Gonçalo Canto Moniz is Associate Professor at the Department of Architecture of the University of Coimbra where he graduated in 1995, and obtained his PhD degree in Architecture in 2011. He is a researcher at the Centre for Social Studies of the University of Coimbra, where he co-coordinates the thematic line Urban Cultures, Sociabilities and Participation. He is co-PI of two European projects: URBiNAT (H2020, 2018-2024) and TRANS-Lighthouses (Horizon Europe, 2023-2026). At DARQ-UC he is co-coordinating the Renovation of José Falcão school. He is a member of the DoCoMoMo ISC Education and Training.

EDUCATION, RESEARCH, AND EXTENSION PRACTICES ON SOROCABA CITY (BRAZIL) MODERN ARCHITECTURAL HERITAGE

TAIANA CAR VIDOTTO
CENTRO UNIVERSITÁRIO FACENS

ABSTRACT

Buildings of Brazilian modern architecture are presented throughout the undergraduate courses of Architecture and Urban Planning, especially considering subjects on Theory and History. Nevertheless, notwithstanding the iconic stature of certain buildings, numerous examples of modern architecture in Brazilian cities remain overlooked. Most of them are abandoned due to the challenges of its conservation; transformed, missing its modern characteristics, or even demolished. The aim of this article is to present different strategies developed on teaching, researching and extension practices with a specific emphasis on modern architectural heritage presented in Sorocaba city, São Paulo state, Brazil. First, in the field of teaching, local modern heritage is presented in site visits and investigation practices which employs documentary research methodologies. Furthermore, within an architecture design studio, the objective is to propose the reuse of a building. Then, considering research practices, two different areas are being investigated. One of them has the aim to identify modern buildings and its authors, in order to produce an inventory. The second study involves analyzing the conservation status of public and institutional brutalist buildings. Finally, in extension practices, as a demand from the Public Security Secretary of São Paulo State, the reuse of one of the cities modern buildings where the Agriculture Secretary was once located. Its reuse was proposed as an internship with the undergraduate students. Considering the publication "A Global survey on education and training for the conservation of twentieth century-built heritage", those initiatives are an important step for the recognition of those buildings by local society and the necessity to maintain and reuse them, through the establishment of public policies, as part of the local history. Finally, a future generation of local architects and urban planners are being prepared to disclose modern heritage and work together with local society as watchdogs for their conservation and reuse.

1. INTRODUCTION

The university was born with three different objectives – teaching, researching, and extension practices. In the undergraduate of Architecture and Urban Planning isn't different. The Brazilian resolution that organizes the curriculum establishes that all three practices must be developed by the students. As such, they must be presented in a document called "Political and Pedagogical Project."[1]

First, research activities can be developed in short term experience as undergraduate research. Furthermore, these practices can also be interconnected with the knowledge involved in Theory and History disciplines, methodologies for urban planning and urban design, as well as documentary research. The development of research skills is incentivised, with a particular emphasis on their application in the Final Graduation Project that includes conceptual ground.

Then, since 2023, due to a law established in 2018, the activities which comprehend extension practices must be developed considering 10% of the curriculum. They also can be developed during complementary activities.

The undergraduate program in Architecture and Urban Planning at Facens[2] has incorporated in its curriculum all the requirements stipulated by the Brazilian legislation. Modern heritage preservation is integrated into these three core practices throughout the entirety of the five-year program. The aim of this article is to present different strategies developed on teaching, researching and extension practices with a specific emphasis on Sorocaba's modern architectural heritage.

The modern architectural heritage can be seen in most of Brazilian cities comprehending a period when the urban development, public and private sectors defended the use of its language. In Sorocaba there are many examples from different authors and periods which are being investigated and are object of study in disciplines, research, and extension projects.

As the document "A Global survey on education and training for the conservation of twentieth century-built heritage" affirms, despite all the efforts to develop a preservation conscience in our students, concerning modern heritage, is necessary to reinforce more practices. From the identification to documentation, improving conservation and reuse practices.

With that in mind, the following article offers a response to the questionnaire outlined by Pedroni et al.[3] concerning the curriculum content of undergraduate courses in Architecture and Urban Planning. Teaching, researching and extension practices encompassing building conservation, and dissemination of research findings, increasing the level of interest among students and future institutional plans including XXth century heritage.

2. ARCHITECTURAL EDUCATION CONSIDERING MODERN HERITAGE

The Architecture and Urban Planning undergraduate course presents modern heritage since the beginning. For 5 years the theme has been integrated into education in design studios, language, and expression practices as well as

2. Facens is located in Sorocaba, a city in São Paulo State.

3. Margherita Pedroni et al., *Global Survey on Education and Training for the Conservation of Twentieth Century Built Heritage* (Los Angeles, United States of America: Paul Getty Trust and Docomomo International, 2020).

built environment technology. This integration is depicted in **Figure 01**, which illustrates the curriculum.

There are specific disciplines in which the main object of study is the modern movement and the XXth century heritage (highlighted in black) and disciplines where those subjects are explored as its background. For instance, in the first years the modern movement is presented during site visits when students identify buildings such the ones by Milton Ghiraldini called "Conjunto Santa Clara" (1963), "Edifício São Bento" (1964) and "Nossa Senhora da Ponte" (1965).[4] They are object of study to present transitional spaces and the connection between architecture and urban planning.

Then, the modern heritage is theme of investigation in theory and history disciplines, which employ documentary research methodologies to generate scholarly papers and reviews. As a result, the documentary research involves the production of 3D models in virtual and physical version, which are exhibited for the community, as seen in the **Figure 02**.

Those disciplines have two different frames to investigate the modern movement heritage. First, in the 2nd year, the modern movement is addressed in a wide global overview and then, in the 3rd year, the objective becomes to recognize and investigate Sorocaba's colonial and modern heritage in its wider national context.

At the end of the 4th year, students have as demand in architectural studio to propose the reuse of a building in the city centrum. The design comprehends concepts of minimal intervention to preserve modern characteristics. This studio prepares the students for the Final Graduation Project in which some of them are deciding the reuse as theme. In those projects, the students are considering not only modern movement buildings, but also examples from the beginning of the XXth century. That expresses their interest in the conservation and preservation of this heritage.

3. RESEARCH CONSIDERING MODERN HERITAGE

Brazilian modern architecture and its XXth century heritage widely recognized, especially its celebrated authors, but in the interior state of São Paulo this style was applied by local authors that are still to be discovered. Due to that, one of the main objects of study during undergraduate research, comprehend the identification and documentation of the local modern heritage. Therefore, the results are disclosed in order that local society recognizes this heritage value, proposing conservation plans.

The first research developed between 2021-2022 focused on mapping buildings featured in the renowned architectural magazine "Acrópole".[5] Then, new undergraduate research was developed, identifying buildings which had as main material fair-faced concrete elements. At that time, a comprehensive bibliographical review was initiated considering publications on brutalist architecture and other buildings from 1950 to 1980. As a result, 35 buildings were identified from schools, institutions, private buildings such residences, and public ones like the city hall and the Municipal Theatre.[6]

4. Taiana Car Vidotto and Giovani Leonardo Gomes, "Arquitetura moderna na Sorocaba planejada: O caso do Conjunto Santa Clara e dos Edifícios São Bento e Nossa Senhora da Ponte," in *14o Seminário Docomomo Brasil*, 2021.

5. Taiana Car Vidotto, Giovani Leonardo Gomes and Gustavo César Dias, "First, identify and document, then, protect and recover: the modern architectural heritage in Sorocaba," *5th Biennial of Architectural and Urban Restoration BRAU5* (2021): 145- 153.

6. Nádia Maria Boscariol Machado, Marcia da Silva Inácio, Rodrigo Henrique Geraldo, and Taiana Car Vidotto, "Recognition and identification of fair-faced concrete buildings in the landscape of Sorocaba/SP," *Revista Mix Sustentável* vol. 9, no. 2 (2023): 107-119. https://doi.org/10.29183/2447-3073.MIX2023.v9.n2.107-119

Then, the research selected four different buildings to identify their architecture, documents, and current state of conservation, evaluating any pathologies present in their façade. The buildings were the "Serviço Nacional de Aprendizagem Industrial" (1965, Architects Lúcio Grinover, Hélio de Queiroz Duarte, Marlene Picarelli e Roberto Tibau); the "Departamento de Agricultura do Estado" (DIRA – 1972, Architects Abrahão Sanovicz); the "Serviço Nacional de Aprendizagem Comercial" (Senac – 1980, Architects Flávio Marcondes, Tito Lívio Frascino e Vasco de Mello), and the "Municipal Theater Teotônio Vilela" (1983, Architect Luiz Athur Guimarães Navarrette)[7] **(Fig. 03).**

Also, the selection of these buildings was based on their respective design and construction periods, facilitating a comparative analysis of their current state of preservation. Both Senai and Dira were built in the 60's and Senac and the Municipal Theater were built in the 80's. In addition, they are buildings of public and institutional use. Their authors had a similarity in their role during the modern period: Senai and Dira were designed by architects which were responsible for the spread of modern language, part of a group called "Escola Paulista"; while the authors from Senac and the Municipal Theater were members of a group known as "Arquitetos não alinhados."[8]

On one hand, documentary records were compiled of each one of the 35 buildings with information like: author, location, year of construction, architect, and which publication mentions them. On the other hand, an extensive investigation was made concerning drawings and other documents from selected buildings. Then, its state of conservation and pathology presence were identified.[9]

The analyses of these buildings indicated structural modifications. Some of them due to the lack of conservation or maintenance decisions made by their administrators. This was evident in DIRA and SENAI, where the flat concrete slab was covered with a roof. At DIRA, the consequence was the skylight's closure, making the internal corridors darker than previewed in the original design. That intervention didn't impact the exterior of the building. However, at SENAI, the rooftop made a significant change in the way the concrete slabs and paraboloid where covered and can be seen only inside the main pavilion.[10]

The other two buildings – the Municipal Theatre and SENAC – hadn't passed through significant changes. Both maintain their structure, but a significant difference was identified between them. SENAC, a private school, had few pathological manifestations in the façade. In the opposite side, the Municipal Theatre, a public building, displayed a higher incidence of pathological manifestations. It is notable the difference due to private and public resources in the conservation and maintenance of both buildings.[11]

In addition, the transformation process of SENAI, considering documentary research in the school library and access to photography's that registries the interventions in the building, were published.[12] While the conservation status of the Municipal Theatre was investigated,

leading to the publication of a comprehensive map detailing damages to its façade.[13]

Another research developed by other students focused on the production of a local architect named Geraldo Caiuby (1946). He was graduated in the year of 1970 at the Faculty of Architecture and Urban Planning of Mackenzie University, in São Paulo. Mr. Caiuby designed many residences and other buildings that made part of Sorocaba's landscape. The documentation of his production was important due to the transformation that is happening in the local context. Of the fifteen buildings attributed to him, nine remain in a good state of conservation; three were modified, losing their characteristics and other three were demolished.

In addition, in the Final Graduation project, developed in the 5th year, our students are selecting as a theme the adaptative reuse. During the year research is developed considering the documentation of the existing building, its author and condition until the development of the reuse **(Fig. 04)**.

Although the academic reuse projects were not implemented, they were presented in evaluation sessions which occur in a public place. During those sessions possibilities of reuse were highlighted and the buildings characteristics and present condition were disclosed.

4. EXTENSION PRACTICES CONSIDERING MODERN HERITAGE

In Brazil, the concept of the extensionincludes interdisciplinary initiatives aimed at fostering interaction between academic institutions and society, producing or implementing knowledge developed together with education and teaching.[14]

This extension practice law was approved in 2018, the same year that the course started. Since then, some of the activities developed concerned the identification, documentation, and promotion of the modern heritage. Not only the buildings that are famous or that show off in the city landscape, designed by well-known architects, but also the ones which were built and designed by local architects.

In 2020, during the COVID pandemic times, São Paulo State Docomomo proposed local workshops in different cities, including Sorocaba. The main objective was to identify, through Google Maps walks in Santa Terezinha neighbourhood, buildings that had elements recognized as modern style. At the occasion, two teachers and nine students were involved. Throughout the virtual visit, was possible to identify 29 buildings that had the characteristics indicated.

In that sense, our most notorious example of extension practice came as a society demand. The Secretary of Public Security from the State of São Paulo started an investigation on how they could organize 13 police districts in a bigger building. The objective was to concentrate strategical sectors of civil police to work together, reusing an available public building. The building selected was useless and had fair faced concrete façade, independent structure, with brutalist characteristics.

13. Nádia Maria Boscariol Machado, Márcia da Silva Inácio, Rodrigo Henrique Geraldo, and Taiana Car Vidotto, "Anomalies in the modern building Teatro Municipal Teotônio Vilela: identification and diagnostic methods," *50º Congresso Brasileiro do Concreto,* Brasília, 2022.

14. Brazil, "Conselho Nacional de Educação/ Câmara de Educação Superior. Resolução no. 608 – Institui as Diretrizes para as Políticas de Extensão da Educação Superior Brasileira," 2018. http://portal.mec.gov.br/index.php?option=com_docman&view=download&alias=102551-pces608-18&category_slug=novembro-2018-pdf&Itemid=30192.

First, the director from the civil police invited the teachers from the under-graduation courses of Architecture and Civil Engineering to identify if there was any signal of significant damage in the building and if a preliminary study was worth it. After this visit and the confirmation that the building had minimal conditions to be occupied with some intervention, a group of two teachers of Architecture and Urban Planning invited students for a short-term internship to develop its reuse with new activities.

When the design process started, there weren't information about the building such as its drawings, who was its author or when it was built. Due to that, the first step was to make an "as built" model. At the same time, visits were made in different police stations considering specificities of the working space.

When the "as built" model was concluded, preliminary studies started to verify the distribution of spaces, maintaining the functionality between each sector. The inherent characteristics of the building, including the rhythm of the concrete structure and the glass façade were maintained, contributing to the formulation of the architectural concept. While the building design was defined, investigations were made in public archives to discover if any documentation of the building could be found. In Sorocaba, any information was found, but in the Archive of the Faculty of Architecture and Urban Planning from University of São Paulo, searching for the architectural projects that were built in Sorocaba, was found the plans of the building that once was called Secretary of Agriculture – Regional Directory, from 1969, whose author was Abrahão Velvu Sanovicz (1934-1999). Then, it was possible to identify the intentions of the original design, as well as redefine the use of some the skylights that were once covered by a new roof as a solution for infiltration problems.

All the design process was a collaborative effort involving both teachers and students. When the first study was made and presented for the directors, the story of the building was clear, and the decisions made to conserve its original characteristics and speciality were respected. Due to the vertical circulation to the first floor, was conceived a simple intervention on the back façade of the building with a new lift for the access of people with special necessities. That experience highlights a partnership developed with the public sector and how the documentary research is significant in the design methodology of reuse.[15] Unfortunately, until now the building is empty.

5. CONCLUSION

The presence of XXth century heritage and modern architecture in the curriculum of Architecture and Urban Planning undergraduate course is remarkable. Considering the three different principles of university roles – teaching, research, and extension practices – they can be seen in all of them. As a result, the students of the institution are prepared to recognize, respect, and propose new uses for them, an obligatory course of action in light of our current urban development and the educational needs of preserve and

inhabit our material heritage. Those practices fulfil the 11th United Nations Development Goal – Make cities and human settlements inclusive, safe and sustainable, promoting sustainable construction industry activities.

It is general agreement that buildings designed by well-known architects are easily reused and conserved. But the ordinary ones still need to be identified and their importance disclosed for local society. As they become reused, other demand is the establishment of a conservation plans.

Nevertheless, some efforts can still be made with the use of innovative tools to amplify the scale and precision of the research. In the next years the creation of 3D models considering Heritage Building Information Modelling (HBIM) is an institutional policy. As the documentation of those existing buildings can be developed during design studio disciplines, they can be articulated with public sector to establish conservation plans.

In addition, another aspect to be improved, is the connection between academic sector with public and private agents. As both have a determinant role in the civil construction investments a close dialogue could guarantee the recognition of those buildings and project purposes that consider the reuse of existing structures.

Moreover, as a future contribution, a digital platform where all research results, documents and reuse design projects can be available. Besides, as a limitation, knowledge itself will not guarantee the preservation or reuse of modern buildings. New practices concerning the public and private sector must be developed to intensify social and environmental aspects of modern buildings conservation. ■

IMPLEMENTING DEMOCRACY IN SOCIALIST ARCHITECTURE. ADAPTATION OF FORMER SOVIET SCHOOLS FOR CONTEMPORARY EDUCATION NEEDS IN LITHUANIA

LIUTAURAS NEKROŠIUS
VILNIUS GEDIMINAS TECHNICAL UNIVERSITY

DOLF BROEKHUIZEN
DELFT UNIVERSITY OF TECHNOLOGY

ABSTRACT

Most of the educational buildings implemented in Lithuania during Soviet rule (1944–1990) are still in use. When they were built, the school was an important institution that reinforced the Communist utopia. The totalitarian model of society, based on hegemony, propagandistic rites, and segregation, was precisely reflected in the architecture of schools. Therefore, contemporary communities in this country face challenges as a result of the non-compliance of buildings and require up-to-date equitable and inclusive education. Spaces which before served in the education of the Soviet man today should be rearranged for a democratic society.

#31

Post-war modernist school buildings are an aesthetic, cultural, and technological representative of the time. They are standard-type structures, designed from a functionalist approach, and assembled from prefabricated reinforced concrete elements, implemented a dozen times in various urban contexts. At the same time, the buildings are original works of architects from that time. Research shown through design studies demonstrates how different standard school buildings can be adapted to a more democratic education system. This university educational project was communicated with the local society. By transforming these buildings from the past, we preserve cultural diversity, engage society in planning processes, and promote sustainable use of resources.

1. SLOW CHANGE TOWARDS MORE DEMOCRACY

Slow change towards more democracy. In Lithuania, there continues to be an urgent need to address spatial challenges in education, which includes adaptation of school buildings so that they meet current needs. However, this is a slow process, particularly for many buildings used for primary and secondary education.

When Lithuania gained independence in 1990 and was no longer under the regime of the Soviet Republic, it inherited an infrastructure designed to support a socialist society. Back in 1942, Joseph A. Schumpeter[1] stated the fact that the concepts of socialism in the Soviet Union had nothing to do with democracy in detail. The spatial infrastructure in this country, like the infrastructure in other parts of the former Soviet Union, was largely the result of standardized design. This was true at least for the buildings for education and childcare. The importance of these buildings cannot be underestimated because these are the basis of cultural education and the political views of the citizens. Educating children was a crucial tool for strengthening support for the Soviet state: Schools not only impart knowledge and skills, but also have a great influence on the moral education of students. It is well known that the Soviet Union, for example, through a detailed system of actions aimed at youth, tried to instill ideas that reflected the dominant communist ideology.[2] Besides education, the system of pioneers and communist youth movements was perhaps the best-known instrument for the coercive sociocultural shaping of young children.[3]

The legacy of standardized school buildings in the former Soviet Union reflected political goals in the sense of uniformity and top-down control. For example, in Lithuania, the absolute majority of schools built between 1944 and 1990 were so-called type schools (**Fig.1**). The buildings had been implemented using prefabricated elements according to the projects, created for multiple uses. The floor plans were typical for the different climate regions and there are just a few exceptions when custom in-site design was used. In contrast to an international context, education in the twentieth century blossomed with a great diversity of approaches[4]. However, in the Soviet Union at that time, only one educational paradigm was permissible. This was inconsistent with the idea of a more democratic conception of education in which students are guided as free individuals. The first statement on the new approach in national education was published in 1989,[5] which required education to use new educational methods that focused on the individual. In order to implement more democratic principles in education, the government of Lithuania, soon after restoring statehood in 1990, began to gradually change the legislation on Education and Care. The Law of Education of the Republic of Lithuania was approved in 1991. In the following years, many changes were made in technical, hygiene, and educational legislation to promote equitability, inclusiveness, diverse education, and person-centred care. Since 2024, the law on inclusivity has been in force, and pioneering work has now been exchanged for cultural courses or sports activities as part of out-of-school care. The law on childcare that comes into force in 2024

requires mandates after-school activities. With these successive adjustments, Lithuania followed the European trend and legislation and strengthened its democratic principles step by step, and will continue to do so.

However, while the legislation was changed on paper, implementation regularly lagged behind. The application of new teaching methods proved difficult, in part because it required a change in teachers' attitudes. Existing teachers are not naturally prepared to exchange their past (positive) experiences with education for new ideas and working methods.[6] Another important cause was the lack of financial means to modify buildings and make them more suitable for the new education, which, for example, required more independent workspaces. Especially in the first decade after 1990, financial resources were limited, and little new construction or adaptation of existing buildings took place. Furthermore, although schools were technically improved with the financial support of European funds, this was not used to fully adapt buildings. In recent years, however, there have been increasing examples of the completion of new schools where innovation has been implemented. Since school building adaptation is also a spatial task, a team of teachers and scholars from Vilnius Gediminas Technical University (Vilnius Tech) initiated a long-term project to enhance knowledge and research in this area. Since 2015, within the framework of university teaching and research in an international context, the team has been developing numerous activities to strengthen and stimulate this process of building renewal as a bottom-up strategy. Not only have they themselves participated in this change for a long time, in fact for several years in a row, but they are also convinced that participation of other parties can strengthen the process of democratization in schools.

International Perspective Project. The theoretical background of the team of scholars' approach is based on an international reflection on the task, which has shown that the renewal of school buildings is relevant. An essential aspect of said approach is the focus on the participation process, in which, for example, extensive research has been carried out by the Germany-based Montag Stiftung. The influential German foundation has demonstrated through numerous case studies, pilots, and extensive information to schools that renewal is a slow but necessary and realistic process. An example of this is the 'Bildungslandschaft Altstadt Nord' pilot in Cologne, Germany, which has been ongoing for several years.[7]

The Vilnius Tech method aligns with research that prefers to approach technical intervention on buildings as part of an integral task. That stance has been observed by researchers in democratically governed countries in Western Europe.[8] For example, in the Netherlands, a team of experts and architecture students of Delft University of Technology, under the initiative of the Chief Government Architect (Rijksbouwmeester), investigated the practice of adapting primary school buildings and promoting integral design.[9]

In practical terms, the multiyear project, which began in 2015, consisted of annual summer schools, field trips to schools, research on school building design, the creation of open-air educational spaces, two international public

lecture series, and two symposia. This paper presents the main findings of the Vilnius Tech project and aims to provide an analysis of the project. The main components of that bottom-up project can be summarized as historical research, research by design, and presentation, which will be further explained below.

2. THEORETICAL AND HISTORICAL ANALYSIS

To gain a deeper understanding of the existing school stock and the task in Lithuania, historical research was conducted initially. The research, carried out by several researchers at Vilnius Tech, was motivated by various perspectives.

Historical research on school buildings in Lithuania uncovered specific local buildings that are characteristic of Lithuania. The article also presented the first national overview of the status of historic monuments and school buildings in Lithuania.[10] In a second article, they focused on the standardization of school design as part of Soviet practice. That research shed a completely new light on standard schools. The authors argued that while standard schools in Lithuania reflected the application of building regulation known as 'SNiP', there were just as many instances in which they actually deviated from standard designs. Specific variations of standard schools were constructed, which are now part of the legacy of school buildings.[11]

In addition to these literature reviews, the scholars also conducted analyses in situ of buildings. During excursions of the summer schools, the focus was on buildings from all building periods, not only historical buildings but also sporadic) new buildings. From those visits to the capital city, Vilnius, and other towns in the country, it became evident that in recent years more investments were made with regard to new construction and alteration. The conversion of the Kačerginė School Multifunctional Center (2022, 2L Architects) shows that existing buildings can also be well adapted to new functions and societal values. Although at the beginning of the project in 2015 it was difficult to find new schools, in recent years several new school buildings have been completed, in which innovative ideas regarding education have been realised. It has helped to better understand the landmarks for the renovation of existing building stock for education and has triggered changes there. More and more schools are adopting people with mobility, hearing, visual, and mental disabilities. In many schools, spaces for working individually and as part of a team have been installed, and improved. At the same time, recreation and personal hygiene spaces instead of mass WC blocks have been diversified. The school community's identity is being more strongly expressed in the space A significant transformation involves rejecting the idea of using space for just one purpose. By making minor changes, such as using fixed-to-floor furniture, and non-transparent doors, existing spaces have become more flexible, multipurpose and now continually evolve. Outdoor space use was developed. School premises in many municipalities have become open to their neighbourhoods.

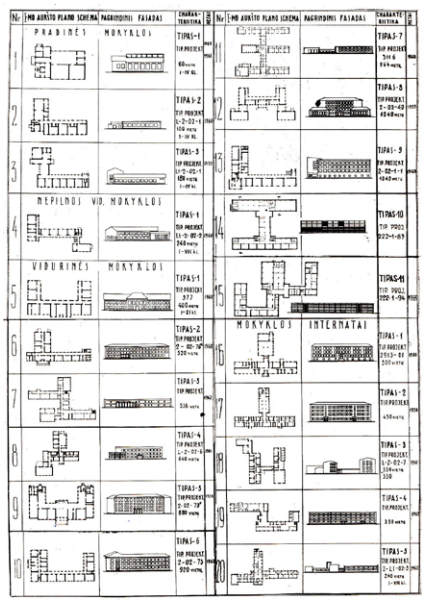
To enrich the content, the researchers also invited external researchers. They presented the latest insights in their fields, such as the history of educational attitudes, the construction of community schools, and the further integration of children with disabilities into regular education. These studies provided a better understanding of the cultural values of buildings and the history of ideas of the building stock. Such information is considered valuable for decision-makers in critical building handling.

3. RESEARCH BY DESIGN AS A TEST AND PROOF

A second research approach is that of design research, which focuses on devising novel solutions for existing school buildings. During several summer schools, students analysed existing school buildings and proposed experimental designs to functionally improve historic buildings. In doing so, they worked with themes, several of which are mentioned below. At the beginning of the research (in 2015), students analysed five different types of kindergarten, primary and secondary schools (built between 1950 and 1970) in Lazdynai and how these buildings could be adapted to new educational methods.

In 2021, with the support of the mental health hospital, students discussed issues of inclusivity in educational spaces. They chose a standard school for 1284 students designed in 1969 at the State Institute for urban design in Vilnius 'Miestprojektas' by the architect Aloyzas Geibūnas, designated project No 222-1-94. In 2023, students discussed wellbeing issues at a full-day school. They analysed and proposed spatial transformations for the school that was built based on a project prepared in 1960 at the state design institute in Riga, 'Latgiprogorstroj'. In 2016, students demonstrated the potential to incorporate new educational methods into a school attended by 1392 pupils. The school, which was established in 1969, underwent a custom design by architect Elena Nijolė Bučiūtė in 1966 under Miestprojektas. The 2018 workshop focused on vocational education in historic buildings, using the former Jewish ORT school from 1925, which is currently utilized by the railway school, as a case study.



The analyses as a whole showed that standardized schools from the Soviet period (1944-1990) could indeed be made more suitable for new education, inclusivity, and care. For example, by changes could be made by adjusting the layout of the building, or developing a different vision for the outdoor space. The advantage of design research is that it allows for the development of fundamental typological variants with less emphasis placed on economic or technical feasibility. That variation in types of play opens up new conversations about desires and possibilities and can enable existing school types to think more freely about their existing building.

In addition to design research, students alongside the school community, also conducted small interventions in schools learning environments. These small interventions signified steps taken towards innovation. The addition of some play objects for the yard of an existing school (placed in a standard type kindergarten building) – the Gymnasium of Blessed Theophilius

Gerosios Vilties Progymnasium, implemented according to standard type project for 1712 pupil, in 1968, Vilnius, Lithuania. Fragment of student proposal to improve educational space for more equitable education, International Summer School 'Equitable School', 2022.

Matulionis in Vilnius in 2017 shows that not only the building is relevant for educational renewal, but also that the outdoor space is an inseparable part of the building (**Fig.2**). In their publication on this intervention, the authors state: 'Understanding of spaces and processes of school together with its community reveal the hidden potential and identity of the school, therefore context-aware transformations rather than predesigned solutions are more acceptable to the community.' The restoration of the disappeared and the development of new connections between the outer and inner recreational spaces is a priority.[12]

Although interventions are only minor locally, the project's presentation has a broader scope. The project also sewed a seed among architecture students who participated in the summer school (**Fig.3**), introducing them to the subject matter, immersing them in it, and encouraging them to sooner or later implement the experiences and views in design practice.

4. KNOWLEDGE EXCHANGE AND PRESENTATION

The central idea of summer schools is to analyse actual buildings and their daily connection with the users of the building. This process involves spending several days in a real school, analysing it, and developing design proposals. This approach is motivated by the need to come up with solutions for existing stock. This process started in the Vilnius district Lazdynai, a neighbourhood

12. The title is inspired by a French publication: Anne-Marie Chatelet et al., *Paris a l' ecole* (Paris: Arsenal, 1993).

built in the sixties and seventies as a model socialist district that was widely presented in vocational magazines in the USSR, GDR, and France at that time.

Equally important were the series of presentations in the participating schools themselves. When school boards and teams invited students to the presentations of their design studies, the knowledge of new possibilities was brought to the attention of the target audience. In addition to these local presentations, an exhibition was also organized at which the results of the scientific studies were made accessible to a wide audience. The exhibition, titled "Lithuania goes to school", travelled through different schools in Lithuania (and the title was inspired by Chatelet, 1993).[13] The aim was to broaden the knowledge of community members on school construction and the ideas behind it. In addition, the spatial transformation model of schools was prepared by scholars and is used by the Vilnius municipality for architectural competitions.

The scientific component of knowledge exchange was further fleshed out through two congresses in which the international context was, once again, specifically sought after. Various experts, with backgrounds in the fields of history of education, architectural history, and psychology, were given a platform for knowledge exchange and discussion. The Vilnius City Municipality, founder of most city schools, was not only the host, but also actively involved itself. It shows how closely practice and research, experts (both architectural, and educational), and communities are intertwined in this project.

5. CONCLUSIONS

In this project, a team from Vilnius Tech, alongside a group of international experts, made an effort to conduct socially relevant research, contributing to the transformation of school buildings in the country and aligning them with more democratic ideas. The team of scholars has provided a unique interpretation of dealing with socialist heritage. The project's three elements — researching the history, present, and future of school buildings, are inseparable — showing that the integrated approach to the task makes sense. The use of a participatory process is perhaps itself a democratic aspect. This involves not only the participation of the school community, but also empowers students to participate as future building designers. ■

BIOGRAPHY

Liutauras Nekrošius (Lithuania) is an architect. He earned a PhD degree in History and Theory of Architecture from Vilnius Gediminas Technical University in 2009. He is an Associate Professor and Dean of the Faculty of Architecture at VILNIUS TECH, a member of the Lithuanian National Commission for UNESCO. His current research interests are the history and preservation of modern architecture and the architecture of educational buildings. He publishes and presents regularly on educational buildings and modern heritage.

Dolf Broekhuizen (The Netherlands) is an independent architectural historian. He received his PhD from the University of Groningen in 2000 for a dissertation on Dutch post-war architecture. He advises governments, companies, and cultural institutions on Dutch architecture, urban planning, and heritage from the twentieth century. He also teaches at the Faculty of Architecture at Delft University of Technology. His research focuses on renewal movements in Dutch architecture of the twentieth century. He publishes regularly on educational buildings. Since 2015, Broekhuizen has been a regular guest lecturer at VILNIUS TECH in Lithuania.

PIMP DANISH MODERNISM: DRAWING AS A PEDAGOGICAL TOOL FOR A SUSTAINABLE FUTURE

ABSTRACT

The paper discusses the outcomes of an elective course for North-American universities' undergraduate students studying abroad in Scandinavia, since Spring 2016. Each semester, students are tasked with examining and assessing the works of Danish architects of the XXth in Copenhagen, Denmark. The primary objectives of this course are twofold. First, it aims to foster an understanding of the Danish modern buildings as physical and social artifacts. Second, it aims to explore how these same buildings can be adapted to meet contemporary social sustainable standards. Students work in groups and represent the complexity of the considered buildings, encompassing materiality, technical processes, cultural, urban and social values, solely through traditional representation methods: drawings. Backed by two editorial projects introduced in class as premises, students utilize digital techniques, incorporating 2D projections and 3D isometric and perspective representations, enriched by diagrams and concise textual descriptions. The final scope is to introduce by drawings two possible interpretations for each case study: one related to its state of the art at the moment of the investigation; and a second one propelling a "pimped" intervention of the case study based on socially sustainable strategies. The pedagogical objective is to bridge the gap between the students' incomer cultural contexts and the Scandinavian hosting one by employing a shared code of representation that, as it is argued, forms the foundation of the architectural profession and a tool to propel alternative historiographies challenging an established heroic depiction of Danish modernism. The drawings produced demonstrate how students grounded their work in both empathy and abstraction to make the specific strategies for implementing sustainability in Danish modern buildings accessible to a wide readership. As a result, rather than mere reporting of some architects' design intentions, students introduce novel design proposals that adapt Danish modernism to contemporary values and principles of social sustainability.

1. PREMISE

The specificity of teaching an architectural elective for exchange students enrolled in North American universities traveling to Copenhagen, Denmark, combined with the task of instructing a design elective course about "Detailing and Sustainability in Scandinavian Architecture", underscores the need to introduce students, many of whom are traveling to Europe for the first time, to accessible literature projects as a mediation. On one hand, there is a need to establish a common starting point for the course among individuals who have never met and come from diverse cultural and university backgrounds[1] on the two course core foci: Danish modernism and social sustainability in the Nordic Context. On the other hand, there is a need to provide facilitation for their own travel, exploration, and living in a completely unfamiliar city for a semester.

Pertaining the first core focus, the required mediation may not only serve as an introduction to Danish architecture and specifically Danish modernism, but also as a systematic overview of Copenhagen, comprising organized spaces, selected buildings, and established routes: an architectural guidebook. From Fall 2021 to Fall 2023, the chosen guidebook was centered on the architect Kay Otto Fisker (1893 - 1965) with the scope of contributing to an international re-assessing[2] of a Danish actor whose name, for too long, was overshadowed by most known names, as his students Arne Jacobsen (1902 - 1971) and Jørn Utzon (1918 - 2008). The architectural guidebook "Kay Fisker - Københavnske Boliger" was itself a former pedagogical exercise held at the Royal Danish Academy by faculties Peder Duelund Mortensen and Mogens Fich[3] whose primary focus was mapping twenty Fisker's housing buildings in the Copenhagen area. What the report contains are few, short, but essential information: a city map, a list of works, and for each of the twenty housing blocks, a city key plan, the full or partial plan of the block with an apartment type, a photo, an address, a short description and, when possible, a reference to one or more published article in Danish specialized architectural magazine. Following the co-organization of a Kay Fisker Symposium[4], since Spring 2024 another guidebook has been selected to both keep up the re-assessing of the canonical historiography of a Danish Modernism mainly centered on welfarism and few renowned architects.[5]And also, to avoid perpetuating a historiography that centres solely on male authors. The second chosen architectural guidebook has been thus the much more recent "By Women. A Guidebook to Everyday Architecture in Greater Copenhagen" as the first outcome of a pivotal scholarship in Danish female architecture (1925-75) titled "Women in Danish Architecture" (Copenhagen University, 2020-23) by the architectural historians Svava Riesto and Henriette Steiner.[6] As the previous one, what the guidebook contains are concise information: a city map, a list of addresses, and for each of the fifty case studies, one or more contemporary photos of the built/landscape project and a short description. In this case, since the drawings are not added to the guidebook, we, as faculties, must operate with archival review[7] while preparing the syllabus, adding, or excluding the case studies based on the accessibility of their set of drawings.

Pertaining the second core focus, the mediation occurs between the introduction of the global complexity of the multidisciplinary environmental dimension, and the local specificity of Danish social sustainable practices and strategies. What might look like a task of Sisyphean proportion has been achieved by a polyvocal perspective. Students have been exposed to a combination of external stimuli focused on practices of sustainable critical thinking, rather than by introducing a single positionality about sustainability. Such combination aims to investigate the impact of systems, processes, organizations, and activities on people and social life filtered through the lens of architecture and building environment. Therefore, the stimuli span from lecture-based presentations by Environmental Policy makers, Cradle to Cradle consultants and Research-based Danish architectural practices; flipped students' presentation about certified sustainable precedents in Scandinavia and their shortcomings; field study visits to community-supported agricultural rooftop[8] and to local community centre re-activated thanks to bottom-up initiatives.[9] Such interdisciplinary behaviour have led to a diversity of concepts, methods, and tools being included by students both in the research phase and in the design process during in-class workshops.

2. THE COURSE

The course in object is a semestral elective for a maximum of 22 students, organized into two modules where the city itself acts as the classroom. Both modules deploy drawing and representation as a tool of knowledge. While the first concerns crucial Danish modern detailing, the second one targets Danish social sustainability. The students' learning is assessed towards the participation to a practical workshop along the semester titled "PIMP MY BUILDING!" divided into as many assignments as the modules of the course and devoted to learning about an assigned building in Copenhagen among the ones of the chosen guidebooks. The first assignment aims to represent, approach, and problematize the state of the art of the assigned building; the second one is meant to propose a "pimped" version of the same building using sustainable strategies. Students are asked to develop the outcome of the workshop as a team, though grading is individual. Generally, teams are of 2-4 students and a single A3 sheet is outlined for each assignment along the editorial guidelines and layout offered by the instructors. Overall, in both assignments, students are tasked with applying the interdisciplinary stimuli they've learned about sustainable complexity to actualize the Danish modernist buildings under investigation. This application occurs at various levels: in the first assignment, it involves conducting semi-structured interviews with inhabitants to gain insights from the diverse social actors who experience modern spaces daily. This approach helps students to better understand the needs and desires of users and evaluate the effectiveness of existing sustainable solutions, if any. As a result, students often opt not to focus solely on technological strategies in the second assignment, despite studying it closely (**Fig.1**). Instead, they propose spatial strategies that promote social dimensions, engage with the tenants of Danish modern legacy, and foster inclusion, social participation,

9. "EnergiCenter Voldparken," energicenter.dk, accessed May 6, 2024, https://energicenter.dk/.

and equitable development. This might span from re-conceptualizing the "gaard" as the common courtyard at the center of many assigned building blocks, de-privatizing it and activating strategies to resist its gentrification; to the re-assessing of the norms and codes that regulate the Danish private property and associationism in dwellings, namely the "ejerforening" and "andelsboligforening" as the different schemes to organize the association of owners based on what is actually owned being the walls or a virtual share.

3. DRAWING AS A TOOL OF KNOWLEDGE

Students are thus empowered in learning and listening to the local voices to analyse and rethink in their own design proposal the social and environmental dimension of the Danish modern buildings with the tools of the architect: the drawing. Starting from the assumption that everything could be represented, the question is understanding how. Technically speaking, a good representation is obtained through what is called *ensuring perception*. In other terms, the task is to ensure that what is shown is a good approximation of what we intend to convey. Nonetheless, an additional responsibility emerges in relation to the readership.

The representation of architecture (more than other subjects) is probably one of the most emblematic cases related to the history of representation. Architecture and the built environment have always been both an art (linked to aesthetics) and a science (building practice) and have recently increased their technological complexity and broadened the range of their effects on society.

Historically, the tradition of detailing has been linked to the architect's ability to enrich and give value and meaning to the architecture itself, whereas today detailing is in danger of simply becoming a technological response and solution to presentation needs.

This means that a more abstract approach must be used to describe the internal complexity of architecture, asking representations to resolve the increased complexity of the concrete phenomenon in front of us.

In parallel, learning processes, particularly in the field of architecture, are influenced by the evolution of digital media and reflect an indirect transmission of knowledge. Our mind is formed by organizing its ability to learn by following the way the new media work.

During the course, the pedagogical approach considers how to deal with this transformation (from analogue to digital) to exploit it and make it effective without suffering a loss of learning structure.

#31

The students' works —the representation of the building state of art (**Fig.2**) and the pimped version (**Fig.3**) — refer to two editorial references. The first is "Instructions and Manuals" column, which was published in *Abitare Magazine* from September 2007 to April 2011 as the contribution of Salottobuono[10] to one of the most influential architectural magazines in Italy, directed from 2007 by the Italian architect Stefano Boeri.

The second practice-based editorial works is the outcome of a research project developed by OFFICE U67[11] and The Empire[12] titled "Foresturbia: a Manual for a Landscaped City" for the Oslo Triennale 2019 named "Enough: the Architecture of Degrowth".[13] The research was rooted on fieldworks and

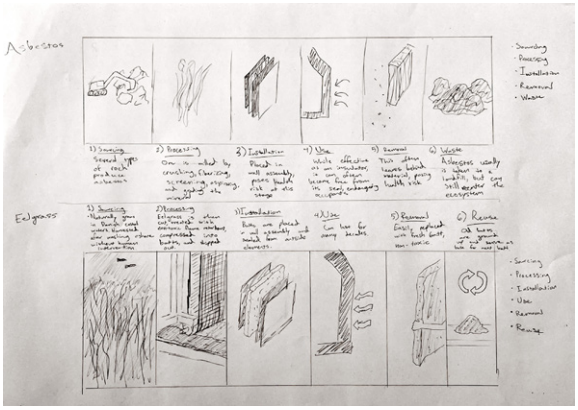
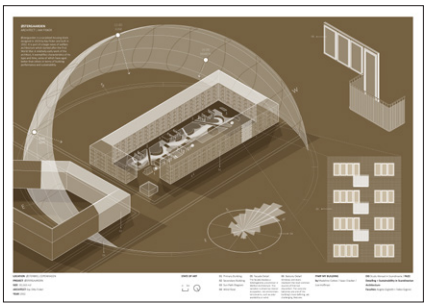
13. Curatorial Team: Maria Smith, Matthew Dalziel, Cecilie Sachs Olsen, Phineas Harper.



site analysis localized in some areas of Oslo investigated under Gigone's Associate Professorship at the Norwegian University of Life Science.



Like in "Instructions and Manuals", also in "Pimp my building!" the renounce of publishing the 'original' drawings of the designers is a mandate. Nonetheless, no limit in terms of content, type of information, or technique is imposed from above. These conditions imply a key responsibility: whatever the students' choice, the employment of the full array of techniques of representation have a big visual impact on how the project is represented. About the readership, the artboards are conceived as a project to read and not just a mere description of design facts. Texts, diagrams, and drawings concur to expand the knowledge of a context of which the project was only the foreground. Due to the obvious limitations in terms of area, the idea is to use a particular type of *disegno* as the core for an array of secondary —but no less important— representations, aiming at highlighting specific features of the project. The type of the focal representation is chosen to let the students' interpretation of an authorial project emerge: this strategy requires a deep understanding of the considered project, and to allow conceiving the project from a kaleidoscopic and inter-disciplinary angle.

"Foresturbia: a Manual for a Landscaped City" plays a role in driving the students' strategies in relation to the sustainable pimped version. The manual was shaped as a tool for encouraging and spreading collective shared knowledge about sustainable living. It contains a wide array of landscape and urban strategies combined with technological solutions. A manual in five scales, from the territorial one to devices that establish a common ground among decision makers, designers, and citizens, in the Nordic territories. It aims at setting new standards in the field of landscape, green approaches, and practices, boosting the potentialities already available within the city. The goal is to introduce topics and strategies that could be very complex in a new immediate understanding. It is based and relies on a common language, which can be easily understood by a diverse group of people. The manual is a cluster of instructions organized in correspondence with a detailed visual layout, where both words and illustrations work together. Texts and drawings form constellations of contents which define new horizons of meaning. But most important it turns out to be a crucial vehicle of knowledge when shared with students coming from other continents to study in Copenhagen.

4. OUTCOMES

In conclusion, this paper presented a formal course designed for exchange students, which focuses on the study of Danish modernism to encourage sustainable design experimentation and cultivate contextual awareness with a strong emphasis on social aspects. The aim of the methodology is not to develop a replicable intervention criterion based on modern heritage education, therefore understanding which are the modern theories, principles and elements that student's study and explore in the pimped proposal is out of the scope of this paper. The aim of the methodology is rather to emphasize how drawing can serve as a tool for fostering critical distance in spatial analysis and facilitating

Figure 3. Cotton, Madeline, Isaac Cracker, and Izzy Hoffman. Østergaarden - *Pimped*. Gigone, Fabio, and Angela Gigliotti, eds. Fall 2022. Drawing on paper, 297 x 420 mm. © DIS – Study Abroad in Scandinavia, Copenhagen.

an understanding of the past, present, and future of Danish modernism. Additionally, another key objective of the course pertains to recognizing that architectural drawing, despite being considered a method of tacit knowledge, is not universally accessible but rather specific to a particular place and audience. Understanding that architectural representation is inherently tied to cultural and social contexts is essential for effectively interpreting and evaluating the significance of information presented in architectural documents, and, even more important those silenced and neglected, as the female agencies in the modern colophon has been for too long.

At the pedagogical level, an achievement of the course is how the individual mode of production is rooted in diverse backgrounds. Usually, this is the only collaboration among each team since these students often meet at DIS for the first time and enrolling in this course in their Danish semester. So, once they are tasked of a collective product, they often encounter challenges due to cultural and educational background, team working, learning styles, priorities, and expectations where the spreads produced are used as a common ground and battlefield at the same time. The pedagogical objective is to experience the multidisciplinary and team-based collaboration as it happens in practice, and to bridge the gap between American and Scandinavian educational cultural-contexts. Despite all, they act towards a collective outcome, both at the level of the team, of the class and even of future and past semesters. Each student ends the course having contributed to the outline of pimped edition of the initially addressed guidebook. Each drawing becomes thus a part of a collective outcome across several semesters: as they were commissioned of a special issue of a journal whose spreads would host "pimped" representations by Danish neglected actors. The students are asked to actualize the guidebooks upgrading the chosen buildings towards sustainable development goals using

only drawings, graph, and texts and the inherent tools of the architectural profession. As faculties, our role is to act as educator, advisors, and supervisors but also as curators and art directors of the students' authored contributions.

It is important to reflect on the flexibility and resilience at the basis of the shown practice-based experiences that turned-out to also be fruitful pedagogical tools for approaching the design tasks within academia.

First, the potential of representing an object as a combination of components –like elements, layers, spheres of influence, etc.– embedded in the artboards. This perspective helps those approaching the design practice to undress an architecture studied for its aura. Finally, what before were hermetic art pieces could here instead be described with an objective set of tools. The process of representing a project using the *disegno* finally matched with the cognitive process at stake during the learning phase. The appropriation of a range of analytical tools is the first lesson as faculties we see in this series of pimped interpretations by students.

Second, the focus on the precision and denotation of the graphics emphasized the meaning of the adopted means: lines and patterns, control and differentiation of the lines' thickness and transparency of the fills, the position and relationship among drawings, diagrams, and texts, etc., reinforced the existence of a personal –although explicit– point of view, applicable without awe to a research subject. This quality is what emerges from the similar looking, but all unique artboards collected across semesters.

Third, the combination of abstraction and narration offers a twofold depth in the reading. Architecture, and design in general, are realms which apparently produce separated outcomes, 'conventional' projects, or theory. But digging into the reasons and meanings of the design field, praxis and theory must constantly inform and influence each other. In this regard, the implementation of a specific technical and analogical terminology for architecture is an essential pedagogical goal which must inform the learning and unlearning of architecture at all levels.

As a result, the final representations of these buildings outlined by the students should not be regarded as mere interpretations of the architects' design intentions. Instead, they represent genuine design proposals that adapt early 20th-century Danish architecture to contemporary values and principles of social sustainability. A shift from welfarism to social sustainability. ■

BIOGRAPHIES

Angela Gigliotti is an architect, educator, and researcher. Her expertise is about Danish professionalism, Transnational and Diplomatic Architecture, Danish Welfare State and Swiss Coloniality. She is HM Queen Margrethe II's Distinguished Postdoctoral Fellow with the project "Unheard Workers" (Carslbergfondet, 2021-24) at the Det Danske Institut i Rom, affiliated with the Chair of the History and Theory of Urban Design (ETH Zürich) and the Arkitektskolen Aarhus. During her Ph.D. "The Labourification of Work" (Arkitektskolen Aarhus, 2016-19), she was Visiting PhD Candidate at the Architectural Association, London, UK (2018). Since 2016 she has been External Lecturer and Research Faculty at DIS Copenhagen.

Fabio Gigone is an architect, educator, and researcher. He is an Internationalisation Postdoctoral Fellow (Carlsbergfondet 2024-26) with the project "The Architecture of Immunity" at the Det Danske Institut I Rom, and at the Chair of the History and Theory of Architecture (ETH Zürich). His PhD "States of Proximity" addressed the notion of privacy in Versailles under Louis XIV (Royal Danish Academy / Centre for Privacy Studies, University of Copenhagen 2023). He was Associate Professor (Norwegian University of Life Sciences, Norway, 2015-18) and founder of San Rocco Magazine. Since 2021 he has been External Lecturer and Research Faculty at DIS Copenhagen.

TRANSFORMING A CONVENTIONAL RIGID CLASSROOM INTO A STIMULATING SPACE

ADÉLA ŠOBOROVÁ
FACULTY OF ARCHITECTURE, BRNO UNIVERSITY OF TECHNOLOGY

ABSTRACT

The article describes how the architecture of modern school buildings of the second half of the 20th century can be transformed into a platform that enables contemporary educational principles that increase the individual's sensitivity to their environment without the need for complex physical transformation. Through the example of educational programs created by architects and educators, the transformation of the classroom space into an unfinished structure suitable for child exploration is demonstrated, leading to better development of children's cognitive functions as defined by Piaget while encouraging social interactions.

A case study of workshops tested in classrooms whose form was influenced by the efficiency of school construction in the 1950s-1980s demonstrates how the space of a standard school building can become a full-fledged space that meets the standards of contemporary pedagogical requirements. The active experience of space leads to the creation of memories through which society can come to terms with the memory of the influence of the communist regime.

Linking the work with the psychological development of the child and encouraging social interaction becomes the basis of pedagogical methodologies. The most common type of space for education in the Czech Republic is rectangular classrooms, allowing frontal teaching. This rigid formative classroom type has become a narrative based on the construction and modernization of education under the communist regime. The form of schools emerged as an ideal for the education of system-compliant citizens.

Education focuses on the creative use of information and ecological thinking. Conceptual changes are causing a transformation in the spatial arrangement of the different parts of schools and their openness. The principles of open-plan schools encourage children to use the learning space and move freely to experience and understand the principles of the environment in which they live, which is proving pivotal in the ecological crisis we face.

1. THE DEVELOPMENT OF THE STANDARDISED CLASS IN THE CZECHOSLOVAK SOCIALIST REPUBLIC

In the current Czech Republic, the socialist regime had a great influence on the shape of the existing school system and the related construction of school buildings. From 1948 to 1989, the so-called " efficiency of education" took place, the purpose of which was to provide education for all children of the working class and thus prepare the youth for all kinds of work and to prepare the population for the future socialist republic.[1] All this was reflected in the school buildings by the necessity of establishing facilities for practical instruction, such as workshops for woodworking, metalworking, papermaking, as well as food cultivation.

Given the Communist Party's goals and the growing population, it was necessary to increase school capacity for all children at the lowest possible cost. The answer was the plans to build system and prefabricated schools.

The new Education Law from 1948 created conditions for the application of the principles of socialist pedagogy, including the requirement that the teacher should play a leading role in the educational process.[2]

The main indicator of class formation was the economy and connection of practical work. The children's manual work corner was either directly adjacent to the classroom, separated by a glass partition, or accessible from a common corridor. The typical classroom itself remained rectangular in shape. The 1960 Methodology for the Construction of Schools specifies the ideal classroom size as a rectangle of 9 m by 6.6 m.[3] This allowed pupils freedom of movement and guaranteed an ideal environment for frontal teaching. The layout of desks was always arranged so that sunlight approached from the left. This form of classroom became formative for the following decades up to the present day.

This process of typification of school buildings created the shape of schools in Czechoslovakia and determined the controlled development of education until the Velvet Revolution in 1989. The narrative of the school classroom influenced generations of children and their descendants who grew up under the communist regime.[4] From the "test schools"[5] established after 1961, the system of lightweight desks and chairs allowing for variation in arrangement proved valid. Class sizes in the standardised school system have so far been in the range of 25 pupils. In recent years, inclusion has become a theme, bringing more staff (assistants) into the physical space of the narrative classroom, which brings new possibilities for using the space and greater variability in teaching methods.

2. EDUCATIONAL METHODS AND SPACE

In the 20th century, experiments and applications of educational reform reflecting new teaching methods in architecture were taking place around the world. Alternatives to the frontal style of teaching are being sought.[6] Across methods, the emphasis on cognitive development of individuals and learning from social connections is also changing.

In Open Schools, the learning space is not defined by a tribal classroom. Children move freely in the open space and there is an emphasis on group work. The open space teaches respect for others. Children tend to discover and explore the diverse space with all their senses. Discovering is what, according to Jean Piaget, is most conducive to cognitive development.[7]

The outdoor environment is best for proper cognitive development. The outdoors represents an environment that is not subject to the constant control of humans. The principles of open-school architecture simulate the outdoor environment. They allow the child to choose, explore, move, discover, and regroup. They create a sense of an unfinished structure that provides similar possibilities for use as the outdoor space.

Today's pedagogy emphasises the development of the individual through individual development - psychological development, and learning from social contacts - social development. Both developments are supported by approaches other than the frontal. From the attempts to change the distribution, open schools represent the most radical form.

Open schools have recently been rediscovered as they meet the current needs for independent work or group work.[8] They offer a variety of seating options: at tables, on the floor, on stairs, in a cave. They follow the trend of open-space offices, which have been transformed from rigid grid cubicles into spaces that allow for working in different positions and atmospheres.[9] The emphasis is on working with information, not on learning quantities of facts. This brings demands on space that would support creative thinking.

3. RELATIONSHIP TO ENVIRONMENT

Today's neurophenomenology speaks of the perception of space as a thing that our body actively interprets with all its senses. Cognitive perception is an active process rather than a passive experience. The experience itself is etched onto our memory, and transmission of architectural values transcends mediated medium. The memories that become ingrained on our subconscious shape our relationship to a place. It is important to build a relationship with cultural sites, but also with the environment itself, in order to protect them.[10]

Some buildings face existential problems simply because they were built at a time that contemporary society considers wrong. The mass construction of schools in the second half of the twentieth century, under the communist regime, defined much of the font of school buildings and classrooms that we still work with today. It is because of the communist context that this construction is often perceived negatively by the public. The key to improving the public's relationship with rejected buildings is to allow people to discover their attributes. Strengthening people's connections with buildings that can either perform their original function or take on a new function but have negative connotations associated with them from the context of their creation, represents a challenge and a space for different activities.

The current school buildings and classrooms are provided because they have sufficient capacity. Most schools in the Czech Republic, therefore,

have to work with classrooms that were built under the previous political regime. The narrative of the traditional form of classrooms is still deeply ingrained in Czech culture, despite no longer being legally mandated. In new buildings, we still encounter classrooms that are planned primarily for transactional learning.[11] Only the connection of the classrooms to the exterior and the places for pupils to meet together outside the classroom change. In addition to corridors, there are also halls, atriums and the like that allow for social gatherings not only in the classroom but also in the pupils' free time.

A general radical change in teaching is not possible from a financial and personnel aspect. The educational space, other than the alternative offered by private schools drawing methods from the reform movements, continues to be characterised by standardized classrooms established by the communist regime. Changes in teaching happen at the level of individual teachers who, at their own risk, deviate from this standard.

4. WORKSHOPS – UNDERSTANDABLE ARCHITECTURE

The project Understandable Architecture[12] was established in 2023 as an artistic-educational collaboration between architects, educators and artists. The main goal was to create an educational programme introducing Brno architecture to children. However, during the research phase of the project, it was concluded that rather than teaching children about individual buildings, it would be more beneficial to teach them to perceive the space in which they move or the environment they live in.

The educational workshops focus on exploring and transforming the classroom space. Pupils engage in physical activities, using all of their senses and collaborate in groups. The stimulus to create their own experience leads to the creation of their own memories, imagination and thus builds a relationship with the environment.

The workshop has two versions, in accordance with the age of the pupils, considering the cognitive development of the age groups. Each version has been tested twice in different groups in learning spaces based on standardized classroom design in primary schools. Version I is designed for individuals aged 7 to 10 years. Version II is for 11- to 15-year-olds.

5.1. VERSION I

Introduction

The workshop programme was presented as a collaborative exploration of the learning space environment. A pop-up method discussion was conducted on what is architecture and who is an architect. Some children did not have any notion of the term architecture, others mentioned terms such as structure, building, house. The discussion ended with the conclusion, "Although the architect is often considered the creator of the environment, the people who inhabit the space have a big part in how the environment looks."

Exploration

The activity began in the hallway outside the classroom. The children were invited to become explorers. Using all their senses and together with

11. Zdenka Veselá, *Vývoj* české školy *a učitelského vzdělání* (Brno: Masarykova univer-zita, 1992).

12. Workshops Understandable Architecture for Primary Schools were created by the team of Anna Kotlabová, Suzan Malý and Adéla Šoborová in cooperation with Brno University of Technology and Masaryk University in Brno.

the lecturers and teachers, they were asked to feel the perimeter of the classroom. The children explored the architecture, the furniture, the bulletin boards. After about 3 minutes of exploration, they returned to the corridor where the task was reflected upon. In both workshops, the group agreed that they perceived the classroom to be larger after feeling it. Some children found it dry, and warm.

The following research assignment focused on classroom material. The children were asked to use a wax crayon on blank A5 paper to represent the textures of the materials found in the classroom. They brought their images back to the corridor. This task took 5 minutes, during which time each pupil managed to depict at least three different materials. In the next step, the children had to take the image of the materials recorded by their classmates and glue the records to the places where they were created. Transferring the records back to the classroom took pupils more than 5 minutes, and not all records were correctly matched.

The following task was based on the frottage spread around the classroom. These served as coloured spots to be connected. The children had to divide into groups of 3-5 and form a human chain to connect the papers of the same colour with their bodies. The movement and body work continued with the next task, where children had to estimate and then check how many bodies were needed to connect the opposite sides of the class diagonally. When asked about the first of the dimensions, the individual guesses of the numbers differed more than the second or third time. It may be said, therefore, that the direct experience has refined their estimation.

Use of space

The children had to choose a place in the classroom where they could not be seen. They hid under desks, behind objects lying on the floor, in cupboards, behind radiator covers. The following instruction was that the children should get to the places where they could be seen the most. They began to step on the desks, window sills, and chairs in the space or create attention-grabbing body poses. Another instruction was to find the place where your body fits best. The children found this under their desks, on chairs, or in alcoves.

Transformation

The children were to form groups of up to 3-5 pupils. Together, they defined the group's space in the classroom with tape to transform it so that the whole group felt comfortable there. For the transformation, they could use everything in the classroom and the materials brought by the lecturers especially for this workshop (flat materials - foil, fabric, cardboard; bar materials - foam tubes, wooden bars and prisms; connecting materials - tape, strings, pegs). The pupils created bunkers that they all fit into. They also used tables, chairs, furniture, mattresses and various hooks they found in the classroom to make their constructions.

Reflection

Reflection took the form of group visits in the created structures. Each group had to present its structure. All bunkers included a roof and in different ways tried to resemble a human dwelling – a house.

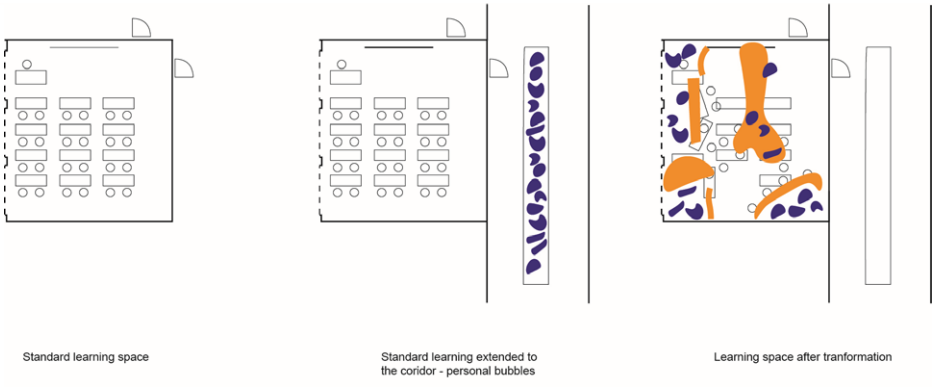

Figure 1. Transformation - workshop at the primary school © (Anna Kotlabová, 2024)

Figure 2. Transformation - workshop at the primary school © (Adéla Šoborová, 2024)

Figure 3. Diagram of the transformation of the teaching space © (Adéla Šoborová, 2024)

The structures contained chimneys, openings for communication with the neighbours, and windows overlooking a completely private space. Some groups established a communication facility between the neighbours. The groups that selected the space in place of the teacher´s desk marked it as the "place of power."

5.2. VERSION II

Introduction

The phase was the same as with the younger age group. This time everyone had an idea of who the architect was. Individuals mentioned city and street planning in addition to the architect's focus on buildings.

Exploration

The probing of the classroom through the senses was the same as with the younger children. Even for the older children, the classroom seemed larger. Making colour frottages and then connecting them with bodies was the same.

Use of space

The following task took place in the corridor. The children had to sit on an unfolded long strip of paper and use a marker to define the boundaries of their personal space. Then they cut out these bubbles from the paper surface and moved them into the classroom space, to places where they would feel comfortable. They sat on their bubbles again. Not only the architecture of the classroom itself but also the social relationships between individuals played a role in the placement of the bubbles.

In the following task, we tried to deepen the pupils' understanding through the sounds of the classroom. Individuals had their eyes closed, and the instructor used the classroom as a sonic instrument. The pupils' task was to record a feeling reflecting the sounds around them on the papers below.

Transformation

The groups were formed by arranging spaced bubbles, taped off to encompass the chosen locations of all group members. The space was then rearranged to ensure that the entire group felt comfortable. The pupils were provided with the same materials as the younger age group.

Reflection

Reflection took the form of visiting, in the same way as with younger pupils. The design sophistication, form and intentions of each of the created structures were at the same level as those of the younger pupils. When asked if the children would like to leave the classroom in this condition, they replied yes, but only for 'free time', not for learning. For learning, they require a clean space at their desk that is not distracting and allows them to concentrate.

The workshops are exercises in engaging sensory perceptions and connecting them to the creative process. The methodology of the workshops will be shared with future teachers and can provide inspiration for teaching various subject areas using space. The methodologies have been designed to show pupils their classroom differently to how they experience it every day and to extend their normal learning space beyond the confines of the

classroom. By breaking stereotypical behaviour along with transforming the learning environment, the children created a memory. Promoting sensitivity to the environment rather than just casual consumption leads to awareness and subsequent conscious sustainability.

The workshops work with a typical class size of 20-25 students, and therefore, they can be applied without increased staff requirements. During the development of the methodologies, trans-disciplinary collaboration between educators and architects proved crucial. The same authors also created a methodology for secondary school students focused on the perception of public space. Understandable Architecture aims to develop interdisciplinary collaboration on a permanent basis and to increase the relationship of inhabitants with their environment.

5. CONCLUSION

In today's times, characterised by climate change, information overload and criticism of consumerism, the requirements for education are also changing. The consumerist mindset that underpins the climate crisis can be counteracted through a deeper understanding of the everyday environment and of our own knowledge and experience. The modernist cultural heritage, which is still viewed negatively in the Czech lands due to its association with the communist regime of the past, is an important part that should be understood. The mass construction during the communist period not only influenced the form of the environment but also shaped the narratives for the future development of architecture.

Understandable Architecture combines architectural thinking about space with educational methods. The combination of learning from space and the concrete linking of different learning topics represents the potential for further development of educational methods without the need for energy-intensive construction of new spaces for education. By using existing structures and using their elements in different ways than we are used to, Understandable Architecture supports the idea of sustainability itself. Furthermore, a more holistic view of architecture and the public's awareness of their own actions, choices, and their impact is proving to be an effective tool for coping with the current environmental crisis. By having a positive attitude and increasing the awareness of individuals towards their surroundings, we can not only protect cultural heritage but also contribute to sustainability and greener living. ■

BIOGRAPHY

Adéla Šoborová is a PhD student at the Faculty of Architecture at Brno University of Technology, where she is interested in the relationship between children and built space. She completed her master's degree at the FA BUT, and since 2022, she has been leading a design studio. She is a co-researcher at the Faculty of Fine Arts BUT, focusing on aspects and possibilities of edible vegetation in the urban environment, and a co-researcher of the project Understandable Architecture in cooperation with the Faculty of Education at Masaryk University. She completed a study internship at the Technical University of Graz.

(RE)SIGNIFYING AND (RE)DESIGNING MODERN SCHOOL PLAYGROUNDS. EXPERIMENTS ON COLLABORATIVE DESIGN IN PORTUGAL

ABSTRACT

The present article aims to briefly describe experiences on collaborative design and knowledge co-creation taking place in Portuguese schools to (re)define school exterior areas in collaboration with school communities. These projects seek to refurbish playgrounds with the schools' communities, to (re)integrate them into the schools' pedagogical programs and routines.

The article will focus on the methodological approach employed in the pilot projects, offering a critical review of its application. Its primary objective is to disseminate the collaborative methodological approach along and its key findings to enable replication in diverse contexts.

Concurrently, the project aims to raise awareness within the school communities about climate change and the importance of creating more naturalized and permeable spaces. These spaces provide cooler and healthier environments, allowing for the expansion of green areas in socially and environmentally vulnerable urban areas. Portugal experiences annual increases in the heat island phenomenon and heatwaves. On a broader scale, it aims to encourage the participation and involvement of local communities in climate policy discussions to identify actionable opportunities that can be presented to local and municipal public institutions. This collaboration aims to implement relevant small-scale interventions with potential for scaling and replication. Furthermore, these projects aim to address a prevailing sense of helplessness among young people in the face of climate change issues by creating/implementing achievable actions. The outdoor spaces surrounding school buildings present a valuable opportunity to address contemporary challenges by aligning with current educational and environmental goals. This can be achieved through the inclusion of natural ventilation systems and green areas that can be offered to the broader community, all while maintaining the buildings' architectural heritage. By reimagining schools in this manner, communities can uphold their cultural legacy while simultaneously tackling urgent modern-day issues such as climate change and the advancement of educational practices.

1. INTRODUCTION

As part of the modern city, modern school buildings were designed to align with new educational policies, paradigms and demands. This transformation of school buildings has also encompassed the school playgrounds. They emphasized pedagogical practices centred around children's interests, autonomy and the integration of outdoor activities into daily routines. However, when educational policies and practices failed to integrate exterior school areas into their educational programs, these spaces' lost purpose, pedagogical significance and use.

In recent times, social and environmental values have resurfaced as key concerns among stakeholders in educational systems, particularly in cities facing extreme weather conditions due to climate change, such as heatwaves. Advocates are pushing for new roles for school exterior areas, transforming them into reference cooling zones for community use and relevant pedagogical spaces for schools. These initiatives aim to refurbish playgrounds in collaboration with school communities, integrating them into educational programs and daily routines. By providing cooler and healthier environments, these projects expand green spaces in socially and environmentally vulnerable urban areas.

The research project ROLE (The Re-design of the Learning Environments. What is changing?) is currently being developed within the thematic line "Knowledge Environments" at CITUA, IST. Its primary objective is to contribute to the (re)design of innovative, effective, and meaningful educational environments, which are deeply rooted in sustainable values encompassing social, environmental, economic, and cultural aspects. The project involves mapping new educational offerings in Portuguese schools, characterizing their educational features, target audience, and understanding their alignment with the needs of communities and territories.

As Portugal faces annual increases in the heat island phenomenon and heatwaves, ROLE seeks to engage local communities in climate policy discussions to identify actionable opportunities for presentation to local and municipal public institutions. This collaboration aims to implement relevant small-scale interventions with potential for scaling and replication. The outdoor spaces surrounding school buildings present a valuable opportunity to address contemporary challenges by aligning with current educational and environmental goals. By reimagining schools in this manner, communities can uphold their cultural legacy while simultaneously tackling urgent modern-day issues such as climate change and the advancement of educational practices.

2. SCHOOL YARDS IN THE 20TH AND 21ST CENTURIES

From the late 19th century, responses emerged to criticisms of traditional teaching methods, which had relied on a rigid model of organizing spaces centered on classroom-based pedagogy (Alegre, 2012). Inspired by Rousseau's 18th-century ideas and later defended by the New Education Movement, there was a growing appreciation for the exterior spaces of

This work has been funded by national funds, Fundação para a Ciência e a Tecnologia (FCT) in the framework of project UIDB/05703/2020 from the research unit CiTUA.

school premises. This shift emphasized individuality, respect for each student's abilities, and the importance of contact between children and nature. The open-air school movement, intensively expressing hygienist concepts in school architecture, introduced a pedagogical method based on outdoor learning. Similar to the New Education Movement, this model focused on the child and employed active learning methods, based on developmental psychology research, to stimulate children's abilities and personal development (Alegre 2015).

Consequently, there was a greater appreciation for the relationship between classroom interiors and their exterior surroundings, as well as the potential of outdoor spaces as effective teaching-learning spaces. This led to changes in school design, including the redesign of classrooms to incorporate more open spatial characteristics and the integration of various school spaces with the outdoor. Additionally, schools began fostering stronger connections with their surrounding community (Alegre 2012) (Lourenço, P. 2022). However, these solutions were sometimes extreme, leading to environments that became very hot in the summer and very cold in the winter due to their large glass surfaces.

In Portugal, public secondary schools underwent significant architectural change throughout the 20th century, which can be grouped into three distinct periods: (1) from the late 19th century up to 1935; (2) from 1935 to 1968; and (3) from 1968 onward. Of the total number, 23% were built by the late 1960s, while the remaining 77% were constructed after 1968, following the adoption of standardized pavilion type designs and mass construction methods (Alegre 2012). These changes in architectural typology also led to a reconfiguration of outdoor spaces.

3. THE SCHOOL'S OUTDOOR SPACE AND THE PEDAGOGY AND DEVELOPMENT OF CHILDREN AND YOUNG PEOPLE

The relationships between a child's development and the enjoyment and exploration of outdoor space are now extensively studied and documented, with the investigations of Carlos Neto standing out in Portugal (Lopes, Madeira, and Neto 2020). However, the role of school outdoor spaces in the development of young people is still much less explored today. Despite wide recognition of the importance of "being outdoors" and the role of outdoor spaces in the physical, cognitive, and social development of children, school outdoor spaces often lack specific architectural and landscaping programs, nor do they receive the same importance in funding allocation for both construction and maintenance of school equipment. Outdoor spaces that are normally framed by pedagogical objectives and integrated into school routines are generally the sports venues. The remaining spaces are essentially used for free play during non-teaching times, which are significantly shorter compared to the average time students spend at school. They are occasionally used for outdoor classes, often related to science and biology.

The importance and benefits of human interaction with natural environments continue to be widely supported in scientific research today,

considering all ages. For example, the "Attention Restoration Theory" developed by Kaplan & Kaplan (Ohly et al. 2016) argues that natural environments act as brain restorers, helping to alleviate mental fatigue and increase concentration and attention, especially if the environment provides changes in routine and involves admiration, exploration, new interests, and activities (Lester et al. 2007).

4. ENVIRONMENTAL PROBLEMS IN URBAN AREAS AND THE POTENTIAL ROLE OF PUBLIC SPACES IN MITIGATING CLIMATE CHANGE EFFECTS

Climate change and specifically global warming affect all areas of human life. One consequence of the current climate scenario is the increasingly common periods of climate extremes, such as heat waves. As the increase in temperature is a global phenomenon, the rise in average temperatures in historically warm territories is currently being felt more acutely. Cities are particularly vulnerable to extreme weather events such as "heat islands" and "heat waves." These phenomena increase climate risks, such as increased morbidity and mortality from heat-related illnesses, higher energy consumption, and deteriorated air quality. In this context, the physical characteristics of cities play a crucial role in either worsening or mitigating the effects of heat waves. As Oke et al. stated in "Urban Climates" (Oke et al. 2017), "a city creates its own climate". The redesign of cities, their public spaces, and their buildings will be fundamental in enhancing the resilience of cities to climate change.

In recent decades, many cities have initiated projects to regenerate their public spaces to increase green areas, create shaded and cooler spaces, alter exterior pavements, improve soil permeability, and open public facilities, such as schools, for community use as climate refuges. An example is the C40 project (https://www.c40.org/pt/cities/), where around one hundred municipalities from cities worldwide have come together to tackle the climate crisis.

4.1. COLLABORATIVE PROCESSES: CO-DESIGN AS A STRATEGY FOR THE REGENERATION OF PUBLIC SPACES

The participation of the school community in creating and remodelling their own school spaces seems obvious, yet it is still an exceptional practice. Collaborative and co-design processes are not yet integrated into the academic curricula of many architecture schools. Despite some examples, their implementation in professional practice remains rare and lacks support from well-established methodological frameworks (Greenall 2023). Even when collaborative processes exist in the design or redesign of recent school spaces (Heitor 2011), the focus of the participatory meetings and collaborative dynamics is usually on the school's interior spaces: classrooms, laboratories, libraries, cafeterias, etc., with no specific concern or program for outdoor spaces.

For children and young people to effectively participate in a collaborative co-design process, they must understand the project's

intentions and motivations, their role in the process, and the roles of the involved parties. Integrating communities into the design of public spaces and equipment fosters active citizenship while improving architectural literacy among users.

In this context, three exemplary cases stand out; i) In Paris, the "Oásis"[1] project, ii) in Barcelona, "Refugis Climatics"[2] and iii) in Brussels, the "Operation Ré-création"[3] program.

In general terms, the projects shared the following objectives:

i) Transform school yards into more natural spaces and reduce the percentage of impermeable surfaces, ii) Make schoolyards places of environmental awareness, hosting activities for both educational and local communities, iii) Promote intercultural and inter-generational sharing, vi) Transform schoolyards into climate refuges open to everyone during heat waves, v) Expand the supply of green spaces in the city and enhance the urban fauna and flora network.

These projects stress out a realignment with the initial objectives of pedagogues and designers who influenced school architecture during the modern movement regarding environmental awareness and the social role of the schools' outdoor spaces.

In co-design strategies, it is crucial to empower users to critically assess the spaces they inhabit while recognizing and preserving important cultural and architectural values. This dual approach ensures users can both evaluate their environments and advocate for necessary preservation or rehabilitation efforts.

5. ROLE: THE REDESIGN OF THE LEARNING ENVIRONMENTS. A COLLABORATIVE APPROACH.

Over the past year, the ROLE project team has engaged in a series of initiatives, such as visits, interviews, workshops, to better understand the Portuguese school community's needs and practices, particularly regarding outdoor spaces. In this context, the ROLE team designed and implemented a collaborative co-design methodology, which is currently being applied to three case studies. Although many schoolyards and playgrounds in Portugal share similar physical conditions, the team identified diverse needs and interests among different schools. The proposed interventions aim to address these varied requirements, recognizing that a one-size-fits-all approach is unsuitable for outdoor spaces, despite the common pavilion typology of the schools (**Fig. 1**). These schools, built according to the pavilion model, with some pre-fabrication strategies, have exterior areas that differ significantly in size.

5.1. COLLABORATIVE CO-DESIGN. EXPERIENCES FROM THREE SCHOOLS

One of the selected schools, Escola Básica de Camarate, in Loures, was part of a pilot case in a prior project, ClimAct (https://www.climact.net/), with the aim of improving the schools' environmental performance. The school design follows the educational construction plans inspired by the model

1. Ville de Paris, "Les cours Oasis," https://www.paris.fr/pages/les-cours-oasis-7389

2. Ajuntament de Barcelona, "Escoles refugi climàtic," https://www.barcelona.cat/barcelona-pel-clima/ca/escoles-refugi-climatic/

3. Bubble, "Opération Ré-Création," https://www.bubble.brussels/operation-re-creation/

projects from the late 1960s, developed using industrialized construction systems in reinforced concrete, incorporating heavy prefabricated elements. It is based on the principle of designing classroom modules with a reinforced concrete beam-and-column structure and solid slabs on the first floor. These blocks or pavilions accommodate the educational spaces (classrooms, laboratories, library, administrative services), arranged around a central module where the access stairs to the upper floor are located, naturally illuminated through a lantern system.

Following this project, the ROLE team was invited to coordinate a co-design process for the redesign and regeneration of a specific area of the school's outdoor space, the "Quinta do Charco". The school grounds include a large outdoor area already used for some educational activities. In particular, the Quinta do Charco space hosts activities related to environmental education. However, it lacks the physical conditions necessary for conducting more extensive educational or recreational activities, as well as adequate accessibility features. Besides, Additionally, it is an exterior area that is currently experiencing degradation and abandonment. Despite being a sizable green area space with potential for open use by the local community it has not yet been fully utilized or maintained (**Fig. 2**). Following this first collaboration, two more collaborative projects are currently ongoing, in two other schools, also in the metropolitan area of Lisbon, both in the municipality of Sintra.

The methodology proposed for the collaborative process was based on the methodologies used in the previously mentioned international projects; "Oásis", "Refugis Climatics" and "Operation Ré-création". The collaborative process involves the participation of students, teachers, staff and parents (**Fig. 3**). The shared objective is to address the specific needs of the school community by transforming outdoor areas into spaces that promote social equity, well-being, and resilience to climate change. These transformed spaces will also serve as foundations for learning about sustainability, biodiversity and climate change.

The ROLE team's co-design process consists of seven phases adapted from (Greenall, Wong, and Toohey 2023):

1. **Preparatory Work:** Initial meetings with school stakeholders to explain the project and gather preliminary information.

2. Co-Analysis: Workshops with students, teachers, staff and parents to identify needs, preferences, and existing problems. The goal is to collect data about the perception and attitudes towards the school's outdoor space.

3. Co-Design: Collaborative sessions to map intentions, desires and visualizations. Drawings, collages, selection of inspiring images, etc. The main objective is to understand the participants' desires regarding the transformation of the school's exterior space while simultaneously exploring the concept of sustainable construction.

4. Co-Creation: Presentation and discussion of proposals developed based on ideas collected during previous workshops. Use of AI for the development of some of the project solutions.

5. Project reviews and final proposal. Plans for construction, budgeting and implementation preparation. Availability of materials, possibility of reusing materials from demolition works in the vicinity, etc. are checked with the school, municipality and other local entities.
6. Co-implementation. Implementation of selected project with the active participation of the school community.
7. Co-evaluation. Creation with the school community of a system for monitoring results and evaluating impacts.

Each phase includes detailed documentation and participant feedback to ensure transparency and inclusivity throughout the process.

During the co-design process and interaction with the school community at Camarate, we became aware that a new project for the school buildings was under development by the municipality. The school community was not included in the process, which previews the total demolition of the original pavilions and their replacement by new pavilions.

As the school premises are wide, the intervention area scoping the co-design process was not affected by the new project. At this stage the municipality was considered as an interested party in the process and invited to participate in the working sessions.

5.2. DISCUSSION OF RESULTS AND PRELIMINARY CONCLUSIONS

The collaborative co-design process fosters a deeper understanding and appreciation of school spaces among the community while providing the research team with valuable data and insights. This approach enhances the longevity and effectiveness of interventions, ensuring that outdoor spaces meet the diverse needs of users and are taken care by the school community.

Although the process is still ongoing, the schools' community already recognize that it allows them to gain insights and a critical perspective on their school spaces. Similar interventions, currently in post-occupancy evaluation phases, have demonstrated that direct user participation in the co-creation process leads to more efficient and lasting maintenance and management of spaces. This involvement increases the functional, environmental and social value of the spaces while promoting more resilient and engaging learning environments.

Although the school community is very sensitive to environmental issues and committed to responsible material choice and solutions, they fluently discuss concepts like flexibility, durability, and the use of recycled and waste materials. However, cultural values of existing structures were never mentioned concerning both the exterior areas and the school buildings. Despite the school pavilions representing an early and uncommon strategy of pre-fabrication and modularity in Portugal, this fact was never brought up during visits and work sessions. Additionally, the idea of renewal versus new construction as a potential sustainability strategy was not considered.

Figure. 2. Plan of Escola Básica de Camarate, highlighting "Quinta do Charco" area. © Luís Roma Fernandes

Figure. 3. Students at Camarate school working on phase 3 of workshop sessions © Luís Roma Fernandes

Despite increasing environmental awareness, there is still a lack of comprehension about the environmental consequences of our actions. Moreover, the belief that new structures are better solutions than refurbishing existing ones remains prevalent. In an article on climate change, (Davidson 2021) discusses the ecological footprint of premature demolitions and advocates for the preservation and reuse of existent buildings to mitigate environmental impacts. Davidson emphasizes the need to consider a larger spectrum than legal standards and heritage classification to promote such preservation.

Linking environmental sustainability to cultural heritage preservation is a necessary and central connection that all parties must recognize. Co-design strategies can be a powerful tool to increase both awareness and literacy regarding sustainable architecture and modern cultural values. This approach reinforces the need to preserve and adapt modern buildings as a strategy to reduce environmental impacts. ■

BIOGRAPHIES

Patricia Lourenço is an architect and Assistant professor at Instituto Superior Técnico (IST), where she teaches Architectural Design studio at the Master's degree in Architecture. The current primary areas of research include 1) Evidence Based Sustainable Architecture, 2) Post occupancy evaluation & buildings in use monitoring 3) Users behaviour data for modelling and simulating buildings' energy performance. Dissemination of results include journal and conference articles, participating as guest consultant for the European Council of Architects regarding the theme "Responsible Architecture". Currently, she participates in the research ROLE (Redesign of learning environments. What is changing?

Alexandra Alegre is an Associate Professor of Architecture at the Instituto Superior Técnico (IST), University of Lisbon, and a researcher at CITUA where she coordinates the thematic line 'Knowledge Environments.' Her focus encompasses school architecture, educational spaces, city and education, spaces for childhood. Currently, she leads the ROLE project, aiming to reshape educational spaces by involving school communities in the redesign process, emphasizing sustainability in social, environmental, economic, and cultural aspects.

Teresa Heitor stands as a Full Professor of Architecture at the Instituto Superior Técnico (IST), University of Lisbon. Presently she serves as director of CiTUA. The multifaceted nature of her work encompasses a holistic understanding of the socio-cultural dynamics at play related with built environment and the communities it serves. The research focuses on understanding how physical spaces can support the needs of learning at all levels and includes advising designers, policy makers and educators on how to create physical learning environments to support the needs of education.

ADAPTIVE MODERN HOUSING: SHIFTING NOTIONS OF COMFORT AND THE TRANSFORMATION OF DOMESTIC SPACE FOR CONTEMPORARY LIVING

ZARA CASTELO FERREIRA
CITUA, TÉCNICO – UNIVERSITY OF LISBON, PORTUGAL

ABSTRACT

The Modern Movement established ambitious housing programs to provide shelter for the greatest number and enhance human comfort. Since then, the concept of "comfort" has undergone significant transformation, challenging the conception of domestic spaces and redefining the way inhabitants live in their homes to cater to their needs and desires.

This session seeks to explore the dynamic relationship between the original design principles of Modern Movement housing and the evolving demands of contemporary living. Through an analysis of case studies and architectural examination, it aims to identify the challenges and opportunities in reconciling the preservation of resilient architectural features with the adaptation to contemporary comfort requirements.

Furthermore, the session aims to contribute to the discourse on sustainable urban development and the construction of healthier environments by highlighting the potential for adaptive reuse initiatives and the repurposing of modern architecture to align with present-day values.

The author is grateful to the Foundation for Science and Technology (FCT) for its support through funding from the research unit CiTUA (10.54499/UIDB/05703/2020) and from a Doctoral Fellowship (SFRH/BD/115196/2016).

Homes are indeed a machine for living, and they play a key role in shaping our human experience. But all homes speak, whether through their presence or absence, of something else that is beyond themselves. They speak of what it means to be human, a matter that is both succinct and immense, astonishing. They speak about the knowledge that is only true when it holds the awareness of what it ignores today and will ignore until the end. They speak of the struggle for survival, with its roughness, its pain, and its tumult, but also of the transcendence we may experience. They speak about intimacy, both within and beyond the skin. They speak of silence and words, which sometimes contradict each other and sometimes not. They speak of the accomplished and the postponed, of sleep and vigil, of fraternity and the opposite, of wound and joy, of life and death.[1]

José Tolentino Mendonça, 2017

Jean Fourastié called *invisible* the revolution that took place in the three decades since the end of WWII to the first oil crisis – *les trente glorieuses* [the glorious thirty]. Nicole C. Rudolph argues that it was invisible because "it took place not in the streets, public space of the *citoyen*, but at home, within the putatively private space of the domicile".[2]

The history of housing has been extensively studied, intertwined with the sociocultural transformations that led to its development. The genesis of the term "housing question" serves as a poignant reminder of the inherently political nature of the housing subject[3]: whether viewed through the lens of ancient Greek philosophy, encapsulated by the concept of "the things concerning the πόλις (polis)", or through the modern perspective emphasizing the necessary agreements for communal living, housing remains a nexus of political and social negotiation across time and cultures. The "housing question", as raised by Friederich Engels in 1872[4], emerged from the starkly contrasting living conditions between the proletariat and the bourgeoisie. While the urban bourgeoisie enjoyed spacious accommodations, the working class endured overcrowded and unsanitary tenements near factories, lacking ventilation, sanitation, and privacy. For Engels, the solution to the housing question would only be addressed through the establishment of a socio-economic structure where housing could be treated as a fundamental human right rather than a commodity for profit, through the abolition of the capitalist mode of production. On the other hand, Le Corbusier's memorable quote "architecture or revolution" (1922)[5] stemmed the belief that efficient architecture and urban planning was the only way to avoid a class-based revolution driven by dissatisfaction with the built environment and social conditions. For Le Corbusier, architecture and urban planning had the critical role of addressing societal challenges.

Regardless of perspective, the technological revolution and social needs prompted the emergence of urban planning and social reform

movements: from Ebenezer Howard's concept of the Garden City (1898) to the Athens Charter (1933) developed within the framework of the International Congresses of Modern Architecture, numerous efforts were made to find well-being solutions for the life organization of communities in a world in permanent change. While the interwar period allowed for the pursuit of new standards for housing, capable of combining a dignified *Existenzminimum* with cost-effective mass housing solutions – enabled by the development of innovative building elements, new concepts of prefabrication, and efficient, systematic building processes – it was the end of the Second World War that gave a whole new scale to housing. After 1945, the housing production affirmed itself as a political and social project for many nations, in the framework of prosperous economic growth and profound social transformation. Whether through welfare state systems, or through the establishment of local housing authorities funded or semi-funded by the government, or through the support of private companies, civil organizations, or associations, it was the time for the large-scale application of the principles of modern architecture and engineering developed before the war. It was not only a time for re-housing families torn apart and rebuilding destroyed cities, but also a time of democratic rebirth – a defining moment for individual and collective freedoms and rights. A new Man emerges and develops itself over these years, with confidence in modernity and progress. Whether for the Engels's proletariat or for the mass-men of Garcia y Ortez (1930)[6], comfort was the basis of the search for, and production of, collective housing, in accordance with the new embraced paradigm evidenced in the 1948 *Universal Declaration of Human Rights*: "Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control." Comfort would no longer only be found in bourgeois houses.

