed an end to the period of Modernism

8. "Hakawati: the ancient Arab art of storytelling," Gulf News. Accessed June 8, 2024. https://gulfnews.com/entertainment/arts-culture/hakawati-the-ancient-arab-art-of-storytelling-1.712001

9. Lest We Forget, *Structures of Memory in the UAE* (Lest We Forget FZ-LLC, 2028), 18-26.

shuffled in by the destruction of Pruitt–Igoe in 1972[10]. As such countries such as the UAE not only offer opportunities to planners to realise visions but also directly engage with leaders. This undoubtedly attracted many architects to the shores of the UAE and others were invited after their initial successes in neighbouring states such as Kuwait or Qatar.

3.2. THE BEGINNING OF FORMAL DOCUMENTATION

Parallel to the period of rapid growth was the formation of various governmental institutions that would begin to lead the national development process for the years to come. The establishment of local municipal bodies along with their respective archives played a crucial role in the shaping of urban settled society and the beginning of archive and documentation of one's history in material form. It is important to understand that the intangible process of 'preservation' through storytelling did not disappear but would now be supported by new physical evidence. Understanding the complexity of the spatial evolution of the UAE it is paramount to consider integrating not only the physical documentation of structures but also the immaterial knowledge in spatial wisdom as shared through the *hakawati* or the *majlis*. Even more so as until today, many structures remain undocumented in plan or document form, making the presentation or research far more difficult as often crucial information on the origin, vision, or development process of these structures is often absent or only sparsely existing.

By the end of the 20th century, many planners active during the 1960s to 1990s had returned to their home countries and took the architectural drawings with them. Even though many experts at the time remained in the UAE and have been residing there ever since, many building documents or information remain in private hands making the importance of community building a significant part of the research and documentation process of modern built heritage in the UAE.

4. AN ALTERNATIVE APPROACH TO BUILDING RESEARCH

Most preservation efforts start with the collection of existing knowledge, evidence, artefacts, and documents of the building structure. This process can become significantly more challenging when documents or historical information is absent or located away from the place of interest. With many buildings being far less documented in the UAE especially those from the period of 1960-1990s, documentation and collection of research forms the most important task towards understanding the history and ultimately role of this structure within the greater evolution of the built environment in the region. While there are many governmental and individual efforts being undertaken in the UAE today to thoroughly study and collect such information it becomes particularly important in the research design to consider the early transience of society as a key driver in this documentation effort.

4.1. PRIVATE ARCHIVES AND COMMUNITY BUILDING

As pointed out earlier, until today a lot of information about the 1960s to 1990s remains located in private archives and collections whether in or outside of

10. Charles, Jencks, *The Language of Post-Modern Architecture* (New York: Rizzoli; 4th edition, 1984), 9-15.

the UAE, and in some cases, community members may not be aware of the importance of the information they hold. Further, the early transient history of the region had also resulted in the preservation of the concept of spaces over the physical space itself, at times making the only remaining evidence of this space the oral histories and stories shared in the majlis. The shift towards a settled and more material-centric historical approach shifted in this transformative period of the 1960s to 1990s. Oral histories then play a crucial role in preserving the memory of space and the history of those various structures. These vital stories are more than mere memories or nostalgic forms of traditions but can give insight into the connection to ancestral lands and pass on knowledge of the desert landscape to future generations.

The absence or lack of extensive material possession meant a focus on the experience and memory of a space, as opposed to the attachment to an object. Storytelling was not only a form of spending time but also offered insight into the ways and protocols of life customs and traditions and offered important information about specific tribes and regions. Following the rapid growth of the UAE in the 1960s and the development of large-scale urban areas, many of these more tribal practices found their way into urban daily life, as did the *majlis* and the tradition of storytelling, the *hakawati*.

4.2. NOMADIC TRADITIONS, THE BUILT ENVIRONMENT AND RESEARCH

Research about this period then must include efforts of community inclusion and collection of the various *hakawati*, poetry, or shared stories from the *majlis* gatherings. While this process may take longer, as it requires the development of trust and gaining access to the society, and is focused on qualitative socio-cultural data, it will ultimately allow the reconstruction of the past of this built structure or ensemble. Understanding the connection of nomadic traditions and the connection between the land and its people has a huge impact on deeply understanding and decoding the design and building history choices of these buildings.

This element of humanity in architecture history research is immensely important in understanding the region's architectural growth, the impact individual leaders or rulers and community had, and therefore, the adaptations that took place even though architects may have initially brought foreign ideas to the shores during the moment of rapid growth and expansion in the UAE. Documentation in initial transient cultures where structures themselves were originally made from vanquishable, the concept and ultimate memory of a place is shared through the discussed intangible practices and requires an expanded approach to the documentation of built structures.

5. CONCLUSION

The connection to the local context (geography, society, culture) as opposed to the role of architectural principles such as those of modernism becomes increasingly important in the development of knowledge and understanding of the evolution of the built environment in the UAE and the Arabian Peninsula. Unlike in 'Western' cities where the immediate built

Figure 1. Dubai urban community gathering. Dubai/United Arab Emirates, 2005. © Credits Adina Hempel, 2005.

surroundings and history of place offer space for interpretation of building context, in the Arabian Peninsula the connection of the people to their land, culture, and intangible practices also found their way into the development of architecture in the 1960-1990s.

It is paramount to consider the intangible practices that shaped the building rather than looking at the architectural history of the region through the lens of Western building principles only. The understanding of societal structures in nomadic regions, not only guides the building concept and development but also impacts documentation methods and ultimately preservation processes that would be considered regionally contextual. Moving forward, it is crucial to continue studying and documenting the architectural legacy of the Arabian Peninsula, with a focus on preserving and celebrating its cultural and historical significance. By incorporating indigenous knowledge and practices into architectural research and preservation efforts, one can ensure that the rich heritage of the region is safeguarded for future generations.

In conclusion, the development of built forms in the Arabian Peninsula from the 1960s to the 1990s highlights the importance of local context, including geography, society, and culture, in shaping architectural practices - unlike in Western cities, where the principles of Modernism dominated in the development of built forms. ■

She investigates socio-cultural influences on architecture and the evolution of interior urbanism in the Arabian Peninsula. Previously, Adina served as Head of Research for GSMproject on the Shindagha Museum in Dubai and was part of the curatorial team for the National Pavilion of the UAE at the 14th International Architecture Exhibition at La Biennale di Venezia. She is a member of the *Technical Committee for Modern Heritage of the UAE* at the UAE Ministry of Culture. Adina Hempel studied at the Technical University of Dresden, Columbia University and New New York Film Academy.

HOW CAN EXHIBITIONS HELP CREATING A SUSTAINABLE AND RESPONSIBLE ATTITUDE TOWARDS THE FUTURE?

BÁRBARA COUTINHO
INSTITUTO SUPERIOR TÉCNICO – UNIVERSIDADE DE LISBOA
CITUA - CENTER FOR INNOVATION IN TERRITORY, URBANISM, AND ARCHITECTURE

ABSTRACT

The relation between museums, archives and libraries has been changing rapidly. Museums are strengthening their socio-political dimension (ICOM, 2022) and must encourage diversity and sustainability, providing diverse experiences of education, debate and sharing; archives are moving from the usual closed spaces with limited access to exhibition rooms where they are displayed; and libraries are increasingly spaces that welcome creation and debate. These changes go together with the profound socio-cultural transformations underway, helping to question modern ideology and all its forms of authority and power. They foster the decolonisation of museum narratives and encourage the emergence of new readings that replace the Eurocentric, male and Caucasian representation with a new legacy for the future that is truly plural, inclusive and intergenerational. Whilst the exhibition gained an increasing attention with museums remake iconic exhibitions, conferences and meetings on the subject multiply, and a vast theoretical production is published, several of them contribute to the post-colonial studies that have been deepened, debating the museums narratives, collections, discourses and practices. Concerning the curatorial practices and the specific language of exhibitions, this session intends to analyse the current rethinking of the framework of the exhibition, in theory and practice, to debate the challenges created by the assumption of the exhibition as a manifestation of a broader, participatory and collaborative critical process. Is also pertinent to discuss how can the principles of a circular economy can be effectively adopted in exhibition assembly, minimising natural resources, reducing waste, favouring the reuse, recycling or repair of materials. The main goal is to think how exhibitions can offer an engaging and meaningful experience that contribute to the development of a deep citizenship and social involvement that may help create a more sustainable and responsible attitude towards the future.

1. INTRODUCTION

The exhibition is the act of presenting, making appear, showing or displaying, according to a certain look, perspective and organisation. This definition remains valid, even considering that since the end of the 20th century, the exhibition has been valued in a broader understanding as a place of experience and production of thought that help debate the established historical narratives. In other words, more and more, the exhibition is a place for exchange and critical production, with a para-curatorial practice that develops a programme of initiatives that run in parallel, rather than in a subsidiary way. Hence, there has been an increase in piecemeal and subjective readings instead of closed and normative discourses, with direct translation into alternative exhibition displays, as well as the affirmation as places for the dissemination and exchange of proposals resulting from individual and anonymous views[1]. However, it's important to assess the visitor's actual participation, because the line between an enriching and stimulating experience and the entertainment that distracts and alienates can be blurred. In this regard, is important to emphasise the need for a committed visitor participation and draw attention that this approach raises also the need of a real museum teamwork in the exhibition, stressing the need to reconfigure the *modus operandi* of museology and curatorship[2], advocating the work must be developed in a circular, close and collaborative way, avoiding the linear and hierarchical sequence.

The nature of the exhibition has also been rethought, given the multiple transformations in the means of information and communication and the fact that we live in a time when digital image processing and manipulation technologies allow for better conservation, accessibility and study, as well as enabling the development of virtual museums, the careful digitisation of works and their dissemination on a global scale, which poses new challenges for curatorial practice.

While the accessibility of artworks contributes to the democratisation of culture, by making public contact more dynamic and allowing different interpretations, at the same time, it increases the aura of that singular moment when we are living the physical experience of the contact with art. Walter Benjamin had already identified this exhibition value and its great potential with the public, defining it as 'exhibitability' or 'exhibition-value'[3]. Thus, the 'aura of artworks has shifted towards their public'[4], which means that the importance of museums, and their exhibitions, lies in the unique opportunity to allow the subject to have a face-to-face experience with the works and the space, at a specific time and place. To this extent, the exhibition space become crucial, and it is essential for each institution to rethink exhibitions, their themes, contents, curatorial and para-curatorial discourses, scenography, methodologies and aesthetics to trigger intersubjective and self-reflective participation (on an intellectual, psychological, spiritual and emotional level). If so, the exhibition can amplify the intrinsic relational value of culture and the arts, since it becomes a privileged place of education, inspiration, dissemination and public engagement, to re-evaluate our own attitudes, values, emotions and capacities, making us more aware of the full exercise of citizenship **(Fig.1)**.

4. Lucy Steeds, *Exhibition. Documents of Contemporary Art*. (London/Cambridge, Massachusetts: Whitechapel Gallery, The MIT Press. 2014), 26.

2. THE MULTIPLE DIMENSIONS OF THE EXHIBITION

In 2007, when *Documenta 12-100 days of art* in Kassel proclaimed, through the artistic director of that edition, Roger M. Buergel, and curator Ruth Noack, that the exhibition should be a 'medium in its own right and can thus hope to involve its audience in its compositional moves[5], it gave evidence of a new disciplinary field and a broader understanding of the exhibition as a place of experience, production and thought.

2.1. THE POLITICAL FRAMEWORK OF THE EXHIBITION

This issue is also related with the growing awareness of the ideological, economic and financial framework of museums and how this has always influenced the programming and management of each institution, its history, collections, building, activity and exhibitions. Knowledge of these factors is particularly important as museums are one of the institutions that contribute to the shaping of collective consciousness through the narratives they build with their collections, exhibitions and publications. The attitude of removing objects from the storage or the archive to exhibit them, in association with other pieces and within the framework of a curatorial discourse, means a process of appropriation, valorisation and recontextualisation that culminates in the attribution of new meanings. The way the objects and documents are displayed, their relationships with each other, the exhibition supports they are on, the circuit suggested, the texts and captions, the role given to the visitor: these are all elements of a narrative, which is never neutral or impartial. The very system of classification and categorisation assumes a certain reading and historical conception and is also one of the factors in the legitimisation of the artwork. In other words, it's very important to realise how the museum's context significantly influences the public's perception, interpretation and participation in exhibitions, knowing that any museum is, by its very nature, a reconstruction, necessarily fragmented and incomplete.

While the same piece can give rise to different narratives and exhibition discourses, the dialogue we establish with artworks remains open throughout our lives and, as such, can always be revisited, depending on the forms and conditions in which the pieces are exhibited, our gaze and our questions. In this way, curatorial work is inexhaustible and contributes to a parallel history – one that records the way the artwork has been perceived over time, the readings it has given rise to and the influences it has exerted at each specific moment, in other words, a history that allows us to know how societies define and value art and culture. This is one of the reasons why museums have been re-presenting or reconstituting iconic exhibitions, at the same time as providing digital platforms where it is possible to consult images and information from past exhibitions. Simultaneously, meetings and debates on the topic are multiplying, several titles are published with the purpose of compiling the exhibitions that have made up the history of art and, more recently, that exhibition catalogs increasingly include descriptive memories, technical drawings and photographs of the exhibition project, recording them for posterity, which will contribute to future studies and academic

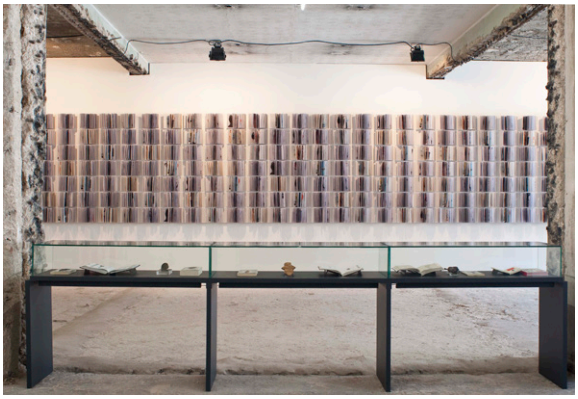
research. The impact of exhibitions on the historical discourse and the way in which they influenced the production of knowledge is also increasingly considered and must be debated. More recently, post-colonial studies have been deepened, debating the difficult issue of the decolonisation of museums, their collections, discourses and practice going beyond the historicist and sequential perspectives, often through collaborative research projects.

At the same time, the emergence of hidden histories about gender, cultural minorities or the environment brings new perspectives that are an important way to relearn universal values, recognising the uniqueness of everyone, showing how the preservation of heritage is a fundamental value in the development of human future, as it is an inexhaustible source of knowledge, learning, questioning and inspiration.

2.2. ARCHIVES ON DISPLAY



Archives are moving from the usual closed spaces with limited access to exhibition rooms where they are displayed **(Fig. 2 and 3)**. Until now, although they were crucial to the researchers, particularly for the contextualisation of the artistic practice, they were rarely displayed and lived mainly as footnote in thesis, books and catalogues. Now, more and more, they become the very subjects of exhibitions, helping to revisit hidden histories that challenge dominant discourses with the presentation of multiple perspectives, while many museums are starting to incorporate them in their own collections and creating permanent gallery spaces devoted to their display. This put new challenges to the museology and curatorial work due to the materiality and specificity of archive material, compelling a debate about the role of displaying archives and books and how this changes the visitor experience of an exhibition and their perception and comprehension of the archive itself. What kind of documents should be exhibited to give visibility to stories that change the traditional historiographical practices, which are largely focused on the biographies of authors and remarkable works? How should they be exhibited and consulted? How can exhibitions contribute to give visibility to archives and how can archives contribute to the transformation of exhibitions as a medium? The archives on display stress also the need of a museological work that combine different interactions between the physical exhibition and the digital media, raising awareness in a broader audience. This requires a study and debate on strategies that, respecting the specificity of each archival material, allow information to be presented in context to be studied, analysed, questioned, discussed, disseminated.

Another challenge with this approach is how the exhibition of archival material can encourage the recovery and sharing of memories or assert itself as a tool for reflection and speculation, moving away from more retrospective or celebratory visions. On the other hand, the exhibition of original material can trigger work that raises awareness of project development and the interrelationship between thought and the intelligence of the hand; the idea, the drawing and the writing; as they can provide information from the first sketches to the final product, going through the

different phases, errors, experiences, materials, in an integrated approach. Depending on the nature of the archive itself and the curatorial approach taken, the exhibition may also reveal or expand aspects of the archive that are not immediately visible in its organisation and structure.

3. CONCLUSION

Through the presentation of case studies or theoretical works on new exhibition approaches in terms of theme, methodology, curatorial practice and specific grammar, the goal is to analyse the ongoing transformations in the relationship between museums, archives and libraries, while also trying to understand how modern ideology and all its forms of authority and power are being questioned. In other words, this session addresses how exhibitions as a medium and part of a wider and participatory process debate museum narratives, collections, discourses and practices, while encouraging the emergence of new readings that replace Eurocentric, male and Caucasian representation with a new legacy for the future that is truly plural, inclusive and intergenerational. The purpose is to contribute for the growing knowledge about how exhibitions can offer an engaging and meaningful experience that helps develop a deep citizenship and a social engagement that might create a more sustainable and responsible attitude towards the future. ■

Bárbara Coutinho PhD in Architecture with the thesis "The Exhibition Space as a 'Total Work of Art'". Degree in History of Art, post-graduate degree in Art History Education and master's degree in Contemporary Art History. Founding-director of MUDE – Museu do Design since 2006. Author of its museological concept and co-author of the architectural concept of the museum's building refurbishing. Guest Assistant Professor (2006-2021) and Guest Associate Professor (since 2021) (IST-UL). Researcher of CITUA – Canter for Innovation in Territory, Urbanism and Architecture. Co-chair of Docomomo ISC on Interior Design and founding member of Docomomo Portugal. Founding member of ID-Iberoamérica diseña Association.

TOWARDS A REPARATIVE ARCHITECTURAL HISTORY

EDUARDO AUGUSTO COSTA
SCHOOL OF ARCHITECTURE AND URBANISM, UNIVERSITY OF SÃO PAULO, BRAZIL

JUNIA CAMBRAIA MORTIMER
SCHOOL OF ARCHITECTURE, FEDERAL UNIVERSITY OF MINAS GERAIS, BRAZIL

ABSTRACT

What kinds of documents, what kinds of archives shall we consider to investigate the complex histories of architecture in order to reverse social/racial exclusion and environmental collapse? How can we expand our notions of architectural documentation and how can we approach these sources? What is the role of exhibitions and how they can contribute to tackling such issues? What methodologies can we engage with so as to achieve a reparative goal in architecture history? How can we see beyond the visual surfaces of the traditional architectural collections in order to consider the bodies and materials involved in the production of architecture?

This paper aims to bring into light a specific discussion in the field of architectural history that is committed to an ethical responsibility of unlearning, as proposed by Ariella Azoulay, in the sense of revising, so as to surpass it, the object-oriented perspective predominant in modern architectural historiography, as put forward by Manfredo Tafuri; the dominance of drawings as research source, as already questioned by Beatriz Colomina; and, last, the traditional scholar attitude concerning critical interpretation and analysis, as also poined out by Ariella Azoulay, when she advocates towards the idea of co-citizenship and research collaboration.

We are strongly inspired by the theories of the Brazilian architect Sergio Ferro, and by the contemporary approach of North-American architectural historian Mabel Wilson as together they combine a critique of the capitalist production of architecture based on the work organization of the construction site, not only locally, but transnationally. We are also inspired by the approaches of Dipesh Chakrabarty, Maria González Pendas, Adrian Forty, and Jane Huton, as they focus on the environment and the material of architecture, its origins, and movements in space, in order to build another history for architecture.

1. INTRODUCTION

Ana Fernandes, an architect and urban planner who is full professor at the UFBA's Faculty of Architecture, coordinated a university project to restore and digitize the collection of the Salvador City Planning Office (EPUCS), which existed from 1943 to 1947. Despite this short period of operation, the EPUCS designed a number of urban plans that inspired politicians and planners for decades. That included the well-known political figure of Antônio Carlos Magalhães who used EPUCS plans in his e rhetorical arguments when he was mayor of Salvador, in the late 1960s, and later bionic governor of Bahia, in the 1970s. In the 2000s, when work began on the EPUCS collection, it was located in the basement of the Mario Leal Ferreira Foundation and was at the limit of material conditions.

José Eduardo dos Santos, teacher and psychologist, is one of the founders of Acervo da Laje, together with another teacher, Vilma Soares. Based in São João do Cabrito, a neighborhood in the railway suburbs of Salvador, the collection was born out of the impulse to remember and collect that nourished the couple in the face of a systematic process of erasure and discrediting of life, in its psychic and material breadth, carried out by public policies with regard to black, impoverished and marginalized territories. It is also in the face of a lack of documentation that the collection makes a vigorous effort to collect, maintain, exhibit and disseminate, bringing to light not only the creative, artistic and cultural activities of the suburbs, but also the historicity of this territory and its challenges in the face of the necropolitics of the state.

We take this encounter[1] between the EPUCS and the Laje collections, between Ana Fernandes and José Eduardo, for what it establishes as the limite-experience of the life of archives: it is true that in both cases we are faced with the fateful absence of adequate public policies, whether for the preservation of documents that belong to a state office from the 1940s, or for the recognition and stimulation of creative activity in territories considered peripheral. But it is also true that both experiences, by refusing the imperative of lack and absence that tends to monopolize debates on archives in territories discredited by the geopolitics of centralities, announce an insubordination to the same narrative frameworks and place the life of archives at the center of our discussion, whether through university engagement or through the autonomy of marginalized subjects: these archives are not inert bodies, but a circuit of lives, human and non-human, intertwined in the limite-experience of continuing to exist. Continuing to exist *in spite of*. We invite our readers to inhabit this text as a place outside established ideas of what an archive is, but within its practices as a pulsating instance: a living body. A living archive. To do so, we call for *unlearning* as a method and *imagination* as a critique. Before going further in this topic, we propose a reflection on the current state of the debate.

1. The conversation between Ana Fernandes and José Eduardo happened in the second seminar online of the research group 'Archives, sources and narratives: between city, architecture and design'.

2. THREE READINGS OF THE ARCHIVE

Thinking about archives has become a political agenda and a social commitment in the beginning of the 21st century. The reasons for this phenomenon range from preservationist interests to reparations processes

and anti-racist agendas. But they also stem from the questions we are asked about the immense amount of data we produce and that is increasingly available to us through digital platforms, hard drives and clouds. Facing a world life that is increasingly connected and archivable, it is inevitable that this agenda will gain momentum and affect us: architects and urban planners.

In Brazil it has gained a certain prominence in recent years, due to the departure of important collections of architects working in the country. As a result, urban planners, architects, historians, critics and archivists have organized seminars, taken the debate to public and national forums and institutions, and produced dozens of texts, articles, books and exhibitions dedicated to the issues that permeate the debate.[2]

If the engagement is led by professionals from different disciplines or institutions with different missions, it is legitimate that the readings, interests and objectives are also diverse and even dissonant. It was with this understanding that Professor Margareth da Silva Pereira gave the opening lecture at the II Seminar on Archives, Historiography and Preservation in 2021. On that occasion, Pereira outlined three perspectives on the subject of archives that are fundamental to understanding the state of the art at the beginning of this century.

The first of these perspectives concerns the way professionals approach the subject from a conservative and preservationist point of view. In this case, a traditional understanding of the subject prevails, in which archives are treated as legal evidence, as a place to store, protect and preserve objects that document certain processes. In the case of architects and urban planners, what is projected onto archives in this understanding is the notion that documents fulfil a role of proof that extends from the characteristics of the built work - in the sense of the material preservation of the asset - to the work dynamics of government institutions and liberal professionals. It's not surprising, therefore, that in this case there is a strong involvement of institutions linked to the profession, as well as institutions led by professionals and teachers interested in the conservation of buildings.

A second perspective is an understanding of archives that derives from debates in history, philosophy and psychiatry.[3] In this case, we add the impact of Freudian theories on the social sciences in the first half of the 20th century and the trauma caused by the Second World War, with the genocide of Jews and Armenians and the mass destruction of documents, monuments and cultural expressions. In this scenario, thinking about archives became an object of study intrinsic to the human sciences, since such structures were understood as manifestations of power, of control, and as a place of subjectivity, of the experience of the body, of social experience. This other perspective is important for the context we are dealing with, because it reframes the archive as an object in itself, as a sign of the historicity of things, of time and of social groups. It's not, then, a question of thinking of the archive as a structure that preserves the evidence of a past in its legal sense, as in the first case, but that it is in itself a manifestation of subjectivity, of desire. The archive becomes a priori an object of social and historical

(São Paulo: FAUUSP, 2021)

3. Jacques Derrida, *Archive Fever: a freudian impression* (Chicago: The University of Chicago Press, 1995); Michael Foucault, *A arqueologia do saber*, (Rio de Janeiro: Forense Universitária, 2009); Jacques Le Goff, *História e memória*. (Campinas: Editora da UNICAMP, 2003).

interest, since it is understood as proof in itself, proof of those who keep and preserve it. The archive allows us to observe the historicity of things.

The last perspective, presented by Margareth Pereira, refers to the concept of *anarchive* developed by the professor of literary theory, Prof. Dr. Márcio Orlando Seligmann-Silva, with reference to the work of Walter Benjamin. In this case, it is understood that the traumatic events of the 20th century overturned totalising discourses and grand narratives, paving the way for the archive - understood as an expression of the totalitarian power of these discourses - to be questioned and problematised. It was necessary to break with totalising discourses, canonical histories and grand manuals. In addition to the radical experiments of the artistic avant-garde at the beginning of the 20th century, this movement found its strength in the discovery of the structure of DNA, made up of four nitrogen bases arranged in a helix and controlled by computer logic. From then on, there was an "awareness that life, like culture, is a history of archives, their rewritings and their metamorphoses".[4]

The notion of rearrangement, rewriting, metamorphosis is fundamental to understanding this third perspective presented by Margareth Pereira. It is not a matter of seeking legal proof, of searching for an archived past, or of considering the structure itself as an object of critical and theoretical reflection. On the contrary, understanding the experience of rearrangement and the possibility of reorganising life opens up space for other discourses and historical meanings to emerge through working in dialogue with and in the archives. We can thus see the emergence of an awareness of the ways in which knowledge, culture and life are produced. An awareness that takes place in the processes of arranging and rearranging, opening up space for other meanings, other sensibilities that are not archived.

The horizon that Seligmann-Silva presents projects her reflection on the work that artists have begun to develop, recalling, rewriting, rearranging and anarchising knowledge. In this case, she highlights the work of artists who collect fragments, shards and scraps of history to create their own archives and build other histories, narratives and subjectivities. It is no coincidence that her text includes the work of Rosangela Rennó, Artur Bispo do Rosário, Marcelo Brodsky and Carrie Mae Weems, artists who mobilise archives, rework the meanings of documents or produce their own archives.

It's worth noting that this dynamic has also positively contaminated the field of architecture and urbanism. If we look at the curatorial proposals of recent biennials - such as the Venice Biennale - we can see that the protagonists in these spaces are no longer urban or architectural projects. They don't present plans, sections, facades, models and photographs, documents that could be considered commonplace in the profession of public companies or professional offices. On the contrary, the curators are much more interested in what lies outside the discipline, because it is here that other sensibilities can be developed. It is in this reordering that the power of transformation lies, albeit under protest from the defenders of a canonical history.

What Prof. Dr. Margareth Pereira presents us with the complexity of the scenario that affects us, making it very clear that there are multiple

4. Seligmann-Silva, Walter Benjamin e a guerra de imagens. (São Paulo: Perspectiva, 2023), p.21.

movements and understandings involved in an archive. But she also reminds us that it is this latter perspective - that of archiving - that can open up other frontiers of thinking in relation to architecture and urbanism, as well as the very manifestation of life in its broadest sense, in contemporary times. It is in this impulse that the vitality of thinking about archives lies. And it is in this sense that we present two fundamental concepts that certain researchers, mainly from literary and media studies, have conceived of recently.

3. UNLEARNING AND CRITICAL FABULATION

In 'Potential History: Unlearning Imperialism', Ariella Azoulay defends the importance of *unlearning* as part of a political ontology that rejects, among other things, the hierarchisation of the subjects that enunciate and produce knowledge.[5] By unfolding unlearning in various theoretical-critical and practical orientations, Azoulay also locates the sense of novelty or discovery, a recurrent feature of academic discourses, in the midst of colonial legacies and rejects the "newness" as the goal of her writing. For her, the basis of political ontology is transgenerational co-citizenship as a premise for any action and critical study to repair and combat the violence we inherit from imperialism, whether as torturers or victims.

Paying particular attention to the relationship between photography and imperialism, Azoulay dedicates her work to experimenting with alternative methods and techniques for researching with photography, given the fact that he origin of this visual technique is, for her, in the imperialist system, which has turned the shutter into a mechanism of expropriation and colonization, also in epistemic terms. For Azoulay, unlearning presupposes a condition of suspension, however temporary, of consolidated structures of production and reproduction of systems of power that perpetuate exclusions and injustices. The suggestion of 'going on strike', which the author mobilizes as an interval of political imagination gives unlearning an active and forward-looking dimension. In this way, we understand unlearning as an ethic for a society, and more specifically for a university, that is committed to fighting the most diverse forms of injustice and exclusion, as it is particularly the case in Brazil.

Arlete Farge, in 'The Flavour of the Archive', first published in 1989, also emphasizes the importance of unlearning in her reflections on what remains behind the scenes, when working with archives.[6] Farge warns of the importance of this attitude towards archives as an intellectual and imaginative disposition to overcome the horizon of expectations created by the structure of the archive, its rules and its laws, its frameworks and its bureaucratic routines, its defenders, in order to breathe air into it that allows us to emancipate our gaze, our knowledge and to foster encounters.

By mobilizing unlearning as a method, or rather as a methodological disposition, the aim is not to refute the previous knowledge that has paved the way for research with and in archives. But it is to open a path for disobedience in the face of theoretical-critical frameworks that tend to determine the roles to be played out by the so-called peripheral regions in archival debates and practices, especially on a broader scale of the geopolitics of knowledge.

5. Ariella Azoulay, Potential History: Unlearning Imperialism. (London: Verso) 2019.

6. Arlette Farge, *O sabor do Arquivo*. (São Paulo: Edusp, 2009)

In this sense, we can speak of archives of ex-centric experiences,[7] without emphasizing the gap, the absence, the lack. This is possible if, on the one hand, we unlearn the horizon of expectation of what constitutes an archive of architecture or urbanism, and if, on the other hand, we deal with absence, when it exists, in a distinct, more fabulatory way.

For Saidiya Hartman, critical fabulation is a method of breathing life, in its potential dimension of rebellion, into racialized subjects who have been captured in the archives of the state, built up on practices of whiteness, in records of poverty, crime and death.[8] Her theoretical proposal does not refer to falsifying data, but to recovering a layer of vital dignity, a pulse of life that does justice to the historicity of these trajectories. The emergence and transnational circulation of the expression critical fabulation, coined by Hartman, has generated a lot of debate, especially among historians. First, for Hartman, critical fabulation does not mean falsifying history. Rather, it means allowing oneself to tell a story, refusing the framework of death, absence and lack, even if there are documentary gaps, in order to fully prove it according to traditional historiographical methods. In this sense, fabulation is also a gesture of unlearning. And, why not, also a gesture of archiving.

Secondly, we endorse Josemeire Alves' critique of the absences or gaps in documentation, especially with regard to the black presence in cities, as eloquent silences.[9] According to the Brazilian historian, the documentary absence is often a presence that we do not recognise because we are unable to see, given the relationship between this framework, the whiteness of the state and the resulting damage to our ability to recognise social subjects and phenomena.

We argue that critical fabulation can also be that change of prism that Josemeire Alves defends; it is an adjustment of our lenses, our frameworks and our modes of institutional organization of the collections themselves, in order to see in the existing documents what racism has imposed on our ways of seeing and on the naturalization of archival procedures that continue the erasure of non-white subjects.

It is within the conceptual key of fabulation that much recent research in the field of architecture and urbanism has been developed, in Brazil, as in the case of 'Inheritance + The fabulous inventory of my grandfather's works', by the sisters Gabriela and Mariana Leandro Pereira, which was presented at the 13th Architecture Biennale in São Paulo in 2022. The proposal pays homage to the authors' grandfathers, João Carlos Pereira and Gumercindo Ruge da Silva (in memoriam), a marble worker and an excavator, and through material and narrative fragments, opens up a debate on the anonymisation of construction workers, who are absent from the hegemonic narratives that have historically constituted the field of architecture and urbanism.[10]

4. CONCLUSIONS

Research that engages with the archival debate allows us to observe the intentions of institutions that aim to qualify the meanings and narratives they produce. On the other hand, we recognise that there are possibilities

8. Saidiya Hartman, Wayward Lives, Beautiful Experiments. Intimate Histories of Social Upheaval,(W. W. Norton & Company, 2019.)

9. Alves, 2020, p. 454

10. These three readings of the archive open up perspectives on how we could work with archives, and project other ways of researching architecture. We could present some examples that we have been working with - such as the research on the Zumvi archive in Salvador or the research on design and environmental history in the FAUUSP archive - but due to the limited space, we decided to present a much more theoretical approach.

for historiographical revision when we displace and disobey the logic presented to us by archives and their institutions, a logic inscribed in their metadata and forms of organization.

If spatiality is the specificity of our approach as historians of architecture and urbanism, how can we systematize historical knowledge on the history of architecture and urbanism, based on the arguments and experiences we brought to light, but moving away from the attitude of *looking at them* and trying *to see with them*? Not only by changing the 'objects of research' or the 'sources', but by changing our tools, our methods and, above all, our attitudes towards archives, we might be able to carry out a work of urgent reparation, participating in collective processes of historicization around Latin American architecture and urbanism. We argue that anarchiving, based on unlearning and critical fabrication, is a way of reframing frameworks and bringing out other connections to populate the world with more stories. ■

BIOGRAPHY

Eduardo Augusto Costa is professor at the University of São Paulo. He specializes in Architectural and Design History, with emphasis in archives, visual culture, intellectual history and environmental history.

Junia Cambraia Mortimer is professor at the Federal University of Minas Gerais, and her work focuses on Urban Studies and Architectural History, with emphasis in visual culture, archives and history of the cities.

DISCOVERING A NEW NARRATIVE: INTERPRETATION METHOD PRACTICES IN THE EXHIBITION *MODERNISM FOR THE FUTURE 360/365*

VILTĖ MIGONYTĖ–PETRULIENĖ
VYTAUTAS KAVOLIS TRANSDISCIPLINARY RESEARCH INTITUTE OF VYTAUTAS MAGNUS UNIVERSITY, KAUNAS, LITHUANIA

ABSTRACT

This paper examines the international exhibition held in Kaunas during its inaugural year as the European Capital of Culture in 2022. The exhibition featured a co-creation process involving 26 artists from modernist cities, including Kaunas (Lithuania), Kortrijk (Belgium), Brno (Czech Republic), Lviv (Ukraine), and Tel Aviv (Israel). Tasked with employing interpretative methods, the artists developed interdisciplinary art projects aimed at fostering a dialogue between art and heritage. By drawing inspiration from the architectural legacy of the 20th century, the sites were viewed as cultural heritage laboratories, where contemporary interpretations and historical narratives were given equal significance alongside authentic remnants of the past. The practice of interpreting modernism highlighted the necessity for a multifaceted narrative for the successful integration of historic urban layers into contemporary cities. This narrative should combine the knowledge, stories, and motivations of scholars, heritage professionals, artists, site owners, the broader heritage community, and an engaged public. As a result, over two years, 18 interdisciplinary art projects were created, providing a significant example of potential approaches to heritage conservation and informing future considerations.

1. INTRODUCTION

Symbolising progress and the future, architecture from Interwar Period now faces a contradictory period of cultural transformation. Innovations in style and technology that signified social advancement have lost their primary roles, gradually becoming historical relics. Buildings and places that were never intended to be monuments have acquired new significance, becoming cultural heritage. Such a transformation poses huge social, cultural, and economic challenges. In light of these contradictions, considerable endeavour has been devoted to comprehending the architectural heritage of 1920s and 30s as a cultural asset possessing significant future potential.[1]

One of the proposed approaches to reassessing the significance of cultural heritage for future generations is through experiment and interpretation, which establishes precedents for innovative methods and practices related to the understanding of cultural heritage. In other words, the goal is to promote awareness, curiosity, and interest by linking the site or objects and their history to the participants' own knowledge, experiences, origins, and values. This can be done using a variety of media, including sound, video, and more, to engage with heritage. Ultimately, interpretation that does not somehow connect what is being displayed or described to something within the personality or experience of the visitor will be sterile.[2]

Moreover, this method of interpretation is closely related to Experimental Preservation. According to Jorge Otero-Pailos, this practice involves a critical re-evaluation and occasional questioning of preservation norms. Experimental preservation begins with a sense of skepticism. Practitioners of experimental preservation carefully select particular objects to assess their suitability as heritage items. This process seeks to confirm, contest, or affirm hypotheses regarding their potential to attain heritage status —those revered objects and accompanying characteristics deemed indispensable by future generations.[3]

Recent international experiences have shown that turning phenomena into experience and provoking resonance and participation, involving co-creation methods have become a successful and influencing curatorial practice, especially when it comes to discussing the backdrops of social realities and disorders, including the role of multi-layered identities and legacy of heritage.[4] In the midst of these contradictions, 20th-century architecture continues to reveal numerous layers of meaning that are both intellectually significant and relevant to contemporary society. This served as the starting point of the curatorial narrative of the international exhibition *Modernism for the Future 360/365*, which took place in Kaunas, during the opening year of European Capital of Culture in 2022.

The article reflects on the examples of interdisciplinary art interpretations in the modernist cities of Lviv, Brno (Czech Republic), Kortijk (Belgium), Tel Aviv (Israel) and Kaunas (Lithuania), which led to deeper research into the stories, memories, and examples of architectural heritage from the period that reveal the complexity of recent European history. The interdisciplinary projects have raised questions such as: How can we inspire a stronger

emotional bond with the built heritage of the 20th century, in particular in terms of the Interwar Period, and the pride taken in the local modernist tradition within local heritage communities? What is the greatest motivation for sharing personal stories about everyday heritage and preserving it for the owners? As far as contemporary society is concerned, what is the value of employing an artistic approach within historic urban landscapes, and what are the new scenarios for doing so?

2. MEETING POINT – MODERNISM

In recent years, Modernism has gained prominence in the cultural landscape of Kaunas, especially since 2015, when the city's interwar architecture received the European Heritage Label. In 2023, the early 20th century urban layer of Kaunas was included in the UNESCO World Heritage List. Enthusiasts of local architecture have meticulously explored every part of the city and examined extensive archival records documenting its development. However, despite this surge of interest and activity, there remains a sense of uncertainty about how to accurately define the history of Kaunas's early 20th-century architecture. During the interwar period, Vytautas Landsbergis-Žemkalnis, one of the city's most esteemed architects, noted that the people of Kaunas appreciated "the rhythms of classical architecture within a modern configuration,"[5] highlighting the influence of Italian Rationalism. In 2016, The Guardian named Kaunas one of the ten best European cities for Art Deco design. Meanwhile, academics continue to seek evidence of a distinct regional school of Modernism.

This naturally raises the question: What exactly is the character of Lithuanian Modernism that Kaunas residents referred to in the press during the interwar period when they claimed to be building a modern city? Did terms like "modernisation" and "modernity" simply signify novelty, or were they linked to the emerging global Modern Movement? These questions have led us to place the phenomenon of Modernism within its proper intellectual and geographical contexts.

The prevailing modernist narrative often highlights a heroic era in which a group of "grand masters" revolutionised contemporary architecture, influencing not only Europe but the entire world. However, a closer examination of Modernism's individual expressions reveals that these celebrated figures represent just a fraction of the broader movement. The full scope of Modernism is evident in the numerous visionary works that, inspired by modernity, transformed living environments across neighbourhoods and streets globally. Local decisions—aimed at finding optimal solutions for housing, integrating nature, developing social infrastructure, improving building materials and techniques, and respecting architectural traditions and aesthetic preferences—gave Modernism its many diverse forms.

The concept of the exhibition was based on this collection of architectural approaches and decisions that expressed the ideas generated by Modernity, Modernisation, and Modernism. Traditional textbooks on modernist architecture rarely include the cities represented in the exhibition

5. A. Braziulis, "Valstybinės konservatorijos rūmai. Pasikalbėjimas su direktoriumi J. Gruodžiu ir architektu V. Landsbergiu," 7 Meno dienos, no. 80 (March 1932):12-14.

within the dominant heroic modernist narrative. The UNESCO-protected White City of Tel Aviv is a rare instance of international recognition, while cities like Lviv, Kaunas, Brno, and Kortrijk are often overlooked among Europe's primary modernist hubs. Nevertheless, the exhibition aimed to promote a retrospective exploration of the fringes and peripheries of modernist history. The aim was to connect these cities into a single network, emphasising that Modernism's global impact is rooted not in the international careers of famous modernist figures but in the efforts of local architects. Figures such as Arnas Funkas in Kaunas, Ferdynand Kasler in Lviv, Bohuslav Fuchs in the Czech Republic, and Huib Hoste in Flanders, who formulated local interpretations of global Modernism, exemplify this idea. Their contributions, along with those of numerous others, illustrate that modernist history is not confined to isolated and unique centres or schools. Consequently, the exhibition aimed to convey modernist heritage not as isolated elements within each city but as a collective of artistic, social, and technological processes that spread throughout Europe, from major capitals to the most remote peripheral towns.

3. MODERNISM AS AN INSPIRATION FOR CONTEMPORARY ART

The Modernist period produced some of the most remarkable examples of both public and private architecture in Kaunas, Lviv, Brno, Kortrijk, and Tel Aviv. Despite this, the value of our heritage from this period is not always recognised by authorities or the wider public. In many cases, this value requires special conservation efforts to protect the private buildings that represent this heritage. Therefore, we have to deal with the same issues of importance, despite our different social, cultural and historical backgrounds. This motivated us to orientate the *Modernism for the Future 360/365* project's main goal towards upholding the heritage of Modernism —by creating new meanings / contemporary discourse and strengthening its European narrative through the creation of new artistic interpretations of modernist architecture and the modernist phenomenon, finding the keys to help us reconsider its value for the future. The number 360 symbolises all possible perspectives of Modernism: cultural, political, economic, and so on. Meanwhile, the number 365 refers to our attention to everyday heritage. It is about more than just visits to churches and museums on special occasions, but concerns everyday architecture: residential buildings, industrial and entertainment facilities.

Given the complexity of the phenomenon, the partner institutions Kaunas 2022 (Lithuania), Cultural Strategy Institute (Ukraine), Interdisciplinary Arts Centre Vaizard, z.ú. / INDUSTRA (Czech Republic), Intercommunale Leiedal (Belgium) and Liebling House – White City Centre (Israel) became organisers' of international artistic residency programmes. After an open call, 26 artists were selected to find a universal language to express it. They drew inspiration from the varied physical and intangible heritage of the modernist period. In total, 18 artistic projects were implemented at various sites, each reflecting a narrative about the distinct layer of modernist architecture and

its characteristics, incorporating both local and international features. Over the course of two years, the process was shaped by in-depth research into history and context, with the assistance of architectural historians. Gaining new insights from audience development experts, the artists' residencies were accompanied by discussions and meetings between the artists and the building owners.

3.1 COMMUNITY ENGAGEMENT

Over 600 local community members in partner cities were engaged through various activities and public programmes. This especially involved artists communities, such as the Nuepiko group, who invited local contemporary dancers for a co-creative process to perform at the Trade Unions Building in Lviv or Erich Weiss, who enabled the local public to rediscover closed cinema space (White House) in Brno and become aware of the value of this forgotten modernist building. In this way, Weiss has managed to generate new awareness among the local population and neighbours regarding a potential future scenario for the building. Erich's idea was inspired by the exhibition *White Space in a White Space* by Stano Filko, Milos Laky and Jan Zavarsky, which took place in the House of Arts, Brno in 1974. It motivated him to reconsider the original concept. As a result, he decided that the most practical intervention in the local context could be the organisation of an Open Day as the first step in making the local public aware of the potential of this building. Finally, after the residency the permanent art space was established here. **(Fig. 1)**

Additionally, children and youth were a crucial part of the community who took part in the residency activities (e.g. Ingel Vaikla, Michal Trávníček and Ivana Kupková, etc.). This also included elderly people (Anrii Linik, Josef Řehák and Karolina Strnadová, etc.), a community on the edge of society (Tadas Stalyga and Rita Kundrotaitė), and national minority groups, such as Jewish communities, and their history in the cities. e.g. Olha Kuzyura created an installation of embossed paper prints made using the technique of blind printing.

Over several weeks of her residency, Olha worked with archival materials, collaborating with researchers into Modernism, Judaism, art critics and collectors in Lviv. Nineteen residents of Lviv were also involved in the project, most of them living in various modernist houses in the city and ranging from the very young to those of retirement age (4 to 90 years old). At the meetings, the author asked residents to share household items and interior details from the 1930s and 40s from their houses, which, in their opinion, could theoretically fit the historical period and style of the apartment in Gallet's Building. The author made prints of these objects and placed these paper copies in Gallet's apartment, where the main artistic process took place. Olha aimed to supplement the space of the flat, to "revive" its history with a so-called "dialogue of details."

This dialogue with city residents brought about an open discussion that provided broad insight into how Lviv residents view their history. The

reflections and artefacts collected have become the basis for an artistic interpretation of Interwar Modernism in Lviv. As a result, the author placed a large installation in one of the rooms of Gallet's apartment, the Crystal Hall. The exact placement of the artwork was significant – it was positioned on a wall that used to be the entrance to another part of the apartment, which was separated and replanned during the post-war period and is no longer accessible today. The artist chose a composition of *mizrah*, which in Jewish culture symbolises a lost home, paying tribute to the tragic history of the former owners of the house —the Gallet family, who were killed during World War II. Among the items whose phantom silhouettes are placed on the wall are decorative grilles, candlesticks, lighting elements, switches, locks, keys and even a button from an SS uniform. Dust and soot, rust marks and even fingerprints on objects serve as natural dyes for the paper. **(Fig. 2).**

3.2 FROM INTERPRETATION TO EXPERIMENTAL PRESERVATION

The international artistic programme facilitated public access to modernist heritage buildings that were previously inaccessible or only partially accessible, including private or non-public heritage sites. This initiative also highlighted local heritage owners and their expertise, encouraging others to participate in heritage preservation. Consequently, choosing the former Kaunas Central Post Office as the venue for the exhibition uniting all these projects was a deliberate and purposeful decision. The recent history of the building exemplifies the contentious standing of Modernism within contemporary society. Engaging directly with this site prompts reflection on and examination of other narratives, some of which have experienced more favourable outcomes.

The construction of the Post Office Palace between 1930 and 1932 significantly altered the urban landscape. The architectural blueprint of the building during its construction era was influenced by a prevailing ethos among interwar architectural practitioners and theorists, seeking to symbolically accentuate the interplay between modern edifices and local heritage, thereby intertwining Vernacularism and Modernism in architectural design. Architect Feliksas Vizbaras, through deliberate allusions to national stylistic elements and decorative motifs, underscored recurrent themes of political discourse in interwar Lithuania, concurrently highlighting the pivotal role of the Post Office in shaping the national identity and projecting the image of statehood. Despite retaining its original function throughout the latter half of the 20th century, the Central Post Office faced attempts to diminish its symbolic importance during the early years of Soviet occupation. Following Lithuania's reclamation of independence in the late 20th century, efforts were initiated to restore the symbolic significance of the Post Office. However, as demand for postal services waned in the early 21st century, a significant portion of the premises fell into disrepair, culminating in abandonment. At the same time, mounting public interest in the interwar architectural heritage of Kaunas propelled the former Central Post Office to the forefront of public discourse, sparking vigorous debate surrounding its preservation and revitalisation.

Figure 3. Feliksas Vizbaras, Post Office Building, Kaunas, Lithuania, 1930-1932, Opening of the International Exhibition "Modernism for the Future 360/365". © AHOY, 2022.

This prompted the exhibition organisers to undertake the formidable challenge of employing creative strategies to highlight a dilapidated building and enhance interest in its preservation. Ensuring that all parts of the exhibition were fully accessible to people with disabilities was as important as sensitively integrating the artistic projects without overshadowing the building's interior. Tailored technical and infrastructural solutions have captured the imagination of a wide audience and garnered the attention of national authorities. The Ministry of Culture has committed to this vision by acquiring a building designated to house the National Institute of Architecture beginning in 2024. **(Fig. 3)** ■

BIOGRAPHY

Dr. Viltė Migonytė-Petrulienė is an architectural historian and researcher in Vytautas Kavolis Transdiciplinary Research Institute of Vytautas Magnus University (Kaunas, Lithuania). She is the manager, and curator of international interdisciplinary projects (STAR Cities; Modernism for the Future; Forgotten Masterpieces; Kaunas 2022, among others). Dr. Migonytė-Petrulienė is also involved in organising and co-organising international conferences, seminars of the 20th century architecture and heritage, their animation and interpretation, and sustainable tourism development. She has published a monograph, scientific and popular articles as well as conference presentations about the history and heritage of modern Lithuanian resort architecture.

ARCHIVE NARRATIVES. CURATORIAL PROPOSALS BASED ON ARCHIVE COLLECTION DOCUMENTS.

MICHELLE LLONA RIDOUTT
PONTIFICIA UNIVERSIDAD CATÓLICA DEL PERÚ

ABSTRACT

In the Peruvian context, where an established architectural narrative is still lacking, it is urgent not only to communicate but also to imagine its architectural identity and promote a broader vision of its architecture. The objective of this essay is to present an alternative to bridge these gaps through virtual architecture exhibitions using archival material. These exhibitions provide greater visibility and dissemination of architecture to reach a broader audience, promoting a deeper appreciation of architectural heritage. Additionally, they contribute to the preservation and accumulation of curatorial discourses over time. This essay focuses on a key characteristic of archival architecture exhibitions: their ability to reproduce and preserve architecture beyond its constructed buildings.