Taking the example of France, in 1929, "modern comfort" was defined by the Larousse Dictionary, as "the ensemble of provisions intended to make an apartment building more comfortable, such as central heating, a bathroom, an elevator, electricity, etc". However, it was only in 1946 that the French census first inquired about the presence of these "elements of comfort" in dwellings across the country. Back then, only 5% of dwellings had a private shower or bathtub. The introduction of the distinction between hot and cold running water reveals that, in 1962, a hot shower was not available to most of the population – only 39.6% of dwellings had it. Answering the lack of such basic needs was the first stage of comfort that was sought to be assured: sanitary housing equipped with indoor plumbing and central heating would protect health and offer security. On a second level, rational, functional, and well-lit flats layouts would offer tranquility and conditions to develop people's minds and passions. Built to the proportions of adults, children, and their needs, with the separation of

6. Ortega y Garcia, *A Rebelião das Massas*, Lisboa, Relógio de Água, 2019 [1930].

functions and filled with the features that would guarantee the physiological and psychological comfort of the inhabitants, the modern home should allow the average person the opportunity to explore and achieve their full potential. A third level of comfort would be later respecting a comfort of use associated with the possession of objects for facilitating daily life. Through the regular consumption of comfort goods, a certain luxurious comfort has been replaced by a comfort understood as useful and liberating. In the framework of an emerging consumerist society, objects of desire[7] – which extended to household occupation – was a method of self-assertion and expression. Linked to progress – of which it is a "natural consequence" – and to the notion of happiness, comfort became a central concept within society's evolution and housing production, having become a symbol of modernity. As comfort developed and established itself in everyday life, it tended to become one of the emblems of the advanced state of development of modern societies as a guarantee of a better life, giving rise to one of the current definitions of comfort by the Larousse dictionary: "psychological, intellectual and moral tranquility obtained by the rejection of all preoccupations".

Modern housing production is extensively studied and disseminated. The territorial scope is vast and the approaches that have attempted to relate housing unit, building, street, district, and city have been numerous: from towers in the centre of big metropolis to low-rise high-density developments in small towns, from serpentine mega blocks in the suburbs, to entire new towns. Some of these studies speak about utopias and the quest for building urban concepts adapted to new social orders, technical innovations, and history; others speak of failures of urban policies, social inequality, and forgotten territories. But few are the ones that address the "invisible" space hidden behind the facades – the home that shelters the daily lives of individuals, families, and communities. In many countries, the emergence of social sciences in the 1960s, coupled with political will, allowed conclusions to be drawn about the housing needs and preferences of the population: through surveys, interviews, questionnaires, and reports, postwar housing often had the privilege of being a result of collaborative work between architects, engineers, sociologists, state officials, and residents[8]. The attention to interiors has been largely neglected for a long time, preventing proper documentation of the architect's omnipresent work on domestic space and the understanding of how they imagined domestic life in the socio-cultural context of different places and times. Additionally, there has been practically no attention in the field of architectural research[9] dedicated to post-occupancy studies capable of evaluating the quality of solutions and how the home interior evolved in response to changes.[10]

Profound social, labour, and technological changes that occurred in the last half-century have impacted the use and transformation of domestic space profoundly. These changes encompass shifting family structures (including singles, patchwork families, single-parent households, multi-generational families, non-resident students, immigrants, city workers,

senior citizens living alone or with a caregiver, co-living arrangements), the evolving gender roles (women's increasing independence and participation in the workforce), the increase in life expectancy. The democratization of education and mobility (increased access to education have prolonged youth and facilitated social and physical mobility, reinforced by globalization), the increased diversity of lifestyles (coming from a wide range of phenomena, such as emigration, digital nomadism, remote work), technological evolution (with the diffusion of home automation, diversification of means of information, communication, exchange, and remote access to goods and services), and the increasing awareness of environmental issues and global emergencies lead to different needs and preferences of domestic life. In these transformation processes, attention also must be given to the housing complexes developed in territories formerly colonized, the procedures that gave rise to them, and the manner of occupation and transformation after independence, through studies that relate architecture, colonialism, and post-colonial identity, which are fortunately beginning to gain prominence.[11]

The housing policies have also undergone profound changes: the oil crisis, beginning in 1973, not only weakened many economies but it has also dissipated the optimism in the idea of progress of earlier decades. Radically changing the socioeconomic paradigm, the Keynesian economic values of the post-war years were replaced by free-market policies. Within the framework of the current neoliberal economic model, architecture ceased to be seen as a social instrument. Private and individual values gained preference over public and collective ones, leading to a growing crisis in affordable housing, even for the middle classes, and increasing homelessness.

Edmundo Desnoes said that underdevelopment is the inability to accumulate experience[12]. The modern era of the 20th century was an incredibly fruitful period for housing production in many parts of the world, resulting from a remarkable combination of political will, technological capability, and awareness of the importance of architectural thought and planning for improving the quality of life of communities. Looking at this production brings us three responsibilities for the future:

1. Faced with the global housing crisis impacting the world today, we must learn from the past and not reinvent the wheel every time we consider housing solutions. This refers to both the design of housing and the formulas that combined interdisciplinary efforts among policymakers, civil society, and the fields of knowledge involved in housing production (architecture, engineering, urban planning, and landscaping).
2. Understanding how people inhabit these houses today is crucial. As Dirk van den Heuvel and Nelson Mota stressed, "the second life of modern housing projects needs further problematization"[13]. Post-occupancy studies, capable of identifying residents' needs and tracking transformations made to the houses over time, are essential for diagnosing these projects. It is essential to understand the influence of shifting notions of comfort on the transformation

12. Edmundo Desnoes, *Memorias del Subdesarrollo*, La Habana, Casa de las Américas, 1965.

13. Dirk van den Heuvel and Nelson Mota, "Modern Housing and the Aesthetics of Growth and Change", in Ana Tostões and Zara Ferreira (ed.), *Adaptive Reuse. The Modern Movement towards the Future. Proceedings of the 14th International Conference*, Lisboa/Porto, Docomomo International/Casa da Arquitetura, 2014, p. 784.

Figures 1-3: Manuel Costa Martins, Hernâni Gandra, Manuel Coutinho Raposo and José das Neves Galhoz, Olivais Sul, Lisboa, Portugal, 1960s. © Zara Ferreira, 2022.

of Modern Movement domestic spaces to meet inhabitants' needs and desires, to analyse enduring design principles that remain functional and relevant today and to identify obsolete elements and spatial configurations on that require adaptation. This is also both relevant for intervening in the existing housing stock but also to inform new housing developments based on past experiences.

3. To explore successful case studies that demonstrate balanced solutions between transformation and preservation within Modern Movement domestic spaces[14]. Many of the transformation processes occurring within housing are carried out by the residents themselves, often without technical knowledge, and sometimes to the detriment of their own comfort. It is essential to align the needs and desires of residents with the professional skills of the architect.

The contemporary agenda highlights the urgency to foster healthier territories. By delving into the interplay between Modern Movement housing interiors and the ever-evolving comfort needs of contemporary society, this session aims to offer valuable insights into the adaptable nature of modern domestic spaces. The exploration of how occupants repurpose modern architecture, aligning with present-day values, holds potential for sustainable urban development and adaptive reuse initiatives. The goal is to contribute to developing efforts towards the effective reuse of existing building stock and inform new architectural endeavours that may harmonize Modern Movement knowledge with current and future requirements. Among potential themes to explore are reinterpreting original spatial layouts to optimize contemporary comfort, adapting interior spaces to accommodate diverse family structures and lifestyle choices, sustainable solutions for energy-efficient transformations in home interiors, the social and psychological aspects of preserving modern aesthetics while fostering well-being, the impact of processes such as gentrification, digital nomadism, emigration, or tourism on the transformation of domestic spaces, and comparative studies between different Modern Movement housing projects and their adaptive reuse in various cultural contexts.

Through this session, we aim to bring together scholars, architects, and enthusiasts to engage in a comprehensive discussion about the evolving meaning of comfort and its profound influence on the redefinition of domestic spaces within Modern Movement housing. By sharing diverse perspectives and case studies from around the world, the session seeks to advance knowledge in the field and inspire innovative approaches to adapting modern architecture for the needs and desires of contemporary living.■

BIOGRAPHY

Zara Ferreira is an architect and a PhD candidate in CiTUA – Center for Innovation in Territory, Urbanism, and Architecture (Técnico – University of Lisbon), with research entitled "Housing for the greatest number in Lisbon: Olivais and Telheiras. The transformation of domestic space and ways of living (1960s-2020s)". She was the secretary general of Docomomo International and co-editor of Docomomo Journal (2014-2018). She was fellow and researcher of the research project EWV_ Exchanging Worlds Visions (2011-2013), where she developed her Master dissertation (2012), focused on "The Modern and the Climate of Lusophone Africa. School Architecture in Mozambique: Fernando Mesquita's Program (1955-1975)."

MODERN ARCHAEOLOGIES: SUSTAINABLE STRATEGIES FOR SOCIAL HOUSING BUILDINGS IN ATHENS, 1950-1970

CHRYSOSTOMOS THEODOROPOULOS
SCHOOL OF ARCHITECTURE NTUA

ABSTRACT

Social Housing Buildings (1950-1970) in Athens stand out for their innovative technology, unique housing conditions, and spatial design influenced by the international modern movement. Architects incorporated global trends with local spatial concepts that strongly influenced the organisation of rooms, the connection between indoor and outdoor spaces, as well as the broader Athenian urban fabric. These complexes offer ideal conditions for urban living with low heights and communal open spaces. Their grid-based construction allows for flexibility, conversions, extensions, and additions. Whether independently or as parts of housing developments, these dwellings are living records of the reconstruction and the economic and spatial evolution of the Greek metropolis.

The Rentis Housing Complex consists of 378 residences, each with a distinctive architectural layout. Each building consists of a semi-outdoor staircase at the centre of the axis, on either side of which three-room apartments are arranged per floor. The complex is designed according to the modern, free-standing building system, creating internal courtyards within plots of various shapes. The facades are made up of the concrete grid frame and infill walls of brickwork, painted in subtle earthly tones. Rooftops were originally designed with laundry rooms and open-air pergolas, thoughtfully preserving views towards the Acropolis.

While tenants' continuous occupancy has helped to maintain most of the infrastructure, significant challenges persist. These challenges include the abandonment of public spaces due to lack of funding, concrete structural decay, inadequate energy efficiency, façade deterioration, and societal shifts that occurred over seven decades.

This paper explores the research, methodology, and design approach undertaken in the elective undergraduate course "Modern Archaeologies: Sustainable Strategies for Social Housing Buildings in Athens 1950-1970" at the School of Architecture, National Technical University of Athens, Greece, from 2022 to 2024. It showcases the outcomes of student projects, emphasising innovative strategies for preserving and adaptively reusing this social housing complex.

This paper was written in collaboration with Dr. Maria Balodimou, Tina Mikrou (NTUA School of Architecture Teaching Assistants) and Ioannis (Ionas) Mountogiannakis (Architecture Student at University of Thessaly).

1. THE BROADER CONTEXT OF SOCIAL HOUSING IN ATHENS

Public housing projects in Athens were initiated by the Greek Ministry of Social Care around the 1920s, as a solution to house large waves of war refugees and clear the slums of the city centre. The new 2-story condominiums were erected within the limits of the city. In 1954, following the rapid expansion of the urban centres and seeking to address the housing of internal immigrants, the Greek Ministry of Employment and Social Security established The Workers' Housing Organisation (OEK). "As with other public housing construction initiatives, the policy of the Workers' Housing Organisation was to promote homeownership, in this case for working-class and employee families."[1] During the 1950s and 1960s, the OEK continued the with the same policy of the 1920s by constructing identical complexes, bigger in scale and with more floors, in the newly formed urban areas in Greece.

This trend was fully embraced in Athens because of its rapid urban growth. Pioneer Greek architects collaborated with the OEK to implement the functionalist principles of modernist architecture in the layout of the buildings and the new settlements. They were heavily influenced by the principles of garden city and modern architecture, as these were introduced by CIAM workshops, the Bauhaus style, and the ville radieuse[2]. Aris Konstantinidis, while working in the OEK (1955-1965) laid the foundation for the aesthetics of the new settlements through the use of exposed, reinforced concrete as the skeleton and the exterior plastered brick walls recessed. The layout was simple and functional with every couple of units sharing a common stairwell. Konstantinidis placed importance on the exterior balcony with its recessed space as a counterbalance to the monolithic volume of the buildings. He also arranged the complexes in such a way so as to form inner courtyards, resembling the traditional way of living. Konstantinidis' influence remained strong for many years following his departure from the OEK.

Modern social housing complexes built during that era feature a combination of enclosed and open spaces, setting them apart from the prevailing trend of continuous construction and prioritisation of private space over public space, in Greek cities at the time. This is a unique feature that still remains evident in these complexes today. On the other hand, the social housing complexes were never integrated into their surroundings, as they have always existed on the outskirts of city limits, as they happen to be placed at the borders between municipal areas[3]. Their extensive public spaces and street network, originally designed but never implemented, contribute to their poor connection with the rest of the city. Vaso Trova states that "the fact that free building was not applied to dwellings of other social classes, helped to identify this model with the workers, thus acquiring a social stigma".[4]

The intense post-war development of the centre of Athens led to a feeling of discomfort among citizens, resulting in the first exodus from the city centre. Suburbs began to flourish, offering better living conditions

for those seeking more autonomy and privacy, as lifestyles changed. Additionally, the dissolution of the Soviet Union and its Bloc contributed to an influx of economic migrants seeking better living conditions in Greece. This, combined with Greece's economic crises, resulted in a significant number of people from diverse social, economic, and ethnic backgrounds (unemployed, immigrants) residing in social housing complexes. These social housing complexes represent the current condition of extensive areas at the Athenian centre; "that is the gradual deterioration of the building stock, abandonment of urban housing by its original residents, settlement of migrants and other low-income groups or of socially marginalised groups, deterioration of urban infrastructures, further degradation of the environment, a further exodus of the previous residents, etc. to the point of the complete devaluation of the buildings."[5]

2. THE CASE STUDY OF RENTIS HOUSING COMPLEX

2.1. THE COMPLEX

The housing complex is located near the centre of Athens, in the broader area of Rentis, a heavy industrial area with scattered housing blocks (Fig.1). Prior to its industrialisation, the area was fertile farmland, next to Kifisos river with small private farms that provided the city markets with fresh products. Post-war development of the city altered the area and industrial units along the new Petrou Ralli avenue were built. The OEK developed three social housing projects in the area. The largest of these is the case study complex, covering a plot area of 36,000 sq.m. bordered by Petrou Ralli Avenue to the north and Agias Annis Street to the east. The design was executed by a team of architects, supervised by George Skiadaresis and the construction completed in 1959. The complex comprises 29 four-story buildings, totalling 378 apartments. The basic unit consists of a semi-outdoor staircase on the centre of the axis, on either side of which, three-room apartments are arranged per floor. The complex is arranged according to the modern, free-standing building system in plots with regular or irregular shapes, creating inner courtyards. The facades are made of a grid frame of concrete and infill walls of brickwork painted in light earthy tones. Rooftops were originally designed with laundry rooms and open-air pergolas for drying clothes. An effort was made by the architects to maintain the view from the top of the buildings towards the Acropolis.

2.2. THE PUBLIC SPACE

The main feature of the social housing projects in Athens is the open space between them. The public space in most Athenian neighbourhoods consists of streets and occupies between 15 and 25 percent of the territory. On the contrary, the public space of the social housing complexes, like the Rentis complex has up to 80 percent of open space consisting of green spaces, streets, sidewalks, and small squares[6].

Additionally, in the Rentis complex, there are some communal spaces and shops located on the ground floor of building 28 and 29 with cafes

5. N.Papamichos, "From the 'antiparochi' to the Stock Exchange" in Metapolis 2001: The Contemporary (Greek) City, ed. Y.Aesopos, Y.Simeoforidis (Athens: Metapolis Press,2001), 85.

6. Trova, "Workers' housing, the other side of modernism," 77.

placed next to the southern eastern side of the complex. These shared areas were intended to provide opportunities for social interaction, relaxation, and appreciation of the close connection with the outdoor environment. Overall, the apartment buildings on Petrou Ralli Street exemplify the synthesis of European modernist influences, as seen in the form, and local design elements, through materiality. The complex offers a blend of modernity and contextual relevance, contributing to the visual appeal and livability of the urban environment.

2.3. THE UNIT LAYOUT

The original floor plan is a functional design approach that prioritises the requirements of standard living of its residents. The carefully considered spatial organisation aims to provide comfortable and efficient living spaces for the working-class population. The floor plan maximises the available space while ensuring a practical layout that accommodates the essential amenities required for everyday living. Upon entering a unit, there is a hallway that is open to the living area, which is separated from the kitchen by a wall. A small passageway is connected to it, along with two bedrooms, a kitchen, and a bathroom. The architects also included two balconies in the plan. One is connected to the living room, and another is connected to the kitchen. The incorporation of the two balconies is intended to enhance the residents' living experience. The architects recognised the importance of outdoor spaces and integrated these balconies into the design to provide an extension of the living areas and provide a connection between the indoor and outdoor environment. The first balcony, accessible from the kitchen, provides a convenient outdoor space directly connected to the kitchen, promoting a seamless transition between the indoors and the outdoors. The second balcony, accessible from the living room, provides residents with another outdoor area where they can unwind, socialise, or enjoy the views of the surrounding environment. The balconies not only offer additional living space but also contribute to the connection with nature and the surrounding environment. The inclusion of these balconies demonstrates the architects' commitment to creating a comfortable and enjoyable living environment for the residents. These outdoor spaces add value to the overall design, offering residents the opportunity to embrace the outdoor lifestyle and enhance their quality of life within the housing complex.

3. CURRENT SITUATION OF THE COMPLEX

Despite the tenants' continuous use, which has helped preserve most of the buildings' core infrastructure, significant issues have emerged in the complex. Among these issues is the abandonment of open public spaces, stemming from insufficient funding even from the original construction phase. Furthermore, the concrete structures present severe decay and can no longer comply with the current safety requirements and regulations. Another important issue is the buildings' poor to non-existent energy efficiency due to both weaknesses in the original construction methods and the current energy

efficiency requirements. Moreover, the partial or widespread deterioration of the façade elements indicates the structures' aging conditions which is also a pressing concern **(Fig.3)**. Additionally, various interventions by tenants, such as the alteration of exterior porches and balconies into interior rooms to maximise space and the application of awnings without complying with any rule whatsoever, further compound the challenges.

4. THE METHODOLOGY OF THE INTERPRETATION

The initial step in this analysis involved a meticulous examination of the original architectural design of the buildings. To do this, the original blueprints were used as a foundation and students carefully selected, categorised, and then examined separate building elements, such as the concrete skeleton, the stairwell, the façade with its various components (windows, doors, and balconies), the unit itself, the rooftop and/or the open public space between the buildings. This comprehensive assessment was facilitated by employing a range of survey tools, including archival drawings, site visits, bibliographic research, and interviews with tenants.

Following the survey, students focused on assessing three main areas of interest. The first area delved into the structural integrity and deterioration of architectural elements, energy inefficiency, and alterations on the building envelope made by residents over time. The second area focused on the public space either between the buildings, including inner courtyards and access streets, or the shared common public space within the units, focusing on stairwells and rooftops. In this area, attention was paid to the deterioration and neglect of these spaces, as well as their abandonment by the residents of the complex. The third area focused on the housing programme, examining the problems occurring with the outdated layouts of the existing units.

5. PROPOSED STRATEGIES AND INTERVENTIONS

The second phase of the projects explored strategic interventions aimed at addressing the issues that were identified in the earlier stage of the process. Proposals differed in themes and scales, encompassing restoration of modern architecture, implementation of new housing programmes through modifications of the existing structures, and expansions - redesign of public and semi-public areas of the complex. In addition, efforts were made to interpret original layouts through on-site documentation and archival research, and invent ways to adapt in order to accommodate the diverse needs of the residents, and investigate preservation principles to guide the framework of the interventions.

Many projects tackled issues related to circulation and accessibility, proposing and designing new staircases or introducing elevators, and ramps for disabled and vulnerable tenants of the complex. Others focused on the design of new, passive bioclimatic systems, including the redesign of common rooftops or the integration of bioclimatic façade elements. Numerous students also proposed expanding the outdoor space of each apartment,

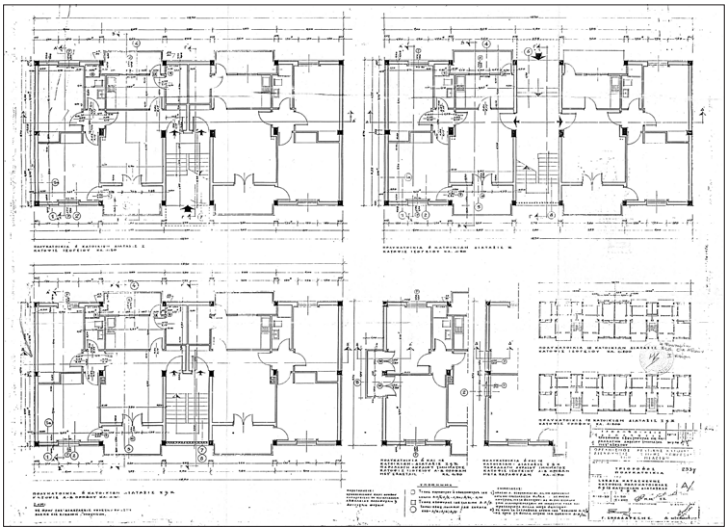
introducing new programmes to increase square footage and enhance quality features. In other instances, the extended balconies were connected to encourage interaction and shared use by groups of tenants. Additionally, certain groups of students addressed adaptive layouts to meet the needs of emerging residents such as war refugees and new types of families, as well as responding to changing patterns of occupancy (co-housing, ephemeral occupancy). In some cases, this resulted in unifying apartments, creating communal kitchens for each building unit and thus allowing for ground floor apartments to become communal hubs for work or study.

The proposed interventions, although different in approach, all took advantage of the buildings' structural grid, allowing for the accommodation of multiple programmes. As a result, new imaginative housing narratives were developed envisioning solutions in a shifting socio-economic reality, while at the same time applying strategies for restoration which included modifications of spaces, façade elements, and the integration of new and repurposed components. The proposals spanned a broad spectrum from applicable restoration approaches to more experimental interventions, reflecting the students' effort to address the multifaceted challenges of the 21st century.

6. CONCLUSIONS

Between 1950 and 1970, numerous Social Housing Buildings were constructed in many areas around the Athenian city centre. These buildings are not only unique for the technology used in their construction but also for the housing conditions and spatial experiences they offer. Influenced by the international modern movement, the architects incorporated local, spatial assemblies in the organisation of the rooms, in the connection between indoor and outdoor and with the urban fabric. The complexes maintain ideal conditions for urban habitation due to their low height and the open, public space between them. Their construction system based on a grid, allows for flexibility, conversions, extensions, and additions. These dwellings, both independently and as parts of housing complexes, are living archives of the reconstruction and the economic and spatial formation of the Greek metropolis.

The course's primary objective is to uncover forgotten cases of Greek modern architecture by examining the as important architectural and social elements. Rentis social housing complex is a fine example of the radical design and theory that was originally developed by Aris Konstantinidis and applied by others, such as the project architect, George Skiadaresis. The complex showcases the power of architecture to address social issues and improve quality of life for ordinary people. The modernist approach and focus on social housing projects have left a lasting impact on Greek architecture. The design of the complex, characterised by a modular layout, relief structure, depth-enhancing techniques, and carefully positioned balconies, exemplifies the potential for creating successful and harmonious architectural solutions that transcend specific locations.



Following a thorough analysis of the original design and the adaptations made by the inhabitants, the proposed interventions aim to provide adaptive

#32

solutions that respect the individual needs and motivations of the residents. Proposals cover a wide range from small, key interventions to larger alterations such as expanding spaces, removing partition walls and unifying interiors, adding new programmes of housing, and revitalising the common and public areas. These interventions create a sense of spaciousness and grant residents the possibility to use their domestic space in diverse ways. The interiors become lighter and the common areas more open and inviting.

By working with existing modern architecture, students become familiar with an important part of our shared history and discover valuable tools and applications of reuse and repurpose. ■

SPATIAL DECOLONISATION OF THE MODERN MIDDLE-CLASS HOUSING OF MOZAMBIQUE

PATRICIA NOORMAHOMED
UNIVERSITY OF BASEL

ABSTRACT

As decolonisation initiatives spread throughout the African continent, the Portuguese government tried to assert and legitimise its presence in the colonial spaces by promoting, among other means, migration from Portugal to the "overseas territories". In Mozambique, most of this wave of European settlers fell within a middle-class socio-economic profile. As such, they became the main target of the housing developments that assisted the migration process until the country's independence in 1975.

This paper focuses on the neighbourhood promoted by the *Sociedade Imobiliária e de Administração Lda* (SIAL) in the early 1970s to accommodate this new middle-class population on the outskirts of the Mozambican capital. Following the urban pattern of the garden city, the single-family houses were designed by architect João José Tinoco, who conceived a series of standard dwellings with a wide range of dimensional and distributive variations that would allow for different modifications both at the time of execution and once built and put into use. This transformation process spread after Mozambique's independence when the new inhabitants who came to occupy the dwellings began to change them to accommodate their evolving comfort needs.

The paper analyses these transformations by focusing on the inhabitants' discourses and new spatial practices. The aim is to understand how the post-colonial occupation of Mozambique's modern domestic environments and the contemporary living requirements of the users have subverted this architecture's spatial and symbolic structure. In doing so, it has been possible to verify that, despite their sometimes-radical nature, these changes have not erased the essence of the project. On the contrary, they have become signs of decolonisation that have added to it the richness of finding that, more than 50 years after its construction, this ever-changing habitat is still being actively inhabited.

#32

1. INTRODUCTION

The decolonisation of the African continent was not only a fundamental historical process in the political evolution of the world after the Second World War but also for the redefinition of modern architecture. Framed by the rise of emancipatory movements, Africa emerged in the second half of the 20th century as a territory in rapid urban development. New housing paradigms were then advanced by confronting the modern with the continent's environmental, historical, cultural, political and social realities.

These paradigms significantly influenced the CIAM's discussions on the notion of habitat. Among others, Georges Candilis drew from the studies carried out by GAMMA and ATBAT-Afrique groups on "the housing for the greatest number in Morocco" to introduce in CIAM IX (Aix-en-Provence, France, 1953) the concept of *habitat* évolutif [evolving habitat]. Based on the idea that "it is for the architect to make it possible for the man to make the flat his home […] man shall have the liberty to adapt [its habitat] for himself",[1] this concept endowed architecture with a temporary character, open to the transforming action of the inhabitants.

The *Nid d'abeille* and *Semiramis* buildings, designed by G. Candilis and Shadrach Woods in the Carrières Centrales district of Casablanca, were presented as paradigms of this *habitat* évolutif. Articulated by courtyards superimposed in height, the buildings were configured through functionally indeterminate rooms aiming to accommodate changes in the inhabitant's living practices.[2] Once they were occupied, these rooms began to acquire different characters as a reflection of the identity of each of their users. The overlapping courtyards have also started to be used as rooms, allowing the inhabitants to increase the original living space of the dwellings. As such, the *habitat* évolutif designed by G. Candilis and S. Woods has taken on new meanings as an ever-changing habitat that users continue to transform through their everyday experiences.

Taking the example of Casablanca as a starting point, this paper analyses the processes of transformation of the *habitat* évolutif designed by João José Tinoco[3] in the neighbourhood promoted by the *Sociedade Imobiliária e de Administração Lda* (SIAL) in Mozambique. Built in the 1970s to accommodate the middle-class population serving the Mozambican capital, this neighbourhood has undergone a process of spatial decolonisation since the new inhabitants who came to occupy the dwellings after the country's independence in 1975 began to change them to accommodate their evolving comfort needs.

To examine this ever-changing habitat, the paper focuses on the inhabitants' discourses and new spatial practices based on interviews conducted by the author in 2019. The redesign of the dwellings complements the field observation, providing a solid base to understand how the post-colonial occupation of Mozambique's modern domestic environments and the contemporary living requirements have subverted this architecture's spatial and symbolic structure.

2. FROM HABITAT ÉVOLUTIF

As decolonisation initiatives spread throughout the African continent, the Portuguese government tried to assert and legitimise its presence in the colonial spaces by promoting, among other means, migration from Portugal to the "overseas territories". Two strategies were used for this purpose: one aimed at creating agricultural settlements scattered in rural areas, the so-called *colonatos*, while the other was based on free and spontaneous emigration, primarily to urban areas. The latter, the most numerous according to Cláudia Castelo, was the one that determined the socio-economic profile of the population of European origin that began to settle in Mozambique during the second half of the 20th century. Employed mainly in the public administration or the tertiary sector,[4] this mass of urban population brought new housing demands, resulting in the expansion of housing developments for the middle class.

In the Mozambican capital, Maputo (known as Lourenço Marques during the colonial period), middle-class real estate developments became widespread and increasingly vertical. The lack of urbanised land, owned by a small number of large companies; the municipal government's inability to provide infrastructure in developable areas;[5] and the proximity of surrounding suburban areas that limited the possibilities for horizontal urban expansion, are among the reasons that favoured this process of vertical densification.[6]

In this context of accelerated urban growth, the city of Matola gained relevance from the 1960s onwards as a sprawling residential area to the west of the Mozambican capital. This housing development did not follow the densified pattern of the former Lourenço Marques. Instead, it moved closer to the principles of the garden city, with detached and semi-detached single-family housing as the preferred prototype. The aim was to contribute to solving the housing problems of the so-called "economically weak". However, as António Rita-Ferreira pointed out,[7] their main users ended up being the middle-class population of European origin and the few local populations to whom the "*Estatuto do Indígena*" had given the label of "assimilated".[8]

In the case of SIAL, the settlement was developed in a designated area of the Fomento neighbourhood following the plan approved by the Matola Municipal Council in 1969. The so-called "economic" houses were designed by architect João José Tinoco, who conceived a series of standard dwellings with a wide range of dimensional and distributive variations that would respond to the inhabitants' diverse aspirations and financial capacities. The combination of different housing models surrounded by gardens would eventually materialise a vast horizontal grid to meet the housing needs of middle-class settlers arriving in Mozambique.

When designing the functional scheme of the dwellings, the architect used a horizontal division of the programme to establish a separation between service areas, assigned to household personnel, and the living and intimate areas, restricted to the family's use. The predetermined nature of these three zones contrasts with the indeterminacy of the mezzanine room located on the first floor – in the two-storey dwellings. This room reflects the desire "to provide a framework in which man can again be master of his home".[9]

4. Cláudia Castelo, "'O branco do mato de Lisboa': A colonização agrícola dirigida e os seus fantasmas," in *Os Outros da colonização - Ensaios sobre o colonialismo tardio em Moçambique*, ed. Cláudia Castelo, et al. (Lisboa: Imprensa de Ciências Sociais, 2012), 30.

8. The "Statute of the Indigenous" in force until 1961 had separated the majority of the African population, known as "Indigenous", from the rest, the "non-indigenous". In the middle were the so-called "assimilated"; Africans who, according to the colonial regime, had internalised Western values and behaviours. Eduardo Mondlane, Lutar por Moçambique (Maputo: Centro de Estudos Africanos, 1995), 43.

9. Smithson, "Team 10 Primer 1953-62," 355-56.

The double height linking the mezzanine room to the main living area further reinforces this desire. Connected to the ideas developed by Le Corbusier in his *Immuebles Villas*, this element provides an understanding of space as a simultaneity of events where space and time are intrinsically linked. The front and rear porches also foster this dynamic perception. As conceived, these "in-between spaces" would not only serve to protect the interior from the direct incidence of solar radiation but would also act as "thresholds" capable of hosting a plurality of additional uses valuable for the inhabitants' lives **(Fig. 1).**

Through these elements, the SIAL houses incorporated a latent idea of a flexible and transformable construction that, starting from a fixed organisational scheme, would support different modifications to be contemplated at the moment of execution and, later, once built and put into use. In other words, the dwellings were planned so that they could be extended beyond the originally defined boundaries, allowing for constant evolution – just like the *habitat* évolutif proposed by G. Candilis.

3. TO EVER-CHANGING HABITAT

At the time of Mozambique's independence in 1975, SIAL suspended its activities in the territory, and most of the homeowners abandoned the houses the company had built in the city of Matola. Those who had the chance sold their homes before leaving. Others handed over their properties to a friend or acquaintance. But most left the Mozambican territory abruptly, leaving the neighbourhood virtually empty for the next few years. The new occupants began to arrive in 1977 in a gradual process organised by the State rental agency, APIE, following the nationalisation of the abandoned housing stock in 1976.[10] Since then; the inhabitants have transformed the original layout and the ways of using it to accommodate their daily living requirements.

On one hand, the plots have undergone a process of densification due to the addition of new buildings detached from the original dwelling. Apart from outdoor kitchens, toilets or laundry areas, these "annexes" have begun to accommodate new uses other than those envisaged in the project, such as offices, gyms, beauty salons, small shops and even entire houses for other family members.

> *We've been living here for over 40 years. The house has three bedrooms, a living room, kitchen, and bathroom on the ground floor, as well as a living room and bedroom upstairs. We have since extended the house at the back, adding an outbuilding with a bedroom, bathroom and kitchen. We also covered the service patio to make a veranda for sitting outside in the summer (Dweller 1).*

Where new constructions have been added, the kitchens of the main house have often been moved outside to allow the use of charcoal as fuel or to keep the interior free from clutter. In the same way that cooking is done outside, there is also a tendency to eat outside to take advantage of natural

10. For more information on the housing nationalisation process that followed Mozambique's independence, see David Morton, Age of Concrete: Housing and the Shape of Aspiration in the Capital of Mozambique (Athens: Ohio University Press, 2019); and Patricia Noormahomed, "Towards the Definition of an Ever-Changing Heritage: A Reading of the (Re)Appropriation Processes of the Torres Vermelhas in Mozambique," *Curator: The Museum Journal* 65, no. 3 (2022)

ventilation. In these cases, the indoor space has become a formal area only used on special occasions and for certain guests.

> *We mainly use the outdoor kitchen for cooking; the one inside is just for small things. The living room is only for visitors. We watch TV upstairs [in the mezzanine] because there you can open the windows on one side and the balcony doors on the other, and the air flows through (Dweller 2).*

These alterations reveal new domesticities with the renewed use of the outdoors: living is no longer restricted to the interior; the exterior becomes an extension of the home. In this process, not only have occupancy rates increased, but the very conception of the housing prototype has been significantly altered. As dwellings have come to accommodate different generations of the same family due to cohabitation practices, they have gone from single-family to multi-family.

> *The house is exactly as we bought it. It has three bedrooms, a bathroom, a kitchen and a common room on the ground floor and a mezzanine floor where there is another living room and two bedrooms with another bathroom. We're using the house as we found it. The only thing we've changed is the backyard because as the family has grown, the house is no longer enough for everyone. So, we built small rooms outside for the children and an outdoor kitchen (Dweller 2).*

Similarly, as the new building extensions are being used for commercial and other activities related to the tertiary sector, the residential prototype and its surroundings have begun to take on new meanings as an overlapping of mixed uses in their "in-between spaces".

In the interior of the dwellings, João José Tinoco's évolutif design has also allowed the space to undergo a wide range of modifications throughout its different temporalities without compromising the original formal expression. Most of these transformations aim to increase the living area of the dwellings. To this end, the backyard porch has been, in some cases, closed off to extend the living room and kitchen area **(Fig. 2).**

> *We extended the back of the house to enlarge the kitchen as well as the living room and create a dining room – that way, the house was tailored to our liking. We also built another garage opposite the original garage (Dweller 3).*

Some garages and front porches have also been partially or entirely enclosed to incorporate their surface into the indoor living space.

> *Some people have altered their homes. Some have enlarged the living room by closing off the front porch. Others have done the same*

but with the garages. Others have been more radical and made a staircase outside the house that connects directly to the first floor. As the top floor is spacious, they now have two independent houses, one upstairs and one downstairs (Dweller 4).

In other cases, extensions have been made by taking advantage of the large attic below the steeply pitched roofs in those models initially designed with a double height. The indeterminacy of the mezzanine floor has thus achieved its purpose of allowing the dwellings to grow vertically. As a result, the dwellers have been able to increase the number of bedrooms to adapt the space to their diverse family structures. In doing so, they have diluted the horizontal separation of the programme as proposed by the original schemes.

We bought the house with two bedrooms and then extended it to add two more. The house originally had only a ground floor, but it was already prepared to have a second floor because it had stairs leading to the mezzanine and the attic. […] We then built an upper floor with two bedrooms, a balcony, and a library (Dweller 3).

The most interesting aspect of this process is that some of the modifications were already carried out during the execution of the dwellings.

Initially, the house was designed with three bedrooms downstairs, but during construction, we asked them to remove one of the bedrooms to make the living room bigger. So, the house was left with just two bedrooms. At that time, we only had two children, so it wasn't a problem. Later, we had another one, so the girl slept in one of the bedrooms downstairs, and the two boys slept on a bunk bed in the mezzanine studio area. Then, in the year 2000, we modified the upper floor and added another bedroom and a small living room (Dweller 5).

In short, as needs change, the inhabitants echo them by transforming the space to adapt it to the specific requirements of each stage of their lives. In the process, the reinforced concrete structure of the houses has not only remained safe and unaltered but has also proved its flexibility in easily accommodating each change **(Fig. 3).**

4. CONCLUSIONS

Overall, the transformations observed in the SIAL neighbourhood reflect the process of spatial decolonisation that the modern housing of Mozambique has undergone since independence. In response to their changing perceptions, desires, needs and aspirations, the inhabitants have transformed and adapted the space and given it new meanings according to their different identities. However, despite their sometimes-radical nature, these changes have not erased the essence of the project. On the contrary, they are signs

Her research field is the architecture of the 20th century, focusing on the modern housing of Mozambique and the (re) conceptualisation of its heritage.

DEPARTURE FROM THE CHANDIGARH STYLE: CONTEMPORARY ADAPTATION TO THE REGULATED MARLA HOUSE

PRIYA GUPTA
FACULTY OF ARCHITECTURE, CEPT UNIVERSITY, INDIA

ABSTRACT

This paper analyses critical design principles of indigenous modernism in the *Marla* house- a colloquial term for the private row house of Chandigarh- and their relevance and obsolescence under the changing notion of comfort. The Marla House was derived from government housing that modernized domestic living in post-independent India. Marla House attempted to provide dignified housing with scarce resources, address climate challenges, and adapt to cultural needs. A lesser deliberated fact is that the development controls of the 1950s regulated these houses. It created uniquely similar spatial planning through similar layouts and facades through standardized openings and projections derived from Corbusier's Modulor, material limitations of exposed brick, and whitewashed projections, and a limited built volume imbibing Corbusier's 'sun space and verdure.' This standardization is intended to achieve dignified urban living and fasten development at a time when there were limited architects. It also standardized everyday life and the notion of comfort.

Since the 1990s, relaxations in dated regulations have been catering to changing lifestyles and expanding the design agency of the residents to transform their homes and evolve their notions of comfort. The transformations have foregone critical features like verandahs, terraces, and brick *jaalis* for space maximization - increasing and merging rooms, introducing attached toilets, and making open and modular kitchens. Transformations from the Modulor-sized window openings to glass fascination depart from the modernist tropes.

The study identifies transformations in the row houses through an architectural survey. It collates the affordances of the house, everyday practices, and the need to retrofit through semi-structured interviews of residents, architects, administration stakeholders and experts. This study gives an insight into the trajectories of lesser-known Marla house transformations as a departure from mid-20th-century Indigenous modernism and the residents' changing notion of comfort and value of these houses as a modern heritage as future practices.

#32

1. INTRODUCTION

Chandigarh's modernism, besides being rooted in principles of CIAM, neighborhood unit, and Garden City, is layered with aspirations of nation-building, a new way of dignified living in independent India, negotiations with modernity via the colonial baggage, austerity in scarcity[1], and the ideologies of multiple and contesting authorships[2] that came from a messy transnational collaboration[3]. Chandigarh, therefore, is often seen as two cities, one of Le Corbusier's footprints - the Capitol Complex and the grand schema of planning, and one of the everyday city that borrows part of Corbusier's modernism, Jeanneret-Fry-Drew's contextual sensibilities and attempts by Indian counterparts like MN Sharma, SD Sharma, and Aditya Prakash to interpret and indigenize modern architecture. The simultaneity in negotiating the region's uniqueness and the universals of science and function can help build the concept of 'Indigenous modernities,'[4] most visible in domestic architecture.

Factors like climate, technology, materials, and the forces of tradition that shape domestic space, when imposed by a standardized and aesthetic regulatory framework, direct toward political and moral complexities of identity, ownership, and dehumanization. However, the volumetric regulations can be seen as integral to modern life for health and safety, a tool to facilitate the construction and integration of technological advancements.

This paper deliberates on how regulations in Chandigarh standardized private domestic space use, the notion of comfort in the 1950s, and its relaxations in the 1990s introduced the agency to alter the houses with the changing lifestyle. It identifies common renovations and resilient features but also questions the role of regulations in balancing the values of modernist idioms and present-day comfort and urban order.

2. DECODING THE REGULATED MARLA HOUSE

The perspective of spatial organization for a house and the uses a house enables builds the interconnection of what the space is and what it does – ensuring what it affords the resident. This affordance builds a notion of comfort. The Marla house was drawn from the already developed designs of government houses. These houses attempted to address aspects of climate cost and culture and established a 'Modern Indian Vernacular.'[5]

The Marla houses draw from their spatial planning (along with façade design) to accommodate regional practices of outdoor sleeping in private outdoor enclosures, using ground stoves (*chulhas*) in the kitchens, and toilets away from the house for hygiene. It aided the notion of comfort of the 1950s. More importantly, they set the city's benchmark through Development Controls for private domestic architecture.

Private housing accounts for 70% of the total housing, of which *Marla houses*[6], a colloquial term for row houses, account for almost 50% of this private housing. This study focuses on Marla houses – the most common being 5Marla, 7Marla, and 10Marla. The need to regulate private domestic architecture arose due to the initial haphazard development,[7] and the Capitol Project Team[8] held the design agency. Other relevant reasons were the lack

of qualified architects, the demand for building quickly, and a vision to have a distinctly urban character.

The Development Controls include Zoning, Architectural Controls, Frame Controls, and Standard Drawings for the private houses. The regulations included detailed drawing sheets and clauses about the limitations on the volume, setbacks, façade design, and integration of services. The Chandigarh Style[9], connotated as "simple, austere brick houses with plastered, whitewashed bands of *chajjas* (cantilevers)"[10], also encompasses the Marla houses through these regulations. They stipulated door-window sizes derived from the Modulor, façade materials, and location of services. While the volume and façade were coded and regulated, the spatial planning also got standardized. The controls ensured a visual urban order, Corbusier's 'Sun Space and Verdure'[11] as standards for dignified urban living.

3. SPATIAL PLANNING OF THE REGULATED MARLA HOUSE

The city was planned in two phases, and the regulations for houses varied in both. Phase 1 had Architecture Control applicable on V4 streets and Frame Control on houses up to 10 Marla. Phase 2 only had Frame Control. While Architecture Controls dictated the external façade design, volume, and initially even the internal planning, Frame Controls were limited to the volumetric extents, outer frame within which the house was to be built, and the façade aperture sizes as per a template of Modulor dimensioned door-window sizes. However, a study of the archival drawings and the architectural survey suggests standardized planning even in Frame-Controlled houses that resemble government house plans, architectural control drawings, and standard drawings. Therefore, all houses had *barsaatis* (a low-height roofed structure above the house), brick *jaalis* (lattice screen), *roshandaans* (clerestory top hung window and mesh), chulhas and flue, two-bay layouts, gallery spaces, verandahs, separated toilet units - all of which defined interior spatial planning and interstitial spaces. Most of these elements attempted to reduce cost, counter the climate, and accommodate local cultural practices. The typical spatial configurations are mentioned below.

3.1. REGULATING THE VOLUME OF THE HOUSE

A narrow front and a deep plot had economized land value and services. The controls accommodated a regional practice of outdoor sleeping and regulated it in the built form. Phase 1 houses had two and a half floors – almost a box-like structure, and the half floor on the top accommodated a *barsaati* that was used as a shelter for sleeping, especially during the rains. This began to be commonly called the Dhai-manzil (two and a half floors). Indian counterparts altered the Marla house for Phase 2 by introducing recessed terraces on each floor for outdoor sleeping and making it three floors **(Fig. 1D, E, and I)**. Window openings on the facades of Frame Controlled houses were regulated under the Modulor proportions. The small windows were preferred to reduce lintel and glass costs, reducing daylight intake into the Marla houses.

8. The Capitol Project Team was Le Corbusier, Pierre Jeanneret, Maxwell Fry, Jane Drew and Indian architects Aditya Prakash, M N Sharma, S D Sharma, and Eulie Chaudhary. Archival records show Aditya Prakash introducing frame controls and names of Pierre Jeanneret, M N Sharma and Aditya Prakash on Architecture Control drawings

11. 'Sun, Space and Verdure' was a planning concept by Le Corbusier. Refer - Randhawa MS, "Landscape and Gardening" *MARG,* (December, 1961): 49-50 and *Chandigarh Master Plan 2031*.

3.2. CONFIGURATION OF DOMESTIC SPACE

A typical plan had two bays due to the structural limitations of load-bearing walls. Larger houses had an additional gallery (corridor) space between the rooms to segregate a passageway for the cleaners and sweepers. Two bays had independent access from the front and back yard – and some residents recall renting one bay in the initial days for income that pays off the loan. Each bay had two interconnected rooms, one leading to the other. The division between these two rooms usually had storage units. The wood-paneled, half-double-doors between the bays in the interior would save circulation space within the narrow bays.

Verandah afforded adjacency to the kitchen, toilet, and backyard (also in the front adjacent to a toilet and staircase in Phase 2) **(Figure 1 A,B,C for Phase 1, D,E for Phase 2, Figure 2a)**. The rear rooms opened into this shaded and semi-enclosed configuration of verandah. Residents, therefore, vouched for its comfort in rain, winters, summer mornings, and evenings and cited it as the most used space.

The architectural survey showcased standardization of the toilets' location, layout, and access based on proximity to the service lanes to save cost and access to toilets from outside for hygiene **(Figure 2a)**. Phase 1 had toilets at the back, and Phase 2 had toilets at the front of the house. Separate WC, bathing, and washing sufficed to have a toilet module on each floor. While Architecture Control stipulated that houses should have staircases in the front, it became a common choice in Frame Control houses as it enabled an easy and independent floor renting.

3.3. INTERSTITIAL SPACES AFFECTING INTERIOR PLANNING

The semi-enclosed spaces - the terraces and verandahs became interstitial spaces that helped transition from a built to an unbuilt space. It facilitated the idea of an enclosure and a sense of control concerning the level of exposure to neighbors. In Phase 1, the upper floors had verandahs and barsaati, and in Phase 2, each floor had a 12 ft recess to accommodate terraces.

Brick *jaalis* determined the interstitiality of the barsaati in Phase 1 and terraces in Phase 2 by partially enclosing them **(Figure 1a, b, d, Figure 3b)**. The jaalis' height, location, and brick patterns were largely regulated to ensure ventilation, cut the harsh sunlight, and provide a visual buffer from the neighbors. The Jaalis became a cheaper, quicker, and integral decorative element in varying permutations of brick. Therefore, these architectural elements collectively defined an interiority in the Marla house in the 1950s –outdoor yet private and established an aesthetic play in the regulated street picture.

4. RELAXATIONS IN THE MARLA HOUSE

The 21st-century domestic space derives comfort through space maximization and expanding interior spaces to accommodate independent multigenerational family units, renting floors, and new domestic technologies in the house. Since the 1990s, the Chandigarh Administration, to accommodate such needs, has proposed piecemeal relaxations that have enabled significant changes in spatial planning and aesthetics of the façade.

Figure 1 Plans for Marla Houses. Phase 1 – Old houses and renovations (A) and (B), Rebuilt (C). Phase 2 – Renovations (D) Rebuilt (E) Sections – (F) Phase 1 old, (G) Phase 2 – Old, (H) Rebuilt – both for phase 1 and 2, (I) Renovations within the old built area. © Author

Figure 3 Phase 2 - Recessed Terraces (A), Photo from the extensions showing back-to back hovels (B), Front Elevation of one old and one rebuilt house adjacent to each other in Phase 1 (C) © Author

A critical relaxation has been the increase in permissible built-up areas. From an estimated 50% ground cover, the Marla houses today can build almost a 70% of plot area (all floors), including a partial backyard cover and permitted basements. Additionally, relaxations permitted a percentage of floor area to be used as a workspace for select professionals, everyday amenity services of the STD-PCO-FAX[12]-Internet cafes, photostats, creche, and rent to paying guests. They also introduced a controversial Apartment Act[13] of floor-wise ownership. Another façade relaxation permits any size and shape of openings, discarding the Modulor. These relaxations paved the way for elaborate renovations in Marla houses.

Interviews with the stakeholders gave divergent stands, while the stakeholders in the administration claimed these were the best possible strategies based on needs. However, two former chief architects observed that the changes were "greed-based" and shortsighted. Ar. SD Sharma, the initial Capitol Project Team member, resonated with the latter, pointing out that a Marla house has a limit to what the house can provide. While this directs to the affordances – the changing notion of comfort and space use – exceeding the maximum capacity has threatened the urban order.

5. THE 21ST CENTURY EXPANDED MARLA HOUSE

Renovations in the last 30 years have shown that residents are adopting open floor plans and flexibility in space use **(Figure 1 and Figure 3)**, and

12. STD-PCO were Telephone services for local and national calling. FAX was a photocopying service.

13. Apartment Act enabled the floor-wise sale of plots where the house may be subdivided into separate dwelling units with not more than one dwelling per floor. After many objections, this Act was put on hold in 2007. However, the builders (and lawyers) found ways around it and started selling properties as a 'percentage shareholder-ship' - Ground floor 50%, First 30%, and Second 20%. With the area relaxations, this subdivision would be altered to 40-30-30.

interior changes were often independent of the relaxations. The interiors began accommodating fridges, air-conditioners, televisions, microwaves, oven-toaster grills, washing machines, and many more household items. The interviews suggest most renovations were piecemeal, with limited civil work and interior alterations. The most common renovations have been integrating toilets, enclosing verandahs, and renovating kitchens. Without fail, residents cited the kitchen and rooms as small in size, implying that the size of these spaces is obsolete today. Kitchens mostly have become open and modular kitchens. Verandahs have been enclosed - either in opening glass panels or with walls and openable door windows for an additional room, or extended the kitchens into the verandahs to make larger, open, and modular kitchens, sometimes combined with small dining (**Figure 2b,d**)

A practicing architect who renovated more than 100 Marla houses explained the lifestyle changes that affect room sizes. A room initially 100 sq ft now becomes an individual living unit accommodating an attached toilet and wardrobe, increasing the size to 300 sq ft. The tripartite toilet unit for each floor now integrates the washbasin, bathing, and WC into a single unit with 2-3 toilet units per floor. Some houses have stores converted into toilets.

Another change has been merging the two interconnected rooms into a large open plan for drawing-dining using steel girders for structural stability **(Figure 2c)**. In interviews, residents claim the renovations allow space use flexibility, openness, and ease of hosting guests. The storage almirahs that separated the two rooms now moved adjacent to the new toilet modules. Considering the two-bay division is a structural wall, residents prefer not to touch it and keep the room separate from the drawing-dining. However, the gallery spaces have been merged into rooms. These examples showcase the adaptability of the Marla house.

However, renovations that enclose the interstitial spaces threatened the modern idiom of sun space and verdure. The piecemeal relaxation on the ground floor has permitted extensions in the backyard that initially started from a store, now allowing a 4ft width of the plot extension and a tail into the backyard **(Figure 3a,b)**. In Phase 2, the stepped terraces are permitted to be enclosed as box-like houses (**Figure 1h, Figure 3a**). These relaxations have increased the proximity with neighbors at the rear end of the house. A resident commented that neighbors now use the roof of the tail extension as a terrace, which visually invades their privacy in the backyard. Another resident commented on the reduced sunlight and closing in of their backyard due to extensions on both sides. Further, protruding balconies have discarded the *jaalis*. The rationale for the Modulor seems obsolete with a freehand on opening sizes. However, facades now have full-height glass panels with a limited cantilevered shade that defeats climate responsiveness toward heat gain **(Figure 3c).** The large glass windows have exposed the interior domesticity and raised electricity bills. The built form no longer adheres to the climatic responsibility or urban order due to the relaxed regulations.

6. CONCLUSION

The adaptability of space reflects the relevance of the indigenous modernist tropes accommodating the changing needs. However, the extent of expansions and additions based on market-driven approaches is questionable. Three renovation tangents emerge. First - Minor expansions within the Marla house retain integral historic values and reflect adaptability for minor renovations, such as expanding to accommodate domestic technologies, larger kitchens, and larger toilets or merging rooms. Second, the Marla houses, now with permissions, encroach onto the interstitial space that showcases space maximization on the same plot. Third, Marla houses are rebuilt under the relaxations to monetize the selling of the house as a percentage of the stakeholder scheme (Apartment Act).

The second and third trajectories exceed the initial stipulated footprint and disrupt the urban order. The Marla house loses its value as a modern heritage, intrudes into the privacy of neighbors' backyards, and resembles back-to-back hovels of industrial towns.

However, renovations within the initially permitted-built floor plan reflect the adaptability and incremental nature of the Marla house. They reflect the current relevance of passive strategies within the house as a climate response. When supported with careful relaxations that continue to respond to climate, new construction techniques, and domestic technologies, there is a possibility to retain heritage value and yet expand the design agency rather than a mere floor area. ■

Her academic experience is in 20th-century Modern Architecture, the Theory of Design, and the History of Urban Form.

REFLECTIONS ON MINIMUM SPACE LIVING IN MACAU

NICCOLÒ ARNALDO GALLIANO
CITUA - IST - UNIVERSITY OF LISBON

ANA TOSTÕES
CITUA - IST - UNIVERSITY OF LISBON

ABSTRACT

The present paper contemplates the ground of research of emerging forms of inhabiting spaces in contemporary urban territories, with a precise focus on Macau's 1960s housing production and its building lifetime. The focus goes to domestic space's architectural conception of resettlement housing production, seen as paradigmatic cases of colonial municipal response to the housing shortage recognised in the Pearl River Delta.

Within the context of valorisation and conservation of Modern Movement architecture, presenting pressing intricate challenges intimately tied to cultural significance, this proposal aims to analyse and present resettlement realities which combine valid minimum format living solutions and adaptive design circumstances.

In order to settle a comprehensive understanding about first statements of architectural modernity in the field of modern housing built in the Pearl River Delta's region as hybrid interpretation of Modern Movement's ideals in colonial Asian territory, this paper aims to approach a case study which shows adaptation of Modern features to sub-tropical cultures, climate, and environment.

Drawing on archival documents, architectural records, oral histories and photographic surveys, the present reflection investigates problematics and potentialities of single space compartment unit format, within consideration of ways in which residents adapted to and coped with the constraints of minimum space living.

The present essay aims to unravel similarities and differences in the spatial constraints faced by inhabitants from 1960s' building inauguration to their lifetime forms of occupation, reshaping how individuals inhabit their homes to meet evolving needs and preferences within domestic behaviours.

Looking to unveil how housing design solutions from the Modern Movement era can effectively address changing necessities and improve spatial comfort while simultaneously striving to achieve objectives such as climate comfort and flexibility, the main goal of this proposal is to identify potentialities for innovative solutions between variations of housing typologies and spatial distributions in high-density living condition.

This work has been funded by national funds, Fundação para a Ciência e a Tecnologia (FCT) in the framework of project UIDB/05703/2020 from the research unit CiTUA. Written in collaboration with Daniela Arnaut, assistant guest professor, CiTUA - IST - University of Lisbon.

1. INTRODUCTION

When governments globally implemented ambitious housing initiatives to offer shelter to a larger public and enhance living standards, they portrayed it as a hallmark of progressive and democratic society. This decisive path included revolutionary changes in urban landscapes, embracing fresh perspectives of architectural design, exploring innovative materials and methodologies, redefining spatial arrangements, and fostering social change.

Currently, to navigate the complexities associated with this historical legacy represents an effortful challenge within a dynamically evolving milieu. Buildings are required to meet new characteristics and adhere to contemporary rigorous criteria, alongside the rapid fluctuations in sociocultural, political, and economic paradigms.

During the early 20th century, continental Europe undertook significant endeavours to transform nascent industrial cities into refined and green urban centres. Advancements in sanitation, public health, and provision of social housing played pivotal roles in metamorphosing dilapidated and unsanitary slums into habitable urban environments. Thus, erstwhile inhospitable sites were transfigured into symbols of modern civilization.

Subsequent to World War II, the domain of social housing witnessed a robust expansion consolidating itself worldwide, albeit with varying degrees of growth and implementation across different latitudes.

In case of Macau, former Portuguese colony, the urbanization process has primarily evolved within the framework of Western urban planning models and architectural conventions, with few adjustments made to accommodate local nuances. The historical integration of Western architectural styles, coupled with the emergence of novel modernist endeavours, underscores the distinctive nature of South China Sea's concession as atypical case studies.

Macau, characterized by its dual cultural heritage and simultaneous connections to both, West and East traditions, assumes a pivotal role in exploring intersections of modernist principles, rooted in Eurocentric ideologies, with rich Asian cultural legacies, uncommon climatic conditions, and local knowledge systems.

Macau area, during the whole 20th century, has been hit by uncontrolled cross-border immigrants flew; due to the persistent socio-economic upheavals and the proliferation of socialist movements within mainland China, people intermittently sought refuge by crossing borders into Pearl River Delta's colonies. The short available land of Macau's Island, beyond the consolidated historical urban framework, was mostly occupied by improvised shelters and unorganized areas.

Due to the urgent necessity to offer decent homes to a larger public and enhance living standards, first developments of public housing in Macau were primarily designed as temporary resettlement housing scheme. The case study on focus in this paper is unfolded in this background.

2. ILHA VERDE RESETTLEMENT HOUSING – KNOWLEDGE FROM THE PAST

Resettlement Housing Block of Ilha Verde Area, designed during 1962 and inaugurated in 1964 by young Portuguese Architects Manuel Vicente and Natalia Gomes, is one of the inaugural resettlement housing buildings built in Macau region.

The building under analysis, as part of an urban plan addressed to economically vulnerable families, is a single-block experiment replicated into a second volume located on the north side of the plot.

As one of the first gest of social housing in Ilha Verde Area, north-west of Macau, it pretends to maximize the assessment of available space, with a total of 90 apartments distributed over 5 storeys.

The project divides its floor plan into 18 residential units, and it is characterized by a rational space distribution in plan and section.

Affordable Housing Block's vertical distribution is provided by a unique central core of walk-up stairs located in the middle of the rectangular perimeter, dividing the volume into two wings. Horizontal distribution is made by an exterior common gallery which walks along the interior perimetral line of the building, on the opposite side of the street-facing façade, which allows each unit to benefit from private access and natural cross-ventilation. Minimum available area is given to circulation with the intention of maximising living-use spaces.

Each unit, of about 25 m^2, is composed of a single-compartment solution with integrated facilities. In order to suggest living/sleeping activities in the internal main space, the room is divided into two zones without resorting to a wall, but with a two-step stair and an item of fixed furniture. The south-facing apartment's side is furnished with a balcony so that the living experience can advance outside. The exterior space is obtained by a volume subtraction, which provides diagonal sun protection in response to the hot and humid subtropical climate. The informal outside living area is sheltered from high temperatures of the rising sun (east and west) and a concrete fixed washbasin is integrated with the handrail protection, in order to solve washing laundry needs. Water facilities, for economic reasons, assume a minimum space format, sharing plumbing and drainage systems with the neighbours' dwellings. The bathroom, equipped by modest installations, opens to the balcony because of hygienic purposes. The kitchen, divided by open fixed wood vertical and horizontal partitions, participates in the main household dynamics.

Units' walls and ceilings are not coated, but just painted; only the balcony surfaces, for conservation and weather protection reasons, are thought to be covered with marbleite, which does not require frequent maintenance.

The building is supported by a structural frame of reinforced concrete and infill panels of concrete blocks forming double-wall partitions. The air chamber in between units satisfies thermal and acoustic insulation. The bottom floor ceiling concrete slab is covered by fibre cement sloping panels. Inclined roofs combined economic and efficient materials with climate prevention to occasional heavy subtropical rains and typhoons.

In the façade, the architect expresses strong relationship between the interior and exterior, showing light filters and maximum functionality. The visual portrait is marked by the adoption of the interior matrix and enriched by a gentle setback of the open balcony in the principal line. A set of interesting rhythms of void and volume is maintained by the staircase core located in the middle of the two apartment's wings, also setback towards the street line.

The use of raw concrete, steel, and glass gave to Affordable Housing Block of Ilha Verde a bold and innovative character. The white-painted structure creates a grid-like pattern that emphasizes the modular units of the building, while also providing a sense of simplicity and functionality. The overall result is an orthogonal plain minimal design that is both striking and functional.

The building in question, like most other examples of Modern Architecture in Macau, is in a state of severe disrepair and very poor state of conservation, exacerbated by numerous significant modifications. Economic considerations supersede heritage values, and this important architectural example in Macau's urban landscape can be considered as endanger of fade over time.

3. ILHA VERDE RESETTLEMENT HOUSING – FROM THE PRESENT

Looking to unveil how housing design solutions from the Modern Movement era can effectively address contemporary needs, while simultaneously striving to achieve objectives such as comfort and flexibility, the present analysis regarding the project on focus aims to discern opportunities and solutions amidst diverse forms of occupation of the housing typology and interior spatial configurations within high-density living condition.

By juxtaposing the original architectural design with the present occupancy, we can delineate the progression of significant sociocultural shifts that have influenced modifications of domestic spaces and assess the responsiveness of the case study to the changing comfort necessities over the past decades.

The main two goals were, on one hand, to recognize principal metamorphoses within the domestic sphere undertaken to accommodate evolving comfort requisites subsequent to 60 years of occupancy; and on the other hand, to identify resilient and obsolete features, assessing their capacity for adaptation and alignment to evolving comfort requirements.

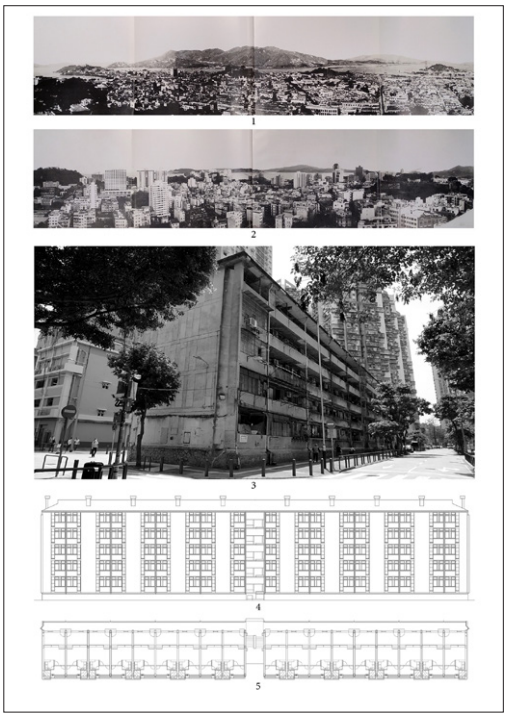
Reflections on interior design schemes regarding the appropriation of space within the apartments throughout its lifespan encompass a nuanced exploration of spatial dynamics, patterns' utilization, and socio-cultural influences. The analytical endeavour about Resettlement Housing of Ilha Verde Area delves into the evolution of single-compartment apartment's form and function over time, considering factors such as resident demographics, lifestyle changes, and external societal trends.

By scrutinizing the spatial adaptations, rearrangements, and modifications undertaken within the typology, the appropriation of the external spaces

through terrace enclosures has been the most common character to notice. The necessity of a larger internal area in such a minimum living format resulted in a fundamental feature among our survey. This behaviour changes inhabitants' interactions with their living environment, as well as broader contextual shifts shaping contemporary domesticity and new plasticity of the external façade.

Looking at the interior configuration, the old terrace, most of the time, hosts relocated kitchen counters, dining areas or laundry corners equipped with modern washing machines and storage furniture.

Besides, the present analysis not only illuminates pragmatic considerations driving spatial appropriation but also unveils deeper narratives regarding identity, memory, and cultural expression embedded within the domestic realm. Another clear interpretation of spatial shift can be given by the current quantity of users occupying each unit. The number of inhabitants of most flats dropped from the original 4/5 people expected at its inaugural stage to mostly 2/3 people. In those cases, the interior elevated entrance platform is occupied by tiny double rooms furnished with double beds and wardrobes. Thin dry walls define and separate day/night use areas following the proportions suggested by the architects, guaranteeing comfortable living rooms. The room's minimum format fits perfectly basic furniture, providing different variations according to users' preferences.



When the occupancy keeps crowded standards (up to 6 users), the open compartment layouts are organized by the adoption of bunk bed disposal as a basic module. The most common case is the location of two bunk beds on the kitchen area's side and a double bed at the entrance corner, maintaining the original cooking facilities location and dining table on the side of the façade line.

Occasionally, units located on the ground floor changed function programs, turning into commercial or service use.

Street-facing retails create activities and public spaces which engage and dialogue with the current urban framework. Within the use of fixed step-up stairs in the front façade, the ground floor arcade's elevated access is made through the principal side of the building. By this, public shops bring new rhythms and communal corners, enhancing the building's integration with the surrounding area but keeping privacy of the apartments' entrance side.

Moreover, in this case of switched ground floor programs, the interior orthogonal scheme proposed in the original project by the architects leads to accurate proportions, suggesting subdivision of public, semi-public and private spaces.

Through a multidisciplinary lens, the study of interior design's reflection on space appropriation in living units offers valuable perspectives on the dynamic relationship between individuals, their habitats, and the societal milieu in which they reside.

4. CONCLUSIONS

Against a backdrop of rapid urbanization, population growth, and economic transformation, within the current housing scenario, the findings of this reflection aim to contribute to the broader debate on complexities and opportunities inherent to the delicate balance between transformation and preservation of domestic spaces.

By offering insights from historical roots to contemporary housing issues in the extremely densely populated city of Macau, the present article questions possible interpretations of domestic comfort which lived substantial evolution reshaping how individuals inhabit their homes.

Portuguese architects Manuel Vicente and Natalia Gomes found in Macau fertile grounds to approach the minimum format housing question within European and Asian cross-influence scenarios.

The project on focus displays evolutions of modern traits and advancements of resettlement architecture approaches in the Macanese built environment tracing lines of nitid distinction.

At distance of around 60 years, the building hosts the same program upfronting different realities and urban scales surroundings. Current forms of unit occupation highlight valid architect's vision of shaping typology solutions, directing the internal layout and gathering functional aspects of the dense and informal local culture of Macau.

"Affordable Housing Block of Ilha Verde" can be considered a "see around" building, which contains and draws rules and instruments to accommodate basic living needs.

Architects, with the adoption of single compartment solutions and minimum format unit plans, integrate technical facilities and draw flexible lines providing adjustable spaces according to user's behaviour. Even in the case of use/function relocation, the horizontal manners proposed by the architect in the original project guaranteed order, maximizing the assessment of available space.

Architects Manuel Vicente and Natalia Gomes, in this project, demonstrate how the modern conception could be interpreted, understood, and enriched in terms of content. They were able to face and respond to diverse physical and social conditions, experimenting innovative solutions which remain currently interesting and valid.

As part of the architectural scenario endanger of fade over time, Resettlement Housing of Ilha Verde Area, among other housing works representing part of Modern Macanese foundations, deserves further consideration and interaction with public interest and memory. ■

ABSTRACT

Social housing projects bear significant historical and architectural importance within modern architecture, arising as responses to the urgent need for affordable and adequate housing for the working class during rapid urbanisation. Completed in 1977 by Kamran Diba Architect, Shushtar New Town in Iran stands out as a rare example of modern development in Iran built with attention to regional vernacular architecture. Its primary purpose was to house employees of a specific company, although the city was designed to accommodate families from different income groups. Today, maintaining social sustainability is a universal factor in the generic discourse of social housing. Although the term "social sustainability" was coined after the emergence of Shushtar New Town, Diba's design considerations reflect an attempt to maximise the social sustainability of the complex. Diba conceived Shushtar New Town based on the idea of creating social and civic engagement. This research focuses on examining the role of open and semi-open spaces, such as open areas, courtyards, terraces, and patios, in promoting social sustainability within residential areas in Shushtar New Town. By analysing the resident-led changes and their underlying dynamics, the research aims to derive valuable insights for future design projects and heritage preservation efforts in social housing. Open spaces play a vital role in the social sustainability process as they offer more. The proposed methodology ensures a comprehensive understanding of spatial transformations and resident experiences in these social housing projects. In this regard, the research employs descriptive-analytical methods, library-applied research, and case studies. This research is part of an ongoing PhD thesis, at FAUP, supervised by Prof. Helder Casal Ribeiro.

1. INTRODUCTION

In the early 1970s, Iran experienced a sharp rise in oil revenues and the political ambitions of the government led to large-scale investments. This resulted in a boom in housing construction and new urban developments. Prefabricated housing emerged as a response to the growing housing market and to shorten construction times. This method of construction, which seemed more economical and practical, was welcomed by investors. The prevailing conditions were based on a Western materialistic and quantitative approach, which was alien to the cultural and social values of Iranian society. On the other hand, the sudden development and abundance of jobs due to the expansion of industry caused massive population migration from rural areas, leading to the need to create residential complexes to house the workforce migrating to cities, and numerous residential complexes were built. The "Shushtar New Town" was also designed and implemented during these years to accommodate employees of the Karun Agro-Industry Company.

"This project is located near the ancient city of Shushtar in the southwest of Iran and follows the traditional urban pattern of Iranian cities with an interwoven urban fabric and bricks (mud) as building materials".[1] The design intentionally incorporated the traditional elements of Shushtar's historical architecture to maintain cultural continuity and respect for the region's heritage.

Upon completion of the first phase of the project in 1977, the outcome was an impressive new hybrid city that effectively reintroduced Shushtar's traditional architectural features within a modern framework. This blending of old and new elements created a unique urban environment that celebrated the historical aesthetic of Shushtar while also accommodating contemporary needs.

2. SOCIAL HOUSING

According to Davis (1995), "Social housing projects hold considerable historical and architectural significance within the realm of modern architecture. They arose in response to the urgent need for affordable and suitable housing".[2]

'The core concept of "public housing" or "social housing" in Iran was formed as a result of the advent of modernisation in the 1940s'.[3]

The creation of social housing was undoubtedly a tool for their social engineering programme and agenda to project a progressive global image for Iran. However, this resulted in a rise in inadequate social housing provision during the 1960s and 1970s, affecting the country's identity and people's attitudes towards the Iranian-Islamic way of life. Criticism from opposition groups led the government to explore alternative solutions to social housing design.[4] Shushtar New Town was presented as an alternative for developing social housing that could address the environmental and cultural aspects while meeting the physical and psychological needs of its residents (**Fig. 1**).

3. INTRODUCING DIBA'S LINE OF THINKING IN DESIGN

Kamran Diba is one of the prominent Iranian architects, having greatly influenced the evolution of contemporary architectural discussions in Iran.

4. Amirjani, "Shushtar New Town: A Turning Point in Iranian Social Housing History.", 3.

"Diba designed Shushtar New Town based on his own perception and understanding of the region and its vernacular architectural elements".[5]

Diba's design method for residential projects prioritised regional cultures and people's behaviour over the functionalist approach of Modern architecture. Diba regarded himself as a "human-friendly" or "culture-friendly" architect, aiming to meet people's desires through design practices rooted in social and humanistic principles.[6]

Overall, Kamran Diba's design for Shushtar New Town reflects his commitment to enhancing quality of life and social sustainability through a design approach that is both innovative and deeply rooted in cultural context. Diba's architectural works bridge traditional Iranian architecture with modern architecture.[7]

Thus, Diba's approach was characterised by a mediating strategy, balancing modern innovations with respect for local traditions. He focused on updating traditional design elements rather than imposing radical new concepts, maintaining a harmonious blend of old and new.[8]

4. KAMRAN DIBA'S THEORIES IN OPEN SPACE

Diba's thinking in the design of New Shushtar reflects his loyalty to traditional and Iranian architecture. The central courtyard, which is one of the important elements of Iranian architecture, plays a prominent role in the spatial organisation of the investigated works. The combination of volumes in the plan has created a different shape of the central courtyard and has added to the spatial diversity of the semi-open space.

"Indeed, Diba replaced the concept of void, a Western phenomenon, with a central courtyard, an important vernacular housing element, to produce a more culturally friendly residential typology".[9]

Diba has been able to enhance the visual appeal through the spatial sequence, which is created through open, closed and semi-open spaces, and to enrich the emphasis on form such as symmetry, rhythm and movement. This type of design aims to provide individuals with a heightened awareness of the created space, and strengthens presence.

"Shushtar New Town is clustered low-rise carpet housing with medium density settlements. This project is laid out on an undulating site near Shushtar, overlooking a river".[10]

Shushtar New Town units are designed according to a courtyard housing model, providing privacy along with other well-known typological features. These designs include various two to three-bedroom and two-story houses, which are the most common types among the units. Additionally, Diba dedicated two sections of his planned project to low-rise units.[11] In addition, the dwellings are designed to incorporate the possibility of unit extension.

5. THE ROLE OF SOCIAL SUSTAINABILITY IN SHUSHTAR NEW TOWN

Today, maintaining social sustainability is a universal factor in the generic discourse of social housing.

Social sustainability interaction is one of the most valuable criteria in architecture, influenced by physical elements and serving as a common language among people. Architectural spaces vary and fulfil users' needs in different situations. Therefore, in architecture, people's relationships, social interactions, security and safety, as well as the quality of communal spaces, all play a significant role in social sustainability.[12]

In the Shushtar project, Diba designed the houses to be closely attached to each other, considering the horizontal density of the buildings because he believed that a certain interaction, coherence, and dialogue among residents would occur in the space between such buildings. These spaces allowed for activities such as children playing under parental supervision and residents socialising in green areas.[13]

Additionally, to address the extreme southern heat, Diba designed Shushtar's streets and open spaces to retain night-time coolness, prioritise pedestrian comfort, and enhance social interaction by eliminating car traffic and narrowing alleys.[14]

He avoided public greenery due to high maintenance costs, instead opting for using private courtyard gardens for shade and greenery. Although incomplete, planned gardens between housing phases were intended to keep the air cooler and fresher. These sustainable design choices aimed to provide shade, improve air circulation, enhance safety, and ensure privacy.

Shushtar´s mass-empty space pattern also heightens these notions through a clear hierarchy of courtyard implementation from urban to individual unit level. The spinal open space stretching through the complex serves as an urban courtyard, and the central open space the community courtyard, and each residential unit enjoys its individual interior courtyard. Community courtyards are more effective in this project, since every residential cluster has been organised around a central open space, reflecting Diba's focus on social sustainability.

At the same time, Diba incorporated the possibility of growing and extending the Shushtar New Town houses through a few simple modifications to the walls between the units.[15] This design approach enhances families' eco-dynamic and social sustainability and diversity.[16]

6. RESIDENT - LED SPATIAL TRANSFORMATION:

6.1. REASONS AND ADJUSTMENTS/ APPROPRIATIONS /UNDERTAKINGS

The design and construction of the new city of Shushtar began in 1974, and coupled with Diba's departure from Iran and the changes of the revolution, the construction of the complex was slow at first and then completely halted in 1979. After that, with the start of the Iran-Iraq war in 1980 and the arrival of war refugees to the unfinished New Shushtar, the social and physical structure of the city faced challenges in providing a well-organised and hospitable environment for its residents.

With the onset of the Iran-Iraq war, residents of war-torn cities were forced to abandon their homes and seek refuge in both nearby and distant cities. Some of them settled in Shushtar New Town; not only in the newly

constructed houses of Phase1 but also in unfinished houses and buildings, some of which lacked doors, windows, balcony railings, and had incomplete sanitary facilities. As a result, the town was occupied before it was truly ready, and under unauthorised conditions.

The residents of Shushtar New Town social housing project actively sought to personalise their houses and adjust them according to their evolving needs and preferences. Open spaces, including open areas, courtyard, terrace, and patio, played a vital role in this process. These spaces offered residents opportunities to create buffer zones, enhance privacy, foster social interactions, and more.

However, the many changes that have taken place in New Shushtar are disappointing: in one-story residential houses, some users filled up the windcatcher holes located in the courtyard walls. Second, almost all of the early tenants blocked the openings facing the pedestrian walkways. It is evident that both of these interventions were aimed at creating more privacy for families.[17]

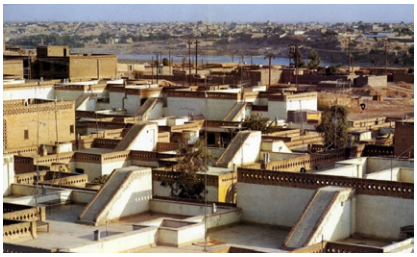
For privacy, a number of residents modified their courtyards and blocked their windows to prevent visual access from other units. Some even extended the walls up to the second floor and roofed the void from above.

In three-story residential homes, due to overcrowding from war and an influx of refugees, terraces have been either walled off to expand interior space, fenced in for security, or covered for increased privacy.

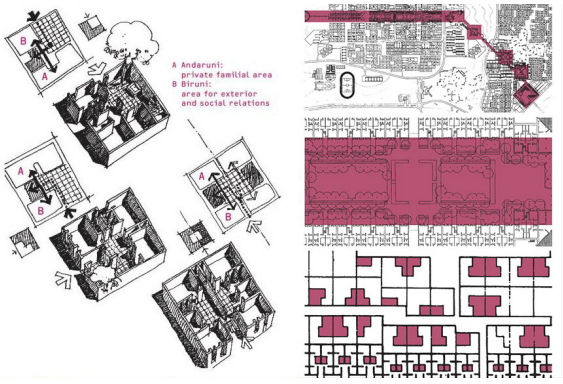
Due to the increase of immigrants, multiple families occupied each unit, with each family in a single room, and occupants sharing service areas. Most of the families transformed the rooms to suit their individual needs. Some occupants even installed new doors to separate their entrances.[18]

"Cars, originally and intelligently planned to be parked at specific, external points in favor of social interaction and walking priority, are now either parked in front of the houses or within the garage converted. Many demolished the external courtyard walls and replaced the entry doors with gate-like doors to house cars".[19]

It is not expected that the needs of the city will be halted over a period of time. Dynamism and change are factors that ensure the sustainability and vitality of an environment. However, what is lacking is a custodian with the responsibilities of a mayor who can control and guide the construction and changes under proper management.



7. CONCLUSION



Based on what has been discussed in this research, it could be stated that the main objective of Shushtar New Town has been to strive for improving the quality of life for its residents. Although unforeseen social events may have hindered the project from achieving its intended outcomes, Shushtar New Town remains an important and illustrative example among new towns. Kamran Diba considers the use of all valuable environmental potentials and resources essential in creating an environment that aligns with culture, tradition, and humanity in the process of producing an architectural work. He is among contemporary architects who carefully consider various dimensions of the design context in their projects. In most of his projects, Diba, besides

Reasons	Spatial transformation	photograph[1]
Privac	• Filling the windcatcher holes located in the walls of the courtyard. • Blocking openings facing pedestrian crossings. • Creating a roof for the courtyard and blocking the windows to prevent the visual access of other units.	
Security	• Converting a private yard into a parking lot. • Replacing the entry doors with gate-like doors for cars. • Extending the wall up to the second floor and roofing the void from the top.	
War	• Transforming the rooms according to their own condition and needs. • Building walls inside the rooms, creating new spaces for sleeping or as kitchens. • Converting a large number of balconies into small rooms.	

Figure 1. Kamran Diba, Shushtar New Town, Shushtar, Iran, 1974-1977.

Figure 2. Urban courtyard, community courtyard, and individual courtyard, Shirazi, after Diba, 1981.

Figure 3. Author, Table 1, Resident-led spatial transformation[20]

addressing the compatibility of functional needs, emphasises the physical situation created by the confrontation of social patterns and group behaviour, and does not separate his architecture from social meanings and dimensions. In fact, what distinguishes this project from other similar projects, both nationally and internationally, is the underlying social approach embedded within it.

Taking into account the two-way relationship between the user community and the physical structure of this town, regulated based on social-cultural interactions and ties, further emphasises its significance. This new town aims to establish a physical continuity with the historical city of Shushtar and, in addition, can be considered one of the few towns loyal to cultural-indigenous and local indices.

In the design of some units, a method has been employed that allows for the expansion of adjacent units by removing the courtyard walls. This possibility of expanding dimensions leads to internal social transformation in the neighbourhood and provides an inherent dynamic for socio-economic movement. In Shushtar New Town, Diba introduced a valuable pattern according to the needs and lifestyle of a new identity, which has a regional identity and is derived from the same social context. Although Diba's theory offered an exciting living environment and he hoped to enhance the social sustainability of the complex by increasing interaction between users and between the old and new towns, the project's incompleteness ultimately prevented it from achieving these goals. Considering that in residential complexes designed and built using mass construction methods, residents attempt to align the architecture with their lifestyle and needs by making changes. In the absence of a plan, established laws, or a management scheme for these modifications, this can lead to chaos and disorder. This results in the deterioration of the design quality, as well as wasted time and resources.

20. Source of all table photos: Amirjani, Rahmatollah. "Shushtar New Town: A Turning Point in Iranian Social Housing History." Doctor of Philosophy in Architecture, University of Canberra, 2020. (photographs reproduced with the permission of Rahmatullah Amirjani)

Therefore, the work does not end with the completion of the construction; rather, consistent and ongoing management of the habitation and modifications is necessary. Consequently, effective management throughout the design, construction and post-occupancy phases is crucial. In this complex, it appears that a lack of management and disorganisation has enhanced related issues. ■

ABSTRACT

Gesamtkunstwerk is one of the mottos of modern architects at the beginning of the 20th century. Following a romanticism placed between Richard Wagner and William Morris, the Modern Movement brought innovative interior design concepts, experimenting with housing and public equipment. Based on the vision that the spatial and construction creation must address everything, designers are often responsible for the interiors of their works. However, interior design has specificities that differentiate it from building design. Several variables can intervene, compromising the strict *Gesamtkunstwerk* concept and allowing hybrid contaminations at conception or throughout its life. The first of these is the greater susceptibility to intervention by the clients, who often assume the role of designer, understanding that they know more about the use and functioning of the building than the architect. The other is the power of time, which is responsible for the many natural changes and transformations of life, working to support the transience of the interior in attempting to keep up with and adapt to those changes. Therefore, as fundamental as recognizing interior design as part of the modern project is to consider that it is essentially an open system, more susceptible to changes and more affected by time. Change is its essential feature! We could also understand it as an ongoing process. In this context, we expect to address questions like how we should deal with interior documentation, conservation, or even reuse. In other words, how should we deal with interior heritage? We invite articles that observe and interpret this subject from the point of view of the transformations that take place in the interior and what is preserved or not, considering not only analyses of specific case studies but even the subject as a field of historical and theoretical reflection on the preservation of the Modern inner Heritage.

1. INTRODUCTION

Gesamtkunstwerk is one of the mottos of modern architects at the beginning of the 20th century. Following a romanticism between Richard Wagner and William Morris, the Modern Movement introduced innovative interior design concepts, experimenting with housing and public equipment. Based on the vision that the spatial and construction creation must address everything, designers are often responsible for the interiors of their works. However, interior design has specificities that differentiate it from building design. Several variables intervene in specific ways, sometimes compromising the strict Gesamtkunstwerk concept and allowing hybrid contaminations at conception or throughout its life.

2. INTERIORS AND CLIENTS

The first of these variables is the greater susceptibility to client intervention. Clients often assume the designer role, understanding that they know more about the building's use and functioning than the architect.

2.1. EDITH FARNSWORTH'S HOUSE BECAME THE FARNSWORTH HOUSE

Mies Van der Rohe met the doctor Edith Farnsworth at a dinner party in 1945. It was only a short time before she asked him to design her weekend house. Five years later, in March 1951, she began occupying the house. However, the interior images that we usually have access to, whether in books and magazines or on the internet, are relative to how the house was when it was opened to the public in 1970, when the second owner, Peter Palumbo, opened it for visitation and publicity. Mies and Lilly Reich designed furniture and arranged it according to the layout in the plans he drew. In the house itself - which is now visitable and functions as a museum of itself - the setting we find is very similar to Palumbo's version, with the addition of some pieces designed by Dirk Lohan, Mies' grandson. The pieces designed by Mies and Lilly Reich are the Tugendhat, Brno, MR, and MR 10 chairs, the MR chaise lounge, the Barcelona stool, and the daybed. All are structured in steel, flat or tubular, and covered in leather, and upholstered with pigskin cushions. There are also side tables structured in steel with glass or wood tops and a dining table in steel and wood. (**Fig. 1**)

That version is quite different from the house Edith Farnsworth lived in between 1951 and 1954 when a significant flood damaged its furniture and draperies. "Far for being naïve in choosing Mies,"[1] she was a very cultured person, a friend of many artists, architects, and designers, and had sincerely adhered to the architect's proposal since hiring him. Even so, some disagreements began to occur during the internal setting in mid-September 1950. She wanted to choose her furniture and the colour of the curtains. To top it off, it was precisely the furnishing stage that was responsible for the main problem between client and architect: the staggering increase in the initial budget. So, when she moved into the house, the furniture was far from complete, and the client and architect were fighting in court.

The house had curtains - chosen by him - and a few pieces that the resident bought little by little. She had a pair of chaise lounge chairs designed

1. Nora Wendl ed., *Edith B. Farnsworth* (Plano: Edith Farnsworth House, 2021), p.22.

by Bruno Mathsson of laminated beech wood with woven hemp straps; another pair of Jens Risom low lounge chairs, produced by Florence Knoll, structured in wood; a pair of bamboo sleeper chairs; a daybed probably designed by Harry Weese, this structured in steel; two wool hugs; a dining table, with a metal structure and wooden top, with six wooden chairs in two different models, both with rattan seat and back. In short, she created an environment that is very different from that found in the frozen house that people can visit today. Instead of the homogeneity composed of furniture structured in steel and covered in leather or with a wooden top like that of the central core, Edith Farnsworth's version is structured in wood and covered in different materials, with a more casual character.

After the 1954 flood, when she lost a lot of things, Doctor Farnsworth opted for a much more pragmatic version: bookshelves attached directly to the spring-panelled core, an upholstered couch, and Roller blinds. That atmosphere remained for more than a decade until she sold the house.

2.2. CONTEMPORARY APARTMENTS GO BACKWARD TO BECOME MODERN

A case to observe is the history of most modern apartments for the upper middle class in Brazil. In São Paulo and Rio de Janeiro, this collection included examples of excellent quality designed by prestigious architects such as Lucio Costa, Oscar Niemeyer, and Vilanova Artigas. Many buildings replaced old mansions, exploring an image linked to the luxurious comfort of progress and technological advancement. However, despite the avant-garde exterior and innovative architectural elements, their units remained reminiscent of the 19th-century bourgeois house, albeit with smaller dimensions. The interior layout continued to reflect a hierarchical structure. The program was usually organized into three distinct sectors: social area, bedrooms wing, and service rooms, with two independent accesses, one for residents and another for domestic servants or service providers, each connected to a specific vertical circulation.

The potential of reinforced concrete structures, allowing fluid and connected spaces, was underexplored. There was no greater spatial integration between rooms, much less between sectors. Likewise, the decoration was not modern. Thick, opaque curtains overlooked the glass facades, and an excess of robust upholstered furniture, rugs, and objects occupied the social rooms. When looking at content and continent together, these modern buildings that housed 19th-century interiors were a heterogeneous product.

The real estate market neglected this collection of buildings in the 1980s and 1990s. In the 2000s, however, it was rediscovered by people for whom appreciating something "modern" has become a symbol of refinement. More than the original quality of the construction, they admired the luminosity and the beautiful views provided by the large openings, the height of the ceilings, the generous square footage, and the flexibility of the concrete structures, allowing all the necessary internal adaptations. These apartments also had competitively low prices compared to newly built competitors.

On the other hand, there were many operational and programmatic demands of contemporary life. According to Marta Peixoto,[2] the most common renovations included eliminating servants' quarters, integrating kitchens with social areas, renovating bathrooms, creating suites, implementing air conditioning systems, modernizing finishes, and electricity and plumbing installations. In most cases, there was a decrease in the density of users as they became smaller families without daily employees. As a result, some of these units have become two-bedroom apartments, one-bedroom apartments, or even large studios. The service doors became little used, restricted to the arrival of purchases, eliminating the original rigid hierarchical system and the chambered monofunctional spaces.

Rather than distorting the original building designers' ideas, these contemporary projects often do the opposite. In the 1950s, the envelope was more "modern" than its content. The language and principles of modern architecture appear strongly in the renovations carried out in the 2000s, incorporating integrated layouts and fluid spaces and visually connecting the interior to the exterior, attributes do not present in the first occupation. It seems that these apartments could only be completed 50 years after their construction when the interior became in tune with the exterior, and they became a harmonious whole.

3. AS TIME GOES BY

The other is the power of time, which is responsible for the many natural changes and transformations of life, working to support the transience of the interior in attempting to keep up with and adapt to those changes.

3.1. THE GLASS HOUSE: LINA BO BARDI'S KALEIDOSCOPE

It is crucial to point out that Casa de Vidro, the house Lina Bo Bardi designed in 1951 for her and her husband to live in, was born a hybrid. It was made up of a glass box supported on slender pilotis, containing the social areas, while the bedrooms were organized in masonry wings around a patio solidly set on the ground. She also designed the house's interiors, blending contemporary furniture with valuable antiques. Initially, the internal ambiance was naked, with few objects and furniture. Over time, a gradual process of accumulation led to another arrangement. The original Baroque statues and Renaissance Cassoni began to live side by side with colonial artifacts, Art Nouveau vases, contemporary design furniture, and even ordinary objects. The residence's ambiance had become something else, filled by the residents with furniture and objects. The glass box turned itself into a container full of memories, as Marta Peixoto observed.[3]

On the outside, soon after the work was completed, Bo Bardi built a new garage, which was made of masonry covered with a rough layer of mortar, rocks, and ceramic shards, replacing the previous metal porch. These walls have small holes where some vegetation grows attached to the rocks. Bo Bardi also took care of the house's gardens, restoring the native forest. Years later, in 1986, she built the Casinha (little house) with André Vainer and Marcelo

3. Peixoto, Marta. "Ahora lo moderno es vintage!," *Summa+*, n. 170 (April 2019): 102-107.

Ferraz, where she installed her office. The building is made of a freestanding wooden structure with wooden fences and a ceramic tile roof. These changes, inside and out, indicate that Casa de Vidro was no longer the same.

In 1990, the Bardi couple created the Instituto Bardi, housed in Casa de Vidro. When Lina Bo Bardi died (1992), her widower donated the house to the institution. Although listed as heritage by state (1987) and city (1991), much of its content was taken by Pietro Maria's descendants after his death (1999). Today, the existing house, listed as a national heritage in 2009, is the third version of the original project, no longer a house but a cultural centre, and set as such. The institution, founded by its former residents, has become responsible for preserving and disseminating the couple's artistic legacy.

Furthermore, is where the public has access to Lina Bo Bardi's work, in addition to temporary exhibitions and events offered to the community. Nevertheless, the content that characterized Casa de Vidro as the Bardis' residence has no longer existed. (**Fig.2**) This detachment between the house and its content goes against the architect's beliefs, her understanding that the architectural work is an indivisible whole. Despite the architect having designed everything, from the landscape to the interior arrangements, the heritage protection measures focused only on the building shell.

3.2. THE TUGENDHAT HOUSE RADICAL GESAMKUNSTWERK

Through a combination of a precise design, good construction, advanced technologies, and outstanding materials, Mies van der Rohe, together with Lilly Reich, satisfied the Tugendhat family's wish for innovation and originality, creating an exceptional way of modern life based on an open plan. As Ana Tostões observed, the house of Greta and Fritz Tugendhat, in Brno, designed in 1928-1929, consists of a unique global work of art – Gesamtkunstwerk – in terms of its placement into its natural setting, spatial organization, construction, technical equipment, and interior furnishings.[4]

In December 1930, the couple moved into the house, where they lived with their children for seven happy years in the most avant-garde interior design atmosphere. In terms of space arrangement, the 2000m2 of the house was designed on three levels, with different plans related to the variation of the slope of the terrain, considering an innovative distributive solution. The entrance is situated at the top level, together with the family wing area. The social areas are disposed on the floor behind, along with the kitchen and servants' area. The basement behind this main level integrated Fritz's photo laboratory and facility rooms for technical equipment such as central heating water and central air-conditioning. About the technical innovations, they were outstanding: the windows could be retracted down to the floor while the heating system underground along the glazed wall prevented the glass misting; a sophisticated air-conditioning system combines heating, ventilation, and humidifier, providing filtered and thermally treated air in the main living room.

Valuable and rare materials have been used in the interiors, primarily made by Lily Reich: Italian travertine, polished chrome columns in the grand room; the semi-circular wall of ebony from Macassar, defining the dining

room; the massive onyx - from Morocco - wall separating the library from the living room. The inner furnishings were made from tubular and strip steel and noble woods. Every piece of furniture was designed specifically for each place of the house and specified upholstery colours and textile furnishings.

The Tugendhat family lived there until 1938 when they fled from Czechoslovakia. The villa was confiscated by the Gestapo in 1942 and became illegal property of the German Reich, suffering radical changes. After 1945, the house was used for military purposes, as a private dancing school, and as a rehabilitation centre for children. After being classified as a National Monument in 1963, the first renovation attempts were undertaken during the 1980s. However, they led to damage to many of the original elements, neglecting the importance of the furniture and the interior design while adapting the house to a guesthouse.

Following a declaration by the Tugendhat family that the villa should be opened to the public, the house became a museum in 1994. Herewith efforts towards the restoration of the villa began and Villa Tugendhat was listed as a UNESCO World Heritage in 2001. Therefore, a careful conservation-science research study, coordinated by Ivo Hammer, was undertaken. As Ana Tostões observed, the aim of the restoration was the lifetime prolongation of the monument in its original state and the reconstruction of missing original parts.

In the interiors, the curtains and the carpets were selected based on historical photo documentation. The restoration of the wooden furniture

required restoring original and preserved elements and replacing all the missing furniture pieces with exact replicas recreated through research on surviving original pieces and archive photographs. The semi-circular Macassar wall is worth mentioning, as this unique element was destroyed in the 1940s. It had been impossible to properly restore the wall until several of the original Macassar panels were found in the former headquarters of the Gestapo at the University of Law in Brno in 2011. Finally, the villa was adapted for use as a museum, which included public access management and a walking route through the house for groups of visitors. (**Fig.3**)

4. FINAL CONSIDERATIONS

Therefore, as fundamental as recognizing interior design as part of the modern project is to consider that it is essentially an open system, more susceptible to changes and more affected by time. In fact, change is its essential feature! Or we could also understand it as an ongoing process. In this context, we expect to address questions like how we should deal with interior documentation, conservation, or even reuse. In other words, how should we deal with interior heritage?

We invite articles that observe and interpret this subject from the point of view of the transformations that take place in the interior and what is preserved or not, considering not only analyses of specific case studies but even the subject as a field of historical and theoretical reflection on the preservation of interior Modern Heritage. ■

BIOGRAPHIES

Ana Tostões is an architect, critic and architectural historian, professor at IST where she is the leader of the Heritage research line at CiTUA. Visiting professor at the University of Tokyo, Navarra, Porto and KULeuven. President of Docomomo International and editor-in-chief of the Docomomo Journal between 2010 and 2021, she is member of the ISC Interior Design and chair of the ISC Publications. She has edited Key Papers in Modern Architectural Heritage Conservation (with Liu Kecheng, 2014) and Modern Heritage. Reuse, Renovation, Restoration (Birkhäuser, 2022). PI research on African architecture whose publication Modern Architecture in Africa was awarded the Gulbenkian Prize.

Marta Peixoto is an architect (1985) with a Ph.D. in History and Theory of Architecture from the Architecture Doctorate Program - PROPAR (2006), UFRGS - Universidade Federal do Rio Grande do Sul, Brazil. She is a full professor at the Department of Architecture - UFRGS, and at PROPAR-UFRGS. She is the Coordinator of DOCOMOMO Brazil, secretary of the Interior Design Committee of DOCOMOMO International. She has written for architecture journals and books and has had a federal productivity grant as a researcher since 2019. Maintains research activity focused mainly on Interiors, Modern Interiors, and Modern Heritage.

RECOGNIZING CULTURAL VALUES IN CHANGES TO MODERN INTERIORS

JULIANO LOUREIRO DE CARVALHO
BRAZILIAN FEDERAL SENATE

ABSTRACT

Between the 1980s and 2010s, modern heritage conservation would generally focus on one of two goals. If the building was an icon, one should recreate its original condition, reflecting a primary interest on the intentions and design from the creation time. If it was *ordinary*, it should meet contemporary performance standards, with little regard to the extent of the changes to be inflicted upon it. That approach left little room for recognising the values associated with the time span between creation and present – the historical trajectory of the building. To fill that gap, and considering the latest developments to the theme, this paper addresses the cultural values of intentional alterations in buildings over time. The research analyses the relationships between original design, subsequent changes, historical data and cultural values in the interiors of three Brazilian churches: Brasília Cathedral (Oscar Niemeyer, 1958-1970), the Church of the Lord's Ascension in Salvador (João Filgueiras Lima, 1973-1975), and the Church of the Divine Holy Ghost in Uberlândia (Lina Bo Bardi, 1976-1982). These cases illustrate situations such as the incorporation of alterations into the building's imagery, updating the perception of the work and replacing its original state as the main collective reference; the gradual accumulation of artworks through time as an accumulation of value attributes; and user-made changes as relevant attributes to be kept. The findings underscore the importance of individualised assessments for each heritage object and consolidate the understanding that changes in modern interiors can be significant cultural value attributes. Moreover, the cases support methodological approaches developed considering heritage built in other periods as also valid for modern heritage.

1. INTRODUCTION

In the text "The Icon and the Ordinary," Hubert-Jan Henket synthetises reflections on conservation of modern architecture that were developing in the early years of Docomomo. According to him, architectural icons should return to their original condition, to convey the intentions of their author and to continue being a reference for design culture. In contrast, ordinary buildings should be pragmatically adapted to current needs, through *adaptive reuse* – a strategy focused on functionality, energy efficiency and meeting contemporary standards.[1] Those strategies were seen as continuing the Modern Movement – praising the design to be restored or the functionality to be recovered.[2]

The two approaches described were highly influential to the conservation of modern buildings in the following decades and were often seen as the only viable pathways. Thus, the *icons* were thought of through their inaugural image, frozen in continuously republished photographs, rather than considering their physical experience.[3] Meanwhile, *ordinary* architecture was primarily seen through the lens of contemporary usefulness.[4]

However, over three decades of international practice of preserving modern heritage have led to a wider conservation scope. Works that present comprehensive views on themes as action principles,[5] varying ways of preservation worldwide,[6] design experiences,[7] and building materials conservation[8] show different developments. They share a broader understanding of the historical trajectory of modern heritage and its interiors, often considering the time span between its origin and the present. Whether from perspectives linked to continental Europe and the Venice Charter or from perspectives linked to Anglo-Saxon countries and the Burra Charter, professionals have become able to assess values related to changes to spatial arrangements and furniture. They have started to appreciate time overlays, once seen as disruptive.[9] The recognition of modern heritage temporal complexity has freed it from the unchangeable icon or the irrelevant ordinary as its sole points of reference.

Considering that conceptual framework and acknowledging the contemporary discontinuity in relation to Modern Movement, this paper explores how intentional changes, accumulated in buildings over time, can bear relevant cultural values. Thus, it analyses three Brazilian listed churches: Brasília Cathedral (Oscar Niemeyer, 1958-1970), the Church of the Lord's Ascension in Salvador (João Filgueiras Lima, 1973-1975), and the Church of the Divine Holy Ghost in Uberlândia (Lina Bo Bardi, 1976-1982). The choice of three churches allows for a closer comparison and a finer analysis of their changes, which can't be deemed inevitable, since they keep their use. Moreover, churches are traditionally prone to historical accumulation of built elements.

Internal spaces changes were assessed in relation to history, original design, conservation conditions, legal protection and user interests,[10] leading to the discussion of the following issues:

a) the integration of changes into the buildings' imagery, updating their reception and overcoming their primary condition;

b) the accumulation of artworks through time as an accumulation of value attributes;
c) user-made changes as relevant attributes to be kept.

2. BRASÍLIA CATHEDRAL – A NEW IMAGE

Oscar Niemeyer designed Brasília Cathedral in 1958, during the construction of the new capital of Brazil. It was built in three stages. Between 1958 and 1960, the structure was erected and so it remained, as part of the landscape of the Ministries Mall. Between 1969 and 1970, the glazed enclosure and the liturgical elements were installed, allowing for the opening of a building with exposed concrete and double grey glass facades (**Fig. 1**). From 1976 to 1978, the sacristy, baptistery and bell tower were completed, with funding from the Ministry of Education, made possible by the listing of the unfinished building in 1967.[11]

About twenty years after the listing of the Cathedral and ten years after its completion, Niemeyer proposed replacing the internal layer of glass with an artistic stained-glass panel by Marianne Peretti. The architect had already expressed dissatisfaction with the existing glass and intended to reduce the sunlight inside the building. The structure was also to be completely painted white – an idea suggested by the architect in the 1970s, that came true together with the stained-glass, perhaps under the influence of Peretti.

These changes deeply altered the perception of the building, specially of its interiors. When viewed from inside, the structure was previously darker than the glass enclosure, and this relationship was reversed. The space became more welcoming, with calm colours interspersing the white, instead of the harsh contrast between exposed concrete and clear glass. The upward, centripetal thrust of the interior was balanced by the predominantly horizontal and concentric lines of the stained glass. The initial conception lost some of its sharpness and momentum, but the building gained in humanity (**Fig. 1**).

The new appearance merged into local landscape and heritage conservation rules. It has become the very Cathedral image, not just its most recent version. For the public, photographs of the exposed concrete structure evoke the unfinished work, not those fifteen years after its opening.

Brasília Cathedral ultimately results from successive configurations that proved provisional. The changes it has been through were so powerful that they created new artistic and architectural values, having definitely moved the building away from its original design. The case shows how even in iconic buildings it is possible to update their image, which can be other than the initial one.

3. CHURCH OF THE ASCENSION OF THE LORD – NEW FOCAL POINTS

The Church of the Ascension of the Lord, by architect João Filgueiras Lima (Lelé), was designed and built from 1973 to 1975. It was the chapel of the new Administrative Centre of Bahia, in Salvador (CAB's Chapel), in an expansion zone of the city, and it became a parish church in 2016. In 2020, it was listed in local level.

11. IPHAN-DF, *Catedral metropolitana de Brasília – Inventário* (Brasilia, [unpublished document], 2017), 11–28.

The nave is defined by columns of exposed concrete, which open up into petals, forming the ceiling and the roof. Steel-framed windows and an exposed stone perimeter wall make up the external enclosure. The roughness of the materials is balanced by the curved shapes. Neutral colours, indirect lighting and the centralised space invite to introspection and quietness (**Fig. 2**). This feeling is accentuated in the baptistry, which has a lower ceiling and less daylight.

Until the 2000s, the building's interiors underwent numerous changes: the nave gained plastic seats, depictions of saints and sound equipment, and the cross above the alter was replaced by a painting of Jesus Christ. The sacristy became storage space, and other secondary spaces had their furniture and finishes replaced by ordinary, new ones.[12]

From 2010 on, a newcomer priest made additions to the existing liturgical elements, under the supervision of architects Doris Vilas-Boas and João Martins de Oliveira – who was an advisor for liturgical spaces to the National Conference of Bishops of Brazil at that time.

The presbytery bears a wooden panel with stained-glass details, by Athos Bulcão. It gained a side altar with an image of Our Lady of the Presentation, a new crucifix instead of Christ's painting, and a golden front piece for the altar table. In the baptistry, the new features were a golden front piece on the altar table, an altar piece of ceramic mosaic depicting the consecrated host, and a side altar dedicated to the Virgin Mary (**Fig. 2**).

Due to their simple shapes and neutral colours, the new side altars and the crucifix seamlessly integrate into the whole. The golden front pieces stand out and stress the altar tables as sacred, focal points, but don't clash into other elements, since they are simple and isolated. Differently, the exuberant colours and square shape of the altarpiece in the baptistery bear too much contrast to the greyish colour and organic texture of the exposed stone wall onto which it hangs, affecting that space negatively. Overall, the new character of both nave and baptistery is richer, less ascetic than Lelé designed them, but they keep its calmness and introspection. The additions are significant works of art and architecture and also the offer of the current generation to the building. Even if not specifically referred to in the listing process, they are new attributes of heritage value. The awareness of the symbolism of these additions is visible in the commemorative plaque of the parish's creation, which combines the images of the well-known facade and the new crucifix, pointing simultaneously to the continuity of the use of the building and to the new status of the community.

Even without reversing the damage previously inflicted to the secondary spaces of the building, the works carried out in the Church of the Lord's Ascension demonstrate the potential cultural value of additions to modern interiors and the importance of their design quality.

4. CHURCH OF THE DIVINE HOLY SPIRIT – NEW SOLUTIONS

The Church of the Divine Holy Spirit, in Uberlândia, 350km South of Brasília, was designed starting from 1976 by Lina Bo Bardi, who called it Chapel of the

12. Ana Carolina Bierrenbach and Marcela Carvalho Porto, *Dossiê* técnico de *tombamento*. *Igreja da Ascensão do Senhor* (Salvador: unpublished document, 2020).

Holy Ghost of Cerrado. It was opened in 1982, still unfinished, and became a Parish Church in 1985. State level heritage listing came in 1997.

The three cylindrical volumes (church, parish house and meeting pavilion) correspond to three interior spaces with different characters and different relationships with the exterior (**Fig. 3**). Over time, the community altered those spaces, aiming to improve their cleaning and security conditions. For instance, the meeting pavilion was enclosed by a mid-height bamboo wall, which was later replaced by a full height roundwood one; in the nave, the internal perimeter, that once featured exposed bricks, was painted white, while the main doors, originally in wooden lattice, were sealed with boards (**Fig. 4**). The plastering of the nave was a particular point of contention between the users and the architects involved with the church, as it deviated from the Bo Bardi's intention.[13]

The building underwent a major intervention between 2008 and 2014, led by Marcelo Ferraz and André Vainer, collaborators of Lina Bo Bardi and co-authors of the project. Works included the maintenance of the reinforced concrete structure, brickwork and wooden elements. It also addressed accessibility, user safety concerns, and the construction of a new, semi-underground parish house. A newbuilt garage and the existing water tank, built differently from the original design, were demolished.

Marcelo Ferraz stated that the his goal was "finishing the things that needed to be finished", but this should be considered together with his assertion that "buildings also have lives and have moments of life different from others, they evolve, devolve."[14] Indeed, although the intervention "showed interest in recovering characteristics of the original design, many alterations carried out over time are understood as irreversible"[15] – including the previously noticed plastering of the nave, enclosing of the pavilion and closure of the door lattice (**Fig. 4**).

Here, the demands for functional adjustments along time have led to successive suppressions and additions, which substantially altered the appearance and spatial feeling of the building. Even in a listed building, the duly approved conservation design by its co-authors acknowledges the use value of significant changes to the original design. Instead of erasing them, the architects allowed for the emergence of new values, such as in the discreetly dissonant dialogue between additions and existing elements. Unlike the other case studies, where new design has led to new architectural and artistic values in modern interiors, in this case, the modest alterations are on the borderline between physical conservation, recognition of already established use values and the creation of new ones.

5. DISCUSSION AND CONCLUSIONS

In Brasília Cathedral, Oscar Niemeyer succeeded in creating a new interior space by altering the building's envelope. This case demonstrates how deep changes to the interiors of a modern icon might update that icon.

The Church of the Lord's Ascension is another modern building where new architectural and artistic values arise from the insertion of items

Figure 1. Oscar Niemeyer, Brasília Cathedral, Brazil, 1958-1978. that were absent from the original design. When Oliveira and Vilas-Boas conceived those additions, the church was not listed. Nevertheless, they adopted a witty approach, balancing the need of a specific character for the liturgic elements and the intention of adjusting to the existing spaces. The permanence of previous inadequate alterations points to the limits of conservation action in face of usage demands.

Limits related to context and usage also override the intention of returning to the initial condition in the Chapel of the Divine Holy Spirit. The conservation intervention by Brasil Arquitetura Office ensured the long-term physical integrity of the building, recognized the use value of elements that altered the original design and solved extant functional challenges through further changes.

The three churches drift from their original designs while significantly adding new cultural values to them, that – values that arise from the work of different agents. The cases help expanding modern architecture conservation approaches, since they bring the time span between design and the present moment, and its traces, as sources of value attributes to be kept. That doesn't mean that *any* changes are valuable; conversely, it points to the need of a critical, case-based reasoning to decide about it.

Since avoiding generalisation and tracking the continuous history of buildings and their interiors are guidelines for heritage from all time periods, the case studies bring methodological approaches developed for heritage in general as also valid for modern heritage. ■

BIOGRAPHY

Juliano Loureiro de Carvalho is an architect, member of ICOMOS and Docomomo International. He works in the architectural conservation team at the Brazilian Federal Senate in Brasília since 2012. He holds master's and PhD degrees in Architecture and Urban Planning, issued by Brazilian universities.

MELCHIORRE BEGA CORPORATE INTERIORS (1959-70): TRANSIENCE AND CARE

SARA DI RESTA
DEPARTMENT OF ARCHITECTURE AND ARTS,
UNIVERSITÀ IUAV DI VENEZIA

ABSTRACT

Melchiorre Bega (1898-1976), architect and designer, was a refined interpreter of 20th century Italian culture. His long activity documents the investigation on the design possibilities at different scales: from stores to villas, from corporate architecture to tall buildings. From Bologna to Milan, Bega's work expresses a world of relationships that led his production outside national borders. As well as in major projects where he spanned five decades and different seasons of Italian architecture, Bega introduced new interior design concepts experimenting with domestic and public furniture.

The research conducted on the Melchiorre Bega fund (Archivio Progetti, Università Iuav di Venezia), analyses the innovation features of three corporate buildings realised in Milan in the second half of the 20th century, where interior design represents an integral part of the modern project: Galfa tower (1959), Stipel headquarters (1964) and Selection from Reader's Digest offices (1970). These buildings represent important examples of Bega's legacy, now at risk (or partially lost) because of a triple fragility that endangers modern heritage: the first is related to the status of modernity that has prevented the historicization and recognition of their values; the second is intrinsic to the lack of durability of industrial building materials and techniques; the third is linked to the limits of national regulation in protecting private heritage built less than 70 years ago.

The study examines the transformative phenomena of the selected buildings relating them to the case-study of the Axel Springer headquarters in Berlin (1966). The analysis of the current state of the interiors, usually intended as an open system more susceptible to changes and more affected by time, allows to highlight different roles of time and use, and to identify physiological transformations capable, in a few cases, of generating hybrid but careful contaminations.

1. INTRODUCTION

Melchiorre Bega (1898-1976), architect and designer, was a refined interpreter of 20th century Italian culture. His long activity documents an intense investigation on the design possibilities at different scales: from stores to villas, from corporate architecture to tall buildings. Bega's architecture expresses a world of relationships that would also lead him outside national borders working in Germany, United States, South America, and Africa. As well as major projects, where he spanned five decades and different seasons of Italian architecture, Bega has introduced new interior design concepts experimenting both with domestic and public furniture: from upper-middle class housing in the 1930s and 1940s, to the bars and stores, Bega confirmed himself as an eclectic designer capable of ranging from the monumentality of the café Grande Italia in Rome (1938) to the rationalism of the Motta store in Milan (1934), from the principles of the International Style of the Motta motorway restaurant in Cantagallo (1959) to the codes of brutalism of the Congress centre in Bologna (1975).

The research analyses innovation features and transformation path of three emblematic corporate buildings realised in the second half of the 20th century in Milan, where interior design represents an integral part of modern project: Galfa tower (1959), Stipel headquarters (1964) and Selection from Reader's Digest offices (1970).

The buildings represent important examples of Bega's legacy, now at risk (or partially lost) because of a triple fragility that endangers modern heritage: the first is related to the status of modernity that prevented the historicization and recognition of their values; the second is intrinsic to the lack of durability of industrial building materials and techniques: products whose transience is linked to the high degree of innovation; the third is finally caused by the limits of national regulation in protecting private heritage built less than 70 years ago[1].

The study documents a context of great uncertainty about the concrete possibility of transmitting modern interiors to the future, due to the heavy losses and damages caused by renovation works carried out in a city, like Milan, that looks to the future often erasing the past. The research analyses the main transformative phenomena relating them to the case-study of the Axel Springer headquarters in Berlin (1966). The current state of the interiors, usually intended as an open system more susceptible to changes and more affected by time, highlights different roles of time and use, and to identify physiological transformations capable, in a few cases, of generating hybrid but careful contaminations.

2. FRAGMENTS OF MILANESE MODERN INTERIORS

An important aspect of the research that has oriented the investigation is the already-mentioned gap in the Italian regulation on protection of modern heritage which leads to the substantial impossibility of listing the Melchiorre Bega's work built after 1954.

Identifying the processes that altered and modified these "clear and light architectures"[2] allows to document a wide range of interventions, from

2. Pier Carlo Santini, "Il palazzo della Stipel a Milano," *L'Architettura – cronache e storia*, no. 115 (May 1965): 6-13.

complete renovations to tangible and intangible micro-histories of use that accompanied the architectures to the present day.

In the second half of the 20th century, Melchiorre Bega has significantly contributed to architectural and construction research on tall buildings, realising, besides many projects remained on paper, important works. The Galfa tower is the result of a re-interpretation of American skyscrapers and embodies an early form of adherence to the aesthetics of the International Style. "The most chaste of Milan's skyscrapers"[3], as defined by Giuseppe Vaccaro, was designed to house the offices of the Attilio Monti's Sarom (Società Anonima Raffinazione Oli Minerali) and became one of the symbols that changed the skyline of Milan during the economic boom of the 1950s.

The building is the expression of the correspondence between concept and construction that qualifies the Bolognese architect's legacy. If in certain contexts Bega's work reflects a highest level of craftsmanship, in Galfa tower the themes of technological development, innovation and industrialisation address both the design and the construction phases. The building stands out for transparency and sobriety, although it has totally lost the advertising status initially accorded to the skyscraper typology.

The tower is 102 metres high, with a rectangular plan developed on 31 floors and 2 floors below ground, which housed technical plants and parking areas. From a structural point of view, the complex combines a pillar structure on plinths with more unusual foundation walls employed in the tower. The principles of standardisation and prefabrication can only be found in the definition n of the envelope and internal partitions, since "the Galfa skyscraper is all cast-in-place"[4].

The decision to set back the vertical load-bearing elements about 2.5 metres from the façades enabled the realization of a continuous curtain wall, produced by the company Luigi Greppi, a mechanical manufacturer involved in post-war reconstruction.

The research on the combined use of traditional and industrial materials connects Bega's work with that of other Italian architects such as Gio Ponti, Piero Bottoni and Luigi Caccia Dominioni. The window frames, in natural anodised Duraluminium and Thermophane glass, followed a rhythm offsetting the alignment of the vertical uprights made of extruded and painted black Duraluminium, in contrast with the silver-coloured fixed profiles.

Thanks to the technical contribution of Gaetano Altieri and Gianfelice Bertolini, the building had an innovative air-conditioning system, characterised by extremely small appliances housed in the thickness of the floor slabs, integrated with furniture (**Fig. 1**). The comfort requirements were also guaranteed by the attention paid to acoustic issues, which led Bega to develop, together with the companies Vis and Valzaretti Modigliani, a solution based on the interposition of a damping layer of glass fibre and a layer of silk and basalt fibre.

A rubber flooring supplied by Domosic, a Castiglione Olona-based company specialised in plastics for the construction industry, was laid on the distribution screed and the anhydrene subfloor. The characteristics

On the themes of the construction site, see also, Stefania Mornati, "Il valore della trasparenza: la Torre Galfa di Melchiorre Bega," *L'ingegnere. Edilizia, ambiente, territorio*, no. 43-44 (May-August 2012): 4-11.

of polychromy and polymateriality were recognizable starting with the flooring of the underground garages, made of red stoneware with the insertion of white bands, contrasting with the black painted reinforced concrete pillars.

The access to the hall, covered with slabs of white Christall marble from the Camonica Valley and furnished with tables of Imperial red granite from Sweden, was through the double glass wall made of Vis crystal and Duralumin frames. The floors were made of Swedish light blue Labrador granite slabs, while the concrete surfaces of the central block of five lifts were cladded with Duralumin sheets.

The offices were located on a central pathway and realised with movable wooden partitions coated by Flexa panels, equipped with glazed transom and Duraluminium frames. The building structure was always concealed by suspended ceilings and cladding panels, chosen in relation to the qualities of the different spaces.

In 1964, the Stipel offices (Società Telefonica Interregionale Piemontese e Lombarda) were inaugurated a few blocks from the Galfa tower. The building, designed with the engineer Ubaldo Castagnoli, represented a horizontal counterpoint to the verticalism of the nearby towers. Like the tower, Stipel offices were characterised by the rationality outcome of the methodological approach in solving technical and technological problems posed by such buildings[5]. It was a hi-tech machine founded on the idea of materials' quality, maintenance simplicity, and plant system efficiency, all factors contributing to the definition of the building image.

The approximately 4600 square metres of façades were defined as rhythmic diaphragms that expressed the internal design criteria emphasising the alternation of two types of materials: Vis Cromo and Thermopane glass by the Fontana company. The aluminium components were produced by Curtisa, a Bologna-based company, while the iron window frames by Cossa, a Milanese company. The secondary façades were clad in grey ceramic mosaic produced by Ceramica Joo Milano, a company that became renowned thanks to the 'diamond' tiles designed by Gio Ponti.

The most outstanding interior qualities were laid in the public hall, where 52 counters were located, emblematic of the relationship that the company established with society. Here again, the combination of industrial and traditional materials was a distinctive feature of the Bega's production. The roof of the public hall was made with iron struts hidden by walnut panels and transparent Perspex elements, a material that allowed both natural and artificial lighting. The lamps were entirely provided by Greco company, with standard and special lighting elements.

Bega expressed his long experience as a decorator precisely in the hall, where he found a balance between adherence to function and creation of a welcoming atmosphere for the public. The polychromy of the hall was enhanced by the Swedish red granite floor, used also on the walls in combination with travertine, the warm tones of the wood and the bronze beam anchored to the ceiling, in correspondence with the desk.

5. Cf. Pier Carlo Santini, "Il palazzo della Stipel a Milano," *L'Architettura – cronache e storia*, no. 115 (May 1965): 7.

The design of the entrance was particularly meticulous and refined, with the access through glass doors that allowed a glimpse from the outside of the decorative panel created by Professor Cinti[6] (**Fig. 2**). Almost all the furnishings of the Stipel offices were created by Melchiorre Bega, confirming his organic design approach from large to small scale[7].

Between 1968 and 1970, the architect built the new offices for Selection from Reader's Digest, together with the architect Renzo Durand De la Penne and the collaboration of Maurizio Dominissini. The building showed substantial differences from the previous ones, both in terms of cultural references and technical solutions. The design idea was based on the composition of plastic volumes, whose façades were strongly characterised by reinforced concrete.

A light-sensitive plaster coloured by "mother-of-pearl fragment"[8] dematerialised the curved surfaces in sunlight.

Unlike the first two buildings based on transparent envelope, this 'concrete monolith' represents the first step of experimentation that would culminate in the design of the Congress Centre in Bologna (1975). It is precisely the ability to evolve over different seasons of architecture that makes Melchiorre Bega an outstanding professional of Italian modernity, with a production capable of maintaining a high quality in various fields.

The building had three basement floors that housed the heating plant and a parking area for about 160 cars, and a seven-storey, open-plan main body that housed offices and reception.

Four smaller volumes defined the complex as a multi-functional system: these latter buildings housed a meeting room, a canteen for two shifts of 200 people, a mechanical centre, and a concierge.

The stark contrast between the massiveness and solidity of the concrete volumes, and the transparency and lightness of the interiors was emphasised (**Fig. 3**).

As in his other corporate works, great care was finally devoted to the well-being of the workers and the welcoming atmosphere of the interior spaces, both in terms of the soundproofing and the quality of the furnishings.

3. CAREFUL CONTAMINATIONS VS FUTURE OBLIVION

Melchiorre Bega made an important contribution to Italian modern interior design concepts, particularly experimenting in public equipment for companies and stores[9]. However, the transience of that idea of interior design arose soon, firstly due to physiological changes induced by clients, then to the power of time, responsible for many radical transformations of a heritage not easily adaptive to changes.

The analysis of the three case-studies shows how the recognition of formal and technological obsolescence alongside the non-recognition of cultural values of modern interiors led to their complete loss.

The Galfa tower housed its original functions until 1980. In 2008, after the discovery of asbestos in the building shafts, the complete demolition of internal partitions and surfaces was carried out. In 2016, the retrofitting by BG&K Architects transformed the tower into a multifunctional building

housing a hotel with 145 rooms and 63 flats. The original curtain wall was completely removed and redesigned with a higher-performance enclosure according to the Bega's design. While the image of the building was preserved, the interiors were removed and updated for the new functions, highlighting two different forms of heritage loss.

Even in the case of the Stipel offices, the abandonment by the original client marked the fate of the building. Telecom Italia owned the complex until 2018, until its sale to a company involved in the urban regeneration plan for the Porta Nuova district. In 2019, the international competition won by Park Associati and Snøhetta architects led to the hard retrofitting of the building, intended as its complete redesign. The project foresaw the complete removal of the external envelope, the internal surfaces, and the technological apparatus, with the partial preservation of the reinforced concrete frame. The original glazed volume has been cladded with fibreglass-reinforced concrete panels, while the new volumes with prefabricated terracotta cells, returning a building that coincides with the Bega's offices only for part of the load-bearing structure.

The Selection from Reader's Digest offices also document transfiguration processes that are damaging the heritage of the second half of the 20th century. After the abandonment in 2015, the change of the intended use was part of the broader Isola district regeneration programme. The project carried out by Asti Architetti destined the building to house 70 flats. The original planimetric layout is the only preserved feature of Bega's work, deeply modified by new external structures grafted to create large terraces. The surfaces were hidden by new cladding, supporting an idea of luxury and novelty that is currently endangering many other modern buildings in Milan.

In a context of risk for the permanence of Bega's entire work, the research intends to document an ongoing process of care and continuity of use that is preserving qualities and characteristics of a significant modern space of memory.

The headquarters of the publisher Axel Springer were designed by Melchiorre Bega and Gino Franzi with the German architects Franz Heinrich Sobotka and Gustav Müller, inaugurated in Berlin in 1966. Almost 60 years later, the office building is still a landmark for the city. The external envelope is realised with a curtain wall composed of Thermopane safety glasses and aluminium profiles, that give the façades a golden tone. Anodised aluminium is also used for the matt cladding of the minor fronts. The use of metals also qualified the interior spaces, where the partitions consisted of movable modular walls coated with nitro lacquered steel sheet, while bronze-olive coloured aluminium sheets were also used as finishes of the lift block (**Fig. 4**).

Like all vital organisms, the complex has changed over time without losing its principal characteristics. The interior design, part of the Bega's project, was considered essentially as an open system, where adaptability to change represents an essential factor for its preservation.

Among the significant but careful transformations[10] realised to better respond to changes in publishing, representative elements of the "glass and steel skyscraper one metre from the Berlin Wall"[11] interiors remain. Still preserved are examples of plant devices that characterised the technological building such as the two 'paternosters', perpetual motion open lifts, now musealised, designed for a more agile connection between floors, capable of documenting the innovation of mechanical connections that in the 1960's could reach a speed of 3 metres per second[12].

Another preserved feature of modern interiors is the integration of the curtain wall with the plant engineering solutions: the shielding of the sun's rays was originally achieved with Luvar curtains placed between the cabinets of the air conditioning system and the glazed façade. The plant system is now changed, but the integration of furniture and technical solutions has been retained, as well as the spatial layout of the offices and the interiors of significant floors.

The experience of the Axel Springer headquarters shows that the quality of design and the users' awareness make modern heritage – and modern interiors – adaptive to changes. Capturing time inside architecture means indeed supporting dynamic processes that can embrace the need for modern heritage to evolve in order to be preserved, identifying correct strategies and defining the limits. ■

BIOGRAPHY

Sara Di Resta is Associate Professor of Architectural Preservation at Universita` Iuav di Venezia. Architect, Ph.D. in Conservation of Architectural Heritage. She is the author of several publications including "Le forme della conservazione. Intenzioni e prassi dell'architettura contemporanea per il restauro" (2016) and "Materiali autarchici. Conservare l'innovazione" (2021). Her last volume is "Melchiorre Bega. Architetture, interni, allestimenti" (2023) co-edited with R. Chiesa. Gold Medal at the VI Domus International Prize for Architectural Conservation and Docomomo Italia executive board member, she is responsible for Education and Internalization of SSIBAP – the Specialization School on Architectural and Environmental Heritage in Venice.

MODERN OVER MODERN. THE SOM INTERIORS RESTORATION OF THE FRANK LLOYD WRIGHT'S ROBIE HOUSE (1967-1975)

DAVIDE GALLERI
UNIVERSITY OF NAPLES FEDERICO II,
ILLINOIS INSTITUTE OF TECHNOLOGY

ABSTRACT

Despite being one of the world's most recognized modern houses of the 20th-Century, the Frank Lloyd Wright's Robie House (1910) has undergone a complex series of events in more than a century as changes in ownership and function, threats of demolition, and restorations, whose traces are latent in the current appearance of the house.

This contribution aims at investigating and interpreting the 1967-75 phase, when the Robie House was turned into the headquarters of the Adlai Stevenson Institute through a project by the Chicago's firm Skidmore Owings and Merrill (SOM) that remodeled its interiors.

This prestigious tenant, entitled to Adlai E. Stevenson II (1900-1965), who was twice a candidate for the American Presidency, converted the house into a multipurpose building, with a reception area, a library, office rooms, conference halls, and public relation spaces, resulting in a rare and stimulating modern addition over a modern authorial house.

This study will provide information about the SOM phase, analyzing its related architectural interventions and their compatibility with the existing palimpsest through a bibliographical, archival, and on-site research.

The current image of the house, frozen in a suspended time, lacks any reference to this period, whose traces were lost, together with the original Wrightian furnishings. The most recent restoration, lasting from 1997 to 2018, led to a new configuration of the house where the Wrightian phase was favored through the salvation of the original vestiges and the partial reproductions of some fixtures.

The outcomes of this paper will ultimately provide new perspectives on a renowned international modern landmark prompting new considerations over its current use and configuration, trying to complicate the concept of authenticity and authorship in the ambitious intention to capture time evolution in a modern architectural interior.

1. THE INTERNATIONAL SIGNIFICANCE OF THE ROBIE HOUSE FOR THE PRESERVATION OF MODERN HERITAGE

Since the early '90s of the 20th Century, within the cultural climate that led to the foundation of docomomo[1], it became central for preservationists to question how established strategies and theories would fit for Modern heritage[2].

More than one critical position came from Italy[3] by scholars who aimed at reconciling the preservation of the Modern within the rooted theory of restoration[4] against an emerging international tendency intent on opening to non-western concepts of authenticity[5].

Famous restorations of modern houses in East and North Europe followed this second approach, such as the Tugendhat House in Brno, Czech Republic, (1928-30) by Ludwig Mies van der Rohe (1886-1969), restored between 2010-12, or the Shröeder House, in Utrecht, Netherlands, (1924) by Gerrit Rietveld (1888-1964) restored in the 2000s. These interventions raised questions related to the period of significance to which these houses were brought back[6]. Preservation, in both these cases, was seen as the process of refurbishing the architectural fabric as close as possible to the original conditions with the reinstatement of new seemingly-original materials through the help of diagnostic scientific processes, historical investigations, and photos[7]. This approach aroused again divergent visions from Italy[8], with an underlying common appraisal intended to let the architectural palimpsest emerge also in modern houses[9].

On the other shore of the Atlantic, the American approach towards conservation had already distanced from Europe with the refusal to adopt the Venice Charter, leading to a national theory applied mainly to patriotic landmarks, where intrinsic architectural values were often secondary to the narration of patriotic events[10].

Frank Lloyd Wright's architecture represented the first spread American type of modern architecture in which intrinsic values were paramount. The restorations over Wright's heritage motivated in-depth studies on how the practice of preservation changed in the US to conserve this material legacy[11].

In the context of Chicago, a city that was the world's epicenter of modern architecture and suburban revolution[12], it was inevitable that pioneering events would occur also in the field of preservation of the Modern, with valuable outcomes also on an international level.

The Robie House, completed in 1910 and owned by three different families in its troubled history, was threatened to be demolished in 1957 by the Chicago Theological Seminary and then saved through an international protest[13]. Citing Daniel Bluestone, «the successful 1957 campaign to preserve the Robie house soon loomed nearly as large in preservation history as the building did in architectural history»[14].

In 1963, after its salvation through the involvement of a private entrepreneur and the creation of the Robie House Committee, the house was donated to the University of Chicago, urging this institution to find other users not to divert funds from ordinary activities.

The Committee's mission was also aimed at collecting funds for a necessary restoration. However, out of the proposed $250.000 they were

only able to raise $65.000, used for an urgent roof repair in 1965[15]. Notably, one of the main individual donors of this campaign was the architect Walter A. Netsch (1920-2008), who had a pivotal role in the SOM interior remodeling of the house.

In 1967, the Adlai Stevenson Institute of International Affairs opted to set its headquarter in the Robie House, relieving the University from the management costs, and hiring Skidmore Owings and Merrill as architects for its restoration. In lacking the necessary funds for comprehensive conservation, the house only underwent interior remodeling. The main protagonists in the design were Walter A. Netsch as managing partner and director, Donald Ohlson as project manager, and Donald Powell and Robert Peters as interior designers[16].

2. THE INTERIOR REMODELING OF THE ROBIE HOUSE BY SOM

The previous condition of the Robie House as a guest house for young ministers of the theological Seminary had hardly ever been photographed or recorded. An enthusiastic and rare memory of a Chicago Theological Seminary attendee recalled the emotions of living in a Frank Lloyd Wright's house with a brief description of the house first floor used as a common space[17].

Attracted by the demolition rumors, the most compelling authorial photo campaign was conducted in 1956 by Aaron Siskind (1903-1991) and Richard Nickel (1928-1972).

However, they were focusing on the original fixed elements such as patterned grids for integrated radiators, oak latticework screens, light fixtures, bulbs, and smooth oak trims, that together produced a Prairie version of a *Gesamtkunstwerk*, disallowing in their reports to comprehensively understand the interiors arrangement before 1967. The house conditions before the remodeling weren't even designed by the architects in charge of the project, keener on surveying the space feature to comprehensively modernize it, rather than catching minor elements of previous conditions.

Therefore, to figure out the SOM intervention it is practical to follow Donald Hoffmann's extensive research on the Wrightian phase of the Robie House[18], supported by the third owners' photos, the Wilbers family, and symbolically walk around the interior space to understand the differences between the two configurations.

Starting from the disguised entrance on the west side of the house, secluded and darkened by an upper balcony, the entry hall was originally characterized by an intentional compression as a prelude to the spatial release exalted by colored sunlight beams at the first floor, directly accessible through the interior staircase. This entry hall was intended by Wright as a visiting ticket giving an immediate essence of the house in its smallest details, as in the cloth motifs above the entry table's vertical rails connected to oak legs. These symbolic features, such as thin oak stiles, and cantilevered smooth planes, characterized the whole composition of Wrightian furniture.

From the entry, remaining on the ground level, two opposite doors opened to the two elongated rooms on the west and east sides, respectively the billiard room to the west, and the playroom to the east.

18. Donald Hoffmann, *Frank Lloyd Wright's Robie House: The Illustrated Story of an Architectural*

The SOM intervention of the ground floor consisted of a complete reinterpretation of the existing spaces (**fig. 1**). Originally, these two areas, as easily comparable in the Wilbers' photos, weren't furnished by Wright and were freely filled with sofas, carpets, fittings, and music instruments, whose forms were dissonant to the aspired homogeneity of the architect's conception.

In 1967, the western billiard room became the new public library of the Adlai Stevenson Institute. Its remodeling involved a partial reuse of the vertical back stiles chairs, originally used on the first floor around the dining table, and, at the same time, the realization of new pieces, such as the consultation table, made of stylistic Wrightian bands mitigated in their ornamentations (**fig. 2A**). This table was a reinterpretation of a typology typical in many Prairie houses, as can be seen in the original Ward Willits House (1902) in Highland Park, or in the Frank Lloyd Wright's Home and Studio (1898) dining room table, all characterized with embossed wooden strips to accentuate the horizontal dimension. In this case, however, SOM did not reuse an existing piece but realized a softened reproduction with the table's feet slightly rotated, in line with other furnishings.

In the creation of this pleasant atmosphere, SOM's design approach recalled the naturality of materials used by Wright flanked by a modernistic ideal, especially in the newly added elements, as for the bookshelves on the long sides, filling the void spots between the two radiators oak covers. Another bookcase covered the vault entrance at the western end wall, and the presence of box-shaped new armchairs defined a charming and relaxed reading space in accordance with the general volumes of the house.

The other side of the ground floor, the playroom, was equally devoid of Wrightian elements and was turned into a conference space with a table occupying the room in its length designed by SOM.

On the first floor, the remodeling scheme was analogous. As the plan shows (**fig. 1**), the eastern living room, characterized by the perspective continuity, saw the only permanence of a reproduction of the Wright-designed and George Mann Niedecken-supervised[19] sofa, complemented by wooden stripes running on its sides to disguise and break its mass from its steps to the overhanging side armrests.

This uninterrupted spatial flow, lacking any doors or partitions at the sides of the main central chimney, was accentuated by SOM with a lounge area consisting of gathering spots made of modernist chairs, seats, sofas and coffee tables disposed to leave a void at the center (**fig. 3A**). As shown by the photos of the time, the SOM drawings were partially changed in the execution. Instead of a double-headed prow table at the west end, the angular alcoves were filled with *ad-hoc* designed chairs made of circular cushions inscribed in a square plan.

What is worth noting is also the absence of the original built-in cushioned inglenook attached to the fireplace. This void gave room to expose the plans of the new SOM Robie House replacing the original cupboards lost over the years (**fig. 3B**).

Masterpiece, (Mineola, NY: Dover Publications, 1984).

19. Cheryl Robertson, Terrence Marvel, *Frank Lloyd Wright and George Mann Niedecken: Prairie School Collaborators*, (Milwaukee: Milwaukee Art Museum, 2005).

The living room image became partially modernistic with Bauhaus-like chairs that, instead of spoiling the comprehensive house idea, exalted with their neutrality the window geometrical patterns, the laylight grids, and the milky overhanging globes of the upper ornamentations.

What Wright didn't intend as an isolated work, but as a combination of art, architecture, and craftmanship, was kept alive in this comprehensive remodeling through a general respectful sense of compatibility and distinguishability of the additions. Especially in terms of space, the dynamic fluidity of the plan "which springs from the south doors and returns at the north windows, expressing a plastic continuity of wall and ceiling"[20], was enhanced in its intrinsic architectural sense.

On the east side, the "majestic dining table guarded by its tall chairs"[21] and decorated with art glass lights had already been taken out, sold, and exposed in a private collection in the 1950s[22]. The central space of the dining room was remodeled with a new table made of triangular movable elements suggesting a plurality of configurations according to various conference typologies and needs.

The realized reinterpretation of the dining room by SOM was the final executive result between a range of solutions all linked by the intention of reconfiguring the core space with a table, surrounded by the original corner oak caseworks, that survived the house changes with the only loss of the latticework screens separating the staircase.

The eastern end prow, as the western, was filled with another set of square-shaped chairs, while the adjacent kitchen and all the servants' areas were turned into offices, retaining their lower prominence in the new configuration.

Another space worth mentioning redesigned by SOM was the main bedroom on the top floor. This space was characterized by a fireplace in exposed roman brick and surrounded on three sides by art glass windows, which produced unique reflections on the wall plasters (fig. 2B). With the SOM intervention, it was turned into the main office, with a central table in a triangular base, whose bowling ball was wider than those characterizing the prow windows. In the wrong assumption that it was part of the original design, the triangular table was wrongly repositioned amid the prow windows on the first floor in the further phases of the house after 1975, with obvious differences in angles matching.

In 1975, soon after the Adlai Stevenson Institute left the house, the University of Chicago started to sublet the indoor spaces to a plurality of renters related to the University activities, such as the Center for Studies in Criminal Justice, the Center for Far Eastern Studies, the Ruth Adams of the American Academy of Arts, the Atomic Scientists Society, or the Shimer College, that led to the inevitable fragmentations of its use, opening to a progressive phase of dismantlement of this secondary phase, whose traces slowly disappeared over time, as happened to the first Wrightian arrangement.

3. THE ERASURE OF TIME EVOLUTION IN THE FOLLOWING PHASES OF THE ROBIE HOUSE

In 1981, the University of Chicago reclaimed use of the house and, given the significance of this architectural masterpiece, only part of the edifice was turned into the Alumni Office spaces. The main floor, with a new configuration made of randomly organized furnishings and aligned velvet seats, served for touristic tours.

In the years 1980-1984 the architect John Vinci, an already established figure of the time in the Chicago's restoration movement, conducted several punctual interventions of repairs to keep the building operable, as tuckpointing, new water collection systems, and structural improvements.

From 1990, Wilbert R. Hasbrouck (1931-2018), another key figure in the local preservation field, begun a photo and survey campaign aimed at

Figure 3. drafting a comprehensive restoration plan, completed by his firm, HPZS in 1993. It included a thorough leaded glass windows analysis subcontracted to the conservator Julie L. Sloan.

The transformation of the ground floor into office spaces with the addition of temporary partitions, had overshadowed the space flow of the house. It set another low point for the house, aggravated by air conditioners, masonry degradations, and the loss of authentic interiors fragments. This phase was reported in Hasbrouck's documentation and can be analyzed today as an important testimony in the evolution of the house.

The restoration plan became effective only in 1997, when the Frank Lloyd Wright Trust became "perpetual" user of the house[23], and a slow process was set in motion, with a first step taken in the early 2000s, when the exteriors were fully restored and brought back to their original appearance, with an intervention conducted by the in-house architect Karen Sweeney. A second phase of extensive restoration, which is today the most recent intervention, was conducted between 2012 and 2019 by one of the leading American experts in this field, the Chicago firm Harboe Architects, directed by the former ISC20C international president Gunny Harboe.

The current condition of the house, following more than a century of alterations that compromised its architectural authenticity and material legacy, is a display of the remaining authentic elements and decorations. Rather than reproducing the Wrightian ornamental apparatus, the restoration architects let the primary authorial phase emerge by means of removal of all additions unrelated to Frank Lloyd Wright, in order to match the mission of the clients to highlight the connections between this architectural masterpiece and its master architect.

In the impossible condition to restore what lost, however, the house lies inevitably in a suspended time. Even if it still represents an international reference for its pioneering architectural modernity, it embodies also a microcosm of restoration approaches occurred within the conversion of the edifice from a house to a house-museum.

In the current international discourse on preserving modern architecture, the Robie House is undoubtedly one the most complex case studies that can arouse questions and undermine established certainties.

Inquiring approaches on modern houses open new lights and elevate the level of debate in conserving architectural masterpieces. These works are world-recognized milestones of the 20th-Century architectural revolution, and methodological inquiries should pursue the relentless ambition to defend the authenticity of this unique, fragile and universal heritage. ■

BIOGRAPHY

Davide Galleri is an Italian architect and Ph.D. Candidate in architecture at the University of Naples, Italy. He has been visiting scholar at the Illinois Institute of Technology of Chicago and is a Fulbright Fellow. His research is focused on interpreting different approaches on preservation of modern architecture, especially in the relationship between Italy and the US, with a keen interest in Frank Lloyd Wright's architecture and the Chicagoan built heritage. He has published several research papers related to modern heritage and won architecture prizes and bursaries on a national and international level.

MUSEUM BUILDING AS A LIVING ARCHIVE AND A "TIME MACHINE". THE CASE STUDY OF MUDE – MUSEU DO DESIGN, LISBON

BÁRBARA COUTINHO
CITUA, INSTITUTO SUPERIOR TÉCNICO, UNIVERSIDADE DE LISBOA

ABSTRACT

MUDE is a design museum housed in a block formed by four main arteries of the modern Pombaline plan that rebuilt Lisbon in the XVIII century. Once the headquarters of the National and Overseas Bank, the site is modern in its spatiality, but nationalist and imperialist in the grammar of its interiors in result of the transformation underwent between 1951 and 1967, designed by Luis Cristino da Silva (1896-1976). Conceived as a total work, the Portuguese architect carefully studied the interiors but at the beginning of the 21st century, they were almost demolished transforming the building in a complex, fragmented and eclectic space. This paper looks at the museological and architectural concepts of the building full requalification to accommodate the museum with three major objectives: firstly, understand how the building becomes a living archive, through the gestures of infrastructure / restore / replace / adaptative reuse; secondly, comprehend how the strategy of re-contextualising the heritage reinterpreted the *Gesamtkunstwerk* concept, transforming MUDE's building into a "time machine" that reinforces its uniqueness; third, evaluate how they overcome the dichotomous container (building) *versus* content (artworks) considering the building itself as one main content of the museum. The paper's methodology is based on the study that the author has been developing within the scope of her responsibility in the museum concept, and combines research in historical archives, analyse of descriptive memories and technical drawings, and monitoring of the works in the building. In addition to demonstrate how the three objectives were achieved, this paper aims to highlight the importance of this museological strategy in the current context of reviewing historical narratives and decolonisation of museums, by transforming the building initially thought of as a closed, hierarchical and segregated space into a democratic, intergenerational and multicultural place, without a destruction of heritage.

1. INTRODUCTION

The history of the block where is now housed MUDE – Museu de Design is mingled with the history of the city and the architectural culture in Portugal since the 18th century. Formed by four main arteries of the modern Pombaline plan that rebuilt Lisbon after the 1755 Earthquake, it was once the headquarters of the National and Overseas Bank (BNU) between 1898 and 1989. During the 20th century, the building underwent two major transformations: in the mid-1920s, when the concrete and the modern structure of pillar-beam-slab were pioneering introduced by the architect Tertuliano Marques (1883-1942); and between 1951 and 1967, when the building was ennobled to become a metaphor of the bank's power in a project by the architect Luis Cristino da Silva (1896-1976). In both cases, the interiors were carefully studied as an essential element to create an integral environment, with a strong identity. In the beginning of the 21st century the interiors were almost demolished due to a new architectural project that sought to meet the new banking requirements. The works were interrupted, following an intervention by the Portuguese Institute of Architectural Heritage. Consequentially, the building was transformed in a complex, fragmented and dissonant space, with several historical layers identified by naked eye. Due to demolitions, the building became bare and "stripped" of finishes, floors, plaster and false ceilings, allowing to identify the system of pillar-beam-slab that created a modern spatial organisation. Finally, in 2016, as a museum, started the building full refurbishment to accommodate the technical needs required to its new functionality, with the building expected to be reopen in mid-2024[1].

While the exterior elevations (except the main façade) maintained the Pombaline model, the interior spaces were extremely eclectic, having, side by side, explicitly modern references and signs of a historicist taste. Ideologically the building reflected an authoritarian, imperialist and colonialist power, perfectly represented in its monumentality, in the site-specific artworks and in the segregated spatial organisation[2].

To evaluate how the close articulation between the museological concept and architectural project converted this complex legacy into a significant heritage, conceived the building as a living archive and a "time machine", this paper will present examples of the gestures of infrastructure / restore / replacement / adaptive reuse to explain how the assertion of the building as one of the main content of the museum fostered the re-contextualisation of the heritage, leading to a reinterpretation of the concept of Total Work, and transforming MUDE's building into a "time machine" where past, present and future are interconnected. With what, we aim to highlight the relevance of this museological strategy in the current context of reviewing historical narratives and decolonisation of museums.

2. REQUALIFY = INFRASTRUCTURE + RESTORE + REPLACEMENT + ADAPTIVE REUSE

The requalification of MUDE's building involved the gestures of infrastructure, restore, replacement of heritage and adaptative reuse of

spaces, always thought and developed in close and permanent coordination between museology, architecture and technical projects. The primary objective was to adequately requalify the building so that it could have a good performance to the new functional requirements as a museum, making it a more meaningful, sustainable, adaptable and therefore more durable architecture. The impossibility of define a rule to apply to the whole building, due to the heterogeneity of the elements presented and the museological intention of preserving them, turned the architectural project into a site-specific and case-by-case study, since it was necessary to adapt the intervention methodology to each specific situation and solve together the difficulties between the heritage preservation strategy and the application of current regulations, particularly in terms of fire safety in buildings or the implementation of new technologies and ecological energy solutions.

2.1. INFRASTRUCTURE

One key element was the building structural reinforcement to provide it with the capacity to withstand a seismic event. This work was guided by the museological objective of making the building a live lesson of architecture and engineering, and such, allowing the visitor to perceive the chromaticism, textures and construction processes in the materiality of the different times. The core of the solution was the construction of a "cage" made up of 12 mm thick steel sheet frames addorsed to all the façade windows openings in all the floors. Welded rods that cross the gaps between vertical, horizontal and diagonal, connected them to each other. The finishing of the steel sheets followed the materiality of the walls where they were located, namely white lacquered or aged and stabilised Corten **(Fig.1)**. Conceptually, can be established a connection with the Pombaline cage reference in that an attempt was made to recover the idea of providing masonry walls with confinement elements along the entire wall. This was fundamental to guarantee the value given to the pre-existing materiality (in particularly, masonry, concrete and stone), while gave visibility to the different layers of architecture and building techniques[3].

2.2. RESTORE

The restoration of pre-existences was a continuous process, as it was necessary to dismantle and preserve several historical elements, repair and reapply them. The diversity of materials, with a predominance of wood, stone, tiles, decorative mosaics and stucco, constituted a challenge, as it required the presence of several conservation expertise. The compatibility between the requalification intervention (that had to guarantee the right performance of an old building to the current legislation) and the restore of the heritage led to inevitable conflicts and tensions. If the reminiscent pre-existences, in marble, wood, tiles, paint or metal, showed the quality of the drawing and the mastery of the several arts & crafts, their restoration inscribed in each fragment a high-quality manual labour that adds one more sign of time and humanity in the site, in the wake of what John Ruskin (1819-1900) argued to be one of the values of architectural heritage.

One of the spaces restored was the auditorium, designed in 1990-1991, when the bank's administration carried out a major transformation on the 2nd floor to install it with foyer and bar, evaluated also the possibility of install a museum on the 1st floor to present the bank's collection. The designer invited was António Garcia (1925-2015), who had developed, over more than half a century, a vast and diverse work of design and architecture, contributing to the awareness and consolidation of the modern design practice in Portugal. António Garcia's drawings[4] demonstrate the care he always took in the proportion and scale of each element; his sensitivity to materials, especially wood; and the attention he paid to the liveability of each space and the quality of execution of all details. The result was an auditorium with 200 seats, translation booths, and foyer and bar, which stands out for its comfort, good accessibility, visibility and acoustics. It is worth highlighting the well-being that results from the unevenness of the audience, the arrangement of the seats and the spacing between rows; the exquisite wooden covering on the walls and pillars; and the physical and visual connection between the auditorium and the bar **(Fig.2)**.

In this project, António Garcia invited to collaborate with him Daciano da Costa (1930-2005), another pioneer of modern design in Portugal with whom he had associated, in 1974, in the direction of the Risco Design Office – Projectists and Design Consultants. Daciano da Costa is the author of the auditorium seats. The 1989 sketches and the prototype created by Metalúrgica da Longra (1990/1991) deposited by the Daciano Family in MUDE, reveal that the seats in the BNU auditorium, despite the different colour, are the same Daciano da Costa initially designed for the main auditorium of Centro Cultural de Belém, at the time on construction[5].

After being equipped with the mandatory infrastructure, the preservation of this auditorium in MUDE represents a special opportunity to the public experience a cohesive environment from the 1990s, designed and furnishing by two important modern Portuguese designers. In this way, the auditorium itself became part of the museum's living heritage.

2.3. REPLACEMENT

The return to the building of artworks, furnishing and equipment belonging to BNU (currently owned by Caixa Geral de Depósitos) stands out with the aim of replace *in situ* or temporarily exhibit them with due contextualisation and historical framing. While the artworks were replaced to where they were originally designed, the furnishing, lamps and equipment may recreate some of the building's interiors and be study due to their relevant cultural value. Special mention is given to the painting on wooden boards by Jaime Martins Barata (1899-1970) entitled "Overseas Development and the Metropolis" (1964) **(Fig. 3)**. Martins Barata was one of the leading painters of his time with a diverse body of work, especially his large-scale works on public buildings, such as universities, courts, town halls. The composition is dominated by a radiant sun, symbol of Life, and the figure of Mercury who links the past and the future, articulating them with the economic and financial role of the BNU. Behind Mercury, a navigator, a friar and a captain are identified next to a compass

5. João Paulo Martins. *O CCB por Daciano da Costa. Design de equipamento e mobiliário (1993-2023)* (Lisboa: Tinta da China e Atelier Daciano da Costa, 2023), pp.156-157.

rose. In front of him, the progress, science and arts are personified by a series of figures who research, teach, build, manufacture and cultivate. With this strategy, the museum intends to recognise the artistic and technical value of the works, looking back, at the sometime, to debate the Eurocentric narratives in museums and the nationalistic discourse.

Drawings, photography's and furnishing that were rescued show how cohabitate the decorative grammar of the Empire Style side by side with modern metal and tubular steel design. Some brands and companies that played an important role in the development of modern architecture and interiors in the 1960s, equipped the BNU's building, such as FOC – Fábrica Osório de Castro, Casa Jalco and Joaquim Mitninsky Decoration that proposed several interiors, showing a modern comprehensive of furnishing to the definition and organisation of spaces[6]. Now, in the context of MUDE, they contribute to a better understanding of the portrait of the country and its material culture during the years 1950-1970. They are also an opportunity to address the urgent need of recognise, dignify and promote the handicrafts, while allows evaluating how Cristino da Silva conceived the bank's interiors as a Total Work, relying, to this end, on the collaboration of the best artists, designers and craft masters. As a result, they contribute to the understanding of the BNU building as a metaphor for the bank's power during the Estado Novo dictatorial regime.

2.4. ADAPTIVE REUSE

The morphological organisation of the building, particularly the accesses, circulations and partitions, reveals its closed and hierarchical nature. The bank's customers entered through three public entrances (the main one, on Rua Augusta; and the others on Rua da Prata), and they only had access to the ground floor and the 1st floor, with circuits clearly determined. For the bank's administration and employees, the accesses were completely distinct and segregated. On Rua de São Julião, there was the employees' entrance and on Rua do Comércio, the administration entrance. The internal circuits were also private and individualised, with this distinction being evidenced by the application of materials, nobles in the administration areas, common on the employees' places of work. Functionally, the vault rooms were located in the basement; the main customer services were located on the ground floor, arranged inside the counter; the bank's administrative and management services were located on floors 1 and 2, along the entire Rua do Comércio elevation; various bank services were located on floors 3, 4 and 5, while another private administration area with a terrace and lounge (dining room) was located on floor 6. We can conclude that the spatial configuration of the bank portrayed the established social structure and an autocratic organisational culture[7].

MUDE's museological concept preserves all the bank's main spaces, accesses and vertical circulation, but greatly expanding public accessibility and free movement throughout the building. To engage the public, all vertical accesses (stairs and elevators) are active to create open and inclusive accessibility to all areas of the building[8]. Nothing was destroyed, everything

was transformed by an adaptive reuse. The administration dining room will be the museum public restaurant; the bank's administration office becomes the MUDE offices; the governor rooms will be spaces of workshops; and the safe-deposit room will become an exhibition gallery; on the ground floor, the counter returns to its original function – as the museum reception desk and ticket office – while it utterly inverts the use of its previous highly restrictive and controlled interior by transforming it into a museum shop where everyone enters[9]; and a major room used by the bank's administration will become the MUDE library specialised in design (**Fig. 4**).

3. CONCLUSION. BUILDING AS CONTENT

Time in museums is essentially long! Through the objects in their custody, the past, present and future coexist. At MUDE, this prismatic dimension of time is reinforced by the building, a pre-existence in which the bare interiors allow us to see what is normally imperceptible to the eye – the layers of different times materialised – for example, in the different bricks, masonry and reinforced concrete systems. This journey through time allows to reconfigure

9. Coutinho, Santos and Fernandes, "Space Syntax as a Tool for an open museum practice: The case of MUDE Museum", 8. 13.

different forms of resignification of the built heritage, generating diverse links between past, present and future that go beyond the linearity of time, allowing intergenerational and multicultural encounters. Behind this strategy is the concept of the building as a museum content. To this extent, the museum building is the first manifestation of the museological policy of the institution that protects it. In MUDE, it is particularly important how the usual container is intentionally understood as content, being transformed in a living archive and a "time machine". In heritage terms, this integrates and makes cohabit different times, rather than radically breaking up. Thus, MUDE gains relevance as an example of how heritage conservation might be more effective when it is based on an adaptive reuse that reinforces its cultural durability, especially when we are facing risks of civilisational setbacks never foreseen for Humanity in the 21st century, as the resurgence of fundamentalism and political extremism. By considering this architectural heritage as content and by contextualising each object *in situ*, MUDE can contribute also to the decolonisation of museological narratives, debating the past and the recent history of Portugal. ■

MODERNITY AND *CUBANIDAD*: CLARA PORSET, TIME, AND IDEOLOGY

JEAN-FRANÇOIS LEJEUNE
SCHOOL OF ARCHITECTURE, UNIVERSITY OF MIAMI

ABSTRACT

In the early 1930s, the modern concept of *cubanidad* (Cuban identity of transculturation), which was already present in literary and artistic circles, became the impetus behind the first generation of Cuban modern architects. The national expression of modernity emerged in architectural circles, and it was increasingly tested by issues of national identity—Spanish, American, and later in the 1950s, African. Eventually, it is the young designer Clara Porset who opened the way with her 1931 lecture titled "La decoración interior contemporánea. Su adaptación al trópico" at the University School of Architecture by advocating the use of the three "P"s— *patios* (courtyards), *portales* (arcades) and *puntales* (columns)—as the ABC of a modern Cuban architecture that would use tradition, history, and adaptation to climate to express the modernizing national identity of the island. Invited back to Cuba for an extended cycle of ten lectures at the University of Havana in 1948, she furthered the thesis that would articulate modernity and *Cubanidad*, working with the climate, the heat, and the intensity of light. The essay argues that, within the tropical environment, modern interior design becomes part of modernity as it is fundamentally conditioned by the indoor-outdoor relationship of transparency and ventilation, and by extension the concept of the natural house. Specific examples from before the 1959 revolution highlight how material devices including *persianas*, *vitrales*, modern *moucharabieh*, and integrated furniture created a unique tropical aesthetic of air, light, and colors. Until the mid-1960s, the post-1959 regime did not fundamentally alter those principles but rather attempted to extend them to the programs of public housing and rural modernization. The elevated cost of energy has so far maintained most climatic devices in place, but it is to be feared that the rise of air-conditioning would destroy the unique indoor-outdoor synthesis in Cuban modern architecture.

1. PORSET AND SOCIAL

In April 1936, the Cuban periodical *Social* devoted a special issue to the *Casa cubana* (Cuban House), and more specifically to the principles that should, according to various authors, guide the development of the modern Cuban house.[1] By the 1930s, residential design had become the natural testing ground for new innovative ideas on architecture and modern life throughout Europe and Latin America, but the Cuban profession and its upper- and middle-class clientele had fallen behind. In the late 1920s, the Cuban periodical *Arquitectura*, published by the *Colegio Nacional de Arquitectos de Cuba* [National Institute of Cuban Architects], opened its columns to articles discussing works by Bruno Taut, Adolf Loos, Frank Lloyd Wright, Le Corbusier, Walter Gropius, and others. Figures such as Josef Albers, Richard Neutra, and Gropius visited the island in the 1930s, and lectured at the University of Havana School of Engineering and Architecture. At the same time, *Arquitectura* began publishing essays and illustrations on Cuban vernacular architecture, bringing to light the historical importance, design simplicity, and modest beauty of both colonial and rural buildings in Havana, Santiago de Cuba, and many other small towns, villages, and landscapes. Hence, the modern concept of *cubanidad* (Cuban identity of transculturation), which was already present in literary and artistic circles gave the impetus to the first generation of modern architects. The national expression of modernity—how to be modern and Cuban at the same time—emerged in Cuban architectural circles during that time, and it was increasingly tested by issues of national identity—Spanish, American, and later in the 1950s, African.

The entrance of *Social* in the discussion of the modern house was thus critical, as the monthly magazine was primarily read by the high bourgeoisie and thus could be influential in directing clients to accept new typologies and esthetic. In his introductory essay "Nuestra casa de ayer y de hoy" (our house of yesterday and today) Joaquín Weiss explicitly argued that the untarnished "rationalism" of Cuban colonial architecture deployed along centuries of use "connected it ideologically with the contemporary architectural trends."[2] For the author, the large size of the rooms, the patio, the portal or colonnaded arcade, the large balconies, the windows, and their protective louvers and screens were the "rational" elements of colonial architecture, most of them linked to the climatic conditions and ensuing urban culture, that had disappeared during the last decades of architectural development.

2. THE OVERLOOKED SIGNIFICANCE OF PORSET'S WRITINGS

In reality, it is the young Cuban designer Clara Porset (1895-1981) who had opened the way by promoting modern ideas about furniture, materials, interior design, and international architectural trends by writing thirty-four articles in *Social* in 1931-32 dealing with Le Corbusier, Robert Mallet-Stevens, the International Exposition of Stockholm in 1930, etc. Following her early studies in New York at Columbia University, she moved to Paris for two years, continuing her courses of architecture and interning with the Art Deco designer Henri Rapin. She eventually built a memorable career as furniture

1. The primary reference for this essay is Victor Deupi and Jean-François Lejeune, *Cuban Modernism: Mid-Century Architecture 1940-1970* (Basel: Birkhäuser, 2021).

2. Joaquín Weiss, "Nuestra casa de ayer y de hoy," *Social* 20, no. 4 (April 1936): 11.

and interior designer between Cuba and Mexico, but the importance of her writings for the development of modern design and architecture on the island has been totally overlooked in favor of her work on tropical furniture and the role of other actors, such as Eugenio Batista (1900-1992). Particularly important was the remarkable lecture that Porset gave on the 22nd of May 1931 at the University of Havana School of Architecture and published under the title "La decoración interior contemporánea. Su adaptación al trópico."[3] The elaborate text detailed the evolution of modern architecture and design internationally, discussing forms, materials, and adaptation to context. For the first time, she advocated the use of the three "P"s— *patios* (courtyards), *portales* (arcades) and *puntales* (columns)—as the ABC of a modern Cuban architecture that would use tradition, history, and adaptation to climate to express the modernizing national identity of the island.

Encouraged by these intellectual exchanges, architects like Rafael de Cárdenas and Batista initiated their search, focusing on the functional logic of design and in particular, ventilation, light, and hygiene. Commissioned in 1938 by the wealthy industrialist and philanthropist Eutimio Falla Bonet, Batista designed the first Cuban modern house. Organized around a series of patios, lined with arcades and windows protected by wooden louvers, the Falla Bonet house (1939) was widely published but remained an isolated example.[4] Indeed, considering the convulsed political times—the fall of Gerardo Machado's dictatorship, the new Constitution of 1940, the Second World War—one had to wait until the end of the 1940s to see the built impact of the new tenets and the burgeoning of a new generation of Cuban architects. They structured themselves in 1941 as the *Agrupación Tectónica de Expresión Contemporánea* (Tectonic Group of Contemporary Expression, or ATEC).[5] In 1943, they set up an innovative exhibit of colonial architecture titled *Trinidad, lo que fue, es y será* (Trinidad, what was, is, and will be) in the heart of Havana. The exhibition advocated that the urban and architectural qualities of Trinidad should be historically preserved, not as a "romantic" expression of Cuban culture and way of life, but rather as an example for the future. The curators concluded that Trinidad could inform contemporary architecture and progressive urban design, while avoiding any temptation to a false historicism. By and large, the exhibition was a continuation, at the urban and regional scale, of Porset's thesis about the three "P"s and the invariants of Cuban architecture—in a manner that can be compared with Giuseppe Pagano's *Architettura rurale italiana* (1936) or José Luis Sert's essays about Ibiza in the Catalan periodical *Arquitectura contemporánea (A.C., 1931-1937)*.

Owing to her political convictions and advocacy, Porset left the island in 1932 during Machado's dictatorship, and eventually moved to Mexico City with her husband Mexican painter Xavier Guerrero. In January 1948 on the invitation of Luis de Soto y Sagarra, professor of art at the University of Havana and influent promotor of the popular arts in Cuba, she returned to Havana to teach a course titled "Espacio interior para vivir en Cuba."[6] The course was organized in ten lectures dealing with architecture and interior design in relation to climate and the specific natural, social, and cultural conditions of the island.

4. The Falla Bonet house was widely published, including in the United States. See for instance "Havana, Cuba: All Rooms in this House Open on Courtyards," *Architectural Record* 86 (July-Dec. 1939): 45-46.

5. The group included Eugenio Batista, Miguel Gastón, Nicolás Arroyo, Gabriela Menéndez, Manuel Tapia Ruano, Carlos Alzogaray, Beatriz Masó, Rita Gutiérez, Emilio del Junco, Eduardo Montoulieu, Alberto Beale, Frank Martínez, Ricardo Porro, Martín Domínguez, Nicolás Quintana, and others.

6. Clara Porset, "Espacio interior para vivir en Cuba. Gestación de la síntesis cubana," manuscript republished in Ana Elena Mallet, ed., *Clara Porset: la Vida en el Arte* (Mexico City: Alias, 2020), 121-122.

In addition, she gave two lectures at the School of Architecture and one at the Lyceum. Within these presentations, she furthered the thesis that would articulate modernity and *Cubanidad*, referring to the necessity of working with the climate, the heat, and the intensity of light. Each lecture was thematically focused, ranging from the analysis of the Taino hut and Le Corbusier's relation to the vernacular to the absence of social housing across the island. Porset's lectures aimed to exploit the potential of the tropics to develop a new design vision but also sought to control, civilize, and transform social reality within the contradictory context of North American neocolonialism.

She specifically emphasized the importance of the ATEC as "the group which has given us examples of how to organize space for living in Cuba… how to assimilate the vital elements of our architectural heritage, how to make concrete the universal principles that will fructify in giving them a Cuban expression… it is the member of ATEC who have embarked on the task, which is in the last instance a full-fledged battle against the climate… The fight against the hurricanes, against the light and the excess of noise, and even more so, the FIGHT AGAINST THE HEAT… it is the eternal fight of man against nature."[7] From that year onward, the members of the group—with the most prominent being Batista, Nicolás Quintana, Frank Martínez, Ricardo Porro, and Mario Romañach—produced scores of houses that were not only unabashedly modern but genuinely Cuban in their typological organization and response to climatic conditions. Following the lessons of Porset for the tropical environment, modern interior design became part of modernity as it is fundamentally conditioned by the indoor-outdoor relationship of transparency and ventilation, and by extension the concept of the natural house. Various material and technical devices including *persianas*, *vitrales*, modern *moucharabieh*, and specially designed furniture by Porset, Myrrtha Vega and Ricardo Porro, created a unique tropical esthetic of air, light, transparency, and colors.

Among the most important houses are Mario Romañach and Silverio Bosch residences for the Julia Cueto de Noval (1948) and José Noval Cueto (1949); also by Romañach, the houses for Aristigueta de Vidaña (1953), Ana Carolina Font (1956), and Rufino Alvarez (1957)—this last one summarizing the work of the architect with exceptional wood detailing, stained-glass windows, various patios, terraces, and gardens on multiple levels, as well as a complicated concrete structural system providing light and ventilation from the roof structures. The plan of the house of the neurosurgeon Carlos Ramírez Corría, built in 1957 in the Alturas de La Coronela neighborhood by Nicolás Quintana, resembles that of a sprawling Pompeiian villa, with multiple courtyards, terraces, a large porch, gardens, and wall paintings. Quintana's other masterpiece, the house of Mardonio Santiago (1957), consisted of three volumes of different heights connected by ground-floor galleries with patios on either side, but the most interesting aspect of this house was not the plan but rather the plasticity of the wall and roof surfaces that wiggle throughout in an angular manner. The walls are filled with colored glass, screens, and wooden louvers to retain the sense of a traditional Cuban residence.

7. Ibidem

3. POLITICAL CIRCUMSTANCES AS AGENT OF PRESERVATION

At the outset of the revolution, a large majority of the architectural profession embraced the hope that the new regime would remedy the problems of the Cuban society by focusing on housing needs, schools, and recreational complexes for the urban and rural population. These were times of both great expectations but also anxieties. Amidst the political turmoil and the uncertain choices that faced the professional architects, major actors of the 1950s such as Eugenio Batista and Nicolás Quintana published important texts that suggested—and perhaps expressed the hope—that the post-1959 architecture would continue to be based upon the critical principles advocated since the early 1930s. Published in 1960, Batista's essay *La casa cubana* (The Cuban House) reaffirmed, three decades later, Porset's concept of the three "P"s—he is credited to have repeatedly advocated them through his teaching at the University—with, however, an important variant, replacing the "p" of *puntal* with that of *persiana* (louver).[8]

In 1964, Alejo Carpentier's essay *La ciudad de las columnas* (The city of the columns) coincided with the emerging nationalist rhetoric that the revolution had deployed from 1959.[9] In this context, colonial Havana, appeared as an environment of defiance against the hegemonic architectural and urban forms coming from international modernism and the United States in particular. Carpentier's poetic essay was dedicated to the old city, its syncretic fusion of styles, and its invariant elements celebrated since the early 1930s by Porset and others. In an essay of 1960, Jean-Paul Sartre intuited the dilemma: "The revolution attempts a beautiful architecture, raising from the earth its own cities. In the meantime, it fights Americanization by opposing it with the colonial past. In the past, Cuba invoked, against the hungry metropolis that was Spain, the United States' independence, and freedom; today it searches its national roots against the United States and resuscitates the dead colonizers ..."[10]

Given that all private initiative and construction was halted immediately, Batista and Quintana's appeal resulted useless, yet, for a couple of years, the regime did not alter the pre-1959 architectural tenets but rather attempted to extend them to the programs of public housing and rural modernization, for instance a series of rural school buildings and vacation cabins. Back in Cuba, Porset embraced the regime's focus on the countryside and its infrastructure, resuming her research on low-cost rural furniture, led with her husband Xavier Guerrero, and designed for a 1941 MoMA competition on "Organic Design for Home Furnishing." Directly commissioned by Fidel Castro to help create the new *Ciudad Escolar Camilo Cienfuegos* (today known as the University of Matanzas Camilo Cienfuegos), she designed and produced thousand seats and tables for the children of the *Ciudad Escolar*, as well as other designs for the University of Havana and the Cuban National Art Schools by the trio of architects Ricardo Porro, Garatti and Gottardi. Disillusioned, Porset returned to Mexico in 1963 and settled there permanently.

Perhaps the last expression of Porset's architectural principles in response to the tropical environment, and a demonstration of the unique continuity of envisioning architecture across four decades, took place in the late 1960s.

Architect Fernando Salinas (1930-1992) developed an experimental house prototype using the Multiflex concrete modular system that he designed with his students at the University of Havana School of Architecture and was first presented at the contest held during the *IX International Union of Architects* (U.I.A., 1967) in Prague. Deployed in 1971 in the suburban town of Wajay, Havana, the system consisted of a kit of parts with a support structure in the form of a central column that held up six by six-meter panels and allowed for growth in multiple directions. In addition to the panels, there were prefabricated kitchens and baths, while doors, windows, and closets, also prefabricated, maintained the screening principles necessary to the control of light and natural ventilation seen throughout the 1950s for the tropical environment. Amongst the various models proposed, the single space unit or studio was selected as an experiment of the possibilities offered by this coordinated furniture-building design, demonstrating once again the continuity of Porset's vision: "The lack of an established tradition as regards this type of

dwelling gave us the occasion for demonstrating the possibility of obtaining: an environmental coherence without resorting to the immobility entailed by the simple repetition of identical furniture pieces as part of a *set*."[11] The Multiflex was simple, flexible, and easy to assemble even though it never developed into a large-scale production system. It was eventually abandoned by the Ministry of Construction in favor of mid- and high-rise housing and heavy prefabrication technology imported from the Soviet Union.

This strategic decision marked the end of a vision of a modern Cuban architecture in relation to nature and climate. Despite the degradation of the built environment, the elevated cost of energy has so far maintained the climatic devices—doors, windows, louvers, vitrales—that created the modern Cuban identity, not only of private houses, the focus of this essay, but also the apartment houses by Mario Romañach and Max Borges, as well as important public structures. However, it is to be feared that the rise of air-conditioning would in the future destroy the unique indoor-outdoor synthesis in Cuban modern architecture. ■

ABSTRACT

The design of the interior has been a zone for diverse actors and agencies during the modern movement period. Staging architects, decorators, and homemakers who shaped answers to modernity in various ways, its outcome is manifold. Due to its pluralism, the modernist interior offers, for this reason, an important lens when investigating the many narratives constructing the history of modernism. Across the different approaches, sometimes expressing the idea of an architectural ensemble, sometimes characterized by constellations of material objects or decoration, the interior often featured certain recurring components, but always differently. Exploring the construct of the interior through such components, i.e., materials, details, colors, objects, furniture, etc., offers the potential to generate new knowledge that might contribute to an international collective memory, inviting a variety of voices to the discussion. The production of textiles, i.e., rugs, carpets, upholstery fabrics, tapestries, etc., was in the modernist period, often balancing at *the intersection of art, applied arts, design, mass production and craft*. It moreover could involve several 'authors' such as the creator and the producer. In addition, the analysis can also develop from the consumers' angle, in relation to users' influence on modern interior textiles, as one of the most personal of interior components, adding to the individual character of the modern interior space. Within modern interiors, textiles are perhaps the interior element that is the most fragile due to being renewed parallel to stylistic tendencies and maintenance purposes. This creates opportunities for discussion related to *temporality and ephemerality*. Thus, in this session, we *focus on the use of textiles* in the modern interior. Using textiles as a catalyst for reflections and investigations into how the modern interior was conceived, new narratives of what influenced interior design and its expression can surface and shed light on multiple, hopefully uncovered perspectives.

#34

1. INTRODUCTION

Investigating and writing the historiography of the modern movement interior is a work in progress. Unlike architecture, interior design is a relatively young field of research. The fact that research into the modern movement interior has remained relatively poor until the last decade can be explained by a number of reasons.

Interiors have, for instance, been seen as the domain of women, often associated with domesticity and decoration and, therefore, inferior to architecture. In a male-dominated architectural culture, interiors were often anxiously avoided, both in theory and history writing. Another reason for the underexposure of interiors in research could be the simple fact that interiors are regarded as an integral part of the architectural design and, as a result, 'dissolve' within the architectural narrative, not being approached as a distinct matter. Furthermore, this issue may be explained by the pace of change regarding interiors. Interiors need to respond and adapt quickly to the needs of the daily life taking place inside them, changing for instance, due to functional as well as trend requirements. Due to ephemerality, research into interiors is often obstructed.

However, recently, interest in the history and theory of interiors and acknowledgment of interiors as a field of research in its own right has risen. Organizations such as the Society of Architectural Historians with the installation of the Historic Interiors Affiliate Group (HIG) and DOCOMOMO, with the formation of the International Specialist Committee – Interior Design (ISC-ID) demonstrate this progress. The activities within the Historic Interiors Group are manifold and develop within working committees, each of which has a particular focus: Research, Events & Conferences, Communications, Emerging Scholars, and Pedagogy. While the DOCOMOMO International Specialist Committee – Interior Design pays sharp attention to the interior in the Modern Movement, the Historic Interiors Affiliation Group investigates historic interiors in the broadest sense. Through annual events, it offers, for instance, a platform for the research of emerging scholars from around the world and across a variety of disciplines, including design, preservation, history, and education. In the past, topics like 'digitality in relation to the study and practice of historic interiors,' 'Exhibiting interiors / interior exhibitions,' 'Spatial education,' and 'Between architecture and archive,' to name some, have been brought to the table. The DOCOMOMO International Specialist Committee – Interior Design has in the past organized symposia on the themes 'Plastics in Modern Movement Interiors conservation and (re)design of Plastic Finishes, Furniture and Products' (2018), 'Living in Colour – Colour and Paint in the Modern Interior and Related Restoration Practice' (2019), Learning from Modern Movement Interiors in Times of Pandemic (2021) – and recently, on Modernist Women Interior Designers and Artists: To Deepen the Reading of the Different Expressions of Female Creativity (2024).