This essay presents the project Archive Narratives, which aims to construct discourses of modern Peruvian architecture based on curatorial explorations from the documentary material of the Architecture Archive of the Pontifical Catholic University of Peru that are exhibited in a virtual gallery. This project explores documentary material from four thematic areas: work, representation systems, creative process and interventions. This premise is presented as a methodology to construct discourses from different points of view based on the dialogue between the archive, the curator and the architect.

Architecture exhibitions play a crucial role in the dissemination and understanding of the discipline. The archival material has the potential to broaden the research field on the project and the architect, creating opportunities to construct new and more discourses. Architectural archive-based exhibitions offer the opportunity to rethink and reformulate established narratives, exploring ideas, creative processes and representations that underpin finished works.

1. INTRODUCTION

The history of modern architecture is closely linked to the history of its exhibitions because they have not only documented the progress of the discipline but have also influenced its development and dissemination. The International Exhibition of Modern Architecture, known as *Weissenhof-Siedlung*, held in Stuttgart, Germany in 1927, is recognised as having been the first architectural exhibition and serves as a fundamental milestone in the development of modern architecture. This exhibition brought together leading architects such as Le Corbusier, Mies van der Rohe and Walter Gropius, and presented experimental homes designed to demonstrate the fundamental principles of modern architecture, such as the innovative use of materials and construction techniques, as well as new conceptions of construction. spatial organisation and urban design. Other exhibitions, such as *Built in USA* at the Museum of Modern Art (MoMA) in 1932 and the New York World's Fair in 1964, have made significant contributions to the recognition and promotion of modern architecture both locally and internationally.

It was only in 1979 with the creation of the Canadian Centre for Architecture (CCA) in Montreal, that there was an important shift in the conception of architectural exhibitions. This centre integrates archives, research, publication and the dissemination of architecture in a single place, thus enabling the first exhibitions to be carried out using its own documentary material.

The main difference between an art exhibition and an architectural exhibition lies in how the works are presented and defined. While an art exhibition presents the work itself and the viewer can experience it directly in the gallery, the architectural exhibitions display works that are never in the room, a building that is not physically present. Architectural plans, photographs, models and documentation are presented in such a way that they explain the concept and process behind the architectural work.

In that sense, when the CCA mounted architectural exhibitions using archival material, from its collection of originals, the viewer was exposed to the work of art itself. Architectural documents created by an architect are considered unique pieces that reflect ideas, representation techniques and creative processes.

This essay discusses the importance of dialogue between architectural archives and curatorial projects for their ability to reproduce and preserve architecture beyond its constructed buildings.

2. URGENT DISCOURSES

Although architectural books and magazines are taking up more space in bookstores, these printed publications mainly cater to a specialised audience. In Peru, architecture exhibitions[1] go unnoticed because most are held in academic settings that are not open to the public and only last as long as the exhibition remains in place. If we also understand that an exhibition, although temporary in nature, can construct discourses that may have a long-term impact, it is essential to reconsider how to document or publish these discourses to ensure their longevity and usefulness for society, elevating the role of architecture within the local community.

1. List of some physical architecture exhibitions held in Peru:
Eduardo Alvarez and Luis Perez, *Llona Núñez. UNT Campus 60 years. Colegio de Arquitectos de La Libertad*, Trujillo 2024

From 2011 to the present. Peru Pavilion at the Venice Architecture Biennale.

When we recognise that exhibitions have the potential to attract a potentially broader and more varied audience than academic publications, we realise the importance of establishing a meaningful link between the intellectual community and the general public. These exhibitions can play a crucial role in educating and raising awareness of the population about the role of the architect, architecture and therefore its cultural and social value.

Peru has not yet managed to construct an architectural discourse despite its important cultural heritage, which gives way to an interesting space for curatorial explorations that seek not only to preserve but also to re-imagine its architectural identity.

3. THE PROJECT

Towards the end of the 20th century, the CCA and other important institutions that house architectural archives[2] valued original documents and drawings in exhibitions because they enrich the public's understanding of architecture and its history. Exhibitions from original documentary material have the potential to reveal theories, representations and processes behind a finished work, whether a building, an essay or a master class. The view from the archives expands the research behind the project and the architect, opening up a diversity of curatorial projects.

In 2016, the Pontificia Universidad Católica del Perú (PUCP) created the Archivo de Arquitectura through the donation of the documentary collection of the architect Paul Linder, and to date has brought together the production of 21 architects who worked mainly in the modern period in Peru.

About five years later, with a more consistent collection, the Archivo de Arquitectura PUCP began calling for curatorial projects on an annual basis, based on original documentary material, with the aim of constructing narratives of modern Peruvian architectural history yet to be told. This initiative, titled Archive Narratives, is a laboratory for curatorial experiments that encourages collaborative storytelling between the architect, the archive and the curator.

The call promotes curatorial projects that aim to delve into deeper discussions, taking into account not only specific technical and disciplinary dimensions but also as a means for social and cultural reflection. The most interesting exhibitions of recent times are those that go beyond showing documents—sketches, plans, photographs, writings, models—following a monographic or chronological order and are structured around a hypothesis, trying to connect the architect and the archive through a broader argument.

For this reason, the bases of Archive Narratives propose four thematic areas that give direction to the curatorial projects: work, systems of representation, creative processes, and interventions from the original. Such themes will be presented later along with a brief reference to four cases of narratives of Peruvian architecture.

Due to the restrictions experienced during the COVID-19 pandemic and recognition of the crucial role of exhibitions in educating and raising awareness of the population about the importance of their architectural heritage, the digital or virtual gallery format appeared as an interesting platform for Archive Narratives.

A virtual gallery has the potential to expand the possibilities of formats, designs, access, dissemination and, above all, to prolong the useful life of exhibitions. Today, online presence has become as significant as physical presence in reaching audiences and establishing a lasting legacy. The digital format also contributes to the conservation of archival documents and preservation, not only of an exhibition but, above all, of a curatorial narrative.

On the other hand, the virtual gallery's location in an architecture faculty that manages an archive guaranteed an environment that allowed for rigorous curation, integration with education, the promotion of research and debate within the academic community and architectural professionals.

The Archivo de Arquitectura PUCP designed a virtual gallery that can include all formats -writings, quotes, images, videos, audio, and downloadable content- with a flexible layout that allows for different assembly options. Therefore, the assembly stage is a design process and, if you will, curatorial exploration as well. This platform was designed not only for the dissemination of the narratives of modern Peruvian architecture but also to allow the versatility of the archives' own documentary formats.

The resulting virtual gallery showcases a collage of individual or collective curations, featuring an array of new narratives that offer a partial or complete analysis. It aims to shed light on specific aspects of the history of Peruvian architecture. Without the intent to present exhibitions with detailed research, we seek curatorial proposals that introduce new approaches and new questions.

We hope that the exhibition space of the "Virtual Gallery"[3] of Archivo de Arquitectura PUCP will progressively become a space for propagating historiographic discoveries of curatorial projects.

4. NARRATIVES OF PERUVIAN ARCHITECTURE

The first exhibition inaugurating the archive in the "Virtual Gallery" was in 2021. Today there are 6 exhibitions in total, with four more planned for this year. It is interesting here to present the results of four exhibitions as examples of curatorial projects under the thematic areas of the initiative: *work, representation systems, creative processes, and interventions*.

The curatorial proposals of "Work" establish a parallel between the work and the archive documents—plans, photographs, articles, and essays—to delve deeper into the principles of modern architecture and how these took shape in our specific context. An example is the exhibition *José García Bryce. Recollections for a history of Peruvian architecture*.[4] This is a curatorial project that goes beyond presenting the architect's building design. Instead, it allows us a more comprehensive view of his work, in which his multiple facets are presented, highlighting his roles as a designer, researcher, historian and teacher. This exhibition features ten works: a graphic essay, a survey, four buildings, a photographic investigation, two articles, and a workspace.

To establish a parallel between the work and the archive of José García Bryce, the curatorial proposal seeks to bring hypotheses and new interpretations through the review of documentary material with other architects and artists. These conversations are presented in an audiovisual

4. Michelle Llona, *José García Bryce. Recolecciones para una historia de la arquitectura peruana*, Galería Virtual de Arquitectura PUCP. Lima, August 2021. https://galeria-arquitectura.pucp.edu.pe/exposicion/garcia-bryce/

format and accompany architectural documents, generally technical, to facilitate their understanding by the public. The exhibition demonstrates how primary research sources can lead to different discourses about the information presented in the original documents of each work.

On the other hand, the curatorial proposals of "Representation Systems" seek to interpret orthographic drawings, axonometric, sketches, collages, photographs, and models, among other formats, in order to understand the forms of expression of each architect, in light of the graphic conventions, contexts and discourses of an era. For this thematic area, the exhibition *Architecture in the Peruvian press. A journalistic review of the modern*[5] is a curatorial proposal that uses journalistic clippings as a primary source of analysis and in that sense, addresses representation beyond the architectural project.

The "Jorge Chávez" international airport was among the emblematic buildings that attracted attention in the Peruvian press, remaining a constant headline since the publication of the results of the contest, in 1960, until its inauguration in 1965. Through its representation in the press, the exhibition addresses the airport project as a response to modernist concerns, architectural competitions, the political scene —this being the first time in Peru in which the architect is recognized as a public figure at the centre of the discussion.

In the exhibitions associated with "Creative Processes", research on design methodologies is expected through different versions of the same work that show the creative and technical process behind an architectural production over time. The original drawings and documents reveal the direct connection with the thought process and the architect's hand. This material reflects the initial ideas, modifications to the project and final decisions that are not visible in the photographs of the final buildings.

The exhibition *Málaga, architectural research*[6] is a methodological proposal by the curator on research in creative processes. This exhibition seeks to approach, from a free perspective, an interpretation of the environment that has allowed the architect Guillermo Málaga to project as he does, as well as the possibilities of continuing to learn from his work.

The contents of the exhibition are the result of a year's worth of review of the drawings and weekly conversations with the architect and also includes work from an elective course where students develop architectural readings guided from planimetry, seeking to uncover the unconscious essence of the building through new representations; It does not look for its origins to value it but rather shifts its gaze to place it once again in front of the uncertainty of itself.

The final topic focuses on "Interventions" based on archival material. This allows for the construction of new original documents and serves as a catalyst for new research and projects. These curators engage in research through creative practice, resulting in pieces that offer new readings or reflections on the architect and modern architecture in Peru.

The exhibition *Inventing a museum. A project based on materials in the García Bryce documentary collection*[7] was curated by two plastic artists. The curators used the documents from the archive linked to the conceptualisation of a Lima Art Museum to superimpose them, transcribe them and overdraw them. This

allowed them to develop a critical discourse between the museology proposal of the Swedish archaeologist Alfred Westholm, heir of nineteenth-century European thought, and García Bryce's modernist museography proposal, which was both simple and flexible, and respected the spatial values of the museum.

5. CONCLUSION

The history of architectural exhibitions has shown us how they have documented the progress of the discipline, influenced its development and promoted its dissemination locally and internationally. However, they also prove to be fundamental because history is essential for developing project maturity in order to create architecture of this era.

This essay highlights the significance of architectural exhibitions in preserving and reinterpreting architecture beyond just the buildings themselves. The curatorial initiative from the Archivo de Arquitectura PUCP offers an opportunity to investigate and communicate Peruvian architecture from the documents prior to the building, bridging an evident gap in all discourses. In this sense, the location of an archive and a virtual gallery in a faculty of architecture is important because it offers a specialised environment that guarantees the quality of research, curatorship, dissemination and therefore education.

The proposed methodology seeks to present new narratives and approaches to modern architecture in Peru. There are still many more curatorial proposals to be added to the Archive Narratives project in order to consolidate knowledge on a single platform, the "Virtual Gallery." This platform will enable us, through various exhibitions, to delve into the written history and theory of architecture collaboratively, involving architects, archives and curators.

The exhibitions transport us to another realm of architecture, where the construction of modern history is essential in developing project maturity to create the architecture of this era, not just building structures, but also shaping memories.■

ABSTRACT

The promotion of modern architecture in the United States owes much to the still relatively unknown work of the US American original Taliesin fellowship apprentice, architect, writer, curator and scholar Elizabeth Mock (1911-1998). Mock was an assistant and acting curator of the Department of Architecture at the Museum of Modern Art (MoMA) in New York from 1937 to 1946. Her tenure at the museum was marked by her collaboration on and organization of several successful exhibitions that demystified modern architecture for the common public. Mock's most important exhibition at MoMA was Built in U.S.A.: 1932-1944 held in 1944, for which she also wrote the book *Built in USA: 1932-1944*. The exhibition was aimed at reflecting on the progress of US American architecture since the pioneering Modern Architecture: International Exhibition, also held at MoMA in 1932, co-curated by Henry-Russell Hitchcock (1903-1987) and Philip Johnson (1906-2005). In *Built in USA: 1932-1944* – both the exhibition and the book –, Mock presented new experiments in US American architecture characterized by a regionalist accent that took a sensitive approach to the site and used local materials and traditions. The exhibition proved to be one of her most successful works at MoMA, and the book became an influential publication. Through the 1944 MoMA traveling exhibition America Builds, Elizabeth Mock's non-European and attentive regional-based approach to architecture that nurtured the exhibition Built in U.S.A: 1932-1944 was to have repercussions in European architecture in the immediate post-war period, echoing as far away as Portugal, then a distant and closed country.

This paper aimed at achieving reflection on Elizabeth Mock's approach to architecture and architecture exhibitions during her curatorship at MoMA, through the 1944 exhibition Built in U.S.A.: 1932-1944 and the accompanying book *Built in USA: 1932-1944* and exploring the repercussions of Mock's unique and cultured approach to architecture.

1. PROLOGUE

On 24 May 1944, the exhibition *Built in U.S.A.: 1932-1944* opened at the Museum of Modern Art (MoMA) in New York. It was organised by the acting curator of the Department of Architecture at MoMA, Elizabeth Mock (1911-1998), who was also author of the book *Built in USA: 1932-1944*[1] published at the same time. The exhibition and book were a high point of Mock's tenure at MoMA. Mock, an original Taliesin fellowship apprentice, began working for the museum in 1937 at the invitation of Alfred Barr (1902-1981), who had been the director of MoMA since it was set up in 1929. She worked as a part-time assistant to the Department of Architecture and Industrial Art, which was under the direction of John McAndrew (1904-1978), from 1937. The mobilisation of men for WWII helped many women make it to more important positions at MoMA. Mock had returned from Switzerland, where she had lived since 1933 with her husband, the Swiss-born architect Rudolf Mock (1904-1977)[2], and where she had picked up her study of architecture at Basel Gewerbeschule again. In 1941 she stopped working for the museum due to the birth of her son, Frederick Mock[3], and returned in 1943, again at Barr's invitation, now as acting curator of the Department of Architecture. Her classes with the art historian Georg Schmidt (1896-1965) in Basel awakened Mock's interest in curatorship, anticipating one of the main paths towards her manifesting her view of modern architecture. The other path was writing.

The *Built in U.S.A.: 1932-1944* exhibition was a success, with both the public and the critics, and the book became an influential publication. Thanks to the travelling exhibition *America Builds*, also organised by MoMA in 1944, and circulation of the book *Built in USA.: 1932-1944*, Mock's non-Eurocentric regionally attentive approach to architecture was to have repercussions in the European architectural scene in the immediate post-war period, echoing as far away as in distant Portugal.

2. THE EXHIBITION *BUILT IN U.S.A.: 1932-1944*

Mock's most important exhibition at MoMA and one of her most successful works at the museum was arguably *Built in U.S.A.: 1932-1944*. The exhibition opened on 24 May 1944 and ran until October 22 of the same year; it constituted the architectural section of the more general *Art in Progress: 15th Anniversary Exhibitions* programme, organised by MoMA to mark its 15th anniversary. As the title suggests, the exhibition was aimed at reflecting on the evolution of US American architecture since the *Modern Architecture: International Exhibition* show of 1932, which had been co-curated by Henry-Russell Hitchcock (1903-1987) and Philip Johnson (1906-2005). That exhibition was the first exhibition dedicated to architecture that had been organised by MoMA and had been decisive for its affirmation as a benchmark institution for the promotion of modern architecture. Mock, who was then still known by her birth name of Bauer, visited the exhibition several times. *Built in U.S.A.: 1932-1944*. featured approximately 50 works constructed in the USA, most of which had been designed by US American architects. There

1. Elizabeth Mock, *Built in USA: 1932-1944* (New York, Museum of Modern Art, 1944).

2. Rudolph and Elizabeth Mock separated in 1948. In 1951 Elizabeth married architect Kenneth Kassler (1905-1964).

3. Elizabeth and Kenneth Kassler had a daughter, Katrina Kassler (b. 1957).

was a predominance of houses, demonstrating Mock's social concerns and an attentive approach to everyday life. In addition to residences, housing projects, public buildings, industrial units and works of engineering were also featured. As in other MoMA exhibitions that had Mock's involvement, several models were presented to the public, as well as a huge number of carefully selected photographs, technical drawings and small explanatory texts on the works arranged in an unusually unpretentious but inviting and contemporary way **(Fig. 1)**. The sophistication of *Built in U.S.A.: 1932-1944* contrasted with the elementariness of how the 1932 exhibition had been presented.

From the beginning of his tenure as curator of the MoMA's Department of Architecture and Industrial Art, John McAndrew worked towards achieving an inflection in terms of the previous approaches the department had taken, which were strongly influenced by Philip Johnson.[4] A more idealistic, aesthetic-influenced understanding of architecture, of which the *Modern Architecture: International Exhibition* show was the clearest example, gave way to a more humanistic approach that placed the emphasis on "the primacy of climate and culture, the impossibility of universal solutions and the emergence of regionally situated modern architectures."[5] Without this meaning that the international reality could be ignored, US-American modern architecture became more favoured in line with a deliberate and wider MoMA movement that reflected the policies of affirmation of a national spirit by the Franklin D. Roosevelt (1882-1945) administration.

John McAndrew's curatorial vision, which imposed a regionalist message on the MoMA architecture exhibitions[6] and which was to be continued on by Janet Henrich (1913-1988) and, later, by Alice Carson (1908-2001) after he left office in 1941, took on new amplitude and depth with Mock, when she became acting curator at the department in 1943. This adjustment reflected the uniqueness of Mock's relationship with architecture.

> *Thus, with the departure of John McAndrew, Elizabeth Mock championed his legacy at the same time as she drew on her own training with Wright, her transatlantic experience, and her association with Mumford (through her sister Catherine Bauer [Wurster]) to bring vernacular and regional expression to a national platform.*[7]

Built in U.S.A.: 1932-1944 – the exhibition and the book – presented a wide and diversified group of new experiments in US American architecture, most of which were characterised by a regionalist accent, with a sensitive approach to the site, local weather and materials, and vernacular tradition. The book is fundamental for understanding Mock's approach to architecture. Her discourse is inclusive, albeit critical. While distancing herself from the more abstract and doctrinaire pioneering of Modern European architecture of the 1920s, even if she acknowledged its importance, Mock did not reject European contemporary architecture. In addition to Le Corbusier (1887-1965), she also appreciated the new Scandinavian architecture, particularly the work of Alvar Aalto (1898-

4. After Philip Johnson left MoMA in 1934, curatorship of the department was first entrusted to Philip Goodwin (1885-1958), and then Ernestine Fantl (1906-1983).

7. Mardges Bacon, *John McAndrew's Modernist Vision: From the Vassar College Art Library to the Museum of Modern Art in New York* (New York, Princeton Architectural Press, 2018), 153. Catherine Bauer (1905-1964) was a defender of public housing. In 1940, Catherine married the architect William Wurster (1895-1973).

1976) and Aino Aalto (1894-1949).[8] At the same time she underlines the referential value of the work of Frank Lloyd Wright (1867-1959) and US American vernacular architecture. Mock writes:

> *Stimulated, perhaps, by Wright and by Le Corbusier's experiments with natural materials in the de Mandrot house (1930-31) and the Swiss Dormitory at the Cite Universitaire in Paris (1932-33), Americans looked again at the stone and wood barns of Pennsylvania, the white clapboard walls of New England, the low, rambling ranch houses of the West, and found them good*.[9]

Built in U.S.A.: 1932-1944 is the manifestation of a non-Eurocentric vision of architecture that reveals itself to be open, updated and cultivated. At the same time, it furthers the emancipation of US American architecture in relation to European architecture, re-rooting it in a new reading of its deepest values. In its condition of summarising and synthesising recent architecture, *Built in U.S.A.: 1932-1944* suggests a pathway ahead for new US American architecture.

3. THE TRAVELING EXHIBITION *AMERICA BUILDS*

In April 1944, the Office of War Information (OWI)[10] commissioned MoMA with a travelling exhibition that was to be shown in Stockholm, Sweden. The show was to affirm the US American way of life and, accordingly, contribute to the war effort at a time in which it (the war) was entering a crucial phase. The reasoning behind an exhibition of architecture was that it "reveal[s] more of our American way-of-life than perhaps any other type of show, except the straight propaganda presentation through photographs of people, films, etc."[11] Given the short time available for preparing the exhibition and the fact that said preparation took place at the same time as organisation of the *Built in U.S.A: 1932-1944* exhibition and a housing exhibition in the United Kingdom, Mock and Elodie Courter (1911-1994), director of the MoMA Department of Circulating Exhibitions, decided that the Stockholm exhibition would be mounted using the available material.[12] *America Builds* was to include 4 sections: 1. Pioneers of Modern Architecture; 2. Outstanding Buildings of the Past Ten Years; 3. U.S. Housing in War and Peace; and 4. Planning in the U.S.A. Section 2 was based on the *Built in U.S.A: 1932-1944* exhibition.

Amerika Bygger opened at the National Museum in Stockholm on 14 June 1944 and ran until August 15 of the same year. The fact that the opening took place a few days after D-Day gave the American way of life promoted by the exhibition added importance. **(Fig. 2)**

The show included some 400 photographs and drawings, in addition to books, magazines, films and building material samples. Alvar Aalto was invited to give a lecture.[13] The exhibition was accompanied by the publication of a book, *Amerika Bygger*,[14] which was structured in accordance with the exhibition sections and was generously illustrated. The Swedish and US American press noted the great visitor flows to, and huge success of, the exhibition. Jørn Utzon (1918-2008) was a visitor to the show. It introduced

him to the work of Frank Lloyd Wright and how he took the location and surroundings for each of his designs into consideration.[15]

After Stockholm, *Amerika Bygger* was presented in Gothenburg in September 1944, also accompanied by the book. In June of the following year, it travelled to Finland, where it was presented in Helsinki. Alvar Aalto wrote one of the introductory texts to the book. Still in 1945, it travelled to Copenhagen, Denmark. And then, in January 1946, it was shown in Oslo, Norway.

In 1945, the *America Builds* exhibition was presented in Switzerland, where it was likewise accompanied by a book. *USA Baut* was shown in Zurich and Berne. The following year, *L'Amérique Bâtit* visited Geneva and Basel. In relation to *USA Baut*, Emil Brunner (1889-1966) noted both the way in which America had learned from the old continent and, above all, how it had increasingly gone its own way in recent decades.[16] The exhibition garnered praise in the Swiss architecture-related press. Later, the Swiss architect Alfred Roth (1903-1998) acknowledged the pioneering character of *USA Baut* in re-establishing cultural links between countries through traveling exhibitions in the aftermath World War II.[17] In this sense, *USA Baut* was a precursor to the *Contemporary Swiss Architecture* traveling exhibition which Roth himself put together in 1952 to be shown in the USA and Canada.

The book *In USA Erbaut*[18], the German-language translation of *Built in U.S.A: 1932-1944*, was published in West Germany in 1948.

4. ECHOES IN EUROPE

In the course of 1945, the architect Fernando Távora (1923-2005), then still a student at the Porto University School, delved into several modern architecture books he had purchased at the time to widen his knowledge. Among those books was *Built in U.S.A: 1932-1944*. The book's presence in Portugal as early as 1945 is revelatory of the unexpected reach of the *Built in U.S.A: 1932-1944* exhibition and added new reach to the repercussions of Mock's approach to architecture. Portugal at the time was a distant country and one far removed from the discussion on architecture. The comments Távora made in the books reveal the importance he gave to Mock's observations, particularly when she refers to the renewed attention of American architects to the vernacular architecture in their country.[19] **(Fig. 3)**

His reading *Built in U.S.A: 1932-1944* contributed directly to the writing of the text *O Problema da Casa Portuguesa* [The Problem of the Portuguese House],[20] which Távora published in November 1945 in the *Aléo* magazine. In this text, Távora argued in favour of the study of Portuguese vernacular architecture, convinced that its value was important for the realisation of contemporary architecture, which had a duty to be Modern. Together with the thoughts of other Portuguese architects, the version of the text published in 1947 was decisive for the realisation of the *Inquérito à Arquitectura Popular em Portugal* [Survey of Portuguese Vernacular Architecture] carried out from 1955 to 1958. Távora was a referential figure in the renewal of Portuguese architecture in the latter half of the 20th century, defending the reconciliation of Modern Architecture and the values of vernacular architecture and tradition.