In addition, many educational institutions are steadily embracing interiors as a discipline equal to others, teaching not only how to design interiors but also how to study and expand knowledge about them through research.

This session contributes to this progressive evolution of research into interiors by suggesting a particular methodology: exploring the modern movement interior through the lens of textiles.

2. A METHODOLOGY FOR STUDYING MODERN INTERIORS

The design of the interior has been a zone for diverse actors and agencies during the modern movement. Staging architects, decorators, and homemakers who shaped answers to modernity in various ways, its outcome is manifold. For this reason, modern movement interiors offer an important perspective when investigating the many narratives constructing the history of modernism.

Across the different approaches, sometimes expressing the idea of an architectural ensemble, sometimes characterized by constellations of material objects or decoration, the interior featured certain recurring components such as materials, details, colors, objects, furniture, etc., - but always differently. Exploring the construct of the interior through such components offers the potential to generate new knowledge and historical evidence. By extension, each of these interior components prompts explorations into history, theory, craftsmanship and its various artistic and applied mediums, manufacturing and production, national and global stances and differentiation, labor and gender, etc., thus solidifying and expanding the historiography of interiors.

In this session, we introduce this inductive research approach, addressing the use of textiles and bringing forth insights into modernist interior design approaches and textile characteristics. The aim is to investigate a variety of textiles, such as rugs, carpets, upholstery fabrics, tapestries, curtains, etc. – both in the public and the private sphere. Also, we wish to elaborate on questions relating to textiles in the modern movement interior, such as the impact of interior textiles globally and locally, textile patterns, women's role and influence, challenges related to the preservation of textiles, etc.

If the value of interiors in the past has been downplayed, the issue of textiles has been even more stigmatized. Often being aligned with the women's domain, the feminine, and associated with decoration, questions arise regarding women's merits and position in the modern interior. Modernist architects frequently diminished the use of textiles, leading to limited research and a lack of documentation of textiles throughout the modern movement.

3. TEXTILES IN MODERN INTERIORS

The minimizing of the modern movement interior undoubtedly also affected the development of theories on textiles, which are still scarce today. However, several seminal texts and sources prove the significance of textiles in the modern movement interior. So did the German architect and art historian Gottfried Semper, with his thoughts about textiles as the origins of building, known as *das Bekleidungsprinzip*,[1] inspire modernist architects to think about textiles as an essential part of architectural space. Lasc has mentioned that Semper's theories on textiles in the interior, prioritizing textiles in architecture, touching upon the role of textiles in the development of the field of interior design, had influenced several

1. Gottfried Semper, *The Four Elements of Architecture and Other Writings* (Cambridge: Cambridge University Press, 2010).

modern architects such as Otto Wagner, Josef Hoffman, Adolf Loos, and Frei Otto.[2]

Loos's essay "The Principle of Cladding" is well-known. In it, he argues that the essence of architectural space results from the wall "dressing" rather than from the structural support behind it, which should be of only secondary importance to the architect.[3]

Another important contribution to the creation of a theory of textiles comes from writings by Bauhaus weavers, including Anni Albers, Gunta Stözl, and Otti Berger.[4] Albers saw textiles, for instance, as an "integral architectural element" and "a counterpart to solid walls."[5] She believed in a strengthened role of textiles, representing more than decoration for an interior space.

Well-known architects such as Le Corbusier, Mies van der Rohe, Turkish interior architect Sadun Ersin, and the Belgian Tapestry artist Julien Van Vlasselaer saw textiles, their textures, interfaces, and patterns as integral ingredients with a strong identity rather than as decorative elements added at the end of the design process. Le Corbusier started to work with tapestries in 1936. In 1948 he developed the theory of the Muralnomad, regarding tapestries as a mobile component in interiors that could be "detached from the wall, rolled up, taken under the arm at will and hung elsewhere.[6]" His production of tapestries is said to be a counterreaction to the critique of the modern interior often perceived as "radically imposing" their "smooth" and "new" surfaces **(Fig. 1)**.[7]

Van Vlasselaer had a similar take on the role of tapestries in interiors. In 1976, he wrote a plea for the reintegration of tapestries in architecture, praising their properties as a "sumptuous" and "irreplaceable" building material with which architects can compose space. Historically, he argued, tapestries united art and architecture. Originally stemming from castles, palaces and religious buildings, tapestries were used to "humanize large surfaces" and "to create warmth and atmosphere," and because of their suppleness and their size, they could easily be relocated and transported. They could be hung in larger spaces and serve as room dividers; outdoors, tapestries could become space definers, and on travels, and owners of tapestries could use them as portable walls when traveling, reconstructing their home environment. From the 15th century onwards, however, this tradition was lost. During modernism architecture was cleansed from decorative elements and camouflaging details, aiming at accuracy and purity. To overcome architectural aridity, Van Vlasselaer pointed out, modernists started to use natural materials without adornment – and they turned to the arts as a means to complete their architectural projects. Van Vlasselaer saw a great opportunity in this development, as it could afford the revival of tapestries, again becoming part of architectural space. Such revival demanded though a close collaboration between architects, artists, and craftsmen, - a condition which he considered possible.[8]

Textiles in the modern interior require their own spotlight depending on their individual functions. They differ in their ephemerality and effect. For instance, while furniture upholstery can be seen as more of a necessity, curtains have often been criticized, being regarded as effeminate and part

of the decoration. When used, they can be stated to be appropriated to the modern movement, with their folds, swags, and patterns greatly reduced[9]. Textiles exude messages about lifestyle and choice, comfort, and well-being, as well as interpretations of representation, experimentation of form and terminologies that expand and enable a clearer understanding of modern design[10]. Textiles have gained additional meaning in the modern period as they enable an element of play for modern interiors[11].

In the modern interior, patterns stand out as the "face" of textiles, especially with bold colors and geometries in the modernist period. However, the nature of the textiles is rarely discussed. Nor can this information find a place for themselves in archives, books, or academic research. Several local applications present themselves; such as, felt, kilims, and other regional textiles brought into the modern interior space.

Textile producers followed the requirements of the modern movement, and adapted the type and patterns accordingly. Turkish textile producer company Sümerbank helped shape the modern aesthetic of a whole nation developing textiles parallel to both architects' as well as women's needs as the decision makers regarding all fabrics in the domestic interior. Sümerbank was also in contact with IKEA and Wolf Company, producing textiles and patterns for this company **(Fig. 2)**. Moderno Turkish furniture company designed whole living room sets, complete with its textile components to inspire the new way of living **(Fig. 3)**. Sadi Öziş, a sculptor and furniture designer, founder of Kare Metal, combined traditional stories of the spiritual "Rumi" figure (a wise religious person) on his designs. These types of local interpretations and collaborations may be seen internationally and it is valuable to research the transnational effects in this regard[12].

That being mentioned, textiles are difficult to grasp in terms of historiography today as they are perhaps the most vulnerable components of interiors and, therefore, the items to be replaced frequently due to maintenance issues, damage from exposure to light and warm and damp conditions that may result in mold[13] (Williams, 1981). Thus, it was critical to emphasize the urgency to focus on textiles in the modern interior in the call for papers in this session, which turned out to respond to this need. The research in this session ranges from national design identities to traditional weaving practices, specific designers, and modernization of ancient motifs in used in textiles in the modern interiors around the world.

4. CONCLUSION

In conclusion, in this session, we focus on the use of textiles in the modern interior as well as local representations of the modern movement with commonalities and differences. In fact, using textiles as a catalyst for reflections and investigations into how the modern interior was conceived is only one of many other perspectives that we can explore to grasp the characteristics and properties of the modern interior. The contributions to this session reveal a richness of approaches and manifold unexpected insights. They broaden our scope and open even more doors into fields of investigation.

Textiles not only contribute to the identity of the modern interior, emphasizing local interpretations of the modern movement around the world, but also reflect the character of the user as they find their place on furniture, carpets, curtains, table cloths, and wall coverings. Oftentimes, textile panels can also be observed as abstract art in interiors around the world. The life cycles of different interior textile components vary, but all are quite limited and ephemeral, which creates a mystery and several possible routes for research around the issue.

The association of women with textiles and the softer side of the modern interior adds a significant layer to the discussion. It can be seen from rare examples that not only women designers, but also women artists, artisans, and weavers collaborated with architects and interior designers during the modern movement. Most of these women have not been credited and this is an important lack in literature. We believe that the quest to unearth the significant role of textiles in modern interiors and the place of women in these processes globally, is an ongoing quest and a relevant one in the years to come. This has been an attempt to delve deeper into these issues and raise necessary questions for future research. ■

BIOGRAPHY

Eva Storgaard is a lecturer and researcher in interior architecture at the Faculty of Design Sciences at the University of Antwerp. She has a specific interest in the culture and history of the Modern Movement and holds a Ph.D. in which she explores less-known aspects of the architectural culture of Danish modern architecture between 1930-70. She is an active member of the International Specialist Committee - Interior Design of DOCOMOMO. Currently, she is co-authoring a book about the teaching model of transformation strategies of modern movement heritage as practiced in the master design studio of interior architecture at the University of Antwerp.

Deniz Hasirci is an interior architect and environmental designer and professor at Izmir University of Economics (IUE), Turkey. She received her PhD degree from Bilkent University and visiting scholarship at NCSU from Fulbright. She led the Dept. of Interior Architecture and Environmental Design at IUE (2010-2017). She is co-coordinator of the DATUMM: Documenting and Archiving - Turkish Modern Furniture (datumm.org) project and founding member of the DOCOMOMO-Turkey Interior Design Committee, member of Fulbright Alumni, Chamber of Interior Architects of Turkey, 4T Turkish Design History Society, member of DOCOMOMO International Specialization Committee-Interior Design, and Design Studies graduate program head at IU

WEAVING (AS A DISCIPLINARY REFERENCE FOR) STAINED-GLASS WINDOWS IN MODERNIST LITURGICAL INTERIORS

ZSUZSANNA BÖRÖCZ

KU LEUVEN FACULTY OF ARTS, UANTWERPEN

ABSTRACT

I propose to discuss the parallels between two artistic disciplines: the stained-glass window and architectural textiles. Parallels, which can provide new insight into how the modern interior was conceived.

Traditionally, architectural stained glass was classified as part of the applied arts, but during modernism, and influenced by changing ideas on Roman Catholic liturgy, the status of stained glass became more fluid.

The canon identifies the starting point of modernist stained-glass as Josef Albers' remarkable window for the entrance hall of the early-Bauhaus Sommerfeld House in Berlin-Steglitz, a Gesamtkunstwerk. In the same total art concept, his later wife, Anni Albers, experimented with textile. In the article *Beyond Weaving: Transdisciplinarity and the Bauhaus Weaving Workshop*, with Anni Albers as a prominent figure, Erica Warren identifies striking parallels between the respective disciplines.

Starting from this article, we would like to develop these parallels by turning to the work of Michel Martens (1921-2006), one of the foremost stained-glass artists in post-war Belgium. He likened stained-glass windows in church interiors to a fabric, woven, as it were, in between opaque walls. In his vision, the wall was continued over the opening, transitioning into a translucent state that modifies daylight in order to create suitable interior conditions.

As the stained-glass window was no longer required to serve as a narrative, it could function similarly to textile in the modern interior: providing colour, texture, and daylight mitigation. Warren describes Anni Albers' Black-White-Red textile design (1926–27) as 'a play between striped and window-pane designs'. The lead-line pattern too can remind of a woven structure, even a form of architecture. These interdisciplinary parallels between textiles and stained glass illustrate the extent of modernism's transdisciplinary mindset and the potential effects on the interior.

1. INTRODUCTION

This paper aims to discuss the striking parallels between two quite distinct artistic disciplines: the stained-glass window and architectural textiles. Parallels, which can generate reflections on how the modern interior was conceived. In the article *Beyond Weaving: Transdisciplinarity and the Bauhaus Weaving Workshop*[1], in which Anni Albers is a prominent figure, Erica Warren identifies striking similarities between the respective disciplines. We would like to further develop these findings by turning to the work of Michel Martens (1921-2006), one of the foremost stained-glass artists in post-war Belgium. He likened stained-glass windows to a fabric, woven in between opaque walls. In his vision, the wall was not being interrupted but continued over the opening, only transitioning into a translucent state to create suitable interior conditions. We wish to demonstrate that the likeness between stained glass and textile not only lies in the variable degree of translucency but also in the weaving of patterns.

2. WINDOWS AND WEAVINGS BY THE ALBERS

The canon identifies the starting point of modernist stained-glass art in the context of the early-Bauhaus Gesamtkunstideal as Josef Albers' (1888-1976) remarkable window for the entrance hall of the Sommerfeld House in Berlin-Steglitz[2]. Though few have survived, there is evidence that Albers frequently experimented with free glass compositions, in which black and white lines seem to echo the traditional lead line, such as in his 'Upward' piece from ca. 1926[3].

In line with the Bauhaus principles of the unity of arts under the cupola of architecture, Anni Albers (1889-1994), experimented with textile at the Bauhaus weaving studio. In the article *Beyond Weaving: Transdisciplinarity and the Bauhaus Weaving Workshop*[4], Erica Warren identifies striking parallels between the respective disciplines of stained glass and woven textile.

The dialogue between Anni's weavings and her husband Josef's stained glass work of the mid-1920's has been noticed before by Briony Fer. The manifest application of horizontals and verticals as a grid, the appearance of a net(work), the presence of black, can all be read as a reference to the lead line, the structural element of every stained-glass window. Her 'Design for a wall hanging' from 1926, featuring white, light yellow and ocher patterns, could perfectly be considered as a model for a stained-glass window. Fer attributes this to the introduction of the grid and the role of transparency and glass in modern architecture, writing that there is 'some kind of intermediary or transitional relation to glass [in modernism] on the one hand and the wall on the other'[5].

An example of Anni's transdisciplinary approach is 'Black-White-Red' textile design (1926–27). Warren describes the composition as 'a play between striped and window-pane designs'[6]. In her book *On Weaving* from 1965[7], Anni writes about the windowpane designs featuring perpendicular lines that suggest the foundational meeting of threads on a two-dimensional

axis, forming a small section of a grid. She emphasises the structural and planar qualities of her work, not only essential when planning and documenting a woven fabric, but also reflecting concerns that transcend the medium and discipline. Her thinking leads into the field of anthropology and certain archetypes[8]. As modernism wanted to go back to the essence, an anthropological perspective on weaving should not surprise.

In accordance with the theoretical framework of the Bauhaus weaving workshop, Anni Albers' 'Black-White-Red' works both as an autonomous piece exploring materiality, technique and composition, and as a functional object within architectural space, providing colour, texture, separation and acoustic dampening. The rectangular pattern showing a window motif may be read as an abstract rendition of a multi-story building. While Gropius proclaimed that the ultimate aim of all visual arts is the complete building, for Anni, the connection between weaving and architecture was more elemental. In her essay "The Pliable Plane: Textiles in Architecture"[9], she articulated the relationship between both disciplines, repeatedly situating the two as analogous beyond the common purpose of providing shelter and being products of skilled workmanship. Demonstrating an ability to navigate disciplinary distinctions, she explained the correspondence as follows: "if we think of clothing as a secondary skin we might enlarge on this thought and realise that the enclosure of walls in a way is a third covering, that our habitation is another 'habit'"[10].

3. THE CHURCH WINDOW IN THE LITURGICAL MOVEMENT

Since the start of the Liturgical Movement around 1900, the Roman Catholic Church had created an opening to the ideals of sobriety, which resonated well with modernist ideas. No longer required as a 'Biblia pauperum', the stained-glass window could function similarly to textiles in the modern interior: providing colour, texture and a dampening of daylight, akin to a curtain.

The window as an element of architecture is directly related to the requirement of daylighting the interior, while influencing the experience and functionality of the space. From an architectural viewpoint, the (abstract or non-figurative) stained-glass of a church intends to direct the space toward an inner spirituality, visually separating the interior from the outside world by a combination of lead lines and cut pieces of glass, a network of opaque and translucent elements. In this function and aesthetically, stained-glass windows show many parallels with hanging textiles, especially curtains. Both the modern stained-glass window and the textile function in a similar way within an architectural space, providing colour, texture and a filter between exterior and interior space[11]. The church window, like a curtain, is an interface provoking interior interactions through atmospheric qualities. The Liturgical Movement and its translation in modernism replaced the narrative of the figurative church window by this elemental function. Stained glass was no longer meant to attract attention, elicit admiration, tell a story or conjure up Devine Light.

11. Warren, "Beyond Weaving: Transdisciplinarity and the Bauhaus Weaving Workshop" 444, 445.

It became an integral element in tune with their character, materiality and colouration, in order to create the conditions for worship, a turning inward, literally and metaphorically[12]. This echoes Anni Albers' statement that a woven fabric can both define and transform space[13], similarly to a semi-transparent screen like a stained-glass window.

Albers' curtains for office buildings, especially her work for Knoll (1958), are primarily developed to filter light. Realised in a very loose weave, they emphasise the individual threads like an architectural art piece, while shaping our behaviour by influencing light and openness[14]. This approach can be traced back to her Bauhaus teacher, Paul Klee, whose investigation of the effects of rhythmic and pure repetition of (almost) identical geometrical forms was entitled 'architecture'[15]. In the Bauhaus weaving classes, textile was never an autonomous decoration, but always part of the furniture (chair), the floor (carpet), the wall (tapestry or wall hangings) or the light control (curtain). It put textile and stained glass on equal footing as elements of architecture. By reducing weaving to its essence, the elemental structure of weft and warp, Anni's work in particular comes even closer to the essence of stained-glass: a pattern of cut glass and lead lines.

4. A LINE FROM THE MIDDLE AGES TO MICHEL MARTENS

Paul Klee's instructions in the Bauhaus workshops related to a thread or a line, such as "take a line for a walk", have been pointed out before[16]. In later autonomous work, Anni Albers reflects on this attitude, for instance in her 'Pictural Weavings', which investigates the elemental act of weaving or braiding as the basis of a tissue or fabric[17].

The association between pulling a thread and drawing was far from new. The Cistercian architecture and art regulations from the 12th century prohibited unnecessary ornamentation, colour and figuration in order to prevent idolatry and to avoid distractions from religious life. These strict rules encouraged the development of novel, geometric patterns for stained-glass windows, that strengthened the relationship between the window and the architecture[18]. Among the surviving patterns, many demonstrate a design which resembles loosely braided ropes, like in the church of the Aubazine Abbey in France. When rediscovered in the 19th century, these monochrome 'lead lights' were likened by some to damask, and appreciated exactly because of their noble simplicity and inextricable bond with the architecture[19].

An interesting case of comparison is Michel Martens (1921-2006), one of the foremost stained-glass artists in Belgium, who likened the role of stained glass in church interiors to a fabric. An autodidact, not bound by the tradition of figurative stained-glass windows but all the more convinced of religion's changed position as a more private matter, he grew toward abstraction. In accordance with both the Liturgical Movement's progressive ideas and the Bauhaus ideals of Gesamtkunst, he approached his work as architectural glass. In his view, the liturgical interior didn't need conspicuous

stained-glass windows, but only windows that supported a fitting atmosphere for worship. He received many commissions for war-damaged churches in need of new stained-glass windows. Inspired by and subservient to the architecture, Martens' windows are not the centre of attention in the interior. On the contrary, they support the contemporary, modern(ist) idea of the interior shaped by the architectural shell, with windows woven over the openings like a fabric. In this vision, the wall was not negated by but continued over the opening, only transitioning into a translucent state allowing in filtered daylight to create interior conditions fit for purpose.

5. THE MAKING OF / MEANING OF

On discovering the ancient pattern-making in Mexico, Anni Albers continued experimenting with geometric structures[20], finding the modernist legacy reflected in Central-American artifacts. "While the useful is defined by its context (the modern interior), the useless defines its own function transcendentally (existential solitude)'", writes Manuel Cirauqui on the relation between craft and art in the work of Anni Albers[21]. Translated into the church window, the first dimension may relate to the necessity of openings in the shell for light, the second to the manipulation of the light to allow a metaphysical experience. For this duality, Semper used the twofold expression of the core form ('Kernform'), that is materially (and functionally) conditioned, and the artistic form ('Kunstform') that envelopes it[22]. Influenced by the writings of polymath and cultural philosopher Oswald Spengler (1880-1936), Semper also made a link to the metaphysical order, which he saw visually manifested in the knot, describing the archetypal 'wall' as a sheet of textile[23]. This association goes back far in architectural theory, to Vitruvius coining the phrase 'weaving a wall'[24].

Looking at the later work of both Albers and Martens, more parallels emerge. From the end of the 1960's, Martens designed almost exclusively abstract stained-glass, creating geometric patterns according to the laws of how antique glass naturally breaks into shards, in order to avoid unnecessary forces and risks of cracking, and omitting all painting on glass. One such example are his two lancets for the late-gothic Saint-Michael's parish church in Ghent. Here, some glass pieces were replaced by mirror glass to lend a lively atmosphere to the interior even after sunset when the interior is artificially lit, counteracting the fact that windows become a black wall after dark when lit from the interior. Comparing these windows with Anni Albers' aquatint 'Second Movement IV' from 1978[25], striking parallels emerge in her pattern of triangles, ordered in 4X4 identical quadrangles, using a limited number of colours but still resulting in a vibrant effect.

Such parallels, which can be explained not by direct influence but by a comparable attitude towards two different but kindred media, by artists who saw their craft in the light of architecture. The parallel receives an intriguing extension in the work of contemporary Belgian textile artist Maryse Krutwage (*1952), who, visiting the St. Peter and St. Paul's church (arch. Louis Delacenserie 1899-1905) in Ostend Belgium, became fascinated

with Martens' windows. Though not her medium, the windows inspired her without being aware that he made the comparison between textile and stained-glass in the context of this, his most important commission in the reconstruction period.

6. CONCLUSION

These interdisciplinary parallels between textiles and stained glass in modernist (church) interiors demonstrate the extent of modernism's transdisciplinary mindset and the potential application thereof in interior spaces and beyond through traditional processes. Modernism was intent on breaking boundaries and hierarchies in an attempt to create a better society. The masterly, correct and magnificent play was not for its own sake, but for what it could catalyse: societal change, equity, better living conditions for all. Against this background, it is good to see that weaving a wall or a window or pulling a thread through glass or air can result in elements that are both functional and help us contemplate what is beyond. In current times it seems this legacy is still very relevant. ■

Zsuzsanna Böröcz is musicologist, and art and architectural historian. She obtained her Ph.D. from the KU Leuven in 2004 with a comparative and contextual study on postwar stained-glass windows. Since then she has been teaching diverse subjects on art, design and architectural theory. As a researcher she is affiliated to both the KU Leuven Department of Architecture A2I research group Architecture Interiority Inhabitation and the University of Antwerp Faculty of Design Sciences Henry van de Velde Research Group. She is since 2022 President of Docomomo Belgium and since 2014 co-founder and co-chair of the Docomomo International Specific Committee on Interior Design.

"ORIGIN: MODERNISED FROM ANCIENT TURKISH MOTIFS"[1]: A CASE STUDY ON HEREKE SÜMERBANK CARPET COLLECTION IN 1965

DIDEM YAVUZ VELIPAŞAOĞLU
DEPT. INTERIOR ARCHITECTURE AND ENVIRONMENTAL DESIGN,
FACULTY OF FINE ARTS AND DESIGN,
IZMIR UNIVERSITY OF ECONOMICS, TURKEY

ABSTRACT

The 1965 Sümerbank[2] Carpet Collection encompasses not only many traditional and orientalist carpet weavings but also some examples that could be described as abstract and occasionally expressionist crafts by prominent artists and designers of the era, i.e. Belkıs Balpınar, Selahattin Gönenç, Orhan Çolak and Hamdi Berdi. These carpets include modernised versions of Anatolian kilim motifs, stylised renditions, and stylised depictions of picturesque Anatolian village-scape. In the catalogue, each carpet is accompanied by the respective cities they belong to, and in this catalogue, the origin of the aforementioned abstract and expressionist works are indicated as "modern" or "modernised from Ancient Turkish motifs." So, what do these works, departing from tradition, signify, and what kind of preliminary work and socio-political environment do they represent? The study examines the influence of the Villageism movement during the period, as well as their influence on craft-base design, on Sümerbank carpets.

1. INTRODUCTION

This study examines the significant transformations in the Sümerbank factory's carpet designs, including variations in local styles, as it transitioned from an Ottoman imperial entity to a key part of the new Republican national infrastructure. Operating between the 1930s and 1980s, Sümerbank factories, which were active in various fields, from fabric to carpets and from shoes to yarn, provided clothing for the whole of society, from the wealthy to the impoverished, and played a significant role in shaping the new Turkish identity that emerged with the Republic.

The 1965 Sümerbank Carpet Collection encompasses not only many traditional[3] and orientalist carpet weavings but also some examples that could be described as abstract, and even expressionist crafts, created by prominent artists and designers of the era, i.e. Belkıs Balpınar, Selahattin Gönenç, and Orhan Çolak. These carpets include modernised versions of Anatolian kilim motifs, stylised renditions, and stylised depictions of picturesque Anatolian village-scape. In the 1965 Sümerbank Carpet Catalogue, each carpet is identified by city of origin, and in this 1965 Sümerbank Carpet Catalogue, the origin of the aforementioned abstract and expressionist works is indicated as "modern" or "modernised from Ancient Turkish motifs." So, what is the significance of these works, departing from tradition, and what kind of artistic tradition and socio-political environment do they represent? It is no surprise that this movement, sometimes known as Villageism, which emerged in the 1930s and dominated the 20th century with its romantic gaze, came to the fore with a group of artist-craftsmen working at the Hereke Sümerbank Carpet Factory.

Located to the east of Istanbul on the shores of the Sea of Marmara, the Hereke Factory was launched as a private broadcloth factory in 1842.[4] Initially, European painters were employed at the Hereke Imperial Factories. However, with the founding of the School of Fine Arts (Sanayi-i Nefise Mektebi) in 1882, this role was taken on by graduates of that school, such as Greek Orthodox Yorgaki, Armenian Osgan Efendi, and Tovmas (Baldasar), who would later go on to become prominent local artists. While the factory's early output mimicked European styles, later, there was a concerted effort to cultivate a cohesive Ottoman style through the involvement of local artists.[5] [6] During the decline of Ottomanism, and then the resurgence of the empire's golden age, Hereke carpets began incorporating design elements inspired by Ottoman territories, including motifs derived from tiles, architectural features, and stone interiors. This initiative aimed to cultivate a national repertoire.

During the Ottoman period, certain Hereke carpets became renowned as classics, typically identified by names associated with their unique designs, such as Polonez and Seven Mountain Flowers. With the establishment of the Republic of Turkey, the Hereke Factory operation was transferred first to the Industry and Metal Bank (Sanayii ve Maadin Bank) in 1925, and then to Sümerbank in 1933. It was generally believed that traditional compositions and canonical patterns like Tebriz, Milas, Polonez and Kafkas had reached the climax of their aesthetics, and thus were unsuitable for redesigning or adapting.

1. In the 1965 Süperbank Carpet Catalogue, abstract and expressionist works are indicated as "modern" or "modernised from Ancient Turkish motifs." This effort represents a struggle to rediscover and highlight the Turkish identity that had been overshadowed by Iranian carpets.

2. In the 1965 Sümerbank Carpet Catalogue, each Turkish city was represented by its traditional patterns.

3. After it was transformed into an imperial factory (Hereke Fabrika-yı Hümayun) in 1845, Hereke factory started producing textiles and carpets for local and international markets, and became an important centre for a series of modernisation projects implemented in the late Ottoman Empire.

2. UNDER THE INFLUENCE OF VILLAGEISM

In his article titled "Beginnings of Folk Civilization-I," published in the 14th issue of *Halka Doğru* during 1913-1914, sociologist Ziya Gökalp (1876–1924) argued that the time had come to focus on the people. He attributed the Turkish word, *Halkiyat*, to the science that examines this traditional civilisation, whose rules are unwritten and is transmitted orally from generation to generation. Alongside this scholarly endeavour, Gökalp emphasised the importance of retaining the influence of Romanticism.[7]

We should pay particular attention to the following words of Gökalp: "What should one do? …To listen to their poetry, their music, to watch their dances, their plays. … To appreciate the beauty in their clothing, the arrangement of their homes, the simplicity of their furniture."[8] Ziya Gökalp invited closer examination into village life, and the agrarianism ideology played a significant role in the emergence of Turkish nationalism.[9]

Throughout the 20th century, Villageism emerged in relatively less-developed countries for various reasons. It is worth noting the increased interest in villages and peasants was fuelled particularly due to the upheaval caused by peasant uprisings in Eastern Europe following the 1917 Russian Revolution and the aftermath of World War I. Indeed, Villageism was a driving force in all the major revolutions of the 20th century.[10] This can be seen in Atatürk's opening speech of the third session of the first term of the Grand National Assembly: "The true owner and master of Turkey, the genuine producer, is the peasant," which would later become the slogan of the early Republican period.[11]

It can be argued that Gökalp's cultural romanticism can be seen in a range of works, ranging from the establishment of the Republican People's Party's (RPP) political principles, including populism, to various activities, like the Turkish Studies Institute and the People's Houses. Gökalp's cultural romanticism is considered evident in these endeavours.[12] The agrarianism glorified rural life and peasants, who they depicted as living in a utopia.[13]

The Homeland Tours (*Yurt Gezileri*) was an event aimed at bringing art together with the public, specifically in villages. Between 1938 and 1943, six tours were organised by the RPP. However, they came to an end with the transition to a multi-party system, and during the era of the opposition Democratic Party, the paintings created during these tours were neglected and eventually disappeared.[14] However, this practice of on-site observation and interaction with villages continued, particularly within the context of Sümerbank, into the 1960s. In a 2021 oral history study,[15] Belkıs Balpınar recounts that during her Chief Draftsmanship years at Sümerbank in the 1960s, the factory artists would take trips to villages to observe local kilim, carpet, and weaving practices. This approach, which blends the modern with the local, is, however, removed from the more populist rhetoric of the multiparty period of the 1950s, and aims to emphasise the local and folkloric as resistance to Americanisation.

In the 1950s, Americanisation had started to become evident in many craft sectors; particularly among Turkish artists, and notably ceramic artists,

who were supported by the Rockefeller Foundation.[16] The artist-craftsmen of Turkey, embarked on a journey to revive ancient, Byzantine, Turkish, and Ottoman crafts, by rediscovering lost colours and forms in their works. For example, ceramic artist Füreya was acclaimed by American critics for her distinctive ability to reinterpret "the heritage of Byzantine mosaics and Turkish tiles" and integrate them into modern artworks.[17] One could argue that the village excursions of Sümerbank in the 1960s could be interpreted as an expression of the aspiration to reestablish the cohesion and continuity of Turks as a nation. The artists mentioned in this context, were less affected by Orientalist discourses, and rather, embarked on a journey of self-discovery through craft, merging the ancient archetypes they unearthed with contemporary art movements.

We should briefly examine the literature on carpets produced during the Republican Period. Among the hundreds of sources, two understandings stand out in terms of pioneering perspectives: first, the carpet is related to an ethnic identity, centred on a nationalist discourse; and second, carpet weaving is a blend of local traditions that reflects cultural amalgamation expressing the image of local artefacts on a volatile material, i.e., carpets. For many historians, the carpet and kilim tradition of Anatolia emerged after the Turkic invasion of Anatolia in the 11th century and was related to the weaving techniques of nomadic cultures to produce shelters. For instance, among a myriad of similar approaches, for Kazım Dirik, an author an officer of Ottoman Army and later a general of the Turkish Army, carpet weaving is central to Turkish identity, which he argues in his book, *Eski ve Yeni Türk Halıcılığı ve Cihan Halı Tipleri Panoraması (The Old and New Turkish Carpet Industry and A Panorama of World Carpet Styles)* in late 1930.[18] On the other hand, the book Goddess from Anatolia, written in the late 1980s by Belkıs Balpınar, one of the key figures in this study as the designer of the aforementioned abstract and stylised carpets, delves into the origin of kilim, or tapestry, in ancient Anatolian civilizations rather than in the culture of Turkic nomads. At this point we can trace the concept of *Anadoluluk* (Anatolianism) and its successor, Villageism, and consequently, an inevitable multicultural heritage. The motives and the patterns of the kilims, according to Belkis Balpınar, have been derived from "our" tradition, *gelenek görenek*, but are independent of any nationalist discourse. In her controversial hypothesis, she connects the tradition of kilim to various images, including reliefs, wall paintings, illustrations of humans from the shrine, cave and niche forms, depictions of goddesses as realistic "birth symbols", mythological images, the floral and zoomorphic features of the local environment (such as goats, and leopards). She specifically focuses on the Neolithic settlements of Hacılar and Çatalhöyük. These images were created in early Neolithic periods, she argues, and remained unchanged over the centuries because, for generations, young girls in the pastoral communities learned the weaving styles from their elder relatives and neighbours. The weaving girls did not design a new pattern or style, for Balpınar, since they were "performers" rather than "composers."[19] As has been shown, Balpınar approaches kilim and carpet weaving independently of ethnic identity, instead, establishing its

connection with a particular place, in this case, Anatolia, and discussing the transmission of this ancient craft across generations.

3. THE 1965 COLLECTION AND THE CARPET SEMINAR OF 1965

Orhan Çolak's work depicts Anatolian motifs unearthed from the depths of darkness. Turkish motifs emerge as if shining through the darkness of the previous era. Portraying stark, simple carpets on the one hand, and traditional Anatolian rugs on the other, this style of work is significant not only for carpet art but also for Turkish painting. **(Fig 1)** Orhan Çolak emerges as the most open-minded individual regarding innovation in carpet and kilim weaving. Çolak participates in seminars in which his colleagues Yusuf Durul and Kenan Özbel argue the notion that not even the slightest detail of ancient motifs should be altered. Çolak disagrees and suggests that new compositions can be created and that this act symbolises the confidence of artists and the era in which they live. According to him, enshrining motifs does not constitute progress in terms of art; on the contrary, it leads towards stagnation and regression. He further explains that "Patterns are not static and fixed; they have undergone changes throughout every era, resulting in our rich archive today. Climate conditions, proximity and distance between regions, powers, and religious beliefs all manifest their influence on carpet patterns." He proposed that a carpet artist should work like an archaeologist, meticulously examining each motif and making necessary corrections and additions to understand the intricacies and anatomy of the design, thus revealing faithful and enhanced versions of the original character.[20]

Selahattin Gönenç, the Carpet Chief of the Hereke Factory, takes another approach to the ancient motifs, but with only a minor touch in his compositions, and in his speech, equating carpet-making to the act of painting. According to him, the harmony and coherence that variously coloured wool threads would express on the surface of the carpet are its most important qualities. While the preparation of the material has always been a commercial and industrial activity, the act of painting is a fine art and the work of an artist, and therefore, the pictorial aspect is the most prominent quality of a carpet. According to him, new carpets must portray themselves as nothing but simple imitations of a very rich past. Accordingly, it was a mistake to underestimate the carpets and designs created by the country's tribes and nomads in their own style. In this view, Turkish carpet designs should be in the hands of skilled and artistic carpet painters.[21] His carpet design featured exaggerated and emphasised geometric patterns adopted from the western Anatolia region. **(Fig 2)**

Belkıs Balpınar, the Sümerbank carpet designer, and perhaps the boldest among this trio in creating new compositions, begins her speech by recalling her participation as a Sümerbank representative at the 1965 Brussels Paris Carpet Fair, and she explains that there was significant interest in their offerings. For her, handwoven carpets were superior to machine-made ones, and the European demand market displayed a variety of preferences ranging from orientalist elements to more geometric patterns. Therefore, according to Balpınar, at that time, the carpet industry experienced a climate of great diversity in which it was possible to produce carpets to cater to every taste.

#34

Fig 4. Village Song, 5004, Origin: Modernised from old Turkish Motifs, Belkıs Balpınar, Türk Halı Desenleri: Sümerbank Halı Albümü, Sümerbank, 1965

"There is no reason for us not to serve the carpet industry to the fullest extent. Therefore, it is necessary to see a lot and work extensively."[22] What is remarkable is that Balpınar mimics an idyllic village landscape adorned with cypress and poplar trees in her studies, which are typical of Anatolian village landscapes. Her figurative experiments are intriguing, as according to art history professor Kenan Özbel, the images on Turkish carpets are not portrayals, but interpretations; they are abstract and stylised. To him:

> *Motifs like a bird, a snake, or a tiger in a carpet occupy the imagination of an artist, inhabit their spiritual world, and symbolize their religious beliefs in an abstract, non-figurative sense on the carpet. Unlike Persian carpets, Turkish carpets do not depict miniatures or figures but rather incorporate abstract figures, placing interpretation, or naturalism on the carpet.*[23]

In light of this, one could argue that Balpınar's carpet designs are unique in exhibiting a stylised form of figurative artistry that narrativises, places an interpretation and depicts a visual narrative. **(Fig 3-4)**

4. CONCLUSION

In 1965, Sümerbank's markets included Austria, Belgium, Denmark, Finland, France, Germany, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and the United Kingdom. In addition, there was a noticeable surge in the market in North America. One of the most important competitors in the market was the brown, pale-coloured Afghan carpets.24 One could argue that the aforementioned artists in question choose bright and pastel colours together to set themselves apart in the market. Furthermore, it could even be stated that the unusual lines in the 1965 Sümerbank Carpet Catalogue are explicitly intended to enhance the identity of Turkish carpets, which had been under the influence of Iranian motifs since the decline of the empire. The perspective of closely attending to the folk, which began with Ziya Gökalp, emerged as Villageism in the Republican era and transformed into picturesque motifs with the rediscovery and renewed interest in Anatolia. Sample motifs blend geometric archetypes inherent in Turkish culture and carpets with stylised pictorial village depictions to offer a modern composition rooted in Turkish carpets. Here, the focus is no longer on endlessly repeating "patterns;" rather, it is a "composition" in which the designer is involved. In other words, draftsmen, who, since the 1950s, have identified themselves as artist-craftsmen, break the conventional cycle of being mere "performers" as shown in Anatolian carpets by Belkıs Balpınar, and now become "composers" themselves. ■

She then earned her master's degree from Architectural Design Programme at Istanbul Bilgi University in 2008, as a full scholarship student. As a Fulbright Scholar, Didem Yavuz Velipaşaoğlu was awarded her PhD degree from the joint Urban Systems programme at Rutgers University and New Jersey Institute of Technology, in 2018. She is the co-founder of MVDY Architects, and is an Assistant Professor at Izmir University of Economics. She is the author of the book *Crafting an Empire: the Hereke Factory Campus (1842-1914)*.

TAPTA–SIMONE GUILLISSEN-HOA: COLLABORATIONS AND CROSSING BORDERS BETWEEN TEXTILE ARTS AND MODERN ARCHITECTURE

APOLLINE VRANKEN
UNIVERSITÉ LIBRE DE BRUXELLES

VIRGINIE MAMET
ACADÉMIE ROYALE DES BEAUX-ARTS DE BRUXELLES

ABSTRACT

In Belgium, the first architects and weavers trained at La Cambre came into practice between the wars. Considering the historical context of the binarisation of genders (men/women) and disciplines (architecture/decorative arts; major arts/minor arts), this study examines the personal and professional relationship between two significant women artists of the same generation. Architect Simone Guillissen-Hoa (born Simone Hoa; Beijing, 1916 - Brussels, 1996) and textile sculptor/artist Tapta (born Maria Irena Boyé; Kościan, 1926 - Brussels, 1997) will be the focus, exploring the gender issues specific to their respective artistic practices, the scales of artistic creation of these two protagonists, as well as the networks between women artists enabling the circulation of creative ideas, solidarity in the professional field and access to commissions. To transcend traditional binary categories, in all senses of the term, and highlight overlooked constellations that have been overshadowed by male names to legitimise women's artistic production and qualities, the mobilisation of the theoretical field articulating gender and art will enable us to comprehend and understand the circumstances surrounding production and the emergence of these artists and the specificities of their artistic fields. This exploration of unpublished archives will reveal a little known interpersonal history. Finally, the analysis of three object-works —Tapta, *Untitled* (Chaise-Coquille, Shell Chair or Diamond Chair covered with ropes), circa 1980; Tapta, *Untitled* (hand-woven shawl), 1970s; Tapta, *Untitled* (fresco/mural sculpture), circa 1981— will examine their textile productions in various modern interiors and their collaborations from a multiscalar prism. This approach transcends the strict boundaries that traditionally separate utilitarian objects from works of art, furniture from architecture.

1. TAPTA / SIMONE GUILLISSEN-HOA: COMMON SOURCES

Simone Hoa (1916-1996) was born in Beijing in 1916 to a Chinese engineer father and a Jewish Polish author mother. She grew up in China, France, and England before moving to Brussels to complete her studies. In 1935, she enrolled in the architecture section of La Cambre, graduating in 1938.

Maria Irena Boyé (1926-1997), known as Tapta, was born into a Polish Jewish family in Kościan in 1926. Her father was an engineer and her mother a painter. After the Warsaw Uprising in 1944, she moved to Brussels with her husband and enrolled in the Weaving workshop at La Cambre in 1946, graduating in 1949.

Founded in 1926, La Cambre School aims to break away from academic traditions. It combined decorative arts and architecture with industry and craftsmanship to (re)value expertise. It was the first time in Belgium that contemporary modern architecture was taught there in a formal language[1], and a *Tissage-Tapisserie* (Weaving-Tapestry) section, teaching textile art, opened within the artistic curriculum. These new pedagogies attracted students, particularly women.

Upon completing her studies, aware of the "woman question" ("*question de la femme*")[2], Simone Guillissen-Hoa was ready to conform to the prevailing gender norms by leveraging her skills in the decorative arts sector[3] to advance professionally. During the post-war shortage of commissions, she balanced her desire to work as an architect with the socio-professional roles expected of her. In 1947, she received a commission and completed her first house, Villa Faniel (Brussels, 1947).

In textile arts, La Cambre graduates faced a more complex professional status. There was no law regulating the profession of *Arts du Tissu* (Textile Arts), and some practices still adhere to the tradition of guilds and manufacturers. La Cambre offered a blend of artistic and craft practices, a dual status reflected in the careers of Tapta and her peers. Tapta's case is therefore unexceptional in a system where the exception is the rule.

Following her studies, Tapta moved to the Belgian colony of Congo from 1950 to 1960, continuing her textile research there. In 1963, she participated for the first time in the Lausanne Biennale, during which she realised that other artists shared her interest in a *Nouvelle Tapisserie* (New Tapestry)[4]. While Tapta's stance on gender issues in the early 1970s (coinciding with the second wave of feminism) is not explicit, her works offer clues. Her rope sculptures play with gender stereotypes, managing to combine preciousness and roughness, warmth and rigour - concepts that art critics maintain in a formal and gendered opposition[5]. Furthermore, in 1972, on the occasion of the first *Journée de la femme* (International Women's Day) recognised by the United Nations, Tapta exhibited *Ouvrage de femme ou Oser voir grand (Women's Work or Dare to Dream Big)*[6]. One can discern an intention to blur codes.

While the two women share a common artistic background and both claim a certain "modernity," they also share a personal experience: both Jewish and Polish (by origin for one, by nationality for the other), they are heirs to these identities and cultures. The connection that likely emerged

between Tapta and Guillissen-Hoa in the late 1970s to early 1980s may be rooted in these similarities, although it is not documented. However, three works and the nature of their acquisition attest to the relationship between the two artists.

Thus, this article relies on previously unpublished monographic data from primary archives (registers, personal photos, interviews, etc.). Additionally, it employs theoretical knowledge that connects gender and art history to place the narratives of Simone Guillissen-Hoa and Tapta within a socio-historical context. The combination of these elements is supported by the analysis of three works that reflect their artistic, personal, and political positions, highlighting the connections between Guillissen-Hoa and Tapta.

2. TAPTA X SIMONE GUILLISSEN-HOA: A MEETING AND THREE RELAY-OBJECTS

2.1 TAPTA, UNTITLED (SHELL CHAIR OR DIAMOND CHAIR COVERED IN ROPES), CIRCA 1980, METAL AND WOOL.

The first work is a Shell Chair, created around 1980 by Tapta. The artist reappropriates the Diamond Chair by designer Bertoia, covering it with a wool rope cushion. Traditionally rooted in domestic, craft, and feminine connotations, textile practices were fully reinvented in the 1970s. Artists of the New Tapestry (*Nouvelle Tapisserie*) —mostly women— felt the need to reclaim fibres to give them a new life, oriented towards monumentality, power, and expressiveness. Terms like "textile sculpture" (sculpture textile) or "soft sculpture" (*sculpture souple*) emerged[7]. These intentions intersected at the time with those advocated by the second wave of feminism in search of a "feminine culture" (*culture feminine*), defined as "an experience linked to the history of women's condition" ("*une expérience liée à l'histoire de la condition des femmes*")[8]. These artists questioned the traditionally established boundaries between major and minor arts, fine arts and decorative arts, art and crafts. The Shell Chair precisely plays with these codes. Is it a customised utilitarian object, a limited-edition designer collectable, or a textile work produced in few copies? The distinction matters little, and indeed, what would be the use in fixing its status? Is its interest not precisely in its form and hybrid status?

Simone Guillissen-Hoa commissions or purchases two Shell Chairs for her studio-apartment **(Fig. 1)**. This space, between private and public, domestic and professional, subverts gendered territories. This hybrid programme between residence and studio is spatially supported by several architectural innovations, including the free design of the ground plan (*plan libre*) that offers real porosity between functions. The free design of the façade (*façade libre*) creates an extension between the interior and exterior. Conceived as a whole, the studio-apartment blurs the binary categories opposing architecture and interior decoration: the architect designs every detail of the place and redraws the contours of her discipline. It is not a surprise to find Tapta's Shell Chairs there, works blending textile arts, sculpture, and decorative arts.

8. Dallier, "Transgression et Extension Des Frontières de l'art," 46.

2.2 TAPTA, *UNTITLED* (HANDWOVEN SHAWL), 1970S, WOOL.

Tapta's second work acquired privately by Guillissen-Hoa or given by Tapta to the architect, probably around 1980, is a shawl **(Fig. 2)**. A small label on the edge of the fabric states "Handwoven by Tapta" ("*Tissé main par Tapta*"). The artist claims the artisanal, "handmade" aspect of her pieces while affixing her artist's signature. If the trend in sculpture in the early 1970s led to a form of dematerialisation of the object, resulting in a relative effacement of the artist[9], textile arts, on the contrary, valued materiality and organicity. Artists in this field do not wish to fade away but rather seek to assert themselves in a male-dominated art world.

Since the 1970s, the reinvention of artisanal vocabulary has been seen in the reflections of architects of the second modernist wave, of which Guillissen-Hoa forms a part. The inseparable relationship between modern and regional[10], between structural revolution of the building and ancestral know-how characterises this second and new generation of modernists, the "post-war modernism"[11], with a hybrid aesthetic language. While the link to the "handmade" dimension is not explicit and the one to a form of "history of women's condition" ("*histoire de la condition des femmes*") is non-existent in the architectural discipline of that time, the use of natural, local materials, anchored in history, innovates and disturbs.

2.3 TAPTA, *UNTITLED* (MURAL FRESCO/SCULPTURE), CIRCA 1981, THICK FUR RUG, WOODEN CYLINDERS, AND LAMINATED WOOD STRUCTURE.

As early as 1968, Guillissen-Hoa was invited to erect the first House of Culture in collaboration with the local agency Winance, Pirson & Ginion. Through various art integrations and collaborations, the architect here surpasses "the mystique of architectural authorship."[12]

The monumental work commissioned by the architect to Tapta is a textile wall sculpture designed to adorn the hall's staircase cage. The custom creation consists of two frescoes directly glued to the walls of two flights of stairs **(Fig. 3)**. It integrates into the space by engaging with its place of reception. Unfortunately, the work was destroyed. Only a few oral testimonies[13] and rare archival photographs remain.

Guillissen-Hoa's architecture offers the House of Culture a spatial arrangement that articulates landscape, architecture, and details in a single harmonious proposition. Tapta's work completes this triptych of scales, invoking monumentality and the everyday, softness and roughness, becoming both an expansive landscape and an intimate envelope.

3. TAPTA–SIMONE GUILLISSEN-HOA : TROUBLE AND TRANSCENDENCE OF BOUNDARIES

By the 1980s, Tapta began to "feel constrained" in this sort of "ghetto" of textile art[14]. She also asserts, despite occasional participations, to have a "horror" ("*horreur*") of exhibitions dedicated to "women's art" ("*l'art des femmes*"), which "undermine the feminist cause" ("*desservent la cause féministe*").[15] This position illustrates the ambivalence within the textile

art renewal movement, torn between seeking a common feminine culture and pursuing singular individuality. Tapta also seeks to go beyond the "decorative" character that, according to her, still sticks to the skin of textile art.[16] She would have liked to use textiles without posing limiting questions, to practice an art "without any label" ("*sans aucune etiquette*").[17]

In a professional sector structured by gender division[18], Guillissen-Hoa's use of the *woman category*, was useful during her early years as an architect. However, towards the end of her career, she shifted towards a collective struggle for women's rights. In 1978, the architect participated in the founding of the Union of Women Architects of Belgium (*Union des Femmes Architectes de Belgique*). Despite the non-binary nature of the Union, its discourse is not essentialist but well emancipatory. Guillissen-Hoa, it seems, would also have liked to practice an art "without any label."

4. CONCLUSION

At the beginning of their careers, Guillissen-Hoa and Tapta share similar backgrounds in terms of family, culture, and identity. However, their enrollment in distinct disciplines at La Cambre, 11 years apart, marked different gender experiences. La Cambre, despite its avant-garde reputation, presents a gender disparity among its sections, a divergence that the two artists subsequently experience in their professions,

16. Wiesława Wierzchowska, "Tapta," *Pokaz*, no. 21 (1997): 14.

17. Baudson, *Tapta, Collections d'Entretiens et d'Images*, 18.

corresponding to a binary gendered social structure. Comparing these two artists highlights these hegemonic mechanisms. However, their artistic relationship reveals other dimensions of their practices: the circulation of creative ideas and professional solidarity among women.

These principles emerge through the three analysed works (shell chair, shawl, mural sculpture), which serve as relay objects, "both parameter and network element"[19], witnesses to connections, and intertwining practices across multiple scales of artistic creation. Tapta sought to break free of the stigmatised codes of textile arts, while Guillissen-Hoa blurred boundaries by exploiting curtain wall qualities and engaging in various professional aspects. Their common assertion of the inextricable link between textile/material - object/sculpture - space/architecture through the creation of their own vocabulary proposes a "new dynamism of space" ("*nouveau dynamisme de l'espace*").[20]

This analysis is not about attributing these experiments to a particular gender identity but about showing how Tapta and Guillissen-Hoa subverted traditional practices and revalorised previously depreciated disciplines (through an argumentation based on gender). They redefined their qualities and statuses, extracting themselves from the societal dictates assigned to their gender.

Their artistic stances and works evolved over the decades, influenced by political, economic, and professional conditions, personal situations, and artistic intentions. Their commitment is understood in light of political, economic, and professional conditions, personal situations, and artistic intentions. They have dealt with the gendered expectations of their time while emancipating themselves from them. While one, Tapta, adopts an artistic position desiring to move away from the "ghetto" of textile art and "women's art," the other opts for a political and activist commitment by co-founding the Union of Women Architects of Belgium. In conclusion, while both are concerned about the positioning of women in the practice of art and their statuses in society, whether social or professional, they formulate different responses to these challenges. ■

BIOGRAPHY

Apolline Vranken is passionate about questions of gender relations in space and urban equality. She investigates these themes in her final thesis Des béguinages à l'architecture féministe. After graduating in architecture in 2017, she worked for over two years as an architect. Today, she is a FRESH-FNRS doctoral researcher at the ULB Faculty of Architecture. She founded "L'architecture qui dégenre" in 2018 and organises many activities, including the Belgian edition of the Women's Heritage Days. Her research focuses on the methodologies of a feminist history of modern architecture, analysing the career of Simone Guillissen-Hoa, one of Belgium's first female architects.

Virginie Mamet has a degree in art history from the Université Libre de Bruxelles (ULB). She teaches at the Académie royale des Beaux-Arts de Bruxelles, works in the Cultural Mediation Department of the Royal Museums of Fine Arts of Belgium, and works independently for various Brussels non-profit organisations and institutions. Her research focuses mainly on textile art. Her master's thesis centred on the relationship to the body in the soft textile sculptures created by artist Tapta in the 1970s.

DUMBARA WEAVING - MINNETTE DE SILVA THREADING A 'MODERN REGIONAL ARCHITECTURE IN THE TROPICS'

INÊS LEONOR NUNES
UNIVERSITY OF COIMBRA, PORTUGAL

ABSTRACT

This paper builds on the work of the architect Minnette De Silva, highlighting the relevance of textiles in her architectural legacy. Particularly, it explores how the revitalization of the ancient practice of Ceylonese *dumbara* weaving determinedly contributed to her unique and pioneering modern interior designs.

Self-coined "an experiment in Modern Regional Architecture in the Tropics", De Silva performed an innovative synthesis fusing modern principles, mastered at the Architectural Association of London, with an assemblage of arts and crafts objects and practices embodying Ceylon's traditional history.

Among them, *dumbara* weaving was especially dear to De Silva. To revive these centuries-old textiles, hand-threaded with plant fibers and portraying symbolic motifs, she founded a handloom studio using up-to-date technologies, and learned how to weave. Therefore, De Silva expanded the applicability of *dumbara* from tapestries, rugs, or cushion covers, incorporating it into architectural elements such as curtains, and panelling. Furthermore, De Silva adapted vernacular designs into modern-styled garments, namely saris that she personally wore. The architect's profound collaboration with local artistry socially uplifted these practices, preventing their extinction, while simultaneously transmuting them into symbols of pre-colonial authenticity during Ceylon's independence.

From this remarkable production of objects, few reached nowadays, emphasizing their ephemerality and challenging archival preservation. Nonetheless, while diminishing, *dumbara* weaving persists today. Integrated into the author's doctoral research, this paper focuses on De Silva's autobiography and fieldwork in Sri Lanka. It involved visiting the architect's remaining œuvre and the Dumbara Valley, unveiling the current revival endeavour. The research aims to draw a theoretical reflection on the construction of the modern interior through De Silva's overlooked legacy and special dedication to textiles, emphasizing how profoundly the thread of the weaver created artistic, social, epistemological, and cultural identity. Besides, it crystallized personal expressions and community history through a complex system entangling gender, class/caste, and colonial-political connotations.

1. INTRODUCTION

The Ceylonese architect Minnette De Silva (1918-1998) is a crucial figure regarding the entanglements of modern architecture and textiles. The revival of Sri Lankan *dumbara* weaving is vital to De Silva's distinctive modern interior designs and significantly contributed to her architectural expression and multifaceted legacy, encompassing architectural, artistic, cultural, social, and even colonial/political dimensions.

De Silva's pioneering theoretical and practical contributions to the Ceylonese, Asian, and worldwide architectural grounds mismatch the attention she has received from historiography. Only a handful of authors dedicated research exclusively to her œuvre[1]. Moreover, if De Silva's architectural legacy remains broadly understudied, even less has been scrutinized about her innovative approach to textiles[2], disclosing investigation gaps this paper aims to address. Furthermore, if vast is the literature about the history of textiles[3], research connecting textiles and the Modern Movement is rare[4]. The Sri Lankan case, and specifically the topic of *dumbara* weaving, is scarcely documented[5]. Conversely, despite *dumbara* not being gender-specific, literature directed to feminine craft contributions provides insightful perspectives to theorize the rich but "overlooked and often despised categories of women's decorative arts (…) as sites of important cultural and social work"[6].

Hence, by stressing De Silva's connection with textiles and *dumbara* weaving as crucial aspects of her modern interior design layouts, this paper aims to contribute to a theoretical discussion about fabrication methods that are frequently overlooked, particularly those beyond the West.

Diverse challenges shaped the methodological approach. On one hand, despite recent efforts in the international context to address women architects' work, De Silva is affected by literature that systematically favors Western patriarchal frameworks, with the Sri Lankan context adding further gender bias. On the other side, the absence of a formal and centralized archive for De Silva's work requires diverse research methodologies and visits to multiple locations. Therefore, the investigation comprises a thorough analysis of De Silva's autobiography. *The Life and Work of an Asian Woman Architect*, which documents De Silva´s œuvre in a lively scrapbook format, is the key textual primary source. The investigation was complemented by extensive fieldwork in Sri Lanka, namely the visit to De Silva's remaining legacy in Colombo and Kandy, including Karunaratne, Pieris, and Fernando Houses, which illustrate the paper, and where De Silva had full freedom to compose the interiors. Additionally, the weavers' work was observed on a visit to the Dumbara Valley. Assisted by a translator, qualitative data was collected through semi-structured interviews. This engagement greatly fostered the understanding of the practice. Subsequently, additional archives were consulted, adding depth to the research. At the Henri Cartier-Bresson Foundation in Paris, photographic material documenting the visit of the French photographer to Ceylon in 1950 showcased *dumbara* weaving. Moreover, despite being tangential to

this topic, material documenting Le Corbusier and De Silva's friendship, consulted at the Le Corbusier Foundation, also in Paris, and De Silva's participation in the C.I.A.M.s[7], consulted at the gta archives at ETH Zürich provided important insights to frame her architectural discourses. Overall, the author is deeply grateful to everyone who supported the research journey for being instrumental in the investigation[8].

2. MINNETTE DE SILVA AND *DUMBARA* WEAVING

Historically, arts and crafts have played a crucial role in Sri Lanka's identity. During feudalism, they thrived under the religious and sovereign monarchy patronage, particularly during the Kandyan Kingdom (1469-1815). Afterward, beneath British rule (1815-1948), and affected by industrialization, these traditional practices entered an irreversible decline that echoes today. During the independence momentum, culminating in 1948, the revival of vernacular vocabularies became vital in fostering nationalism. As the final stronghold of the authentic pre-colonial Ceylon, the city of Kandy emerged as a relevant national symbol.

1948 was the year that Minnette De Silva returned home, after graduating from the Architectural Association of London (1945-1948) under a modern curriculum. Simultaneously, she was firmly rooted in her country's cultural heritage and greatly influenced by the arts and crafts of her hometown Kandy. Therefore, De Silva's architectural expression became a fusion of modern and vernacular principles and elements, in a synthesis self-coined "an experiment in Modern Regional Architecture in the Tropics"[9]. In her houses, a repertoire of geometric façades, free plans, and concrete structures cohabited with a profusion of murals, clay tiles, earthenware pottery, lacquered wood carvings, and hand-woven *dumbara* mats. The vibrant dichotomy contributed to a rich interior design layout.

Among these objects and practices, *dumbara* weaving was especially dear to De Silva. Besides childhood encounters, her relationship with textiles is set in her autobiography in 1950, during her mourning for her father. She "pledged to collaborate with the craftsmen and the artists" working on her houses, willing to "research and experiment." The same year, while in London, she attended a private weaving school in Kensington, "so that on my return I could sit with the weavers and together work out new methods for the old"[10].

The 'old' regarding *dumbara* signifies weaving with *hana*, a long, thorny point-leaved hemp. Less than two hours from Kandy, nestled in the Dumbara Valley, Thalagune and Uda Dumbara are villages where this traditional process can still be experienced as described in Ananda Coomaraswamy's seminal book *Mediæval Sinhalese Art* **(Fig.1)**:

> *The well-known* Dumbara *mats, called* kalalaya*, are made by men and women of the* Kinnaraya *caste, practically the lowest of Kandyan castes (…). The fiber of which the mats are made is niyanda, the bowstring hemp (…). The rounded green leaves of this common*

9. Minnette De Silva, 'A House at Kandy, Ceylon', *Marg*, June 1953, 4.

10. Minnette De Silva, *The Life & Work of an Asian Woman Architect* (Colombo: Smart Media Productions, 1998), 163.

*xerophitic plant are gathered, and scraped against a log (*niyanda poruva*) with a wooden tool (*ge-valla*) (…). This scraping removes the fleshy part of the leaf, leaving the white fiber, which is oiled and brushed, and then ready for use almost immediately. Part of the material is left white, the rest dyed red, yellow, or black (…). The loom (…) is a low horizontal contrivance, something like the loom used in cotton weaving, but much more primitive. There is no* alvala*, or pit for the weaver's feet; the operator squats on the mat itself*[11].

Dumbara belongs to the broader highly-significative Ceylonese arts and crafts scene. Henri Cartier-Bresson, visiting the island in 1950, remarked on how the designs were connected with the good taste of the peasants that he observed in the East[12]. Indeed, *dumbara* weaving's essence and uniqueness depend on its intricate and traditional design motifs and the weaver's taste and expertise. Representing spiritual and cultural meanings, including flowers, leaves, animals, and geometries, these designs significantly lengthen the *dumbara* process. Accordingly, an updating endeavor has been undertaken to fight globalization and the declining interest of younger generations in a low-profit caste-related practice which has condemned many handlooms. In line, weaving techniques were adapted and other looms and materials are currently employed, such as cotton, silk, and synthetic yarns. Indeed, *dumbara* was inscribed on the UNESCO List of the Intangible Cultural Heritage of Humanity in 2021, illustrating its enduring adaptability. Further steps in the research should assess the measures' effectiveness for continuing the practice.

A similar approach had been taken by De Silva seven decades earlier. Despite trying *hana*, she utilized cotton yarns, and "traditional weaving was adapted to suit modern conditions and the use of modern looms which were less labor intensive"[13]. De Silva's early creations are showcased in her first commission, Karunaratne House (1947-1951). Located in a sloping terrain overviewing Kandy Lake, the house is built in concrete, featuring glass brick walls and locally supplied wood and stone. A London-trained De Silva designed flexible plans, opening the house to the landscape. Concurrently, Kandyan arts and crafts are also present. Terracotta tiles with vernacular subjects on the façade wall preannounce the interior: lacquer woodcarvings on the staircase railing, decorative earthenware jars in traditional designs placed throughout the space, and a mural from a local artist marked the setting. Traditional colours, displayed in ancient temples, still persevere in the pillars and walls, yet red, gold and black tones were also used in the remaining elements.

In Karunaratne, *dumbara* mats are incorporated in several elements **(Fig.2)**. Usually applied as wall hangings, tapestries, rugs, or cushion covers, De Silva also used them as floor rugs, chair covers, and table mats. Still, she expanded and repurposed their applicability by incorporating them into architectural elements. For instance, *dumbara* drapes and curtains were "based on the traditional weave (which craft is fast dying out,

11. Coomaraswamy, *Mediæval Sinhalese Art*, 243.

12. Henri Cartier-Bresson, 1950, 56G-688-18, Henri Cartier-Bresson Foundation.

13. De Silva, *The Life & Work of an Asian Woman Architect*, 163.

only a few good traditional weavers are left) but woven on modern looms, with designs improved on traditional patterns and motives and colours, to suit contemporary taste and needs"[14]. Furthermore, *dumbara* was also used as ceiling panelling and "for the first time as door panelling"[15]. An example is the 'tree of life', a traditional motif, weaved in *hana*, in traditional colours. Conversely, geometric designs were present in Pieris and Fernando Houses **(Fig.3)**.

All these elements are stated as woven in the architect's studio. Indeed, a newspaper clipping from 1950 reported: "When Minnete [sic] is neither at the studio nor at the site, then she is busy at the weaving centre in her home" where she worked in her own loom and employed "three girls", one of them weaving *dumbara* mats[16]. However, De Silva commissioned weaving as well. In a letter, also dated 1950, she inquired about the possibility of accomplishing a certain design for curtains of a nursery. To achieve De Silva's design the weaver suggested adjustments, namely creating a white border so that a yellow background could accommodate the desired white figures[17].

Additionally, De Silva's experiments with textiles went beyond architectural elements. Her autobiography showcased a handloom practice-cum-business, where she experimented *dumbara* mat motifs in cloth. Called 'Ceylon Kandyan Handlooms', the studio's brochure, dated 1967 to 1968, included the types of clothes produced, namely robes, coats, jeans, shirts, sarongs, accessories, cloth bags, etc, along with textures, prices, and even transport time by sea and air, denoting international commercial aspirations. Images of certain garments are showcased, with De Silva noting her wearing some of these attires. The textiles were handwoven based on motifs such as "geometrical and natural forms on a background weave of 'boxes' of colour or plain or striped", adapted for Spring/Summer modern-styled clothes. Regrettably, regarding cloth weaving, De Silva reported "little support", "little encouragement" and limited resources, resulting in the closure of the study center[18].

The aforementioned narratives represent De Silva's closest relationship with textiles and the culmination of her production of material objects, as they are not detailed re-addressed in her autobiography. The saris she created and wore until her final years were testified by a family member as her most beloved belongings[19]. In post-colonial Ceylon, and alongside Minnette De Silva, other prominent women's work with traditional crafts and textiles, such as Barbara Sansoni and Ena de Silva, was also influential[20].

3. CONCLUSION

Visiting De Silva's legacy today comprises diverse outcomes. For instance, from the three mentioned houses, Karunaratne is in an advanced state of dilapidation, Fernando was recently demolished and Pieris is inhabited in an impeccable state of conservation. However, despite the persistence of other forms of arts and crafts (tiles, grids, wood carvings), the absence of traces of *dumbara* is a common factor. It emphasizes the ephemerality and

challenging archival preservation of textiles, exposing their fragility within the realm of interior design.

Another aspect worthy of examination is the lack of studies dedicated to crafts, particularly textiles. Indeed, these practices often slide into the material or mundane categories, considered a lower rank in the hierarchy of art, and therefore have been largely overlooked by architectural historiography. Simultaneously, not only craftsmen became despised and "threatened with categorical 'deskilling' in a world that apparently no longer appreciates what it once praised in them" but also industrialization fated "the political weakness of those whose competence is specifically local"[21]. Mindful of these power systems and exclusion mechanisms, De Silva's revitalization of *dumbara* encompassed manifold connotations,

20. Martino Stierli et al., *The Project of Independence: Architectures of Decolonization in South Asia, 1947-1985* (New York: The Museum of Modern Art, 2022).

21. Michael Herzfeld, *The Body Impolitic: Artisans and Artifice in the Global Hierarchy of Value* (Chicago: University of Chicago Press, 2003), 1,2.

(arguably) above all, social ones. The artisans, especially the weavers, were neglected and underpaid as part of the lowest strata of the Ceylonese caste system. De Silva's revitalization efforts aimed to uplift practices and practitioners, avoiding their extinction.

Furthermore, since this revival occurred during Ceylon's independence momentum, political and colonial outcomes also imply. During this period, arts and crafts emerged as national symbols of resistance, becoming meaningful for embodying pre-colonial authenticity. Parallelly, since De Silva was closely tied to India, two personalities were perhaps influential. Firstly, the photographs of her weaving displayed in her autobiography seem inspired by the Gandhian spinning wheel as a representation of self-sufficiency. Secondly, De Silva's close friendship with Kamaladevi Chattopadhyaya, an activist who propelled the crafts in India in order to uplift the craftsmen, is also noteworthy. Both connections denote the socio-political power of cloth and suggest likely entanglements with De Silva's line of thought[22].

Lastly, artistic connotations should be addressed. De Silva's architectural discourses preceded the vision later defended by George Kubler that "art can be expanded to embrace the whole range of man-made things (…) By this view the universe of man-made things simply coincides with the history of art"[23]. In tune, other authors underscored craft's "undeniable humanizing appeal"[24] and how it "met human needs in a more sensitive way than contemporary (…) methods do. It is this belief that sends us back to the past, and that sends us to the local and the specific"[25]. In addition to being meaningful epistemological processes of knowledge-making and essential tools for understanding and crystalizing the history and culture of humanity, craft plays an important role within architecture, defining architectural space, also in modern layouts. Referring to Karunaratne, De Silva emphasized how traditional craftwork "adds a richness of feeling and human touch to this modern house"[26]. Concurrently, she also stated: "In this house the architect, the craftsman and the artist have worked together"[27], a reference to Sigfried Giedion's concept of the "synthesis of the arts"[28].

In sum, De Silva's incursion into textiles illustrates a rich and complex network of relationships and meanings. Over time, weavers threaded their history through this practice, creating personal expressions and community ties, and, overall, contributing to materializing Ceylon's identity. *Dumbara* weaving was as crucial to De Silva's modern interior designs as she was to its revival, opening doors to its endurance until today. ■

BIOGRAPHY

Inês Leonor Nunes is a Ph.D. candidate at the University of Coimbra, Portugal. Her research, entitled "The Social within the Tropical: The Community Engaged Architecture of Jane Drew and Minnette De Silva" explores the influence of social concerns in shaping Tropical Architecture. This research is funded by the Portuguese Foundation for Science and Technology and has received a Doctoral Research Residency Program grant from the Canadian Centre for Architecture. An article integrated into this investigation received the Lifchez-Berkeley Prize (best paper by a junior scholar) at the International Association for the Study of Traditional Environments (IASTE) conference in Singapore 2022.

EDUCATING COMMUNITIES THROUGH INDUSTRY: JOHN COTTON DANA'S, *THE HERITAGE OF 3000 YEARS OF ART IN MODERN RUGS AND CARPETS* EXHIBITION AND *FLOOR COVERINGS EXHIBITIONS*, 1929- 1930

ANITA PUIG GÓMEZ
UNIVERSIDAD ANDRÉS BELLO

ABSTRACT

This paper addresses the question of how the Newark Museum, inspired by John Cotton Dana, managed to engage with its community through education, industry and the appreciation of traditional crafts. Two major textile exhibitions were held in 1929 and 1930 which contributed to local industry and commerce. To achieve this objective the exhibition presented a historical perspective on weaving intertwined with what could possibly be the first instance of modern furniture being placed alongside arts, or as an artistic object. It engaged with the visitors using department store conventions by placing them inside staged interiors. This exhibition will undergo a review through the examination of archive material collected at the Newark Museum. Consideration of Dana's visionary approach to museography and art objects and reviewing the textiles displayed will allow us to explore the significance and conventions of the modern interior through textiles and how the message was delivered to visitors.

1. INTRODUCTION

John Cotton Dana was a prolific librarian and the museum director of the Newark Museum of Art in the United States. Born in Woodstock, Vermont, in 1856, he spent his early days as director of Denver Public Library, where he established his vision of the relationship between books and objects and access to them as a means of promoting education and engaging with local communities. For Dana, libraries and museums had to "transform from a temple of wisdom undisturbed, to an open workshop of delight and learning"[1]. After Denver, he began to implement his pragmatic but radical ideas on art and education directing the Newark Public Library from 1902 until his death in 1929[2]. The idea for an art Museum for the city of Newark, began on the fourth floor of the Newark Free Public Library in 1904, but after its formal incorporation as a museum in 1909, several exhibitions were held in the library building until the New Museum was inaugurated in 1926, continuing with the long-term premise "what can museums do for the community?"[3].

The museum intentionally set itself apart from traditional art museums. Instead of competing in terms of artworks with major museums "within an hour's drive of Newark"[4], it sought to improve and display the products of local industry, influencing and "moving its communities to greater proficiency in the arts of living," displaying everyday objects that showcased industrial techniques, educating the eye through material history, as other industrial museums had done in England or Vienna in the early 20th Century[5]. Dana believed that museums could serve as educational tools to connect everyday life with industry, bringing art into people's homes by improving the design of domestic objects. He saw the Newark Museum as a means of local education, focusing on "the historic development of the industries which produce them (objects); and the relationships of those industries to the development of social conditions"[6]. Dana's main concerns about the utility of museums were addressed by organising important exhibitions that combined art, craft and industry. His interest in connecting with the everyday led to interesting curatorial choices, showing objects in use, recreating past environments such as the Colonial Kitchen exhibition, or recreating processes such as the 1915 New Jersey Clay Products Industrial Exhibition or the 1916 New Jersey Textile Exhibition[7]. The Museum's exhibitions featured pottery, textiles and other industrially made objects which were displayed, alongside the process and talent behind the making of those objects. Dana intended for those objects to demonstrate their teaching value as "subject to improvement in adaptation to purpose and skill in production," but most of all, to "add a surplus of art beyond the needful, which is the foundation of decorative arts"[8]. Most importantly, these exhibitions were important in helping visitors understand that the objects they have at home, which are locally manufactured, are the result of an artistic process as significant as the masterpieces exhibited in most museums of art. By understanding and explaining the process in the exhibition, accompanied by the historical narrative that links object, tools, forms and artist with ancient techniques and material processes, the object becomes an artefact of beauty, and art.

9. Similar strategies were used by the Werkbund. The way of arranging the exhibits and the protagonism of the materials were in line with the ideas of the Werkbund and the importance given to the window display as

Dana firmly believed that department stores had taken the lead in integrating modern art into everyday lifestyles and homes. They fostered a symbiotic relationship with local communities, by including living spaces and tactile experiences of everyday objects with customers. The department store display encouraged the use of objects in a domestic context[9]. This is crucial to understand, as his connection with department stores was not only substantial in terms of display and exhibition, but also because the building designed to be the new Newark Museum of Art, was made possible by a generous donation from Louis Bamberger, a renowned department store owner and proprietor of Bamberger & Co. Bamberger & Co., and would also be the location for hosting the 1929 exhibition, *The Heritage of 3000 Years of Art in Modern Rugs and Carpets*, which was followed by a similar exhibition inside the Newark Museum called *Modern Rugs and Carpets*[10].

Both exhibitions demonstrated how modern textiles had evolved from historical techniques and how textiles were already defining new relations with modern interiors, furniture and the importance of department stores in terms of production, consumption and industry. The foreword to the *3000 Years of Art in Modern Rugs and Carpets* exhibition catalogue emphasised the role of department stores by asking "now that we have department stores, do we need museums?" Dana considered that "to adorn the utilities as our factories produce them, is to make them strong competitors with the foreign, the ancient, the rare and the costly, and thus by their readier sale to profit the artist who planned, the designer who adapted, the mechanic and the inventor who created and adjusted the productive machine, the corporate stockholders who made the factory possible and the distributor in the department store"[11]. All those benefits came from merchandising, fostering sales and applying all the arts of presentation, the Department stores had taken the lead in promoting industrial arts, while Museums continued to work as mere vessels of unobtainable art[12].

2. TEXTILES AND NEWARK MUSEUM.

In 1912, Dana travelled to Europe to collect objects while simultaneously organising one of the most important exhibitions of the Museum, titled *Modern German Applied Arts*. This exhibition was considered the first modern Industrial exhibition in the United States[13]. The shift in museum exhibitions was not only in regards to the theme and carefully chosen objects, curated by Dana with the intention to "leave out everything which imitates the antique and does not show creative impulse"[14], but it also aimed to train local industries and expand their production possibilities. Dana incorporated a notable innovation in this exhibition, as the objects on display were likely to be purchased by visitors, thus expanding the agency of the museum within the Newark community. A price list was available at a desk in the exhibition rooms, allowing visitors to inform themselves immediately of the prices.

The German Applied Arts exhibition, included a complete section on Textile Fabrics. The catalogue provides a clear and compelling rationale for the next textile exhibitions at the Newark Museum. It states "the weaving industry, which in the nineteenth century obtained its necessary patterns from the rich archives of

a way of connecting consumers with the product in a practical and educational way. Lilly Reich is a great example of this search and relation between industry and consumer through her most relevant exhibitions. See: Magdalena Droste, "Lilly Reich: Her career as an artist", in *Lilly Reich: Designer and Architect* (New York: The Museum of Modern Art, 1996), 47-59.

10. *The heritage of 3000 years of art in modern Rugs and carpets* (Newark: L Bamberguer & Co). This catalogue was also made possible with documents from Bigelow - Hartford, a large carpeting Mill located in Connecticut with stores in Madison Avenue, New York.

11. "Foreword," in *The heritage of 3000 years of art in modern Rugs and carpets*. (Newark: L Bamberguer & Co).

12. A plan for a new Museum: the kind of Museum it will profit a city to maintain. It is remarkable how Dana's ideas resonated years later in the MOMA Exhibition Design for Use, in 1944 which highlight the exhibited objects as a result of practical experience dictating modifications to shape, improved by economic and production methods. industrial museums, owes its early acquired, modern trend to the circumstance that without its cooperation new chamber decorations were impossible."[15] Textiles will be the main theme and subject of debate on two more occasions.

2.1 MODERN RUGS AND CARPETS

Department stores, textiles, exhibition, display and utility all came together and culminated in two consecutive exhibitions: *The Heritage of 3000 Years of Art in Modern Rugs and Carpets* in 1929, and *Floor Coverings* in 1930. Despite Dana´s death in 1929, his ideas persisted and were present in both exhibitions. Modern machine processes, such as modern looms were put on display alongside ancient textile techniques and primitive weaving processes[16].

Dana was determined to reveal contemporary art in his art shows, influenced by history and traditions. Based on the idea that "all art is but the recreation and reinterpretations of tradition"[17] and his modern tapestries creatively reflected this idea while being rooted in the enduring nature of humankind and technique.

The 1929 exhibition showcased four inspirational sources: Near East, Peasant Arts of Europe, Households of Colonial Times and Primitive Arts of the World. This first exhibition, titled *The Heritage of 3000 Years of Art in Modern Rugs and Carpets*, was held at the Bamberger & Co. department store, and also featured a lecture programme led by distinguished academics, museum directors, and magazine directors. Although the programme was organised chronologically, the main focus was placed on homes, textiles, and how to understand modern spaces and times. The next exhibition, held only a few months after the Modern Rugs exhibition, was the *Floor Covering* exhibition inside the Newark Museum.

The images from this exhibition, held in the archive, illustrate the concept of modern art, modern rugs and the setting of modern objects in an ideal interior. The exhibition pictures show a model of a Jacquard-type machine loom with a man operating the machine. Another exhibition picture displays what is called the African alcove, featuring a rug from Banga Mayotte, an unfinished mat and a Luvituku mat. These objects convey a message on geometry, the loom and the idea of a single line as the original use of material, creating space through repetition. This imagery is fundamental for understanding the shift towards modern interior design. What is relevant is the composition of the complete object through the artist's mind and, based on technique and material, both of which could be universally found and understood.

The combination of creativity and technique led to a technical abstract language, as there was no need for the obvious figurative elements. Instead,

16. John Cotton Dana, "The experiment of the Newark Museum", 176.

17. John Cotton Dana, "The experiment of the Newark Museum", p.181.

it was necessary to understand the logic behind its fabrication as a universal value. By removing figurative elements, only technique remained. Another museum display picture shows a complete interior, whose significance lies not only in the carpets displayed but also in the furniture selected to complete the setting. The table and the chair are recognisable Mies van der Rohe and Lilly Reich designs, including the MR armchair from 1927, along with a chair that bears a striking resemblance to the Cantilever chair, also designed by Mies. Despite their iconic status today, both chairs are labelled as Designed by Donald Deskey, as are the other chair and table placed in the interior display.

The possible mislabelling is likely due to the timing of the exhibition. The selection of furniture defining the modern interior in the display predates the important Modern Architecture Exhibition of 1932 at MOMA, where the main concepts of the Modern Movement were coined in the United States. The cubist abstraction and Art Deco elements of the rug on the floor bear strong similarities to the work of Eileen Gray, who developed her own carpets in the 1920s. Although Dana was focused on his local industries and the educating role museums played in guiding other designers and artisans, the selection of pieces, and the arrangement of interiors and furniture at Newark Museum exhibitions integrated exhibited objects into the productive system of domestic consumption. This achieved the objective of bringing art into everyday life, inside every home, by educating taste in a manner similar to magazines or department stores.

3. OBJECTS AND THE VALUE OF PROCESS.

Cotton Dana´s approach to museum objects can be understood as a dialogue between the production system and the real exchange value. Objects represent the process of industrial labour and human education through experience. Objects can be understood in relation to the industrial process, as well as in regard to the other objects in history and the society that produces them. They function as a symbiotic and prolific community that benefits from education and production. His museography builds history with traditional arts not by symbolism or iconographic interpretations but rather through the value of universal craft knowledge and respect for the materials and communities that sustain them. It is for the overall benefit of the community that artistic objects obtain commercial value, and thus abstract expression allows technique and material to be the protagonist, reinforcing the anonymity of the author in opposition to the unique and exceptional dualities of renowned artists. Industry and department stores profit from the abstraction and reproduction of modern objects, unifying communes in an economic system of cohesive development through art in the everyday. ■

THE MODERN INTERIOR: ESSENTIAL QUALITIES THAT REMAIN

ZSUZSANNA BÖRÖCZ

ABSTRACT

At the beginning of the 20th century, modern architects wanted to create better living conditions for all layers of society, often working toward a total concept of architecture and interior. The modernist architect sought a functionally organized floor plan, opened it up to daylight and fresh air, replaced ornaments and tapestries with smooth, uncluttered surfaces, freed walls from their structural function, introduced fluidity and spatial adaptability. Throughout the avant-garde period of «heroic» modernism and long after, these qualities attracted only the progressive clientele. The frugal, abstracted appearance of modernist housing, for instance, contrasted with the enduring bourgeois idea of the home as a personal refuge. Despite this, in the middle of the last century, the MoMo legacy spread worldwide, overlapping local customs and materials, and resulting in excellent and resilient architectural solutions. In the early 2000s, after the late-20th-century criticisms had cooled down, modern architecture returned and continues to underlie architectural discourse.

After a century of modernist legacy, it is an excellent time to reflect on some of its essentials. What are the modernist interior's timeless spatial qualities for living, working, leisure, health, or worship? What are the factors determining its adaptability? How can modernist heritage be adapted to meet current requirements regarding material use, energy flow, respect for nature, and social equity? How can it once more help generalizing improved living conditions? Can new technological advances inspire a modernism for the 21st century?

This session welcomed abstracts focusing on examples of MoMo interiors in a comparative and interdisciplinary way. Papers that connect material issues with the social context earned our particular interest, illustrating the enduring merits of original designs, either restored or adaptively reused. Contextualization and embedding in a theoretical and critical framework from extended fields of knowledge were encouraged.

1. INTRODUCTION

At the beginning of the 20th century, modern architects wanted to create better living conditions for all layers of society, thereby often working towards a total concept in which architecture and the interior were designed as a unit. The modernist architect did not only seek a functionally organized floor plan, he also opened up the home to daylight and fresh air; he replaced the dust-gathering tapestries and ornaments with smooth, uncluttered surfaces; he turned dark corridors into exciting architectural walks; he freed the walls from their structural function, introducing fluidity and spatial adaptability. All this to accommodate a new lifestyle. Throughout the avant-garde period of "heroic" modernism and for a long time after, these qualities attracted only a progressive clientele. The frugal appearance of modernist housing, with its abstract interpretation of interior qualities, contrasted with the enduring bourgeois idea of the house as a refuge for the intimate and the nostalgic. Despite this, in the middle of the last century, the MoMo legacy spread out across the world, overlapping with local customs and materials, and resulting in excellent and resilient architectural solutions. In the early 2000s, after the criticisms that had grown during the second half of the 20th century had cooled down, modern architecture returned and continues to underlie much of architectural discourse.

Now, after a century of modernism, it is a good time to reflect (again) on its essentials / fundamentals. Straight off, it is important to note that, while the essentials of modernism are all rooted in (a certain interpretation of) functionality, functionality itself – which surely must be considered a 'constant quality' of modernism - is multifaceted. And moreover, it should be clear that the criteria and parameters which constitute functionality, they are not constant, they change over time, as does society and its expectations, customs, aspirations. With some degree of confidence, we can propose this to be true especially when we turn our attention to the interior. However, undeterred by the challenge, we will be looking in this session for the timeless qualities of the modernist interior. We will try to probe into its essentials, while trying avoiding the pitfalls of considering 'timeless qualities' under rapidly changing conditions. One essential attribute typically ascribed to modernist architecture is the Gesamtkunst approach, in which the structural shell, the interior furnishing and decoration and even the loose furniture are developed and realized in one integral concept. Clearly, this inextricable bond is bound to pose specific challenges after a while, when not only new ways of living and thinking, but also climatological conditions are crying for adaptation.

2. FROM FUNCTIONALISM TO 'ACCIDENTISM'

The characteristics and attributes of the modern interior go beyond the drawing up of checklists, especially in a global perspective. A 'unified approach' of modernism was already attacked in its early period by the Austrian-born architect Josef Frank (1885-1967), designer of the iconic Villa Beer in Vienna (1929-1930)[1], representative of the Neues Bauen. In his

1. In collaboration with Oskar Wlach (1881-1963).

critical notes, which were not widely noticed at the time, yet opposed by influential modernist like Sigfried Giedion (1888-1968) during the CIAM meetings of 1928 in La Sarraz, Frank sounded the alarm on the codification of modernism, and especially on the link between standardization and aesthetic objectives. In his eyes, the aim of modernism had to be a response to contemporary challenges, primarily by the design of a field for everyday life as 'a continuation of the whole search of freedom'.[2] Though for many, the road to this so called 'freedom' was paved with standardization and universal design, Frank contested this assumption, especially in the realm of the domestic space. In his eyes, establishing a new canon was not the answer. It was not the historical form as such that had devaluated and needed to be replaced by a 'better' solution. Instead, architectural forms and ideas had been changing in reaction to the evolution of their context. Therefore, he proposed that modernism should seek answers to the continuously emerging challenges of life.[3] Modernism needed to be first and foremost a methodology (rather than a style). From this explanation, Frank deduced that not 'functionalism' was the foremost characteristic / principle of modernism, but what he coined 'accidentism'. The term 'accidentism', which refers to the specific design response in each project to the particular set of accidental conditions and their subsequent evolution. With this response, which, incidentally, did not deny the role of functionality, Frank hoped to open up the modernist ideal to great diversity, even complete freedom and pluralism.[4] The notion of modernism should, at its heart, be evolutionary rather than revolutionary[5], he stated, which inherently contradicts Le Corbusier's axiom that to love purity should be a moral act, leading to joy through pursuing perfection.[6] It was, in many ways, precisely this imperative of purist functionalism that postmodernism attacked in modernism: the belief in the unique, absolute and contextless solution, (a belief that Le Corbusier himself had later left behind).

3. ADAPTABILITY TO CHANGING REQUIREMENTS

Today, due to various changing conditions such as comfort and energy requirements, much of modernist architectural heritage is in danger of disappearing. Projects by lesser or unknown architects are most at risk as their cultural value has not yet been fully assessed. Typical cases include modernist single-family houses, which are considered banal; high-rise apartment blocks, which are considered inhuman or ugly; abandoned parish churches in Western Europe, which as Gesamtkunstwerk are difficult to adaptively reuse. These and many other cases are being demolished or radically altered. Even when the structure is preserved, the interior furnishing is removed without a second thought. A simplistic real-estate rationale is almost always the decisive factor. Needless to say, the outcome of these operations rarely constitutes an improvement.