5. EPILOGUE

Elizabeth Mock's tenure at the Department of Architecture at MoMA was marked by the constant thinking of the public. She was as concerned with the ordinary public as she was with architecture-related professionals without compromising on the modernity and the quality of the architecture on display. The modern house and the routine of the dwellers were common themes of her exhibitions, demonstrating her social concerns and an attentive approach to everyday life. Mock was a woman with ample knowledge of the modern architecture of Europe, the USA, and Brazil, which she interpreted based on her own critical thought and sought to share through her various professional links. Mock's most enduring legacy of her tenure at MoMA, however, was her non-Eurocentric and regionally attentive approach to architecture, of which the 1944 exhibition *Built in U.S.A.: 1932-1944* and the book of the same name are arguably the most far-reaching manifestations. The *Modern Architecture: International Exhibition* show of 1932, introduced to the USA the European architecture of the 1920s. Just 12 years later, with the aid of the traveling exhibition *America Builds* and circulation of the book *Built in USA: 1932-1944*, the *Built in U.S.A.: 1932-1944* exhibition showed Europe a modern architecture impregnated with regional values that contributed to a revision of the Modern Movement, which at the time was just beginning to emerge.

Elizabeth Mock left MoMA in 1946, dismissed by Philip Johnson. Her curatorship of the *Built in U.S.A.: 1932-1944* exhibition was ignored by

BIOGRAPHY

João Miguel Couto Duarte (1966) is a Lisbon-born Portuguese architect practicing since 1990 and an assistant professor at the Faculty of Architecture and Arts, Lusíada University, Lisbon, where he teaches since 1991, and a research associate at Design, Architecture and Territory Research Centre [CITAD]. He is also a film producer. João holds a degree in Architecture from the Faculty of Architecture, Technical University of Lisbon (1990), an MSc in Art Theories from the Faculty of Fine Arts, University of Lisbon (2005) and a PhD in Architecture from Faculty of Architecture, University of Lisbon (2016).

Maria João Moreira Soares (1964) is a Lisbon-born Portuguese architect practicing since 1988, an assistant professor at the Faculty of Architecture and Arts, Lusíada University, Lisbon, where she has taught since 1989, and a research associate at Design, Architecture, and Territory Research Centre [CITAD]. She is Assistant Director of CITAD, a member of CITAD's Board of Directors, and the Architecture and Urban Planning Research Group coordinator. She is also a film producer. Maria João holds a degree in Architecture from the Faculty of Architecture, Technical University of Lisbon, 1987, and a PhD in Architecture from Lusíada University, Lisbon (2004).

FOOD PARTY: REFLECTIONS ON COMMUNITY ENGAGEMENT THROUGH FOOD PROJECTS IN ARCHITECTURAL EXHIBITIONS

LEYUAN LI
UNIVERSITY OF COLORADO DENVER

MAX BRAVO
SCHOOL OF THE ART INSTITUTE OF CHICAGO

ABSTRACT

In recent decades, the acceleration of urbanization and soil degradation has raised severe concerns regarding decreased farmland. As access to nutrition becomes increasingly dependent on a complex and fragile food system, which often impairs public food security, the attention towards fresh, organic produce has encouraged the emergence of growing food in urban areas, such as community gardens and shared rooftops. The introduction of agriculture into urban spaces is necessitated not only as a means of ensuring nutrition, but also as a way to promote public care and community engagement. In response to these emerging conditions, projects at architectural exhibitions and biennales seek to explore the immediacy and agency of care at divergent scales through the medium of food. While these exhibition projects are entangled with different political and social concerns, they draw upon the cultural and ecological value of food production, carving new avenues for community engagement where the politics and powers of food are materially and ecologically investigated. These projects *seek* to ask: what narratives about food and food-related activities do exhibitions intend to foster? How could architectural exhibitions become a productive platform to devise, spatialize, and communicate resistance and resilience to social and environmental unrest?

To answer these questions, the paper will analyze several curatorial and exhibition projects related to the theme of food, examining divergent measures that promote social interaction and ecological awareness through the medium of food. It will also discuss the role of architectural exhibitions as crucial devices for convening and communicating with the public, rendering visible the material forces that contribute to new forms of community engagement in the 21st century.

1. INTRODUCTION

Architectural exhibitions have always been a significant platform for showcasing emerging design technologies, spatial innovations, and theoretical inquiries into a material world saturated with ever-changing social, political, and environmental issues. Traditionally, these exhibitions have been inclined towards the collection and display of objects that serve as repositories of 'high' cultures for the educated and elite, with limited attention to quotidian objects and everyday experiences associated with the public. However, in recent years, there has been a remarkable shift in architectural exhibitions and biennales, moving away from the hierarchical curatorial paradigm towards a perspective of care that engages everyday objects and activities of divergent communities. What exemplifies this notable shift is the burgeoning discussion in architectural exhibitions around projects that interrogate urban farming, food culture, and its architectural response, speculating on the tools and spaces of food production as social and cultural catalysts in forging new forms of collectivity. As argued by the curators for the Spanish Pavilion in the most recent Venice Biennale, titled *The Laboratory of the Future*, "By eating, we digest territories."[1] In the context of global uncertainties and social and environmental unrest, food, along with its relation to bodies, communities, and territories, continues to echo as a critical factor in shaping our world.

Over the past decade, the Bi-City Biennale of Urbanism and Architecture (UABB) has witnessed various forms of community engagement tackling food production and food-related activities. For instance, in 2009, a series of planting modules was devised as a landform installation at the West Kowloon Cultural District, where children in the neighborhood used the modules to grow and harvest the lettuce; in 2017, the public audience gathered for food activities under the large chimneys, titled *Fired Foodies Club*, designed by Atelier Bow-Wow (**Fig. 1**). From interactive installations to pop-up dining experiences, food projects have emerged as powerful tools for engaging diverse audiences and fostering transdisciplinary dialogue, acting as productive apparatuses to expand the architectural discourse by unfolding its entanglements with different political and social concerns. These exhibition projects draw upon the entrenched cultural and ecological value of food production, carving new forms of community engagement where the politics and powers of food are materially, socially, and ecologically investigated.

2. THEORETICAL FRAMEWORK

To comprehend the agency of food in architectural exhibitions, it is imperative to elucidate several questions related to contemporary curatorial practices and the pressing social and environmental issues. For instance, what is the role of architectural exhibitions in engaging the public beyond providing visual and sensory experiences? How do food-based projects and activities at architectural exhibitions facilitate conversations that engage divergent communities? How can architectural exhibitions challenge dominant power structures and support community-driven resistance and resilience to social and environmental unrest we face today?

1. Andrews Blanco and Oscar A. Sanchez, "Foodscapes, 'By eating, we digest territories". Spanish Pavilion at the Venice Architecture Biennale 2023," Metalocus, accessed May 5, 2024, https://www.metalocus.es/en/news/foodscapes-eating-we-digest-territories-spanish-pavilion-venice-architecture-biennale-2023.

As the immediacy of the food crisis becomes more apparent, so does the urgency to unravel food systems and the environment that supports them. Over the past decades, the acceleration of urbanization and soil degradation has raised serious concerns about the decrease in farmland. A recent study reveals that the world has lost one-third of its arable land due to erosion and pollution. With intensive agricultural practices, including the continual plowing of fields and the heavy use of fertilizers, the quality of land and the food it yields continues to decrease, which limits access to nutrition and thus impairs public food security. This escalating concern around food production has spurred two areas of inquiry in architectural exhibitions: on the one hand, it explores the architecture's role in the politics and logistics involved in food transportation, distribution, labor, and maintenance. It delves into the ecology of food materialized in farmhouses, food factories, and supermarkets, which is epitomized at the Tallinn Architecture Biennale 2022, titled *EDIBLE; Or, The Architecture of Metabolism*. On the other hand, it examines the emergence of farming practices, such as urban farms, community gardens, and domestic gardens, which are encapsulated in the projects *Landgrab City* and *Value Farm* at the Bi-City Biennale of Urbanism and Architecture 2013. These exhibitions aim to explore food not only as a source of nutrition but also as a means to enrich community engagement. By involving communities in the process of knowing, growing, and sharing food, these exhibitions aim to reveal a world of nutrition that necessitates collective efforts to sustain its fragile ecosystem, redefining the agency of mutual care through the medium of food.

In addition to its ecological and environmental dimensions, the social and performative value of food is underscored in many food projects to enhance community engagement through architectural exhibitions and biennales. As the architectural historian Elizabeth Cromley asserts, the activities around food, including cooking, storing, serving, eating, and disposing, function as a food axis in the social production of space.[2] Food is theatrical and performative. In the space where the cleansing, cutting, cooking, and sharing of food converge, a routine of activities transforms into a theatrical site for potential performances and social interactions.[3] In other words, the production and consumption of food is the production and consumption of social spaces that enable activities of care and conviviality. This connection between food and collectivity is exemplified in the project titled *Secret Ingredient*, designed by Herkes Icin Mimarlik (HiM Collective) as part of the 2019 Chicago Architecture Biennial. Centered around a series of picnic tables, the project brought together visitors and residents in the neighborhood in the garden of the Anthony Overton Primary School. Through a series of interviews and activities engaged in the sharing of "Soul Food," the exhibition intended to unearth the "secret" stories of the marginalized African American communities and their struggles for food sources and civil rights. These small-scale interventions and installations in architectural exhibitions draw upon the medium of food as the catalyst for collective behaviors, operating as the infrastructure of care to promote a new set of social codes and spatial politics that crafts new modes of collectivity and solidarity in the living community. In response to these

2. Elizabeth C. Cromley, "Transforming the Food Axis: Houses, Tools, Modes of Analysis," *Material Culture Review* 44, (Fall 1996): 8-20. https://journals.lib.unb.ca/index.php/MCR/article/view/17695.

perspectives, two curatorial and exhibition projects will be further examined in the next chapter.

3. CASE STUDY

3.1 FOOD: BIGGER THAN THE PLATE

In 2019, the exhibition, titled *FOOD: Bigger than the Plate*, was held at the Victoria and Albert (V&A) Museum of London. Curated by Catherine Flood and May Rosenthal Slone, the exhibition offers a compelling insight into food and its broad narratives, suggesting innovative ideas that interrogate the convoluted relationships between the environment and the diverse organisms inhabiting and digesting it. This series of inquiries is facilitated by projects on community involvement, emphasizing the significance of social interactions, such as collective dining and farming, as powerful tools for challenging established perceptions of food that separate consumption from production.[4]

The exhibition suggests the role of food as not only a sustenance of nutrition but also a medium that carries narratives of its origins and its transformative processes. As food journeys from transportation to our plates, it is crucial to consider its impact on the environment, elevating the act of eating from mere necessity to a critical understanding of our surroundings. This includes educating the community on the ecological footprint at each stage, from farming practices to transportation methods, as well as the complex network of labor and capital forces involved in food processes. As the exhibition unfolds, it introduces four main sections: *Compost, Farming, Trading*, and *Eating*. Though all of them touch upon different aspects of community engagement, *Farming* and *Eating* are more entangled with our everyday activities.

Farming explores the intricate connections between landscapes, organisms, and those who cultivate our food. By showcasing innovative farming techniques, it highlights the recalibration of our relationship with the land through sustainable agricultural practices. This is rendered visible by community-driven projects, such as *Bicitractor*, developed by Farming Soul, to support small-scale farming. *Bicitractor* is a pedal-powered machine equipped with electric assistance designed for small- and medium-sized vegetable farms. In contrast to traditional machine-powered tractors, *Bicitractor* offers farmers the benefit of eliminating the inconvenience caused by the internal combustion of engines and the unpleasant odor of exhaust fumes. Aside from its contribution to reducing carbon dioxide emissions, *Bicitractor* operates on an open-source principle, with the manufacturing plans for the vehicle free and available to all in the community.[5] Moreover, the project enables community collaboration by offering a hands-on approach to work collectively from the initial stages of cultivation to the final collection of fresh produce. By involving members of the community in these activities, Bicitractor not only enhances practical skills but also cultivates a deeper appreciation for the collective efforts involved in food production.

In the *Eating* section, the exhibition presents a bold departure from conventional food practices, underscoring the cultural, social, and political dimensions of cooking, dining, and other forms of food consumption. In this section, meals are explored as more than mere sustenance; they serve as vehicles

4. Sarah Dawood, "V&A Food Exhibition Challenges Our Ideas of Consumption," Design Week, accessed May 5, 2024, https://www.designweek.co.uk/issues/10-16-june-2019/va-food-exhibition-challenges-our-ideas-of-consumption/.

5. Dawood, "V&A Food Exhibition Challenges Our Ideas of Consumption,"

for storytelling, cultural exchange, and community engagement. By dismantling traditional nutrition paradigms, new forms of eating practice encourage visitors to think critically about food choices and their broader implications on societal norms. This concept is highlighted in the *Loci Food Lab*, which crafts sustainable canapés using ingredients that are frequently disregarded, such as vegetables deemed "too ugly" for supermarket shelves.[6] This innovative approach seeks to educate visitors about inventive ways to mitigate food waste and reconsider production and consumption practices. Another avenue through which the exhibition promotes community engagement is by introducing novel approaches to dining, highlighting the importance of the table not as a surface for eating, but as a connector for diverse culinary traditions, practices, and storytelling. Central to the exhibition is an 11-meter-long table showcasing diverse projects, ranging from inventive cutlery designs to unconventional utensil shapes **(Fig. 2)**. It also includes the adoption of unconventional methods such as group eating, framing it as a collective activity that not only nourishes the body but also fosters human relationships, sparks debates, and encourages meaningful conversations. The exhibition communicates a clear message: food is much more than what we eat; it is a sophisticated system encompassing social, cultural, and environmental implications that offer a compelling vision for a more sustainable and socially conscious food future.

3.2 FOODSCAPE

As part of the Venice Architecture Biennale 2023, the Spanish pavilion, titled *FOODSCAPES*, is dedicated to highlighting the architectural presence in the complex processes of production, distribution, and consumption. Curated by Manuel Ocaña and Eduardo Castillo-Vinuesa, the exhibition invites contemporary creators to investigate the often-overlooked architectural aspects of manufacturing and their impacts on the surrounding environment, exploring the role of physical architectural frameworks in facilitating food-related processes **(Fig. 3)**.[7]

The exhibition comprises three main frameworks: *Feast, Total Recipes*, and *Public Program*. *Feast* is an audiovisual feast composed of five movies, each of which delves into five constitutive layers of agro-alimentary systems, including *Foundation, Production, Distribution, Consumption*, and *Digestion*. *Total Recipes* is a research project that goes beyond the finding of traditional recipes filled with mixing protocols of the ingredients available in our kitchens. Through a collection of ten case studies, *Total Recipes* explores the infrastructural chains necessitating the production of each ingredient, showcasing how different dishes cut across the five layers provided in the first framework. *Public Program* is a collection of short films that delve into the present conditions of food environments via lectures, workshops, film showings, and guided tours. It invites viewers to actively engage with their communities by exploring complex global food systems, revealing untold stories, and fostering a shared dedication to creating a more sustainable, fair, and resilient future.

While the exhibition as a whole prioritizes community involvement, *Total Recipes* underscores how the ingredients of a dish traverse multiple

7. "Copenhagen Architecture Festival (Cafx) - A Place to Explore, Discuss & Communicate Urban Challenges," Copenhagen Architecture Festival, accessed May 5, 2024, https://www.cafx.dk/.

scales of community engagement in the digital age. For instance, in *Recipe 1*: "Ghost Tortilla" by Lucia Tahan, an architect and augmented reality software designer, she investigates the process of making a tortilla, tracing the links between the traditional practices of an egg farm and the digital landscapes of a data farm. As the quintessential Spanish dish, tortillas have long carried a cultural symbol of the Spanish community. However, the way they are made is shifted from an ordinary kitchen to a "ghost" kitchen, which produces food that is transported directly to the homes of clients who order via digital technologies. Tahan argues that this digital innovation has marginalized the role of architects in regulating the spaces of production, with its negative social impacts on the local community due to the noise, smell, and garbage produced by these ghost kitchens.[8] As she immerses herself in this investigation, Tahan's curiosity is piqued by the symbiotic relationship between age-old culinary craftsmanship and the digital innovations reshaping the gastronomic landscape of contemporary society. "Ghost Tortilla" exemplifies the ambition of Total Recipes to unravel the intricate tapestry of tradition, technology, and taste that intertwines to redefine our community in the digital age.

4. REFLECTION

The term "curation" finds its roots in the Latin word "curare", which translates to "to care". This etymology underscores the fundamental nature of curation as a practice of care, a concept that has shaped the way museums interact with people. In the context of early and modern European museums, curatorial practices were primarily focused on the care of collections and objects, which were considered valuable for their educational and scholarly significance. The role of the curator and the curating institution was considered pivotal in imparting knowledge to the public, perpetuating the singular authorship that informed how society was perceived and dissected.[9]

However, over the past few decades, there has been a noticeable shift towards the notion of architectural exhibitions as crucial devices for convening and communicating with the public. The idea of care has been expanded to include the care of communities where diverse constituents reside. Following this curatorial shift, food projects serve as a powerful medium to facilitate the exchange of conversations in communities. However, as the production of food is ephemeral and interactive, food exhibitions and projects are often subject to a performative process that requires meticulous attention to the growth of plants and the preparation of fine cuisine, both sensitive to unpredicted reaction and participation from the audience, and thus inclined to be unduly curated based on a finished product rather than an open, flexible process. This polished outcome of the exhibition is criticized by Chris Fite-Wassilak in his review article of *FOOD: Bigger than the Plate*, in which he claims that the exhibition is the product of a consumerist middle-class society that produces and consumes its own narratives. The exhibition, as he argues, "presents well-designed, consumer-friendly products that tweak on the outputs of the current system instead of offering provocations or reflections to what and how we eat together."[10] This critique arouses critical questions: is there a "radical attitude

10. Chris Fite-Wassilak. "Food: Bigger Than the Plate Review," E-Flux Criticism, accessed May 5, 2024, https://www.e-flux.com/criticism/278274/food-bigger-than-the-plate.

of cooperative inquiry" into the representation and participation of food in architectural exhibitions? How do these exhibitions react to the messy, dirty, and unpredictable reality? How could these exhibitions reject a prescribed timeframe and the constraints it entails, and what do exhibition spaces and events leave behind them once their performance ends?[11] As highlighted in the author's project, titled *Balchen* **(Fig. 4)**, when the biennale venue was shut down unexpectedly due to the pandemic control, the residents in the neighborhood volunteered to look after the plants and take ownership of the installation as if they were part of the curated repertoire. This unplanned publicity became even more prominent when a local farming organization adopted the installation and continued to foster food in its rooftop venue—the exhibit was animated as a catalyst for facilitating and empowering community engagement rather than merely staging such events in a didactic way. Such unpredictability is hard to project, but perhaps it could be examined as the immediate "future" of the architectural exhibition, whether as risk or as potential.[12] As Castellani concludes, "We must make room for art and food as our everyday source of relating and healing."[13] In other words, the ways in which the production of food in architectural exhibitions fosters and inspires an everyday practice of care remain further critical inquiry. ■

BIOGRAPHY

Leyuan Li is a Chinese architect, educator, and researcher whose professional and academic work focuses on interior and urban realms in the articulation of spaces and societies. He has practiced architecture internationally at OMA and SOM before founding his design practice, Office for Roundtable. Li is assistant professor of architecture at the University of Colorado Denver. His writing has been published in esteemed journals, and his curatorial projects have been exhibited at the Denver Art Museum, the 9th Bi-City Biennale of Architecture and Urbanism in Shenzhen, and the UCCA Center for Contemporary Art in Beijing. Most recently, he was awarded the 2024 AIA/ACSA Housing Design Education Award.

Max Bravo is currently enrolled in the architecture program at the School of The Art Institute of Chicago. With a foundation in interdisciplinary studies, he seeks to explore the role of existing materials in architectural design, aiming to cultivate a deeper appreciation for the dynamic relationship between form and substance.

EDUCATION TO CONSERVE MODERN HERITAGE: METHODS AND TOOLS

ANDREA CANZIANI
MINISTERO DELLA CULTURA, ITALY
DOCOMOMO ISC E+T

CHANDLER MCCOY
GETTY CONSERVATION INSTITUTE

ABSTRACT

Modern heritage is increasingly understood and appreciated but there are still significant hurtles that must be overcome to ensure that modern places are conserved and well cared for. This paper discusses the educational challenges in the conservation of twentieth-century built heritage in terms of both what needs to be taught, how it is best taught, and who should be receiving this training. The need for increased educational opportunities for those involved in conserving modern heritage was confirmed in a joint research report written by Getty Conservation Institute and DOCOMOMO International, which was published in 2020. The survey also pointed out that this sort of training is happening, although its reach is currently limited. Examining some education and training efforts, aimed at both university students and professionals, we find there are several notable efforts underway that offer useful lessons. At both the student and the professional levels, a need for broadening what we consider heritage, and who it matters to, are becoming part of the educational content. This also means that conservation should be taught as a multi-faceted subject, including social, economic, as well as historic and cultural values. Investigating successful trainings we see that they should deliver theory, methodology, and technical subject matter. In many cases, using case studies of successful conservation projects engages professionals by demonstrating actual example of the application of conservation science or technique.

Education and training are key to advancing the practice and ensuring better conservation outcomes, Overall, the paper stresses the importance of a well-rounded educational framework that not only imparts technical knowledge but also cultivates an appreciation of the historical, cultural, and social significance of modern architectural heritage. This comprehensive educational approach is deemed crucial for effective and sustainable conservation efforts.

1. INTRODUCTION

Modern heritage is increasingly understood and appreciated but there are still ways to go to ensure that places are conserved and well cared for.

Modern sites are aging, their uses often becoming obsolete, and their physical conservation poses difficult technical challenges which make them vulnerable to insensitive alterations, neglect, and demolition. In addition, the climate change emergency and rapid societal changes require balancing different needs that at times compete with conservation priorities. In an increasingly complex world, professionals working on modern heritage conservation are faced with difficult decisions that require a large set of skills and competencies including engaging stakeholders to ensure good conservation outcomes.

Could this be why, despite diligent attention to this matter, and the evidence that there have been decades of successful conservation practice the field of education and training for conserving modern heritage has lagged behind?

Over recent years a wealth of knowledge has been developed which needs to be disseminated widely both to the students, emerging professionals, and to those already working in decision-making positions. Education and training are key to advancing the practice and ensuring better conservation outcomes, as declared in the *DOCOMOMO Manifesto on Education*.

The need for increased educational opportunities for those involved in conserving modern heritage was confirmed in the joint research report "A Global Survey on Education and Training for the Conservation of Twentieth-Century Built Heritage" by Getty Conservation Institute and DOCOMOMO International, which was published in 2020.

Almost two thirds of the respondents acknowledge an interest in the subject of conservation of this topic. Nevertheless, the survey reveals still many open challenges and points out lessons and recommendations for the future.

These findings were one of the starting point for the DOCOMOMO International Specialist Committee Education+Training to set a discussion and a working group aimed at examining how education and training could be key to advancing the practice and ensuring better conservation outcomes. The results are collected in the 2022 *DOCOMOMO Manifesto on Education*. As the manifesto makes clear, modern heritage education must be seen as a multi-faceted and strategic effort that must be implemented on a full spectrum of platforms and to diverse audiences.

But, how is modern heritage education unfolding today? How the complex aims of the Manifesto can be realised?

2. GLOBAL PERSPECTIVES ON TWENTIETH-CENTURY HERITAGE EDUCATION

Based on the experience developed over these years, we can affirm that different approaches to pedagogy (and practice) of twentieth-century built heritage conservation coexist, also including different opinions on whether

or not it should be taught separately from traditional conservation curricula, and how it can be integrated therewith.

In the academic sector, education and training on twentieth-century heritage conservation are generally integrated into broader heritage conservation education programs. This integration can be seen as advantageous because it provides extensive knowledge in the field of cultural heritage and confirms that the conservation of modern architecture does not require a separate conservation theory and methodology. However, it also presents a potential drawback: most architecture and engineering schools do not offer architectural conservation at the undergraduate level, and the curriculum has limited scope for teaching about traditional materials, surveying, and diagnostics. Specialized education in architectural conservation primarily occurs only at the postgraduate level and there is often insufficient time to address the unique challenges of modern architecture, risking an oversimplification of contemporary conservation approaches. As Cristina G. Longo points out, «Theoretical and design concerns seem to lag behind scientific/technical developments in architectural conservation, and there is a lack of awareness even on existing contemporary theories of conservation and only limited informed open and public debates on conservation»[1]. This issue is particularly noticeable in the tendency to prioritize the restoration of original appearance or conditions, which may not always be feasible or appropriate.

Other educational institutions beyond universities are actively engaged in the field beyond just teaching it. Through their work, they play an essential role not only in fostering the study and documentation of twentieth-century built heritage but also in raising awareness and developing a community of professionals sensitive to the topic. These institutions, which may include education and training committees from various NGOs like GCI, DOCOMOMO, ICOMOS contribute significantly to the broader educational and conservation efforts by providing practical training, workshops, seminars, and public engagement activities. Their involvement helps to bridge the gap between academic knowledge and practical application, essential for effective conservation practices.