What could halt this unbridled destruction? At the most fundamental level, we need a mind shift across society that preserving and working with existing buildings and materials is in most cases more sustainable

and advantageous than demolition and new build. Embodied carbon emissions should always be taken into account, but also the possibility that an existing material may be superior to its replacement. This makes the underrepresentation of lesser architecture in heritage inventories even more problematic. It would help if heritage assessments were by default made of all heritage, regardless of architectural or cultural value. In cases where these values are limited, context value, material value or enduring use value may provide arguments for preservation and reuse. Though the heritage professional may be able to identify reasons for preserving modest modernist buildings, it often remains hard for the general public to accept these. This is even more true for modern interiors. It is crucial, therefore, to emphasize all existing qualities, especially those that would be hard to equal today.

We can now return to Jozef Frank's coinage of 'accidentism' as the core principle of modernism. As we have seen, Frank reacted against the idea that functionalism was to be achieved through standardization and universality, and instead emphasized the need for adaptability to changing (functional) requirements. In Frank's conception of the living room, for instance, it is, even in the lifetime of one generation, the product of consecutive coincidences or momentary correspondences. It is never finished and can accommodate the changing needs of its occupants'.[7] This implies that, we are not infringing on the core quality of modern architecture, when we adapt it to changing needs, but rather that we are making use of it in doing so. This puts the challenge of adaptive preservation of modernist heritage in a slightly different light and raises new questions. How can modernist domesticity be adapted to contemporary living standards while preserving the (heritage) values of the original concept? Can a functionalist design possess an 'accidentist' quality, even if it was not consciously designed for that quality?

4. THE (MODERNIST) HOME AS A LIVING ORGANISM

In their article "This is not a (bed)room", Marta Peixoto and Angelica Ponzio deal with two well documented examples of (rather luxurious) modernist flats, zooming in on spatial fluidity and transparency from the perspective of the use value for past and present.[8] The authors touch upon the notion of flexibility by investigating privacy issues which are linked to ideological questions on interactions between family members but also to a conscious sacrifice in exchange for a superb spatial experience. By comparing Gio Ponti's (1891-1979) Via Dezza apartment (1957, Milan, Italy)[9] and Paulo Mendes da Rocha's (1928-2021) Butantã house (1964-1966, São Paulo, Brazil)[10] they raise issues on (new) normative criteria for modern architecture[11], while questioning pure formal conceptions.

Gio Ponti designed a home as a living organism, whose functionality didn't only serve basic needs but was conceived to offer joy when experiencing it. For this, a total concept was needed that surpassed formalism. He argued that the total concept needed to be flexible, so that, when moving or changing furniture, the space "[…] should not look in

disarray. A room is richer in its resources, it has 'all of its resources', only if it easily allows all the transformations that please us."[12] In his penthouse on the Via Dezza, Ponti designed an integrated sequence of rooms by distancing the separation walls from the façade, thus creating a passage along it. It created various visual and spatial connections and far-reaching transformability. Adjusting to 'modern living' was not achievable by prototyping nor by repetition. The rooms should not even be 'labeled'[13], but designed as adaptable spaces, a backstage for life: enjoyable, delightful and opposed to a static existence. This was realized in his adaptable Casa Adatta in 1972, which was designed for the quickly changing world.[14]

In his Butantã family house, the Brazilian architect Paulo Mendes da Rocha had a similar aspiration of organizing the domestic domain in a fluid circulation plan, providing access between the veranda and the living room through a part of the childrens' bedrooms. Thus, the design made the children's rooms subordinate to a collective spatial ideal for the family house, with the result that their skylit bedrooms in the central area of the plan did not enjoy any privacy, at least as we understand it today.[15]

In both cases, the bedroom plays a key role. Bedrooms as intimate areas have long been a feature of well-to-do houses, but only became a standard in western societies in the 20th century. Even then, the position and definition of a bedroom, remains fluid. The modernist interior did not promise a bedroom for each member of the family, stating to prioritize the quality of life of the house as a whole, closely identified with its spatial quality and in reaction to the 19th-century model of the bourgeois home.

5. MINIMUM SIZE, MAXIMUM TRANSFORMABILITY

The two cases above are high-value examples. Let us now look at a more modest example, representative of lesser heritage from the modern era. Again from another country, with a different social and political background in the post-war period, namely a 86 m² flat in a small apartment block of six flats, two on each floor, in the lower hills of Hungary's capital, Budapest, built in 1960. A private initiative of befriended couples with small children, the project was designed by an engineer, Jenő Zajovics.[16] An independent concrete post and beam structure allows the residents of each apartment to choose the circulation and organization of spaces, which indeed they do. The ground-floor flat overlooking the garden offers an interesting case. It interprets the 19th-century lower-middleclass dwellings of Central-Europe, which lack separate bedrooms. During the day, the bedlinen were stored in special cupboards, the beds transformed into chaise longue's and the doors left open to create larger spaces.

The entrance hall contains a garderobe, a toilet and doors to the north-facing kitchen and to the living area. Here, the dining room functions as the central circulation space. It gives access to the bathroom (adjacent to the kitchen), to the west-facing (bed)room and to the south-facing living room. In its turn, the living room opens on the left to a small adjoining bedroom (the former maid's room, previously accessible from the entrance

hall) and on the right to the room in the southwest corner, which opens onto a terrace as well as to the west room mentioned before. The corner room with terrace acts as the flat's focal point, the more because it has the typical central-European tiled stove. The heat from this single high-efficiency low-temperature heating element is distributed through the whole flat through openings above the doors to adjacent rooms.

In all its modesty, this flat offers a degree of openness and adaptability that rivals the famous examples above. Its effectiveness derives from two factors: the renouncement of monofunctional rooms and the circular circulation (around the stove), offering each room two points of access. In line with the modernist idea of contact between kitchen and dining room, a pass-through hatch and cupboard assists in serving the table, a modest variation on Ponti's display-window.

The flat was designed for a family with two children, a resident grandmother and a maid. Later the maid's room was integrated in the apartment. It offered another opportunity for spatial continuity, emphasized by placing an open cabinet in the passageway.

Over the years, only the function of the central dining room has remained the same. Ponti's motto "minimum size and maximum transformability"[17] perfectly describes the flat. The family with four children installed shared bedrooms in endless configurations, using room dividers and solutions from modern living publications. The parents, two doctors, embraced the modern way of life without throwing away the furniture of previous generations, exactly as Josef Frank had suggested: it is not an outdated style that requires change but the context. As long as the old functions well in the new context, there is no reason to change it. So they used (and repaired) what they had and added new items as needed.

As modernism linked hygiene to openness, the rooms in the three cases bathe in daylight: in the case of Ponti and Mendes da Rocha through the front and back side, in Budapest literally walking around the flat, from the small bedroom in the southeast, across the living room filtered by fir trees, to the terrace in the afternoon and the sunset behind the hills in the west rooms. If the flat had had closed-off bedrooms, this wealth of daylight would not have felt the same. On the other hand, the apartment does have issues of privacy, as do the other cases.

6. CONCLUSION

We set out to tackle the challenges in preserving and (re)using modernist architecture and interiors, resulting from the inevitable change of functionality over time. If the essence of a project is to survive, this change requires adaptation or better still, adaptability. This quality seems at odds with other ambitions of modernism such as the Gesamtkunstwerk, standardization and universality. For this reason, Jozef Frank put forward the principle of 'accidentism', which prioritizes the bond between the design and the changeability of context. The notion implies that a well-considered adaptation of modernist heritage is nothing else than the application of a core quality. Moreover, it creates an opening to a more varied value assessment, centered on the evolving connection between design and program. This alternative interpretation of 'essential qualities' allows to attribute value to a wider range of modernist heritage, and more opportunities for preservation and reuse. ■

WOMEN'S ADVISORY COMMITTEE-VAC AND JOHANNA KROEP-DE JONGE: THE LEGACY OF DUTCH WOMEN'S AGENCIES IN MODERN INTERIORS

CAROLINA QUIROGA
SCHOOL OF ARCHITECTURE, BUENOS AIRES UNIVERSITY,
BELGRANO UNIVERSITY, ARGENTINA

ABSTRACT

Pioneering women interior designers such as Johanna (Annie) Kroep-de Jonge (1923-2016) made significant contributions as part of the Rotterdam Women's Advisory Committee VAC (*Vrouwen Advise Commissie*), a precursor voluntary women's organisation that advised the municipality on housing and the environment, developed quality standards and introduced innovative participatory methodologies - workshops, surveys, excursions - to integrate women's voices.

Annie Kroep-de Jonge graduated from the Rotterdam Academy of Art and had an active interior architecture office alongside her husband, Willem Kroep. Between 1954 and 1957, she joined the VAC team, made up of women housewives, politicians, architects, dancers, pharmacists, and doctors. This was the most intense period advising on the newly built neighbourhoods that solved the housing problem after the bombing of Rotterdam: Pendrecht, Schiebroek, Zuidwijk, Hoogvliet, and IJselmonde. As a result of her spatial knowledge, Kroep-de Jonge led the VAC exhibitions, which were ¨modelflat¨ or furnished apartments. Model homes were commonly used in the Netherlands to promote furniture produced by well-known companies, as well as the ideas of renowned architects or, to display functional homes. In contrast, VAC's ¨modelflat¨ was resident-based and aimed to help women design their own modern spaces. They were organised both in the new housing complexes as well as in buildings found in deprived urban areas affected by severe problems of habitability. This paper aims to explore what the modern values of this unknown practice were, as well as examine its scope, permanence and future capacities. It is based on intensive archival research. Deconstructing modernity from a feminist perspective not only repairs the absences of the past but also recovers experiences that can trigger more democratic and inclusive approaches to modern heritage conservation.

1. INTRODUCTION

Women have played a fundamental role in the Modern Movement, creating concepts and spaces for a better life, but their contributions are absent or hidden in literature and archives. Modernity was narrated on the basis of a canon that created an intentionally selective version of the past around male figures or 'great master architects'. It is necessary to place women at the centre of history by documenting distorted and forgotten events in order to restore their lost voices and build a more solid and representative basis of historical knowledge.[1]

From this perspective, the main aim of this paper is to make the unknown legacy of Annie Kroep-de Jonge and VAC Rotterdam visible, as well as its distinctive values and potential, focusing on her modelflat proposals. It is based on my research that began in 2009 on the architect Wilhelmina Jansen, founder of VAC, and was later further developed by the donation of her personal archive in 2018.[2] VAC documents are composed of the committee's 20 years of notes, limited to few drawings, which involved classification and research in other archives.

2. VAC'S (HER)ITAGE

Johanna (Annie) Kroep-de Jonge (1923-2016) was a member of the VAC between 1954 and 1957. The Women's Advisory Committee VAC (*Vrouwen Advise Commissie*)[3] was a precursor voluntary women's organization that advised the Rotterdam Housing Department. Although it was formalised in 1946, the idea of the VAC began to take shape 10 years earlier, expanding the network of women's agencies that emerged in the first feminist wave such as the Dutch Housewives' Association (1912).

Born in Rotterdam, Annie was the fourth child and only daughter of Jaan Oranje, a manager in the linen room of a hospital, and Jos de Jonge, an architect. Although her vocation was science, she attended the Academy of Visual Arts and Technical Sciences in Rotterdam where she met her husband Willem Kroep (1923-1992), a carpenter and furniture maker. Following the end of the Second World War, they worked as draftsmen in an architectural firm and then opened their own interior architecture office.[4]

Until 1988, the office carried out residential, commercial and educational projects. Highlights included the interior design of the St. Lucia School for Teachers (Jos and Leo de Jonge, 1955-58) and the Anthony Veder and Co. office in the Amstleven building (Harry Nefkens, 1956), both of which have been declared national and municipal monuments respectively. From the 1970s onwards, Annie dedicated herself to art - tapestries, watercolours, paintings, collages - travelling to the Mediterranean and North Africa, where she participated in exhibitions with her works.

Annie's work at the VAC had the distinctive value of developing and applying modern design criteria for better living based on a woman's perspective. VAC's aim was to interpret the voice of women with regard to housing, furnishings, and home maintenance, as well as to strengthen contact between residents, architects and the government.[5] The committee reviewed

5. VAC Rotterdam, Note, 26 February 1953.

housing department projects and produced reports and research. To get women's opinions, it organised activities - surveys, excursions, exhibitions - the results of which were its knowledge base for consultancies.

A noteworthy aspect was the collaborative and transdisciplinary approach of the committee. Annie articulated her interior design expertise with women of diverse backgrounds including housewives, pharmacists, politicians, dance professors, doctors of medicine, and members of feminist associations such as the Dutch Female Electricity Association and the Dutch Housewives' Association. In related disciplines, she associated with Wilhelmina Jansen, the pioneer architect and author of the working women's building RVS Flat, and also had connections to Ada Kuiper-Struyk, a politician and housing expert.[6]

The VAC was a critique of the ambivalent responses of the Dutch Modern Movement (*Het Nieuwe Bouwen*) to domesticity because of its historical association with the feminine. The new architecture was the liberation of society and women. For example, Peter Oud[7], the architect in charge of the city of Rotterdam promoted female participation in housing design. However, public housing was the domain of male architects.[8]

Kroep-de Jonge's period as a member of the VAC was the most intense as she advised on the newly built neighbourhoods that solved the housing problem after the bombing of Rotterdam: Pendrecht, Schiebroek, Zuidwijk, Hoogvliet and IJselmonde. In addition to the advice provided, she also took part in several excursions to conduct surveys after the buildings were occupied to obtain the residents' opinions. Additionally, she took part in VAC commissions producing reports on home technology.

The women's committee was undoubtedly fundamental in the recognised quality of post-war housing in Rotterdam, which was one of the most studied cases worldwide. Thousands of dwellings integrated VAC's minimum standards of quality in terms of hygiene, functionality and technology, which were developed by systematizing women's opinions (through surveys, and excursions) on the home and focused on room measurements, window size, wardrobe width, number of heating appliances, etc. These criteria formed the basis for the current housing regulations. VAC's knowledge spread throughout the Netherlands, reaching 45 committees in different cities in 1960 and 285 in the 1990s.[9]

3. MODELFLAT AS DEMOCRATIZATION

As a result of her spatial knowledge, Kroep-de Jonge led the VAC exhibitions, which were ¨modelflat¨ or furnished apartments. Model homes were commonly used in the Netherlands to promote furniture produced by well-known companies, as well as the ideas of renowned architects or, to display functional homes. Model homes furnished in the 1950s and 1960s by the Dutch Association for Correct Living (*Stichting Goed Wonen*) are the most widely recognised. Their aim was to promote specific pieces of furniture for the bourgeois class.

In contrast to this commercial profile, one of the modern values of the VAC modelflat was the democratization of interior design by making it

accessible to all citizens. The post-war reconstruction of Rotterdam allowed the working classes to experience modern urbanism and architecture and the VAC integrated women's perspective into the entire process. However, the flats in the social housing projects were handed over empty of furnishings and lacking in guidelines in terms of how to organise them.

VAC's exhibitions were based on residents collecting opinions from housewives and informing them on how to live at home.[10] The idea was very different from Correct Living's model homes, which were conceived as a tool to liberate the Dutch interior from the bad taste of the population, especially women who were in charge of the household.[11] The VAC modelflat was hosted in the new districts of Overschie, Hoogvliet and Zuidwijk in 1952 and Schiebroek in 1953.

In 1954 Annie Kroep-de Jonge made her first modelflat in the new district of Zuidwijk. Over a period of 8 days, from 2 to 9 October, four furnished units were visited by 1400 people in a building designed by Jos and Leo de Jonge.[12]

Annie conceived modern space as a right for everyone and believed that "¨Comfort is not bought, it is created¨. Therefore, each room was designed by combining used furniture, donated by women from the committee, and made use of avant-garde objects, which were not always affordable to the working class. Through these 1:1 arrangements, women acquired the knowledge and tools to design modern interiors through spatial experience, focusing on flexibility, efficiency, and the use of natural light. The programme included lectures and, on the last day, a discussion forum where all stakeholders involved in housing production -government, politicians, architects - came together to listen to the voice of the housewives. With a didactic mission in mind, Annie included a series of posters hung on the walls with slogans to read during the visit, a true manifesto:

Can You think, work and play quietly at home? Then you can live there too.
Lighting is not decoration.
Are you walking into the light?
Do you also think the lookout is more important than the view?
Your interior is not a hindrance, is it?
The furniture should serve you, not you the furniture.
Don't be a slave to your furniture.
Comfort is not bought, it is created.
One needs space to live, not furniture.
If you want your children to play, you have to share space with them.[13]

Pendrecht's exhibition (19-27 October, 1956) was the most influential, and was visited by 3000 people including residents, government officials, politicians and students of technical disciplines.[14] In 1948 Lotte Stam-Beese, head of the Department of Urban Development and Reconstruction, was commissioned to design Pendrecht (1949-53), the westernmost development of the Zuid plan that expanded Rotterdam to the south.

12. VAC Rotterdam, Exhibition report 1954.

13. VAC Rotterdam, Minutes, 23 October 1954.

14. Johanna Kroep-de Jonge, 1956.

Stam-Beese proposed the 'housing unit' (*wooneenheid*) as the basis for thinking in terms of an ascending series of spatial units: dwelling, group, neighbourhood, district, city. The VAC took part in the decision-making on all levels, including urban densification, development of the residential buildings, the interior of the units through the exhibitions and the monitoring of the results of the project through resident surveys.[15] Four apartments were furnished in the Pendrecht III complex by architect Harry Nefkens. Annie's layout included furnishing almost all the rooms with a mixture of old and new pieces that were not very expensive. (**Fig. 1**)

According to the VAC report, not all furniture (drawers under beds, children's bins) was already mass-produced, however, it was intended to be reproduced by the residents. This reinforced the non-commercial character of the modelflat as well as the role of housewives as designers and not simply consumers. Activities included a lecture on the history of housing and the future development of Pendrecht, as well as film screenings and a discussion forum. Additionally, the VAC brochure, '*Finally a house',* was distributed and included drawings and practical advice on how to organise the interior of the home. [16]

Crowswijk´s innovative exhibition, *How to make space in my house?,* was the clearest example of the democratic sense of the modelflat. It was located in a social housing complex affected by severe affordability problems in a marginal urban area of the Crowswijk neighbourhood (12-15 March 1955). The initiative was taken by the local Working Committee of the Protestant Church to help a large number of poor families to make better use of the space in their small dwellings with only one or two rooms. [17]

Annie furnished four four-by-five-metre rooms with the kitchen and the door as fixed elements. The first room had the existing residents' layout (symmetry, centrality). In the second, the same furniture was used to show how the modern asymmetrical organisation provided more space and better-differentiated uses. The third room included only modern or simpler furniture, exploring a new aesthetic. The fourth room had the same furniture as the third, but accentuated the spatial effect.[18] (**Fig. 2**) Modelflat was visited by 600 people, most of whom were interested in the second proposal as they could use their own furniture.

VAC's modelfat helped residents to create their own interiors by achieving one of the most important principles of modernity: total design. VAC archives and newspapers reported on the popularity and impact of the exhibitions. Extensive photographic records from the Department of Housing showed the influence of the modelflat on everyday life. Residents set the interiors using space, light, visuals and connections to the gardens. They used the same modern furniture and lamps designed by Wim Rietveld or Willem Gispe, alongside objects from their own history and identity, such as plants, picture frames and antique furniture. (**Fig. 3**)

Until the mid-1960s, Annie's ideas were integrated into several modelflats, spreading modernity to thousands of homes. By 1956, the VAC took the decision to stop organising its own exhibitions due to the work

involved and avoid cooperating with other initiatives (Correct Living, Bouwcentrum, Men and House Foundation) that were not based on the residents.[19] The committee continued to advise on model homes in private initiatives, such as the furniture companies De Klerk (Barendrecht, 1957 and Lombardijen, 1960) and Martens (Hoogvliet-Westpunt, 1960), and Housing Corporations (Zuidwijk, 1960). In 1964, working with De Klerk, they advised on 4 modelflat in buildings for the elderly in Tuinenhoven, Alexanderpolder and Tuynenburg.

19. VAC Rotterdam, Report, 8 August 1956.

4. PERMANENCE AND CHALLENGES

The modern values of the VAC remain in the configuration of the post-war stock building. The concepts of light, air and space are still considered valid in providing a better life and defining the social identity. From the 1980s onwards, when the state covered the housing deficit, the housing corporations began to renovate the complexes distorting their characteristics or, in fact, demolishing them to build new ones. In recent years, this constructed heritage has been revalued and protected, but its conservation is difficult due to its large scale and population.

Bringing the significance of the VAC as a spatial practice to the present has great potential in the rehabilitation of mass housing. One of the fundamental learnings to be taken from the VAC was that the modern interior is an indivisible dimension of the urban and architectural aspects and that it was the residents who could design them themselves. Understanding this historical condition of mass housing can shed light on what is considered Dutch best practice. It focuses only on architectural values (historical, expressive, typological) and intervention guidelines (restoration of façades, adaptation of facilities, remodelling of ground floors). However, projects rarely address interiors, let alone involve the inhabitants.

Modelflat, designed by Kroep-de Jonge, has the capacity to reverse this situation by activating rehabilitation processes that once again achieve spatial democratisation. Its didactic and participatory essence is a trigger for residents to learn from and appreciate the merits of modern interior design, as well as to elaborate new meanings about these concepts in accordance with contemporary culture, their own history and subjectivity.

Another not-insignificant issue is the pioneering social value of integrating an intersectional feminist perspective by reversing gender hierarchies and stereotypes in spatial design in socially vulnerable sectors. This is a priority matter in the agenda of sustainable development and urban public policies. The challenge is to integrate it into heritage conservation in the context of new social dynamics: coexistence groups, diverse identities, multiculturalism, among others.

Revisiting modernity from a feminist perspective has provided insight into a completely unknown aspect of the past and present. In the same spirit of the VAC, reclaiming the voice of the women on the committee and their experience can trigger more inclusive and democratic approaches to modern heritage conservation. ■

ABSTRACT

Transitional spaces, such as galleries as access systems in residential buildings, were widely explored architectural devices in Modern Movement architecture. These devices were also frequently linked to the idea of communal spaces. The purpose of this article is to confront the design solutions advocated at that time with ageing in place and well-being challenges, incorporating accessibility, independent living, health, and comfort issues as unquestionable needs in the contemporary age. Despite the distinguishable qualities of the original design, the demands for comfort and well-being have evolved exponentially over recent decades, as well as the need to deal with inclusive design and the urges of climate change.

Three examples built in the 1950s in Porto, Portugal, commonly recognised as references with architectural value have been selected. The buildings incorporate galleries or raised walkways, providing access to apartments with distinguishable features regarding spatial organisation, and which have mostly been kept in their original condition. These galleries vary in size, materials, and openness to the dwellings, revealing wide-ranging appropriation possibilities.

Despite the challenges in times of crisis, these circulation spaces offer great potential to increase the inhabitants' living conditions and the interior qualities of the apartments as extensions to the outdoors (sun, fresh air, views). Hence, this article will address the following questions: what former design and spatial features can be retrieved in contemporary housing design solutions? How can raised walkways and galleries contribute to enhancing well-being and inclusiveness? Are these spatial devices fully adaptable to current demands without a loss of the building's identity and the apartment's inner qualities?

While scoping the richness of the Modern Movement housing legacy, the purpose of this discussion proposal is two-fold: to evaluate conscientious retrofit actions of culturally valuable housing stock and to advance yet-to-be-learned design solutions that may enlighten contemporary visions and best practices.

This article was developed with the support of the Center for Studies in Architecture and Urbanism of the Faculty of Architecture of the University of Porto (CEAU-FAUP) and funded by the Foundation for Science and Technology (FCT, Lisbon, Portugal) under the project UIDB/00145/2020. Gisela Lameira and Luciana Rocha research are also funded by FCT through the Scientific Employment Stimulus programme.

1. INTRODUCTION

This article outlines the role of transitional spaces in the Modern Movement housing design and their potential to accommodate current needs and enhance health and well-being.

The built environment has profound implications for quality of life, affecting health and well-being[1]. Improving living standards implies a broad understanding of several factors (among which, psychological and emotional aspects play a fundamental role). Healthier ways of living can be achieved through architectural design, considering tackling not only the building's physical elements, such as improved ventilation, adequate temperature, or light, but also how the inhabitants appropriate space. Therefore, housing design strategies should increase diversity and adaptability[2] promoting holistic visions that connect societal challenges, such as the ageing population, the urgency of climate change, energy efficiency, and the rising involvement of the inhabitants in co-creation processes and project decisions. The ageing population issue is a complex, multi-factor phenomenon, posing challenges to housing design beyond mobility, accessibility or barrier-free environments. Homes should be readily adapted for people as they grow old or face a disability, enabling inhabitants to live independently in varied housing typologies suited to personal choices or support levels, mostly within their communities. Furthermore, the challenges in design for ageing include regaining outdoor spaces as key devices to improve health and well-being as people grow old.

The retrofitting of Modern architecture is a historical and social imperative undertaking, stemming from the need to adjust to the abovementioned contemporary challenges and the required protection of its cultural and architectural heritage legacy. Effectively managing the preservation of this heritage alongside energy-efficient solutions is mandatory to ensure the longevity and significance of these housing complexes and the comfort of their inhabitants.

The access gallery is a shared distribution system that enables entry to several apartments with a single vertical communication hub, granting an economy of resources. In addition to a transitional space character, the galleries have a liminal identity anchored in a sequential passage ritual.[3]

Although often seen as controversial spaces due to their widespread implementation in state-funded housing in low-income-level neighbourhoods (highly ideologically driven in the 1960s, e.g., the 'streets-in-the-sky', namely Park Hill, Robin Hood Gardens, Golden Lane housing estates) in previous decades, these "in-between" (outdoor-indoor) spatial devices were noteworthy for their design details and spatial qualification, being part of widely accepted architectural solutions for the middle classes.[4] [5]

Several contemporary proposals are recovering the potential of the raised walkways/access galleries as critical architectural devices to promote and improve well-being, leading to increasingly generous spatial areas. Positive behaviour, intergenerational encounters, social connections, and physical activity, for instance, are among the most recognisable benefits of these shared spaces, as recent studies have highlighted in similar contexts to those

of Portugal[6] and can be seen in recent projects such as La Balma (Lacol 2021) or Alí Bei (Pau Vidal 2020). This model continues to be a recurrent choice, as evidenced in ongoing projects, for example, Carrer Veneçuela (Peris + Toral, under construction).

The first section of this article reviews the buildings' characteristics and establishes the analysis of the access systems as the interplay between formal principles and modern inhabiting. The second section draws on research on solutions and best practices, confronting the retrofit challenges in the case studies with contemporary paradigms in other contexts and built solutions. Finally, the last section (Conclusions) establishes the obstacles and potential involved in reclaiming the outdoors to improve health and well-being in existing modern housing buildings.

2. RECLAIMING THE OUTDOORS AT OURO, AFONSO V AND PARNASO BUILDINGS

2.1. MATERIALS AND METHODS

Targeting the design characteristics of the raised walkways/ access galleries, the methodological approach to the selected case studies foresaw onsite inquiries pursuing the identification of accessibility obstacles and comfort deficiencies, identifying alterations made by the inhabitants and the solutions implemented to achieve higher standards of comfort. Passive design strategies from the construction period were analysed to empirically evaluate the buildings' adequacy to contemporary sustainability and energy efficiency challenges. An assessment of the ageing population's needs was also conducted, targeting not only accessibility problems identified in the outdoor circulation areas but also the potential of the transitional spaces to improve the well-being of the inhabitants, particularly the older adults.

Challenges to retrofit were identified and confronted with solutions and best practices found in other national and international intervention solutions.

2.2. THE INTERPLAY BETWEEN CONSTRUCTION, LANGUAGE, ACCESS SYSTEM AND DWELLING

Constructed in the 1950s, the three case studies – Ouro (Arch. Mario Bonito, 1952-1955), Afonso V (Arch. Pereira da Costa,1953-1955), and Parnaso (Arch. José Carlos Loureiro, 1955-1959) – were designed by architects who were extremely active and influential during this period, having introduced conceptual innovations in national architectural production: in urban framing (posing alternatives to the traditional city block and introducing common green spaces), in access systems (articulating vertical systems with access galleries), in the functional programme (combining housing with commerce and/or services), in the typology design (through the rationalisation of space standards), in construction systems (introducing reinforced concrete structures), and in materiality (experimenting through materials and textures). However, despite recognising this common and identity-defining language, these buildings exhibit great diversity in terms of their formal options and spatial organisation[7].

7. Luciana Rocha, "The Preservation of Authenticity and the Awareness of the Necessary," *DOCOMOMO Journal. Modern Housing. Patrimonio Vivo*, no. 51 (2014): 80-84.

Although the Ouro, Afonso V, and Parnaso buildings exhibit significant experimentation in using gallery access systems, they partly differ due to these background circumstances and formal decisions.

As architectural devices connecting the collective exterior and individual interior, the access galleries motivate the distribution of apartments with service areas facing the access and the main rooms on the opposite façade for privacy protection. However, the case studies also allocate bedrooms or living rooms directly facing the galleries. In these cases, the privacy of the apartments is ensured by differences in levels between the exterior and the interior and by the design of elevated windows in these compartments, as seen in the Parnaso and Ouro buildings. Moreover, in the Afonso V building, a solution with horizontal grilles in service areas (laundry) optimises the ventilation and lighting of these spaces.

The galleries also play an essential role in promoting social encounters. Although these spaces are mainly designed as circulation areas in the cases under analysis, given their narrow width and limited relationship with the apartments' indoor areas, there are also some larger adjacent social spaces. For example, the first-floor gallery in the Ouro building is a covered exterior space delimited by a pillar structure supporting the upper floors. This area extends to a private but collective-use exterior terrace above the ground floor (**Fig. 1**). The difference in levels (with the terrace being slightly lower) and flooring materials (terrazzo in the gallery and mosaic on the terrace) stands out in the relationship between these two spaces. On the top floor of this building, there is another intermediate, exterior, and collective space, located on the sides of the setback volume of the housing units. The Afonso V building also incorporates a private terrace for collective use situated slightly below the gallery on the first floor (**Fig. 2**). The absence of these areas in the Parnaso building is compensated by generous private individual balconies facing south and a collective central area inside the plot for everyday use (**Fig. 3**).

Thus, these architectural devices take on particular relevance in the design of the elevations and the architectural language of the ensemble. This feature is particularly significant in the Parnaso building, where the galleries configure the North façade of the larger volume. In this case, they also serve as a protective barrier against wind and noise from the adjacent street, exhibiting elevated high walls with opaque planes and occasional glass areas (**Fig. 3**).

In the Afonso V building, the design of the access galleries is associated with the construction system of the ensemble, notably through the integration of the pillars of the East façade. Furthermore, this case is also noteworthy for the use of colour in specific elements, such as the balcony guards and the occasional connection to a volume of staircases of a sculptural nature (**Fig. 2**). The main galleries of the Ouro building, facing south, present two distinct materialities: perforated brick balconies on the intermediate floors and opaque balconies on the upper floor. This floor also incorporates vertical grilles in front of the entrance doors to the dwellings (**Fig. 1**).

3. RETROFIT. SOLUTIONS AND BEST PRACTICES

Despite their architectural and spatial qualities, these buildings face challenges regarding the needs and well-being of the ageing population. One of the main problems lies in the physical barriers, such as the absence of a lift in the Afonso V building or the level differences between the galleries and the interior of the apartments, as in the Ouro or Parnaso buildings. These barriers hinder the circulation of people with reduced mobility and complicate the future adaptation of the buildings. Additionally, design options such as placing service areas (e.g. kitchens, laundries) facing the galleries or elevated windows affect the relationship of the apartments with these indoor-outdoor intermediate spaces. With other features (e.g. broader width), they could perform as living areas and as an extension of the interior spaces, such as in La Balma. In this regard, the narrow width configuration of the galleries gives them a predominant circulation character. However, the Ouro building shows

signs of appropriation of these spaces by the inhabitants. Nevertheless, this is limited to placing plants near the entrance of the apartments and clotheslines on the balconies. The absence of shading systems, especially in the south-facing galleries, is also a problem in terms of ensuring space comfort, given the need for more control over sun exposure.

These intermediate, transitional spaces reveal great potential to improve the living conditions of the inhabitants and promote community relationships.

The terraces next to the galleries represent valuable and frequently underutilised spatial assets. A significant endeavour towards transforming these areas would be to install communal facilities, such as benches and tables, thus fostering interaction among residents and boosting the sense of community. The incorporation of greenery and the establishment of communal gardens should also be considered. These elements can enhance spatial comfort and promote the adoption of healthy practices, including homegrown organic products. Illustrative examples of such initiatives can be found in the residential ensemble for older adults, social housing, and temporary housing on Carrer Veneçuela (Barcelona, under construction) and the mixed-use complex featuring accommodation for the elderly and public amenities in Glòries (Barcelona, 2017), both designed by Peris + Toral architects or in Alí Bei social housing ensemble in Barcelona by the Paulo Vidal architectural practice (**Fig. 4**). In Ouro and Afonso V, these areas take on even greater importance to mitigate the lack of space in the predominantly narrow galleries.

The installation of shading systems to regulate and offer protection against sun exposure, especially in south-facing galleries, would also represent a significant means of improving comfort. Architectural cooperatives, such as Lacol, frequently employ these devices as part of passive strategies for bioclimatic construction. Housing cooperatives such as La Balma (Barcelona, 2021) and La Borda (Barcelona, 2017-2018) are exemplary for their incorporation of roller blinds on balconies.

The galleries may also function as spatial devices for thermal regulation, resembling Winter Gardens or Greenhouses, which have had a recognised historical impact[8 9]. Moreover, glazed balconies offer many advantages, especially in cold climates, regarding optimising the greenhouse effect to enhance thermal comfort and energy savings. However, these devices can jeopardise the overall indoor environmental quality, triggering overheating problems and reducing air flow and natural light in adjacent interior spaces. To mitigate these problems in warmer climates, this system must be combined with passive techniques to avoid overheating, such as solar shading and ventilation solutions[10]. Galleries should be regarded as dynamic elements to avoid disrupting the cross-ventilation of the surrounding spaces, especially the interior of the dwellings. This airflow could be maintained by installing ventilation grilles and mechanical sensors for automatic opening. This design approach is recognised in the works of Lacaton & Vassal such as the Grand Park (Bordeaux, 2017), offering a contemporary interpretation of

the Greenhouse concept. Another example is the renovation of House 1522 by H Arquitectes (Barcelona, 2015-2017), using a glazed enclosed space as part of a bioclimatic scheme.

The placement of a door with an air-permeable structure in the antechamber of the duplex housings in the Afonso V building may also improve the cross-ventilation of the dwellings. This solution of intermediate spaces between the access and the dwelling has been used in recent constructions such as the Alí Bei social housing ensemble. (**Fig. 4**). These alterations evidence the adaptability of these buildings to current demands.

4. CONCLUSIONS. OBSTACLES AND POTENTIAL FOR IMPLEMENTATION

Reclaiming the outdoors, the transition spaces between housing structures and the city, involves reframing the existing areas, often used solely for circulation or without an assigned use, to enhance the role of architecture as a promoter of improved health, well-being, and ultimate happiness. The formal and programmatic experimentation seen in some examples built in the 50s and 60s, in terms of access schemes, flat roofs and terraces, bring inherent qualities to the buildings, which nowadays enhance their appropriation as collective extensions of the dwellings.

However, when discussing Modern Movement Architectures, especially the paradigms with greater collective recognition, some obstacles to intervention may be identified.

1. The conflict of hypothetical alteration solutions with the preservation of the protected heritage: the Parnaso building has been classified as a Monument of Public Interest (MIP) since 2013; also, the Ouro building and the Afonso V building were identified as Properties of Heritage Interest in the Heritage Charter of the Municipal Master Plan of Porto, which might hinder changing the exterior envelope of the buildings or installing equipment without obtaining a prior permit, or without significantly altering their original architectural language and identity.
2. The condominium/inhabitants frequently pose barriers to the placement of mobility aids equipment (e.g., lift platforms), often for aesthetic reasons, and to the design of communal use facilities, mainly due to cultural resistance to shared spaces within the building (security, noise, management problems). At this point, in some cases, such as the Ouro building, some equipment has already been installed to reduce physical barriers. However, it is still very restricted and does not guarantee free movement in the entire building.

   Despite the need to address the issue of accessibility holistically through a plan from the entrance of the building to the apartments and common areas, some obstacles are, in fact, impossible to overcome. The significant experimentation found in these buildings (steps along the pathways linked to degrees of privacy and differentiation, for instance) brings overall spatial quality.

3. The inexistence of knowledge of building use among the residents leads to reduced levels of comfort and all kinds of construction pathologies. For example, cross-ventilation and shading should be ensured, especially when enclosing the access galleries, however these factors are frequently neglected when such interventions take place. An active pedagogy towards use of the building's elements and enhancing the overall energy performance of the building[11] could mitigate some of these problems through the development of user manuals, or training sessions.

Spaces frequently found in modern movement paradigms built during the 1950s, namely terraces and accessible roofs, can easily house equipment and activity areas. Also, recessed raised walkways could incorporate enclosed areas to promote winter gardens.

Access galleries can enhance well-being by promoting controlled appropriation areas, allowing for living spaces that complement those inside the home, and/or providing equipment for collective/ individual use (areas associated with leisure, namely physical activity, social gatherings, or productive activities: gardening, cultivation, domestic activities, among others). Furthermore, intervention solutions must be confronted with the inhabitants' perspective according to their cultural backgrounds, needs and habits.

These spatial devices carry considerable potential and can be adjusted and adapted differently to meet contemporary demands: the fact that recently concluded housing projects in Spain systematically recover these intermediate spaces supports this idea. ■

BIOGRAPHIES

Gisela Lameira (Viseu, 1978) is an architect and a contract researcher at the Center for Studies in Architecture and Urbanism/ Faculty of Architecture of the University of Porto (FAUP–CEAU, Portugal) and holds a PhD in architecture from FAUP (2017). She worked as a research fellow on the FCT project "Mapping Public Housing: A Critical Review of the State-Subsidised Residential Architecture in Portugal (1910–1974)," hosted by FAUP/ CEAU [P2020-PTDC/CPC-HAT/1688/2014] and is currently undertaking research for the research projects "Climate adaptation for older people living in vulnerable urban areas", hosted by FEUP [PTDC/GES-URB/2038/2021].

Luciana Rocha (Santa Maria da Feira, 1983). Architect, PhD in Architecture (FAUP, 2016) and contracted researcher at CEAU-FAUP. She was a research fellow on the FCT project "Mapping Public Housing: A critical review of the State-subsidised residential architecture in Portugal (1910-1974)" [P2020-PTDC/CPC-HAT/1688/2014] hosted by FAUP/CEAU. She researches on architectural heritage of the 20th century, mainly multifamily housing, and intervention strategies regarding preservation measures, energy efficiency, comfort and well-being based on case studies and inhabitants' experiences. Currently, she is undertaking the research "Well-Balanced Energy Housing: Reasoning Method towards interventions crossing Heritage, Efficiency and Comfort" (WellBEH) at FAUP/CEAU.

Rui Jorge Garcia Ramos (Viana do Castelo, 1961) is an architect and Full Professor at the Faculty of Architecture of the University of Porto (FAUP). He researches the relationship between culture and ways of living, housing programs, and the "inclusive architecture" from ageing to sustainability. He is a researcher at the Center for Architecture and Urbanism Studies (CEAU-FAUP) and was the Principal Investigator of the interdisciplinary project "Mapping Public Housing: A Critical Review of the State-Subsidized Residential Architecture in Portugal 1910–1974" (FCT, 2016-2020). He was Vice-Rector of the University of Porto between 2014 and 2018.

FROM PROVINCIAL TO INTERNATIONAL: MODERN INTERIORS OF A CURITIBA IN TRANSITION

GIOVANNA POLONIO RENZETTI
MACKENZIE PRESBYTERIAN UNIVERSITY, BRAZIL

RUTH VERDE ZEIN
MACKENZIE PRESBYTERIAN UNIVERSITY, BRAZIL

ABSTRACT

Fashion, decoration, and lifestyle magazines were primary vectors in the dissemination of the "precepts" of modern life in Curitiba, capital of the state of Paraná, Brazil since the 1920's. From the 1950s the city went through an economic and cultural expansion, supported by the wealth brought by agricultural expansion, which would culminate in its international notoriety, thanks to well-publicized transformative urban actions, where houses with an eclectic style, construction techniques and furniture arrangements that recalled references from the origins of European immigrants gradually its gave way to residential projects with less hierarchical plans and more functional, illuminated and fluid spaces, with more rationalized structural solutions and in tune with the modern architecture. Selected from among the modern Curitiba residences published at that time, two case studies are presented in the following article: one at the beginning and other at a more consolidated moment in this "modernization" process; both for clients with the same desire: to be modern: the Cleuza and Ayrton Cornelsen residence (1949) designed by the resident and architect Ayrton Cornelsen himself; and the unbuilt project of the Hellio Setti residence, by the then engineer and architecture student Jaime Lerner (~1963), future urban planner and mayor of the city. The focus of the analysis sets on the study of architectural interiors, and the verification of how they are presented graphically and textually as part of the catechization effort to disseminate the values of modernity in a city yet to be modernized.

1. INTRODUCTION

Fashion, decoration, and lifestyle magazines were primary vectors in the dissemination of the "precepts" of modern life. Curitiba, the capital of Paraná State, Brazil – still a provincial city by the middle of the 20th century – experienced great growth after the 1950s. The city experienced an economic and cultural expansion supported by agricultural wealth, and in the 1960s-70s Curitiba gained international notoriety thanks to well-publicized transformative urban actions. At that moment its upper-class former rural shyness gave way to the longing of public show-off and intellectual pursuit. Publicity articles focusing on house interiors aimed at the bourgeois class were written in the manner of "domestic manuals" with informative subjects on architecture and interior design trends, highlighting houses considered as "modern and functional", closely followed by readers from the intellectual and upper classes aiming to live with the updated technological, social and artistic innovations of metropolitan Brazil and the modern world. Illustrated magazines, from Rio de Janeiro and São Paulo, and others locally produced increased their circulation in Curitiba. Their articles opened up space to aesthetic judgments, which valued the modern atmosphere of residential interiors and inspired the Paraná elite. Eclectic houses made with outdated construction techniques and cosy furniture arrangements, reminiscent of the immigrant's European origins gradually gave way to residential projects with less hierarchical plans, more functional, illuminated and fluid spaces, and more rational structural solutions in tune with the modern architecture.

The written press, both technical and lifestyle-oriented, was an important vehicle for cultural dissemination and opinion formation on the aesthetic tastes of life, interior design and domestic living in Curitiba. Our current research is looking at a broad amount of these documentary sources; they provide the collecting of a considerable volume of information. Among the modern Curitiba residences published at that time, two case studies have been selected to be discussed in this article. One was created in the beginning and the other at a more consolidated moment in this "modernization" process; both for clients with the same social desire and economic means. The Cleuza and Ayrton Cornelsen residence (1949) was designed for his family's personal use by architect Ayrton Cornelsen. The unbuilt project of the Hellio Setti (1963) residence was designed by the engineer Jaime Lerner, who was studying architecture and would gain notoriety in the next decade as an urban planner and city's mayor. The focus of the analysis is on the architectural interiors and how they are graphically and textually presented as part of the catechization effort to disseminate modern interior values, such as open plan floor concept, modern and functional furniture, adaptive spaces and the impression of the client's characteristics in the overall design of the house.

2. AYRTON & CLEUZA CORNELSEN RESIDENCE

An isolated figure in the dissemination not only of modern residential architecture in Curitiba in the 1940s and 1950s but also of its modern interiors, Lolô Cornelsen was a contemporary of Curitiba-born architect Vilanova

Artigas, who early moved to the metropolis of São Paulo leaving Lolô alone to face the conservative Curitiba class, with almost no pairs until the arrival of a group of Paulista architects that came to the city in the early 1960s.

From a troubled upbringing, Lolô adopted as a surrogate father the French master Le Corbusier, with whom he got acquainted by reading his books, received as a gift from the urban planner Alfred Agache séjour in Curitiba, in 1943. His residence gives testimony and witnesses his discipleship commitment, demonstrated by the treatment of natural light in the internal spaces, and the Corbusian pilotis and free plan. Not to mention the maestro's inspired curves – unheard up to then in Curitiba's architectural panorama and hardly seen again in the following decades in single-family homes.

The Ayrton and Cleuza Cornelsen house design was published in the magazine "A divulgação" (1953), under the title "An example of functional architecture"[1]; the main interest of the article was on the "most beautiful interiors in the capital". The article focuses on the house's interiors, with three images and just one photo of its exterior, highlighting the detail of the curved railing designed and the abstract ceramic panel on the facade. The magazine aimed to emphasize the new features of a modern routine, crowned by a project that did its justice, to draw people's attention to the new times that were announced and had finally arrived.

The project designed by the architect for himself and his family was unlike anything previously seen in Curitiba at the time. It was located at the back of the plot, and the vegetation, or the "bush" – an inconvenience for the local elite – was given extreme importance in the draft of the plans and for the internal temperature control (DUDEQUE, 2001). It is worth mentioning that during the 1940s, the temperature range in the capital of Paraná used to reach negative temperatures in the winters and exceed 35°C in the hottest months. Lolô's solution was to design and build the house following the incidence of the sun, defining a point where all the walls of the house converge from the parallel movement of the sun near the winter solstice (25°C S), creating a fan-shaped floor plan.

Thanks to this approach he was able to create a sunlight incidence balance, whereas in the morning the bedrooms, with their north-facing façade, received more light during the winter and were shaded during the summer, and the same happened with the other areas of the house, social and service, as the day went on. The north face, punished by the sun during the summer, on the other hand, was protected by native vegetation, carefully crafted by the architect.

In addition to its unconventional location at the back of the property, the main access from street level and a curved path that led to the car garage on the lower level, which was set into the ground, the main floor plan featured a balcony with large glazed openings, giving access to a ballroom with a bar, where the family entertained their friends.

Highlights of the house include the smooth ceiling, modern furniture with comfortable armchairs and the biomorphic table (1947) signed by Isamu Noguchi, as well as the woodwork designed by the architect himself to meet his needs: a counter attached to the wall without a base.

1. A DIVULGAÇÃO, "Um exemplo da Arquitetura Funcional," *Graficart* (Curitiba), November 1953, 34-35.

This minute care is also found in the house's other rooms. In the dining room, there were Riga pine chairs and a blackwood folding screen used as a divider between the dining and living areas. The premise of the furniture design was to obtain clean lines and utility above all, as well as comfort, which is emphasized in the living room with comfortable, hand-stitched armchairs.

Another innovation proposed by the architect demonstrates his pioneering spirit, not only in the state of Paraná, but also in comparison with the interior housing decoration in the metropolis of São Paulo, which at the time was still taking its first steps towards more comfortable furniture. The English style of the living room was chosen at great cost, as the vast majority of society remained faithful to traditional French furniture, which was bound by the rules of luxury and the tradition of living rooms[2].

From the documentation studied, it is possible to confirm the use of various pastel colours in the living areas, such as pink, blue, green and yellow. In the architect's studio, there is a combination of modern furniture and curtains printed with Picasso drawings, expressing his tastes and personality. It should be noted that Cornelsen founded his own furniture and carpentry factory to produce modern pieces for his home and his clients, after not finding any local producers able to attend to his needs. In that workshop, he developed gates, windows, doors and all the wooden profiles that were used in his projects.

3. HELLIO SETTI RESIDENCE

The Setti residence, designed by Jaime Lerner, was featured in the most prestigious Acrópole architectural magazine, published in São Paulo, in issue no. 306, of May 1964 – but it was never built. The publication states that it was a house for a small family, with an intense social life (ACROPOLE, 1964).

The publication opens up with an image of the house's facade; there are also floor plans in a simplified drawing and some perspectives illustrating the internal spatiality and interior design. From the street, the house appears to be organized in three volumes: a wall that extends to the alignment, forming a fenced-in patio, a set-back horizontal stripe which culminates in the first floor of the house, and a smaller overlapping volume on the second floor, extending towards the facade. On the first floor are the social areas – arranged as an open space - part of the intimate area, located in the back of the plot, and part of the service facilities in the front façade - inverting the traditional house plan which was then familiar to the elite. The upper volume includes another part of the intimate area and the rest of the service facilities: another innovation, in terms of hierarchical spaces. What matters to the author is the functionality of the spaces according to the sunlight and natural ventilation, blurring the fixed definitions of what should be the "noble façades" of the residence.

The magazine draws attention to the internal arrangements of the house and emphasizes the room's interiors, by including the publication of several sketches showing the furniture designed by the author and its arrangement, featuring the library, the main bedroom and the living room.

In the library, there are sliding doors to isolate it from the living area if necessary; wooden furniture and stools were designed to fit into the gaps as

2. The author describes the transition from French to English furniture that gradually began to appear in the interiors of São Paulo homes as the combination of "two needs, physical and spiritual rest, being the objective of domestic decoration, which will concretely result in the combination of visual effect with physical comfort [...]". Vânia Carneiro Carvalho, *Gênero e Artefato: O Sistema doméstico na perspectiva da cultura material – São Paulo*, 1870-1920 (São Paulo: Edusp; Fapesp, 2020), 171.

bookshelves, when not in use. The living area occupies a lowered floor space so that the upholstered seating would be level with the rest of the home's floor. A water mirror on the side of the windowpanes extends outside the construction. This architectural and decorative solution is like one adopted at a "Case Study Houses" published by the American magazine "Arts & Architecture": the Miller Couple House (1957) in Indiana, United States, by architect Eero Saarinen.

The dining room was proposed with a fixed stone table, which would be covered by the same tiles as the floor, suggesting integration, simplification and continuity of material finishings. The chairs would have a straight design, with no ergonomic concessions, to be made from iron profiles, with a simple leather seat and backrest, and appear to be the architect's design. The bedroom features a bed made of rosewood (a wood still widely used in the 1960s), a Japanese lamp and exposed brick walls (ACROPOLE, 1964).

The proposed solutions were quite innovative, considering the panorama of Curitiba's residential architecture at the time, which was changing, but still were quite conservative. Another point of interest in the interior proposals is the partitions – one between the double bedroom and the dressing room and another, more subtle, between the living room and the dining room; both would be made up of furniture (cupboards). This solution was atypical until then in the houses of the capital of Paraná, although it was already present in other examples in Northern America, Europe and São Paulo homes, where the use of furniture as a room divider, designed by the architects themselves, also became common at this time (late 1950s and 1960s). It can be seen in the floor plans that the interior spaces are designed mainly for the social spaces, and in particular for the areas facing the patios and outdoor areas. In terms of layout, the furniture is placed in the room without obstructing circulation, with generous dimensions.

4. PARALLELS OF A CURITIBA IN TRANSITION

Both projects stand out for their interiors with functional lines, few adornments and modern furniture, a fact that emphasizes their publication in magazines in their respective periods.

However, Lolô Cornelsen's pioneering spirit and irreverence are clear. With a project dated 1949, if we put it side by side with Lerner's Setti residence from 1963, we could say that the projects are practically contemporary. Cornelsen implemented pilotis in a city where residential construction was mainly focused on eclectic facades and rococo furniture, so much so that he resorted to creating his own modern furniture and woodwork factory. Another point that stands out is his progressive design thinking when it came to electrical installations - locating several power sockets (for the forthcoming electrical boom) in the service areas, a trait that was still uncommon in the 1940s and 1950s.

Almost 15 years later, Jaime Lerner designed the Hellio Setti residence, paying attention to its interior details and furniture arrangement, allowing functionality to flourish in line with the personality of its residents. The then

architecture student's concern with the design of the furniture is notable in the project, an unusual characteristic of his contemporaries and last seen in Cornelsen's residences in previous decades. However, he differs from Lolô in the materials used, in which he uses brick and iron in his furniture. Lerner's architectural and interior design innovations, nevertheless, culminated in the project being published in a magazine with the widest national circulation.

The interior design qualities adopted by Lolô Cornelsen and Jaime Lerner coupled with the quality of the architectural project created the backdrop for the interior environments, when innovation was poorly understood by the conservative upper-class élite. Few were those who were willing to embrace change. But once the time for change came, the qualities of Curitiba's modern interiors began to be seen in the following years, carrying the legacy of the modern architect's daring interior design skills with a pioneering spirit. ■

ABSTRACT

In 1934, José Galnares (1904-1977) completed the project for the refurbishment of the premises of the Cerveceria Tomás, or Tomás Alehouse as it is known in English, in the historic centre of Seville. Having studied architecture in Barcelona, he returned to his native city and carried out rationalist interventions in the alehouse, alongside other refurbishments of commercial premises. Through these designs, he demonstrated his skill as an architect, as well as his knowledge of the European avant-garde and his ability to design in detail.

The research we present here aims to highlight the exceptional nature of these avant-garde designs - brilliant examples of rationalism - in the context of 20th-century Seville in order to reclaim the relevance of the documentary collections as a source of knowledge of this ephemeral architecture that formulated an innovative image in the city. In highlighting José Galnares as a key architect of the modern movement in Seville, this work confirms his influences and commitment to the New Architecture. The study method is based on in-depth research and consultation of the unpublished documentation in the archives of José Galnares, with the aim of identifying all the planimetry referring to this project and the architectural typology to which it is linked. The bulk of the work is based on describing, analysing and contextualising all the planimetric production of these interior designs.

Through the detailed study of all this unpublished graphic production, we highlight the architect's skill and sensitivity at the earliest stages of his career. We show how, with these commissions, José Galnares demonstrates his expertise in renovation and his profound knowledge of the principles of modern academicism. In short, taking the refurbishment of this alehouse as a reference, we highlight the value of the recently recovered documentary collection and consolidate a historic moment, rationalism in Seville, by showing unknown projects that have unfortunately disappeared nowadays.

1. INTRODUCTION

In Seville, interventions in commercial premises were a professional field in which the modern style was to experience a notable acceptance - despite the conditioning factors of the Seville context - with José Galnares Sagastizábal (1904-1977) as one of its greatest architects. In 1934, in the heart of the historic centre of Seville, in the popular Calle Sierpes (or Sierpes Street as it would be known in English), José Galnares completed the project to refurbish the premises of the Tomás Alehouse. This young architect studied architecture at the Barcelona School of Architecture, where he was trained in the principles of the modern movement and the avant-garde. On completing his studies, he returned to his native city of Seville, which was going through a complex period of crisis at the time. The design of the aforementioned alehouse was to form part of a coherent group of refurbishments of rationalist premises in the historic centre of Seville, small commissions that the young architect shrewdly took advantage of in order to break ground in the professional market in Seville. With these designs, he demonstrated his skill as an architect, his knowledge of the European avant-garde and his ability to design in detail. These works served to inject the rationalist aesthetic into the Sevillian landscape with great mastery and to establish Galnares as a local reference in the field of new architecture.

2. GALNARES'S SOCIAL CONTEXT AND BIOGRAPHICAL NOTE

The modern movement in Seville began with figures such as Secundino Zuazo, Fernando García Mercadal and José Lluis Sert at the beginning of the 20th century. But it was not until the Second Republic that this movement experienced its greatest application with the contributions of Gabriel Lupiáñez, José Diaz Langa and José Galnares Sagastizábal, among others, who, despite the circumstances of the context of the time, were able to apply the foundations of rationalist architecture in the Andalusian city.

During the 1930s, Seville was conditioned by the economic depression and social conflict resulting from the complex period of the Second Spanish Republic (1931-1939). The Sevillian construction sector, like many other sectors of the economy, experienced an acute economic crisis caused by the international economic situation - derived from the 1929 Crash - and the Spanish political context. Sevillian architecture was in crisis, especially considering the previous period of splendour during the Ibero-American Exposition of 1929. For this event, the Andalusian city underwent a major urban renewal with architects playing a leading role. This explains how the city's architectural production went from a significant rise around 1928 followed by a sharp decline in the subsequent years, reaching its lowest point in 1933 with minimal output[1]. Such a situation remained complex with the political events in Spain and the distrust of capital during the Second Republic. Specifically, between 1933 and 1936 there were ups and downs in terms of architectural production because, depending on the political group that governed Spain, the financial sector either provided or failed to provide investment, interfering in productive activity.[2] At the same time, as

2. José Manuel Macarro Vera, *La utopía revolucionaria: Sevilla en la Segunda República* (Sevilla: Monte de Piedad y Caja de Ahorros de Sevilla, 1985).

a consequence of the depression in the construction sector, unemployment levels increased and the problem of decent housing worsened.

Seville's particular situation was influenced by the dominance of historicist solutions during the first decades of the 20th century, which pushed new modern forms into the background. Although many of the local architects were trained in the Schools of Architecture of Madrid or Barcelona, architectural renovation in the Andalusian capital was not feasible due to the rise and expansion of historicism. Likewise, Sevillian architecture was conditioned by the lack, even in the 1930s, of a reasoned urban plan for the city, making it difficult both to expand the city and to apply new ideas to the urban environment.[3]

Our architect, José Galnares Sagastizábal (1904-1977), was born in Seville into a wealthy family of bourgeois descent. Of an ingenious character, the young Galnares moved to Barcelona to study architecture, immersing himself throughout that formative stage in modern knowledge and approaches. In particular, he was directly influenced by the European and international avant-garde, through masters such as Le Corbusier and Josep Lluis Sert. On completion of his studies in 1932, he returned to his native Seville with the fervent idea of conquering a city in depression; a place where Regionalism had established itself as the city's architectural style. Although Galnares's return coincided with the context of social upheaval and economic depression, the circumstances did not prevent our architect from embarking on his extensive professional career with unwavering dedication, fortitude, and tenacity.[4] His facet as a designer of modern interiors is noteworthy, as he contributed numerous notable projects in the rationalist style in Seville.[5]

3. RATIONALIST PROJECTS FOR COMMERCIAL PREMISES IN THE AREA AROUND CALLE SIERPES

In the popular Calle Sierpes in the heart of Seville - one of the city's historic arteries - the young José Galnares carried out a series of precise architectural interventions in the manner of small surgical operations in the centre of Seville in order to transmit the values and concepts of the new modern aesthetic to the bulk of the lay population.[6] And it was precisely in this period of crisis, which particularly affected the architecture and construction sector, that this type of minor renovation work served as one of the professional fields through which the modern style was able to establish itself more easily on the Sevillian architectural scene.[7]

The commercial environment of the aforementioned Calle Sierpes was to become an outstanding showcase for the new modern aesthetic, thanks to the various commercial premises of rationalist design that were built. In particular, Galnares became the professional who carried out the most projects in this architectural field in his time, a fact that is clearly demonstrated by his private archive. The study of Galnares' projects has allowed us to learn about a good number of interventions of this type, which were designed and executed in the mid-1930s on various ground floors of buildings intended for commercial use. For this study, we will focus on examples of interventions from 1934,

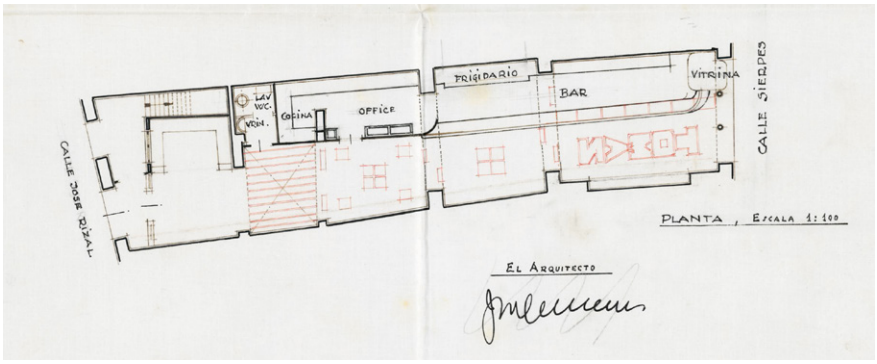
the first of which was the unique Tomás Alehouse on Calle Sierpes no. 102 and Calle José Rizal no. 19. This project was followed in the same year by the interventions of Calzados Segarra on Calle Sierpes no. 25, Lechería SAM on Calle Martín Villa no. 9, Banco de Los Previsores del Porvenir on Calle Rioja no. 9, Philips Ultra Radio shop on Calle Sierpes no. 34 and Salón de Té Gayango on Calle Tetuán. All of these proposals for rationalist-designed premises were executed thanks to the detailed development of each design.

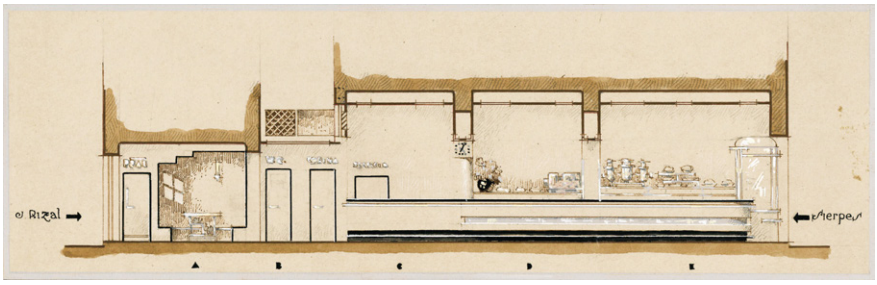
4. THE PROJECT FOR THE TOMÁS ALEHOUSE

The refurbishment of the Tomás Alehouse was the first published work by José Galnares. This project was commissioned by the hotel businessman Tomás Galiana in 1932 for the adaptation of the premises as a bar located in the aforementioned Calle Sierpes in Seville. Executed a year later, it was a project for the interior reform of premises on a narrow, elongated plot with a facade at both ends leading onto both Calle Sierpes no. 102 and Calle José Rizal no. 19. With a very specific use and programme, the proposal executed by Galnares is extremely interesting, incorporating a modern aesthetic strategy and response never before seen in the centre of Seville.

The premises, situated on the ground floor of a building between party walls, presented itself as a complicated intervention in advance owing to the very geometry of the space both in plan -an excessively narrow and elongated plot- and in the irregularity of the longitudinal section -which was cut by the hanging beams and structural buttresses of the existing building- resulting in an uneven space with different heights in each bay.



After carefully observing the project's original planimetry and the photographs of the finished intervention, we analyse and demonstrate the strategies that the modern architect José Galnares devised to execute such a unique piece of work.



If we consider the floor plan, the scheme that organises the space is clear, a functional programme in which the plot is segregated into two longitudinal strips: the service area and the public area. The first strip, in which the service spaces are articulated, contains the interior space of the bar, the catering equipment, the office, the kitchen and the toilet; the second strip, which is a little wider, is the leisure space for the customers (Fig. 1).

Having reviewed the remaining drawings made by Galnares, it is clear that the great interest of the proposal lies in the study of the sections of the project. As José María Jiménez Ramón mentions in his article, it is evident that the architect in this project understands the machinery as a fundamental element in his modern intention; in fact, the solution of the section responds primarily to the distributive and functional conjunction of the machines in relation to the workers and clients.[8]

This is why, focusing on the longitudinal section, we point out how, when faced with the problem of the excessive depth of the site and the different heights it presented, the architect took this condition as an opportunity to articulate the total volume into smaller spatial units, thus dynamising the total spatiality and establishing a unitary strategy in the intervention. To achieve this,

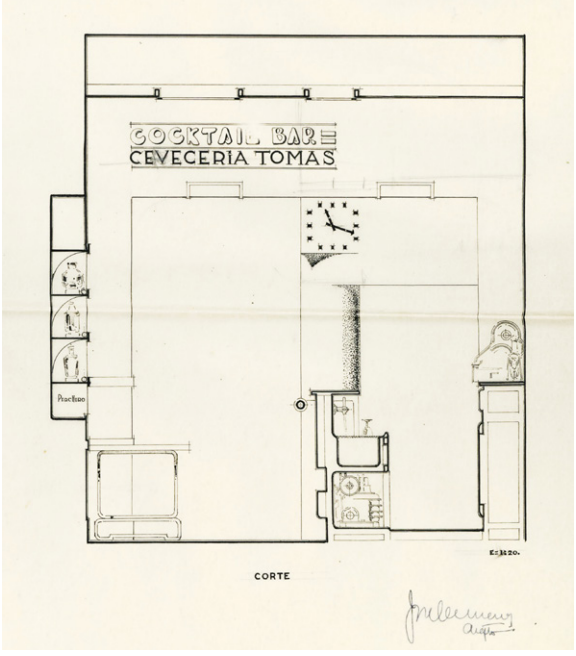

Figure 1. Plan of the project for the Tomás Alehouse at 102 Sierpes Street, commissioned by Tomás Galiana (1934). e 1:100. FIDAS Archive, JGS Fund, udo.JGS_IN0448.

Figure 2. Longitudinal section of the project for the Tomás Alehouse at 102 Calle Sierpes, commissioned by Tomás Galiana (1934). FIDAS Archive, JGS Fund, udo.JGS_IN0448.

Figure 3. Cross section of the project for the Tomás Alehouse at 102 Calle Sierpes commissioned by Tomás Galiana (1934). e 1:20. FIDAS Archive, JGS Fund, udo.JGS_IN0448.

the section is once again distributed into two zones: the bar area next to the main access from Calle Sierpes, and a smaller-scale area behind the impasse of the building's interior courtyard. With regard to the heights, the strategy is to align the height of the ceiling in the rear area, the patio window, the beams of the bar area and the lintel of the main entrance **(Fig. 2)**. And it is in these gestures that the mastery of the young Galnares becomes all the more evident, as he takes

advantage of the existing structural elements as details to integrate the design of his proposal. He strategically inserts curved walls, and design elements such as the clock or the placement of recessed luminaires under the hollow of the beams, which poetically reference the building's load-bearing structure.[9]

The rhythmic articulation of these spaces by means of the accentuated overhangs creates a surface in relief on the ceiling that the architect takes as if it were a new façade. Once again there is a canvas on which to incorporate elements that qualify and make the space attractive. Thus highlighting the expressionist nuance of his proposals, which is evident in the image of the detail on the ceiling in which the graphics of the name of the premises 'TOMÁS' take on a clear protagonism[10]; making it the icon of the intervention.

Returning to the floor plan drawing, we can see how Galnares pays particular attention to the configuration of the ceiling plan, not only by drawing its projection on the floor plan - thus corroborating how each element of the ceiling fits in with the design of the floor plan - but also by the graphics through the use of red lines, which in contrast with the black projection, refer to and accentuate the vital importance that the author gives to these elements in order to understand the interior design strategy in its entirety **(Fig. 1)**.

In this plan, the care taken in the graphic documentation is once again evident, with a surprising drawing of the cross-section at a scale of 1:20, unusual in the planimetry of Sevillian rationalism.[11] A magnificent drawing not only because of the careful design of the entire perimeter of the section and the functional study of the furniture it contains, but also because it was a graphically exquisite drawing in the hierarchical representation of lines, the catering equipment, the modern furniture, the curved walls, the signs and the clock **(Fig. 3).**

In short, on analysis of this refurbishment, we can appreciate how the Sevillian José Galnares - a decidedly modern architect - was able to take this renovation as an opportunity to skilfully express his knowledge of rationalist design. And it is these rationalist foundations that establish a common intervention strategy to functionally resolve the programme. In its brilliant execution, the special attention and, indeed, the design of the details stand out, whose purely modern imprint makes the intervention an exceptional example of a rationalist refurbishment of premises. The incorporation into the design of a certain expressionist nuance to these elements gives the intervention an attractive and suggestive aesthetic never before seen in Seville for this type of leisure space.

5. CONCLUSIONS

In this type of interior design renovation, due to its ephemeral natu re, it is extremely important to preserve the original project documentation. For this case study, the preservation of José Galnares's archive has been an effective tool for learning about rationalist interventions in the heart of Seville's historic centre.

9. Jimenez, "Los locales comerciales, una de las vías de introducción de la arquitectura moderna en nuestra ciudad," 74-96.

10. López, "El proyecto de construcción de la imagen de la arquitectura moderna 1925-1939 Andalucía, Margaret Michaelis."

11. Jimenez, "Los locales comerciales, una de las vías de introducción de la arquitectura moderna en nuestra ciudad," 74-96.

As we have been able to verify, the strategies of the solutions provided by José Galnares are of a high expressionist, plastic and aesthetic value. For this reason, his exterior and interior designs for commercial projects stood out in a Sevillian context of clear regionalist pre-eminence. Even more so, this interior and façade design proposal included graphics where European avant-garde influences can be appreciated.

Likewise, after analysing the work, we can note the outstanding role of our author as a professional architect, demonstrating his expertise in the suggestive design of his proposals. In addition to his extensive expertise in construction and modern materials, he adeptly executes intricate construction details that align with the concept of a rationalist project.

We note, in turn, the pioneering methodological proposal that Galnares used when it came to tackling the architectural project in its entirety at the beginning of the twentieth century, which remains valid today. Once the work has been executed, the aim is to find a good photographer in tune with modern aesthetics, capable of transmitting the values and concepts of this new architecture to the rest of the population through the subsequent publication of the work in magazines and specialised media.

The graphic production is of a high quality, not only because of the way in which the morphology of the project is represented, but also as a result of the graphic techniques used, where all the details of the modern furniture and machinery are drawn with particular skill and charisma.

In short, the Tomás Alehouse executed by José Galnares is a notable example of his professionalism and bold commitment to incorporating the new aesthetic in the city of Seville, a latent modern testimony of great quality that has disappeared from the urban scene today. ■

TIMELESS QUALITY IN A SOCIAL HOUSING ESTATE FOR ALL: THE TRANSFORMATION OF DOMESTIC SPACE AND LIFESTYLES IN OLIVAIS NORTE (1960S-2020S)

ZARA FERREIRA
CITUA, TÉCNICO – UNIVERSITY OF LISBON, PORTUGAL

ANA TOSTÕES
CITUA, TÉCNICO – UNIVERSITY OF LISBON, PORTUGAL

ABSTRACT

This work focuses on the architecture of domestic spaces in the Olivais Norte neighborhood (1959-1962), serving as a paradigmatic case in Lisbon's municipal response to housing shortages prevalent in the Portuguese capital during the latter half of the 20th century.

With the aim of fostering integration and mitigating the development of social ghettos, the neighbourhood's housing buildings were designed to accommodate four distinct socio-economic categories, bringing together individuals from different social backgrounds. This collaborative effort engaged economists, architects, engineers, sociologists, and anthropologists, leading to a series of projects that reveal significant experimentation by modern architects in responding to the challenges of "housing for the greatest number". This included a deliberate focus on designing domestic spaces to lifestyles of different social classes.

This paper seeks to identify the principal housing models within the Olivais Norte buildings, in their correlation with the socio-economic categories for which they were designed, and to map changes that have occurred after 60 years of use. The comparative analysis between the original design and current occupancy aims to assess the adaptability of the case studies to the evolving comfort needs over the past five decades.

This examination will be based on a comparative analysis of two surveys conducted on the case studies: one focusing on the original project, using primary source collection (architectural drawings, project descriptions and publications of the time) from archives and libraries, and another on the current occupancy, involving visits to selected residences, metric surveys, photographic documentation, redrawing of changes, and resident interviews.

The goal is to assess resilient and obsolete features to inform potential rehabilitation projects or providing insights for contemporary residential architectural endeavours.

The authors are grateful to the Foundation for Science and Technology (FCT) for its support through funding from the research unit CiTUA (10.54499/UIDB/05703/2020) and from a Doctoral Fellowship (SFRH/BD/115196/2016).

1. OLIVAIS NORTE: "THE FIRST TRULY MODERN LARGE-SCALE HOUSING PLAN IN LISBON"[1]

The severe housing shortage in Lisbon around the 1950s led the municipality to create offices dedicated to housing (GEU - Urban Studies Office in 1954, and GTH - Technical Department of Housing in 1960) and new housing programs, such as the one defined by decree-law no. 42454 (1959). This established that social housing should be distributed within four socioeconomic categories: 40% for the poorest families (category 1), 30% for category 2, 20% for category 3, and 10% for the wealthiest families (category 4).

Olivais Norte, designed by Guimarães Lobato, Sommer Ribeiro and Pedro Falcão e Cunha, between 1955 and 1959, was the first neighbourhood constructed within this new framework. Covering an area of 40 ha, it was planned to house 10.000 inhabitants in 2.500 dwellings.

Olivais Norte has been considered the first realisation in Lisbon of a large-scale housing plan designed in a truly modern way, because it broke with the traditional urban planning embodied by the street-block system, inaugurating the adoption of the Athens Charter in Lisbon: the urban structure was based on a rational occupation of the site marked by the isolated insertion of residential buildings, subject to the criteria of solar exposure and ventilation, in an open landscaped space. The circulation spaces formed a hierarchical system with differentiation between vehicular and pedestrian circulation networks, with a road layout independent of the buildings' orientation. Conceived as a neighbourhood unit, the facilities supporting the housing constituted a nucleus in a civic-commercial centre, in the middle of the cell. The school is located no more than 250 meters from the housing. The open space, treated as landscaped areas, represented a very generous portion, 62% of the total area.

Each team of architects designed building types for specific socioeconomic categories, with each type constructed multiple times throughout the plan: Abel Manta (b. 1928), Artur Pires Martins (1914-2000) with Cândido Palma de Melo (1922-2003), Nuno Teotónio Pereira (1922-2006) with António Pinto de Freitas (1925-2014) and Nuno Portas (b. 1934); Pedro Cid (1925-1983) with Fernando Torres (1922-2010); Braula Reis (1927-1989) with João Matoso; João Vasconcelos Esteves (1924-2014). The construction lots were sold to entities of social interest. This process allowed the neighbourhood to be defined by distinct social universes: a building for army officers could be next to one occupied by families relocated from shantytowns. This system contributed to the intended social mix for the neighbourhood, aiming to avoid the creation of social ghettos.

This endeavour produced several architectural solutions that addressed the modern concept of "housing for the greatest number", emphasizing the adaptation of domestic space to the varied needs and aspirations of different social groups. To address these concerns, interdisciplinary teams, including sociologists, anthropologists, historians, economists, architects, engineers, and landscape architects, collaborated to study different population

1. Leopoldo de Almeida, "Olivais-Norte, nota crítica," *Arquitectura*, n. 81 (1964): 12.

segments, employing scientific methods from the emerging social sciences of the 1960s to inform the design of domestic interiors.

2. MODERN INTERIORS FOR THE WEALTHIEST: RESISTANCE AND PERMANENCE

For the higher-income families, five parallel buildings were designed: four identical blocks designed by Pires Martins and Palma de Melo for category 3, and a single block designed by Abel Manta for category 4.

With a highly hierarchical occupation of the territory based on socioeconomic categories, these five blocks are situated near the civic-commercial centre and the school in the highest and most central area, oriented along Cartesian axes, reminiscent of an acropolis. Measuring approximately 70-80 meters in length, and with 8-11 floors, they have the most imposing presence in the neighbourhood. They epitomize the typical modern housing block, embodying rationalist principles: the plastic exaltation of vertical communications, wall-to-wall balconies, large windows, pilotis on a broad platform articulating access, the expressed modulation of the structure in the façades, and shared terraced roofs.

During the *Estado Novo* dictatorship (1933-1974), Portuguese society was divided between two extremes: a high-income social group that held power and a working-class, labor-intensive, or rural population that was extremely poor. These two realities are evident in the architectural design of the different socioeconomic strata for whom the Olivais residences were intended. Buildings for the higher-income categories included a clear differentiation between residents and service staff, as they were designed to include live-in maids, featuring two distinct access systems, from the building entrances leading to separate elevators, to the apartment entries. Interestingly, while the residents' access spaces are small, dimly lit halls designed for quick access and emphasizing home privacy over public encounters, the service doors and elevators are in spacious, well-lit, and ventilated areas. In the case of the buildings by Artur Pires Martins and Cândido Palma de Melo, these service accesses are aligned with horizontal exterior galleries facing the interior service areas. This setup aims to foster close relationships and mutual support among workers, while demonstrating the architects' concern for their wellbeing conditions.

This dichotomy extends into the interior of the dwelling, following the classification of housing into zones – privacy, reception, and service – that emerges throughout the progression of socioeconomic strata, influenced by the architectural conception of bourgeois housing of the nineteenth century. The main entrance aligns with a long corridor leading to the living room, dining room, and bedrooms, following a Babylonian logic of sequential spaces inherited from the past. The service entrance is connected to the kitchen, which is aligned with a laundry area, a room and bathroom for live-in maids, and the family bathrooms.

These apartments feature generous sizes (115 m^2 for 4-bedroom units and 145-130 m^2 for 5-bedroom units).All living rooms and bedrooms have

independent balconies (10-12 m²) equipped with sliding wooden shutters. They include built-in furniture integrated into the space design, and well-designed details that enhance the quality of the interior space, such as light and ventilation slits near the ceiling in the living room. Everything is orthogonal and functional, following a hierarchical logic of organization.

One of the few customizable elements in Abel Manta's residences is a sliding wooden door that connects the living room to the dining room, offering the flexibility to expand or enclose the social space. The structural modules, governed by room widths, could also allow some flexibility through the removal of partition walls. However, these dwellings have undergone minimal changes over the years, except for the enclosure of balconies, a widespread practice across all social classes in Portugal. Many of these apartments are still occupied by their original residents, typically elderly matriarchs, often over 90 years old, living alone in spacious homes with the assistance of maids and nurses. In this regard, common alterations include bathroom renovations, involving the replacement of bathtubs with showers for mobility reasons. The large service areas allowed for easy adaptation to the introduction of appliances not originally envisioned when the buildings were designed, such as washing machines. It is common to find decor reminiscent of the wealthier families of the 1960s, alongside modifications that have darkened their originally bright interiors: the closure of open spaces, covering surfaces with wallpaper and carpets, and heavy furniture from earlier eras.

In these prominent urban buildings, it's easy to understand how ownership significantly affects maintenance and transformation.. The Abel Manta building, appearing as a single volume, consists of two independent lots. One lot remains owned by the Social Services of the Armed Forces, restricting alterations by residents, but is mostly unoccupied. The same happens with two blocks of Artur Pires Martins and Palma de Melo. On the other lot, originally public property, the apartments were sold to the families that now manage the building through a condominium. There, while high occupancy is evident, each resident customized their home freely to the point of making the urban image of the building quite unrecognizable.

3. MODERN INTERIORS FOR THE POOREST: FLEXIBILITY AND TRANSFORMATION

Lower-income families were provided with nine building types designed by four architectural teams. Vasconcelos' housing complex includes two types of Y-shaped blocks for category 1, comprising nineteen buildings. Braula Reis and Matoso designed seven canal-like buildings along the streets, featuring three similar building types for category 1, differing in circulation with either a left-right system or a gallery. Cid and Torres designed two building types for category 2: one comprising four long buildings formed by the superposition of duplexes, with upper access via a gallery; the other consisting of five shorter row buildings formed by grouping three lots each. Teotónio Pereira, Pinto de Freitas and Portas' complex, intended for category 2, consists of six row buildings formed by aggregating four lots and five eight-floor towers.

These buildings feature a greater repetition of types and more varied orientations, dispersed around the periphery of the cell, integrated with the terrain's topography and vegetation. Except for the towers, all other buildings have four to five floors, avoiding the cost of elevators and fostering a closer-knit community. Due to low-income conditions, sedentary lifestyles, and cultural habits, it was thought that providing communal meeting spaces – both outdoor and indoor – as extensions of their homes would be valued by low-income residents. These spaces aimed to encourage social gatherings, interactions, and foster strong neighbourhood relations, seen as vital for their well-being.[2]

The towers designed by Teotónio Pereira, Freitas, and Portas exemplify this effort. Each tower is designed with a central access space on every floor, featuring a spacious, well-lit and airy living area. The floors are adorned with "Portuguese pavement," giving the sensation of being outdoors. Open balconies facing the garden allow residents to decorate with their own plants, while fixed benches on every level provide resting spots. A generously sized area ensures children can play safely, countering the isolation typical of tower buildings. In row buildings, the common space is located outdoors in a covered area at the back of a storage building, where it is common for residents to have barbecues. Combining art and architecture, each building received interventions from different artists in their common space, enhance the daily lives of residents and dignifying social housing.

Except for the towers, all buildings for categories 1 and 2 had fully open access points, at both entrances and mid-height windows along the circulation spaces. The aim was to create strong permeability between public and common areas, promote a healthy contact with nature, and foster encounters and mutual support among neighbours. The row buildings, like those by Braula Reis and Cid, extend this approach with aerial streets – horizontal circulation galleries –linking various volumes. Today, only one building in the neighbourhood retains its original openness. Due to the insecurity caused by the drug addiction epidemic in the 1980s and the common shift to condominium ownership, most buildings have closed all openings with doors and windows. There was also widespread city apprehension among rural migrants, and privacy and seclusion are valued across Portuguese society. This significantly altered communal living, aligning it with a broader contemporary desire for individualized lifestyles.

Indoors, different teams of architects prioritized different aspects to meet the reduced budget, with most of them opting either for the areas or the quality of finishes. Most of the dwellings are two-bedroom, ranging from 40-56m^2, and three-bedroom, ranging from 47-72m^2.

Affordable housing of the time focused on minimal areas, making living rooms multifunctional and often integrating kitchens. i Homemakers frequently rejected this open-space layout, preferring spacious and separate kitchens.[3] This preference was reflected in most Olivais Norte low-income dwellings. The kitchen and the living room, often of similar size, were separated by practical wood pass-through cabinets that provided storage and offered flexibility. The quality of interiors was a priority for most architects, not only through functional and minimalist layouts but also by introducing

exceptional wood details that remain in perfect condition today, including furniture, frames, handles, and finishes designed to promote good thermal and acoustic conditions. Architects also aimed to establish a connection with the outdoors and maximize natural light to enhance residents' well-being, evident in the placement of windows in almost every bathroom and in front of kitchen sinks. Contrary to apartments for wealthier families, the design of these apartments prioritized organic layouts, allowing residents the freedom to interpret their dwellings while fostering spatial fluidity and strong family communication. Balconies were often conceived as living spaces or connectors between different areas.

The original residents are now aging, and there is widespread turnover in occupancy. Since the neighbourhoods were established, illiteracy has

significantly declined from 33% in 1960 to 3% today. Following the democratization of higher education after the end of dictatorship in 1975, Portugal now boasts a higher percentage of young people with tertiary education than the European Union average. Social disparities have narrowed over recent decades, resulting in the emergence of a middle class. Nowadays, those who occupy homes originally designed for the lower categories are graduates in their 40s. Today, both men and women work, large families are rare, and there is a lack of neighbourhood, family, and social support. These dynamics are reflected in the use of domestic spaces: the main transformation documented in these houses is precisely the quest for the hyper-functionality in the living area, achieved through the opening of the kitchen and often converting one of the adjacent rooms into a remote workspace. The younger generations' preference for the "open space" concept represents a physical and symbolic support for a more open family sociability, domestic collaboration, and simultaneity of functions and needs, and a preference for forms that offer interactive conditions for viewing, listening and expression between household members. Thus, the functions of living, cooking, eating, cleaning, working and playing coexist in the same large room, shared between parents and children.

The need to update service spaces with new appliances in small homes reinforced the choice to combine spaces flexibly and enclose balconies. Despite today's more individualistic and hectic lifestyles, the importance of communal spaces, particularly post-Covid-19, is gaining prominence. These spaces meet increasingly valued needs for well-being, serving as extensions of home interiors for moments of solitude with morning coffee, virtual meetings, or for celebrating birthday parties.

4. ADAPTIVE REUSE FOR ALL

Today, Olivais Norte is highly esteemed for its accessibility to essential daily services and for its robust integration with healthy natural surroundings. The visited flats reveal a strong capacity for adaptation, and many of the original and recent residents show pride in the place they live and recognize its qualities.

Over the last three decades, the reuse and adaptation of interiors have been accessible to most of the original residents, who have transformed their homes to suit their tastes and needs. While some have improved, others have deteriorated due to the absence of collaboration with specialized professionals and the lack of regulations regarding interior alterations. Nevertheless, the neighbourhood is at a crucial moment that presents both risks and opportunities. The original residents are reaching the end of their lives, and the neighbourhood is starting to be occupied by younger generations. While some bring reinforced and updated knowledge about the history and quality of these buildings and strive to restore original solutions, acknowledging their functionality, aesthetic appeal, and heritage value, many other flats are purchased by real estate agencies that turn them into IKEA-style homes to sell at low costs, often destroying functional features and significantly degrading the comfort of these dwellings. A neighbourhood that was designed in a global and integrated

manner, serving the community, is being weakened by neoliberalism that allows for autonomous and individualistic action in "collective" housing.

There has never been an integrated renovation project within the neighbourhood, even if it is possible to find good renovation projects within some flats.[4] It's important to draw the attention of stakeholders to the quality of this collective project and housing buildings and provide qualified renovation proposals. On this matter, greater attention should be given to the buildings still owned by public entities and almost entirely unoccupied, which have a unique opportunity to develop a good global requalification project. This could serve as an example of public investment in solving the housing problems that are currently so complex in Portugal, while preserving heritage and adapting high-quality interiors to contemporary comfort. ■

ABSTRACT

Acknowledging the diversity of architectural and urban modernity's legacy implies examining, among other aspects, the particularities of migratory flows, educational processes, political situations, economic conditions, social characteristics, cultural encounters, or available resources that have defined its development in different latitudes.

Outside the conventional understanding of what constitutes modern architecture, there have been conditions that determine particular developments and outcomes, which not only form part of the most significant proportion of the built environment but also materialize processes of social adaptation and cultural hybridization, as defined by Néstor García Canclini, and that eventually lead to a critical interculturality, as Catherine Walsh has coined it, which recognizes the value of diversity.

Following Sébastien Marot's approaches to memory in architecture, in this session, rather than discussing outstanding examples of architecture, we are interested in analyses of projects, which at different scales, are a reference for alternative collective memories, especially in the Global South. With this in mind, we expect to exchange ideas about the heritage constituted by different forms of memory that materialize in modern projects and constitute references to identity, selected memories associated with events that might be conflictive and have impacted upon disciplinary production, such as migration flows, dictatorships, natural disasters, economic crises, processes en masse, drastic changes, dominant ideologies, gender perspectives, and hegemonic currents, among others. Due to the rejection of what they symbolize, some of these examples may need to be revised at their time or now.

The session is interested in comparing perspectives that allow for the evaluation of the conditions in which this 20th-century heritage is valued and preserved as an example of other Modernities. In this way, it is proposed that the session will be a critical discussion regarding works and projects that embody a polemic memory in architecture, the city, and the territory that might shed new light on the idea of identity and otherness in a global context.

#36

1. INTRODUCTION

The conception of modernity as a unitarian block has been amply discussed within academia and, in DoCoMoMo's context in the last decades. Most recent discussions about the content, role, and impact of the canon highlight that these issues are not exhausted. Debates on how to approach the tension between the conventional mainstream and the blind spots are at the core of what is considered otherness.

This session aims to contribute not only with new objects of study, but other references, perspectives, agendas, and interpretations, amongst others. Singularities of the alternative enable a range of possibilities for reflecting on the sameness and the otherness, for instance, discussing modern cultural assets as a conflictive heritage created in different contexts of the Global South. Therefore, we will join ongoing dialogues on the valuation of active memory, identity construction, cultural hybridity, interculturality, otherness, and diversity. We expect to consider documentation, identification, valuation, preservation, and social appropriation issues.

2. OTHER MODERNITIES

Other modernities have been part of the scholarly discussion. Once a validation criterion is set, it defines what is included as much as what is excluded. The canon of historiography reflects it, but we argue that it has simply been reduced to a mutual aesthetic, temporary, geographic or temporal understanding of what constitutes modern architecture.

As evidenced by Ana Esteban Maluenda's review of texts and images from multiple editions of the canonical historiography of modern architecture,[1] including Hitchcock and Johnson, Sartoris, Pevsner, Giedion, Benevolent, Curtis, and Frampton, this indicates a modernity that is homogeneous and predominantly of European origin. In contrast, Curtis's initial recognition of the understanding of works produced in different latitudes and with different temporalities and resources, incorporating elements of connection between the universal and the singular, stands out. A case in point might be the salient examples of modernity in what can be considered an unconventional context, such as in the National School of Arts in the outskirts of Havana, Cuba. **(Fig 1)**

Indeed, Latin America, Africa, and Asia have traditionally been outside the canon. We have considered encouraging a discussion based on interpretations by various authors who report on those conditions that enable us to appreciate other Modernities.

Shmuel Noah Eisenstadt, in Multiple Modernities[2], is perhaps one that highlights how classical sociological studies of Marx, Durkheim, and Weber define a canonical argument reflected in Anthony Giddens' statement in 1990: "Modernity refers to the modes of life or social organization that emerged in Europe from the seventeenth century, and that later spread worldwide from its influence."[3] This interpretation implies reducing the Global South to a helpless vessel passively receiving European influences. Understanding cultural processes is absurd, so the author questions the

homogenizing and hegemonic condition of a unique and authentic modernity. For this reason, it resorts to identifying multiple conditions and procedures of modernity that can even be discordant.

On the other hand, Göran Therborn, in Entangled Modernities,[4] calls for recognition of the contrasts between past and future in modernity as that point of articulation. However, it emphasizes the implication of understanding the different tensions that do not coincide and that, in practice, have clearly failed, so again, a plural and intersecting denomination is resorted to. In the same sense, Arturo Escobar[5] points out the disillusionment of some principles proposed in modernity that, although laudable, have not been fully fulfilled, and so he proposes the notion of transmodernity based on interculturality.

Under the title *Other modernisms*, the introduction to DoCoMoMo journal's identifies the 9th DoCoMoMo conference (2006) as a "cycle of thinking on the content and coherence of the modern movements architecture".[6] The publication also compiles a selection of registers of mainly European countries, some of the traditional American ones, a few from Asian and Oceania, and no African examples of otherness as discussed. Perhaps the openness to a diverse and deeper understanding of the sense of modernity apart from canonical art history allows for a wider comprehension of alternative approaches to the sameness and otherness of modernity.

Thus, this theoretical framework enriches former discussions by endorsing diverse references and perspectives of modernity as a multiple and entangled phenomenon that conditions the sense of otherness.

3. ARCHITECTURE AS A CULTURAL FACT

Studies that expressly mention processes that acknowledge the influence of other modern architectural currents are still anticipated. Here, we propose two routes. On the one hand, through critical interculturality, following what Catherine Walsh proposed,

> *It makes visible different ways of being, living, and knowing and seeks the development and creation of understandings and conditions that not only articulate and make differences in dialogue within a framework of legitimacy, dignity, equality, equity, and respect but also – at the same time – encourage the creation of "other" ways of thinking, being, learning, teaching, teaching, and others. Dreaming and living that cross-border*[7]

In other words, through the construction of parallels and dialogues between different people, it recognizes the value of the other in their diversity as a peer, affirming the possibility of coexistence. On the other hand, the processes of cultural hybridization, as initially proposed by Néstor García Canclini,[8] makes visible mutual influences that create new forms and authentic cultural expressions. In relation to the discussion of other modernities, which are out of the centre due to the diversity and complexity

of their context, there is a pivotal understanding of the condition of the built environment regarding its possibilities of making an imprint and generating the condition of legacy. From this point of view, the otherness of modernity could be determined by migration flows, educational processes, gender roles and cultural encounters. Within diverse contexts, the outcome might not fit under global logic or could contradict common knowledge about what constitutes a valuable legacy. A common image that comes to mind in this sense, is the Central Library of the UNAM, Mexico. **(Fig 2)**

Accordingly, Sébastien Marot advocated for a richer understanding of how architecture conditions and recalls its context: "architecture as an instrument of memory, memory as a material, or as a dimension of architecture".[9] In some cases, agendas and interpretations of what materialized through architecture under political situations, economic conditions, social characteristics, or available resources could condition how the memory and identity implied in the architecture is produced and historically understood. In this case, otherness can be taken from what has been left outside or discarded, what has been resignified, or what is examined with all its own complexity and contradiction.

4. HOMOGENIZATION VERSUS CULTURAL DIVERSITY

As has been argued, it is from the very core of architectural modernity that the idea of describing what was happening as a unitary movement, exportable to other latitudes, was born. For example, Hitchcock and Johnson, when holding the exhibition of modern architecture in 1932 at the MOMA, entitled it *The International Style* and asserted that: "a single modern style has already been born... This contemporary style that exists throughout the world is unitary and inclusive, not fragmented or contradictory".[10] At present, there is agreement that this exhibition brought together a wide range of works that were not necessarily governed by the set precepts. On the contrary, what was presented there, and we can extend it to modernity itself, was rather a dissimilar set of projects, which confirmed the cultural diversity existing in architectural production: "the security and even arrogance with which the existence of an international style was then affirmed, was accompanied by an inability to enclose... an architectural production that far exceeded the narrow molds of such a style".[11]

Thus, the historiography of modern architecture has constantly had the challenge of overcoming the limitation posed by modernity itself when trying to describe architectural production as a unitary formal system. Part of the historiography has faced this challenge through specific interpretations that delve into certain conditions of the countries located, preferably in the Global South.

The Other Modernities that this session proposes to highlight are those that have been influenced by problems of cultural conflict and political violence, which responded from a formal and spatial diversity. The precarious conditions of the societies of the South have led to the existence of multiple cultural and political conflicts in these states, some

derived from the condition of colonies (Africa) or from weak democracies that have seen dictatorships position themselves with the brutality of their violent practices (Latin America and Eastern European countries). In both cases, architectural modernity has had to adapt to or modify the supposed official canon.

This change has led to diverse, speculative practices carrying a sense of memory directly associated with the political and social conditions in

which they are framed. Thus, the identity of these works is defined by their capacity for cultural adaptation, achieved through the development of their spatiality, the generation of climate control devices, and the integration of the arts, to name just a few.

Modern architectures have evolved in these latitudes with greater freedom and design speculation, as they could work with the inclusion of local cultural variables for their adaptation and relevance for their population. The case of African colonies is of particular interest in this context. However, it can also be observed in Latin American countries where local artistic manifestations were inserted in works of architecture, for example, through murals that represented activities typical of their towns. On the other hand, vernacular structural systems and constructive materials were included, such as mud, handmade brick, native woods, and local stones.

5. MEMORY, POLITICS AND CONFLICT

As has already been anticipated, many cases of the legacy of modern architecture are related to countries where political conflicts spread due to the instability and weakness of governments and the emergence of state violence. In these contexts, modern architecture was the scene of conflict. Indeed, these spaces were originally created with certain aspirations but were later contradictorily transformed into places where acts of violence and traumatic experiences occurred.

The conditions in which architecture has resisted uses so dissimilar, even contradictory to their origins, question the capacity of spaces and structures to submit to these uses and represent them, transforming themselves into sites of memory that recognize and commemorate them. These questions are intended to be addressed broadly by the discipline, as Schindel and Colombo have stated: "Geographers, space theorists, and architects are for their part becoming more and more concerned with the study of contemporary cartographies and topographies of exclusion, exception and state violence, and are at the same time paying more attention to the spatial manifestations of trauma and memory".[12]

In their initial expression, modern architectures aimed to address the prevailing conditions, responding to the cultural, social, and functional requirements for a society concerned with human beings, their well-being, and their physical and moral development. Contradictory to the assumption of dictatorial governments, these same spaces, given their size, were used as centres for the exercise of state violence, many of them becoming detention and torture centres, scenes of atrocities. Thus, public buildings, stadiums, schools, and hospitals were occupied for purposes opposed to their original vocation: "Space is assumed here not to be a static and fixed support of the historical events, nor a naturally given, neutral dimension but a social product and a productive force. Therefore, the process by which violence reconfigures space cannot be considered unidirectional".[13]

An example of this is the Venceremos Popular Resort, which was created as a vacation retreat for workers and used for such purposes

12. Estela Schindel and Pamela Colombo, *Space and the Memories of Violence* (London: Palgrave Macmillan UK, 2014), 2, https://doi.org/10.1057/9781137380913.

13. Schindel and Colombo, 4.

between 1971 and 1973. Subsequently, between 1973-1976, it was used as a political prison camp during the military coup in Chile, where detainees were not subject to a judicial process and remained under the supervision of the Navy. It is currently a site of memory, declared by the Chilean state as a national heritage site **(Fig 3)**.[14]

6. CONCLUSIONS

As a point of coincidence, in a similar time frame, some of these diverse manifestations and geographical heterogeneity have their origins in conflicting events. These have led to an adaptation and variation of the canon established, apparently by modernity, introducing local cultural variables that enriched the proposals of the Global South. Thus, modernity as a unitary system was crossed by innovative proposals encompassing the project's different conditions in its spatiality, materiality, structure, and program. The local culture assumed these architectures to represent the specific aspirations of the places where they were produced.

Thus, seeing these Other Modernities implies openness to new perspectives, cultural sensitivity, and consideration of inclusive and sustainable solutions. Interculturality fosters the creation of spaces that reflect each community's identity and cultural heritage, promoting social cohesion and intercultural understanding. Historical revisions allow for a necessary perspective to resignify, include and validate more references, resources and interpretations. In this way, a new heritage is produced, embodied in memory. It is no longer the monumental or historical heritage that is established in a society commemorating heroic deeds. It also involves acknowledging traumatic events, digesting and transforming spaces of violence, torture, or conflict into a part of our cultural heritage through these architectures.

On the other hand, memorialization processes give way to a new field of critical discussion: "Space contains and accumulates several layers of memories proceeding from different historical times".[15]

Thus, heritage is understood in its dynamic condition, where various actions allow conflicting experiences to be valued, representing a society in constant search of its history. The contribution from the changes that occurred in cultural creation, social practices, and material production, as well as in the representation of the state, among others, leads us precisely to consider the particularities of each territory, landscape, city, and society, where the Global South provides us with a source of valuable examples of adaptation and appropriation through these Other Modernities. ■

MULTI-STOREY BUILDINGS IN LIMA (1939-1970) A PERUVIAN GENEALOGY OF A MODERN TYPE

JAVIER ATOCHE INTILI
PHD ARCHITECT

ABSTRACT

This paper aims to highlight significant multi-storey buildings in Lima's historic centre, designed by either European or local architects during the last century. Following the 1930s, multi-storey construction in Lima was driven by earthquake reconstruction (1940) and urban planning regulations (1946) that promoted densification in the historic area. European architects played a key role in the introduction of vertical architecture. Foreign involvement in Lima's modernisation was influenced by the Good Neighbour Policy (1933-1945), which took advantage of the historical links between Europe and Latin America. This facilitated exchanges between the International Congresses of Modern Architecture (or CIAM, as it is otherwise known) members exiled during the Second World War and Peruvian intellectuals educated in Western countries, thus strengthening inter-American relations (Atoche Intili, 2023). In the last century, US-Latin American relations went through three phases that influenced architectural trends (Liernur, 2002). Lima's multi-storey buildings embody a hybridisation of local Peruvian culture and European modernist influences, shaped by the government's economic and political strategies for the capital. This historical fusion remains a compelling but little-known narrative that deserves to be preserved as a testament to Lima's architectural evolution and cultural exchange.

1. INTRODUCTION

Since the beginning of the modern era, the history of Latin America has been marked by close cultural ties with the Western world. According to the Peruvian sociologist Aníbal Quijano, in Peru the European cultural hegemony established at that time favoured the continuity of privileged relations with certain countries throughout the 20th century. Such relations included economic exchanges with European countries in the first third of the century and political influence from the United States after the Second World War. These exchanges were strengthened by the presence of European intellectuals in the Andean country throughout the 20th century, who influenced the urban and architectural development of Lima and facilitated the spread of new types of buildings, such as multi-storey buildings.

2. FOREIGN REFERENCES AND THE IMPORTATION OF A TYPE

The Argentine historian Ramón Gutiérrez identifies the European cultural transfers of the first third of the century and the growing North American presence since the Second World War as the main external influences on Latin American architecture in the last century[1].

It is of particular interest that this shift in the hegemonic centre from Europe to the USA involved European intellectuals who emigrated to North and South America. This was the case for several European architects, such as the German Paul Lester Wiener, the Spanish Josep Lluís Sert and the Austrian Richard Neutra. Wiener and Sert, who were the founders of Town Planning Associates, offered their professional services to the Corporación Nacional del Santa for the Plan Piloto de Chimbote (1947-1948), a planned settlement for 40,000 inhabitants on the north coast of Peru. Sert became a consultant to the Oficina Nacional de Planeamiento y Urbanismo (The National Office of Planning and Urbanism, as it is known in English) during the development of the Plan Piloto de Lima (1947-1949), an application of the first phase of the Regulatory Plan for the Peruvian capital[2]. In a lecture entitled Metropolitan Future of a City with a Great Historical Heritage (Lima, 1945), Neutra developed the urbanist ideas expressed by the CIAM members and applied them to the historical context of Lima[3]. The reception of these designers in Lima society was influenced by the foreign policy of the United States of America (Good Neighbour Policy, 1933-1945).

The spread of multi-storey buildings in Peru was facilitated by a series of articles published by Fernando Belaúnde Terry in the early years of *El Arquitecto Peruano* magazine[4], which also highlighted prominent European and American precedents. Among these influential models, notable for their vertical development and contextual dialogue, is the Ministerio da Educação e Saúde Pública (Affonso Reidy et al, advised by Le Corbusier, Rio de Janeiro, 1937-1943), widely publicised in the Peruvian media. In this Brazilian project, the main south elevations were characterised by a full-height curtain wall and the north façade was protected by fibre cement sunshades.

El Arquitecto Peruano was also active in the modernisation and expansion of the Peruvian capital through urban planning and public housing,

3. "La visita di Richard J. Neutra", *El Arquitecto Peruano*, Lima, September 1945.

4. Fernando Isaac Sergio Marcelo Marcos Belaúnde Terry (Lima 1912- 2012). A key figure in the development of political and professional relations between Peru, the United States of America and Europe in the 20th century. He founded and directed until 1933 *El Arquitecto Peruano*, a Peruvian magazine specialising in urban planning, architecture, construction and interior design, published from 1937 to 1969 and 1977.

especially after the Peruvian census and the Lima earthquake of 1940: on 24 May, a seismic movement measuring 8.2 on the Richter scale was recorded under the Peruvian central coast, the strongest in the twentieth century. The epicentre was 120 kilometres north-east of Lima, affecting the city and other smaller towns along the coast, such as Callao, Miraflores and Chorrillos.

The spread of multi-storey buildings in Lima was not only driven by foreign projects highlighted in specialist publications or supported by CIAM members throughout the Americas. The contributions of European architects working in Peru during the 20th century - such as the Germans Werner Benno Lang and Paul Linder, the Italians Gianfelice Fogliani and Mario Bianco, the Swiss Theodor Cron and Paolo Mariotta - were crucial in introducing this architectural type to Lima. Following on from these influential examples, both foreign and local, Lima's buildings gradually freed themselves not only from historical references but also from viceregal influences[5].

To gain a deeper insight into the introduction of multi-storey buildings, it is important to mention projects by European architects in Lima. Casa Gildemeister (Werner Benno Lange, 1928-1930) is an early example of a Peruvian multi-storey building in the Art Deco style, designed as the headquarters of a trading company founded by a German family. Its unprecedented height of six storeys anticipated the surge in new construction in Lima by approximately a decade. The Edificio Irma (Gianfelice Fogliani, 1946-1948) was one of the first multi-storey buildings to be built for residential purposes in accordance with the 1946 urban planning regulations. Meanwhile, Edificio Arnodi (Paul Linder, 1950) exemplifies the coexistence of traditional elements within a vertical structure, featuring apartments in a then-new horizontal ownership format.

3. FROM THE EXALTATION OF LOCAL CULTURE AND TRADITIONS TO THE SEARCH FOR A NEW SYNTHESIS

According to the Argentine historian Jorge Francisco Liernur, relations between the United States and Latin American countries in the 20th century were characterised by three phases: first, the rejection of the American model by exalting local culture and traditions; then, imitation as a means of competing and overcoming foreign influences; and finally, the search for a new synthesis[6]. These three phases are evident in the significant number of multi-storey buildings constructed in Lima between the late 1930s and the 1960s and regulated since 1949 by the Plan Piloto de Lima[7].

The exaltation of local culture and traditions in architecture, the first phase in the relationship between North and South America, is apparent in numerous Peruvian buildings such as the Edificio Rizo Patrón (Enrique Seoane, Luis Solimano, Lima, 1939-1940). The tension between culture and civilisation is reflected in its architectural language, which is rich in traditional references. Enrique Seoane, Peru's most prolific architect of multi-storey buildings, contributed to this eclectic neo-colonial style eight-storey building. It features a symmetrical composition of base, body and crown elements, with a prominent triple-height neo-baroque doorway accentuating access to the

commercial spaces. The reinforced concrete frame is concealed by a compact volumetric design characterised by vertically oriented windows, revealing the construction system mainly through the floor plan.

Imitation as a competitive strategy to overcome foreign influences, characteristic of the second phase of US-Latin American relations, was facilitated in Peru by efforts to promote modern culture. These initiatives, led by architecture students from the Escuela Nacional de Ingenieros (The National School of Architects, as it is known in English) (1945-1946) and members of the Agrupación Espacio (a group comprised of architects, artists and intellectuals in the period of cultural renewal) (1947-1955), culminated in significant achievements such as the recognition of the Edificio Guzmán Blanco (Manuel Villarán, 1952) with the Chavín Prize from the Peruvian Ministry of Public Education[8]. This building, supported on pilotis, had a reinforced concrete structure, balcony frames, and full-height glazing and was a departure from the classical tripartite elevations that influenced subsequent buildings in Lima, as documented in the New York Museum of Modern Art's catalogue of Latin American Architecture Since 1945[9].

The section of the MoMA catalogue entitled 'Urban Façades' highlighted two important Peruvian multi-storey buildings that were the forerunners of many future projects. The first, Edificio Ostolaza (Enrique Seoane, 1951-1953), for which Seoane received the Chavín Prize in 1953, is a corner solution with a two-storey base and blocks of apartments and offices integrated into the street pattern. Elements such as volumetric division, asymmetry and moucharabies were repeated in later buildings such as the Edificio de la Compañía de Seguros Atlas (José Alvarez Calderón, Walter Weberhofer, 1953-1955) and the Galerías Comerciales Mogollón (Raúl Morey, 1958).

The Edificio Radio El Sol (Luis Miró Quesada, 1953 - 1954) is the second Peruvian example cited in the MoMA catalogue. Like Ostolaza, Radio El Sol won its architect the Chavín Prize in 1954. The building's corner solution, a reinforced concrete frame with projecting elements on both streets, is one of the earliest examples of a fully curtain-walled façade in Lima. This technological innovation gives the building the appearance of a glazed parallelepiped supported on pilotis. This architectural line, characterised by the extensive use of glass in its facades, also includes the Edificio Nyci (Enrique Seoane, 1956), a composition of base, tower and opaque prism with vertical circulation, and the Edificio Seguros El Sol (Enrique Seoane, 1956 - 1958), a tower on a base covered with a mixture of traditional (brick) and modern materials, such as glass, plastic, and aluminium.

The spread of new construction technologies and materials in the 1950s was led by multi-storey buildings of European design. Examples include Compañía de Seguros Peruano-Suiza (Theodor Cron, 1952-1956), which pioneered open-plan layouts and aluminium frames; Hotel Savoy (Mario Bianco, 1954-1957), which integrated parking between the basement and the tower; and Compañía de Seguros La Colmena (Paolo Mariotta, 1958-1961), notable for its steel structure and aluminium cladding. These innovations became the hallmarks of later multi-storey buildings.

8. The Peruvian laws of 1942 and 1947 recognised the diverse scientific and humanistic disciplines as contributors to the country's development, and consequently began to promote their production, especially with the creation of an architectural prize, called the Chavín Prize, which awarded the winning authors monetarily. See Congreso de la República del Perú, 'Ley N° 9614', Archivo Digital de la Legislación Peruana (30 September 1942); 'Ley N° 10869', Ibid. (31 March 1947); 'Premio de Arquitectura Chavín: espíritu y realidad', Dimensión Arquitectónica (1958).

9. Catalogue of the homonymous exhibition at the Museum of Modern Art, curated by Henry-Russell Hitchcock, organized in New York between 23 November 1955 and 19 February 1956. Henry-Russell Hitchcock, *Latin American Architecture since 1945,* New York, Museum of Modern Art, 1955.

A synthesis between internal culture and external civilisation, which characterised the third phase of American relations, found its first examples in two high-rise buildings in Lima. The aesthetic experimentation of this phase, as seen in the structural integration of facades such as the Edificio Ostolaza and the extensive use of curtain walls such as the Edificio Radio El Sol, culminated in proposals such as the Banco Comercial and the Centro Cívico y Comercial de Lima.

Banco Comercial (Enrique Seoane, 1962-1963) was a private investment initiative for the administrative headquarters of a local bank. The base, clad in ceramics reminiscent of pre-Hispanic textile patterns, consisted of two volumes of different heights, in harmony with the surrounding buildings. Above, a fully glazed monolith asserted the bank's presence on the Lima skyline. The interplay between different materials, the progression of the volumes, the solidity of the base and the transparency of the tower all work together to blend the internal cultural heritage and the external technological influences. Described in *El Arquitecto Peruano* as 'the new expression of an old language', the Banco Comercial symbolises this synthesis.

The Centro Cívico y Comercial de Lima (Adolfo Córdova et al, Lima, 1966-1970), built on the site of a former penitentiary, was the result of a design competition launched during the administration of President Fernando Belaúnde Terry (1963-1968). Envisioned in the 1949 Plan Piloto de Lima by the Oficina Nacional de Planeamiento y Urbanismo, the complex was intended to link the established urban centre with the expansion areas of the 20th century. Selected from several Brutalist designs, the proposal maximised the structural and expressive potential of reinforced concrete, evident in exposed materials, expansive spans and cantilevered structures. The monumental complex, which resembles a contemporary archaeological site like Puruchuco, included a 33-storey tower - the tallest in the city at the time - housing offices, an auditorium and ancillary services.

4. MULTI-STOREY BUILDINGS: LIMA'S MODERN VOCATION

Multi-storey buildings became prominent in Lima from the 1930s until the late 1960s. In the 1940s, the need to rebuild after the earthquake and to comply with Peruvian urban planning regulations encouraged their proliferation in Lima's historic centre. European architects who immigrated to Peru played a crucial role in the introduction of these structures, as evidenced by early examples such as the Edificio Gildemesiter, Edificio Irma and Edificio Arnodi. The reception of these designers and their proposals for the urban development of the city by Lima society was influenced by the foreign policy of the United States of America and the activities of CIAM members in Peru. The dissemination of multi-storey buildings in Peru was facilitated by a series of articles published in the magazine *El Arquitecto Peruano*.

Their architectural merit was recognised by institutions such as the Peruvian Ministry of Public Education, with multi-storey buildings dominating the early editions of the Chavín Prize. Notable winners included the aforementioned Edificio Ostolaza and the Edificio Radio El Sol. These

Peruvian examples received international recognition and were included in exhibitions at MoMA, highlighting the quality and diversity of Latin American architecture between 1945 and 1955. After a period in which such buildings were considered to be in fashion and received widespread recognition of their architectural qualities, these buildings were guiltily forgotten, often subject to shoddy renovation or, worse still, demolition or abandonment.

The uniqueness of Lima's multi-storey buildings lies in the fact that they are the result of a new language or identity that the architects, sensitive to the contexts in which they worked, have created. They symbolise the Peruvian government's economic and political ambitions for its capital. They stand as significant architectural statements, advocating for their preservation as cultural heritage for future generations[10]. ■

Javier Atoche Intili (Lima, 1977) is a registered architect in Peru (2003) and Italy (2008), with an office in Brescia. He is a specialist in both monument restoration (2008) and architectural composition (2014), having received his Doctorate in History of Architecture at the Sapienza Università di Roma in cotutelle de thèse with the Università della Svizzera italiana (2021). His research was awarded the Premio Enrico Guidoni fourth edition, the Premio Letterario "La Calcina - John Ruskin" Scrivere di architettura second edition (2021) and was published as Lima la Moderna (DOM Publishers, Steinhäuser Verlag, 2023).

MEMORY, LEGACY AND IDENTITY: MODERN HERITAGE IN ANGOLA AND MOZAMBIQUE

ANA MAGALHÃES
CITAD | UNIVERSIDADE LUSÍADA

ABSTRACT

The geo-political context following the WWII was marked by the decolonization of African and Asian territories that had historically been dominated by European states. On the eve of the independence of the new countries, the actions of the colonizing states also changed. It's important to highlight the relationship between the aesthetic project of the Modern Movement, and the modernization of these overseas territories. If, on the one hand, these territories functioned as laboratories for the modern project, on the other, we must consider that the very idea of otherness, of a cultural, geographical or social nature, allowed the integration of other identity parameters. During the two decades following the end of the WWII, two movements of absorption and transformation took place simultaneously: on the one hand, the spectrum of the Modern Movement as a doctrine is broadened on a large scale and, on the other hand, the dogmatism of the modern vocabulary allows itself to be *orientalized* by the different cultures.

In Angola and Mozambique, former Portuguese colonies, architectural production can be understood under the sign of flow and exchange. This production manifests itself above all in the adoption of a formal vocabulary whose dominant references are its affiliation with Corbusian grammar, Brazilian plasticity and, in a broader sense, the modern response to the tropical climate. This article aims to analyze two exemplary works of architectural heritage from the Modern Movement in these two African countries that allow us to question the boundary between memory and identity. In 2008, the controversy surrounding the demolition of the Kinaxixe Market in the center of Luanda, highlighted the need to reflect on the value and identity of the modern heritage built in the former Portuguese colonies. Almost fifty years after the independence of Angola and Mozambique, identity and heritage are still sensitive issues.

1. INTRODUCTION

The geo-political context following the World War II determined a new social and economic order. The period was marked by the successive decolonization of African and Asian territories that had historically been dominated by several European states. During the second half of the 1940s and throughout the 1950s, on the eve of the independence of the new countries, the actions of the colonizing states also changed. In this context, it is important to highlight the relationship between the aesthetic project of the Modern Movement, understood in the Western sense, and the modernization of these overseas territories, whether African or Asian. If, on the one hand, these territories functioned as laboratories for the modern project, on the other, we must consider that the very idea of otherness, of a cultural, geographical or social nature, allowed the integration of other identity parameters. As Tom Avermaete emphasised "architects attempted to engage in their projects on colonial ground with the local conditions by synthesising the way of living of the colonised (...) and the project of modernisation into a new and 'other' modernism. The experiments of modern architects in the so-called colonial 'laboratories' therefore played an important role in the critical revision of the modernism and the emergence of post-modernism within architectural discourse.[1]

Following the end of the WWII, two movements of transmission, absorption and transformation took place simultaneously. On the one hand, associated with the growing modernization of the new states, the spectrum of the Modern Movement as a doctrine, or more significantly as imagery, is broadened on a large scale and, on the other hand, the dogmatism of the modern vocabulary becomes more flexible and allows itself to be *orientalized* by the different cultures in which it operates. Interest in architectural culture outside the "Western" circle takes on new contours. The magazine *Architecture d'Aujourd'hui*, for example, has a number of thematic publications that report on the miscegenation of the modern model in other geographical contexts, of which we can highlight the issues entitled "Constructions en Pays Chauds"[2] with works designed across the broad spectrum of tropical geography or "Afrique Noire"[3], especially dedicated to French-speaking African countries.

The question, as William Curtis (1999) explains, is to understand what should be kept from the original prototypes and what can be transformed according to other climates, new cultures, beliefs, construction techniques and architectural traditions: "(...) the two decades after the Second World War were characterized by a far greater diversity within the modern movement in its originating centers, and by a higher valuation of the indigenous, the variable and the regional. The planarity of the International Style gave way to a more sculptural and robust form of expression in which bare brick and concrete, texture façades and the density of walls played a greater role. The broadening of the aesthetic spectrum permitted new alignments with the vernacular and the arcaic and helped to simulate fresh readings and interpretation of local identities."[4]

As the modernization of developing countries takes place during the post-war period, the vocabularies they receive are no longer those based

#36

on the founding models of the Modern Movement, but models in which the absorption of other cultures is already evident. One of the paradigmatic cases is Le Corbusier's work in India, where, while the architect remains faithful to his doctrine and lexicon, but, at the same time, he clearly seeks to get closer to Indian culture and identity. The influence of these works thus reaches not only the Indian territories but also the centers of origin. What we witness is a large-scale dissemination in two directions: the model that migrates and the migrated model that returns.

2. MODERN ARCHITECTURE IN THE TROPICS

Most former African or Asian colonies are located in tropical climate zones. The concept of tropical architecture may be read in various ways. In its usual definition, it means an architecture that is fit for the tropical climate, where the building is designed by observing the climate's and the site's specific conditions. Therefore, it takes into account objective criteria, such as location, space and programme organisation in accordance with the best exposure to the sunlight or the winds, using fixed or mobile devices for shade or soil and roof sealants in accordance with the rainfall.

As a general rule, the formal language of the Modern Movement's architecture, particularly through the Corbusian work, as well as the Latin-American architecture disseminated during the second post-war, has easily and enthusiastically incorporated this new vocabulary applied to the specific conditions of the response to the tropical climate. In addition to the nature of a construction based on scientific parameters, tropical architecture acquires an aesthetic meaning.

What we see, quite often, is a phenomenon of "tropicalization" of the architectural language in and outside the tropics, where the built work sometimes obeys rather aesthetic criteria than strict science. But, while this "tropicalization" effect may fall within the framework of the global mass influence and homogenization of modern architecture during this period, one may see, at the same time, a convergence on local cultures and identities through a reinterpretation of native elements and traditional techniques, the outcome of which is, in its turn, also disseminated on a large scale.

At the same time, the meaning of tropical architecture also observes readings of an ideological, or even political, nature. The Indian Prime Minister Jawaharlal Nehru, for instance, who had invited a large international team led by Le Corbusier to design Chandigarh, the future capital of the Punjab, more than upholding modern architecture, would rather use the term tropical architecture, aiming at the specific conditions of the place, the society and the climate, and defined it as the antithesis of colonial architecture[5].

As a general rule, immediately after the Second World War, the agendas of the largest colonising powers placed their wagers, through their overseas urban planning offices, on public infrastructures investment policies, and at the same time, on a specific architecture for the tropics (of which the studies carried out by Maxwell Fry (1899-1978) and J. Drew (1911-1996)[6] or the Architectural Association's pioneering course on Tropical Architecture

5. Vandana Baweja, "A Pre-history of Green Architecture: Otto Kenigsberger and the tropical architecture. From princely Mysore to post-colonial London." (PhD diss., University of Michigan, 2008), 119-120.

6. Maxwell Fry, and Jane Drew, *Tropical Architecture in Dry and Humid Zones*. (London: William Clowes and Sons, 1964).

are good examples). It is interesting to see that, in spite of the substantial ideological differences between the European States, their investment programmes had a similar template, were it under a neo-colonial viewpoint, as in the case of democratic states such as France or England, but also in the framework of a colonial incentive, as in the case of Portugal.[7]

3. ARCHITECTURE IN ANGOLA AND MOZAMBIQUE AS A MODERN LABORATORY

After World War II, when Portugal was still living under a dictatorship, anachronistically valuing its empire and its colonies, a number of young architects went to Angola and Mozambique, former Portuguese colonies, and affirmed a modernity that was far from the State-sanctioned architectural models. Such modernity was translated into freedom in a firmer appropriation of the modern movement codes in an international meaning.

Regardless of the specific circumstances of those two African territories and the individual interpretations of the authors, it is possible to observe a common denominator in the developed works and assert an identity belonging to the various genealogies of the models conveyed by the Modern Movement. Such identity is clearly shown in the adoption of a formal and spatial vocabulary composed of a combination of invariable features, especially in a remarkable absorption of the models conveyed by Le Corbusier's work and doctrine seasoned with the lexicon and plasticity of Brazilian modern architecture.

For these architects the chance to build in the African territory was the ideal laboratory, not only as to the more orthodox or more hybrid interpretation of the modern vocabulary, but also as to the construction techniques and adaptation to geography and climate. The specific nature of this architectural production was possible due to a strong mastering of the technical and structural capabilities of reinforced concrete as a standard, industrial production constituent, as well as due to its expressive qualities as regards plasticity or texture.

4. MODERN MOVEMENT HERITAGE IN ANGOLA AND MOZAMBIQUE: TWO LANDMARK BUILDINGS

Today, in a post-colonial context, it is important to reflect on the value and identity of modern architectural heritage in these African countries. The two case studies we present, were built in a colonial context by architects trained in Portugal, although located in very different territories - Angola and Mozambique, they have the common denominator of being urban landmarks infrastructures designed in the 1960s, which structure the city's design and keep their original function.

Following a competition for the "Angola Broadcasting Plan", the project of the Broadcasting Center of Angola building was commissioned to Fernão Simões de Carvalho (born in 1929), who would develop it in collaboration with José Pinto da Cunha and Fernando Alfredo Pereira. Simões de Carvalho, a graduate of the School of Fine Arts in Lisbon, completed an internship at Le Corbusier's studio under the guidance of André

7. It is important to stress that unlike the majority of these former colonies that were decolonised since the beginning of the 1950's until the mid 1960's, the African lusophone colonies only became independent in 1975, as one of the fundamental consequences of the 1974's Portuguese Revolution that put an end to the previous dictatorial regime.

Woscenscky between 1956 and 1959. Simões de Carvalho's training was deeply influenced by the significant projects taking place at Le Corbusier's studio during this period – including experiments with the construction and plasticity of "*béton brut*" and the application of the "*Modulor*" system.

Only the first phase of the complex plan would be built, with the construction of the Studio Block, located next to the main boulevard and situated in the centre of the plot, and a Workshop building, located to the northeast of the site.

The studio block is a large rectangular-based parallelepiped volume, positioned in the centre of the plot and set back from the extremes, creating surrounding landscaped spaces. The building functions as a dense box contained within a grid of exposed concrete, resting on a partially submerged base floor, with functional spaces only at the periphery of the building.

The building's design is based on the harmonious measurements of Le Corbusier's *Modulor* system. In addition to the application of the *Modulor*, references to Le Corbusier are very prominent in this work. The design of the broadcasting centre clearly harkens back to Le Corbusier's research on the expression of *béton brut* in his later works.. In addition to the alternating grid geometry, Simões de Carvalho incorporates Corbusian formal elements, as it can be observed in the expressiveness of the concrete gargoyles or in the interplay of materials: the dominant exposed concrete combined with tile surfaces or glazed surfaces.

The effectiveness in responding to the tropical climate was one of the concerns that guided the design of the building. In addition to its favourable orientation with respect to the prevailing winds in the Luanda region, the layout of circulation spaces promotes efficient cross-ventilation. The design and placement of sunshades were carefully considered based on solar exposure, although compositional choices prevailed. Thus, the façades are designed in pairs: a grid pattern on the northeast and southwest façades, and vertical sunshades oriented at 45 degrees on the upper façades, which are more exposed to harsh sunlight. The semi-external entrance atrium and the array of interior landscaped courtyards are elements that promote natural ventilation and airflow.

The Luanda Broadcasting Centre, a facility of great programmatic and technological complexity, was, during this period, a pioneering equipment within the framework of Portuguese architecture.

Today, the National Radio of Angola remains fully operational and, despite being in good condition, its service area has expanded beyond the limits of the building. On the periphery of the plot, a series of makeshift constructions have been added, which do not allow for a comprehensive reading of the building and diminish its quality. The Radio is an exemplary work of the legacy of the Modern Movement, seen in the context of Luanda's society as an urban and architectural landmark. Its study and conservation would enhance Angola's architectural heritage.

The history of Beira, the second-largest city in Mozambique, is intrinsically linked to the history of the railway in Africa. The Beira Central Railway Station would become the largest public work in the city, addressing the need to

accommodate the existing movement of passengers and goods which served as a connection to the interior of Africa. Its location was defined in the functional zoning proposal of the Urbanization Plan for the city in 1951. Situated at the northern end of the city, near the port, this significant infrastructure served as a focal point in the city plan. The railway complex was developed by a team that included the leading architects residing in Beira. The plan of the complex delineated three functional areas, each with distinct volumes. Consequently, the project was divided into three parts, with each architect on the team responsible for one: the grand station to Francisco Castro, the terminals and service area to João Garizo do Carmo and the office block for administrative purposes and coordination of the project to Paulo Melo Sampaio.

The Station, the most remarkable building in the complex, is a vaulted nave, asymmetrically and off-centre juxtaposed to the office block, creating a grand welcoming space for the station. The expansive area of the Station is conceived as an architectural promenade with a sequence of events that guide us from the atrium entrance to the terminals. The office block is a large, seven-story rectangular volume, partially raised on pilotis and characterized by an exposed structure made up of overlapping "boxes" that create long openings between the floors. Despite the different authors and the volumetric variation among the three buildings, the work maintains a sense of coherence and unity. Compositional balance is achieved through the distinct expression of form and scale of each part and the clarity of the articulation of the spatial and functional sequence.

The project for the Beira Railway Station exemplifies the principles of the international architectural language of the post-war period. In addition to the fundamentals of Corbusian grammar, the extensive formal lexicon of Brazilian modern architecture, a common characteristic in the language of its authors, is abundantly applied here. This includes the plasticity of curved

forms evident in the large vault or the sequence of Catalan vaults, grids and brise-soleil, material textures, polychromy, and the integration of artworks.

The Beira Railway Station is a mature work in the application of this modern lexicon with international standards and demonstrates the consolidation of the authors' trajectory. It can be regarded as an exemplary building of the heritage of the Modern Movement, within the context of a new concept of monumentality.

The Beira Station, in addition to being an exemplary case of modern architectural heritage built in Africa, maintains an iconic and popular dimension in the city (an example of which is the prominence of the building's image on the flag of the municipality of Beira),. The government of Mozambique is currently seeking to enhance the value of its ports and railway infrastructure. In the context of new strategies for economic and tourist revitalization of the city of Beira, this building will undoubtedly play a key role in responding to its urban and architectural redevelopment. In 2019, the Beira Railway Station received a 'Keeping it Modern' grant from the Getty Foundation to study the conservation and rehabilitation of the building[8], thus reaffirming not only its economic and symbolic dimension in the city, but also the importance of its legacy in enhancing the architectural heritage of the Modern Movement in Beira. The application proposed the enhancement of the building "as an element of the city's identity and thus contribute to the public recognition of Beira's wide architectural heritage', also emphasising that 'the Beira Railway Station can be achieved as an urban catalyst in Beira's urban development, contributing to the ethic planning of our future cityscape, while preserving the legacy of the MoMo."[9]

Almost fifty years after the independences of Angola and Mozambique, identity and heritage issues are still a sensible topic. Far beyond the difficulty of dealing with the memory of this Modern Movement heritage, we are confronted with the History of these countries in transformation in the search for a new course and a new identity. Only an in-depth knowledge of the cultural and scientific value of this heritage may overcome other priorities, whether of a political or a social nature. ■

Assistant professor at Universidade Lusíada de Lisboa since 1990 and Researcher at CITAD since 2015. She has published the book "Moderno Tropical - Arquitectura em Angola e Moçambique, 1948-1975", ed. Tinta da China (2009), awarded the DAM Architectural Book Award 2010 in the category of Architecture History. She investigates 20th century architecture, especially on the Modern architectural heritage in the colonial period, a subject on which she has published several articles.

THE ETHICS OF PRESERVATION OR REPURPOSING OF YUGOSLAV WWII MONUMENTS

TATJANA ALEKSIĆ
UNIVERSITY OF MICHIGAN, ANN ARBOR

ABSTRACT

This presentation is concerned with the general neglect, vandalization, and widespread destruction of some of the most representative Yugoslav *spomeniks*, as they are now collectively known, from a south Slavic word for "monument," or "memorial," that were designed by prominent Yugoslav modernist architects and sculptors between the 1960s and 1980s. They collectively shot into *anonymous fame* in 2015, after the appearance of the photo book by the photographer Jan Kempenaers, which presents them without authorship, purpose, or any kind of commentary, as odd, forlorn, numbered structures. This photo book created considerable interest in using the *spomeniks* as props for musical spots, advertisements, sci-fi movies, or even as surfaces for skateboarding or parkouring gigs. Many of the individuals who decided to use the *spomeniks* for whatever purpose quote this catalogue as inspiration, and none of them shows any more curiosity in finding what these structures actually represent than the photographer who presented them in such a problematic way. In a review of the photo book for the British *Guardian*, Joshua Surtees insists, in a condescending manner, typical of much writing on communist topics, that the photographed structures were commissioned by nobody other than the Yugoslav dictator Josip Broz Tito himself. The *Guardian's* author sails precisely on the patronising post-communist European narrative, which has focused on the revisionist cancellation of distinctions between fascism and communism, and which is important for my subsequent discussion.

It is a truism that monuments have always been contentious sites of memory politics, and that they expire once they no longer speak to the people who live with them. Perhaps, however, we could agree that monuments glorifying prominent individuals - leaders, kings, revolutionaries - are the first logical targets of such replacement impulses that have happened at many historical turning points. In recent history such a massive monumenticide took place all over the former Eastern Bloc during the decade of the 1990s, when a lot of Lenins and other communist ideologies or revolutionaries were downed, usually to be replaced by national ideologues and conquerors[1]. Nowadays we are witnessing a global phenomenon of removing monuments with contentious histories (confederate, colonizing), and their occasional substitution with those that more appropriately reflect the political sentiment of our time. However, my question is whether memorial sites that commemorate victims of mass attrocities likewise expire in the way of the Lenins, the Louises, or the Caesars? Because most of the Yugoslav *spomeniks* were erected at a site of a Nazi massacre of civilians, or a big WWII battle in which the Yugoslav people suffered tremendous losses. Because thousands of their unclaimed bodies still lie underneath[2].

The *spomenik*s' abstract form is a result of both the stylistic choices of their makers and of the planning committees' determination to promote a universal, optimistic message for the future, believing that public monuments should not be considered as sites of mourning, but instead as symbols of stability, reconciliation, and progress.[3] Originating in grassroots initiatives by the local communities of victims and survivors of WWII,[4] the *spomeniks* defy platitudes about being "communist," or "totalitarian," impositions on collective memory, with which they have frequently been described since the demise of Yugoslavia. Even a superficial comparison with monumental architecture in other formerly socialist countries would be enough to testify to the overall absence of socialist realist or ideological motifs in the *spomeniks*. Imagined as symbols of the common Yugoslav antifascist liberation struggle, the *spomeniks* were instrumental in the Yugoslav post-WWII regime's cosmetic memory engineering, which was allegedly directed at obliterating the evidence of deadly ethnonationalist fighting among various Yugoslav ethnicities and religious groups that caused almost as many war victims as did the fascist massacres and offensives. Such abstraction is not itself without controversy. On the one hand, it carried quite a significant political message, as the *spomeniks*' construction and dedication to unspecified "victims" of equally unspecified "fascists and their domestic collaborators" tiptoed around the fact that both victims and perpetrators of civilian massacres and concentration camps were ethnoreligiously marked, and that they died precisely, and solely because of their perceived ethnoreligious affiliations. It was especially visible in the almost total absence of any memorials specifically dedicated to the Jewish Holocaust victims, despite the fact that some territories of Yugoslavia were the first to be declared *judenfrei* in the occupied Europe. In fact, Bogdan Bogdanović, the author of the majority of *spomeniks* created

the only such monument dedicated to the specifically Jewish victims, located in Belgrade. On the other hand, this abstraction led to the translation of the many victims killed in massacres of civilians as acts of "patriotic deaths" for socialist Yugoslavia. The latter reason directly interfered with planning for some memorials, most notably for the Jasenovac Memorial to the victims of the Ustaša concentration camp, given that the authors struggled to integrate the prisoners' victimhood into the victorious narrative of the Yugoslav antifascist struggle.[5]

Aesthetically, some *spomeniks* were inspired by medieval sarcofagi found in Bosnia, while others were largely abstract in their expression. From the very planning stages, they were envisioned as public spaces that would be integrated into the landscape and invite visitors to interact with the natural spaces and their constructed extensions (Fig 1). It may be of interest to note that practical details of the *spomeniks*' future use by the public, such as their proximity to the road infrastructure, visibility from the roads, and potential for public interest, were as significant in the planning stages for memorial complexes as was their symbolism.[6] And indeed, during their heyday, Yugoslav memorial complexes were frequently used for televised commemorative events and educational trips, but were much more popular as recreational grounds for family picnics and weekend breaks.

At the time when the last ones among them were finished, in the late 1980s, the common memory of the Yugoslav antifastict struggle was already being manipulated by tendentiously revived, exaggerated, and even fabricated memories of inter-ethnic trauma caused during WWII, precisely the kind that the regime was sweeping under the carpet for decades. Divisive claims to ethnoreligious victimhood, but also the aggressive revival of fascist collaborators symbolism that caused this victimhood, swept Yugoslavia, and led to extensive historical revisionisms, one dimension of which was, expectedly, the altering of both the narrative and material memoryscapes in the Yugoslav successor states. In the worst of cases, post-Yugoslav regimes have adopted the fashion - perhaps most controversially extant in the Spanish Valley of the Fallen - of erecting monuments to collective national victims, which disregard whether they died as victims or perpetrators of war crimes.[7] This ethnocentric *ressentiment* was profoundly influenced by the contemporaneous pan-European anti-communist reckoning, which has worked hard on the consolidation of its common historical narrative, blending communism and fascism into a nowadays ubiquitously invoked "totalitarianism." Some authors define these developments as part of a "Transition ideology" with clearly right-wing revisionist roots based in "ethno-methodologism and the superiority of Western civilisation",[8] wherewith the EU "has embraced an anti-totalitarian ideology that contributes to [... the] relativisation and rehabilitation of the fascist past"[9]. The entire twentieth century in Europe thus seems to have been lived in indistinctly "totalitarian" ideologies, and the reasons for the victimization of groups of people under either of the two ideological systems, are effectively obliterated. New generations are furthermore denied the knowledge about

the deeply racist, homophobic, and xenophobic ideology of fascism, whose main propellent and ultimate goal were the destruction of otherness.

Besides ideology, another important reason for the socialist *spomeniks*' abandonment in the post-socialist period seems to be precisely their abstract aesthetics, the trait for which they were so appreciated by art historians, but that the new nationalist sentiment could not interpret for its purposes. In the realm of material history, a wave of vengeful memoricide during the Yugoslav dissolution wars left the symbolically emptied public space, which was subsequently filled up with religious and other examples of traditionalist monumental architecture - precisely of the kind that the modern *spomeniks* were intended to counter-weigh.[10] In contrast to socialist monuments' depictions of courageous defiance oriented toward the future, post-socialist sentiments focused on the suffering, expressing a "defensive semantics of ethnonationalist ideologies, turned towards the past".[11] Post-Yugoslav ethno-states rapidly constructed their new collective memoryscapes through the most commonly used symbols: horsemen signifying the creation, eternity and invincibility of the nation, or funerary monuments exuding pathos for victims of, frequently, communist violence. On the other hand, memorial sites that could be reclaimed for national ambitions were left alone, frequently with the addition of religious elements, as was done at the Sutjeska Battle National Park spomenik in Bosnia, or the Memorial Complex Bubanj in the Serbian city of Niš. In both these examples, the addition of a Serbian Orthodox chapel next to the memorial claims the victory, or the suffering, for the Serbian nation only, eradicating the multiconfessional and multiethnic composition of both the combatants in the Sutjeska battle, and the prisoners of the concentration camp who were massacred at the Bubanj hill, respectively. However, an unusual memorial site in eastern Serbia, where Bogdanović had created a memorial for the fallen fighters of events that span centuries, and range from the uprising against the Ottoman occupation in 1804 to the victory over fascism in 1945, remains an interesting, albeit rare, example of a *spomenik* that has been well maintained even after the breakup of Yugoslavia. I ascribe its survival precisely to its local, if transhistorical, character, which is deeply rooted in the soil and lives of the population on a small territory.

1. POLITICALLY (IN)CORRECT HERITAGE

By now there is a whole genre of photography, performance, and video art that revels in ignorant fascination of the *spomeniks*. And while we do not have to necessarily subscribe to the rather essentializing claim that any non-commemorative use of monuments automatically qualifies as disrespect to the victims, it could be worthwhile thinking about why Yugoslav monuments, and in extension Yugoslav victims, do not deserve the same kind of reverence shown to memorials to some other victims. Would it be considered unnaceptable to create an unrelated performance at some better known places of authentic human suffering and death? There will inescapably be a lot of differing opinions about this, and one of the most radical may

10. For example, in Croatia alone, over 3000 *spomeniks* and other memorials to the victims of fascism were destroyed - in some cases these were small local initiatives, although some took serious efforts to accomplish, as will become clear further in this presentation.

11. Kuljić, "Novi javni spomenici u regionu: oružje u građanskom ratu sećanja"

be that of the Isreali artist Shahak Shapira, the creator of the controversial website Yolocaust, and the related social media campaign "undouch me," both of which, the activist claims, served the intended purpose of educating many people about proper behavior at sites of commemoration. In my use of this website in an undergraduate course on the Holocaust in Yugoslavia, I watched how unthinking posters apologetically removed their photos after being publicly shamed by Shapira.[12] It begs the question of why a selfie at the Berlin Holocaust Memorial, which is technically not an authentic site of death, would be considered more unacceptable than parkouring over Yugoslav monuments where thousands of unclaimed bodies still lie underneath. Nor why such egregious disregard of Yugoslav socialist heritage could not create the media outrage similar to that caused by the carving of initials into the Roman Colosseum by a tourist. Because, essentially, both are acts of willful and ignorant defacing of built heritage.

We could raise multiple questions about both outright dismissal, or problematic cooptation of historical legacies in general, but particularly of societies and historical periods, like Yugoslav socialism, that are considered "totalitarian," "failed," defeated, or otherwise insignificant. Inappropriate uses of the *spomeniks* therefore, are rooted in positions of dismissive hegemony that sees these socialist/communist/Eastern European structures as meaningless repositories of discredited political practices, and therefore fit to be used as a prop for any artistic, or even recreational purpose. In the mix of a casual disregard for their meaning and simultaneous fascination with the monuments' allegedly otherworldly form, Kulić denudes the colonial mentality that appropriates anonymized structures for self-promotion, or financial gain.[13] Raino Isto describes the stages through which Yugoslav socialist historical heritage is transformed into empty signifiers, ripe for an alien landing.[14] With the devaluation of the ideology that held Yugoslavia together, the monuments to/by that system of values likewise lose their significance and original function. They become genuine "time capsules" whose content can be filled by any other ideology, or system of values, but not before they become a "universal heritage of humankind".[15] It is precisely the monuments' "universality," the quality extolled by art historians as their most valuable attribute, that facilitated the specific disaffection that subsequent generations cultivate for the *spomeniks*, allowing their cooptation for any and all purposes, including dystopian or alien spectacles. Paradoxically enough, in this *alien-nation* Isto recognizes the seed of a new life for the monuments, a utopian future potential which may create new meanings to the future generations.

Despite their physical destruction, many of the Yugoslav monuments have gained an immaterial presence in digital archives, a good example of which is the Monument Database, curated by Donald Niebyl.[16] A yet new leap has been made in the virtual recreation of Vojin Bakić's massive Monument to the Victory of the People of Slavonija, dynamited by the Croatian army in 1991, whose project of virtual recreation recently won the award of the Europa Nostra initiative.[17] Namely, a group of artists and

activits have recreated it in its original site as a hologram,[18] while plans are in the works for it to be stored in an app, and be available to visitors (Fig 2). This and similar actions indicate that the struggle for memory is still ongoing, and that we can feel free to reinterpret Lefebvre's "end of space,"[19] not as the ultimate destruction of memory the *spomeniks* symbolized, but as their recreation in the virtual sphere, from which they will continue to speak to future generations, hopefully in a language they will be able to understand.

2. CONCLUSION

I raise the issue of an ethical approach to the preservation of monumental legacy created in a state and under a political system that no longer exist. Furthermore, this paper cautions against the emergence of a colonial attitude to the history and sacrifices of non-Western subjects. During the process of post-socialist transition, the specificities of Yugoslav WWII resistance to fascism were neglected in the rush to fit the self-serving common EU narrative of anti-communism, which conveniently glazes over European overwhelming complicitness with the fascist project.[20] Accompanied by a specific "hierarch[isation] of victimhood",[21] post-communist historical revisionism allows for Eastern European victims of genocidal massacres to be ignored. While some authors do not find such appropriation particularly problematic, others deplore the kind of content that is created at these sites, given that the "inadequate presentation of memorial legacy obliterates the significance of the unique historical heritage within Europe," which greatly surpases the structures themselves.[22] ■

"UN PUEBLO SIN MEMORIA, ES UN PUEBLO SIN FUTURO:" MEMORIES OF MODERNISM AND VIOLENCE AT THE NATIONAL STADIUM OF CHILE

VALENTINA ROZAS-KRAUSE
UNIVERSIDAD ADOLFO IBÁÑEZ, CHILE

ABSTRACT

This paper examines the dictatorial transformations of one of Chile's most iconic modernist buildings, the National Stadium in Santiago. First, it reveals how the military neoliberal project, armed with strategies of terror, amnesia, and deregulation, has shaped local memory culture. Second, it looks at the long history of the National Stadium's 86 years of existence, to illuminate how gender stereotypes, material obsolescence, and subversive memories have transformed both the meaning and the uses of the modernist stadium. Still standing today, the National Stadium bares traces of institutionalized forgetfulness, as well as the oppositional tactics of memorialization organizations protesting menaces of demolition and privatization.

1. INTRODUCTION

The creation of the National Stadium in 1938 was entangled with two fundamental dimensions of Chilean modernity: modern style and modern planning. As the centerpiece of a public urban development project, it followed the stylistic and humanistic premises of local architectural modernism, on the one hand, and on the other, was in tune with socio-political endeavors to modernize Chile (Fig 2.). Once the biggest building in Santiago, the stadium was imagined as a stage for modern mass-culture, a trophy that would prove Chile's commitment to modernization to the rest of Latin America. At the same time the stadium was conceived as a laboratory for the 'modern man,' and thus contained reformist aspects that were envisioned to stimulate the body and mind of those who entered it (Fig 3). Breaking with these utopian ideals, in 1973 the stadium became a space of horror, when the military dictatorship transformed this temple of modern sports into a detention, torture and extermination camp. During the first 58 days of the regime, the National Stadium stopped being a sports field and received the 10.000[1] victims and the perpetrators of a dictatorship that would be in power for 17 years.[2] To dismantle the modern ideals of the National Stadium, the military used the venue both in its functional and symbolic dimensions.

The public visibility of the prison camp installed within the National Stadium gradually attracted more and more detainees' relatives, who gathered in front of the compound's gates in search for news from their loved ones. This is how the stadium's built perimeter became a landscape of resistance for the victims' relatives. These groups of relatives, constituted predominantly by women, originated the memorial rite of the velatón[3] [candle-lighting], commemorated until today every September 11th –the day of the military coup– in front of the northern entrance of the National Stadium. Precisely because it became a site of memory, under the dictatorial Pinochet regime the National Stadium's materiality was allowed to deteriorate. While the National Stadium has been analyzed from multiple perspectives, the erasure of the stadium's humanistic ideals and its relationship to the deregulation of urban development and its attendant suppression of the modern planning practices has not been closely studied. This paper examines the National Stadium's dictatorial transformations to reveal how the military neoliberal project, armed with strategies of terror, amnesia, and deregulation, has shaped local memory culture. Likewise, it looks at the long history of the National Stadium's 86 years of existence, to illuminate how gender stereotypes, material obsolescence, and subversive memories have transformed both the meaning and the uses of one of Santiago's most iconic modernist buildings. Still standing today, the National Stadium bares traces of institutionalized forgetfulness as well as the oppositional tactics of memorialization organizations protesting menaces of demolition and privatization **(Fig 1)**.

2. THE MODERN STADIUM

In 1938, at the time it was inaugurated by president Arturo Alessandri Palma (1932-1938), the Stadium was the largest building in the capital, and

1. There are different calculations for the number of prisioners who were held at the National Stadium. The exact number is still uncertain. Based on oficial prisioner's entry lists published by the former head of the National Intelligence Directorate (DINA) Manuel Contreras at least 10.000 people were imprisioned at the stadium during the first 58 days of the military regime. Nevertheless other authors estimate 12.000 or even 14.000 prisioners for the same period of time. (Manuel Contreras Sepúlveda, *La verdad histórica: el ejército guerrillero : primer periódo de la guerra subversiva, abril de 1967 al 10 de setiembre de 1973* (Ediciones Encina Ltda., 2000).)

2. Adolfo Cozzi, Estadio Nacional (Santiago de Chile: Editorial Sudamericana, 2000); Jorge Montealegre, Frazadas del Estadio Nacional, Colección septiembre (LOM Ediciones (Santiago, Chile)) (Santiago, Chile: LOM Eds, 2003).

3. During the *velatones* the relatives of the victims of the dictatorship, survivors and activists organize an activity in memory of the victims of the National Stadium and the dictatorship in general. At the centre of the commemoration, which takes place on the night of September 11th, is the lighting of candles in honor of the deceased, which are placed along the perimeter wall of the stadium. In addition, the rite is accompanied by poetry readings, speeches, music and artistic exhibitions.

as such, the role it played for the city surpassed its use as a sports venue **(Figures 2 and 3)**. The National Stadium was a symbol and an instrument for the modernization of the state as well as the city. Originally, the building was the centrepiece of a national project of physical and moral regeneration. As such, the Stadium was part of an educational program that promoted sports to champion an ideal 'Chilean race'. As the largest monument in Santiago, the National Stadium was envisioned as a stage for modern mass culture, and a trophy that would demonstrate Chile's commitment to modernization vis-à-vis the rest of Latin America. Simultaneously, it was conceived as a laboratory for the modern citizen, and therefore contained reformist aspects that were thought to stimulate the mind and body of its visitors.[4] Besides addressing a national debt in sports infrastructure and functioning as an educational space, the Stadium was conceived as an urbanization agent. Consequently, the construction of the stadium had major repercussions in the neighbourhood in which it was implanted. Designed as part of an urban complex that comprised modern housing, a bacteriological institute, a university campus, a school and a new tree-lined avenue, the National Stadium would conform a modern model neighbourhood for the rising middle class.

3. THE POPULAR STADIUM

Although the neighbourhood that developed around the National Stadium was oriented towards the middle classes, the site was, since its creation, a place of encounter with the other, an urban space that by density and appeal presented a characteristic social melting pot of Santiago. In addition, the Stadium was a sought-after place for mass politics: since the inauguration of the building to the breakdown of democracy in 1973, all of the republic's presidents–with the sole exception of Juan Antonio Ríos (1942-1946)–used the National Stadium to address the country. The *Unidad Popular* (UP) [Popular Unity], Allende's government coalition, exacerbated this model and politicized the National Stadium with greater intensity than any of the preceding governments, organizing political congresses, celebrations and acts within the site. The panorama during the four years of the UP government presented a stadium reddened and conquered by the popular masses. Its large seating capacity and symbolism turned the building into a microphone to address Chile, and in Allende's case; the world as well. For these reasons, during Allende's government the National Stadium was transformed into the most public and influential tribune of the country.

4. THE MILITARIZED STADIUM

The dictatorship not only used the National Stadium as a detention, torture and extermination camp during the first two months of its regime, but made it into one of its main stages of political promotion. The close-knit relation of the venue with the nation's presidentialism and in particular its political conversion during Allende's government, made the building an irresistible stage to be conquered by the military dictatorship. During the first 58 days of the regime, the Stadium stopped being a sports field and received the 10.000[5] victims and the

4. "Revista Crack," Editorial Zig-Zag II, no. 61 (December 9, 1938).

5. There are different calculations for the number of prisioners who were held at the National Stadium. The exact number is still uncertain. Based on oficial prisioner's entry lists published by the former head of the National Intelligence Directorate (DINA) Manuel Contreras at least 10.000 people were imprisioned at the stadium during the first 58 days of the military regime. Nevertheless other authors estimate 12.000 or even 14.000 prisioners for the same period of time. (Sepúlveda, *La verdad histórica*.)

perpetrators of a dictatorship that would be in power for 17 years.[6] To dismantle the modern ideals of the National Stadium, the military used the venue both in its functional and symbolic dimensions. The spatial layout of the building was functional for its conversion into a prison camp: the dark hatches and multiple compartmentalized dressing rooms, the panoptical control that could be exerted from the marquee across the whole venue, together with the segregation of the movement of people, contributed to the transformation of the Stadium into a military camp.[7] Nevertheless, it was the Stadium's visibility, its preeminent role within the city and its recognition as a place for recreation, entertainment and spectacle, which comprised the symbolic reasons to transform the sports venue into a concentration camp in order to intimidate the opposition. Functionalism and symbolism were combined to form the largest prison camp operated by the military regime. As a visual example of military authority, the building's transgression was largely amplified through speeches, images and films within the country and abroad.[8] The public visibility of the prison camp installed within the National Stadium gradually attracted more and more detainees' relatives, who gathered in front of the compound's gates in search for news from their loved ones. This is how the stadium's built perimeter, especially the ticket booths located at the main access towards Avenida Grecia, became a landscape of resistance for the victims' relatives. These groups of relatives, constituted predominantly by women, originated the memorial rite of the *velatón*[9] [candle-lighting], observed until today every September 11th –the day of the military coup– in front of the northern entrance of the National Stadium.

5. THE NEOLIBERAL STADIUM

Even though the military occupation of the National Stadium lasted only 58 days, it was a disruption that set off a long period of urban deterioration and obsolescence of the entire lot, as well as its main building. The neoliberal economic model deployed by the military dictatorship brought with it a deep discredit for urban planning that materialized in the opening of the urban limits of the city of Santiago, the de-territorialization of subsidies that disarticulated the link between communities and their territories, and the exemption of land taxes, among other measures. The National Stadium became a mirror image of the new urban model[10]. It follows that, during the 1980s, the 64 hectares of the compound began to be fragmented into smaller independent lots, divided by fences and walls. For the first time in the history of the National Stadium, the building and its premises were no longer planned as an whole urban complex, and instead, it was subdivided into various publicly and privately managed sub-lots. Simultaneously, an unprecedented growth transformed the Stadium between 1990 and 2000, more than ten projects were carried out to improve existing infrastructure as well as to create new buildings. Nevertheless, most of these projects were not inscribed within a plan for the totality of the sports complex.[11]

6. THE MEMORIAL STADIUM

The restoration of democracy had no immediate effect on the National Stadium. Although the uses of the compound were democratized, the

9. During the *velatones* the relatives of the victims of the dictatorship, survivors and activists organize an activity in memory of the victims of the National Stadium and the dictatorship in general. At the centre of the commemoration, which takes place on the night of September 11th, is the lighting of candles in honor of the deceased, which are placed along the perimeter wall of the stadium. In addition, the rite is accompanied by poetry readings, speeches, music and artistic exhibitions.

venue continued its path of material obsolescence initiated during the military dictatorship. Democracy was installed in the building by the 1989 referendum that marked the end of the dictatorship. That same year, Amnesty International organized a mega-concert at the Stadium, with the presence of groups of relatives of the *Detenidos Desaparecidos* [Disappeared Detainees]. The following year, the newly elected president Patricio Aylwin (1990-1994) celebrated his commencement with a massive purifying event at the National Stadium, during which a Chilean flag of monumental proportions was unfolded over the field. Despite these symbolic events, the National Stadium and its past were institutionally forgotten. For almost a decade it remained in a dormant state with almost no visible traces of its history, until the year 2003, in which a series of community initiatives, public policies and urban projects aligned to rediscover the building.[12] That same year the Council of National Monuments declared the National Stadium to be a 'National Historical Monument,' which triggered a series of commemoration and renovation projects, both public and private, that were debated across the country in newspapers and magazines.[13] The contradiction between making the building a piece of national heritage and its profound physical decay finally led, in 2010, to the remodelling of the building and the development of *Memorial 'Escotila' 8* [Memorial 'Hatch' 8] **(Figure 4).** Since that day, the national soccer team never plays at the stadium's full capacity for, because a remembrance of those who lost their lives at the National Stadium, an area of 185 m^2 of old wooden stands always remains empty (Figure 1). ■

THE RECOURSE TO THE AUTHENTICITY IN THE MODERN ARCHITECTURE OF MOBUTU'S ZAIRE

MANLIO MICHIELETTO
GERMAN UNIVERSITY IN CAIRO, EGYPT

ABSTRACT

In 1960, the Belgian Congo became an independent nation, gaining independence from the colonial power. The later constitution of the Republic of Zaire sparked the rediscovery of so-called authenticity, which also influenced the architectural language that shaped the colony for decades, the so-called tropical modernism. However, the hybridisation characterising the country's vast territory carries its new identity. A particular form of eclecticism was already shaping the nation established from the ground up at the Berlin Conference of 1885: a country with nine climatic zones and more than four hundred tribes. Since then, the term "hybrid" is no longer used in opposition to "authentic," but has become synonymous with it. This paper delves into the unique and intriguing legacy left by the research of a Congolese identity in architecture during Mobutu's reign through the lens of two intriguing case studies: the INSS (National Institute of Social Security) building designed by Marcel Lambrichs (1966) and the Saint Anthony II Church (1982) designed by Paul Dequeker. These selected artefacts, located in the capital city of Kinshasa, were respectively created at the beginning and close to the end of the recourse to authenticity. To make the constructions local, architects designed them in accordance with the climatic characteristics of a specific climate, place, and culture while using elements of decoration inspired by traditional art. Therefore, modernism is adapted to the context and updated according to the ongoing political orientation. The analysis of the case studies is conducted using a qualitative method, in which the historical and recent literature support the thesis of the hybridisation of an international architectural language by injecting local traditional decorative artworks into the design process.

1. INTRODUCTION

Following independence in 1960, the Belgian Congo underwent a process of remaking its past to shape the future of a new nation. The constitution of the Republic of Zaire sparked the rediscovery of so-called authenticity, which also influenced the architectural language imposed by the colonial authorities, the so-called tropical modernism. Admitting the impossibility of maintaining pure cultural identity, Zairian politics accepted all influences as authentic, which would likely allow for a distinction between the local and the global. Nevertheless, the hybridisation characterising the country's vast territory carries its new identity. A particular form of eclecticism was already shaping the nation established from the ground up at the Berlin Conference of 1885: a country with nine climatic zones and more than four hundred tribes. Since then, the term hybrid is no longer used in opposition to authentic but has become synonymous with it. This understanding is that of architects who described their architecture as African or Congolese, provided there is a distinction between what could be described as international architecture. The paper analyses the legacy left by the research of a Congolese identity in architecture during Mobutu's reign. The investigation is led by taking into consideration two significant case studies: the INSS (National Institute of Social Security) building designed by Marcel Lambrichs (1966) and the Saint Anthony II Church (1982) designed by Paul Dequeker. These selected artefacts, located in the capital city of Kinshasa, were respectively created at the beginning and near the end of the process of pursuing authenticity. These case studies, the first and last significant architectural projects of the authenticity era, hold immense importance in understanding the evolution of the Congolese architectural language. To make the constructions local, architects, in their commendable effort, designed them in accordance with the climatic characteristics of a specific climate, place, and culture while using elements of decoration inspired by traditional art. Therefore, modernism is adapted to the context and updated according to political orientation. The analysis of the case studies is conducted using a qualitative method, in which the historical and recent literature support the hybridisation of an international architectural language by injecting local traditional decorative artworks into the design process. Initially, there was confusion about the "return" and not the "recourse" to authenticity, which did not necessarily imply living once again in the huts for dwelling. Instead, it is a successful symbiosis between tradition and modernity, between the local and the global, the native and the imported culture. The INSS building is the first to correspond to the architecture of authenticity. The sunshades are combined on the main elevation with the integration of a giant mosaic. Integrating works of art, particularly frescoes, in public buildings also appeared in the Saint Anthony Church II in the 1980s.

2. METHODS

Beginning with the assumption that tropical architecture originated in Africa from the colonial experience before the Independence movement, it still constitutes a valid reference for designing a more sustainable future. It must

also be considered an architectural language characterised by adapting to and drawing inspiration from the context, deriving its purpose from the context itself. Authenticity was introduced in the 1970s in Congo, representing an upgrade for tropical architecture related to the tangible environment and intangible memory. The method approach adopted for the research is based on historical data from literature about tropical architecture and authenticity, initially describing and contextualising the two topics in Congo. Once the historical background is laid out, two adequate case studies will be introduced and analysed in the capital city of Kinshasa. The discussion takes a quantitative approach to understanding the relationship between the selected artefacts and the epiphany of authenticity. The aim is to demonstrate that the iconographic depiction of Congolese art obtained by adding a mosaic on the main façade of the INSS building and interior traditional decoration motifs on the Saint Anthony II church can be epitomised as two built architectural synecdoches. The conventional art style is recognisable in most public and private buildings in the Republic of Zaire.

3. FINDINGS AND DISCUSSION

Tropical architecture in Africa and authenticity in Congo are presented here to provide the necessary background to contextualise the case studies, the INSS building and the Saint Anthony II church. Two public construction projects, the National Social Security Institute headquarters located in Gombe, the European quarter of Kinshasa, and a new church constructed in Bumbu, a suburb of the capital city, mark the ongoing uncontrolled urban growth.

3.1. TROPICAL ARCHITECTURE IN AFRICA

In the 1950s, the architecture of many African countries was characterised by so-called tropical modernism. The spread of this architectural rediscovered language was credited to the achievements of Maxwell Fry and Jane Drew in West Africa: "to draw reasonable deductions from the past habits and styles of construction of tropical regions, to solve our current problems"[1]. A conference on tropical architecture was held in London in 1953[2], and a publication on the topic appeared for the first time in 1956, *Tropical Architecture in the humid zones*. The Architectural Association (AA) London, where the two British architects, Fry and Dry, studied and worked, established a specialised Department of Tropical Architecture at the AA School of Architecture. In Belgian magazines on architecture and urban design like *Rythme*, there have also been recommendations for tropical design since the end of the 1950s, as well as examples that illustrate the applications in buildings like that of Antonin Raymond in India[3].

The transformation of tropical architecture knowledge led to a shift from a purely functionalist approach, typical of the hygienist era, to a more philosophical strategy for designing a new aesthetic. Maurice Houyoux is among the pioneers in Congo and Africa who attempted to translate tropical modernism into an architectural language. Nevertheless, when he designed the headquarters of the Belgian Congo Bank in Léopoldville in

3. Carle Loo, "Protections contre les rayons solaires", *Rythme 3*, no. 6 (Juin 1949), 18.

1949, there were already articles discussing the climate, such as "Living conditions and physical factors to which homes in the Belgian Congo must respond"[4], "Protection against solar rays"[5], or "Building in the tropics"[6], which appeared in magazines. Victor Olgyay, who published *Designing with Climate: a Bioclimatic Approach to Architectural Regionalism*, concluded that whether we draw inspiration from or reinterpret ancient vernacular architecture or whether we examine climatic, topographical and biological data, we arrive, superstitious exceptions aside, at the same conclusions about buildings expressing a regional character[7].

TROPICAL ARCHITECTURE PRINCIPLES

The hot and humid climate is characterised by average temperatures ranging between 20 and 35°C, with relative humidity above 55%. It is the combination of humidity and heat that makes this climate uncomfortable. Without neglecting the attention given to each culture and the construction techniques that this may involve, and regardless of the regions or microclimates, the primary and minimal principles for building in a tropical environment are the same:

- Protection from direct solar heating.
- Constant cross ventilation.
- Natural internal lighting.
- Sustainable, low inertia construction materials.

These requirements are linked to thermal, health, and lighting comfort. Indeed, the main challenge of building in tropical regions is to avoid overheating buildings under the sun. The correct and rational application of the aforementioned principles makes limiting or eliminating the need for air conditioners or any high-energy-consuming machine possible.

3.2. AUTHENTICITY IN ARCHITECTURE

What exactly does authenticity mean? In President Mobutu's speeches, authenticity generally refers to a policy of cultural independence. By extension, authenticity became synonymous with culture, tradition, and civilisation. The foundation of the concept was laid in 1966, even if the term authenticity did not become a political keyword until 1971, marking the beginning of the so-called Zairianization of Congo. In 1966, the government decided first to change the names of cities, and at the end of the same year, President Mobutu invited the people to be proud of their identity. The following year, the creation of the Popular Movement of the Revolution (MPR) marked a shift towards achieving genuine Congolese nationalism in its doctrine. Initially, it was still a question of "return" and not of "recourse to authenticity"[8]. Read in a very orthodox manner, the "return" to authenticity could mean, in the field of architecture, living in huts. Although comfortable and adapted to the tropical climate and its wooded landscape, most city dwellers had already abandoned the huts in 1965, some of whom considered themselves modern citizens living in modern cities. The word "return" had a backwards-looking, conservative

connotation, which could give an image contrary to the progress the new Zaire aimed for.

"Recourse" should not mean taking everything from our ancestors' tradition, but only what is beneficial to modernity. However, what could "authenticity" mean in the arts? Authenticity in Zaïre is more than a slogan. Far from opposing progress, it would promote a mix of local and global traditions and modernity. Acknowledging the progress made, the approach would include inserting the relevant traditional elements into the modern. In Kinshasa, especially in the city centre, the buildings were all white and retrieved their tradition of tropical modernism, a contextualised architectural language. Inserting relevant traditional elements into the design process means rediscovering the typical decorative *apparatus* conceived in interior and exterior spaces. The art decoration expressing Zairian authenticity was portrayed in the INSS building through a mosaic on the main elevation and in the Saint Anthony II church through the repetition of traditional patterns on the indoor walls.

3.3. THE INSS BUILDING BY MARCEL LAMBRICHS

The Belgian architect Marcel Lambrichs started working in the colonial Congo in the early 1950s. He designed the *Caisse d'Epargne* between 1953 and 1957, located on the current avenue CADECO. In 1956, he won the competition to construct the Belgian Embassy, celebrating the fiftieth anniversary of the colony's constitution. Like most architects who arrived in Congo before independence, Marcel Lambrichs proposed a suitable architecture for the local environment, referring to the usual tropical toolbox: vertical sun breakers, perforated walls, and loggias.

THE PROJECT

The INSS building is on Boulevard du 30 Juin, the main road in the city centre of Kinshasa (Leopoldville), where most public buildings are still located. Lambrichs takes full advantage of the site's location by aligning the long elevations to the Boulevard, which are oriented north-south, thus facilitating and enhancing ventilation. The sunshades that had made tropical modernism successful are preserved but reduced to yellow glass panels, giving the bulky building an impression of lightness (**Fig. 1**). He offers a double façade or skin to achieve optimal conditions of thermal comfort. The void between the two layers results in a ventilation chamber and serves as insulation against wind and sound. Glass-coloured panels are a new material in the Congolese construction market, and the architect remains modernist by using new technological materials to reinterpret the "tradition" of tropical architecture.

THE AUTHENTICITY

The need for authenticity is materialised in a nearly 50-square-metre mosaic plaque in the Boulevard elevation (**Fig. 2**). What does the INSS mosaic represent? The painted characters are not Europeans but rather indigenous

people depicted while doing their traditional occupations. It recalls the trades and activities of the ancestors set in the typical environment: a river in front of a forest completed by adding vases in traditional shapes. There is a clear distinction between the woman who fishes and the man who makes and sells pottery, and there is another figure surrounded by plants who works the field. Instead, the upper part of the mosaic illustrates the INSS services. First, the benefits served during old age are represented by an older man holding a stick in his hand, which might also remind us of benefits in the event of disability and occupational disease. The woman with the child on her back, facing the man between two plants, reminds us of the benefits for the subscribers' families. Therefore, Marcel Lambrichs's integration of a different art form into his architecture was a strong gesture toward representing a culture rejected during colonisation by the authorities.

3. 4. SAINT ANTHONY II CHURCH

When Paul Dequeker designed the Saint Antoine II church in 1982, he completed several religious projects, including the original Saint Antoine I church in Congo. For the Belgian missionary, architecture must modernise itself and return to ancestral sources, recognising traditional African features balanced with technoscientific acquisitions—a mix between tradition and modernity[9].

THE PROJECT

The original Saint Antoine church was designed in 1961 with a simple plan—a circular gathering space with a podium on the east side. Due to the relatively small size of the Bumbu suburb community, a 320 m² room was constructed to accommodate around 300 worshipers. The subsequent version is not so different in the programme. It is designed for 800 worshipers, accommodating almost 500 more, and has a surface area of 745 m² (**Fig. 3**). Saint Antoine II's church came at a time of reliance on authenticity, and the reforms introduced by the Vatican allowed for progress in integrating local characteristics into the liturgical celebration. The shapes of both buildings remained simple[10], and the features and details of tropical modernism corroborated this. Moreover, the gradually dimmed lighting provides a perceptual tension that gently animates the interior atmosphere and makes it sacred.

THE AUTHENTICITY

A congregation member added frescoes to the interior walls after discussions with parishioners on the themes to comply with the integration of artists' work specific to the era of authenticity. Dequeker suggested reproducing the designs of Kasai velvets, which were far from being merely decorative, and indeed, these precisely woven wall rugs extend over the chief's hut, as seen in Kuba culture (**Fig. 4**). This wall decoration is a symbol and a "signage of places", a "qualification of spaces", and a "transformation of wall surfaces"[11].

4. CONCLUSION

The recourse to authenticity suddenly ended with the collapse of Mobutu's long rule. The country's name moved back from Zaire to Congo, a switch that *a posteriori* sounds more authentic. The colonial authorities gathered under a unique flag the existing Realms and Tribes that stretched in the equatorial forest, and the Kongo one, close to Angola, had a long historical heritage. In architecture, the wave of authenticity has led to the inclusion of decorative elements inspired by traditional art forms, such as mosaics and frescoes in the design process. The INSS building and the Saint Anthony II church are analysed for their quintessential value, depicting the merging process between tropical modernism and the recourse to memory. The mosaic installed in Lambrich's project, and the frescoes painted on the interior walls of the Dequeker's religious space are fragments of the past embedded in the tangible and intangible

construction of a community that, despite the technological progress, has to recognise itself and embrace its culture.

Today, no achievements accomplished by architecture during the recourse to authenticity are visible in the colonial urban fabric of Kinshasa or even in the vast sprawl of the city towards the east and south. The pathetic recourse to such blunt modernity involves imposing models that are ill-suited to the physical context or local culture. ■

Dr. Manlio Michieletto is an Associate Professor of the Architecture and Urban Design Department. He holds a Master of Architecture and a PhD in Architectural Composition from the IUAV University of Venice. He has held several teaching and research positions in different Institutions in Europe and Africa. After working as an Associate Professor in DR Congo, he was Dean of the School of Architecture and Built Environment at the University of Rwanda. In 2011, he launched his practice, designing and carrying out projects in Italy, Burkina Faso, DR Congo, and Rwanda. His research focuses on satellite city development, architectural heritage, and tropical architecture.

INTERSECTIONS OF ETHNICITY, NATIONAL IDENTITY, AND MODERN ARCHITECTURE: A VIEW FROM LATIN AMERICA

IVO GIROTO
UNIVERSIDADE DE SÃO PAULO

UNIVERSIDAD DE LOS ANDES

ABSTRACT
This paper problematises the construction of national identities through historical narratives and the role played by architecture in this process, addressing the artificial nature of these narratives, which respond to the need for social cohesion in the context of the nation-state. It focuses on the cases of Mexico and Brazil, exploring how race and ethnicity were part of the construction of national identities -especially through the concept of miscegenation- and how modern architecture draws on these identities. It concludes that these ambiguous and contradictory bases should be critically examined, making use of transdisciplinary perspectives.

1. INTRODUCTION[1]

As observed by Irene Cheng, Charles L. Davis II, and Mabel O. Wilson[2], to understand the imbrication of race in modern architectural history, we must not only incorporate previously excluded building practices, but we must also look to the heart of the canon, deconstructing that which appears to be universal, modern, and transparent. In this sense, we need to recognise that architectural history should examine transdisciplinary, transnational, and transcontinental dialogues and exchanges between political agents, artists, writers, and architects both inside and outside the places that have been traditionally interpreted as centreers.

An analysis of the period of the initial development of modern architecture reveals an apparent operation in opposite directions. While in the northern hemisphere, the unrealistic and historically problematic notion of a universal, historically uprooted architecture was being built, in much of the southern portion of the globe ethnic and historical roots underpinned the construction of modern national identities, thus embracing the role of architectural works as subjects in cultural pedagogy. Jorge Francisco Liernur has already explained[3] how the paradoxical movement of modernity, through imposing the laws of universalisation and expansion, ends up stirring up the forces of the singular and the national. The same author also analysed the relationship between miscegenation and modernisation in Latin American architecture at the beginning of the last century[4], in a pioneering text from which this paper intends to build on through further questions.

For Latin American nations, as well as many Asian and African ones, constructing the past and the future simultaneously was a necessity for the social stability of ethnically and culturally heterogeneous countries, many of which had gained their independence not long ago. Of course, this phenomenon is not limited to the regions mentioned, taking into account that since the middle of the 19th century, the construction of national identities based on fictitious ethnicities[5], invented traditions[6], and imagined communities[7] supported the consolidation of modern nation-states. As explained by Gellner[8], narratives about national foundations construct the original myth and were necessary in convincingly underpinning, or creating, common roots in a society.

No nation naturally has an ethnic base, but as social formations become nationalised, the different populations become "ethnified". In other words, they are represented in the past or the future as if they formed a natural community[9]. To consolidate the idea of a shared entity of origin, language, and race would be central elements.

The racial diversity of Latin America is the result of the confrontations of diverse Indigenous populations, colonialism and slave trade, and other complex exchanges that occurred after the region gained independence in the early 19th century. Such diversity is particularly relevant when addressing discussions on national identities, and architecture both reflects and forges these identities. This paper argues that modern architectural

narratives should not be seen as separate from efforts of nation-building, and therefore, relevant to discussions on ethnicity. It takes Latin America, and the cases of Brazil and Mexico within it, as an opportunity to provide a more nuanced understanding of the intersections of race, national identities, and modern architecture.

2. UNIVERSAL RACE: REGIONAL ARCHITECTURE?

In the case of Latin America, from the second half of the 19th century until at least the middle of the last century, a project was put into practice to build less ethnically heterogeneous and more culturally unified populations. This text aims to observe how, in multiracial countries with a high degree of miscegenation, *mestizaje* emerged as both a problem and a solution, as a lack of and a source of identity. Within this context, the cases of Brazil and Mexico present a privileged interpretative panorama based on their common attributes, their specificities, and the dialogues between them that contributed to the foundation of hegemonic ideologies on miscegenation, and which, in turn, underpinned the premises of their modern architectures.

Under the biological determinism of the late 19th century, pseudo-scientifically based on the inferiority of non-white races, miscegenation was seen as both negative and necessary. During this period and into the first decades of the 20th century, intellectuals from various fields of knowledge sought to establish a single ethnic identity for these countries at the centre. In the visual arts and literature of the second half of the 19th century, the Romantic movement tried to build a model of a national Being, establishing the figure of the indigenous person as an immaculate ancestor - Rousseau's good savage, in the case of Brazil - or as a symbol of greatness and bravery - the great pre-Hispanic civilisations, in the case of Mexico.

More than honouring the "Indian" and his legacy, it was a question of creating an allegory of the birth of the nation from the crossroads with the European conqueror, the moment from which the Brazilian and Mexican nations were founded.

In Europe, this principle of nationality triumphed after the First World War[10], due to the collapse of the multinational empires and the need to reorganise the continent's nation-states. In Latin America, the rise of nationalism during the same period seemed to address other demands. While Brazil was undergoing major economic and social transformations as a result of the late abolition of slavery in 1888, the influx of large masses of immigrants, and the onset of the industrialisation process, Mexico was grappling with efforts to stabilise and establish a new political and social order following the 1910 revolution.

The theory developed by the anthropologist Manuel Gamio[11], that only the homogenisation of race, culture, language, and economic conditions would forge the foundations of the Mexican homeland, would be further taken up by the philosopher José Vasconcelos, Secretary of Public Education under President Álvaro Obregón (1920-1924). In his 1925 book-thesis *La raza cósmica* (The Cosmic Race)[12], he predicted the

emergence of a "fifth race" in Latin America that would encompass the other four races in the world and, more importantly, surpass them. More than a tendential analysis, Vasconcelos declared a project to forge a new *mestizo* and homogeneous race, favouring the idea of synthesis over that of racial and cultural plurality. In his book *Indología*, from 1926, the issue is further explored under the argument of the abolition of existing races through *mestizaje*, whose varied matrix and synthetic result would put an end to existing racial hierarchies. Establishing Latin America as the site of this new synthesis and the birth of a culturally and biologically superior global race, Vasconcelos moves it from the periphery to the centre of the planet's future[13].

It is possible to draw parallels between Vasconcelos' thinking and that of the Brazilian polymath Gilberto Freyre, who, like Gamio, was a student of the US-based German anthropologist Franz Boas at Columbia University in the early 1920s. In his 1933 classic *Casa Grande e Senzala* (The Masters and the Slaves)[14], Freyre shifts the concept of race from a purely biological sense to its relationship with culture, representing Brazilian society as having its origins in a triangle whose vertices are the white, Indian and black races. Similarly to Vasconcelos, Freyre created a perspective of the future based on messianism and utopia, which in the Brazilian case was decisive in consolidating the idea of racial democracy, which had a lot of penetration in the narrative construction of the nation in subsequent decades[15].

Both Freyre and Vasconcelos repositioned the problem of nationality based on *mestizaje*, transforming what was ambiguity into uniqueness, and what was negative into positive. Both consolidated an ideological operation that had been under construction for decades: the past no longer represented backwardness, but the source of originality for projecting the future. Although hiding or flattering histories of (racial) violence., they also recognised, each in their own way, the fundamental actions and contributions of the people subjected by the invaders.

Perhaps the most significant contradiction was the search for distinctive identities in the dynamics of *mestizaje* since the dynamics of hybridisation tend to relativise the concept of identity, rather than increase racial and cultural differentiation between nations.