An excellent example of this approach to heritage conservation is the training course «Inheriting the Present: The Care of Contemporary Architecture», organized by the Fondazione Scuola per i Beni e le Attività Culturali in Rome[2]. The first edition, held in 2023-24, effectively combined the development of theoretical and methodological skills needed to think, plan, and design the conservation of contemporary architecture, with the creation of a community of practice.

This community includes officials from the Ministry of Culture responsible for the protection and cataloging of modern heritage, ensuring that theoretical learning was closely integrated with practical, real-world application of preservation.

This dual focus helps foster an awareness critical for effective conservation work and for engaging with various stakeholders, including citizens living in the buildings under preservation. And, offering training like this to cultural

1. Cristina Gonzalez-Longo, «Can Architectural Conservation Become Mainstream?», in *Heritage and Landscape as Human Values*, ed. Maurizio Di Stefano, ICOMOS 18th General Assembly and Scientific Symposium, Florence 2014 (Napoli, Edizioni Scientifiche Italiane 2015), 626.

2. The course "Ereditare il Presente. La cura dell'architettura contemporanea," curated by Andrea Canziani, is organized by the Fondazione Scuola per i Beni e le Attività Culturali in Rome in collaboration with the Direzione Generale Creatività Contemporanea of the Italian Ministry of Culture. It is designed to delve into contemporary architecture conservation and is structured into thematic modules: A - Education for the conservation of modern heritage: sources and study tools; B - Contemporary architecture in Italy: protection of cultural assets and copyright; C - The restoration project between contemporary methods and materials: challenges and perspectives; D - Preserved contemporary architecture: designing for use; E - Conservation and restoration of systems and envelopes: the conservation of the contemporary and its cultural and energetic sustainability. https://www.fondazionescuolapatrimonio.it/ereditare-il-presente-cura-architettura-contemporanea-corso/ [accessed on 10.06.2024]

heritage authorities rather than only to practicing architects means it will reach a vital group of decision-makers with possibly far-reaching effects.

Alongside examples like this, it must be noted that there is a significant shortage of skilled practitioners and contractors in the conservation of contemporary built heritage. As more heritage buildings and sites require substantial interventions, both interest and awareness of the field's challenges are growing. There is a clear demand for more professional training; however, vocational education and training (VET) on this topic is often overlooked, leaving contractors without the necessary skills. From the perspective of creating a skilled workforce, capable of supporting design choices rather than opposing them, due to a lack of knowledge on how to intervene in contemporary architecture, a notable example is CONCRETO, a 36-month project started in 2024, bringing together 13 partners from 5 EU countries to promote the rehabilitation of concrete architecture. CONCRETO is an Alliance for Education and Enterprises within the Erasmus+ Programme funded by the European Union[3]. The starting point is the lack of specialist skills available and the need to develop guidelines and standards for the quality regeneration and maintenance of our modern concrete buildings. Therefore this project brings together academics, professionals, and construction workers with the aim of developing skills for the recovery and conservation of historic reinforced concrete through both theoretical training and significant, substantial practical restoration activities.

In short, training is a perceived necessity, but what type of education follows from it? Can we tackle the problems of how without having answered the whys? Edgar Morin[4] would have reminded us that the goal is a well-made head, not a well-filled head.

3. CRAFTING CONSENSUS FOR MODERN HERITAGE

The importance of integrating theoretical frameworks with practical knowledge is well documented in the DOCOMOMO Manifesto on Education, which contains eight key messages outlining the aims of education for modern movement heritage. The Manifesto emphasizes the need to educate about the significance of modern heritage, before and regardless of any official recognition or listing. It advocates for preserving authenticity in both ideas and materials, and for safeguarding all traces of time. It also highlights the practice of preventive conservation to address the fragility of modern architecture through regular, scheduled maintenance that aligns with all themes of sustainability. Additionally, it promotes cultural sustainability alongside environmental and economic sustainability. Finally, it encourages citizen participation, recognizing that the rights, values, memories, and interests of heritage communities are crucial elements of effective conservation.

It is interesting to note how the ability to manage public participation emerges as a professional skill to be recognised and cultivated. Conservation experts should better communicate with communities using clear, simple language and diverse media to explain conservation principles and share project results. Similarly, educating the public about architecture

4. Edgar Morin, *La Tête bien faite. Repenser la réforme, réformer la pensée* (Paris: Seuil 1999)

and conservation is vital, much like teaching sustainability. Integrating conservation into educational curriculums is essential for developing informed citizens[5]. We protect something when we feel represented in that thing, and the decision to conserve appears as the clearest manifestation of a recognition of value. These statements bring us back to a specific disciplinary area[6], but they also ask us to intervene on the social dimension of the relationship between heritage and the subjects from whose recognition this derives. In summary, it involves giving value to themes and disciplines that belong to the processes of patrimonialization that include anthropology and sociology and cover topics of significant interest for contemporary society such as post-colonial and queer studies. It is increasingly evident that the nature of conservation and heritage education is not just technical. The Faro Convention by the Council of Europe in 2005 marked a shift, recognising that the conservation and education of heritage isn't merely a technical endeavour but deeply intertwined with political and social dimensions. This approach emphasises the active involvement of communities in the heritage they live with, suggesting that heritage should be seen as a resource for sustainable development and promoting a diverse and inclusive interpretation of heritage narratives. This comprehensive view supports the idea that heritage conservation extends beyond preserving physical structures to fostering cultural continuity and social cohesion. The issue is particularly evident for the modern which embodies divisive themes, linked to political or colonial regimes, or to certain ideas of welfare that appear discriminatory but are carriers of cultural, ethical, and social values still relevant for the 21st century.[7]

4. EXPANDING HERITAGE EDUCATION

To approach these objectives, two groups appear as key stakeholders who are outside the usual educational programs and need to be involved and considered: the citizens —as the inhabitants/users— and the decision-makers.

4.1 ENGAGING CITIZENS

If we try to assess the relationships that are created between education for citizenship and heritage education—understood as an interdisciplinary education founded on active participatory methodologies—it becomes clear that this does not only address formal school system educators but also those involved in informal education, especially those who work with heritage as bearers of knowledge[8]. Heritage education, therefore, is seen not just as the transmission of content, but as making heritage relevant in the contemporary world as a bearer of meanings and values that can improve, both culturally and socially, the quality of life for each individual. This process mirrors the fostering of awareness and appreciation in contemporary art, which often encounters skepticism due to well-understood factors.

Schools and universities bear the great responsibilities of the formal system, but there must also be continuing education that, for instance, engages professionals who play a crucial role in mediating between inhabitants and architectures.

Notes for an anthropology of Inhabiting the Modern Heritage», in *Modern Heritage Between Care And Risk*, ed. Maria Bonaiti Sara Di Resta, (Venezia: Bembo Officina Editoriale 2022) 284-305.

4.2 ENGAGING DECISION-MAKERS

A fundamental aspect in the relationship between modern heritage and its care is to educate decision-makers, as they have the responsibility for collective choices that have immediate consequences. Intervening in this area can seem challenging because it affects codified work systems and established habits. In the public administration sector, if we exclude continuous training systems linked to mandatory professional updating that do not reach everyone or that have to address multiple topics, we are dealing with individuals who are not involved in formal education processes but rather in informal ones. At the same time, however, action is needed on only a limited number of individuals, who, moreover, have a specific interest in developing necessary skills. This goal is closely linked to specific national situations and cannot be standardized because decision-making systems differ for each country, as do laws. Nevertheless, we believe it is crucial not to forget these figures and to include them as much as possible in our considerations about the key stakeholders.

5. EDUCATIONAL EXPERIENCES

In terms of developing a pedagogical approach to the subject, the papers in this session offer some possible examples.

First, the Eramsus course called Joint Masters RMB which is being planned by five European universities on conserving modern heritage developed at the Master's Level has decided to focus on adaptive reuse as the framework for its studio projects. This will give students more than a theoretical understanding of modern heritage conservation, it will require them to develop design solutions for real buildings, forcing them to grapple with practical and technical challenges. Furthermore, because of the regional diversity of the five participating universities, the students will be exposed to a wide variety of regulations, climates, and building typologies, which will give them broad understanding of the role context plays in conservation. The desired result of this program will put theory into practice within an academic context.

The example of the GCI conservation professional-level course addresses the need for heritage professionals to learn about the wide the broad spectrum of historic, social, technical, and advocacy issues that confront those in practice, and relies heavily on case-studies as a teaching tool. In this way the participants learn new skills and, importantly, how to apply them.

The creation of a conservation management plan for a Benedictine Monastery church in Santiago, Chile, demonstrates how learning various tools and methodologies that are required for writing a CMP for a modern-era structure has provided certain skills to those architects and conservation professionals related to the values-based approach to conservation, including engaging with stakeholders.

Finally, reflecting on how can students effectively incorporate political, economic, and sociological considerations into their designs, Artina Qehaja highlights the challenge of grasping a wide array of topics within a limited

timeframe. This underscores that conservation is a multidisciplinary field encompassing economics, politics, sociology, and information technology. It advocates for an educational approach that integrates historical appreciation with contemporary needs, preparing students to effectively preserve architectural heritage for future generations. The ultimate goal is to deepen our understanding of architectural history in a way that informs and enhances current and future conservation efforts. ■

BIOGRAPHY

Andrea Canziani is an official at the Italian Ministry of Culture and collaborates with the Fondazione Scuola dei Beni e delle Attività Culturali in Rome, curating educational courses on contemporary architecture. He was DOCOMOMO Italy's General Secretary and now co-chairs DOCOMOMO ISC Education + Training. He earned his Master's and PhD from the Polytechnic of Milan, focusing on cultural heritage protection and the economy of culture, and completed a postgraduate degree in Monument Restoration at the University of Genoa. He also teaches Architectural Preservation at the Polytechnic of Milan and is a member of the Italian Society for the Restoration of Architecture.

Chandler McCoy, AIA, directs the Conserving Modern Architecture Initiative at the Getty Conservation Institute in Los Angeles, which aims to enhance modern heritage conservation through educational programs, field projects, and publications. Before joining GCI in 2015, he was Associate Director for Planning and Design at the Presidio Trust in San Francisco. McCoy holds a BS in Architecture from the University of Virginia, a Master of Architecture from Columbia University's GSAPP in New York City, and a certificate in Architectural Conservation from ICCROM in Rome. He also serves on the board of the Barnsdall Art Park Foundation in Los Angeles.

THE CMAI'S INTERNATIONAL TRAINING ON THE CONSERVATION OF MODERN HERITAGE

MARGHERITA PEDRONI
GETTY CONSERVATION INSTITUTE

ABSTRACT

Conserving Modern Architecture Initiative (CMAI) is a long-term initiative of the Getty dedicated to advancing the practice of modern heritage conservation. One key strategy for achieving this goal is through a diverse array of educational activities, ranging from introductory and advanced courses to specialized workshops. In 2023, CMAI launched the first iteration of the International Course on the Conservation of Modern Heritage (MAC), an comprehensive training program designed for mid-career professionals.

The course featured a blended format, comprising nine weeks of online instruction followed by a two-week in-person session in Los Angeles. The curriculum integrated cultural, social, environmental, and economic dimensions of modern heritage conservation. addressing a wide range of contemporary issues in modern heritage conservation. From theoretical and methodological foundations to practical and technical aspects of conservation practice, the values-based approach underpinned the entire course which explored topics such as the identification of modern heritage, upgrades and adaptation, environmental sustainability, climate change, the conservation of relevant modern materials, and the role of advocacy in protecting 20th century heritage.

The blended format provided numerous advantages, combining the flexibility of online learning with the immersive experience of in-person interaction. Online sessions allowed for an international roster of instructors and an extended course duration, enabling in-depth coverage of diverse topics and ample time for participants to assimilate the content. The in-person component built on the online foundation, offering participants the chance to apply their knowledge in a local field project, engage in discussions, exercises, and practical demonstrations, and visit 20th-century heritage sites undergoing conservation.

Overall, the course created a platform for sharing experiences, challenges, and insights among participants and instructors, fostering a rich international exchange and the community of practice.

1. INTRODUCTION

From May through August of 2023, the International Course on the Conservation of Modern Heritage (MAC) convened twenty-six participants to advance their knowledge around the challenges and opportunities for conserving modern heritage globally. This inaugural MAC course began with nine weeks of online learning followed by an intensive two week in-person program in Los Angeles. The course was designed and delivered by the Getty Conservation Institute (GCI)'s Conserving Modern Architecture Initiative[1] (CMAI) at the J. Paul Getty Trust (Getty) with experts in the field of modern architecture and heritage internationally.

Training and Education is a major tenant of the CMAI's approach to advancing the conservation of modern heritage internationally. CMAI has been delivering short courses for mid-career professionals since its very early days in 2014. The courses have always been in high demand demonstrating that there is a great need and demand for educational opportunities for professionals working with modern heritage. Between 2018 and 2019, in partnership with DOCOMOMO ISC E+T, CMAI conducted a global survey of academic and training institutions to assess current offerings and gaps in educational and training programs related to the conservation of twentieth century built heritage[2]. The results of the survey highlighted a scarcity of dedicated educational opportunities in some regions, especially at the professional level. These findings, together with CMAI's direct observations of the field, led to the decision to create a new long, course on the conservation of modern built heritage.

The course closely aligns with the principles outlined in the DOCOMOMO Manifesto on Education[3] - both in its objectives and its content - offering participants a broad view on what constitutes the heritage of the 20th century and proposing a holistic concept of sustainability, encompassing cultural, social, environmental, and economic considerations. It equips participants with a nuanced understanding of a values-based approach, encouraging interdisciplinarity and underscoring the importance of community and public-engagement in conservation endeavors.

2. COURSE AUDIENCE

The target audience for this course is mid-career professionals with previous experience in the conservation of modern heritage and various professional backgrounds – practicing architects, planners, engineers, heritage conservators/historic preservationists, site managers, heritage government officials, policy makers, non-profit professionals, and academic professors.

Twenty-six participants from twenty-three countries were selected for the first iteration of the course based on a set of criteria to ensure geographical and professional diversity **(Fig. 1)**, and the selection of participants in a professional position to immediately influence decisions, enact change and disseminate their learnings. To foster a rich exchange, participants were required to bring case studies to share with the class which provided a global perspective, and enabled participants to identify common challenges and

1. The CMAI was established to address the challenges of conserving modern heritage and gaps in the education, promotion, and conservation of modern heritage around the world. Since its founding in 2013, through field projects, research on modern building materials and techniques, and creation and dissemination of technical and methodological resources, the CMAI has become a recognized international player in the field of conserving modern heritage.

2. Pedroni, Margherita, Cesar Bargues Ballester, Andrea Canziani, Wessel de Jonge, and Chandler McCoy, *A Global Survey on Education and Training for the Conservation of Twentieth-Century Built Heritage: Research Report*. (Los Angeles: Getty Conservation Institute; Lisbon: DOCOMOMO International, 2020).

3. DOCOMOMO International. *Manifesto on Education*; (DOCOMOMO: Valencia, Spain, 2022).

emerging trends. Such discussions not only enriched individual learning journeys, but also enhanced the collective experience for all involved.

3. COURSE OBJECTIVES AND CONTENT

In shaping the curriculum, CMAI undertook a thorough reflection on the knowledge base of professionals in the field alongside their ongoing learning needs. The challenge was to uphold the program's relevance for a global audience, catering to the diverse educational and professional backgrounds of the participants while imparting practical skills and tools applicable in various contexts.

As a result, the course addresses heritage in its cultural, social, environmental, and economic dimensions, providing participants with an interrelated set of competences. This approach pushes participants to think beyond the physical aspects of heritage, to a more holistic view of heritage management and conservation as a means to support broader societal goals[4].

By the conclusion of the course, the goal was to have participants able to:

- Articulate and identify the broad range of challenges to protecting and conserving modern heritage within the framework of historic conservation practice and philosophy.
- Apply a values-based conservation methodology to modern heritage places.
- Identify and address technical challenges related to the conservation of modern materials.
- Understand the implications of climate change mitigation and adaptation in the conservation and management of modern heritage places.
- Understand the role of advocacy, its strategic objectives, and its application to conserving modern heritage in their own region.
- Expand their professional network by engaging with colleagues from around the world.

The course commenced with an exploration of the field's evolution since its beginning and the pivotal role of key international organizations in its advancement. Delving into the challenges inherent in conserving modern architecture, we emphasized the need to broaden the understanding of 20th-century legacies worldwide. This necessitated embracing a narrative that transcends linear Western-centric perspectives, acknowledging the diverse contributions of non-Western cultures to architectural historiography. Introducing the Twentieth-century Historic Thematic Framework[5], we provided participants with a tool to recognize and safeguard a vast array of building typologies and places by connecting them to the key themes that shaped the 20th century and its built environment. Emphasis was also placed on raising awareness of modern landscapes and settings, and support their conservation bridging the gap between buildings and the broader environment and context.

The course presented modern heritage conservation anchored in the principles contained in the Madrid–New Delhi Document and the conservation methodology outlined in the Burra Charter which offers a step-by-step process **(Fig.2)** based on cultural significance, prompting critical reflection on what,

4. Erica Avrami, and Randall Mason. "Mapping the Issue of Values." in *Values in Heritage Management: Emerging Approaches and Research Directions*, eds. Erica Avrami, Susan Macdonald, Randall Mason, and David Myers (Los Angeles: The Getty Conservation Institute, 2019).

5. Marsden, Susan, and Peter Spearritt. *The Twentieth-Century Historic Thematic Framework: A Tool for Assessing Heritage Places*. With contributions from Leo Schmidt, Sheridan Burke, Gail Ostergren, Jeff Cody, and Chandler McCoy. (Los Angeles: Getty Conservation Institute, 2021).

why, and for whom we conserve before defining how to do so effectively. To this aim, the course emphasized the importance of identifying and engaging stakeholders and communities, demonstrated through various case studies. By highlighting the dynamic nature of heritage values and the often-overlooked intangible attributes and social significance, instructors fostered a nuanced understanding of significance as the cornerstone of managing change.

Building on this basis, the course moved on to discussing the delicate balance between conservation and changes to accommodate current needs and requirements to either retain their use(s) or to find new. Instructors presented case studies demonstrating how to navigate the need of upgrading and adapting buildings without compromising significance.

Recognizing the urgent imperative of climate action, the course underscored the pivotal role of modern buildings in mitigating climate change by exploring strategies to enhance energy efficiency and reduce their carbon footprint by careful reuse. It also emphasized the importance of proactive adaptation measures in the face of emerging impacts of climate change on modern places.

The course provided comprehensive insights into the evolution of modern materials and building techniques and addressed the conservation of modern materials such as concrete, plastics, mosaics, wood, and key building elements such as steel and aluminum windows. Maintenance was repeatedly mentioned as an essential aspect of effective and sustainable conservation, but also one that is often overlooked and should be elevated in the conservation practice.

The critical role of advocacy in modern heritage conservation was also a central point. Moving beyond reactive responses to imminent threats, we proposed proactive advocacy strategies grounded in economic viability, environmental sustainability, and social cohesion, to foster a broader societal appreciation for our collective architectural heritage, including dissonant heritage.

4. ORGANIZERS AND INSTRUCTORS

The course was conceived and organized by the author of this paper, Susan Macdonald, and Chandler McCoy, with help from Elsa Haarstad, the 2022-23 CMAI's graduate intern. With an international cohort of participants, MAC placed emphasis on ensuring a geographical and professional diversity of instructors where possible. To this aim, the team consulted four international peer advisors[6] to provide inputs on instructor selection, curriculum development, and case study identification. The teaching team for the online component consisted of Getty staff and external experts brought on as instructors representing a mix of conservation specialists, practicing architects, and professors. The online component ultimately had 32 instructors from 14 different countries who presented case studies from their countries and regions. The examples presented by instructors, as well as the case studies brought forth by participants throughout the course, ensured representation of geographies, typologies, and scales and reflecting the challenges that participants were facing in their work.

The in-person component relied entirely on local instructors with the exception of Sheridan Burke, from Australia, who was a core instructor both online and in person.

6. David Fixler (USA), Fernando Diniz Moreira (Brazil), Sheridan Burke (Australia), Ho Weng Hin (Singapore)

5. COURSE STRUCTURE

This course was designed to leverage the benefits of both online and in-person formats, and it aimed to cater to a diverse range of learning styles by incorporating a mix of activities, including pre-recorded video lectures, readings, assignments, group work, individual exercises, asynchronous and synchronous tasks, online forums, live Q&A sessions, demonstrations, site visits, and field project work. Throughout the course, there was a consistent emphasis on experiential learning. Participants were given ample opportunities to put their knowledge into practice with exercises.

ONLINE COMPONENT

The online component was organized into nine modules, paced at one module per week with a relatively high intensity (8-10 hours of estimated workload per week). This section of the course followed a flipped classroom approach, which means that the participants first gained exposure to new material through prerecorded video lectures and readings, before meeting on weekly live sessions where time was spent on live interaction.

Each module contained the following elements:

- Six to nine pre-recorded video lectures of about 30 minutes each.
- An extensive bibliography of recommended readings and readings for further study.
- Assignment prompts related to the content of the module to allow participants to actively reflect on the lectures, bring in their own experiences and case studies foster peer-to-peer exchanges. Participants were encouraged to not just bring good/best-practice case studies, but also controversial, puzzling, or challenging examples. To submit their assignments, participants prepared a single PowerPoint Slide and submitted it ahead of the session. Once assignments were collected, they were shared with the class so participants could see each other's submissions.
- A 90-minute live session where participants and module instructors met for Q&A, present a selection of assignments, and discuss them with the class.
- Written Forum to engage in off-hour discussions with participants and instructors.

In total, the online component included 62 lectures plus five short-form interviews with leaders of key modern heritage professional groups. All video lectures were professionally filmed and edited, then embedded into the Getty's learning management platform where participants could watch the videos with closed captions. Participants have continued to use the platform long after the course conclusion to rewatch lectures and consult the educational material as they need.

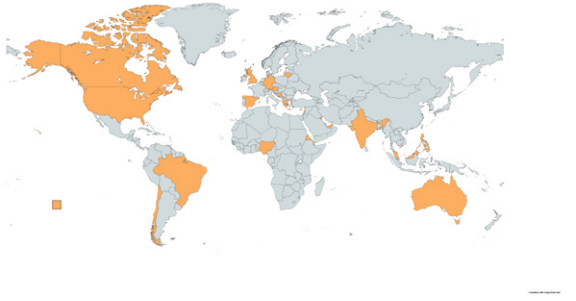
As most topics discussed are part of current debates, the course was intended to provide a platform for participants to share experiences and advance the discourse alongside instructors. The weekly live sessions were an extraordinary opportunity to do so. Through Q&A, debates, and participants presentation of assignments, the course allowed for an enriching exchange among participants and instructors.

Teaching online afforded us the opportunity to expand the course curriculum, encompassing a diverse array of topics delivered by a globally representative cohort of instructors. This format provided flexibility for participants across various time zones to engage with prerecorded video lectures at their convenience, allowing the review of material as needed to ensure a thorough understanding. This approach established a solid foundation and rapport for the subsequent in-person component of the course.

IN-PERSON COMPONENT

Following a small break, participants convened in-person in Los Angeles from August 5 through 20 for a practical, face-to-face learning experience grounded in the conservation methodology proposed. Using Los Angeles as a classroom, the in-person component allowed participants the opportunity to apply what they learned online.

Over two weeks, participants attended and engaged with additional lectures, class discussions, a field project, site visits to historic modern sites, demonstrations, and social events **(Fig. 3 and 4)**. Lectures and talks were provided by Getty staff as well as Los Angeles based architects, conservators, planners, historians, advocates, and government officials.



Participants visited many renowned modern heritage sites to see and discuss with site managers and architects recent or undergoing conservation efforts, including the Lovell Health House (Richard Neutra), Salk Institute (Louis Kahn), Eames House (Charles and Ray Eames), Hollyhock House (Frank Lloyd Wright), and Sheats-Goldstein (John Lautner).

The program of the in-person component was organized to follow the steps of the conservation planning process **(Fig.2)** with lectures, activities and the field project exercises matching the steps of the process. During the two weeks, participants worked on a field project that required them to apply the conservation planning methodology process they had learned online to an actual site, the Richard and Dion Neutra Reunion House (1951) in Silverlake, Los Angeles.

The participants were divided into five groups and tasked with creating a high-level, executive summary style Conservation Management Plan for the site. They drafted a statement of significance, identified key elements to the site, assessed risks, vulnerabilities, constraints, and opportunities at the site, drafted conservation policies, and established priorities for Reunion House. All groups presented their findings and recommendations on the final day of the course to the institution who owns and manages the house.

6. LESSONS LEARNED AND CONCLUSIONS

The MAC course, several years in the making, was a learning journey for participants, instructors, and organizers alike. In the course, emphasis was placed on broadening the participants understanding of modern heritage and its conservation practice by theoretical reflections, imparting tools that professionals can apply in their work, and disseminating existing resources and references that are already available but often scattered.

Figure 3 Participants on a tour of the Salk Institute. Photo: Cassia Davis ©J. Paul Getty Trust

Figure 4 Participants during the concrete conservation workshop at the Getty Villa. Photo: Cassia Davis ©J. Paul Getty Trust

Crafting a program that is relevant to international mid-career professionals with different backgrounds and professions, represents a quickly evolving field, provides an overview on international practice, while presenting a coherent methodology and imparting technical skills was a challenging task that required balancing many needs. The course was largely based on the values-based methodology outlined in the Burra Charter and made extensive use of international case studies to demonstrate its practical application. Even though these examples are the specific product of a particular context and culture, they ground the methodology and can serve as an inspiration and foster the generation of new ideas. The active engagement of participants proved instrumental in enriching the course content, infusing it with more examples, challenges, and insights coming from their professional experience. This participatory approach truly fostered knowledge exchange among participants and significantly enriched the learning environment.

#30

Robust evaluation mechanisms were employed to gauge participant feedback systematically, thereby informing enhancements for subsequent iterations. Overall, participants lauded the course's hybrid nature, striking a good balance between theoretical underpinnings and practical applications underscored by field projects and site visits and highlighted the networking opportunities. They also offered constructive suggestions for refinement, such as slowing the pace of the online component, including more non-Western examples, increasing the focus on hands-on exercises, and diversifying the types and scale of places presented. These considerations along with our own will guide the refinements of the course for the next iterations.

The course's hybrid format afforded unprecedented flexibility while mitigating the logistical challenges associated with international travel. The online component allowed for a comprehensive exploration of diverse topics and accommodated a global cohort of participants and instructors. By blending pre-recorded video lectures with live zoom sessions, we provided the opportunity for interactions with the instructors and exchanges with the other participants. Although the in-person component necessitated travel to Los Angeles, it provided a rich immersive experiences and hands-on activities, complemented by the presence of local and international instructors.

The production of high-quality pre-recorded lectures was a significant upfront effort, but it allows the course's replicability and potential for wider dissemination by other institutions we may share our materials with. ■

BIOGRAPHY

Margherita Pedroni is a Project Specialist for the Conserving Modern Architecture Initiative at the Getty Conservation Institute and an expert member of the ICOMOS ISC20C. She is an Italian-qualified architect with both a Bachelor's and Master's degree in Architecture from Politecnico di Milano and a Post Graduate Specialization Diploma in Built Heritage and Landscape Conservation from the University of Genova. Prior to joining the GCI in 2019, Margherita worked as a heritage conservation specialist in Italy, Singapore, and Myanmar.

JOINT MASTER RMB, REUSE OF MODERNIST BUILDINGS

MICHEL MELENHORST MSC
TH-OWL DETMOLD SCHOOL OF DESIGN

ABSTRACT

Most of the built-up urban fabric worldwide dates from the 20th century, especially the four decades after 1945. In all parts of the world, heritage is in danger of being destroyed with the risk of losing specific cultural elements, environments, and energy stored in the structure and material. It is a modernist heritage that needs reuse and preservation specialists to prevent demolition, contribute to meeting our climate goals and secure sustainable development.

Many tools, services, and design strategies for conserving and adaptively reusing modern movement heritage have been developed in different parts of Europe to meet specific needs and concerns, building codes and legislation, and supporting geographic and demographic conditions. The Joint Master RMB Reuse of Modernist Buildings, designed and accredited by the TH-OWL, ULisbon, UCoimbra, UAntwerpen, and UBelgrado, in collaboration with Docomomo International, frameworks its educational program by bringing together successful approaches and experiences from the RMB partner countries and based on existing research, educational practices, and reference projects. This European reuse approach integrates different European contexts regarding spatial patterns and cultural heritage, climate and construction principles, and the knowledge about social and technical evaluation and monitoring of spaces as key factors for professional education in reusing modern movement architecture and urban planning.

The paper describes RMB teaching methodologies, the curriculum, the intended learning outcomes, the division of tasks. Moreover, an additional focus in the paper lies on the value RMB places on working with case studies, problem-based learning, and workshops, as well as the specific significance of working with existing buildings and heritage in education on-site, compared to working on new buildings and environments.

1. INTRODUCTION

Most of the built-up fabric in urban areas worldwide dates from the 20th century, especially the four decades after 1945. It is a modernist heritage in danger of being destroyed with the risk of losing specific cultural elements, environments, and energy stored in the structure and material. These buildings are not always the prima donnas of modernism but have great qualities that deserve loving protection and careful reuse. Careful handling has a giant impact here since this is such an enormous stock.

Modernist heritage requires professional reuse and preservation specialists to prevent demolition and the loss of specific cultural elements and environments. With an appropriate way of reuse, we can better meet our climate goals and secure the sustainable development of buildings and neighbourhoods, creating a cleaner, safer world.Tools, services, product solutions, and design strategies for the adaptive reuse of modernist buildings have been developed in Europe to meet specific needs and concerns, building codes and legislation, and support geographic and demographic conditions. The experiences and approaches are different in each country.

In this relevant professional area and research field, a European approach to the reuse of modernist buildings can integrate different European contexts regarding spatial patterns and cultural heritage, climate and construction principles, and the knowledge about social and technical evaluation and monitoring of spaces as a key factor for professional education. Thus RMB is an educational framework of common definitions, approaches, and methodologies on a European level based on existing research, educational practices and reference projects in the RMB partner countries. RMB collected knowledge from various European regions to develop them as new transnational teaching material for a two-year Joint Master programme. The current RMB team includes the universities of Belgrade, Coimbra, Lisbon, Detmold, and DOCOMOMO international, who now have compiled a fully accredited two years Joint Master programme and are ready to start. It is an interdisciplinary framework combining perspectives from Architecture, Interior Architecture, Landscape Architecture, Urban Design, Architectural Engineering and Humanities (Conservation Science, Cultural Heritage, Architecture History, Heritage Studies). RMB students were and will be selected from these fields and will be working in multidisciplinary teams.

#30

RMB´s overall framework of the study programme aligns with agendas/ charters in the field of architectural and urban design, adaptive reuse, research and education, and current global and national priorities for the development of research and education. RMB will use international and national priorities agendas to evaluate the compliance of the study programme's objectives with the overall objectives in education.

2. OBJECTIVES AND FOCUS

RMB follows the framework for Qualifications in the European Higher Education Area (FQ-EHEA) and describes the intended outcomes with the specialist RMB focus in mind.

RMB students obtain deep and qualified academic expertise and knowledge of concepts, designs, legislation, technical constructive aspects, and analytical skills in the areas of modernism itself and building conversion and reuse of modernist buildings. The programme holistically combines aspects from interior architecture, monument preservation, landscape and urban development, as well as building technology and construction related to building conversion and reuse of modernist buildings. Students will be empowered to independently and responsibly solve complex tasks in heritage and reuse, design practice, science, and research.

- The European and international character of the RMB prepares students for a global and interdisciplinary career and teamwork based on a broad spectrum of expertise.
-The Master's degree program is designed to empower graduates to work independently in academic research and development and to complete a PhD if desired. Furthermore, successfully completing RMB will enable students to enter senior civil service positions.
-RMB Students will learn to deal with built heritage issues and reuse them confidently in a methodologically clear, participative and respectful way. They will approach conservation, transformation, and reuse from a broad perspective. This perspective includes spatial patterns, cultural heritage, participation, climate and construction principles, social and technical assessment, and building space monitoring. They will have a holistic, multidisciplinary view and knowledge of reuse, but will ultimately be specialists because of the RMB-specific focus on the heritage of modernist architecture.
-RMB graduates will be well-prepared for an international labour market through an overview of reuse on a European scale and international cooperation between students and teachers during the Master's. Students will be well-equipped for the contemporary working practice of 'mobile' offices with staff in different locations. They will combine a high sensitivity to local conditions with a broad experience and knowledge of international best practices and collaborative, effective working methods. Master students who successfully applied for a place in RMB may come from different backgrounds; they hold a bachelor's in architecture, interior architecture, landscape architecture, heritage or structural engineering and also will find jobs in within a broad field such as architectural offices, heritage offices, construction companies and public services.

RMB objectives reflect the DOCOMOMO Manifesto on Education[1]

Intrinsic to the overall concept of modernism, is that innovations in different fields were established. They form the three focal points to address in RMB that prepare students with the specific knowledge required for a successful and respectful design of reuse of modernist buildings.

1. "DOCOMOMO Manifesto on Education Tokyo – Valencia", docomomo, accessed June 9, 2024, https://docomomo.com/wp-content/uploads/2022/09/20220909_docomomo_manifesto_education_final.pdf

- Focus 1: On a conceptual level, modernist architecture is characterised by a re-definition of the habitat, especially the relations between inside and outside and the open-space system of organisation, supported by innovative urban design goals. This modernist age's architecture and construction boundaries became fluent or even non-existent. The interaction between inside and outside played an ever more important role defining new spatial qualities intending to improve the well-being and health of the urban population compared to the industrialised cities of the 19th century. This new architecture was looking for a new city and a new society spread worldwide, but it was adapted to each local environment from north to south and from east to west.
- Focus 2: On a societal level, the rapid and non-adapted replication of modernist buildings worldwide has led to a critical perception and recognition of this enormous building stock. This perception complicates and prevents sustainable reuse and refurbishment, often demolition and new constructions are favoured, thus retaining the thermal and structural mass of the stock to retrofit them into energy-efficient and user-friendly buildings. Far from this identity issue, the modernist buildings answered particular functional briefs: housing and other community facilities such as schools. Reusing these buildings creates new challenges for architects, stakeholders, and future users to compromise the modern legacy and current needs.
- Focus 3: On a technological level, new materials and experimental constructions were used in load-bearing structures, building envelopes, and interior finishing, utterly different from the traditionally used systems of the preceding centuries. Many refurbishments show that these structures are difficult to adapt to current standards and requirements without risking the loss of their characteristic strengths. Modernist architects were innovative and developed fragile constructive systems that create specific challenges in adapting buildings.

3. DEVELOPMENT OF A STUDY PLAN

To compile a study plan with the objectives and focus in mind, RMB partners tried out joint design and analysis workshops, contributed to and organised conferences, wrote articles, compiled study materials, and invited lecturers to participate in RMB. Conference proceedings and three magazines with RMB as guest editor were published. RMB lectures, were recorded and desiminated. All RMB partner countries have important modernist architectural and urban heritage and relevant reuse experiences that will be the basis for the educational process. We selected cases from the partner countries, analysed them in workshops, and published them in the RMB case study handbook, an essential source of information for the design studios in the RMB master. Thus, RMB material for educational purposes was developed. In this period, the universities also got to know each other thoroughly and gave the different academic cultures a place in the education and partner cooperation agreements. We initiated numerous collaborations with specialists, NGOs, companies, and agencies that

contributed to the development phase and will contribute their specialist knowledge to the RMB master in operation.

An evaluation of the curriculum's content and methodology through surveys and questionnaires investigated the students' and teachers' perceptions of it. The comments of students and teachers were analysed and classified, identifying adjustment needs in the teaching and learning methodologies and their adequacy to the defined learning objectives. Finally, the RMB advisory board and non-academic partner docomomo international advised and commented on the curriculum, thus initiating another round of improvement.

4. CURRICULUM

The universities developed a four-semester curriculum with:

- Theory courses that provide backgrounds and training in scholarly skills.
- Specialised practical courses allow students to apply the theoretical knowledge they have gained and to develop skills for use in design studios.
- Design studios and workshops integrate analytical, practical, teamwork, and creative skills.
- The thesis, for which students develop a topic in several workshops and choose one of the universities as the location for their final RMB semester. The learning objectives, competencies, teaching methods, and assessments form a coherent, intertwined structure. Each partner brought in its competencies and specialisations.
- TH-OWL: Interior architectural design, typological studies, urban/landscape design, research by design and design by research, history of Modernism in Northwest Europe, heritage studies and computational research techniques.
- University of Coimbra: history of Modernism in Southwest Europe, urban design, participation and social aspects in designing for reuse, environmental design, reuse theory.
- Instituto Superior Técnico /University of Lisbon: Modernism and housing, architecture and sustainable development, environmental design and users' behaviour in buildings, building technology and general assessment of buildings in use, theory of reuse of buildings and heritage.
- University of Belgrade: History of Modernism in Southeast Europe, Urban Morphology, Building performance simulation and verification, structural systems, and construction techniques of modernist buildings.

Students and, to a lesser degree, teaching staff in RMB travel between the partner locations. The first semester is taught at the TH OWL Detmold School of Design in Detmold, Germany. The second semester in Portugal at the Architecture Faculty of the University of Coimbra and the Instituto Superior Técnico/University of Lisboa, the third semester at the architecture faculty of the University of Belgrade Serbia and the final semester is the Thesis Semester, the Students choose one of the four partner universities for their thesis.

The RMB master is fully accredited.

5. AN ESSENTIAL SIDESTEP: THE EXISTING

Working with the existing, the real, and the love for it infuses RMB. Planning within heritage is different from designing new buildings: The context, the buildings, landscape or neighbourhoods are already there; one can touch, smell, go inside, test it and possibly talk with the inhabitants. RMB places great value on being 'on-site', not remote, and promoting on-site tactics in design and research. In design, scientific and artistic research has become increasingly important in practice and education. It became an informed design and moved from search to research.[2]

An effect of this is 'scientification' and restriction through obligatory methodologies. Using intuition and direct sensory, subjective experiences and experiments as drivers to co-feed a design is easily forgotten. RMB's strength lies in in-space fieldwork. It is not only scholarly, lab-type or library research; RMB needs `action research and design'. It is a design and research on a 1:1 scale, intentionally personal and possibly subjective, using direct experiences next to sources sublimated through text or drawing. It is a compelling way of exploring and being, by necessity, in direct communication with existing spaces. The principles are not so different from other kinds of research: there is a presumption; one collects evidence to understand the presumption or find proof for it; the results of the investigation and the methodology used are made accessible and transparent to a larger audience; and this gives input for subsequent steps. The great thing about action research is that these three steps – question, collecting, and result – combine in one act!

Bernard Tschumi's theoretical framework, which links architectural concepts, use, and actual space, inspires RMB. Tschumi wrote about the tension between use and form that becomes visible in a building's changing appearance and spatial conditions over time. In the preface of his book Architecture and Disjunction, Tschumi reflects on some of his earlier essays, concluding that what retroactively connects them is that: "While

2. Frank Weiner "The Emergence of Research and the Decline of Search in Architectural Education and Practice" *Proceedings of the Architectural Research Consortium/European Association for Architectural Education*, 2007.

their common starting point is today's disjunction between use, form, and social values, they argue that this condition, instead of being a pejorative one, is highly 'architectural'… architecture being defined as the pleasurable and sometimes violent confrontation between spaces and activities".[3]

Tschumi states that the point where a building has collected traces over time, where it shows life and death, and with borrowing George Bataille´s concept of transgression for architectural purposes, is where concept and real space might join; in Architecture and Disjunction, he explains:

"Whether through literal or phenomenal transgression, architecture is seen here as the momentary and sacrilegious convergence of real space and ideal space. Limits remain, for transgression does not mean the methodical destruction of any code or rule that concerns space or architecture. On the contrary, it introduces new articulations between inside and outside, between concept and experience. Very simply it means overcoming unacceptable prevalences".[4]

Time reveals the ultimate form-use disconnection – the wearing out of the original idea – making clear innovation is needed in concept, in building, or both. In RMB, we don't wait for transgression to happen because we can provoke or experimentally search for it through action research! It is concept development in action in existing buildings and spaces. It is about finding new uses, testing new concepts, challenging form vs. use, occupation with guerrilla actions while constantly developing new tools and methods for transgressing the existing state of buildings.

6. PESKY PROCESS MOMENTS

Composing a Joint Master with participants from different countries is challenging. Content-wise, the partners were soon on the same wavelength, and the universities' specialisms and personalities produced an exciting and appropriate curriculum. Dealing with bureaucracy and administrative issues was and is a big challenge; each university has its mores, i.e. the distribution and uses of funds differ, and achieving a fair distribution is a challenge. In long-term processes, partners and people will drop out. Keeping up the energy and finding the right new people is a continuous task, which incidentally also has a positive side: it prevents a static, inward-looking attitude.

RMB sees the differences in the preservation and reuse of the built modernist heritage in Europe as a particular strength; they form the foundations of the master. In other areas, however, we have found that despite many theoretical agreements between countries in the EU, practice is much more recalcitrant, and differences between regions are a tenacious problem. The accreditation of RMB is an example. Although the EU has agreed on the so-called European approach, which means that a European approach to accreditation is valid for accreditation in the member states, many countries, including RMB countries, still require national accreditation, leading to costly delays.

A start-up problem is that university boards often welcome a new course of study but are reluctant to invest in it beforehand. I.e. investing in programme accreditation without being sure to get funding for it where, unfortunately, funding authorities a valid accreditation is conditional for

3. Bernard Tschumi, *Architecture and disjunction* (1st MIT Press paperback ed.. Cambridge, Mass.: MIT Press, 1996) P. 4

4. Bernard Tschumi, "Architecture and Transgression", In *Architecture and Disjunction*. (Cambridge, Mass: MIT Press, 1996) P. 78

grant funding. Another hurdle is the delay or lack of financial updates of subsidies in line with inflation. As inflation shows significant differences between the partner countries, it is too great a financial risk for some partners to take on this RMB adventure.

7. CONCLUSIONS

After the latest consortium changes, a fresh accreditation is within reach. An application for the so-called Erasmus Mundus Joint Master grant for students and partners will follow in February, and the enrolment procedure is open from late 2025. ■

Michel Melenhorst studied architecture at the TU Delft, worked at Wiel Arets and Rem Koolhaas/OMA offices and was a partner at DAAD Architects. He is a Professor of Contextual Design and Reuse at the TH-OWL, a visiting professor at the University of Belgrade, and a guest lecturer, tutor, and lecturer at universities worldwide. Michel Melenhorst leads "RMB reuse of Modernist Buildings", is active in docomomo's workgroup education, has extensive international experience in design, education, and research in different combinations and specialisations, and loves to talk, show, and write about it.

THE CONSERVATION PLANNING AS A CONTRIBUTION TO EDUCATION AND TRAINING FOR TWENTIETH-CENTURY HERITAGE CONSERVATION

SANTIAGO BECKDORF
SCHOOL OF ARCHITECTURE, UNIVERSIDAD DEL DESARROLLO, CHILE

ABSTRACT

Chile's built heritage primarily stem from its colonial legacy and the advent of modernity in the later nineteenth and twentieth centuries, responding to geographical conditions.

Similarly to many other regions, the need for recognition of Twentieth-century (20-C) heritage is one of the main challenges concerning conservation practices.[1]

Even though there has been a growing interest and awareness in built heritage in recent decades, it is necessary to develop and disseminate methodological tools that allow caretakers and professionals in modern heritage to identify and assess cultural significance, develop conservation guidelines, and coordinate stakeholders for feasible and sustainable implementation over time.[2] Additionally, there is a need for more training programmes to educate qualified professionals and technicians in safeguarding twentieth-century heritage.

The paper depicts existing challenges regarding training and specialisation in the field. It identifies various instances—both nationally and internationally—from which knowledge can be transferred, both for professionals in modern heritage conservation and users and caretakers of cultural sites.

Thus, the experience of developing the Conservation Management Plan for the Church of the Benedictine Monastery of the Holy Trinity represents a significant effort to establish valid methodologies and procedural instruments for enhancing and preserving modern heritage. [3]

Developing the Conservation Management Plan has been a profound learning experience through workshops and courses addressing the various stages of the conservation planning practice.

1. INTRODUCTION: THE CURRENT SITUATION OF MODERN HERITAGE TRAINING.

1.1 SITUATION ON THE INTERNATIONAL STAGE

The heritage of 20-C architecture continues to be underrepresented. In fact, it was not until 2016 that seventeen of Le Corbusier's projects were added to the UNESCO World Heritage List, and three years later, eight prominent works by American architect Frank Lloyd Wright received similar recognition. However, the need for recognition and protection of this kind of heritage is still paramount.

Despite a remarkable inventory of sites (buildings and landscapes), the situation is no better in Latin America and the Caribbean.

The need for more education and training programmes is one reason for the lack of focus on 20th-century heritage conservation. Topics related to 20-C heritage conservation are delivered as a component within broader programmes. As such, only limited focus is placed on this type of heritage and its conservation.

In 2018, the Getty Conservation Institute and the Education and Training Committee of Docomomo International conducted a survey, reaching out to over 750 academic and non-academic institutions in 115 countries.[4] The study showed that while the topic interested most of the institutions surveyed, there is a need for greater quantity and depth of programmes at both academic and postgraduate levels (undergraduate and postgraduate), as well as technical training.

Latin America and the Caribbean rank second after Europe in terms of education and training programmes. The most common courses feature subjects related to heritage conservation, workshops, certificates, and diplomas. Regarding the most consulted topics, there is a notable interest in the conservation practice and intervention of heritage buildings, followed by themes related to design, preservation, and construction techniques.

Emerging topics such as adaptive reuse, Heritage BIM, facility management, sustainability, and artificial intelligence for identifying structural damage are open for discussion. These areas offer potential for expanding the range of possibilities for educating professionals in the field.

1.2 SITUATION AT THE LOCAL LEVEL

Of the more than 1,800 listings from the National Monuments Council of Chile (CMN), less than 5% belong to buildings or environments from the 20-C period.[5] This situation is not unique to our local reality and has been widely discussed.[6] This issue is exacerbated by a misunderstanding of modernity, the belief that 20-C buildings are not old enough to need protection. In addition to the geographical situation of our country, it is exposed to saline environments resulting from its extensive bond with the Pacific Ocean and its vast colonial heritage, periodically threatened by strong earthquakes. While the aforementioned represented one of the main drivers behind the thriving modernism in Chile, incorporating more suitable construction techniques for the country's seismic reality, the appreciation of twentieth-century built heritage remains precarious.[7]

1. The term "Twentieth-century Heritage" is used instead of modern architecture, modernism, or the modern movement, understanding that the emergence of architecture corresponding to these movements occurred at different times in various cultures.

2. *"Burra Charter; the Australia ICOMOS Charter for Places of Cultural Significance," 2013.*

3. The Benedictine Monastery, Santiago - Chile. Its church (1962-1964) was designed by the architects and monks Gabriel Guarda (1928-2020) and Martín Correa (b. 1928).

4. Review the document "A Global Survey on Education and Training for the Conservation of Twentieth-Century Built Heritage," published by The Getty Conservation Institute & Docomomo.

5. Based on the National Monuments Council (CMN) report on current listings as of March 2024.

6. Susan Macdonald, "Modern Heritage in the Twenty-First Century". *Conservation Perspectives; The GCI Newsletter.* No 38. (May 2023): p.4.

7. Fernando Pérez O., *Arquitectura en el Chile del Siglo XX; Iniciando el Nuevo Siglo 1890-1930* (Santiago, ARQ Ediciones, 2017).

The National Monuments Council, responsible for safeguarding cultural heritage, was established in 1925. The Church of the Benedictine Monastery of the Holy Trinity of Las Condes became the first modern work to be declared a Historical Monument in 1981, just 17 years after its construction was completed.[8] In 40 years, we have yet to grasp the cultural value of Twentieth-Century architecture, which is considerably under-protected. The current state of the country's modern heritage is concerning due to insufficient legal instruments, limited public funding, and the non-existent offer of training programmes that provide theoretical and technical knowledge regarding the evaluation, restoration, and management of 20-C heritage. It is worth noting that although there are academic programmes in cultural management and heritage intervention, there are no specific programmes at university and technical-professional levels.

Thus, this work highlights the importance of local and international initiatives that contribute to the training process of academics, professionals, and technicians involved in the various stages of the 20-C heritage conservation process.

1.2.1 SITUATION OF CHILE REGARDING 20-C HERITAGE TRAINING PROGRAMMES

In line with the regional situation, the educational offerings focused on heritage conservation and management addressed the general subject, and no programmes specifically targeted 20-C heritage conservation.

This lack of focus is one of the main reasons associated with the lack of appreciation, craftsman skills, and knowledge generation which are essential for a more promising future for modern heritage in the architectural and urban realm.

Having reviewed the current academic programme at its different levels, there is a robust offer of Master's degrees, Diplomas, and Courses in cultural heritage conservation and management.[9]

Although none of the programmes include twentieth-century heritage conservation, most address topics related to the subject of study, such as digitisation and documentation, values and attributes, local codes and regulations, funding instruments, technical assessment of materials, and procedural aspects of cultural heritage site management.[10]

However, courses that valorise 20-C heritage and provide a theoretical framework and practical tools for its conservation are scarce.

Some cases are worth mentioning, as they greatly contributed to the field through education and training. The work carried out by academic institutions such as the Cultural Heritage Centre of the Pontifical Catholic University of Chile gains relevance through initiatives such as documenting cultural heritage and jointly organising the "18th International Docomomo Conference and Workshop for Students". Similarly, public institutions such as the National Centre for Restoration and Conservation (CNCR) contribute to offering courses and training programmes linked to managing cultural heritage.[11] One noteworthy example is the case of the SUBDERE Academy, which offers a Diploma in Heritage Conservation and Management for more than

8. Definitions from the National Monuments Council (CMN): Historic Monument: places, ruins, constructions, and objects owned by the state, municipality, or private individuals that, due to their quality, historical or artistic interest, or their antiquity, have been declared as such by supreme decree, issued upon request and prior agreement of the Council. Typical Zone: urban or rural real estate properties that constitute a representative settlement unit of the evolution of the human community and stand out for their stylistic unity, materiality, or construction techniques.