Similarly, the nationalist tendencies that marked the architectural production of the early decades of the twentieth century were permeated by ambiguities. The search for the genuinely national intensified in the years close to the commemorations of the first centenary of the independence of Latin American countries (1908-1926 approx.). Expressions flourished that tried to produce the national based on the rescue of colonial architectures.

In Mexico, architects such as Jesús Acevedo and Federico Mariscal claimed that the Mexican citizen was "the result of a material, moral and intellectual mixture of the Spanish race and the aboriginal races that populated the Mexican soil. Therefore, Mexican architecture has to be the one that emerged and developed during the three virreinal centuries in

#37

which "the Mexican" was constituted"[16]; defending the same architecture, but rejecting miscegenation, the Portuguese engineer Ricardo Severo argued that traditional Brazilian art was not based on the "elementary arts of the primitive Indigenous", but only emerged after the establishment of "the peoples who left Western Europe in the 16th century to discover the rest of the world".[17]

The heart of the discourse that supports modern Brazilian and Mexican architecture was laid during neo-colonial experimentation and, in turn, was heir to the ethnic-racial theories of the 19th century. Such influence is evident in the works of key figures of modernity in these countries, such as Luis Barragán, Carlos Obregón Santacilia, and Lucio Costa, who began their careers with revivalist works.

Costa, the great creator of the synthesis between modernity and tradition that characterised the first Brazilian architectural modernity, later dismissed his early works as a "neo-colonial misconception". He also distanced himself from discourses that flirted with scientific racism and in the early 1930s he incorporated Gilberto Freyre's culturalist vision, marking a shift towards a positive perspective of miscegenation.

Noting that colonial architecture was an adaptation of Portuguese vernacular architecture to the tropical environment, like a "ready-made garment that has to adapt to the body of the new land", Costa argued that it had undergone a process of simplification, taking on an "unpretentious and pure" character. He uses Gilberto Freyre's concept of "softening" to convey the idea that Brazilian culture is the result of European civilisation becoming tropicalised and softened by nature and the influence of indigenous and African people.

Costa establishes a reasoning based on social, technical, and aesthetic approximations between modern and colonial times, for example when he states that the natives' forms of sociability and climate suitability would have had repercussions on the large covered spaces of the colonial ranchos, which moved away from the metropolitan tradition and leaned towards the monumental indigenous shelters. "So, in a way, everything intertwined - the Indigenous oca, the Trás-os-Montes house, the so-called 'Bandeirante' house, the farmhouse, the suburban house, the urban neighborhood house."[18] In 1926, Carlos Obregón Santacilia, like Costa, was already advocating for the adoption of a "line of world architecture" and stated that working within the Mexican tradition did not mean imitating it but rather, making it evolve. As the author of the most emblematic works of the Vasconcelista neo-colonial period, such as the Mexican Pavilion at the Exhibition of the Centenary of Brazilian Independence in 1922 and the Benito Juarez Primary School in 1924, for Obregón Santacilia, in the 20th century "the spirit and character of the race of each people"[19] would become more evident from a common base provided by mechanical means, modern procedures and programmes.

There is no denying the success that theories on *mestizaje* have had in many Latin American countries, offering a practical response to the

impasse between national unity and population fragmentation. However, it is important to note that the *mestizo* solution does not fully resolve the identity crisis and can in fact in many cases, exacerbate it. Take, for instance, the work of an architect like Juan O'Gorman, whose career seems to chronicle an incessant and insatiable search - perhaps because it is unattainable - for true "Mexicanness".

From the introduction of rationalist architecture in Mexico combined with some local colour, such as in the case of Casa Estudio Diego Rivera y Frida Kahlo (1929-31), O'Gorman went on to invest in the radicalisation of the modern synthesis of the arts, masterfully developed by Mexican muralism. His subsequent works displayed varied and even conflicting experiments, including for instance, the monumental murals that cover the regular volumes of the UNAM Central Library (1949-1951) and the hybrid and organic aspect of his Casa Cueva (1948-53). These pieces reflect the search for a genuine Mexican identity, which seems to reach paroxysm and a dead end, and are a protest against civilisation and the order of modern architecture itself.

3. CONCLUSION

Rather than a harmonious blend, the dynamics of *mestizaje* reveal an existential crisis reflected in the incessant and "painful construction of ourselves", developed in the rarefied dialectic between "not being and being other"[20].

This may have something to do with the adoption of a contradictory discourse by birth, conceived by Latin Americans themselves concerned with building a place in the international community. Ricardo Piglia, in discussing the history of Argentine literature, refers to this as a cross-eyed gaze, marked by a split, a double temporality, and two autonomies[21]. This is the only way to understand the opposing forces at play, the simultaneous pursuit of a global race and a local architecture.

In the same sense, it is impossible to ignore the obvious contradiction underlying the notion of an autonomous modern architecture based on colonial references. However, one cannot fail to recognise that this operation effectively created very strong sense of national conscience, expressed in a curious reversal of meaning that turned the colonial into an effective tool for decolonisation. The dissemination of the "Brazilian style" - with Oscar Niemeyer as a shining star - offered new references to modern architecture worldwide, inspiring architects in the various countries worldwide, including those in the North Atlantic region. A similar phenomenon occurred with Barragán's architecture, whose characteristics were widely replicated both within and outside Mexico.

To address this process, it is necessary to deconstruct the historiographical narratives based on interpretations of central and "deviant" peripheries. For Liernur, the issue with this type of approach is that it ignores, or conceals, the multiplicity of alliances and points of contact that intersect in opposite directions across the seemingly solid boundary between the "outside" and the

"inside", the pure and the contaminated, the national and the local, within the framework of modernisation processes.[22]

However, as in the case of *mestizaje*, the contradictions arise more from the result of complexity and richness than of simplifying binarisms. The shifts between positive and negative poles do not define a fixed position, but a pendulum movement characterised by a dynamic that sometimes constructs, destroys, and reconstructs social - and architectural - meanings according to the interests of those who mobilise them.

Finally, it is important to stress that the influence of racial perspectives is constitutive of modern architecture as a whole, and not a theorisation only limited to nonwhite and subaltern spaces. As Irene Cheng, Charles L. Davis II, and Mabel O. Wilson note, racial thought was present in architectural modernism through concepts such as evolution, progress, climatic determination, and regionalism, even when it was concealed in the broader ideology of internationalism and colour-blindness embodied by modernism's white walls.[23]

To gain a deeper understanding of architectural history, the full complexity of architectural works should therefore be studied in a manner that takes into account the identity paradigms of its era, and the particular stances architects take regarding these paradigms, positioning themselves intentionally or unintentionally, and often realigning their points of view as their careers advance. ■

LÚCIO COSTA ON ALEIJADINHO: RACE AND THE BUILDING OF THE NATIONAL ARCHITECTURE

JAIME SOLARES CARMONA
YALE UNIVERSITY

ABSTRACT

Lúcio Costa is the leading theorist of the first generation of Brazilian modern architects. This cycle can be delimited by two critical moments in his production: when he became director of the Escola Nacional de Belas Artes (National School of Fine Arts) in 1930 and the inauguration of Brasilia in 1960. During this period, and primarily through his writings (1924-1951), the definitions of race and national identity went through significant changes, shifting from eugenic processes of whitening the race and erasing Indigenous and black architectures in the 1920s to Gilberto Freyre's theory of "racial democracy" later, from which the miscegenation of different ethnicities would constitute the Brazilian people. As a case study, we will analyse how Lúcio Costa manipulates and reconstructs his evaluation of the historical figure of Antônio Francisco Lisboa, - Aleijadinho (Little Cripple). We will see how, at first, Aleijadinho was harshly criticised and had his work downgraded by Costa and how, years later, this figure would be celebrated through a historiographical operation of constructing a "national genius" to establish a genealogy that would justify the work of Oscar Niemeyer. Special attention will be given to the historical process of erasing the corporeality of Aleijadinho – a black man ("dark brown," as reported by his daughter-in-law Joana) and with a disability – and his consubstantiation in the body of Oscar Niemeyer, a white man without a disability. We will analyse the racial discussion in the context of the formation of national modern architecture in the first decades of the 20th century, with particular attention paid to the body category and its social markers, and examine how Costa constructs a canon that influences our historiography to this day.

The discussion of race in modern architecture has emerged in recent years in both the United States and Latin America.[1] However, little has been said about Brazil's specific case, especially regarding how canonical modern historiography discusses race and nation in the first half of the 20th century[2].

This paper aims to bridge the gap by examining how notions of race and nation appear as central categories in Lucio Costa's writings (1924-1951). He can be considered the leading theorist of the first generation of modern architects in Brazil, having laid the foundations for what we still consider to be the modernist historiographical canon.[3] To this end, our analysis will pay particular attention to how Costa devalues/valorises the historical figure of Antônio Francisco Lisboa, or Aleijadinho (Little Cripple) (1738-1814), to construct a genealogy of Brazilian architecture through the lineage of a "national genius," understood herein as an intellectual embodying the highest aesthetic and moral ideals representative of the nation. Costa suggests that this idealised figure would galvanise the very construction of the not-yet-formed Brazilian nation. This genius would run from Aleijadinho to Oscar Niemeyer (1907-2012) through a subtle process of "whitening"[4] and "disembodiment" of the former.

1. LUCIO COSTA: FROM NEOCOLONIAL TO MODERNISM

Lucio Costa (1902 - 1998) was born in Toulon, France, and moved permanently to Brazil at age fifteen. He entered the "Escola Nacional de Belas Artes" [National School of Fine Arts], graduating as an architect in 1924. During his undergraduate years, he became the star student of Jose Marianno Filho, a leading proponent of the Neocolonial style. In his graduation year, he wrote a column in the influential Rio newspaper *A Noite* demonstrating his aspiration for national architecture.[5] Costa revealed that he did not expect to find a consolidated "national architecture" here since we still had "a cosmopolitan people, of a not yet definitively constituted race." He suggested that we should have established a guideline, a past, whether good or bad, to follow as a solution. Although, like Marianno, Costa wants to "rehabilitate the architecture of race as a relevant factor in nationalization"[6] by using the term "guideline" and relativising the moral value of the past from which to establish it, Costa demonstrates that even though eugenicist ideals influence him, he is not affiliated with pure race eugenics, as in the European Mendelian totalitarian experiments that would consider Latin-American racial mixing a racial degeneration.[7] The central racial thesis developed in Brazil at that time was that of the "myth of the three races": the white Portuguese, the black African, and the indigenous American. In both the negative view, which believed mixing races caused the degeneration of the Brazilian people, and the positive view, which exalted the benefits of this mixture, we see a prospective eugenicist project, not a retrospective one.

This eagerness to unravel the roots from which we can shape our future is central to Costa's thinking and is a defining feature of modernism in the Latin subcontinent. As Carlos Ferreira Martins states, one of the essential differences between the European and Latin American architectural avant-gardes is that while the first was a denial of the historical past and a

7. Eugenics was created by the English anthropologist Francis Galton in 1883. Based on Charles Darwin's evolutionary theses, he proposed the existence of a hierarchy between races. In Brazil, this ideology was strongly present in the fascist-inspired political movement Ação Integralista Brasileira and in scientific institutions such as the Sociedade Eugênica de São Paulo (SESP).

universalist project of humanity, here, the past serves as an element of social cohesion in the process of building a non-cosmopolitan nationality.[8]

This bridging of the past and the future defined Costa's idea of national architecture. Tavares refers to this theoretical foundation as the "colonial-modern synthesis," structured mainly from the mid-1930s when Costa definitively adhered to the modernist aesthetic. This pursuit of an authentically Brazilian architecture that disregards the indigenous building tradition becomes the primary similarity between Neocolonial architecture and Modernism. However, unlike Neocolonial theories, Modernism did not seek a historical-stylistic recovery of colonial architecture. Instead, it operated from this past towards a tautological historical scheme that would result in Modernism. Brazilian modernism is, therefore, characterised by this fusion of tradition and modernity. It is a tradition, in the words of Otilia Arantes, "without traditionalism."[9]

Costa's shift from traditionalism to modernity follows a period of profound changes and overlaps, both in terms of aesthetics and politics. As the Week of Modern Art in 1922 took place in Sao Paulo, considered the inauguration of the artistic avant-garde in Brazil, the International Exhibition of the Centenary of Independence took place in Rio de Janeiro, the country's capital, featuring the construction of several Neocolonial pavilions. Years later, the "Estado Novo" [New State] (1930-1945) arose as a totalitarian government led by Getúlio Vargas. Under the aegis of industrialisation, its "conservative modernization" reproduced the eugenicist racism of previous decades and instigated the first wave of urbanisation aligned with an idea of national integration. Many modern artists and thinkers, such as Mário de Andrade, worked for his government and had a great interest in the Baroque art of Aleijadinho: "The modernists reinvented the figure of Aleijadinho as an alchemical hero who had come to bring about the impossible unity of Brazilian races."[10]

António Francisco Lisboa (1738-1814), better known as Aleijadinho due to his physical deformations in his later years, was born in Vila Rica, quite possibly the son of Manuel Francisco Lisboa and his slave Isabel. He was freed at his baptism and was born "dark without the right to a portrait."[11], in other words, poor and socially vulnerable.

In the Brazilian context, a "dark brown" person is usually referred to as a mulatto, even though we now use the term Afro-Brazilian.[12] Aleijadinho's race has always been the central theme of the works surrounding him, from the pioneering biography by Rodrigo José Ferreira Bretas, written in 1858, to more recent works, such as Celso Kelly's 1960 book, which relates the artist's *virtuoso* work to a supposed rebellion he had "against the dark pigments of his skin, an exasperation common to mestiços." [13] His originality was thought to stem from a process of denial of his black origin, thus producing a "whitened" art. After falling into oblivion for almost half a century, Aleijadinho "was recovered as a figure of national artist by the builders of Brazilian modernism in the 1920s, namely through the intervention of Mario de Andrade".[14] What is striking, therefore, is that while modern intellectuals exalt Aleijadinho as a representative of the mixture of the three races, Lucio Costa still resists this appreciation of the architect.

In the article "O Aleijadinho e a arquitetura traditional" [Aleijadinho and traditional architecture] (1929)[15], Costa criticises Aleijadinho's tendency to carry out detailed work, accusing him of being a "decorator, not an architect" once, instead of producing "robust, strong, massive" work, Aleijadinho would produce that which was "thin, delicate, fine, almost like a medal." This far-fetched, heterodox, and inventive architecture bothered Lucio Costa, for whom Aleijadinho's work was inseparable from himself: "It escapes, it slips, it is itself. - Himself."[16] Costa would not abandon this intimate association between author and work in the following years.

In 1930, he became the director of the National School of Fine Arts. Already critical of the Neocolonial style, he decided to implement a course with a modernist orientation and would delve deeper into Le Corbusier's work in the following years. In 1937, Costa wrote " Documentação necessária" [Necessary documentation] [17] for the Serviço do Patrimônio Histórico e Artístico Nacional (SPHAN) [National Historical and Artistic Heritage Service][18], where he started working, laying the foundations for the canonical historiography of Brazilian architecture.

In this text, we can already see the influence of sociologist Gilberto Freyre's concept of "racial democracy"[19] and its part in the "softening" process with the presence of blacks and indigenous people in the production of colonial architecture and its de-characterisation of the Portuguese-European matrix.[20] Although he acknowledges blacks and indigenous people's constructive culture, Costa favors the know-how of the white Portuguese, especially in terms of the the master builder figure, the "velho portuga" [Old Portuguese], who would have safeguarded the good colonial architectural tradition. In other words, "from the Luso-Brazilian experience, architecture would develop coherently for centuries, until the consolidation of rationalist conceptions in the 1930s - with only a lapse of time marked by the eclectic period."[21] If, in previous years, Costa disqualified Aleijadinho from being an architect because he made everything "thin, delicate, fine, almost like a medal," these qualities now define part of the technical vigour of the new modern architecture.

2. ALEIJADINHO AND OSCAR NIEMEYER

The reconciliation with Aleijadinho would allow Costa to associate modern construction techniques with colonial ones, as he did in 1937, and to the genius of Aleijadinho himself, which would be compared to Oscar Niemeyer's. In 1948, the artist and critic Geraldo Ferraz opposed the historiography of the Rio school (written and led by Costa), claiming that Gregori Warchavchik and Flavio de Carvalho were the true pioneers of modern architecture in Brazil due to their linguistic avant-gardism in early works in Sao Paulo. In response, Costa advocates Niemeyer as the great master of the period, one that "expressed itself through the chosen personality of this artist, just as it already expressed itself in the 18th century, under very similar circumstances, through the personality of Antônio Francisco Lisboa or Aleijadinho.[22]

Costa's unquestioning admiration of the figure of Niemeyer, through his affiliation with the genius of Aleijadinho, is a rhetorical device of *argumentum*

18. Rodrigo de Mello Franco created SPHAN in 1937. La Costa wrote some of his fundamental texts on the historiography of Brazilian architecture, including "Notas sobre o Mobiliário Luso-Brasileiro" (Notes on Luso-Brazilian Furniture) (1939) and "Arquitetura Jesuítica no Brasil" (Jesuit Architecture in Brazil) (1941).

19. Silvana Rubino. "Gilberto Freyre e Lúcio Costa, ou a 'boa tradição." In *Oculum Ensaios*, v. 2, 1993.It is essential to point out that this concept has suffered great criticism, notably from the anti-racist theory of authors such as Abdias de Nascimento.

20. Costa, *Documentacao necessaria*, 87.

21. Rodrigo Espinha Baeta. "Modernist criticism of colonial architecture and the Baroque in Brazil: Lucio Costa and Paulo Santos." *Cadernos de Arquitetura e Urbanismo*, v. 10, n. 11 (December 2003): 35-56.

22. Lúcio Costa. "Depoimento do arquiteto Lúcio Costa sobre a arquitetura moderna brasileira." *Diário de S. Paulo* (March 7, 1948).

ab auctoritate. In Baeta's words, "Niemeyer assumes the role of architectural genius for the "contemporary" context, in the same way that the mulatto absorbed this condition in the colonial period - Niemeyer is, finally, the modern Aleijadinho."[23] This exaltation reaches its apex in the 1951 text Muita construção, alguma arquitetura e um milagre [A lot of construction, some architecture, and a miracle], in which Costa speaks of a "key to the enigma"[24] to explain Niemeyer's exceptionality, while also acknowledging architecture's broader socioeconomic and political conditioning factors that contributed to a radical change in Brazilian society: the end of slavery and the Industrial Revolution. If, on the one hand, he considered slavery to be an obsolete system with "such vile foundations," on the other hand, he accused African-Brazilian youth of corrupting national culture through Americanisation and social degeneration due to their "vulgar ways." Finally, while he seemed sympathetic to the valorisation of work (in line with the labour rights won during the Estado Novo), he set a limit: asking for more money or behaving less docilely than during slavery would define "rebellion" on the part of domestic workers.

3. WAS LUCIO COSTA A RACIST?

Race never stopped being a fundamental category of social analysis for Costa.[25] His historical scheme of "colonial-modern synthesis," perfected from the end of the 1930s onwards, reverses a tendency from the 1920s to credit racial mixing with the impossibility of developing a genuinely national architecture. This inversion also affects Costa's appreciation of the figure of Aleijadinho, who becomes a national genius in canonical historiography and the genesis of Oscar Niemeyer's geniality.

By sublimating the discussion of body and race in Niemeyer and Aleijadinho, Aleijadinho's whitening is imbued into his progressive scheme of "body replacement." The fact that Niemeyer's white, non-disabled body does not appear in Costa's narrative does not equate to its silencing regarding Aleijadinho's disabled and Afro-Brazilian body. Post-racialising an individual, considering the discussion of a nation that is deeply racialised, has the same effect there as it does today: making it invisible. Costa's sense of disembodiment is not progressive but reactionary. In a way, it is possible to say that the whitening of Aleijadinho, by Lucio Costa, is an epistemological erasure. This symbolic killing is necessary to allow for the "healthier and purer" white, able-bodied modern architect to prevail. The process of producing a "genius" genealogy is, in this sense, a covert, and thus very effective, historiographical strategy of a hierarchisation of racialised bodies, culminating in the white, non-disabled body – Niemeyer - at the expense of African-Brazilian, disabled body – Aleijadinho. ■

MODERN WHITE: THE INTERSECTION OF RACIAL IDENTITY AND PENTELIC MARBLE ARCHITECTURES IN TWENTIETH CENTURY ATHENS

ANGELOS CHIOTIS
DELFT UNIVERSITY OF TECHNOLOGY

ABSTRACT

This paper investigates the profound influence of white Pentelic marble on modernist architecture in Athens, Greece, and its broader implications for architectural and racial narratives worldwide. The historical context begins with a Eurocentric view of architectural evolution, tracing a lineage from ancient Egypt through Greece and Rome to Western Europe. Influential figures like Quatremère de Quincy, Winckelmann, Fergusson, and Viollet-le-Duc contributed to a racialised perception of Greek architecture, which Adolf Loos later expanded into racial historicism, linking modernity to Western Europeans.

Amidst these Eurocentric narratives, Greece's unique contribution to modernist architecture, particularly the use of Pentelic marble, stands out. This material, historically significant and symbolically potent, has been pivotal in Athenian architecture, expressing prestige, power, and cultural identity. The paper explores Pentelic marble's socio-political symbolism and its role in Athens' architectural landscape.

The study also delves into the evolution of the colour white across science, culture, and architecture from the 17th to the 20th centuries. Contributions from scientists like Newton, Goethe, Chevreul, and Helmholtz reshaped the understanding of white light, influencing its symbolic associations with purity, cleanliness, and social status. In Greece, white became a symbol of national identity and classical heritage, deeply intertwined with neoclassical architecture and the country's cultural revival.

Modernist architecture in Athens, characterised by minimalism and functionalism, embraced Pentelic marble to reconcile modern aspirations with classical heritage. Key landmarks, such as the Hilton Athens and the United States embassy, exemplify this integration, reflecting a blend of modernist principles and classical motifs.

The paper critiques the International Style's imposition of Western ideals, highlighting the complexities of cultural appropriation and the erasure of indigenous traditions. By examining the multifaceted significance of white Pentelic marble, the study underscores its role in shaping modernist aesthetics, racial identities, and the global architectural discourse.

#37

1. THE WHITE LEGACY OF MODERN ARCHITECTURE

Before the nineteenth century, architectural and civilisational histories were predominantly Eurocentric, centring on Europe and the Near East. They constructed a supposed lineage from ancient Egypt through Greece to Rome, culminating in Western Europe. This notion of linear progression positioned Greece as the cradle of modern architecture. Influential figures like Antoine-Chrysostome Quatremère de Quincy, Johann Joachim Winckelmann, James Fergusson, and Viollet-le-Duc shaped these perspectives with their interpretations and biases.

Quincy broadened architectural typology by incorporating ethnographic insights, linking Greek architecture to the humble hut typology.[1] Winckelmann attributed the brilliance of Greek art and architecture to the favourable conditions of Greek climate and culture.[2] Fergusson[3] and Viollet-le-Duc[4] asserted that Athenian architecture and the Parthenon arose from a racial blend of Aryans and Semites. These ideas laid the groundwork for Adolf Loos' racial historicism, associating modernity with northern or western Europeans.[5]

However, amidst these Eurocentric narratives, one cannot ignore Greece's unique contributions to architectural thought and practice.[6] Notably, modernist architecture in Greece stands out for its extensive use of Pentelic marble. This pure white to light grey material, with origins dating back millions of years, holds a central place in international architecture. Predominantly quarried on the southern slopes of Mount Pentelicus near Athens, it has significantly influenced the aesthetics and symbolism of Greek architecture. Beyond its practical applications, Pentelic marble symbolises prestige, power, and cultural identity. Its association with state-sponsored initiatives reflects socio-political ideologies. Whether used in the construction of governmental buildings, cultural institutions, or corporate headquarters, Pentelic marble serves as a visual manifestation of authority and cultural continuity.

This paper aims to unravel the multifaceted significance of Pentelic marble within the architectural modernist narrative in Athens, Greece. Additionally, it endeavours to explore parallels between the use of Pentelic marble in Athens and its deployment in architectural projects worldwide. Through the exploration of the evolution of colour white across science, culture, and architecture, this paper aims to investigate the origins of modern aesthetics through neoclassical architecture. By focussing on both Athenian and international case studies, it seeks to draw conclusions about the role of white Pentelic marble in the formation of modernity, whiteness, and racialised identities.

2. THE WHITE EVOLUTION ACROSS SCIENCE, CULTURE, ARCHITECTURE

COLOUR THEORY AND NATIONAL IDENTITY

Between the 17th and 19th centuries, advances in the study of optics and light reshaped our understanding of white light. Isaac Newton's prism experiments revealed that white light encompasses all visible colours, profoundly

impacting both science and art.[7] This insight led to deeper colour theory exploration in the 19th century, with Johann Wolfgang von Goethe, Michel Eugène Chevreul, and Hermann von Helmholtz contributing significantly. Goethe viewed white as a symbol of purity and completeness,[8] while Chevreul saw it as a neutral base affecting surrounding colors.[9] Helmholtz offered a scientific explanation of white as a blend of all visible wavelengths.[10]

In the 19th and early 20th centuries, white gained symbolic importance, expressing purity, innocence, and cleanliness, particularly in Western societies.[11] This symbolism found expression in Christian iconography, where white symbolised divine light and holiness.[12] Additionally, white clothing became a mark of wealth and social status due to its maintenance difficulty.[13]

White also played a crucial role in national symbolism. The Greek flag, designed during the Greek War of Independence, features alternating blue and white stripes with a white cross on a blue canton. The white stripes symbolise the purity and innocence of Greece's struggle for independence[14] and reflect the nation's values and aspirations. Greece's fight for independence was intertwined with a desire to reconnect with its ancient heritage. The new Greek state adopted symbols and narratives that emphasised continuity with classical antiquity.

Furthermore, Greece witnessed a cultural revival in the late 19th and early 20th centuries, reinforcing its national identity. The resurgence of classical themes in art, literature, and architecture often utilised white to symbolise the nation's modern reemergence with strong ties to its ancient roots. This revival was not just an aesthetic choice but also a deliberate effort to align modern Greek culture with the perceived glory and purity of its ancient past, fostering a sense of continuity and national pride.

CLASSICAL HERITAGE AND NEOCLASSICAL ASCENDANCE

Throughout the 19th and 20th centuries, the colour white became a profound symbol in Athens, Greece, deeply embedded with national and racial connotations.[15] This symbolism was linked to notions of purity, classical heritage, and Western colonialism. The 19th-century revival of classical antiquity significantly influenced national identities across Europe, with Greece at the forefront. Ancient Greece, idealised as the cradle of Western civilisation, positioned Athens as the epitome of this revered legacy. White, reminiscent of pristine marble statues and temples, came to express the purity and grandeur of this classical epoch.

The enduring imagery of white marble ruins and neoclassical facades in Athens shaped global perceptions of Greece as the cradle of Western civilisation. During this period, Athens saw a renaissance of neoclassical architecture and art, where the prominence of white symbolised the ideals of beauty, harmony, and rationality associated with ancient Greek culture.[16] This aesthetic preference reinforced the connection of white with cultural and racial purity.

The neoclassical movement, which flourished from the late 18th to the 19th centuries, greatly impacted the use of white in architecture. Inspired

by the symmetrical lines and architectural finesse of ancient Greek and Roman structures, architects favoured white marble and white-painted surfaces to evoke the splendour and purity of classical antiquity. In 19th-century Athens, following Greek independence, neoclassical architecture reemerged. Public edifices such as courthouses, museums, and government structures used white marble or white-painted facades, paying homage to the city's classical heritage.[17] This further associated white with cultural purity, national pride, democratic ideals, justice, and civic virtue.

Pentelic marble, particularly esteemed for its use in classical monuments like the Parthenon, became the preferred material for expressing modernist ideals.[18] Its pristine quality was evident in notable neoclassical structures both in Athens — such as the University, Academy, and Vallianeion Library — and internationally, in buildings like the Carnegie Museum of Art's Hall of Sculpture and the Victoria Memorial in London. Institutions such as the British Museum and the United States Capitol also adopted similar white materials, extending the influence of classical inspiration into modernist contexts.

3. THE WHITE AESTHETICS OF MODERNISM

INDUSTRIAL ADVANCEMENTS AND MODERNIST IDEALS

The Industrial Revolution brought significant changes to architecture through new materials and methods, such as cast iron and steel, known for their durability and modernity. The introduction of Portland cement in the early 19th century transformed architectural potential, enabling the widespread use of white concrete.[19] This material's durability and versatility made white a key feature in modernist architecture, symbolising purity, simplicity, and neutrality. Modernist architects, including Le Corbusier, used white to emphasise the unadorned forms of their buildings, reflecting the movement's focus on cleanliness and modernity.[20]

The Bauhaus movement, central to modernist ideology, adopted white for its clean and minimalist aesthetic. White surfaces were used to foster a sense of openness and highlighted the importance of form and space.[21] This approach significantly influenced Athens, where the convergence of modernist principles with the widespread use of white surfaces became a significant motif indicative of the city's evolving aesthetic trajectory. During the interwar period and post-World War II reconstruction, the International Style, characterised by its minimalism and lack of ornamentation, gained popularity in Athenian architecture.[22]

Pentelic marble, known for its white color, was particularly suited to express modernist ideals. Greek architects used this material to reconcile modern aspirations with the enduring legacy of Athenian classical monuments. This integration allowed modern structures to blend seamlessly into the urban fabric of Athens while showcasing the sleek, functional aesthetics of modernism. The concept of white as a symbol of purity and the amalgamation of all colours, rooted in 19th-century colour theory, continued into the 20th century, bridging modernist principles with classical aesthetic

values. This concept found expression through the widespread use of Pentelic marble in both residential and public constructions, bridging the gap between modernist ideals and the venerable aesthetic heritage of classical antiquity.

Though the International Style is primarily associated with American, French, and German architecture, its impact reached international contexts, including Athens, Greece. Athens, the cradle of classical architecture, saw a spread of modernist elements in its architecture, which had parallels with the International Style in the United States. Both movements looked back to classical ideals for inspiration.

ATHENIAN MODERNISM AND PENTELIC MARBLE

In the early 20th century, Greece saw a revival of its architectural heritage, spurred by increased tourism and international diplomacy. American architects and scholars, drawn to Greece, introduced the aesthetic preference for white structures, influencing the preservation and restoration of historical buildings with a white finish. This period marked a shared appreciation for a clean, white aesthetic between Greece and the United States, symbolising modernity, and the preservation of cultural heritage.[23]

A notable example of this architectural trend is the Hilton Athens. Built in the post-war era, it represents a shift towards tourism development and modernity. The hotel's use of Pentelic marble on its facade and in its atria blends modernist aesthetics with elements of classical Greek heritage. This integration of Pentelic marble serves as a visual connection to ancient Greece amidst rapid modernisation, aligning with broader trends in modernist architecture seen globally, such as in the United Nations Headquarters in New York.

The United States embassy in Athens, designed by Walter Gropius, attempts to blend Hellenism with the needs of post-war diplomacy. It combines American modernism with Greek architectural traditions, featuring a symmetrical layout, a colonnade, and extensive use of Pentelic marble, reminiscent of the Parthenon. This design reflects the United States' post-World War II efforts to assert cultural and political presence by incorporating local architectural styles. However, it also mirrors contemporary American trends, suggesting Gropius may have been influenced by his American colleague Edward Stone's design for the New Delhi chancery, rather than solely Greek antiquity. The embassy's use of Pentelic marble and symbolic landscaping elements like olive and cypress trees aim to connect with Greek traditions, though the intention behind these choices remains open to interpretation.

Both the Hilton Athens and the United States embassy exemplify the trajectory of Athenian architecture, with Pentelic marble serving as a unifying motif linking past and present. The pervasive use of white in Athenian architecture underscores a deep connection to classical heritage and national identity, reinforcing Athens' status as a symbol of Western civilisation, where the colour white assumes a powerful symbol of historical continuity and racial purity.

4. THE WHITE ARCHITECTURE OF APPROPRIATION

In the 20th century, the International Style emphasised volume over mass, lightweight industrial materials, minimal ornamentation, and functionality. Architects like Le Corbusier, Ludwig Mies van der Rohe, and Walter Gropius championed this movement. Its rise paralleled high modernism and European colonial expansion, often imposing Western architectural ideals on colonies in Africa, Asia, but also Greece. This imposition was intended to symbolise modernity and progress but often suppressed local traditions.

In the early 19th century, white in architecture signified heritage, national identity, and purity. However, during European colonial expansion

and the transatlantic slave trade, white also came to symbolise racial supremacy. The era consolidated racial ideologies that used white to denote the supposed superiority of the "white race." Ethnographic studies and racial theories often referred to the "Aryan race" as the pinnacle of human development, influencing national identities and racial policies in various countries, including Greece. Thus, from the 17th to the early 20th century, white's conceptualisation evolved, shaped by scientific developments, cultural symbolism, and socio-political contexts. White transitioned from representing scientific phenomena to embodying purity and racial ideologies, delineating its multifaceted role in society.

Pentelic marble, historically significant in ancient Greek temples, gained prominence in modernist architecture, symbolising both national and international significance. Its use prompts questions about the need for monumental gestures in post-war contexts and the appropriation of cultural symbols. Although tied to Greek identity, Pentelic marble's adoption in international projects complicates claims of a universal Western identity and raises concerns about cultural exchange and potential erasure of indigenous heritage.

The juxtaposition of Pentelic marble with traditional architectural elements underscores the tension between preserving heritage and embracing modernity. Its application in modernist architecture reflects a redefinition of aesthetics and universal symbolism. In modernist architecture, Pentelic marble expresses a complex interplay of monumentality, national identity, universality, and heritage. Its application transcends geographical boundaries, prompting considerations of cultural appropriation and the erasure of indigenous architectural heritage, while exploring themes of cultural exchange and identity construction in a globalised era. ■

BIOGRAPHY

Angelos Chiotis is a PhD candidate in Architecture Philosophy and Theory at the Department of Architecture of Delft University of Technology. Formerly a senior architect for architecture firms in Stockholm and Milan, Chiotis currently holds a position as a studio instructor at the Agential Materialism design studio and serves as a guest researcher at the Ecologies of Architecture research group. His doctoral dissertation, titled "Pentelic White: The Legacy of Pentelic Marble in Neoclassicism, Modernism, and Environmental Change from 1821 to Today," engages with postcolonial approaches to investigate the role of Pentelic marble in shaping the Greek nation-state.

A NETWORK FROM THE MIDDLE OF THE WORLD: MODERN ARCHITECTURE AND CULTURAL HYBRIDISATION IN QUITO

INGRID QUINTANA-GUERRERO

CHIARA LUCIA STORNAIOLO JÁCOME
UNIVERSIDAD DE LOS ANDES, COLOMBIA

ABSTRACT

During the 1940s, many European artists migrated to South America, due to WWII. Trained under Bauhaus pedagogies, these designers aimed to create a *Gesamtkunstwerk*. Many sought to settle in Latin American metropolises where economic dynamics and their market demands, including affordable housing and everyday objects, were on the rise. Some of these artists ended up in smaller Andean countries such as Ecuador, known for its cultural diversity stemming from geographical variety and the overlapping of pre-Hispanic cultures.

These actors connected with Quito's artistic elite, and were instrumental in initial efforts to develop a local architectural modernity. Their continuous interaction with Latin American and European artistic networks led to the shift in the architectural education at Universidad Central del Ecuador (UCE), the creation of the Ecuadorian Institute of Folklore (1961) and galleries which boosted the promotion of Ecuadorian design, both locally and overseas.

Based on primary sources from LIPADA, Casa de la Cultura Ecuatoriana, Blomberg Archives, among others, this work illustrates how informal dialogues and institutional actions taken by the aforementioned actors led to architectural experiments in Quito from the 1950s, including housing, institutional headquarters, educational, and leisure facilities. The narratives behind these works merged rational and eclectic elements, echoing indigenous and colonial styles, on the use of popular techniques from ancestral crafts, and on the intentional inclusion of local artists' works within the architecture as a way of accomplishing unique total works of art.

#37

1. INTRODUCTION

Beginning in the late 1930s, Ecuador hosted political, economic and cultural events[1], which contributed to a regional modernity. The Banana Boom (1945-1960), the Oil Export Boom (1970s), periods of right-wing rule and dictatorship (1934-1979), and Quito's designation as the venue for the XI Inter-Andean Conference of Foreign Ministers in 1954 (which ultimately did not take place), led to the execution of several projects in the city, including master plans such as Uruguayan Guillermo Jones-Odriozola's urban project for Quito (1942-1945)[2]; renewing curricula in art, local architecture and design schools, and founding the School of Architecture (1946) at Universidad Central del Ecuador (UCE), as well as new cultural and research institutions[3]. These developments also contributed to the transformation of urban and domestic spaces, designed by emerging building and furniture industries.

Despite these facts, Quito remains overlooked in regional architectural historiography. Our research aims to rectify this through the interpretation of local narratives based on hybrid features of Ecuadorian production, derived from complex relational networks among people and trades.

FROM GESAMTKUNSTWERK TO HYBRID ARCHITECTURES

Artistic creation in the early 20th-century was nurtured by Richard Wagner's concept of *Gesamtkunstwerk*, which aims to combine architecture, art and life through incorporating elements from various trades. However, it is crucial to understand modern architecture within its relational network, facilitating a dialogue between global disciplinary discussions and regional concerns. Therefore, we consider the total work of art as a device for creating and inhabiting architectural projects. We rely on García-Canclini's notion of hybridisation[4] for referring to architectural production as a particular system for introducing disciplinary research into global exchanges. This approach enables us to examine how works circulate within the professional community and are received by peers, clients and users, ultimately determining the works' success[5].

2. ACCLIMATISATION. "HEIMAT" AS HIBRIDISATION PILOT

The Freudian concept *Unheimlich*[6]. (uncanny or unhomely) describes "what is […] frightening precisely because it is not known and familiar". This relates to some individuals' experiences when they first arrived in Ecuador. Migrants from the German-speaking world experience a challenging uprooting when faced with an unknown (albeit European) language and the striking Andean topography, Ecuadorian light and tropical weather. Quito's Pichincha volcano symbolised both the city's vulnerability and its identity. Therefore, this meant that the cultural landscape did not match the romanticized depictions of foreign explorers in the 19th century.

Llorca[7] describes the Ecuadorian context[8] in which migrant architects had to assimilate notions like scarcity (which, does not necessarily relate to the lack of resources but to deliberate austerity[9]); immediate or instinctive response, stratification; territory, nature and systems of association and dispersion. Travelling architects in the Americas[10] responded to these qualities

by creating a *Heim* ("home" in German) where local features negotiated with European aesthetics. The initial version of domestic local modernity was addressed to / produced by an elite that praised rational aesthetics.

The work of Czech architect Karl Kohn exemplifies this by combining his Modernist European training, and folk symbols and materials related to domestic practices. His own house, built in 1949, is a manifesto of rational aesthetics from the inside out, as well as a complex universe within its intimate spaces, overlapping memories from traditional domesticity in Prague (exemplified by the fact that the Kohn-Schiller family brought all their furniture from their hometown), lessons from Adolf Loos's *Raumplan,* the distant landscape and sculpted nature (with a garden that surrounds the house, concealing it from pedestrians and protecting it from solar radiation). Inside the house, Kohn incorporated niches and furniture displaying Ecuadorian pottery created by his students, including the renowned artist Oswaldo Guayasamín **(Fig. 1)**.

3. TRANSFERTS. GLOBAL ACTORS AND LOCAL NETWORKS

Kohn's haphazard arrival to Quito, as his ship had stopped in Guayaquil en route to Argentina. While in Guayaquil, he was offered a teaching position at Quito's Escuela de Bellas Artes.[11] This might explain why he seemed to act in isolation in Ecuador. However, his production connected with a network of exiles, including Dutch artist Jan Schreuder, who collaborated with local craftsmen. This network[12] included local architects such as Hugo Galarza, trained at Cranbrook Academy of Arts and UCE, giving him a transdisciplinary vision of architecture. Galarza, along with Schreduer and Austro-Hungarian Olga Fisch, joined the Instituto Ecuatoriano de Folklore, a research group attached to Casa de la Cultura Ecuatoriana, which was founded in 1961 by Brazilian anthropologist Paulo de Carvalho Neto. Its establishment was driven by new public laws aimed at developing crafts within industrialisation. This institute empowered strategic public programmes such as Programa Indigenista Andino, which has been operational since 1953[13].

Fisch's interest in local folk art was sparked during her time at Wiener Werkstätte in Austria and Düsseldorf Kunstakademie in Germany.[14] Such interest grew while teaching at Escuela de Bellas Artes de Quito, mentoring artists such as Jaime Andrade-Moscoso, Guayasamín and Leonardo Tejada. As a leading researcher at the Instituto Ecuatoriano de Folklore, Fisch's voice, informed by her exploration on Hungarian and local folk traditions, was crucial in promoting a hybrid approach in architecture, validating the actions of local residents in configuring domestic spaces and popular taste: "By blending them well with modern furniture, we can create an exquisite fragrance and charm. [...][15]."

Members of these institutions also undertook exploration trips, usually engaging artists and intellectuals keen to understand local traditions and craftsmanship. Fisch, Galarza and Guayasamín participated in those trips and documented indigenous lives through photography, writing and painting.

Within Instituto Ecuatoriano de Folklore, exploratory trips also included local artists like Tejada and his wife, Elvia, and Andrade-Moscoso, a pioneer within the Ecuadorian Indigenism movement which characterised his early career. Subsequently, he explored abstraction of the Ecuadorian folk — dancers, peasants, singers— through murals in public buildings and spaces[16].

Andrade-Moscoso's interest in indigenous themes and aesthetics is a stark contrast to his training at the Fine Arts School in Quito and the New School for Social Research in New York. Eventually he became dean of the UCE School of Architecture where his dual background informed a pedagogical proposal for architecture studies that incorporated art courses as the core of the curriculum. This exposed a future generation of modern Ecuadorian architects to hybrid creation ideas.

Lastly, architectural works operated as hubs for creation and exchange: one of which, the Hotel Colón (1964-1978), represents an ambitious attempt to create a monumental *Gesamtkunstwerk* in Quito. One of the owners was Betty Deller's father. She cofounded one of the most influential galleries of modern art in Quito, La Galería, which was a hub for cultural discussion among prominent Latin American artists. She also oversaw art purchases for the Hotel, fitting in with its architectural design. American interior designers Roland Jutras and Fisch curated the purchases, encouraged by Ecuadorian legislation[17]. Andrade-Moscoso exhibited at La Galería and first used its premises as a workshop[18].

The Hotel Colón's comprehensive work of art experience was preceded by the Hotel Quito (1958-1960), designed by American architect Charles McKirahan, who was internationally recognised as an expert in tourism facilities. Its interior design was undertaken by British designer Henry End, who was trained at the London Royal College of Arts and specialised in hotel decorations. He was also engaged in the study of Ecuadorian art history[19]. Its construction, predominantly in concrete, was directed by UCE-trained architects. The hotel was intended as a cultural exchange hub for foreign visitors, with its rooms serving as platforms for discussions between local and global artistic expressions, showcasing ideas for an Ecuadorian modernity.

4. HYBRIDISATION. THE SCALES OF DOMESTICITY

Creating a appropriate environment for modern life was not restricted to the scale of the house, as racial and spatial segregation in Quito was still influenced by the colonial fabric of the city. New districts and infrastructures had to bridge the gap between vernacular life and aspirational culture. The urban area between Quito and Colón hotels formed a cultural and leisure hub for the aspirational middle-high class, comprised of local intellectual elites, conscious of their pre-Hispanic legacy. Therefore, hotels and other modern buildings worked as landmarks mediating between urban and domestic scales.

The Hotel Quito, promoted by the Instituto Nacional de Previsión and situated in a new urban fabric, was designed to adhere to the formal codes of canonical modernity, reinforcing Odriozola's proposal of a monumental diagonal axis, which consisted of wide avenues across the territory. The hotel

offered panoramic views of the Guápulo district and the Eastern valleys bordering Quito. Its entrance portico on González Suárez Avenue is designed in the shape of a hyperbolic paraboloid, echoing iconic concrete architectures, such as Felix Candela's, while the arcade of the reception volume and the stone facade of the casino's reflect Guapulo's traditional architecture[20]. Furthermore, the dorms' volumes follow a sinuous pattern, matching the *carioca*-styled design of the gardens by local landscape architect Andrés Chiriboga, who had trained with Roberto Burle Marx in Brazil. The double-height wall, inside the northside of the reception's volume, features a bas-relief anonymous abstract mural inspired by a mythological indigenous figure: Patecte. The mural, along with the helical staircase, confers a domestic character to the volume serving as a viewpoint to the created and far landscapes. **(Fig. 2)**

Hotel Colón was built in front of El Ejido Park in the La Mariscal district, which is located at the northern boundary of the historic city. The hotel was constructed in phases on a block that was previously occupied by traditional

20. The second and third phases of Hotel Colón were conceived by Ovidio Wappenstein and his second partners, Ramiro Jácome and César Galvez.

1930s houses. It is situated within an urban grid that still retains the patterns of the colonial fabric, despite being surrounded by institutional and housing towers. The Hotel served as a testing ground in Ecuador for artistic and architectural modernities: while the plan-stepped tower, "La Santamaría", third phase of the project, features a striking sculptural facade over Patria Avenue, the original volumes, conceived by the Spanish-Ecuadorian architect Ovidio Wappestein (who was married to Betty Deller) and his first project partner, Alfredo León, "La Pinta", created two parallel bars, connected at ground level by a platform[21]. This strategy reimagined the concept of a hotel as a closed ensemble permeated by the city. Its circulations and facilities are opened up to the public, allowing them to experience the rough concrete texture of the building, which echoes pre-Hispanic stone's unevenness. There, local artworks —including the mosaic Mural *Danzantes II* (1967) by Andrade-Moscoso— also interact with the architectural space. The mural formed part of a larger collection of archeological pieces, paintings and local crafts purchased for the Hotel, including the tapestry *Estructura Rojo y Azul* by Colombian weaver Olga de Amaral (1971). The latter set of pieces recalls the relevance of textiles at the Bauhaus, striking a balance with brutalist architecture. **(Fig. 3)**

A younger generation of Ecuadorian architects including Andrade-Moscoso's son, Jaime Andrade-Heymann and Milton Barragán, continued the search for a total work of art embracing Quito's hybrid condition of cultural production. Both were trained at UCE and still practice sculpture and product design, and also incorporate these works into projects responding to collective housing programmes.

One of the notable projects is Atrium (Milton Barragán, 1981), a building located near the Guápulo area. It faced a paradoxical condition, derived from the need to consolidate the street frontage over González Suárez Avenue, which was occupied by ten-story high housing towers, while also dealing with the dramatic terrain slope towards the east. Atrium features a rational facade that extends the horizontal lines of the neighbouring buildings, and is only disrupted by two compositions. These include a mosaic mural playing with the typography of the word "Atrium" on the ground floor, and a vertical bas-relief above, illustrating modernist abstract figures. This strategy is repeated in a grand five-floor high interior atrium, reminiscent of techniques in pre-Columbian arts from Ecuador such as those of Valdivia. The other three facades reveal exposed brick walls, evidencing masons' skilled handiwork. The eastern facade displays apartment balconies that blend domestic interiors with the natural landscape through the views and the arrangement of potted plants.

Finally, we will discuss Hábitat Guápulo, a housing complex designed by Andrade-Heymann and Mauricio Moreno (1983). It may be considered as the climax of typological and aesthetical hybridisation in Quito's domestic architecture. It stands out not only for its reimagining of the housing block through terraced structures that house duplex and triplex units but also for its incorporation of elements from traditional Ecuadorian homes, such as carpentry, ceilings, etc. The ensemble establishes two dialectic situations. On the one hand, it provides a collective garden that functions as a sculptures

21. Monard, Shayarina and Lusardi, Giada. *Con vista al interior*. Quito: Pontificia Universidad Católica del Ecuador, 2023.

yard —Andrade-Heymann's workshop is located on the same level— enabling a direct dialogue between arts and the powerful landscape of the valleys. This space also features a stone-mosaic mural by Andrade-Moscoso. On the other hand, the architects incorporated mechanical devices such as an elevator of their own design, inspired by their appreciation of British technology. Furthermore, Andrade-Heymann's apartment operates as a global-local *Gesamtkunstwerk* by arranging an inner sculpture garden in the mezzanine with works by himself and his father. The apartment also exhibits household settings with furniture pieces by Artectum, a firm created by local architect Fernando Jaramillo, as well as Fisch's carpets and lamps, ceramics and paintings by Andrade-Heymann **(Fig. 4)**.

5. FINAL CONSIDERATIONS FROM THE MIDDLE OF THE WORLD

Due to the lack of primary sources revealing architectural discourses where hybridisation as strategy might be registered, we understand that our interpretation of the narratives behind modern architecture in Quito and its dialogue with other trades is largely speculative. Nevertheless, statements from prominent figures in both Ecuadorian cultural networks/institutions, as well as in the art scene –particularly Andrade-Moscoso's and Fisch's– have certainly been on the agenda of the new School of Architecture at UCE. In the same vein, it is likely that Galarza's action in public programmes for enhancing local folklore enriched their activities.

This analysis, based on the reading of the selected projects does not aim to be conclusive. However, it has allowed us to identify hotels and housing projects as suitable programmes for establishing dialogues between local and international materials and languages. It also communicates how a Modern domesticity "from the middle of the world'' should be shaped and lived, on different scales. In other words, the geo-referential (cosmic, according to indigenous beliefs) condition of Quito imposes not only physical demands on its architecture but a full engagement with universal debates. Finally, the entanglement of arts, crafts and buildings reveals the creator's hand as the main instrument for conceptualising and executing a local *Gesamtkunstwerk* through the involvement of a complex network of creators in vernacular aesthetics and techniques. ■

(RE)DISCUSSING MISCEGENATION IN THE HISTORIOGRAPHY OF MODERN ARCHITECTURE

ALEX DE CARVALHO MATOS
UNIVERSIDADE DE SÃO PAULO

ABSTRACT

Between the mid-1990s and the end of that decade, two "(Re)discussions" were undertaken. One of them was presented by an Argentine architectural historian in 1995 within the scope of the 1st DOCOMOMO Brasil seminar - (Re)discussing modernism: Universality and diversity of the modern movement in Architecture and Urbanism in Brazil. This is the reflection developed by Francisco Jorge Liernur in *The mask under the mask: miscegenation and modernization in 20th century Latin American architecture*. The other "(re)discussion" was the one mobilized in 1999 by a Congolese-Brazilian anthropologist, Kabengele Munanga, in *(Re)discussing miscegenation in Brazil: national identity versus black identity*. The proximity between the two publications, both in time - the 1990s - and in theme - miscegenation - draws attention to a sharing of concerns between the field of architecture and anthropology that occurs when Liernur revisits the first experiments that rehearsed miscegenation in the architectural field and Munanga reexamines the issue of national identity. But, if on the one hand, miscegenation appears to be a possibility for thinking about "cross-fertilization,"[1] on the other, it presents itself as an "obstacle" in the construction of "a collective, politically mobilizing identity."[2] The present work crosses these two "(re)discussions" in order to examine the meanings that miscegenation takes on in relation to debates on transculturation, cultural anthropophagy and racial democracy, and in relation to those ongoing in the architectural field at that time. Through analyzes of the circumstances that inform the architectural historian and the anthropologist, light is shed on some aspects that emerge in the face of the racial issue included in the discussion on miscegenation, instigating the formulation not of answers, but of questions that need to be asked to the "point of view" of the architectural historian.

"Anthropologists call mestizos only the sons or daughters of Spanish men and indigenous women", postulates Argentine architectural historian Francisco Jorge Liernur in the first sentence of *The mask under the mask: mestizaje and modernization in 20th century Latin American architecture*, his text published in the proceedings of the 1st DOCOMOMO Brasil Seminar, an event held in Salvador between the 12th and 14th of June 1995 with the title "(Re)discussing modernism: Universality and diversity of the modern movement in Architecture and Urbanism in Brazil". On this occasion, to support his considerations on miscegenation, the author mobilizes a wide spectrum of authors and identifies the diffusion of the term as well the emergence of the first criticisms regarding the limits of its use:

> *[...] can architecture criticism and history appropriate the term in this strict sense? If so, which works would take the place of the 'Spanish men'? Herrera's or Churriguera's? And what about 'indigenous women'? the tents of the Araucanians or the monuments of Incanato?*[3]

The author presents the answer below:

> *the evident nonsense of these questions suggests the convenience of giving the word a broader and more ambiguous meaning, extending it to any hybridization between "white" and "indigenous" elements, as a particular case of the more general problem of mixture or transculturation.*[4]

A few years after these formulations, at the end of the 1990s, the Brazilian anthropologist of Congolese origin Kabengele Munanga also launched his criticisms of the concept, especially with regard to its ambiguity. In *Rediscutindo a mestiçagem no Brasil* (1999), a book published for the first time in Petrópolis, Munanga considers that "mestizaje, from a populationist point of view, is a universal phenomenon from which populations or groups of populations only escape for limited periods". From this angle, it is nothing more than "an exchange or flow of genes of varying intensity and duration between populations that are more or less biologically contrasted."[5] However, the anthropologist does not escape the fact that "the notion of miscegenation, whose use is both scientific and popular, is saturated with ideology."[6]

This is what we can infer when we follow the transformations of this notion between the end of the 19th century and the beginning of the 20th century, with the profusion of studies that sought to make sense of this process. Munanga draws attention to the impacts of the abolition of slavery in 1888, which confronted Brazilian elites with the emergence of a new category of citizens: the formerly enslaved. At this moment, not by chance, "the construction of a nation and a national identity became crucial for thinkers such as Silvo Romero, Euclides da Cunha, Alberto Torres, Manuel Bonfim, Nina Rodrigues, João Batista Lacerda, Edgar Roquete Pinto,

6. Munanga, *Rediscutindo a Mestiçagem no Brasil*, 18.

Oliveira Viana, Gilberto Freyre: what was at stake, in this intellectual debate, was fundamentally the question of knowing "how to transform this plurality of races and mixtures, of such different cultures and civilizational values, of such diverse identities, into a single collective of citizens, in one nation and one people."[7] The answer to the problem, although it was informed by pseudoscientific notions of that moment, nevertheless gains an original formulation by inverting the sign of the meaning of miscegenation: if until then it was seen in a negative way, as a threat to the project of a nation that if white was wanted, many of these thinkers went on to demonstrate that miscegenation would make the black element disappear in a few generations, given the supposed genetic predominance of the white element, which could still count on the arrival of European immigrants. Thus, aiming to whiten the population, the Brazilian *intelligentsia* presented the country's dominant classes with a way out to guarantee the stability of the oligarchies, made up of white men in power, without resorting to the segregation policies adopted in the USA or the extermination policies adopted in Germany or, as we will see, in Argentina, approaching the stance adopted by colonial France, which began to promote the idea of "cultural miscegenation" under the anti-Nazi argument.[8]

The project of a whitened Brazilian nation failed, but the ideology of mestizaje had its successes with regard to the secularization of the expectation of whitening. Unlike the USA, where "racial ideology was conducted in such a way as to grant no place to an intermediate person in the biological scheme", that is, to no mestizo, in Latin American countries, like Brazil, where "mestizos consider themselves as true 'Americans' to the extent that blacks can be considered Africans and whites Europeans,"[9] the mixture, by accepting whitening, foresees a differentiated place for the most whitened, which would lead to "reducing discontent between races."[10] It is for this reason that Munanga considers that the miscegenation policy increases the difficulties for the emancipation of black people - thinking of black people here as black and brown -, since it poses as yet another obstacle to "building a collective, politically mobilizing identity."[11]

At the end of the 20th century, the Latin American historiography of architecture was also going through a crisis in relation to the theme of identity, or rather, *identities*, as people no longer believed in the convergence towards a "national identity", but in the proliferation of new identities of "place", of "context". Once the era of civil-military dictatorships in the region was over, the reopening of democratic horizons for the countryside took place with *critical regionalism* in the vacuum left by universalism and in dialogue with concerns from other disciplines, especially the human sciences, impacted by the thoughts of figures such as Michel Foucault and Edward Said.[12] The DOCOMOMO itself in which Liernur launched *The Mask Under the Mask* was an example of this, featuring in the subtitle of the event, alongside the term "universality", the word "diversity". In an assessment of the field's historiographical production between the end of the 1980s and the first decade of this millennium, Silva Arango notes the scarcity

of "general histories" as a symptom of a "theoretical tendency to consider that Latin America is not a 'historiable' unit'", given the "diversity" of its "distinct regions" as an impediment to a "homogeneous" or "universalizing vision". Microhistory gains space, biographies are reborn.[13]

But in *The Mask Under the Mask*, the strategy adopted was neither "universality" nor "diversity": faced with the need for global syntheses, Liernur adopts the method of comparative history, through which he seeks to account for the heterogeneity of the continent and of their "mixtures" without resorting to microhistory and identities. Its refractory position to concerns about the identity is clear from the title: it evokes the idea of "mask", like that of *Black skin, white masks* (1952) - a work by the Martinican psychoanalyst and activist Frantz Fanon who is a reference in studies of subalternity -, as a game of "disguises", which points to the impossibility of distinguishing not only what is "black", but also what would be indigenous under the "white mask" when the subject is miscegenation, a condition in which all the difference would be dissolved by transculturation processes. The term does not go into depth, but a footnote informs that the reference is *Transculturación narrative en América Latina* (1982) by the Uruguayan Ángel Rama (1926-1983). In this book, in turn, Rama argues that the term was originally coined by Cuban Fernando Ortiz (1881-1969), for whom transculturation concerns the process that necessarily implies "the loss or uprooting of a previous culture, which could be considered a partial deculturation, and, furthermore, means the consequent creation of new cultural phenomena that could be called neoculturation".[14]

Rama relies on this understanding and comes to the conclusion that it is not simply a question of "giving in to the external modernizing impact in an example of extreme vulnerability". At the same time, he does not fail to consider that "modernity cannot be renounced and denying it is suicide". What is at stake, I concluded, is "renouncing oneself to accept it".[15] Although Liernur does not understand transculturation exactly as a "renunciation" of oneself, but as a "game of mirrors" that makes it impossible to distinguish origins, he shares with the Uruguayan the idea that this process founds "Latin American culture" and that the "mixture" emerges, "positively or negatively", as "a characteristic feature, articulating many of the responses to the recurring problem of identity".[16]

Unlike Liernur, Munanga re-discusses miscegenation to put the racial issue back into debate. The question, however, does not concern the acceptance or not of miscegenation which, as we also saw in Munanga, configures the very dynamics of every culture. The problem lies in the way it is read, starting from a point of view in which black people are *absent* in this process. In part, this is due to a previous absence, that of contributions from Brazilian neighbors in the construction of this conceptual framework, weighing in this selection a certain "Hispanism", a correlate of "Lusitanism", both insufficient to the ambition of interpreting processes that seek to encompass the entire Latin American continent.[17] On the other hand, the

absence of black people in *The Mask Under the Mask* has links with the absence of black people in the Argentine imagination itself, not the result of a supposed rarefied presence of black people in Argentina - studies by Uruguayan Vicente Rossi (1871-1945) about the black matrices of tango and painting by Pedro Figari (1861-1938) about *cadombé* already prove the opposite in the 1920s - but from whitening policies.[18]

At the end of the 1980s, Ramón Gutiérrez, aligning himself with Cristián Fernández Cox, stated that "the persistence and persistent ubiquity, to this day, of manifestations of popular beliefs, of its sacred values, its essential ways of life, of its creativity" form a "complex", quoting Octavio Paz, of "unconscious attitudes and structures, which, far from being survivors of an extinct world, are constitutive experiences of our contemporary culture…". Next, he adds that this reality of "deep America", an expression he rescues from José Maria Arguedas, "is embedded in societies distinct from those formed by the transcultural fusion of the Iberian conquest"[19]

In another direction, *The Mask Under the Mask* shows *the recurrent difficulty for architectural historians to address the racial issue*. In the introduction to the anthology *Race and Modern Architecture* (2020), Chinese-American Irene Cheng and African-Americans Charles L. Davis II and Mabel O. Wilson argue scholars in the field generally "avoid the topic of race," and even "when they acknowledge the subject, they often quickly dismiss its significance, or they throw it outside the appropriate limits of the discipline"[20]. Such a stance, as the authors note, contrasts with what occurs in other disciplines such as history, law, anthropology, geography, political science, cultural studies and literature, from which emerge studies on coloniality, post-colonial theory, critical studies on race and about whiteness, also known as whiteness studies.

The contrast between the notion of miscegenation presented by Liernur in *The Mask Under the Mask* and that presented by Munanga is evident. This does not mean that the architectural historian's vision no longer has affinities with other Brazilian lineages of reading about miscegenation, such as racial democracy and cultural anthropophagy - the author assume that his thinking "is actually a little anthropophagic"[21]. While the first identifies miscegenation as the antidote to racial segregation, since the genetic and phenotypic mixture of blacks, whites, indigenous people and immigrants supposedly prevents differentiation between subjects based on their appearance or origin, the second exalts the incorporation of the "other" and not its annihilation or exclusion as the foundation of Brazilianness. However, Afro-Brazilian sociologist and economist Marcelo Paixão argues that these notions end up masking the violence of racism: while the ideology of racial democracy disguises the reasons for inequality between whites and blacks, justifying it, for example, by the "small space of time passed" since the end of slavery for the full integration of black people into Brazilian citizenship[22], cultural anthropophagy or assimilation "does not represent social integration of people of African descent": if it is different from what happened with the

Indians in the North American Old West, because "it would not be done without leaving traces", the appropriation of "such a contribution from Afro-descendants" is made at the same time as it leads "to its end", functioning as a "consolation prize" for " fact of having their creativity transformed into the basis of the formation of nationality", even if "strategically excluded from it"[23]

The mask Under the Mask thus demarcates a critical orientation that will move away from the idea of dependence and cultural subalternity in search of "cross-fertilization", transatlantic circulations, the global system. If, on the one hand, there are surprising historiographical gains for the field of architecture with a strategy attentive to "identity traps"[24], on the other, some lessons learned from the singularities that persist in mixtures are abandoned and certain structural debates, such as the racial issue in architecture, are left aside from systemic analyses. In this sense, re-discussing mestizaje and modernism since Latin America, before offering answers, must provoke questions that interrogate the complexities that shape processes of mestizaje, transculturation and anthropophagy. Every "mixture" is made up of its ingredients and the work of architectural historiography is to identify and examine them to restore their multiple meanings. ■

ABSTRACT

Ahmedabad, in the Indian state of Gujarat, is an example of a vibrant, chaotic city, where human life intertwines with animal life, featuring the circulation of polluting and noisy vehicles of various kinds. There is an image of communal movement linked to the importance of the Sabarmati River, whose bed and banks have been used extensively for dyeing textiles. Ahmedabad has become a city of cultural and educational advancement, thanks to its textile production and the impetus provided by generations of Jain weaver families. This progress led to its prosperity. During the colonial period, Ahmedabad was able to assert its pre-autonomy by escaping the British colonial burden. In this context, the Sarabhai family, a world of political activists, philanthropists, scientists, artists and cultural patrons with international influence, flourished and was one of the most well-known contributors to this prosperity. Geeta and Gira Sarabhai, two sisters born into the family in the early 1920s, will be instrumental in putting Ahmedabad on the map of modernist activities. Geeta, a musician with a background in Indian classical music, and Gira, an architect, designer and curator, through inter-continental travelling and the search to find points of encounter and balance between a secular cultural milieu and an avant-garde milieu outside their country, were to bring to their hometown many figures of distant and unlikely origins. These figures were artists, choreographers, musicians and architects, most of them from North America.

This paper explores the role of Geeta and Gira Sarabhai in the transcontinental and inter- and transdisciplinary modernity that emerged in Ahmedabad in the 20th century. A modernity that moved together within the fabric of a weaving city, Ahmedabad.

1. MOTTO

There is something molten in me. I do not know how else to begin. To begin again, all over again, as if in each attempt something needs to be recast, rekindled, some bond, some compact between flesh, clothing and words. There is something incendiary in me and it has to do with being female.[1]

Bathed by the Sabarmati River, Ahmedabad is the most populous city in the Indian state of Gujarat. Due to its textile production and the impetus provided by generations of *filateur* families, it has become a city of cultural and educational advancement, which led to its prosperity. A sphere of political activists, philanthropists, scientists, artists and cultural patrons with international influence, the Sarabhai family was one of the most important contributors to this progress. Ambalal Sarabhai (1890-1967) and Saraladevi Sarabhai (1896-1975) had five daughters and three sons. Geeta Sarabhai (1922-2011) and Gira Sarabhai (1923-2021), two of these daughters, became key figures in defining Ahmedabad's identity rooted in transcontinental modernity. **(Fig. 1)**

2. AHMEDABAD, A WOVEN CITY

In their 2009 book *Living with Memories: Parsee Dwelling in Early Settlements of Gujarat*, Snehal Nagarsheth and Pallavi Chilleriga, state the following: "India is like an intricately woven carpet of untiring worlds, which are constantly engaged in a conversation, which is at once familiar and unfamiliar."[2]

The Indian state of Gujarat was formed throughout history through various conversations, resulting from a process of "percolation". Ahmedabad lies on the banks of the River Sabarmati. The waters of the river and the region's soil type combined to make the city a textile industry centre. The industry flourished in the 19th century under the control of the British Raj, leading Ahmedabad to become the second largest cotton-producing city in India. Thanks to its wealth, Ahmedabad was able to avoid the colonial British yoke and thus affirm its own pre-independence. Ranchhodlal Chhotalal (1823-1898) was the great driving force behind modern Ahmedabad. He founded the Ahmedabad Spinning and Weaving Company Ltd, in 1861, which was the first textile mill company in Ahmedabad and one of the first in India. Kasturbhai Lalbhai (1894-1980), Ahmedabad's richest industrialist, was the great driver of the cultural and educational progress of the city. He was the co-founder of the Ahmedabad Education Society, which was to result in Ahmedabad University and the Indian Institute of Management Ahmedabad (IIMA).

Ahmedabad became a cluster of powerful and wealthy families linked to the textile industry. The relationships between the members of the city's *filateur* families, who were of the Jainist faith, reveal a political resilience which found a parallel in the huge cultural and educational investment carried out in the city. Among these families, the Sarabhais stood out. The family rose to prominence in the early 20th century. Anasuya Sarabhai

(1885-1972), Ambalal Sarabhai's sister, left for England in 1912 of her own accord for an education. Back in India, she became involved with women's rights activists and worked with underprivileged communities. Ambalal Sarabhai was chairman of Calico Mills and founder of the Sarabhai Group of Companies. He was involved in the Indian independence movement and was an early supporter of Gandhi (1869-1948). Saraladevi Sarabhai, Ambalal's wife, was a women's rights activist. The couple had five daughters and three sons. Mridula Sarabhai (1911-1974), following in the footsteps of her aunt Anasuya, became a political activist. Gautam Sarabhai (1917-1995), a mathematician, and Gira Sarabhai played pivotal roles in the foundation of several institutions in the city. Vikram Ambalal Sarabhai (1919-1971) became a physicist and astronomer and was one of those responsible for the Indian space programme. He was chairman of the Indian National Committee for Space Research and the Indian Space Research Organisation. Together with Kasturbhai Lalbhai, Vikram was a co-founder of the IIMA. Geeta Sarabhai (1922-2011) was a musician and of the first women to play *Pakhavaj*. William Curtis describes the Sarabhais as "Modern Medicis."[3]

3. A WEB OF INTERCONTINENTAL RELATIONS: THE ROLE OF GEETABEN AND GIRABEN

Like their siblings, Geeta Sarabhai[4] – nicknamed Geetaben – and Gira Sarabhai – nicknamed Giraben – were homeschooled by teachers from Cambridge and Santiniketan. Their mother was influenced by teaching methods that used a humanistic and naturalistic approach and encouraged freedom of expression. In Lucknow, India, Geeta took a master's exam in Hindustani classical singing at the Bhatkhande Sanskriti Vishwavidyalaya.[5] She became a musicologist and a practising musician. In 1946, at the age of 25, she went to New York to study Western methods of composition. Her first choice was the Julliard School, although she never attended it. Isamu Noguchi (1904-1988), a friend of Geeta's brother Gautam, introduced her to John Cage (1912-1992), claiming that her studies would be more fruitful if she sought a less formal education. Geeta became friends with Cage and Merce Cunningham (1919-2009). With Geeta in mind, Cage wrote in 1954: "[a]n Indian musician told the traditional answer in India [to the question 'why do I make music'] was 'To sober the mind thus make it susceptible to divine influences.'"[6] When Geeta left New York, Cage and Cunningham found in the Sarabhai family, especially "Geetaben", a unique group of patrons who invited them to perform. Cage, Cunningham, David Tudor (1926-1996) and Robert Rauschenberg (1925-2008) all visited Ahmedabad in 1964, accompanying the Merce Cunningham Dance Company.[7] David Tudor became friends with Manorama Sarabhai, widow of Suhrid Sarabhai Sr, brother of Geeta and Gira. Robert Rauschenberg, for his part, maintained a friendship and several collaborations with Asha Sarabhai, who is married to Suhrid Sarabhai Jr, son of Manorama. Rauschenberg explored this "new world" in support of his work. In 2018, Paul Purgas, a musician and artist with a background in architecture and Indian ancestry, found several tapes of

rehearsals, improvisations and small electronic compositions at the National Institute of Design (NID).[8] Some of the recordings belong to Geeta's experiments. The recordings were made from 1969 to 1973 in a studio at the NID, using a Moog synthesiser.

Gira Sarabhai, the youngest of eight siblings, travelled to Kashmir in her late teens. During this time, she was self-taught in history. Her interest in architecture led her to contact Frank Lloyd Wright (1867-1959) so that she could benefit from his teaching at Taliesin. He agreed to train her.[9] In the late 1940s, Gira travelled to the USA to study and work with him.[10] She was part of the team that developed the Guggenheim Museum in New York.[11] In a 2012 interview with Shilpa Das, Gira reportedly said: "After working in Wright's office all day, we were allowed to be present in the studio at night. Wright's students would work in the studio all night long. To our good fortune, we could look at the original drawings, plans, and masterpieces at night."[12] Like her sister Geeta, Gira was a friend of Cage's. Together with her brother Gautam, Gira was co-responsible for two of India's most important post-colonial design institutions: the Calico Museum of Textiles, which they founded in 1949, and "which is widely regarded as having housed the best collection of Indian textiles in the world,"[13] and the NID, which was founded in 1961. With Gautam's involvement, Gira suggested that Wright should develop a design project for the Calico Mills of the Ahmedabad India Store, an administrative building for the mill complex. Although Wright produced several drawings dating back to 1949, the project fell through due to "permission issues and construction restraints from the Ahmedabad Municipal Corporation."[14] On the site of Wright's project, the Calico Dome was built in 1962 to house the showroom and shop of the Calico Museum of Textiles. The dome was conceived by Gautam and designed and detailed by Gira, influenced by Richard Buckminster Fuller (1895-1983), one of the international figures who travelled to Ahmedabad at the siblings' invitation and with whom they formed a friendship. Gira curated all the museum's catalogues until her death.

4. *THE INDIAN REPORT*

The collection and the catalogues of the Calico Museum played an important role in the exhibition *Textiles and Ornamental Arts in India*, which was held at the Museum of Modern Art (MoMA) in New York in 1955. **(Fig. 2)** Edgar Kaufmann Jr (1910-1989) and Alexander Girard (1907-1993) were involved in the exhibition. In the exhibition catalogue, Gira Sarabhai's name appears in the 'Acknowledgements', and the Calico Museum is the first institution on the list of lenders to the exhibition, which also includes Manorama Sarabhai.[15] The reference to Charles Eames (1907-1978) in the catalogue – the name of Ray Eames (1912-1988) is omitted – is significant.

Alexander Girard, known for his contributions to textile design, worked on many occasions with the Eameses, who appreciated the craftsmanship of the many countries they visited. The Eameses' meeting with Pupul Jayakar (1915-1997) at the exhibition paved the way for the idea of "introducing

design as a modern profession in India."[16] Jayakar was an Indian activist and supporter of Indian handicraft traditions who founded the Indian Handlooms and Handicrafts Export Council (IHHEC). The Indian government formally requested the Ford Foundation invite the Eames couple to visit India in 1957.[17] In 1957 the Eameses visited India with the aim of writing a report on the establishment of a multidisciplinary school with design as its underlying theme. During their three-month stay in India, the couple travelled all over the country and contacted Gira and Gautam.[18] In April 1958 Charles and Ray Eames presented *The Indian Report*.

> *India stands to face the change with three great advantages – First: She has a tradition and a philosophy familiar with the meaning of creative destruction. Second: She need not make all the mistakes others have made in the transition. Third: Her immediate problems are well defined: Food, Shelter, Distribution, and Population*.[19]

Gira and Gautam Sarabhai were part of the committee formed to find a location for the new school that was in line with the recommendations of *The Indian Report*. The final choice was Ahmedabad, to which the efforts of the two siblings undoubtedly contributed. Founded in 1961, the NID was formally inaugurated in 1962. The NID's current premises opened in 1967. Gira didn't want to take credit for her designs – many of which were carried out in collaboration with Gautam – and rejected the title of architect, preferring to be called designer. However, the NID architectural design project was essentially her work, in collaboration with other architects and structural engineers. The result of the collaboration is a sober and elegant building, characterised by the use of patios that facilitate transition between the interior and exterior spaces, seeking to provide shade in the region's high temperatures. The vegetation is carefully deployed, maintaining the building in a small, secluded environment within a bustling, dynamic city. Although Gira collaborated with Wright, there are clear parallels to be drawn with Le Corbusier (1887-1965).[20] **(Fig. 3)**

Regarding the new NID premises, Balkrishna Doshi (1927-2023) has said:

> *Even though the Sarabhais travelled extensively and had been exposed to the world outside, their core Indian values and belief in Indian culture remained intact. Their identity drew its strength from this core. This is manifested not just in NID, but also in the Calico Museum for instance, in the way they both went about their work and in the way they lived their lives. To me, their inherent sensitivity towards the architecture of the institute is unparalleled. Non-architects [sic] doing architecture is rare and remarkable. This, I think, is the basis of NID in general – to rediscover India and to create an Indian identity.*[21]

20. Gita Sarabhai was instrumental in inviting Le Corbusier to design the Villa Sarabhai in Ahmedabad.

21. Das, *50 Years*, 23.

Gira, Gautam and Geeta were responsible for most of the distinguished guests who taught at the NID – the Eameses, Cage, Tudor, Rauschenberg, Fuller, Khan, Stella Kramrisch (1896-1993), Maxwell Fry (1899-1987), Henri Cartier-Bresson (1908-2004), Claude Stoller (1921-2023), Frei Otto (1925-2015), Adrian Frutiger (1928-2015), Deborah Sussman (1931-2014), Trisha Brown (1936-2017) and Steve Paxton (1939-2024), among others.

NID became a school that valued learning by doing, adopting an inter- and transdisciplinary approach to design. Just as Gira and Gautam had envisioned, and the Eames had suggested.

5. BETWEEN FLESH, TEXTILES AND WORDS

Geeta Sarabhai's trip to New York and her meeting with John Cage may have been a starting point. Several contacts were established, and a group of New York artists put Ahmedabad on their map. Gira Sarabhai consolidated these contacts. In the words of Asha Sarabhai, Gira was "a very fine architect, but very much on her own terms"[22] and an advocate of a hands-on approach to all things. Her never-ending involvement with the collection of the Calico Museum of Textiles crossed borders and oceans. Together with her brother Gautam, they sought out international names who could consolidate the value of experimental teaching at the NID. However, Geeta and Gira's names and lives are referenced only in short articles. The privacy requested by the sisters didn't help to make them more recognised names. Possibly, the fact that they were women and Indian didn't help either. Gira died in 2021, the last of the eight siblings. Some in-memoriam articles have been written about her. Laila Tyabji wrote: "[a]ll of us in the design space in contemporary India owe Gira Sarabhai a huge debt of gratitude for her selfless, perfectionist, single-minded work."[23] Later, in 2024, Christopher Turner was to write that Gira Sarabhai's contribution to Indian modernism is not sufficiently recognised.[24]

Geeta and Gira Sarabahi helped bring modernity to Ahmedabad. Looking at the Sarabhai siblings as a whole, and following in the footsteps of their parents, this modernity extends to India and takes on a sense of progress, primarily political and social, which is also manifested in industry and science, as well as in music, architecture and design. But Geeta, and especially Gira, have always sought to root this modernity in the deep identity of Ahmedabad. The values of the world they have encountered, particularly in New York, and the experience they have gained from their extensive contacts with international personalities, have always been incorporated into the values of their ancestral culture, thus promoting the development and affirmation of that culture rather than its hybridisation. Geeta and Gira Sarabhai's cultural activism complements the political and social activism of many of their family members, especially the women. This cultural development has proved fundamental to the realisation of a polarised regional modernity in Ahmedabad. Geeta's and Gira's words come mainly through the testimony of third parties. Their legacy – in music, architecture, design education, interest in textiles and museology – is the

greatest evidence of their commitment to the realisation of this modernity, in the way it incorporates tradition in the affirmation of the contemporary.

The secretive Gira Sarabhai, direct and stern, and the more hesitant and insecure Geeta, who was perhaps more of a dreamer in her philosophical thoughts, offered themselves as go-betweens, running between other people, involving them and taking them to an unlikely place. The youngest two out of eight siblings, full of privileges from birth, gave their flesh, through textiles, words, encounters and disagreements, to the cause of modernity. ■

BIOGRAPHY

Maria João Moreira Soares (1964) is a Lisbon-born Portuguese architect practising since 1988, an assistant professor at the Faculty of Architecture and Arts, Lusíada University, Lisbon, where she has taught since 1989, and a research associate at Design, Architecture, and Territory Research Centre [CITAD]. She is Assistant Director of CITAD, a member of CITAD's Board of Directors, and the Architecture and Urban Planning Research Group coordinator. She is also a film producer. Maria João holds a degree in Architecture from the Faculty of Architecture, Technical University of Lisbon, 1987 and a PhD in Architecture from Lusíada University, Lisbon (2004).

João Miguel Couto Duarte (1966) is a Lisbon-born Portuguese architect practising since 1990 and an assistant professor at the Faculty of Architecture and Arts, Lusíada University, Lisbon, where he teaches since 1991, and a research associate at Design, Architecture and Territory Research Centre [CITAD]. He is also a film producer. João holds a degree in Architecture from the Faculty of Architecture, Technical University of Lisbon (1990), an MSc in Art Theories from the Faculty of Fine Arts, University of Lisbon (2005) and a PhD in Architecture from Faculty of Architecture, University of Lisbon (2016).

REVISITING THE MODERN ARCHITECTURE CANON: PARALLELS AND DISTINCTIONS IN BRAZIL AND CZECH REPUBLIC THROUGH FEMINIST PERSPECTIVES

ANA GABRIELA GODINHO LIMA
UNIVERSIDADE PRESBITERIANA MACKENZIE

KLÁRA BRŮHOVÁ
FACULTY OF ARCHITECTURE, CZECH TECHNICAL UNIVERSITY IN PRAGUE;
ACADEMY OF ARTS, ARCHITECTURE AND DESIGN IN PRAGUE

ABSTRACT

This article engages in the debate on the Modern Architecture canon, focusing on the need to destabilise gender-biased narratives that marginalise women's contributions. It examines the systemic exclusion of women architects in Brazil and the Czech Republic, drawing from two key research projects linked to two of the authors: Merli's Brazilian doctoral research and the "Women in Architecture" project conducted by a team of Czech researchers: Brůhová (project co-leader), Hlaváčková, Huber-Doudová (project co-leader), Malošíková and Zahrádková. The study highlights how these works challenge the androcentric canon through biographical, decolonial and gender analysis, interviews, and both archival and secondary research. The Brazilian research identifies key female architects from 1930 to 1960, emphasising their overlooked contributions. The Czech project explores gender disparities and societal biases affecting women architects' visibility. These studies propose methodologies for integrating women's contributions into the mainstream architectural narrative. The findings suggest the necessity of reshaping the narrative to include collaborative and processual aspects of architectural work.

1. INTRODUCTION

This article contributes to the debate on the Modern Architecture canon which considers the matter of canonical protagonists and architectural objects. One of the central concerns is to question the predominant narratives perpetuated through texts and disseminated in architectural education, which, traditionally, have centred on male achievements, reinforcing gender bias and marginalising women's contributions. This androcentric narrative emphasises individual genius over collaborative efforts and isolated objects over other meaningful forms of architectural contributions. Feminist scholars like Kingsley[1], Ahrentzen[2], Willis[3], or Lima[4] have criticised this approach since the second wave of feminism. They argue for a more inclusive and contextual understanding of architectural history that accounts for the collective and processual nature of architectural production.

In recent years, academic research surrounding the contribution of women in modern architecture has experienced significant growth and development across both Latin America and Europe. Diverse perspectives have been adopted, including compiling inventories of women who graduated in architecture, identifying contributions overshadowed by male partners and recognising various forms of contributions beyond design and construction. However, the proportion of research and publications remains limited compared to the comprehensive nature of the current debate on modern architecture.

A considerable number of these works are destined to be published in special issues of academic journals dedicated to women in architecture or presented in thematic sessions at academic events. While this focus brings much-needed attention to women's contributions, it also risks marginalising these works by segregating them from mainstream architectural discourse. Such practices may inadvertently reinforce the perception that women's contributions are a niche topic rather than a fundamental part of architectural history.

In Brazil, for instance, among the 9,049 architectural master's and doctoral theses registered in the national theses database (Portal Capes), only 107 are dedicated to women in architecture[5]. Notably, 70 of these theses are dedicated to Lina Bo Bardi, an exceptional protagonist in this field. Excluding these, only 37 theses approach the contribution of women in architecture as the main theme, accounting for a mere 0.4% of the total. Similarly, the conclusions of the analysis, which focused on the teaching of architectural history at universities in the Czech Republic, show that the androcentric discourse significantly dominates the interpretation: in the teaching syllabi, women make up only 2.07 % of the named personalities from the history of 20th-century architecture.[6] Examples from both countries show that despite the increasing number of female graduates in architecture, their contributions remain under-recognised in mainstream architectural history.

Within this scenario, this text examines the similarities and differences between Brazilian and Czech research on the contributions of women architects, gender disparities within the architectural profession and canon, as well as systemic inequalities that women architects have faced. The study is built upon two key research projects developed by two of the authors:

1. Karen Kingsley, "Gender Issues in Teaching Architectural History," *Journal of Architectural Education* 41, no. 2 (1988): 21–25.

2. Sherry Ahrentzen, "The F Word in Architecture: Feminist Analyses in/of/for Architecture," in *Reconstructing Architecture: Critical Discourses and Social Practices*, ed. Thomas A. Dutton and Lian Hurst (Minneapolis – London: University of Minnesota Press, 1996), 71-118.

3. Julie Willis, "Invisible Contributions: The Problem of History and Women Architect,," *Architectural Theory Review* 3, no. 2 (1998): 57–68.

4. Ana Gabriela Godinho Lima, "Aspectos da pesquisa em gênero e processo de projeto," in *Pesquisa em projeto e extensão na pós-graduação em Arquitetura e Urbanismo*, ed. Angela Maria Gordilho-Souza, Marcio Cotrim, Naia Alban Suarez (Salvador: Edufba; Rio de Janeiro: Anparq, 2020), 143–159. Ana Gabriela Godinho Lima, *Arquitetas e Arquiteturas na América Latina do Século XX* (Masters Thesis, Universidade de São Paulo, 1999).

5. Giovanna Augusto Merli, *Arquitectura con firma femenina: aportes para una rescritura de la arquitectura moderna brasileña, 1930-1960* (PhD Thesis, Universidad del Bío-Bío, 2023).

6. Klára Brůhová, "Exclusive Histories, Unseen Narratives," *Architektúra & Urbanizmus*, no. 58 (2024): 6 – 19, doi 10.31577/archandurb.2024.58.1-2.1.

the Brazilian doctoral research "Architecture with a feminine signature: Contributions to a rewriting of modern Brazilian architecture, 1930–1960," by Merli (2023) and the "Women in Architecture" project (2021–2024), conducted by Brůhová together with the Czech team. Both works critique the modern architecture canon through a gender perspective, discussing how women have shaped the architectural landscape despite systemic exclusion.

2. THE GENDER BIAS FACTOR

2.1. BRAZIL: OVERCOMING CULTURAL BARRIERS

Despite the social, economic, and cultural difficulties faced by women in accessing higher education in Brazil by the late 19th and early 20th-century, there were no formal rules, legislation, or restrictions preventing women from attending architecture schools. However, between 1930 and 1960, only 182 women graduated as architects compared to 2,231 men.

In her 2023 study, Merli set out to review elements of the historiography of Brazilian architecture, focusing on the decades from 1930 to 1960, when Brazilian modern architecture achieved international recognition.[7] The study identified 182 female graduates highlighting 33 professional activities and six significant figures: Zélia Maia Nobre, Maria do Carmo Schwab, Francisca Franco da Rocha, Maria Laura Osser, Enilda Ribeiro, and Miranda Magnoli. These architects integrated modern techniques with local traditions, significantly contributing to Brazilian modern architecture's national and international relevance. Despite these findings, the main research challenge consisted of a significant lack of information about female architects from this period. This historiographical gap meant that only a few names and their contributions were mentioned in historical records, and even fewer academic studies explored their works and trajectories.

2.2. CZECH REPUBLIC: CHALLENGING ANDROCENTRIC DISCOURSE

The "Women in Architecture" project in the Czech Republic addressed gender disparities within the architectural profession and canon. Similarly to the Brazilian case, the Czech research team noted the absence of women in architectural history and investigated their contributions. The study focused on the second half of the 20th century when a significant proportion of architecture graduates were women, with over 30% in the 1960s and 50% in the 1990s. Despite these numbers, few women were included in the Czech architectural canon. Analysis shows that only two women architects have reached the position of established renowned creators in the Czech narrative: Alena Šrámková and Eva Jiřičná (who worked abroad until the 1990s). Věra Machoninová, alongside her husband, is also mentioned quite often. Thus, we come to number 3 of the canonised female architects from the second half of the 20th century[8]. It is also worth noting that the scissors were opened already in the context of achieving prestigious positions[9]. For example, we did not find any women architects serving as the head of any of the state project institutes, established during the socialist era as part of the centrally controlled construction industry, or their departments. It is also

7. As Zein demonstrates, this happened in good measure due to three publications derived from expositions at the Museum of Modern Art in New York, MoMA: "Brazil Builds" (1943); "Latin American Architecture Since 1945" (1955); "Latin America in Construction: Architecture 1955–1980" (2015). These catalogues featured only male Brazilian architects. See Ruth Verde Zein, *Revisões Historiográficas: arquitetura moderna no Brasil* (Rio de Janeiro: Rio Books, 2022).