9. Programmes address specific topics, such as the "Advanced Documentation in Historic Buildings" course at the Faculty of Architecture of the Pontificia Universidad Católica de Chile or the "Diploma in Management of Artistic and Cultural Heritage" at the University of Chile.

10. Centro del Patrimonio de la Pontificia Universidad Católica de Chile. Last modified: May 3rd, 2024, accessed May 6th, 2024. https://centropatrimonio.uc.cl/

400 public officers from a diverse range of institutions related in conserving cultural heritage. Finally, organisations such as ICOMOS and Docomomo are important advocates for Twentieth-Century heritage and play an important role in raising awareness of initiatives that contribute to educating students, technicians, and professionals involved in managing built heritage.

2. CONSERVATION PLAN FOR THE CHURCH OF THE BENEDICTINE MONASTERY OF THE MOST HOLY TRINITY.

As part of the Getty Conservation Institute's "*Keeping It Modern*" initiative, during its seventh and final edition in 2020, the Faculty of Architecture and Art of the University of Desarrollo nominated the Church of the Benedictine Monastery of the Most Holy Trinity in Las Condes.

The programme's objective was to develop a Conservation Management Plan (CMP) that establishes the elements making a place worthy of preservation and protection.[12] Additionally, it sets out a series of criteria for managing the processes of change that every site experiences throughout its history, avoiding the compromise on its cultural significance.

This exercise is relevant to the local context because it is the first methodological tool for assessing, evaluating, and making technical recommendations for conserving and maintaining a heritage site corresponding to the modern period.

3. EDUCATIONAL OPPORTUNITIES ARISING FROM THE EXPERIENCE OF THE CMP.

From an academic point of view, the development of the CMP itself was a space for profound learning through a robust programme of workshops, conferences, seminars, and support material provided by the Getty Conservation Institute. This allowed the project team to become acquainted with the 20-C Heritage Conservation Plans' theoretical and methodological framework, as defined in instruments such as the Burra Charter (ICOMOS Australia).

This programme enabled us to participate in activities that make significant contributions to the field, such as the "*2020 International Conference on the Conservation of Modern Heritage*," which convened key players from the public sector and academia, the CMAI International Course for the Conservation of Modern Heritage, and the KIM Regional Conferences and Workshops.[13]

The aforementioned has inspired the incorporation of a specialisation track focused on heritage conservation into the architecture undergraduate programme at UDD School of Architecture. This aligns with many of the theoretical approaches and methodologies applied to the Benedictine Monastery Church CMP.

3.1 INTERNATIONAL COURSE FOR THE CONSERVATION OF MODERN HERITAGE (CMAI)

This programme, in addition to being one of the few, if not the only one globally, focuses on the conservation of 20-C heritage. It offers the

11. Centro Nacional de Conservación y Restauración (CNCR). Last modified May 2024 accessed May 2024. https://www.cncr.gob.cl/

12. James Semple Kerr, "The Conservation Plan; A guide to preparing conservation plans for places of European cultural significance" (New South Wales, ICOMOS Australia, 7th edition, 2013).

13. J.Paul Getty Trust. Conserving Modern Architecture Initiative. Last modified May 2024, accessed May 2024. https://www.getty.edu/projects/conserving-modern-architecture-initiative/international-course-conservation-modern-heritage/

opportunity to engage with professionals from diverse backgrounds and expertise, enriching discussions by offering diverse perspectives on the topics addressed by the programme.

In order to incorporate topics related to the development of Conservation Management Plans (CMP), the programme provided innovative insights into the future of modern buildings currently at risk of deterioration or demolition. Concepts such as Adaptive Reuse envision new scenarios for these sites to further promote their attributes and values that define their cultural significance, thus raising awareness for their protection.

Being part of this group of professionals also fosters space for discussions and the development of seminars and meetings, which are extremely beneficial for promoting awareness of conserving twentieth-century heritage.

3.2 KEEPING IT MODERN REGIONAL WORKSHOPS FOR PROFESSIONALS IN THE FIELD OF 20-C HERITAGE CONSERVATION

To showcase the results of projects funded by the J. Paul Getty Trust through its "*Keeping It Modern*" initiative, International Conferences and Workshops have been held in different parts of the world to facilitate the transfer of knowledge and skills to local institutions responsible for the care of modern heritage.

In February, the "*2024 Taiwan Convening*" brought together experiences from projects related to heritage conservation in the Asia-Pacific region, represented by professionals from Taiwan, Turkey, Japan, the United States, India, Italy, Australia, and Chile. The meeting focused on conservation projects on buildings as significant as Frank Lloyd Wright's Robie House, Kenzo Tange's Yoyogi National Gymnasium, and Le Corbusier's Gandhi Bhawan. Additionally, attendees had the opportunity to visit the ongoing works based on the CMP of the Luce Memorial Chapel, designed by architects I.M. Pei and Chen Chi-Kuan.

Another KIM workshop will soon take place in Kosovo (June 2024), followed by the *International Conference and Workshop for the Conservation of Twentieth-Century Heritage in the Southern Hemisphere*, held in Santiago, Chile, in April 2025. This event, organised by the UDD School of Architecture, aims to explore the conservation planning methodology from the experience of "*Keeping It Modern*" grantees from Portugal, Brazil, Argentina, Uruguay, the United States, and Chile.

In addition to the Conference, a six-week Student Workshop will consider multiple scenarios for adapting 5 Fire Stations in Santiago by assessing the cultural significance, current condition of the sites, and user requirements, and finally, developing conservation policies to address change management through a design proposal.

These activities leverage young students' interest in conserving twentieth-century heritage and represent opportunities to reflect on the current situation and challenges faced by the field in our local context. By focusing on upstream efforts, these Conferences and Workshops would raise interest in new academic and training programmes addressing twentieth-century heritage conservation.

Fig.3 Benedictine Monastery Church CMP presentation at the 2024 Taiwan Convening. Credits: Taichung University Photographic Archive. Prof. Chijeng Kuo.

Given the lack of training programmes, these experiences are crucial to triggering changes in the existing education offering, broadening the scope, and including existing theoretical and methodological approaches to allow for effective and sustainable protection of our 20-C heritage.

#30

4. CONCLUSION.

In recent decades, there has been increased appreciation for 20-C heritage. This is evidenced by the growing number of sites registered on UNESCO's World Heritage List and the various organisations (academic, public, and civil society) advocating for the preservation of these properties, neighbourhoods, or landscapes.

However, there is a significant lack of educational programmes at all levels, from academic to technical and professional. This reality not only affects the capacities for implementing management plans or interventions on heritage properties but, worse still, fails to raise awareness of 20-C heritage and reveal its importance and urgency for protection, especially

among younger generations who will be responsible for defending this cultural heritage in the future.

Due to the low demand for undergraduate and postgraduate programmes in modern heritage conservation subjects, short courses, workshops, seminars, and applied research projects offer a viable and effective alternative to address the skills gap. Additionally, international programmes such as the Getty Foundation's "*Keeping It Modern*" initiative or the courses promoted by the Conserving Modern Architecture Initiative (CMAI) serve as spaces where, in addition to accessing cutting-edge knowledge, methodologies, and innovative procedures, shared experiences are valued. International and cross-disciplinary networks are generated, enabling collaborative projects' development.

Our region faces several challenges related to climate change and housing scarcity. Twentieth-century heritage conservation represents a promising opportunity for the future, and professional training, and it is crucial to raise awareness and advocate for future heritage sites.[14] ■

ABSTRACT.

MAPA PERU, an academic initiative launched in 2023, explores the impact of Modernism and sustainability initiatives in Arequipa, Peru's second most populous city. Despite Arequipa's reputation as a historic city, the influence of Modernism is often overlooked and remains largely unrecognised and undervalued, to the extent that it was not considered in the statement of Outstanding Universal Value when the city was designated a World Heritage site in 2000. MAPA PERU therefore aimed to raise awareness of the potential and challenges of Arequipa's Modern architecture. This involves re-mapping of these places, by evaluating current uses and users, identifying heritage and character-defining values, and assessing the potential for adaptive reuse of two representative Modernist buildings: the Gamesa Galleries, a mixed-use complex with residential and retail uses located in the historic city, and the Nicolás de Piérola residential building, a social housing complex located right outside the city centre. The one-week workshop, held in August 2023 with students of Architecture, Urbanism, and History from four Peruvian universities in Lima, Cusco, and Arequipa, involved field visits and documentation, diagnosis of building status and uses, and analysis of the adjacent urban fabric, considering form, matter, original function, current uses and users, resilience, sustainability, and capacity for adaptation to future needs and possibilities. The analyses revealed that while both buildings are in good condition and continue to serve their original purpose, they have been affected by densification, changes in land use, and urban growth. As such, proposals were made to address these transformations and potential new layouts and uses, so that these buildings can be adequately valued and maintained, and can continue being assets to Arequipa and its people.

1. INTRODUCTION

Located at an altitude of 2335 metres above sea level, on the banks of the Chili River, at the foot of the Misti, Chachani, and Picchu Picchu volcanoes and surrounded by lush countryside and agricultural terraces, lies the historic city of Arequipa, the second largest in Peru. It was founded in 1540 by Spanish conquistadors near a prehispanic village located in the present-day district of San Lazaro. Over the next three centuries, the city expanded and acquired several magnificent civil and religious buildings, though most of the city's traditional buildings are one storey tall and built of sillar. This lightweight, yet compact, tufa-like volcanic rock comes in shades of pink and white and was obtained from nearby quarries, the remains of ancient volcanic eruptions. While Arequipa is blessed with a magnificent natural setting and a year-round mild and sunny climate, it is also vulnerable to frequent earthquakes which though destructive, have also spurred ingenious architectural innovations, such as robust walls, vaults, the use of courtyards, patios, and the preference for sillar as a construction material due to its availability, and malleability, making it a good canvas for ornamentation, strength, and lightness.

2. AREQUIPA BECOMES A WORLD HERITAGE SITE

The historic city centre was designated a World Heritage Site (WHS) in 2000. In order to be included in this list. a statement of "Outstanding Universal Value" is required, and in the case of Arequipa, the statement privileges the ornamented architecture and the urban fabric of the Colonial (1540-1821) and early Republican period as the most significant values to be preserved, describing it as "a masterpiece of creative integration of European and native characteristics (...) challenged by the natural conditions, the Indigenous influences, the process of conquest and evangelisation, as well as the spectacular nature of its setting,"[1] thus implying that mid-century and Modern buildings do not add significant value. This means that there are currently no guidelines on how to intervene, and renovate these structures in such a way that respects their character-defining attributes, while also addressing the need to update obsolete materials and services; adapt to new uses and users; and consider improvements in areas such as energy use, comfort, sustainability, and technology.

Unfortunately, Modern buildings are facing many of the same challenges as the city centre, such as the deliberate demolition of historic buildings, uncontrolled urban sprawl into the countryside, the absence of a risk-preparedness plan, the creation of newer retail, commercial, and entertainment centres outside the World Heritage Site (WHS) limits, a decline in permanent residential population in the historic city, vehicular congestion and pollution, and often insensitive, piecemeal interventions that have negatively affected many buildings.

3. MODERNISM IN AREQUIPA

Obedience to the site
Obedience to construction systems

1. "Historical City Centre of the City of Arequipa" World Heritage City Convention UNESCO, accessed June 24, 2024, https://whc.unesco.org/en/list/1016/

Obedience to the function of housing
... is the manifestation of modern life, and its relationship with public space.[2]

By 1940, Arequipa was preparing to celebrate its 400th anniversary with a new urban masterplan designed to guide growth, modernisation, and address challenges related to industrialisation, migration from rural areas, and population growth, including the need for more housing and infrastructure. This urban plan, in addition to the two earthquakes in 1958 and 1960 that destroyed many historic buildings, facilitated the introduction of Modern architecture and urbanism, much of which was developed by local architects.

While most of the best-known examples of architecture and urbanism from this period are located in Lima, which is also where most Peruvian architects received their education and training, Arequipa developed its unique flavour of Modernism, drawing from vernacular architecture, ornamentation styles, and the local climate.

4. CASE STUDIES

4.1 THE GAMESA GALLERIES: MODERNITY IN THE HISTORIC CITY

The Gamesa Galleries are an emblematic mixed-use residential, professional, and retail complex designed by local architect Gonzalo Olivares Rey de Castro (1930-2019) and completed in 1961-1962. Situated in the heart of the historic city centre, they are located between Mercaderes, the city's main commercial street which was converted to pedestrian-only in 2008, and the quieter Santo Domingo street. The architecture of Gamesa is representative of the Modern style and stands out for its functional design and ability to integrate multiple commercial spaces in the same place, making it a landmark in the historic centre of Arequipa.

Gamesa is composed of three main parts. The base level contains a passageway lined by retail space connecting the streets, Mercaderes and Santo Domingo, as well as an open courtyard that serves as a meeting and social space. This feature is inspired by the central patios of traditional houses and can be enjoyed year-round thanks to the sunny, mild climate and absence of rains. The upper level of the base contains an above-ground parking lot. The passageway anchors the two main tower blocks, located on each street: the Mercaderes Tower, containing offices, and the Santo Domingo Tower, dedicated to housing. A third tower was planned, but never built. Access to the upper levels is provided through a combination of ramps and elevators.

Gamesa embodies simplicity in its lines and forms, and its structure prioritises functionality and spatial efficiency. Architect Olivares succeeded in creating a modern building that respects and complements Arequipa's historical, cultural, and urban landscape. At the pedestrian level, the complex presents a futuristic, yet familiar character to the urban form by incorporating the architect's interpretation of traditional architectural elements such as those found in traditional tambos.

2. "C.H. Nicolas de Pierola I Etapa. Habitar" Radar, accessed June 24, 2024. https://www.facebook.com/RadarRevistaArquitectura

4.2 THE NICOLAS DE PIEROLA RESIDENTIAL COMPLEX: MODERN LIFE AND ITS RELATION TO PUBLIC SPACE

Nicolas de Pierola is a remarkable social housing project designed by architects Adolfo Cordova (1930-2022) and Carlos Williams (1924-2004). This complex was inaugurated in 1966 and was commissioned by architect and President Fernando Belaunde Terry (1912-2002) during his first term in office. All three of these architects were key figures in the Peruvian Modern Movement.

The complex is located just outside the historic city centre and was built during a period of significant urban growth due to migration and the expansion of economic activity in the region. This led to the growing demand for housing and basic services, and resulted in the creation of new residential, commerce and retail areas.

The design of the complex includes multi-storey buildings surrounding a ten-storey multi-family building, as well as courtyards and passageways that give the place a familiar human scale. The façades feature large textured and inlaid surfaces, with exposed concrete structural details and railings. In addition, wood joinery and interspersed brick panels add a touch of warmth and visual variety to the architectural composition. The complex also included several open and common areas that, in subsequent years, began to be occupied by vendors authorised by the municipal government. While this change brought new life and movement to previously underused areas, it also eliminated these common areas and led to piecemeal, and sometimes damaging interventions that degrade the site as an architectural object.

5. MAPA PERU AND ITS OBJECTIVES

Academia has a responsibility to contribute to the identification, recognition, conservation, and protection of Peru's 20th-century and Modern heritage, along with their associated values, and the works of Peruvian architects. MAPA thus aims to raise awareness and generate greater interest in the significance and impact of this Modern heritage, as well as to contribute to its adequate maintenance, conservation, renovation and adaptation, ensuring appreciation for future generations.

The first edition of MAPA PERU was organised by the Peruvian Network of Universities (RPU as it is known by its acronym in Spanish) as part of a collaborative inter-university research project, and it involved the participation of four universities from three different cities with different realities. These included the Pontificia Universidad Católica del Perú (PUCP) and Universidad Católica de Santa María (UCSM) in Arequipa, both private, located in Lima and Arequipa respectively, as well as the public Universidad Nacional San Agustín (UNSA) in Arequipa, and Universidad Andina del Cusco (UAC) in Cusco. Over one hundred architecture, urbanism, and history students and ten teachers and scholars met in Arequipa in August 2023, for a workshop that lasted seven days.

The objective was to identify character-defining traits and values, explore the state of conservation, current uses and users, and transformations and interventions in the two case studies, to evaluate how they have adapted

to current urban conditions and the impact of the WHS designation, and thus to propose ideas to help these buildings to adapt to the future, especially regarding advancements in sustainability, tourism. The workshop also included a third case study, the Andres Avelino Caceres Commercial Platform, a sprawling marketplace that is expanding and taking over the adjacent countryside. This study considered the effects of changing land use, urban planning and design, and informal and unplanned growth, which falls outside the scope of this work as it is not a Modern building or site.

6. REMAPPING MODERNISM IN AREQUIPA: THE WORKSHOP

For us, it was essential to understand the historical context of Peru's Modern architectural and urban legacy in order to shed light on its relevance and intention at the time they were conceived and first built. We also considered it important to understand the influence of pre-Hispanic and historic Spanish and European influences from an interdisciplinary perspective, to distinguish the elements that make Arequipa-based Modernism unique, as well as to bring more attention to the works of Arequipa-born and based architects. Remapping, therefore, corresponds to the need to recontextualise, in time and space, buildings that we do not want to be lost to oblivion due to demolition or significant transformations that will obscure their original traits, uses, and intentions.

6.1 WORKSHOP METHODOLOGY

The academic exercise involves understanding the problems in the transformation of the collective living and working spaces of the Modern movement and their integration into the existing urban fabric through a multidimensional approach that contemplates history, contemporary needs, and potential future developments. Careful and critical observation and documentation were crucial during the field visits.

The workshop consisted of four stages. The first was the preliminary research and information gathering, which took place before the students arrived in Arequipa. This included virtual meetings with team members from different universities in the other cities, as well as reviewing existing documentation such as archives, films, books, and journals, to gain insight into the buildings, and their historical and urban context, and how they were used in the past.

Upon arrival in Arequipa, the students and faculty teams commenced the second stage of the workshop, involving field visits, during which time the students observed and documented the buildings using written descriptions, photography, and hand-drawn illustrations. Drawing is an essential tool for understanding the sites, as it gives one the confidence to work on what is seen, what is found, and what is experienced, without physical or temporal distances. Drawing also serves as a tool for interpretation, as it facilitates our understanding of the original form and function, its changes and uses over the years, and how to respond and react to the site. Emphasis was placed on this moment as half of the participants were unfamiliar with the buildings, and the dynamics of the environment. For this reason, it seemed

Fig. 1. Galerías Gamesa visit during workshop. (2023) © Carlos Torres Flores

Fig. 2. Nicolás de Piérola Residential Complex visit during workshop. (2023) © Carlos Torres Flores

Fig. 3. In classroom workshop session (2023) © Carlos Torres Flores

relevant to us to sensitise the participants with the buildings, the place and its relationship with the urban fabric, its dynamics and its temporality.

The third stage took place over two days in the classroom and involved assessing the buildings themselves as a group through discussions, graphic exercises, and examining the material that the students had produced on site. The goal was to reach a consensus on the character-defining values of each building, their uses and users, challenges and potential, as well as the values to protect, conserve, and communicate. Many crucial decisions had to be made at this stage regarding what was worth protecting and preserving,

what needed to be renovated and transformed, and their potential for future uses and users. We made 4 smaller groups in which we mixed the students from different universities and cities so as to enrich the conversation with their different experiences and approaches.

The fourth and final stage involved planning and designing interventions considering the buildings and their adjacent urban context —the remapping exercise itself. The production was carried out using different types of mapping that communicated the dynamics, sketches that transmitted perception, physical maquettes and digital models, urban and exploited axonometrics that showed the physical situation of the buildings and their potential uses. Sectional analysis was also used to communicate the new ideas of proposed spatiality.

At the end of the workshop, we held a final review in which the students presented their proposals and received feedback and comments from the faculty members, the organising committee, guest professors and authorities; in addition to their peers.

7. FINAL THOUGHTS: UNDERSTANDING THE MAIN CHALLENGES OF LOCAL MODERN HERITAGE AND THE REMAPPING

Our observations and the students' proposals revealed that while the case studies remain in relatively good condition, they have nonetheless been affected by the passage of time, and costly renovations and maintenance are needed to replace some of the worn-out and obsolete systems. Furthermore, the needs and expectations of the users, especially regarding housing, have changed, and the perceptions and uses have also been affected by larger social and economic transformations in the city. For instance, Gamesa was a major hub for retail and a popular gathering place for many years, but the growth of the city and the opening of new malls and department stores in the new neighbourhoods have made it less appealing and consequently, now many stores remain empty, the base level remains underutilised, and the main courtyard and passageway serve more as a convenient shortcut between Mercaderes and Santo Domingo street than an actual shopping destination and meeting place for locals and tourists to gather. Similarly, Nicolas de Pierola has introduced small-scale retail that occupies the complex's common areas, thus providing neighbours with a convenient place to shop and meet, but with less common spaces. The proposals put forward during the workshop mostly focused on revitalising and adapting these underused spaces, to consider current urban conditions in the historic city and the larger metropolitan area.

Proper maintenance, renovation, and transformation of these buildings will significantly and positively affect local communities. For us, it is essential to consider how changes would impact social cohesion and the quality of life of the inhabitants. The conservation of Modern heritage requires striking a balance between renovating and adapting these sites to changing conditions and preserving historical, architectural, social, and character-defining values while considering new needs and regulations such as accessibility, energy efficiency, and technology.

Sustainability is a core value when considering Modern buildings. When we consider the words of Carl Elefante, former president of the American Institute of Architects when he claimed that "The greenest building is the one that already exists."[3] This means that existing buildings hold valuable embodied energy and are already significant investments in time, energy, resources and materials. Therefore, the most sustainable action to prevent waste is to maintain and adapt these buildings, which requires careful planning and understanding of these sites, their current conditions, challenges and potential.

Finally, the workshop results make it clear that it is essential to understand the problems of each architectural object in both its original and current context, to give them a new life that takes advantage of its potential. Academia, and interdisciplinary initiatives like MAPA, are necessary to conduct the required research and communicate the results with practitioners, leaders and decision-makers, and the public, to generate awareness and interest, and be able to make informed decisions about the future of Modernism in places like Arequipa. ■

3. "The greenest building is the one that already exists" by Robert Adam, September 24, 2019. *AJ Architects' Journal*, accessed on June 24, 2024. https://www.architectsjournal.co.uk/news/opinion/the-greenest-building-is-the-one-that-already-exists

BIOGRAPHY

Carlos Torres Flores. Architect with sixteen years of professional experience in Peru and abroad. He holds a Master's degree in Rehabilitation and Restoration of Architectural Heritage from Universidad Politécnica de Cataluña in Spain, and specialised in design and construction, historic preservation and adaptive reuse, environment, climate, and sustainability. He is a founding member and director of Proyecto Patrimonio – PAT, a consulting and design office based in Lima, Peru, specialising in architecture, urban design and planning, cultural projects, and legal counselling related to the built heritage, and teaches courses on architectural design and conservation at different universities in Peru.

Mariano Quiroga Robles. Architect and Urbanist from the Pontificia Universidad Católica del Perú (PUCP), with a Master's in Direction and Management of Construction and Real Estate Companies (MDI) from PUCP and the Madrid Polytechnic University. He has worked at COSAPI and Echeverría Izquierdo Perú and has been an Educational Spaces Specialist and consultant at the Ministry of Education in Perú. He is the director of Habitáculo, a consulting, architectural, and urban design office based in Lima. He teaches courses on architectural design and urbanism at various institutions such as Universidad Peruana de Ciencias Aplicadas (UPC), PUCP, and CENTRUM PUCP.

Rosabella Alvarez-Calderon Silva-Santisteban. Archaeologist, urbanist, and professor at the Department of Architecture at Pontificia Universidad Católica del Peru, with a Master's in Design Studies and Critical Conservation from Harvard University. She has been a consultant foú UNESCO Peru, the Peruvian Ministries of Culture and Tourism. She is a founding member and specialist in conservation, urbanism, and accessibility at Proyecto Patrimonio – PAT, a consulting and design office based in Lima, Peru. She has been a Fellow at the Dumbarton Oaks Research Library and Museum in Washington DC and has published in local and international journals, including the APT Bulletin.

WHAT DO WE WANT FROM ARCHITECTURAL EDUCATION?

ARTINA QEHAJA
INDEPENDENT RESEARCHER

ABSTRACT.

This paper delves into the evolution of architectural education in response to the unique challenges posed by the conservation of modern heritage. Drawing upon personal past experience as a student, it underscores the need for an interdisciplinary approach, integrating elements of economics, politics, sociology, and technology into conservation efforts.

At the heart of this exploration lies the concept of ageing in architecture, which the study approaches through a holistic lens encompassing more than mere physical deterioration. By examining the ageing process of buildings, the paper identifies four key dimensions—materiality, use, context, and concept—that influence our perception of a building's age and inform tailored conservation strategies. It highlights the vulnerability of Modern buildings due to experimental design choices and material selection, stressing the importance of early intervention and informed decision-making within the context of evolving urban landscapes.

While there is a consensus on the necessity of skilled hands, whether dealing with Modernist structures or those from earlier periods, an examination of the history of Modern architectural conservation reveals that technical challenges are just one aspect of the broader conservation landscape.

This complexity poses a significant educational challenge, requiring students to grasp a wide array of topics within a limited timeframe. By adopting a balanced approach that combines historical value with contemporary needs, students can play a vital role in preserving our architectural heritage for future generations. The paper seeks to cultivate a critical engagement with how the past intersects with the present, encouraging a perspective that relates to the legacy of earlier generations not with intimidation, but with a profound understanding of our place within this continuum.

#30

1. THE EVOLUTION OF ARCHITECTURAL EDUCATION

If you have ever had to learn about, or teach on the topic of the conservation of Modern Heritage, you are likely familiar with the frustration a student can experience, especially if they struggle to engage with the abstract ideas of the twentieth century. This challenge is not necessarily built into the subject itself, but rather originates from the intellectual achievements of this period. Buildings from this era were designed to be of their era, "new," reflecting the spirit of the age. The association of this heritage with recentness, manifested tangibly through cleanliness and shininess, can lead to the misconception that they are timeless and immune to aging.[1] This misconception sometimes gets in the way of students understanding why conservation of this heritage is necessary and how to approach it effectively. Without understanding its nature and significance, it is easy to feel lost, especially when the timing is tight, a common challenge for students balancing multiple tasks beyond design and construction.

To understand how to approach this task, it is insightful to examine the approach of the Bauhaus, the first school fully connected with Modernism. This departure from traditional teaching methods, notably different from the Beaux-Arts model, emphasised hands-on experience and direct interaction with materials, similar to the Montessori "learn by doing" approach.

Although Gropius, the founder of the Bauhaus, did not teach architecture there, the introduction of architecture into the curriculum under Hannes Meyer's leadership in 1927 as "Building Science" marked a pivotal moment. This shift coincided with the concept of separating design from manufacturing, a development crucial for the cost-effective modernisation of industrial cities.

Today our appreciation of Modern heritage extends beyond mere nostalgia; its focus on efficiency and functionality suggests an inevitable evolution in architectural practice. The sheer volume of buildings from this period attests to both architectural innovation and intellectual achievement, enduring despite any perceived shortcomings. Ernst May alone managed to build close to around 12,000-15,000 apartment units in this period, regardless of the school's teachings.[2]

Modern buildings, often products of experimental design, display a particular vulnerability. Even if we were to perfect the teaching of material conservation techniques, which has been a focus for many years now, a lingering question persists: How can we ensure that the conservation of Modern heritage effectively balances historical values with our contemporary needs?

2. TRACKING A BUILDING'S JOURNEY THROUGH TIME

Understanding how historical and contemporary elements can be held together requires discussing the passage of time. By exploring how buildings change over time, we gain insight into which aspects may require conservation efforts and the reasons behind them. Understanding how a building changes post-construction—essentially tracing its journey through time—can clarify what it means for a building to age.

Time shapes a great deal of our perceptions and interactions with the world. Just like everything else, including us, buildings are not immune to the effects

1. Andrea Canziani, Andrea Luciani, and Margherita Pedroni, "Learning from Modern Heritage: Methodological Tools for Re-Thinking Education in Conservation," A*daptive Reuse: The Modern Movement Towards the Future, 14th International Docomomo Conference* 2016, 848.

2. Thomas Edelmann, "A Lot of Life in One Person," Stylepark, August 16, 2011, https://www.stylepark.com/en/news/aa-lot-of-life-in-one-person.

of the passage of time. As a building ages, we begin perceiving it as though it belongs to another era, transitioning from a contemporary object to being seen as something of the past. But how can we tell if a building is genuinely ageing?

When examining how a building ages, four key dimensions come to mind. These are not guidelines specifically but rather structured approaches, offering a framework analysis and helping to guide decisions when uncertainty arises.

2.1. MATERIALITY

Materiality is arguably the most obvious and quantifiable indicator of a building's age. By simply observing a building's physical condition and how it has held up over time, we can tell whether it reflects the contemporary era or a past one. While all buildings look new upon construction, the tangible effects of ageing gradually become apparent. Over time, paint peels, and new materials corrode, leading to decay and possible structural deformation.

Modern buildings, often the results of experimental design, are particularly susceptible to deterioration due to design choices and material selections. This vulnerability necessitates repairs earlier than structures built using traditional methods—typically within 25-30 years after construction with major renovations generally required every 50-60 years.[3]

Research and case studies underscore the technical complexities inherent in this process[4], emphasising the role of expert handling to ensure the longevity and structural integrity of buildings. While fully comprehending this intricate field is not possible in a short timeframe, it is beneficial to become familiar with the reasons behind material decay and particularly its pace. Understanding construction materials, their properties, and ageing processes is vital for effective preservation and maintenance. This knowledge can help us make more informed design decisions, effectively manage existing materials, and make better choices regarding replacements.

2.2. USE

Another practical indicator of a building's ageing lies in its use, which often entails the layout and organisation of the structure. Buildings frequently adapt to changing circumstances and functionalities over time, sometimes straying significantly from their original intent. Even if a building continues to serve its initial purpose, shifts in how people use the space demand updates and revisions. Evaluating a building's adaptation in terms of use involves examining its historical purpose and function, comparing it with its current state to measure its level of adaptation and identify areas requiring further adjustments.

This includes understanding the building's historical context by considering the following questions, bearing in mind that historical records often have limitations in their completeness and may reflect the biases of those who documented them.

1. Where is the building located?
2. Who was it built for?
3. What purpose did it originally serve?
4. How did it once function?

3. Macdonald, Susan. "Materiality, monumentality and modernism: continuing challenges in conserving twentieth-century places." From an address given at the Unloved Moderns conference in Sydney, Australia. 2009.

4. Margherita Pedroni et al., "A Global Survey on Education and Training for the Conservation of Twentieth-Century Built Heritage" (J. Paul Getty Trust and Docomomo International, 2020), 38.

Figure 1 Aerial View of Villa Savoye. Google

Figure 2 Lucien Hervé. Distant view of the northwest and southwest façades of Villa Savoye, Poissy, France. 1931 or later, comp.: 16.0 x 23.8 cm, Collection Centre Canadien d'Architecture/ Canadian Centre for Architecture, Montréal.

Understanding a building's values, strengths, and weaknesses allows us to make informed decisions about which elements to preserve and which to modify, aligning with its evolving functions.

When possible, it's helpful to remember that buildings should be responsive to their local environmental conditions, which not only ensures sustainability but also enhances comfort for its occupants. Ultimately, buildings are more than mere structures; they are spaces where people live and work, fundamentally designed for those who use them.

2.3. CONTEXT

Context is a particularly intriguing way to measure a building's age, in such a way that it does not concern the building itself, or at least not directly, but rather everything else happening around it. Initially, buildings are designed to adapt and blend seamlessly with their environment, aligning with infrastructure, optimising views, and integrating smoothly among neighbouring structures.

This is the context in which Villa Savoye finds itself today. **(Fig 1)** The photograph taken in the 1930s **(Fig 2)** captured a context that no longer exists.

As urban landscapes evolve and expand, the land around a building can undergo significant changes. Such alterations can shift the building's relationship with its surroundings, ultimately influencing our perception of it. Buildings that were once well-integrated may now appear mismatched as new structures emerge, roads expand, or land use shifts. Urban densification can lead to once-harmonious buildings becoming out of sync with new infrastructural developments, with formerly isolated structures becoming engulfed by urban expansion, or vice versa. Moreover, the transition of the villa Savoye from a private residence to a public museum has brought about other shifts, in funding, management, and other aspects. Thus, context encompasses both the tangible physical elements surrounding a building and intangible factors such as social, economic, or political considerations. This marks a clear transition of conservation from a technical endeavour to an interdisciplinary practice, presenting a significant challenge for students, who are now expected to delve into more than just design and construction.

2.4. CONCEPT

Modern heritage buildings are more than physical structures; they encapsulate the ideas, values, and aspirations of their era. This conceptual dimension also influences their ageing process, as ideas and trends evolve. Thus, buildings can become "conceptually" old, regardless of their physical state. Measuring this is challenging, as some concepts age faster than others, especially those tied to trends. Consequently, even well-maintained buildings can seem old when the ideas they represent become outdated, leading us to perceive them as "dated" rather than simply "aged."

Historic photographs frequently feature the latest technological advancements—such as new car models, accessories, and hairstyles—set against newly constructed buildings that were once symbols of modernity. However, upon revisiting these images today, the elements intended to

highlight the building's modernity today appear outdated, while the image of the structures themselves remains largely unchanged. This observation prompts an interesting consideration: despite the rapid evolution of many aspects of life, the physical appearance of a number of buildings may have remained relatively constant over time.

Coming up with a plan for conserving a building that is ageing in a single dimension, such as materiality, is typically an easier task to manage. However, when a building begins to age across multiple dimensions — material, functional, and contextual— it often creates a sense of unease. This complexity arises because conservation at this point involves more than just addressing technical issues; it entails navigating the interplay between architecture and ever-changing elements of economics, politics, sociology, and technology, among others, factors that are not always predictable and often beyond our control. This uncertainty can lead to a tendency to restore the building to a state in which the ageing "problem" had not yet manifested itself, often reflecting its original or a well-documented, so-called "authentic" former image. While widely discussed, the topic of authenticity remains a thought-provoking and essential aspect for those new to the field, challenging established beliefs and encouraging their re-evaluation.

3. BRIDGING THE PAST AND FUTURE: MODERN HERITAGE PRESERVATION THROUGH INTERDISCIPLINARY EDUCATION

The concept of Modern heritage conservation that embraces change can be a compelling topic for students, testing boundaries and sparking debates on the extent of acceptable change. Problems arise precisely at this juncture —when delving into the specifics of proposed changes, it becomes crucial to assess whether the proposals genuinely contribute to the building's conservation or might cause more long-term harm. Modern buildings are highly sensitive to minor changes, just like those from earlier periods.

Therefore, how can students effectively incorporate political, economic, and sociological considerations into their designs?

3.1 THE INTERSECTION OF POLITICAL CONSIDERATIONS, SOCIOLOGICAL PERSPECTIVES, AND ECONOMIC FACTORS IN MODERN HERITAGE CONSERVATION

To effectively address economic, political, and sociological factors, conservation education must adopt a multidisciplinary approach. This integration prepares students to develop well-rounded strategies that consider all aspects of Modern heritage preservation.

Politics plays a crucial role in shaping conservation efforts. Laws and regulations determine how buildings are protected, zoned, and maintained. These political frameworks influence not only the physical conservation of structures but also public opinion and societal values, which can prioritise or overlook their conservation.

From a cultural and societal standpoint, sociological studies highlight the importance of Modern heritage. Understanding the cultural value attached

to these structures helps in crafting preservation strategies that resonate with contemporary society, including dynamics of urbanisation such as gentrification and displacement. Involving communities in the conservation process is crucial for ensuring cultural sensitivity and support. Educational initiatives play a key role in helping communities recognise and value their Modern heritage, and in turn, the cultural value placed on these structures often determines which ones are prioritised for conservation.

Economics is another essential factor in determining how resources are allocated for conservation, renovation, or demolition. Effective conservation strategies should align with long-term financial and environmental goals, as emphasised by scholars like Della Torre in discussions on planned conservation.[5] Integrating economic strategies into conservation practices ensures that efforts are sustainable and beneficial in the long run.

CURRICULUM DEVELOPMENT / Designing a comprehensive curriculum for conservation students begins with intensive documentation analysis. This first step ensures that students gain a thorough understanding of the project in all its complexities and nuances and what it is that they are trying to conserve before shaping their conservation strategies.

Detailed case studies, both successful and unsuccessful, should be integrated early into the curriculum to provide practical insights into real-world conservation challenges and decision-making processes. By examining case studies from different regions of the world, students can understand how certain decisions may be successful in one context and less so in another, promoting a more nuanced approach to conservation strategies.

Sustainability should be a core component of the curriculum, highlighting the advantages of building conservation, such as minimising waste and preserving the embodied energy in existing structures.

COLLABORATIVE LEARNING / Collaborative learning is another critical element, where students benefit from the insights of professionals from diverse fields like architecture, politics, economics, and history. This can be achieved through lectures, panel discussions, workshops, and field trips to Modern heritage sites. These hands-on experiences allow students to observe ongoing conservation efforts, understand their impact, and engage directly with local communities and stakeholders to appreciate the social implications and communal benefits of conservation efforts.

USE OF TECHNOLOGY / Digital tools and software can manage the complexities of conserving Modern buildings. Architectural simulation software and virtual reality can create conservation scenarios, allowing students to experiment with various preservation strategies and observe outcomes. This dynamic learning experience emphasises the process over the final image, fostering discussions on the implications of different conservation techniques on cost, energy efficiency, and structural integrity.

5. Della Torre, Stefano. "Economics of Planned Conservation." INTEGRATING AIMS — BUILT HERITAGE IN SOCIAL AND ECONOMIC DEVELOPMENT, 2010, 141–56.

ASSESSMENTS / Project-based assessments should be introduced where students are tasked with developing and defending conservation solutions, which include as many factors as possible (like economic, viability, political feasibility, and cultural sensitivity). This approach challenges students to apply their learning in a complete manner and prepares them for the complexities they will face in their professional careers. Importantly, it also teaches them to prioritise effectively, make the most of available resources and recognise that perfect solutions are often unattainable. These assessments provide a good opportunity to measure how the alterations can be balanced against the significance of what has been altered.

FURTHER PROFESSIONAL DEVELOPMENT

Finally, ongoing professional development is essential. Offering specialised courses in conservation and encouraging participation in relevant conferences and seminars can provide students with the latest research and practices in the field. This continuous learning ensures that students remain at the forefront of conservation techniques and strategies.

By combining different fields of study, real-world examples, teamwork, modern technology, thorough evaluations, and continuous learning, we can provide students with the skills and knowledge they require to balance old and new elements in their conservation work. With this well-rounded and comprehensive education, they can create conservation strategies that preserve the past while also meeting current and future needs. ■

RE-EDUCATION FOR REUSE OF MODERN SPACES. SOCIAL AND ENVIRONMENTAL DIMENSION AS A PLATFORM FOR INCLUSIVE DIDACTIC AND RESEARCH

UNIVERSITY OF COIMBRA, PORTUGAL

ABSTRACT

Modern futures, sustainable and culturally diverse, claim to think critically about certain emerging challenges in education and research for the valuation, documentation, conservation and reuse of the legacy of the Modern Movement, in the context of the complex and changing scenarios of today's world. On the one hand, the social dimension, about the engagement of communities/people that inhabits modern legacy, to identify its needs and challenges – resources, security, health – as well as the priority on the international agenda of inclusion and social participation for a fair development. On the other hand, the environmental dimension, about built heritage as a non-renewable symbolic, physical, and economic resource whose demands – climate change, energy, nature - require creative designs for a sustainable development.

This paradigmatic time that society and its environment are going through today is prompting us to review the forms of production and transmission of knowledge, as well as the objects of study. Interdisciplinary and transversal knowledge, situated learning-teaching, alternative didactic strategies, inclusive perspectives, and everyday modern heritage as study cases, are some of these contemporary educational challenges. In this context, this paper provides a conceptual framework for the session that aims to discuss socially, and environmentally innovative and inclusive experiences developed for the training of students and researchers in the disciplines of spatial practices to adapt or rehabilitate buildings, sites or neighbourhoods of the Modern Movement.

1. INTRODUCTION

The Societal and Environmental Challenges are at the top of the international agendas due to the accelerated transformations that are facing today the urban and rural territories, where modern movement played a key role during the 20th century. On one hand, globalisation is having an impact on the perception of modern heritage generating social inequalities and lack of human rights. On the other end, Climate Change is imposing a new ecological awareness that affects the preservation and reuse of modern spaces.

Architecture and Urbanism Education institutions are late in the integration of these emerging issues into the training process. In fact, educational policies are insufficient or fragmented to deal in depth with the contemporary complexity that claims a permanent adaptation and updating of contents and didactic strategies, as well as the exploration of experimental and alternative ways of teaching and learning knowledge.

DOCOMOMO has an educational aim since its foundation well represented in the activities of the International Specialist Committee on Education + Training (i.e, declarations[1], workshops, surveys), the DOCOMOMO Journal publications[2] and in the international conference papers. Nevertheless, social and environmental dimensions are marginal in these spaces of debate and sharing of knowledge.

In the field of research, this topic receives today broader attention with the European programme framework New European Bauhaus, an open call to rethink Bauhaus values in the frame of the social and environmental challenges, namely highlighting the importance of co-creation to establish the connection between people and nature.

In this context, this paper provides a conceptual framework for the session that aims to discuss socially, and environmentally innovative and inclusive experiences developed for the training of students and researchers in the disciplines of spatial practices to adapt or rehabilitate buildings, sites or neighbourhoods of the Modern Movement.

2. SOCIAL AND ENVIRONMENTAL DIMENSION

Modern futures, sustainable and culturally diverse, claim to think critically about certain emerging challenges in education and research for the valuation, documentation, conservation and reuse of the legacy of the Modern Movement, in the context of the complex and changing scenarios of today's world. On the one hand, the social dimension, about the engagement of communities/ people that inhabits modern legacy, to identify its needs and changes – resources, security, health – as well as the priority on the international agenda of inclusion and social participation[3] for a fair development. On the other hand, the environmental dimension, about built heritage as a non-renewable symbolic, physical, and economic resource whose demands – climate change, energy, nature- require creative designs for a sustainable development[4].

This raises questions and challenges:

To what extent do we venture to cross the frontiers towards re-education or the exploration of alternative methods and tools for the adaptive reuse

of modern architecture in today's complex scenarios? What pedagogical strategies promote situated and engaged knowledge in students with the social and environmental reality?

2.1. INTERDISCIPLINARY AND TRANSVERSAL KNOWLEDGE

Schools in spatial practices - interior architecture, architecture, urbanism, landscape - are generally oriented towards training professionals with artistic or technical profiles producing new spaces. While modern built heritage/legacy/spaces are generally part of mandatory courses on theory and history, and part of elective courses where students do not always design adaptive re-uses. Or it is addressed by traditional design studios, often lacking appropriate theoretical and methodological underpinning, as demonstrated in the *Global Survey on Education and Training for the Conservation of Twentieth-Century Built Heritage*[5], organised by DOCOMOMO and the Getty Institute.

This implies a double educational challenge. Also, the integration of these issues when intervening modern landscapes and architectures that have their own conceptual and material characteristics requires research and documentation as a starting point for the re-design process.

At the same time, social and environmental issues are rarely integrated as transversal content in the curricula to provide theories, instruments and activities to deeply understand the needs and desires of users and the benefits of nature-based solutions, as well as to carry out joint design processes.

These topics are out of the architect's education, because they need interdisciplinary knowledge that can understand the social and environmental conditions that these buildings were produced in, and that can support its reuse in the context of these two dimensions. Although spatial practices are important, it is necessary to stimulate the dialogue with social and environmental sciences – sociology, anthropology, geography, biology.

This interdisciplinary dialogue was already integrated in the modern architectural education[6], from the initial Bauhaus to the late Harvard, São Paulo, IUAV, Delft, Porto, among others, with different approaches, but with common interests. Rethinking Bauhaus is also reopening the schools of architecture to other disciplines that can promote collaborative practices among professionals, academics, stakeholder and students, i.e, teamwork, as claimed by Walter Gropius[7].

2.2. SITUATED LEARNING-TEACHING

Education to preserve and reuse modernity is not exempt from the hegemonic narratives that dominate knowledge and literature. Especially from Europe, a body of concepts, historical periodisations and conservation criteria have crystallised that do not reach all territorial realities. The post-war period as a historical milestone or the material fragility of modern architecture does not represent the processes and characteristics of the modern legacy of contexts such as Africa, Asia or Latin America.

Situating the teaching-learning process implies thinking globally and acting locally. On the one hand, understanding the social and environmental

7. Gonçalo Canto Moniz, "Training the Architect: Modern Architectural Education experiences," *DOCOMOMO Journal* 49 (2013): 10-15.

problems that affect us today as a planetary community. On the other hand, by taking into account the cultural and historical particularities, the economic and technological resources of the modernity of each place. Likewise, acting locally means working with real contexts in articulation with local authorities and communities to understand the real challenges of co-production.

2.3. ALTERNATIVE DIDACTIC STRATEGIES

Beaux-arts didactic was spread all over the world and is on the top of the alternatives in every educational reform, as an artistic statement and a guarantee of the architecture autonomy. Bauhaus didactics may have the same impact in several countries worldwide. Based on these pedagogies, the design studio still guides education in architecture and spatial practices. Its values are undoubtedly reflection in action and the integration of knowledge from different backgrounds through the project. But also, the design studio has a dynamic where students generally interact with a tutor (or several) and advisors who are the authorised voices on the topics. This legitimisation of expert knowledge produced by and from academia has, for example, overlooked or undervalued the experience of users.

A valuable antecedent of the Modern Movement were the experiences on "*radical pedagogies*" in São Paulo, Porto, Yale, Paris or Chile schools, in late 1960s[8] where students claimed for the social and political role of architecture[9].

Co-creation processes between students and the community to activate modern neighbourhoods, buildings or public spaces makes it possible to integrate the voices of those who are the meaning of heritage conservation. Similarly, programmes articulated with stakeholders: governmental agencies, productive sector, NGOs, activist groups. To this end, it is necessary to think of new ways of organising working groups, exploring, representing and communicating the processes of valuing, conserving and reusing heritage.

2.4. INCLUSIVE PERSPECTIVES

Education is not neutral and has historically reproduced social processes of exclusion in terms of gender, ethnicity and class. It is worth mentioning that modern pedagogies such as Bauhaus were brutal examples of discrimination. Because of the large number of women in his first enrolment (84 women, 79 men), Walter Gropius imposed that the school would only have 1/3 women and vetoed their entry to the architecture workshop, a discipline considered masculine. Women studied in the photography, ceramics and textile workshops until Lotte Stam Beese was admitted to architecture, 8 years after Bauhaus was founded[10].

During the 1970s, the pioneering summer courses of the Women's School of Planning and Architecture (USA)[11] questioned the hierarchical and heteronormative structures of architectural teaching and practice by addressing women's issues in the design of cities and spaces. However, they did not have much reverberation.

Inclusive educational policies[12] are an ongoing challenge in the organisation of institutions and programmes dedicated to documenting and

conserving the Modern Movement. It is relevant that training and research are based on approaches that question hegemonies, recognise inequalities as a problem and propose solutions aimed at equity and inclusion: the feminist, intersectional, multicultural, queer perspective, among others. Its potential addresses both the historiographical revision of modernity to recover the contribution of women and all those authors eclipsed by the canonical figures, and the actions of urban or architectural rehabilitation to consider the active participation of the diversity of social groups in the community **(Fig. 1)**.

2.5. EVERYDAY MODERN HERITAGE

The transition from modern architecture to modern heritage meant broadening educational criteria based on the theoretical and technical revisions that arose to carry out its conservation: the displacement of material authenticity to the authenticity of design, the difficulty of articulating contemporary operations with architectures that are still references, the restoration of new materials (concrete, plastic), among others. Although advances have been made, teaching to conserve the recent past often refers to the canonical origin of the heritage field: the preservation of iconic buildings carried out by specialised knowledge.

Modern everyday heritage[13] is one of the central educational themes towards a sustainable approach to the recent past. It is necessary to expand the concept of modernity as a monument to cultural heritage: material and immaterial aspects that represent the history and memory of the different groups that make up a society. Anonymous architectures, industrial architecture, urban infrastructure works -education, health, recreation-, neighbourhoods and mass housing complexes are part of the daily life of the community. (**Fig. 2**) And they are also those that lack protection, maintenance and appropriate interventions. Thus, it becomes relevant in the first place to take this non-iconic and representative architecture of local realities as a case study. Second, that students can think of creative proposals for reuse with active community participation.

3. CONCLUSIONS

Modern architecture aimed to provide better conditions for society and its environment by producing new ways of thinking about urban planning, landscape, architecture and design.

Since the awareness of the value of modern architecture as heritage, education for its conservation and reuse also had to integrate theoretical and instrumental knowledge in order to train future professionals on the most appropriate forms of carrying out these actions. Today, the accelerated changes and profound contrasts that the world is witnessing mean that education often fails to address these complex scenarios, both in terms of content and didactics.

The session will explore some successful educational cases that can work as best practices. In Brazil, Sorocaba school of architecture is integrating modern heritage into the education course, research projects, and extension practices, exploring a social and environmental dimension.

In Lithuania, the program Vilius Tech Project discusses how soviet schools can be renovated with democratic principles through the students and communities' participation in multiple activities (workshops, tours, lectures). In Czech Republic an educational programme for non-architects (pupils) aims to transform modern schools built in the during the soviet period with architects, artists and educators promoting interdisciplinary. Finally, in Denmark, drawing is used as a pedagogical tool to investigate and to design based on socially sustainable strategies

Far from representing a limitation, this complexity is the possibility of adapting knowledge in a constantly evolving thematic field. It is also an opportunity to dare to explore didactic experiences in the disciplines of spatial practices to adapt or rehabilitate the legacy of the Modern Movement oriented to innovate and experiment, with situated and inclusive approaches, on the same pillars that sustained modernity: the social dimension and the environmental dimension. ■