8. Klára Brůhová, Petra Hlaváčková and Šárka Malošíková, "Kde jsou architektky?" *Sešit pro umění, teorii a příbuzné zóny*, no. 33 (2022): 38–83, https://vvp.avu.cz/sesit/sesit-33/.

9. Klára Brůhová, "Architecture and Emancipation. The Situation of Women in the Field of Architecture in Socialist Czechoslovakia," in *The Future is Hidden in the Present. Architecture and Czech Politics 1945–1989*, ed. Veronika Rollová and Karolina Jirkalová (Prague: AAAD, 2021), 282-330.

telling that only one woman in socialist Czechoslovakia managed to obtain a professorship in architecture.

These findings led to the main research question: Why did women in architecture remain less visible and have more difficulty reaching prestigious positions than their male colleagues? To answer this, the research team opened two lines of inquiry: First, they examined the experiences of women architects through in-depth, interviews, revealing systemic disadvantages and societal biases affecting women in the profession. Second, they deconstructed the principles of narrative formation in architectural history by analysing professional journals from the 1980s and 1990s , and selecting review publications and teaching materials. This analysis concluded that women's creative work was only marginally present in these materials, highlighting a double marginalisation of women in architecture: first through career barriers and later through neglect in the canonisation process.

3. METHODOLOGICAL APPROACHES

3.1. MERLI'S BIOGRAPHICAL AND DECOLONIAL ANALYSIS

By focusing on individual biographies, Merli aimed to bring visibility to female architects' achievements and challenge the male-dominated narrative. Her decolonial approach challenged colonial power dynamics represented by canonical male-centred narratives and brought protagonists to marginalised contributions of women architects, emphasising the context-specific knowledge produced by them[10].

The work of Argentine architect Marina Waisman[11] served as the main theoretical reference. Although the research objectives and hypotheses were understood as being within the "qualitative field," Waisman's support was combined with Vieytes' (2004) methodology, which employed quantitative instruments and techniques applied to social sciences research. The first quantitative phase of the research followed Vieytes' methodology, starting from a defined population and narrowing down the variables of interest until reaching a precise population aligned with the research objectives. The population included architects who graduated in Brazil between 1930 and 1960. Merli first identified the architecture schools[12] of this period and searched their archives for lists of graduates. The research identified 2,431 professionals who graduated in architecture in Brazil during the study period, including 182 women. This included practical, theoretical, and/or teaching professional performance, evidenced by magazine and newspaper articles, as well as publications in conferences, and school records.

3.2. CZECH SCENARIO: CONTEXTUAL AND INTERDISCIPLINARY APPROACH

After outlining the hypothesis of double discrimination, the Czech research team sought to include women architects and create a framework for changing the narrative. The theoretical basis of the Czech research drew from scholars like Kingsley (1988), Willis (1998), and Ahrentzen (1996). All three authors described very accurately the problems of conventional canonisation principles and, on the basis of this critique, also outlined a possible path to a more

School of Architecture of the Federal University of Rio Grande do Sul (FAU-UFRGS), the School of Architecture and Urban Planning of the Federal University of Rio de Janeiro (FAU-UFRJ) and School of Architecture of the Federal University of Minas Gerais (EAUFMG), Faculty of Architecture and Urban Planning of the University of São Paulo (FAU-USP), Faculty of Architecture of the School of Fine Arts of São Paulo, Faculty of Architecture from the Mackenzie Presbyterian University, Faculty of Architecture and Urban Planning of the Federal University of Bahia (FAU-UFBA) and the Department of Architecture and Urban Planning of the Federal University of Pernambuco.

inclusive history of architecture. In principle, they recommend taking into account the context and the processual and collective nature of architectural production and focusing on a broader variety of tasks that architecture brings. They also critiqued traditional historiographical methods that isolated designers, overlooked collaborative efforts, and ignored key social aspects of architectural practice, such as clients, users, as well as economic and power relations. An important theoretical basis for the project was also the texts by Rostislav Švácha, Czech architectural historian, who encourages a rethinking of what is considered architecture and urges to move beyond the conventional interpretation "[...] that only finished constructions can count as architecture". According to Švácha, architecture accounts for much more: the circumstances, thoughts, sketches, even the reception among the general public, criticism, reviews, theoretical interpretations etc.[13]

Based on these theoretical foundations, the "Women in Architecture" project created an online research database with detailed biographies and inventories of works by women in architecture.[14] The database includes not only creative architects but also preservationists, critics, activists, curators, and other "helping professions." This effort aimed to expand the field's scope. To reflect the processes of architectural work, the database also features interviews with female architects, highlighting their perspectives and experiences.

Despite being aware of feminist critiques of the biographical method, the project team followed examples of comparable foreign projects to highlight female figures effectively. By including diverse professional paths, it aims to broaden the architectural field and emphasise shared female experiences. This basic reference material supported further interdisciplinary analyses illuminating the socio-political context of Czech women architects and the canon's creation.

4. FINDINGS AND DISCUSSION

Both the Brazilian and Czech cases highlighted the systematic exclusion of women from the architectural canon and their significant yet under-recognised contributions. Women in both contexts faced cultural and institutional barriers but made substantial contributions to the field through various roles, including research, conservation, criticism, and community projects. While both projects aimed to revise the architectural canon, their methodological approaches differed. Merli's (2023) research focused on biographical narratives and decolonial perspectives, bringing individual achievements to light and challenging Eurocentric biases. In contrast, the Czech team adopted a broader contextual approach, integrating interdisciplinary insights to understand the collective nature of architectural production and the socio-political conditions affecting women's work.

4.1. BRAZIL: OVERCOMING CULTURAL AND SOCIETAL BARRIERS

In Brazil, female architects navigated significant cultural and societal barriers to gain recognition, often working collaboratively to shape Brazilian modern architecture. Merli's (2023) research highlighted how these women

13. Rostislav Švácha, "Architectural Media in Women's Hands," in *Profession: [Woman] Architect* (Prague: Kruh, 2003), 130.

14. *Women in Architecture. Architecture and Emancipation in the Czech Republic after 1945*, https://zenyvarchitekture.cz/homepage-en/ .

integrated modern techniques and local traditions, contributing to the national and international relevance of Brazilian modern architecture.

Merli (2023) identified key figures who were active participants in developing and disseminating Brazilian modern architecture. For example, Schwab's 1967 Catetinho effectively addressed climatic issues of sunlight and ventilation and Maia Nobre's 1957 Park Hotel in Maceió showcased innovative construction techniques combined with traditional Brazilian design elements such as patios and terraces.

In Brazil, women contributed significantly to education and institutional strengthening. Nobre played a pivotal role in creating the Faculty of Architecture at the Federal University of Alagoas, while Ribeiro was instrumental in forming the Brazilian Institute of Architects in the Rio Grande do Sul region (IAB-RS). Magnoli revitalised the landscaping area within the Faculty of Architecture and Urban Planning at the University of São Paulo, fostering teams and consolidating critical discussions on this topic. In the field of criticism, figures like Francisca Franco da Rocha published ideas on project functionality and quality. Ribeiro analysed architectural variables linked to social and economic realities, while Magnoli explored how human behaviour studies could influence urban design, engaging with contemporary architectural discourses.

Brazilian women architects also made significant advances in disseminating modern architecture both locally and internationally. Franco da Rocha and Osser promoted modern principles through national magazines, while Osser, as a correspondent for *L'architecture d'Aujourd'hui*, highlighted Brazilian modern architecture on an international stage.

4.2. CZECH REPUBLIC: ADDRESSING OBSTACLES AND EXCLUSIONARY PROCESSES

In the Czech Republic, the "Women in Architecture" project addressed both the obstacles that women had to overcome in their careers and the exclusionary canonisation processes that prevented them from entering the narrative of architectural history.

The research uncovered various barriers, such as the "second shift" and androcentric settings, which led to skepticism in entrusting women with larger contracts or leadership positions. Pierre Bourdieu's concept of the "masculine order" provided a theoretical framework for understanding these gender inequalities[15]. Interviews with Czech women architects illustrated these issues. For instance, one architect noted, "When my husband [also an architect] and I went to a construction site, it was 'Mr. Engineer, Mr. Architect,' with everything being addressed only to him". Another commented, "In our department, only men were given leadership roles. I didn't like the fact that I was being mentored and basically doing the same job."[16]

These barriers and stereotypes prevented women from obtaining prestigious and decision-making posts, thus excluding them from the conventional narrative of architectural history, which typically attributes authorship to only one leading creator. The research concluded that

15. Pierre Bourdieu, *Masculine Domination* (Stanford University Press, 2001).

16. Interviews with Czech women architects, conducted under "Women in Architecture" project. For the sociological interpretation see: Karina Hoření and Barbora Vacková, "Unfinished Emancipation" in *Women in Architecture. Critical Studies and Gender Analyses of the Czech Architectural Setting after 1945*, ed. Klára Brůhová and Helena Huber-Doudová (Prague: AAAD, 2024).

addressing these systemic issues requires transforming the narrative and dismantling the "masculine order" in society.

5. CONCLUSION

Reshaping the modern architecture narrative to recognise and acknowledge women's contributions is an ongoing endeavour gaining momentum worldwide. This article contributes by analysing two studies from Latin America and Europe, revealing common historiographical strategies that marginalise women's roles in modern architecture.

The Brazilian research, through a thorough review of university archives, identified key figures, highlighting their significant yet underrecognised contributions to Brazilian modern architecture. This approach challenges the male-dominated narrative by documenting the diverse roles women played in architectural practice.

In contrast, the Czech project used interviews and gender analysis of both archival and secondary materials to uncover systemic barriers and societal biases that limited women's visibility in the architectural canon. By documenting these obstacles, the research underscores the need for a more inclusive historiography that acknowledges collaborative and processual aspects of architectural work.

Ultimately, achieving a modern architectural narrative that integrates women's contributions seamlessly into the mainstream, rather than segregating them into special sections or journal issues, would signify substantial progress. These complementary strategies offer methodologies for future researchers, providing a broader understanding of modern architecture. By documenting diverse roles and systemic challenges, these studies contribute to laying the groundwork for more integrated and equitable histories of Modern Architecture worldwide. ■

REMAPPING MODERN ARCHITECTURE: THREE MODERN BUILDINGS BY FEMALE ARCHITECTS IN MACEIÓ/AL

MANUELLA MARIANNA CARVALHO R. DE ANDRADE
UNIVERSIDADE FEDERAL DE ALAGOAS

ÍTALO MONTEIRO DE OLIVEIRA MARIANO GOMES
UNIVERSIDADE FEDERAL DE MINAS GERAIS

ABSTRACT

The historiography of Modern Brazilian Architecture consecrated the works of male architects from Rio de Janeiro, São Paulo, Minas Gerais and Brasília, conforming to some well-known canonical narratives. Only a few female architects are recorded, as authors or collaborators, such as Lina Bo Bardi, Carmem Portinho, Lota de Macedo Soares, Rosa Kliass, Jô Vasconcelos, Janete Costa and Lygia Fernandes – the latter was recognised for her Maceió city project involving the design of the Dr João Paulo de Miranda Neto Residence (1955), mentioned in Henrique Mindlin's "Modern Architecture in Brazil" book (1956). This reference prompted recent research on Maceió's modern architectural history involving women architects. Although Lygia Fernandes is recognised as a pioneer, Zélia Maia Nobre was the most active of the city's professionals, and rediscovering the works of these two women was the driving force behind the archival research on the Licensing Department of Maceió City Hall. Two parameters defined the spatial and temporal cut-off of the research: the historical value and the importance of the remaining modern examples of the downtown Maceió area, in need of recognition and safeguarding. The archival research prioritised the 1950s to 1970s period, which is considered the most significant moment of modern architecture production in Maceió. This article has identified three modern architectural works in Maceió that stand out for their modern plastic expression appropriate to the city's social and geographical context, designed by pioneering female architects: the Sociedade de Medicina by Lygia Fernandes (1956), IPASEAL by Zélia Maia Nobre (1969) and SENAC by Simone Mendes Normande (1975). These structures are notable for their modern plastic expression, fitting for Maceió's reality.

1. INTRODUCTION

Historical consciousness implies awareness of change.[1] Historical research in architecture and urbanism has been marked by strong questioning of the canonicity of works, the need to decolonise Modern Architecture's Eurocentric and misogynistic history and the opening up of the field to previously marginal studies such as women's roles in architecture and urbanism theory and practice.

Researching and writing about the history of lesser-known places and subjects showcases the dual consciousness of the "perennial present": the idea that general concepts are reflected in specific cases, and specific cases are reflected in general concepts. These dual consciousnesses, as defined by Heller, are present and intertwined with the aims of this research, as they seek to collaborate with the construction of a history that is yet to be recognised and told. Reflected generality involves challenging the established norms through other interpretations and arguments. The aim here is not to dismiss or invalidate them but to expand, complement and rewrite them by the insertion through introducing unrecognised specificities. The reflected particularity comes from an aspect of our past that stands out as a cultural influence, capable of altering the generality. "It is through particularity that generality is constituted, not the other way around".[2]

This research is not meant to question the canons, but it does recognise their insufficiency. The particularity reflected in the generality, as a path to revise such incompleteness, is introduced in this research by the revealing and studying of architectural works produced by women, in this case, situated in the city of Maceió/Alagoas, in the Northeast region of Brazil. The focus is on gender and locality, effacing their marginal position that stemmed from patriarchal and peripheral displacement categories.

Lygia Fernandes designed Dr João Paulo de Miranda Neto Residence (1955), which was mentioned in Henrique Mindlin's *Modern Architecture in Brazil* (1956), and is the only work from Maceió to be mentioned in his book. In a way, that could be considered paradoxical: a woman occupying a marginal place (in both senses) in modern historiography – at least for a brief instance, as no other mention of her work in the city's repertoire is further mentioned in other canonical books.

Zélia Maia Nobre, a practising architect and professor, played a significant role in creating the Architecture and Urbanism faculty in 1974. Her work was instrumental in the development of Maceió's modern architecture.[3] Lima, quoting Hughes (1996), states that, for women, "the marginal, or even external, position (...) provides a better situation to cast a critical eye [and] propose a new vision, (...) to the changes taking place in our time".[4] This was indeed a relatively positive change in the 1950s and 1970s decades when society was still predominantly patriarchal and the role of women, when visible, was typically associated with a male figure.

The decades of the 1950s-1970s saw the peak of modern architecture production in Maceió.[5] To identify the women who were involved in architectural projects, a documentary investigation was carried out in the Maceió City Hall archives, focusing on the city's downtown area due

to its historical significance. Five women architects were found: Lygia Fernandes, Zélia Maia Nobre, Leila Pedrosa, Simone Mendes Normande and Edy Marreta, contributing a combined total of 14 projects. Although all these works were built, not all of them still exist and some that remain have been heavily altered. These numbers alone are insufficient to qualitatively recognise these women's works. This article will present a brief overview on three quality examples: the Sociedade de Medicina by Lygia Fernandes (1956), the IPASEAL by Zélia Maia Nobre (1969) and the SENAC by Simone Mendes Normande (1975).

The selected characterises what Veyne considers "non-factual" events, facts from a local history that have not yet been consecrated or were invisible to previous histories.[6] By exposing and interpreting an architectural fact, one starts to reveal what was an unrecognised history. That alone is not sufficient to reach completion but may, at least, subsidise episodic ignorance, as put by Waisman: "The short duration, the episodic history (...) could be compared to the duration of works and projects".[7]

The documentary investigation at the municipal archives helped create objective criteria that defined the selection of the three works.

These are: a) the printed project documentation should be well preserved so as to allow for the drawings' reading; b) the building's current existence, albeit with transformations; c) the non-repetition of authorship and the typology. These criteria align with Waisman's proposition of considering the dual character of a conjuncture reading, as it should consider the historical object – the original project documentation, which presents "the capacity to engender ideas, currents and trends"[8] – and the present object, which considers the work's duration and today's permanence.

In our field, there has been an increasing focus on studying the works of women architects as part of the growing historical awareness of modern heritage in Maceió, thanks to recent academic research. Women's recognition is frequently downplayed by statements on their practices as being "allowed" or "supported" by men, whether colleagues or family members. However, this controversy is not the focus of this article. The modern expressiveness of the works under analysis will only consider the project and its current existence, to assess whether their transformations respect their original characteristics or not. Modern architecture quality and its preservation should be considered from the work's attributes – not from genre or authorship.

2. THREE WORKS BY FEMALE ARCHITECTS IN MACEIÓ

The analysis is based on careful observation of the design projects, and examination of their attributes, to identify the relationships among their formal, functional, structural, locational, environmental and technical elements. The aim is to recognise and demonstrate their modern architecture expressiveness, while also considering possible associations with other historical exemples. Their modern attributes can be understood through their drawings allowing the visualisation of a variety of aspects, such as shapes, contours, lines, compositional elements and their relationships. Additionally,

this process helps in understanding the functions and activities attributed to the spaces by the represented elements and symbols in the drawings.

2.1. MEDICAL SOCIETY BUILDING

The building shows a simple modern design, consisting of two rectangular/perpendicular prisms situated according to the configuration of the plot and the planned activities. The main access is signalled by a marquee on the smaller east façade prism. The original drawings of the licensed project show clear signs of some unexecuted works, as the façade was to receive a second "cobogó" perforated wall along the entire length of the upper floor. Instead, only a continuous glass curtain wall was built (**Fig. 1**).

The open pilotis columns on the lower floor create a rhythmic pattern on the building's exteriors and support the prism's free span, in addition to bringing a modern character to the pedestrian scale. The structural solution, the proposed activities, and their locations on the floor plans are functionally and qualitatively related to the spatiality of the exterior/interior relationship, balancing the necessities of attending to sociability and providing clinical care.

The entrance is marked by a striking marquee that elegantly protects the arrival with a solid trapezoidal slab and flagpoles. From there, visitors are then introduced to the double-height hall. The curved staircase on the right leads to the auditorium and library on the upper floor, adding a touch of grandeur to the ambience. The sloping floor of the auditorium requires a small external staircase on the mezzanine level, and the library has an external terrace that overlooks the open area, though the open area no longer exists.

The open floor plan on the first floor allows the social lounge to connect to the kitchen at the back, which is next to the outside bar along the north side of the building. On both sides, the lounge is opened to the exterior by large window frames with banners that allow for physical and visual permeability.

The building's structure, featuring double waffle slabs and grid-spaced pillars, allows for the open spaces in the auditorium and the social hall, while also preventing noise interference between adjoining rooms. The auditorium's ceiling slopes parallel to the floor in four parts aligned with the window frames, providing an elegant ceiling light. The round pillars on the first floor stand out from the fencing on the upper floor, puncturing the masonry while maintaining a consistent rhythm on the façades. The ground floor of the building is clad in stone on the south side, while the east front features characteristic ceramic or glass tiles from that period.

The building exists today, but it has been abandoned and remains unoccupied. Its original volume and modern expression, the round pillars detached from the masonry, the marquee and the simple internal staircase are preserved. The auditorium's spatiality is maintained, but not the original window frames. The library terrace has been lost. The spatiality of the lounge has had its visual permeability interrupted and its space subdivided. The outside bar no longer exists, and neither do the coverings. Its 1950s work's aura is now limited to its formal volume, but the modern values of its historical pre-existence are still preserved.

2.2. IPASEAL HEALTH HEADQUARTERS

The IPASEL is a vertical building with a tripartite volumetric division. The base has a raised first floor over a semi-sunken floor, the body has six standard floors and a roof. The volume follows the plot's trapezoidal shape, with the rear façade set back from its boundary, giving the building three distinct façades and a median façade. In a predominantly horizontal environment, the building's verticality is unmistakable, marking its presence and modern expression (**Fig. 2**).

On the ground floor, one access staircase leads to the bank branch on the left and the other leads to the building entrance. Three double-height rectangular structural columns, detached from the sidewalk alignment, emphasise the building's verticality. A ramp leads to the garage on the semi-sunken floor. On the second floor, a curved balcony railing wraps around the front and north side façades, subtly revealing the plasticity of the concrete, but horizontally marking the front façade, announcing the continuous plane of the vertical body.

The original project featured a vertical plane of the building body with a brise-soleil lattice protecting the west façade. The way it is incorporated into the internal division of each floor varies. From the second to the fifth floors, the boundaries of the rooms are set back from the lattice, providing a free space for circulation and ventilation with solar protection. On the sixth and seventh floors, the glass enclosure of the rooms is recessed, but entirely. This differentiation is due to the internal spatial arrangement of each floor as each floor has a different layout.

The rear vertical plane is marked by the structural grid of columns and slabs, sealed with glass frames, with an opaque vertical strip for the sanitary facilities in the centre. The south and north façades are opaque. In the original project, the brise-soleil lattice surrounded the building, not for functional purposes, but to create a plastic unity of modern expression, which is now absent.

The rationalisation of building installations and vertical circulation, located on the central transversal axis of the trapezoid, led to the structural column grid with varying modularity. On the left, there are four rows with four columns, while on the right, there are four rows with three pillars. The structure allows for some flexibility in the spatial partition distribution on each floor. On the seventh-floor right auditorium, the central pillars are removed, and the internal space is defined by concave and convex planes in the walls and ceiling to improve acoustic management. The IPASEAL roof deck is clearly defined as a garden terrace.

The building has undergone extensive and poorly-executed renovations. The original brise-soleil has been replaced with glass frames akin to those used on the original rear façade, losing its climate adaptability. However, the building still retains its overall unity. On the roof, new additions have been inserted and neither the bar nor the gardens exist. While the plastic expressiveness of the brise-soleil lattice was effaced, the expressiveness of the base remains and retains its modern authenticity, through its verticality and dialogue with the urban space.

2.3. SENAC VOCATIONAL TRAINING CENTRE

The Senac has a single floor, and its modern character can be appreciated through its pure geometry, as well as in the plastic and compositional expression of the elements that make up the form and in the structural modulation. The building houses administration offices, educational facilities and an auditorium. The horizontality is unmistakable, marked by the roof made of corrugated fibre cement tiles, with gutters and floor trapezoidal bases designed to channel the rainwater flow via a vertical duct, that does not touch the base. The elongated design of the wooden frames, separated by vertical brises, stands out at the main entrance, bringing together square doors and frames. All these elements depict the modern austerity of the building (**Fig. 3**).

The structural pillars that define the grid transversely align with the compositional elements – beam rail, tube and trapezoidal base. Planned spaces, such as the living rooms, keep the structure's modularity or are split in half for the wet areas.

This approach breaks up the rigidity and composes a new rhythm in the external configuration and internal layout, situating the educational and administrative spaces next to the courtyards and establishing the auditorium place. The compositional regularity in two rhythms is maintained on the west façade but altered on the east façade, internal to the plot, to better capture the rainwater.

The design makes excellent use of the flexibility in the configuration of the spaces around the small central courtyard with a garden. It differentiates between masonry at the ends and wet areas and partitions on the inside, which makes the building more visually appealing. The educational building also boasts an external garden, while the auditorium intersects the perpendicular single volume between the playroom and the classrooms, maintaining a cohesive design through the use of these same compositional elements.

The building has undergone significant modifications. The corrugated tiles have been replaced by a gable roof with clay tiles. The trapezoidal rails that delimit the modules have been kept. The entire façade facing Av. Assis Chateaubriand was irreversibly changed. However, the auditorium remains. Faced with this loss of its modern attributes, it must be acknowledged that ill-informed contemporaneity did not value the expressive plastic unity of the work, opting instead for a non-descript façade.

3. FINAL REMARKS

The three works presented helped bring modern expression to Maceió in their own unique ways and at their own pace. From simple geometric prisms to the verticality reinforced by the brises-soleil lattices, and to the expressiveness of the concrete in natura. These three female architects persisted and did not give up their professional careers. The works show a modernity that transcends gender distinctions. The modern significance lies in the modulation that allowed internal flexibility through the "open structural system, independent of functional and aesthetic articulation".[9]

The awareness of this system as a modern attribute demonstrates how the three women experienced modernity differently, even though they were

contemporaries. There is a typological difference, but there is also a strong modern stance not previously known. The original projects raise the hypothesis that Lygia and Zélia may have been aware of the possibility of alterations during execution. The absence of the cobogó or the brise-soleil does not detract from the modern purpose, but simply changes its characteristics. Simone carried out the original project and the changes came later.

These works were designed by three women, who undoubtedly shared an erudite knowledge of their architectural and cultural epoch, celebrated in the canonical historiography. The lazy discourse would be to say that Ligia would not have achieved recognition without the acknowledgement of Mindlin's book, or that Zélia and Simone would not have carried out their work without the support of their husbands, an engineer and an architect respectively. However, the better way to dismiss misogyny is to examine the buildings themselves. These are distinctly delicate, subtle and austere works, exemplifying modern expressiveness through their specific attributes. They particularly capture an appropriate quality that resonates with tropical Maceió's reality. It is a shame that we have yet to fully recognise their value as local modern architecture masterpieces. ■

BIOGRAPHY

Manuella Marianna Andrade has a PhD in Architecture and Urbanism from Mackenzie Presbyterian University and is a professor at the Faculty of Architecture and Urbanism at the Federal University of Alagoas. She works in the field of architectural theory, history and criticism, with research interests in modern and contemporary architecture in Latin America.

Ítalo Monteiro holds a master's degree in Built Environment and Sustainable Heritage from UFMG and a degree in Architecture and Urbanism from UFAL. His research focuses on the history of architecture and historical heritage, with a focus on cultural significance and modern architecture in the centre of Maceió/AL.

THE ARCHIVAL IS POLITICAL

ABSTRACT

The examination of private collections and oral histories as new documentary sources sheds new light on the work of the first generations of women architects in Chile (1930-1949). These sources reveal various types of practice among pioneering women. Firstly, there were those who balanced roles within public institutions while pursuing private practices. Secondly, there were women who developed creative design work within public institutions. And thirdly, there were those who operated private practices while collaborating with other women.

The research draws upon private collections to later cross-references these with municipal archives and other secondary sources to corroborate findings. This approach critically evaluates the interplay between women's archives and research practices. Ultimately, it seeks to enhance our understanding of early women's contributions to modern architecture in Chile.

1. INTRODUCTION

Who were the women architects of the past and what did they do? These simple questions become all the more challenging when undertaking research on the first generations of women architects in Chile, especially on those who graduated before 1950. Their limited presence, not only in architectural history books but also in public archives, makes it difficult to find information about their progressive incorporation into the professional field.

Joan W. Scott stresses how the limited availability of documents relating to women has been problematic, as "archives provide the stuff of memory, the raw materials out of which collective identity and a place in history are fashioned"[1]. In response to this, special women collections and archives have been established in Western Europe and the United States since the 1900s[2]. However, similar efforts in Chile have only begun to emerge in recent decades[3], and there are no collections specifically dedicated to women architects.

In consequence, unconventional research sources, such as private family collections and oral histories, become meaningful in characterising the paths of pioneer women architects. As experienced by the authors and in accordance with Michelle Perrot's ideas: due to the historical place women have occupied in society, it is more likely to find their traces in private archives than in public records[4].

Recent studies have noted that in Chile at least 29 of the 46 women architects who finished their studies alongside 542 men between 1930 and 1949 worked in public institutions. Within those spaces, emphasis has been placed on the fact that they mainly carried out administrative tasks that differentiated their work from traditional design practices[5]. However, oral histories and first-hand historical documentation from private collections suggest that this understanding of the pioneering practices of women could be further expanded upon.

For the purpose of this research, the methodology implied uncovering private sources of information about the architects who completed their studies between 1930 and 1949[6], which was divided into two phases. The first stage involved tracing family lineages through genealogy websites (FamilySearch, Geni) and the National Civil Registry of Chile, and then reaching out to descendants and gathering information via email and interviews. The second phase required cross-referencing the "unofficial" information —such as addresses of buildings and authorships— with other sources. This involved data collection from municipal archives, Aguas Andinas[7], books and articles.

It is worth noting that the findings of this article are restricted by the responses gathered within the timeframe of the research and the possibility of cross-verification, which was limited to a fraction of the women architects of the period. Even though the findings cannot be extrapolated to the experience of others, they reflect the nuances that emerge when alternative private sources are consulted, as a way of compensating for the scarcity of evidence available in the public ones.

6. The period selected for this study (1930-1949) aligns with what Peliowski et al. nominate as the 'first generation', as they identify a change in the professional participation of women graduated since 1950.

7. Aguas Andinas is the main sanitary company in Chile and holds a historical technical archive of sanitary projects in Santiago.

2. THE PRIVATE AND THE PUBLIC

The first main finding from a hybrid sourced approximation is that many of the pioneer women architects undertook private practice in parallel to their known work in public institutions. It was the case of Mariana Valverde Goñi (1936 UC[8]), Ester Durán Buendía (1936 UCh), Graciela Espinosa Moder (1937 UC), Graciela Marcos Mora (1941 UC), Esmeralda Rojas Cellier (1944 UC) and Violeta del Campo Moya (1944 UC).

Mariana Valverde, Ester Durán, Graciela Espinosa and Violeta del Campo used to work at the Municipality of Santiago[9] while engaged in private practices. Valverde developed a three-story building in Cousin 0364, Providencia built in 1952[10]. Durán won the competition for the new Spanish Club in 1946 with Raúl Delfau[11], Espinosa designed a church at Las Cruces, El Tabo in 1951[12]; and Violeta del Campo designed her own two-storey house[13] and remodelled a one-storey house in Arauco Street 535 (1950)[14].

The information provided by the descendants of Graciela Marcos and Esmeralda Rojas, in particular, has unveiled the diverse nature of their respective career paths. For instance, Esmeralda Rojas Cellier designed residential and industrial projects prior to and while working at the National Railway company (FFCC) and at the Housing Corporation (CORVI). Her work in private practice includes various houses and the factory for the Comandari family in San Joaquín, Santiago, 1950[15].

Similarly, Graciela Marcos had a very prolific practice prior to and alongside her work in the Caja de Empleados Particulares [National Fund for Private Workers] in Santiago. She designed the family house for her parents, where she used to live with her brother and sisters in Ricardo Lyon (**Fig. 1**)[16]. She got married in 1937 and moved to Cauquenes with her husband, the engineer Gastón Fermandois, and their three children after the Chillán earthquake of 1939, where they collaborated on various architectural works. The family grew in Cauquenes, and they returned with four children to Santiago in 1944[17].

Graciela worked for several decades at the Caja de Empleados Particulares[18]. Concurrently, she managed a private practice alongside her responsibilities of caring for her mother and raising her five children. She developed mostly residential projects which included alterations to their family home in Lota Street to earn an income from renting the ground floor and to accommodate an independent area for her mother[19]. Between 1964 and 1972, she subdivided land in Latadia[20] to design residential projects[21] and two "L"-shaped two storey houses in Padre Rafael Román[22] (**Fig. 2**).

Many of the works described previously were found via interviews with families, who kindly supplied information regarding the locations of the architects' projects. Even though the plans were held by public institutions, the testimonies from their families allowed for their discovery by providing either addresses or client details, as it is not possible to search for projects using the architect's name in municipal archives.

3. DESIGN WORK WITHIN PUBLIC INSTITUTIONS

The second key finding from cross-referencing diverse sources is that the work of these pioneering architects in public institutions was not only administrative, but also involved architectural design. Design work was not unfamiliar to public institutions as they held departments dedicated to the creation of affordable housing and infrastructure.

Two examples of this practice are the Conjunto San Pablo by María Rojas González (1943 UC) and the expansion of the Cerrillos Airport in 1957 by Iris Valenzuela (1949 UCh). Conjunto San Pablo was designed by María Rojas as part of the National Fund for Public Workers and Journalists (EEPP y P) as indicated in the Bulletin of Institute of Architects of Chile in 1945[23]. The two "U" shaped four-storey buildings still exist and in their original design comprised 16 commercial stores at the ground floor level (8 for each building) and 12 apartments per block on the first, second and third levels. The inscriptions on the buildings read "Propiedad de la Caja Nacional de Empleados Públicos y Periodistas" [Property of the National Fund for Public Workers and Journalists]. However, the Building Permit application[24] indicates Manuel Valenzuela Garrido —chief of the Architecture department— as the author of the plans, budget and specification and his signature is found on the plans alongside those of María Rojas González and Héctor Silva Baetzer. Hence, if it were not for the bulletin's publication and her washed-out signature in the original architectural plans, María Rojas' participation as an architect would be lost behind the authorship of the institution.

In the same way, the authorship of Iris Valenzuela was indicated in a footnote of a publication by Eliash & Moreno in 1989 as part of the Ministry of Public Works[25] and has since been cited by others. Revisiting the project's original public documentation seems necessary, which might help understand the nuances of Valenzuela's specific implication in the design process.

Pairing designers and works within public institutions is quite rare because the authorship of this type of work often lies under the institution's name. Nevertheless, more findings in this area might come from analysing private collections and interviews.

4. COLLABORATIONS

The third main finding of mixed-source research is that pioneer women architects collaborated with one another in the professional field. When descendants of the women architects were asked if their ancestors worked with others, the names of other women were often mentioned, mostly of the few who studied at the same time as the other women in question.

For instance, in oral interviews, Aída Rivera Méndez (1937 UC) was mentioned by the niece of Esmeralda Rojas[26]; Marta Martínez (1941 UC), María Sougarret (1939 UCh) and María Rojas by the daughters of Graciela Marcos[27]; and Graciela Marcos by the son of María Lasserre (1939 UC)[28]. Some of the names were later found in other documents; for example, the association of Esmeralda Rojas and Aída Rivera was found in the plans and documents for a house in Nancy 704, Ñuñoa for Juan Montenegro in

progreso de Chile) 1910-1960 (Santiago, Chile: Ed. Andrés Bello, 1962), 172–73.

1940[29], where the former is indicated as contractor and the latter as architect **(Fig. 3)**. Similarly, Graciela Marcos and María Lasserre won the competition directed by the renowned architect Juan Martínez Gutiérrez for the Spanish Home in 1939[30].

In addition, Esmeralda Rojas mentioned in a letter to her brother that she worked with Mariana Valverde in the same construction company before finishing their studies in 1933 for a man known as Salinas and carried out drawings for a girls' school for her classmate Aída Rivera[31]. Equally, María Elena Vergara Navarrete (1935, UC) collaborated with Violeta del Campo Moya in works related to the latter's house in 1937[32].

Other records have unveiled intertwined relationships among the architects. For instance, the book *Dedicatorias a Violeta del Campo M*.[33], which contains letters from Violeta's architecture classmates Graciela

Espinosa and María Vergara during their early years of study, offers valuable insights. Remarkably, this book was found among the possessions of Esmeralda Rojas's family.

The previous findings add depth to our understanding of the collaborative networks and friendships within the early cohorts of women architects. Although limited by the sources found to date, these insights indicate the support networks forged among these women helped them navigate their professional paths, in a field then dominated by male practitioners.

5. THE ARCHIVAL

Family archives and oral histories provide insights into the work of the first generations of women architects in Chile. These alternative sources suggest that it might have been common for women architects to maintain a creative private practice alongside their work in public institutions. Moreover, they show that their work within public institutions was, in fact, heterogeneous and comprised design work and construction management in some cases.

Exploring this intimate sphere brings a new, and often neglected dimension of their careers: the balance between domestic life, private practice, and institutional work. These collections provide information on professional paths that had to coexist with the demands of family and were, in most cases, multifaceted, with both stable and unstable jobs running simultaneously and characterised by female collaboration networks. Understanding these aspects of their careers deviates from the notion of the "heroic figure" of modern architecture discussed by Colomina[34] and delves into the subtleties of private life.

Nevertheless, a series of issues arise from these observations. What would happen if the women did not keep personal records? What would happen if their families did not preserve them? And what if they did not have descendants to do so?

Ultimately, the findings of this research stress that the archival is "political"[35]. This is because breaking down both the physical and theoretical barrier between the private and the public spheres constitutes a form of political action, given the intricate connection between history and archives. This assertion echoes the sentiment articulated by the French historian Fustel de Coulange: "No documents. No history"[36]. ■

ABSTRACT

This paper summarises the research on the work carried out by female architects who graduated in Uruguay between the 1920s and 1950s. Our team, based at the History Institute of the School of Architecture, Design and Urbanism of the University of the Republic in Uruguay, conducted a study that analysed multiple archives, held interviews, and searched even in the most uncommon places, inquiring about a broad diversity of aspects of the life and work of these women. This presentation pursues two objectives. On the one hand, it aims to share some of the team's findings during the investigation: the production of high-quality modern architecture carried out by women individually or in teams, of various programmes and scales throughout the country. On the other hand, the discussion about the research itself gave way to the critical review of the path travelled both by the female architects and the research team and the existing challenges in the Uruguayan environment for the real and equal recognition of the contribution of female architects.

1. INTRODUCTION

The Uruguayan academic-architectural community was not immune to the processes by which research on the contribution of women in architecture has multiplied in recent years. The achievements of the Uruguayan architects who have been active in the country since 1923 —when the first woman architect, Julia Guarino[1], graduated— are only now being rediscovered. Their previously omitted works are beginning to be valued today. However, peer recognition is still far away.

In recent times, it has been necessary to review and investigate the contribution of women to various areas of modern society. In architecture, historiographic reviews with this perspective have shed light on some events in the history of architecture with errors and omissions recorded. Since the 1970s, the traditional history research model has received criticism. It was denounced, as explained by Bárbara Biglia and Núria Vergés Bosch, that "the androcentric and sexist nature of the research, the invisibility, and inattention to the experiences and interests of women, the devaluation of knowledge traditionally associated with the feminine, as well as the inequalities in gender that take place in the processes of knowledge production"[2] were indeed an issue.

Male bias in historiography is not confined to the history of architecture but permeates all disciplines. However, architecture was one of the branches that took longer to address this problem. The most renowned historians of the 20th century have omitted the role of female architects for various reasons. At times, people have wrongly assumed that there were no female professionals until the mid-century, while others ignored their contributions, guided by the biases in traditional historical research methods based on incomplete archive reviews[3]. Since records documenting female activity were disaggregated or difficult to access[4], professional women were often excluded from historical accounts. This also occurred in Uruguay.

2. RESEARCH METHODOLOGY AND EPISTEMOLOGICAL APPROACH

The project aimed to study the contribution and impact on architectural culture of female professionals in Uruguay between 1923, when the first female architect in Uruguay —Julia Guarino— graduated, and 1958, when professionals trained in the first architecture curriculum finished graduating. This chronological cut allowed for the delimitation of a group of 70 female architects. Although the graduation date defines the group of architects considered, the extent of their careers determines that works outside that period are included as objects of study as it enables a comprehensive understanding of them.

Within this framework, the main objective of the research was to identify the production and disciplinary activities carried out by these professionals and to critically analyse their works in relation to the context in which they belong. The main hypothesis of this work focused on demonstrating that there were indeed female architects in Uruguay who

3. Among the authors that took on the subject: Meltem Ö. Gürel – Kathryn H. Anthony, "The Canon and the Void: Gender, Race, and Architectural History Texts", *Journal of Architectural Education* LIX, 2006, no. 3, 66-76; Julie Willis, "Invisible Contributions: The Problem of History and Women Architects", *Architectural Theory Review* III, 1998, no. 2, 57–68; Karen Kingsley, "Gender Issues in Teaching Architectural History", *Journal of Architectural Education* XLI, 1988, no. 2, 21–25; Florencia Fernandez Cardoso, "How Wide is the Gap? Evaluating Current Documentation of Women Architects in Modern Architecture History Books (2004–2014)", in: *MoMoWo: Women Designers, Craftswomen, Architects and Engineers between 1918 and 1945*, Ljubljana 2017, pp. 230-249).

4. It is worth noting that one of the difficulties identified by some historians such as Milka Bilznakov in the 1980s was the dispersion or non-existence of archives that included works by women. For this reason, the International Archive of Women in Architecture was created at Virginia Tech, which attempts to bring together the dispersed material on the work of women architects since the 19th century. See more in Despina Stratigakos. *Where Are the Women Architects?* (Nueva Jersey: Princeton University Press, 2016)

made significant contributions to architecture and urbanism. In fact, until now,[5] the historiography of architecture in Uruguay has had little record of activities or projects carried out by female architects.

The project's methodological approach began with reviewing disciplinary publications and then focused on archival research, particularly the Heritage Archive of the Ministry of Transport and Public Works (MTOP) **(Fig 1)**. Interviews played a crucial role in obtaining firsthand information from female architects and individuals associated with them. This approach enabled the verification of female authorship of numerous works and access to relevant private materials.

Primary sources revealed that female architects in Uruguay had opportunities to access technical positions in state architectural offices, contributing significantly in both quantity and quality, despite limited private sector commissions. These sources were crucial for understanding their careers, context, and contributions to the built environment and culture. The contrast between primary sources and the lack of recognition in historical research highlights the importance of document-based work and justifies the research methodology. The goal is to understand the context in which these women worked, their opportunities and challenges they came up against, and how they silently but irrevocably occupied various spaces within the discipline.

3. MODERN PRODUCTION OF FEMALE ARCHITECTS

The female architects have been protagonists in shaping the physical framework in which Uruguayan society has developed its life as a community (Fig 2). However, the historiography of Uruguayan architecture, until relatively recently and even with some diffidence[6], has failed to recognise their fundamental role, which is often made invisible under the umbrella of the state, and has marginalised women all the more-so, due to their gender. The material signs that the buildings represent show that professional quality is not a gender issue. This is how Nelly Grandal experienced it, as evidenced when she said: "You should act correctly so that they cannot tell you did it wrong only for being a woman."[7] It was a challenging journey, but she and many other female architects made it possible.

The research has uncovered a wealth of quality modern architecture produced by women, either individually or in teams, across various programmes and scales throughout the country. Notable examples include the School of Viticulture (Julia Guarino, 1937), the Trinidad High School (Sara Morialdo, 1954), the Liceo Bauzá (Elsa Maggi, 1953), the Industrial School of Pando (Nelly Grandal, 1964), and numerous homes in Montevideo (Otilia Muras), Tacuarembó (Elodina Balestra), Piriápolis (Emilia Alperovich), Minas (María Luz Morosoli), and Punta del Este (Susana Pascale). These works, previously overlooked by local historiography, are characterised by their delicate design, geometric precision, open spatialities, and carefully selected and executed materialities, all of which contribute to their unique and significant architectural value.

7. Architect Nelly Grandal in an interview by Laura Cesio and Christian Kutcher on June 26, 2015.

Over the course of five years, research has revealed that many female architects held positions in various national and departmental public offices in the country. Likewise, the interventions and projects they carried out while serving as public officials in different archival documents have been reviewed and systematised within the scope of this investigation. These records allow us to infer that the number of projects they were in charge of and the different scales and work programmes they tackled were similar to those of the male architects.

In the first half of the 20th century, the promotion of public infrastructure works by the state required increasingly more technicians capable of executing them[8]. In this context, it led to female architects carving out a niche for themselves in state technical offices while at the same time there was a significant increase of the number of women obtaining a degree in architecture. Among these confirmed cases, important groups worked continuously in the Departmental Council of Montevideo and in different autonomous entities. In particular, in the Architecture Division of the Ministry of Public Works, many female architects could practice the profession under conditions comparable to those of their male colleagues[9]. Some of the architects who worked in that office during that period included Julia Guarino, Adela Yanuzzi, Sara Morialdo, Zulma Roncagliolo, Elsa Maggi, Nelly Grandal, Ines Caprario, Claudina Vidal, Beatriz Sarthou, Nelly Bianchi, Maria Teresa Bruno, and Elvira Godel. Additionally, the office had positions of drafters and other technical officials, among whom there was also a significant female presence. Moreover, they were responsible for managing construction projects, both their own and those of other technicians. **(Fig 2).**

It is crucial to document the projects and work of female architects in order to understand their contributions. However, there is still a need for more research in the field of private professional practice. While access to work in the private sphere has historically depended on contacts and other relational factors, a widespread observation is that commissions for independent architects mainly came from family members and were linked to residential projects. This statement was formulated using the methodology adopted based on the review of archives, and conducting direct surveys, and interviews with the descendants of the architects carried out within the framework of this study. In many cases, female architects worked in the private sphere in partnership with their spouses. This situation of double association, family and work, has well-known examples internationally.[10] In Uruguay, duos such as Grandal-Scheps, Muras-Giraldi, Gilboa-Reverdito, Villar Marcos-Pascale, or Andreasen-Santamarina had a massive production. They won prizes in competitions[11] and developed intense work in quantity and quality. Nevertheless, the contributions of women were often hidden behind their partners or professional peers.

In both public and private domains, female architects were participants in the changes taking place in the discipline, and, from this record, they contributed to the installation and consolidation of modern architecture in Uruguay. Some architectural works display characteristics of early

9. Various public documentary repositories have been used in the research process. In particular, the Heritage Archive repository of the Ministry of Transportation and Public Works (MTOP) stands out. Based on the review and research work in this archive, female authorship in a significant number of works has been verified.

10. Beatriz Colomina. *Sexuality & Space*. (New York: Princeton Architectural Press, 1997).

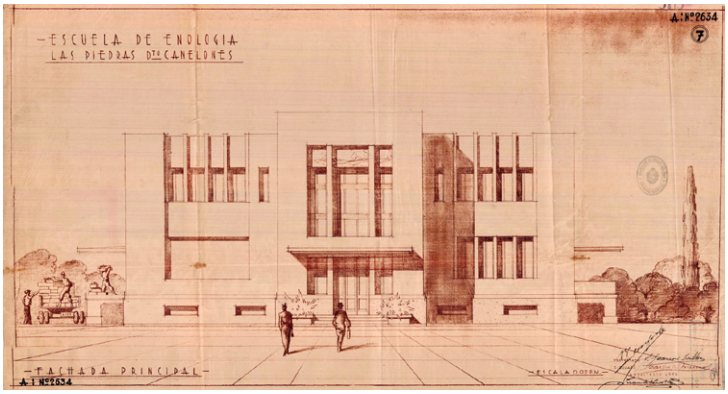
11. Some competitions in which female architects were awarded prizes were the Municipal Palace of Maldonado in 1962, the Palace of Justice in Montevideo in 1963 and the Departmental Council of Montevideo; with participation by Susana Pascale along with Julio Villar Marcos. For their part, Nelly Grandal and José Scheps participated in the competition for the Social Security Bank in 1957 and in the NCI Synagogue where they obtained the first prize. Felicia Gilboa participated as a team in several competitions, obtaining the first prize in 1958 in the Competition for the Headquarters of the Drivers' Protection Centre.

modernity in their volumetric conformation, in the rationality of the functional approach, in the hygiene conditions, in the integration of new structural systems, in the formal purification, in the compositional systems where the openings are of average dimensions cut into the façade plane with a predominance of full planes. At the same time, other projects represent a second phase of modern Uruguayan architecture, characterised by volumes scattered across the landscape with extensive differentiated exterior spaces, and a prevalence of continuous glazed strips. These designs achieve a balance between horizontals and verticals, and spatial connections link the interior space with the exterior and the city. As a whole, they can be understood as different approaches to modernity in the country.

4. RESEARCHING URUGUAYAN FEMALE ARCHITECTS

The team of teachers from the History Institute responsible for this communication has contributed in multiple dimensions to the visualisation and valorisation of the work of these women architects. Among other things, the team has organised public exhibitions, presented their findings at conferences and in the media, collaborated in promotional exhibitions, and has recently published the book titled "Uruguayan Female Architects. Trajectory of the first generations", which includes a long-term investigation -not without difficulties- and opens doors for future and necessary complementary research. On the other hand, at the initiative of the same team, one of the main spaces of the School of Architecture, Design, and Urbanism of the University of the Republic (the only public architectural training centre in the country) has been dedicated in honor of Julia Guarino, on the centenary of her graduation.

In Uruguay, there is a modern architectural corpus with unique characteristics that have been contributed to by female architects. The protection and enhancement of these assets produced in the 20th century began very early in the history of the country and has even achieved international recognition. However, the corpus remains incomplete and continues to be biased. Although in a long-term historical perspective, it is possible to recognise an expansion of the concept of heritage that transcends the objective idea, that of the "big names", that of the "outstanding architects." Nevertheless, there are very few buildings designed by women which have been declared National Historical Monuments or have any protection at departmental level. Examples of recent exceptions include the home designed by Otilia Muras and Héctor Giraldi, declared a Departmental Asset of Montevideo **(Fig 3)**, and the Viticulture School designed by Julia Guarino, protected by the Municipal Administration of Canelones.



In the processes of heritage protection in Uruguay, particularly concerning modern architecture, the coincidence between the systematised generation of new knowledge and heritage protection has been vital, as has the relationship between the ideas of heritage and the architectural historiography of every moment[12]. The new historiographical developments that challenge certain perspectives and offer fresh approaches to the contribution of women to the

discipline will allow us to broaden our cultural perspective when it comes to valuing and protecting the architectural works they have produced.

As a final comment, the research allowed the team to critically review the journey taken. To this day, Uruguayan idiosyncrasy presents challenges in accurately and equally recognising male and female architects' contributions to the past, present, and future construction of our heritage and our built reality. For the feminist thinker Silvia Federici, this issue of labour inequality between men and women is caused by the emergence of

a new type of patriarchy. One in which, in effect, women are no longer just housewives; they are or can also be academics, but in which traditional values and social structures, such as those governing the life of university institutions, continue to be traditionally masculine[13].

The study discovered that most female professionals have limited opportunities for participation and leadership in the vast area of architectural practice. However, in the present, various groups within academic and social organisations are taking the lead in the process of recognising female architects as peers. In the same terms, While teaching has traditionally been a female-dominated profession, particularly at the elementary and high school levels, men dominate in higher education and management positions[14]. This minimal representation in decision-making spaces reflects uneven competition and indicates that the militant work of feminism is still necessary. Furthermore, if the research field of women in history is led only by female researchers, there can be no opportunity for change. We need to embrace the history of humanity as a whole if we intend to build a sustainable and equal society in the future. ■

ABSTRACT

In seeking to build a broader and diverse history of architecture in Latin America, Torre[1] pointed out the absence of women's contributions to cultural discourse, especially those who bring together indigenous, Ibero-American and African cultures. Lima[2] showed that the contribution of female architects in Latin America was until then eclipsed by male figures considered "geniuses", who displaced female participation to a marginal position in architecture. The trajectories of female architects who worked in the Brazilian Northeast and made this region and its field of research still remain absent from Latin American historiography. This text explores the contribution of these female architects from Haraway's perspective of localised knowledge (1995)[3], exploring how the practice of feminist objectivity can offer a more critical and interpretative vision. This perspective was used by women who shared similar situations of otherness, migration and gender, such as architects Minette da Silva, Denise Scott Brown and architectural historian and theorist Sibyl Moholy-Nagy[4,5,6]; as well as by the architects who worked in the Brazilian Northeast, a culturally privileged region. This Northeastern culture, the raw material for research, was catalogued, inventoried, contributed to the fields of urban research, landscaping, construction methods of the Brazilian Northeast, interior design, among others, used their partial perspective to obtain an "inside" view, such how, Lina Bo Bardi (1994)[7] perceived the popular culture of the Northeast as more Eastern than Western; Janete Costa, Neide Mota de Azevedo, Liana Mesquita were inspired by localised knowledge from the Brazilian Northeast to answer specific questions in different areas of the professional field of architecture as a strategy for professional affirmation, using this vernacular knowledge reinterpreted in the light of regionalist currents excluded from hegemonic narratives that follow the masculine, European or North American pattern).[8]

1. INTRODUCTION

The contribution of female architects who worked in the Brazilian Northeast between 1958-1979, with few exceptions, remains absent from the Brazilian modern architectural historiography[9]. One of the reasons for this exclusion is the notion of otherness constructed by intellectuals for the Brazilian Northeast, as a space of longing and territories of revolt and utopia, developed within Brazilian culture and used in opposition to the South (Southeast) to differentiate the North from the South[10].

In the historiography, the Northeast has constantly been labelled as the site of 'regionalism', a term that is ambiguous, since it can refer to positions that fluctuate between a local reinterpretation of international ideas and a reactionary conservatism of a folkloric or populist nature"[11]. Historiographical narratives favour a double invisibility: "*Due to the maintenance of a false homogeneity of architecture, works that diverge from the Eurocentric and hegemonic pattern of Western architecture still remain excluded from international collections of architecture, culminating in a double condition of otherness for women in the Brazilian Northeast, they are the 'others' of the 'other'*"[12].

The science applied in the context of feminism can be understood through the lens of Donna Haraway's situated knowledge (1995)[13]. Therefore, the knowledge and expertise of female architects about the popular culture of the Brazilian Northeast are examples as women's social position enables a partial perspective stemming from the standpoint of the subjugated, allowing for a more critical and interpretative view that is suitable to reality.

This scientific endeavour differs from the typical model of science, which reflects the social and historical context that produced it - predominantly Western, bourgeois and masculine - and which perceives the world from a "*ubiquitous*" and universalistic standpoint. Feminist objectivity aims for a "*localised territorial, social, and temporal*" perspective, and most importantly, a human one.

The adoption of a partial perspective as an alternative to the neo-positivist prevailing model of scientific research is rooted in the feminist epistemological approach known as: **standpoint**, wherein the researcher does not remove their subjectivity from the equation, and "*attaining objective knowledge requires a dialectical and critical analysis of subjectivity*." Within existing frameworks, confronted with the inability to eliminate oneself from the research, individuals conceal their subjectivity through neutrality: the dominant scientific objectivity would represent a singular subjectivity, characterised by white and Western men. [14]

The female architect, by merging gender and profession, embodies both an insider, owing to her education, and an outsider, owing to her divergence, capable of innovating her practice and subjecting it to critical scrutiny, thereby challenging certain aspects of architectural production.[15]

This symbolic subversion breaks with modern canons, whose ideals (in the world and in architecture) placed women in a position of negative

opposite: this implies that the very definition of Woman in modernity (although mistaken) is based on the masculine.

Thus, the integration of female architects into the labour market was consolidated with much struggle and was marked by the creation of innovation and differentiation strategies stemming from the attitude of exploring fields that were undervalued by men, such as landscaping, social housing, interior design, museography, scenography, among others.[16]

A striking point in the production of these professionals for which they gained international notoriety is their relationship with popular culture, the vernacular and their pioneering research of cultures still not corrupted by Western civilization in their respective regions, shared similar situations of otherness, migrations, and gender.[17] Thus, after this theoretical presentation and introduction of the epistemological background, we move on to a brief dive into the trajectory and work of the women architects who lead the discussion of the work stated here.

2. LINA BO BARDI: LOCALISED KNOWLEDGE OF NORTHEASTERN CRAFTSMANSHIP

Lina Bo Bardi (Rome, 1914 - São Paulo, 1992) made forays into the interior of Bahia and the Northeastern backlands inspired by the expeditions of Brazilian modernists, such as Mário de Andrade's folkloric mission[18], in search of the rich vernacular culture of the Brazilian Northeast: the raw material untouched by industrial civilization – mainly due to the isolated character of the Northeast – still present in the region at the time, especially in the backlands and hinterlands[19]. Lina Bo Bardi knew how to look at the hammock (...) at once a bed and an armchair, whose "*perfect adherence to the body, the undulating movement, making it one of the most perfect resting instruments*".[20]

She noted the richness of Northeastern craftsmanship: "*marvelous handicrafts, tools, the working tools of São Francisco's fishermen are of marvelous refinement*" and she "*recognized the aesthetic in trash - in objects exhibited at the Northeast Exhibition (Bahia,1963), made from burnt light bulbs, fabric scraps, cans of lubricants, old boxes, newspapers*.[21]

She mapped out Northeastern artisanal production - "*collecting clay animals, votive offerings made from umburana wood, natural or polychrome wooden boat figurehead, tissue paper lace, tin oil lamps - and proposed the installation of a Museum at Solar do Unhão, conceived as a center for popular art documentation and technical studies on the Northeast*"[22] - and where she designed the famous wooden staircase with joints inspired by ox carts.

She perceived the cultural abundance within reach, a unique anthropological richness: "*And it was possible to build from there a Brazilian design, from forks to bottles, from glasses to lamps*."[23] For Lina Bo Bardi, it was a question of *"searching for the roots of the country (whatever they may be: poor, popular), which does not mean preserving forms and materials, but rather evaluating original creative possibilities*."[24]. She sought in craftsmanship the basis for arriving at a Brazilian alternative

industrial design and "*Brazil would have an industry based on the skills at the hands of the people, from the perspective of the people, with originality*". "*We could reinvent eating utensils, plates, shirts, shoes*."[25]

Lina Bo Bardi and Celso Furtado's initiative at Sudene created in 1961 *Artene* (an agency dedicated to assisting artisans). "*Its basis was the survey of the socioeconomic conditions of the rural and semi-rural people, craftspeople, lacemakers, potters, carpenters, weavers, etc"*. The first step was mapping the Northeastern artisanal production.[26]

3. FROM THE POT TO THE STREET: TRADITIONAL CONSTRUCTION METHODS OF THE BRAZILIAN NORTHEAST

Neide Mota de Azevedo (São Bento do Una, 1932 - Recife, 2015), an architect from the School of Fine Arts of Pernambuco (1953-1957), was the daughter of farmers. Neide dedicated herself to investigating traditional construction techniques of the Northeast at the Housing Center, created in 1963 and coordinated by her since 1964, and renamed the Center for Housing Studies and Planning (Cephab). She had a successful research career, combining two types of vocations: technical and researcher. She specialised at the Inter-American Housing and Planning Center - CINVA, Bogotá (1963) and in the Urban and Regional Planning Course of the OAS, in Lima (1972) .[27]

Vernacular architecture in the Brazilian Northeast was her main focus of work: "*In the Northeast of Brazil, there is an accumulated building experience that deserves to be recognized and understood from different angles, encompassing, aside from the use of materials and construction techniques, solutions for water supply, storage and cooking of food, as well as the treatment of internal and external spaces*."[28] She documented "*non-industrialized materials, frequently extracted from nature, such as; clay, wood, straw, etc. buildings commonly involve self-build practices on the part of the poorer population, either in urban or rural setting*".[29]

Architects Neide Mota de Azevedo, Liana Mesquita, and Ivone da Silva Salsa (also the group's photographer) explored the traditional construction methods of the Northeast by documenting its vernacular buildings. The Traditional Construction Methods research (1978) coordinated by Neide Mota, at the Housing Center (Cephab), UFPE, in collaboration with Sudene and CNPq, documented methods to build with simplicity in tropical regions, raising and inventorying solutions to the housing problem in three Northeastern states: Pernambuco, Paraíba, and Alagoas. Twenty-three locations were researched in the Backlands, eighteen in the Hinterlands, sixteen in the Coastal region and in the Forest. [30] (**Figure 1**)

They recorded doors and windows, made of wood or straw, frames, sealing elements (panels woven from coconut leaves), sinks for washing dishes and clothes, brick tables for stoves, hammock stands, forks, tables, coffee and meat grinders, solutions for storing food, seeking "*precious lessons of popular wisdom so full of simplicity and creativity*"[31]. In wattle and daub buildings, they recommended "*the introduction of improvements, build a cement grout or lime and sand base, serving as a foundation for*

the pillars and half-timbers [...] painting or whitewashing the walls and the use of vegetation, both for the exterior and interior of the houses, [...] construction with green fences replacing walls"[32] (Figure 2)

By exploring the traditional construction methods of the Northeast, they shifted their focus to a field of knowledge that remains largely unexplored a scientific endeavour different from the usual model of science - hegemonically Western, bourgeois, and masculine - which reflects the social and historical context that produced it, and points it towards the discovery and development of a new professional field: urban ecology and cultural landscape.

4. DECORATION AND THE TROPICS IN THE INTERIOR DESIGN OF JANETE COSTA

Northeastern craftsmanship was the source of inspiration for the Pernambuco architect Janete Costa (Garanhuns, 1932 - Recife, 2008). In the 1970s, she gained prominence by using locally crafted pieces still undervalued in interior design projects. She created the "*Interferences*" project, which envisioned:

> [...] *the identification of groups and communities of artisans working in the Northeast region of Brazil, classification by the raw material used and by the artisanal products or objects produced, the mapping and identification of groups and communities, and the identification of groups or communities that could work together to achieve the pilot project* [33].

Through the junction of art, technique, and local craftsmanship, Janete Costa forged a distinguished career in the field of interior design. It's noteworthy that this was an area often considered "feminine" within architecture, precisely due to its association with the domestic and private sphere. Particularly during modernity, it was perceived as the place where women could act .[34]

> At the conference Decoration and the Tropics (1973), she attested that *Decoration begins with the application of the indispensable utility material, the pot, the pitcher, and the hammock on the painted door, newspaper cutouts, pieces of paper lining the shelves, the plant tin covered with paper, the ruffle on the door, the holy picture. It is man projecting himself, his culture, his roots, his values, his problems. And everything that grows from the ground is the ground rising*.[35]

In the Olinda's houses, she observed "*vivid colors, mysticism, superstition, ornamentation; the composition always geometric, primary and rigid*!"[36] She suggests, "*at mid-height of the huts' walls, covered with straw and with cross ventilation, to allow for an environment in line with ecology."37* She attested that *"In the tropics, protection against heat and excessive brightness (...), white reflects heat and black absorbs it, (…) the landscape here acquires great intensity of color and is bright, transparent, and strong*. [38]

In a statement to Borges in 1991, she relates:

As a child, I used the pot, drank water from the pitcher, played with Vitalino's[39] *toys and cloth witches, cooked in clay pots. But as I grew up, all of this was associated within me with a state of poverty. (...) Only when I distanced myself did I realize that the pot and the pitcher had been a privilege for me, this happened in the early 1960s (...) I spent months traveling, researching furniture, toys, ludic art, sacred art with great passion, it was when I woke up and rediscovered my origins.* [40]

39. Vitalino Pereira dos Santos (Caruaru, Pernambuco, 1909-1963) was a notable popular ceramist known for his pieces inspired by rural and urban everyday life, rituals, and the imagination of the Brazilian Northeastern hinterlands population. See https://enciclopedia.itaucultural.org.br/pessoa9523/mestre-vitalino

40. Adélia Borges et al. *Janete Costa: arquitetura, design e arte popular*. Recife: CEPE, 2020. p.18

She reused objects, giving them new uses: a basket was adapted for a napkin holder, a blanket unfolded into placemats, the woven baskets for carrying supplies from the artisans of Riacho das Almas-Pernambuco were added to rice paper to compose lamps, and the ceramic tubes from the potters were transformed into umbrella stands. Like Lina Bo Bardi, she saw a path in craftsmanship, the theme of her exhibition with three to four thousand pieces at FIESP (1985)[41]. (**Figure 3**)

5. FINAL REMARKS

The knowledge and expertise of architects about popular culture is an example of the use of localised knowledge and a practice of feminist objectivity[42]. In the Brazilian Northeast, architects valued elements of local popular culture that lacked commercial value. They discovered in exploratory expeditions, inventories for cataloguing and documentation, answers to specific questions in various areas of the architectural professional field (architectural design, construction methods, landscaping, and interior design) and thus used the vernacular knowledge of the Northeast reinterpreted in light of regionalist currents excluded from hegemonic narratives of a male, European, or North American pattern. And in this way, they used their partial perspective to obtain a view "from within." ■

BIOGRAPHY

Guilah Naslavsky is an Architect and Urban Planner (UFPE, 1992), master and doctorate (FAU USP, 1998, 2004). Architecture and Urbanism professor (Unicap, UFPB, UFPE) and a member of Post graduate program MDU/UFPE. She was granted the DOCOMOMO international grant (2008). She was a visiting scholar at UT-Austin, (Capes, 2015-2016). She coordinates the Laboratory of Architecture and Urbanism Image (LIAU - DAU/UFPE) and "Architects in the Brazilian Northeast" research group, published: *Arquitetura Moderna em Recife, 1949-1972* (PMR, 2012) and "*Brasil Nordeste Mulheres Arquitetas*" (2021). She was a Fulbright visiting scholar (2022) at Columbia University and wrote articles to international and national reviews.

Maria Luíza Rocha Mariz Valença is an Architect and Urban Planner graduated from the Federal University of Pernambuco, currently pursuing a master's degree in Urban Development (MDU/UFPE). Researcher at the Laboratory of Architecture and Urbanism Image (LIAU - DAU/UFPE) and member of the research group "Architects in the Brazilian Northeast." Since 2019, has been researching architecture and gender.

Rafaela Silva Lins is an Architect and Urban Planner graduated from the Federal University of Pernambuco (2018-2023). She has also been a researcher with a Pibic/Propesqi/UFPE scholarship (2020-2021) and is a member of the study group "Architects in the Brazilian Northeast" at the Architecture and Urbanism Image Laboratory.

ARCHITECTURAL HERITAGE DISCOURSES AND CONSERVATION STRATEGIES

ELVIRA PÉREZ V.
SCHOOL OF ARCHITECTURE,
PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT

The field of architectural conservation is currently undergoing a profound transformation, driven by evolving discourses, changing perceptions of heritage, and advancements in technology. Contemporary conservation approaches consider heritage as a living entity that adapts to social, cultural, and environmental shifts, particularly within modern architecture. This article examines the intricate relationship between architectural discourses and conservation strategies, emphasising how historical concepts, such as those proposed by Alois Riegl and Françoise Choay, have shaped contemporary understandings of heritage as a social construct. The shift towards recognising culture as integral to sustainable urban development, as highlighted in the UNESCO report, underscores the need for a holistic approach to heritage management. The article advocates for an inclusive and collaborative conservation practice that engages diverse stakeholders and addresses contemporary challenges like globalisation and climate change. Ultimately, it calls for a dynamic dialogue that redefines heritage as a vital resource for social and economic development, rather than merely a relic of the past.

The field of architectural conservation is currently undergoing a significant transformation, spurred on by a dynamic interplay of evolving discourses, changing perceptions of heritage, and the emergence of new technologies. While the past has traditionally been viewed as a static entity to be preserved for future generations, contemporary approaches to conservation embrace the idea of heritage as a living entity, susceptible to transformation and adaptation in response to changing social, cultural, and environmental contexts. This shift is particularly evident in the realm of modern architecture, where debates surrounding its valuation and conservation have become increasingly complex.

An intricate relationship exists between architectural discourses and conservation strategies, drawing upon a critical examination of modern heritage in global contexts. This analysis underscores the importance of understanding how evolving discourses shape the ways in which we perceive, interpret, and manage modern buildings, highlighting the challenges and opportunities presented by this dynamic field.

The idea of heritage has evolved over time. Since its beginnings with the French Revolution, the concept has shifted from a narrow focus on monuments and works of art to a broader view encompassing culture, memory, and collective identity. Heritage is not merely a legacy of the past; it is also a tool for building the future. Heritage management should be a dynamic process that adapts to the needs and challenges of the present.

In 1903, the Austrian art historian and theorist Alois Riegl published *The Modern Cult of Monuments: Its Character and Origin*,[1] which discusses the changing perceptions and values associated with monuments over time. Riegl argues that the significance of monuments is not solely based on their historical or aesthetic value, but also on their ability to evoke a sense of continuity and cultural identity. He introduces the concepts of "age value" and "newness value." "Age value" refers to the appreciation of monuments for their historical significance and the memories they embody. In contrast, "newness value" highlights the desire for innovation and the contemporary relevance of buildings and structures. Riegl suggests that modern society has developed a cult around monuments, emphasising their preservation and reverence, not just as relics of the past but as meaningful symbols that connect individuals to their cultural heritage. This perspective shifts the focus from mere physical conservation to the emotional and social roles that monuments play in contemporary life. Overall, Riegl's work encourages a deeper understanding of how monuments serve as markers of collective memory and identity in a rapidly changing world.

At the end of the 20th century, the theorist and historian of urbanism and architecture Françoise Choay published *L'Allegorie du patrimoine* or *The Invention of the Historic Monument*.[2] In this work, she questions the notion of heritage, its historical construction, and its repercussions in the contemporary context. Choay argues that heritage, rather than being an inherently natural reality, is a modern concept that has undergone a process of evolution and transformation throughout history. She posits that heritage

1. Alois Riegl, *El culto moderno a los monumentos: caracteres y origen* (Madrid: Visor, 1987).

2. Francoise Choay, *Alegoría del patrimonio* (Barcelona: Gustavo Gili, 2007).

is a social construct; there is no "objective" or "natural" heritage. It is a concept that society defines and redefines based on its interests and values. Additionally, heritage serves as a tool of power, with the discourses and practices of heritage potentially used to legitimise authority, justify social inequalities, and promote specific political interests.

In the UNESCO report *Culture: Urban Future; Global Report on Culture for Sustainable Urban Development* (2016),[3] the shift in the concept of heritage to urban culture is emphasised. The report establishes that culture is fundamental to building more sustainable cities. Cities are not just physical structures but they are also complex ecosystems based on social interactions, cultural practices, and creativity. Culture can contribute to sustainable urban development by promoting social cohesion, inclusion, innovation, and economic growth. It is a powerful tool for building more sustainable and inclusive cities. To achieve this, a holistic approach to urban management is needed—one that incorporates culture at all stages of the planning and development process. In summary, culture is an essential component in creating more sustainable cities and highlights the role culture can play in promoting social cohesion, inclusion, innovation, and economic development.

A crucial first step in understanding the relationship between architectural discourses and conservation strategies lies in deconstructing Eurocentric perspectives on modernity. This discourse highlights the challenges and opportunities presented by a shift towards a more inclusive and collaborative approach to conservation. Such an approach recognises the need to engage a diverse range of stakeholders, including architects, historians, preservationists, community members, and policymakers, in the process of understanding and managing modern heritage.

We must understand heritage not only through a monumentalist lens but also through a broader vision encompassing culture, memory, and collective identity. The main contemporary challenges facing heritage include globalisation, urbanisation, technological development, mass tourism, and climate change, all of which have an impact on heritage, from public policy to restoration and museum practices. Comprehensive heritage management that considers the social, cultural, economic, and environmental dimensions of heritage is essential. Heritage is a strategic resource for sustainable development and the construction of a more just and inclusive society.[4]

The future of architectural conservation lies in embracing change and fostering a dynamic dialogue among various stakeholders. This requires moving beyond a static view of heritage and recognising the ongoing evolution of modern architecture in response to changing social, cultural, and environmental contexts.

Developing a contemporary perspective on heritage involves transforming our understanding of it beyond mere antiquity and historical values. Overcoming the traditional view of heritage requires a dynamic understanding of its meaning, the incorporation of new technologies,

and the active participation of communities in addressing contemporary challenges. In this way, heritage can be seen as a valuable resource for social and economic development, and not just as a vestige of the past.

In conclusion, the complex relationship between architectural discourses and conservation strategies necessitates a critical and nuanced approach. The future of architectural conservation depends on understanding the dynamic evolution of modern architecture and the changing ways in which we perceive, interpret, and manage modern buildings. There is a wealth of further research to be undertaken, new questions to be addressed, and innovative approaches to be developed in order to ensure the effective conservation of modern architectural heritage in all its forms. ■

TOWARDS A CONSTRUCTION OF HERITAGE ASSESSMENT CRITERIA FOR MODERN ARCHITECTURE IN ECUADOR

FERNANDA M. AGUIRRE B.
UNIVERSIDAD DEL AZUAY

VERÓNICA HERAS B.
UNIVERSIDAD DEL AZUAY

SANTIAGO VANEGAS P.
UNIVERSIDAD DEL AZUAY

ABSTRACT

The School of Architecture of the University of Azuay (earq UDA, as it is known in Spanish) and the National Institute of Cultural Heritage of Ecuador - Zonal 6 (INPC Z6), organised an International Workshop in order to discuss historical cultural heritage and valuation heritage of modern architecture. The participants from all over the world offered perspectives from their fields of research through their most recent research or as compilations of their careers.

This article collects and critiques the main ideas through themes that group common threads among the actors: the dichotomy between the terms "modern" and "modernity" from a decolonisation perspective, visual intelligence as an agent in shaping criteria for visual value and its impact on architectural modernity, evaluation tools including cards, documentation, and legislation, and collective sensitivity as an inevitable regulator of heritage preservation.

Without intending to force coincidences or antagonisms, this text aims to establish possible criteria for modern heritage evaluation applicable to Ecuador and, by extension, Latin America. As such, the order in which the themes appear is not accidental.

The results offer insights into the relevance of modern heritage in Ecuador, emphasizing the importance of cultural decolonisation; a critical stance that aims to recover the potential to understand, think, and act socially, ultimately contributing to a more meaningful legacy of the Modern Movement.

1. INTRODUCTION

The debate surrounding the identification and valorisation of heritage in Ecuador remains, to this day, subject to citizen recognition and, certainly, governmental action to ensure its safeguarding. Every effort still falls short in achieving the prevailing value of heritage as the cultural capital of our nation, transcending the cliché of "identity." Therefore, considering those buildings designed and built in our nation that adhere to the formative criteria of the Modern Movement is a matter that provokes controversy and confusion. This is partly due to the lack of time elapsed since the construction of these buildings, or because assessments on value and their meanings are still in a very nascent stage of development. The latter is particularly concerning because, despite the fact there have been debates on defining criteria for identifying and protecting international modern heritage from the 20th century beginning in the 1980s, they are not entirely applicable to modernity in the Americas.

Regarding research on the modern project in Ecuador, in June 2021, the School of Architecture of the University of Azuay and the National Institute of Cultural Heritage of Ecuador - Zonal 6 (INPC Z6), organised an international workshop in order to discuss historical cultural heritage and valuation heritage of modern architecture. The participants from all over the world offered perspectives from their fields of research through their most recent research or as compilations of their careers.

2. MODERN, MODERNITY: APPROACH FROM A DECOLONISATION VIEW

The term "modern" has a complex meaning, reflecting an awareness of an era that connects to the past, antiquity, while also considering itself as the result of a transition from the old to the new.[1]

From a decolonial and emancipatory perspective, any approach to modernity must reject all forms of Eurocentrism. It is impossible to have an emancipatory view in Latin America that can be understood as a form of modernity. In this context, "other modernities" must be questioned, and perspectives considered that go beyond the materiality of the buildings, also focusing on new processes of modern colonisation carried out by longstanding global and globalising institutions. It is important to recognise the often-overlooked role of the Catholic Church in these circles of modernity, and its desperate struggle for survival intertwined with the spirituality and emotions of vulnerable sectors. These modernising and exclusionary strategies, often enacted by the Church, are manifested in new forms, new places of habitation, and the spatial usage of thousands upon thousands of inhabitants.

Alexandra Kennedy researching the Basilica del Voto Nacional in Quito (1887-1924), argues that the terms "modern" and "modernity" would then seem to be phenomena, and often attributed to everything to the desire for secularization, as supported by liberal governments or cultured individuals, professionals educated in the new academies or schools of engineering and architecture.[2]

1. Jürgen Habermas, "La modernidad, un proyecto incompleto," in *La posmodernidad*, ed. Hal Foster. (Barcelona: Editorial Kairós, 2008), 19.

2. Alexandra Kennedy, "La iglesia renovada." I Taller Internacional de estrategias de valoración patrimonial de la arquitectura moderna. Cuenca, Ecuador, 1-2 June, 2021.

However, at the same time, it is important to develop a locally-based history through which one can value and understand one's own heritage. It is crucial to understand for example, that the occupation of the western hemisphere and the Americas coincides with the development of architecture as an autonomous discipline, and these are not coincidences, in fact, there is no coincidence. The processes of abstraction and transformation of lived space into calculated, drawn space through drafting tools reflect a form of occupation and control.

Here, the term "abstraction" suggests particular attention. The use and ownership of "abstraction" come into play due to the need to eliminate any qualification that might distort the real attribute in a specific modern architecture project. We are not aiming for simplification; instead, what interests us are its processes of formation, the processes of architectural formation. The literature on modernity has given little or almost no emphasis to the true innovation that modernity entailed, and that innovation is called abstraction.

This intricate search for the essential has a direct outcome for Fernando Luiz Lara:

> *… it is to seek information, to seek experiences, to seek affections that were erased in this process of abstraction because abstraction, as it functions, separates some variables, separates some concepts that will be worked on to accelerate the process of manipulation and control of nature*[3]

Abstraction as a design tool is inherently assumed by modern architects, as it allows for the extrapolation of project strategies attached to the constructive and/or functional attributes themselves. For example, architect Francesco Maccaferri's modern buildings in Guayaquil demonstrate how modernity can be expressed not just through style, but as a response to specific needs or circumstances. It is, therefore, possible that the principles of abstraction are inherent in the architectural design process. Compte further emphasises the need to delve deeper, and he confirms that:

> *Every place, every architecture of each site must have its own history and its own explanation, and that we must have our own model of analysis; that we must have flexibility and adaptation to what the local history is, and that this local history obviously needs to reference national history, but we also need to highlight what is significant in a specific period in the place where this architecture develops*.[4]

3. VISUAL VALUE CRITERIA. ARCHITECTURAL MODERNITY

At this point in time, there is interest in exploring how modern architectural projects represent responses to a nation's culture and society. Their physical, formal, and even spiritual realisation relates to processes achieved in each historical stage. Thus, "the modern" or "modernity" can be understood by studying specific architectural buildings and historical events that speak to the evolution of architecture in the nation.

3. Fernando Luiz Lara, "Arquitectura moderna en las Américas y decolonización." I Taller Internacional de estrategias de valoración patrimonial de la arquitectura moderna. Cuenca, Ecuador, 1-2 June, 2021.

4. Florencio Compte, "Ciudad y proyecto moderno en Ecuador. Caso Guayaquil." I Taller Internacional de estrategias de valoración patrimonial de la arquitectura moderna. Cuenca, Ecuador, 1-2 June, 2021.

Understanding modernity as a transitional, whether evolutionary or not, would help demonstrate how modern the Andean road system *Qhapaq Ñan* is, as well as the vernacular housing in rural Azuay. Similarly, the Basilica del Voto Nacional in Quito (1887-1924) is as modern as the Palacio Municipal (1953) in Cuenca. However, it must be recognised that the criteria for heritage assessment in each case are not the same, and perhaps not comparable, as they require independent attention that should avoid eurocentric comparisons.

On the other hand, architectural modernity is authentic when it eschews stylistic and ideological or aesthetic prejudices. It becomes authentic when it represents a personal interpretation of the architect or designer, in this case, assuming its role as a contemporary actor in its own time. Sometimes authenticity is mistaken for stylistic nationalism that seeks to reclaim the unique and indigenous styles, attempting to resolve projects through emotional means. In contrast, authentic modernity is rigorous and reflective operating within a framework defined by the idea of truthfulness, simultaneously sensitive and universal. Universality is a consequence of the abstraction in the process of formal realisation of an architectural project.

Following on from the earlier discussion on abstraction, the principle of visual intelligence is highly relevant, considering the constructive and cognitive dimension of the gaze, particularly in the context of photography. Photography can be understood as the art of looking so that others see. It significantly influences how architects and society at large see and understand the world, its landscapes, cities, and buildings.[5] Visual evidence, through images and photography, plays a fundamental role in heritage assessment, serving as a historical document but also as a tool for identifying design values. This argument is supported by ongoing research projects on modern architecture in Latin America and projects by architects who have enriched their work through photography.

In other words, if looking and designing merge in the same act of creation, it would be possible to unveil design criteria through careful observation.

Therefore, it is essential to conduct research on modern projects, detached from stylistic comparisons but approached through its intrinsic systematisation and the complex task of critical project analysis. The research conducted by Pablo Frontini on Raúl Sichero and his personal, academic, cultural, and political environment allows for an in-depth analysis of modern values in an interconnected manner, even encompassing the urban realm.[6]

Under this focus, modern values emerge integrally and specifically to the building. While project strategy comparisons can be seen in other projects or architects, they cannot be reduced to parameterisations like simple checklists.

4. ASSESSMENT TOOLS: SHEETS, DOCUMENTATION, LEGISLATION

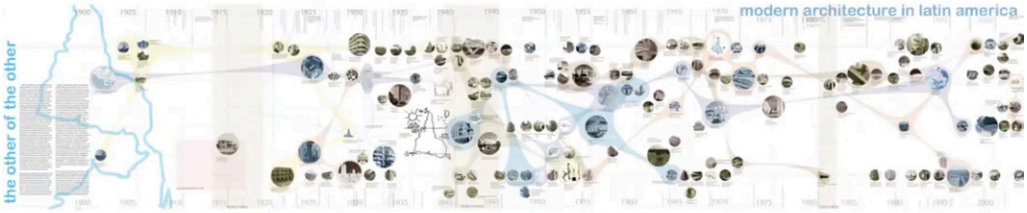
The Workshop was enriched by various learning experiences with existing heritage evaluation tools. Jeff Cody, from The Getty Foundation, presented the publication "The Twentieth-Century Historic Thematic Framework: A

5. Cristina Gastón Guirao, "El modo en que miramos," in *Click 1 Fotografía como arquitectura*, ed.Cristina Gastón (Barcelona: Iniciativa Digital Politècnica, 2015), 14-19.

6. Pablo Frontini, "Análisis y crítica de obra. Estudio de caso." I Taller Internacional de estrategias de valoración patrimonial de la arquitectura moderna. Cuenca, Ecuador, 1-2 June, 2021.

Tool for Assessing Heritage Places," which seeks to understand and evaluate the significance of various modernities worldwide through ten themes. It identifies and analyses potential social, technological, political, and economic catalysts that shaped cities and rural environments in the 20th century. These themes can be applied and adapted globally by those interested in heritage conservation. The tool's versatility has allowed it to be integrated into our work of establishing criteria for modern heritage valuation. The themes have been developed based on preservation experiences in the United States:

> *There are many precedents for these thematic frameworks as they're called particularly in the United States with the National Park Service, but also in Australia, in Canada, for example. And we've benefited from looking at the way that other groups have thought about thematic frameworks. Thematic frameworks also are somewhat related to what might be called themes studies in English about particular industries, like the heritage of the oil industry issues. And these are somewhat related to the thematic framework but not identical. Similarly here in the United States, we very often use it in planning for conservation.*[7]



Heritage legislation for modern projects in Ecuador remains unclear. The discussion on the complex case of the struggle to safeguard Hotel Quito highlights issues with institutional bureaucracy and the aggressiveness of the real estate industry. Despite the abundance of technical documents, the protection of the property hangs by a thread. The Hotel Quito building meets all evaluation criteria with its intrinsic value, comparative importance with its iconic status, and its referential value. However, the building was sold to a private company for a real estate project leading to the land value prevailing over heritage value.

In other cases, cataloguing indeed proves to be a fundamental aid to safeguarding. The Modern Architecture in Peru Catalogue emphasises the creation of a database inventory that compiles and systematises original information and documentation, later disseminated through an online platform. Despite similarly challenges in developing modern heritage values, their efforts in dissemination have influenced official declarations, enabling interventions to develop a living heritage.

5. COLLECTIVE SENSITIVITY

Collective imagination defines heritage preservation. Values cannot be considered homogeneous, permanent, or "socially" objective. They are intangible concepts expressed through images of the attributes that represent them and make them "socially visible." They change historically, both due to evolving social dynamics and communication methods, which are particularly significant today. From the need for dissemination akin to "attractive marketing" to seduce and "connect" with the public, to the urgency of actively involving them in safeguarding processes, when speaking of collective sensitivity, it is evident as time progresses, the

diversity of cultural expressions, tastes, and perspectives will also become more pronounced.

Moreover, without a comprehensive social consciousness of historical, aesthetic, and symbolic values, the threat to heritage assets will remain latent.

The "classic" heritage evaluation appears marked by cultural significance and intense historical value and its identification may be more straightforward. Without aiming to describe the well-known assessment, but also without excluding valuable foundations, we refer solely to the Nara Document. This document states that the preservation of cultural heritage in all its forms and historical periods finds its foundations in the values attributed to heritage in each era. Thus, it is crucial to have accurate information about the original characteristics of cultural heritage to assess its authenticity thoroughly. Therefore, authenticity is a fundamental factor in evaluating the values of the site or asset and understanding it is vital in the conservation of cultural heritage. Depending on the nature of cultural heritage, its cultural context, and its evolution over time, the assessment of authenticity can be linked to various sources of information. These sources may encompass aspects such as form and design, materials and substance, use and function, tradition and techniques, location and surroundings, as well as spirit and sentiment, along with other internal and external factors. Using these sources helps identify specific aspects of the cultural heritage under examination including artistic, historical, social, and scientific dimensions.

In contrast, when it comes to modern heritage, historical, aesthetic, and symbolic values are not on equal footing, hence evident safeguarding is hindered. Historical values are still under construction, with ongoing research on documentation and cataloguing shedding light on the history of cities and their citizens. In regards to aesthetic values, the focus of the Valuation Workshop, does not rely on a single valuation tool based on checklists or simple comparisons with modern architectural buildings inside and outside the Americas. Instead, the project and its authentic attributes must fully and coherently reflect to its time and circumstances.

However, symbolic values are perhaps the most challenging to construct because their action, while it may be a consequence of the dissemination of the other two, will not be immediate. Symbolic values cannot be assumed or imposed unless society recognizes them as its own.

6. FINAL CONSIDERATIONS

This essay critiques the main ideas through themes that group common threads among the presenters. Without intending to force agreements or disagreements, it aims to interpret possible criteria for modern heritage assessment applicable to Ecuador and, by extension, Latin America. Therefore, the order in which the themes appear is deliberate, and each theme is argued and supported by the presenters themselves. This analysis contributes additional reflections that lead to four fundamental ideas:

1. Evaluating cultural heritage from a broad and multidisciplinary context in order to consider contributions from specialists in various disciplines.
2. Ensuring that strategies for identifying and valuing heritage have a holistic character and are based on evidence that contributes to its cultural and symbolic significance.
3. Recognising the inherent abstraction of modern buildings, understanding that the identification of modern values could acknowledge that architectural projects contain universal criteria that only become specific when rooted in the environment, programme, and contemporary technology, thus carrying an intrinsic cultural component.
4. Analysing modern buildings should consider not only the building itself but also the architect and its social and cultural context, thereby relating it to historical, cultural, and economic aspects and the disciplinary field. ■

MODERN TERRITORIES AND LOCAL ARCHITECTURES: PERU'S TOURISM HOTELS FROM 1930 TO 1970

TRILCE BRAVO GUZMÁN
CENTRO DEL PATRIMONIO CULTURAL,
PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

ABSTRACT

Hotel architecture in Peru during the 20th century reflects the impact of modernisation on the country's tourist infrastructure and the effort to balance functionality with local identity and cultural heritage. This approach has enabled hotels to meet the expectations of modern tourists and serve as local embodiments of the cultural identity of the regions where they are situated.

This essay analyses three hotels located in emblematic cities of southern Peru, regions known for their challenges in connectivity and access. These hotels represent advancements in functionality and modern comfort, striking a balance between contemporary architectural innovations and the preservation of regional cultural identity.

These buildings are notable examples of how modern architecture in Peru does not manifest uniformly. Rather than adopting a monolithic approach, Peruvian modernity diversifies into various forms that integrate specific regional elements, reflecting a unique adaptation to local realities. These hotels illustrate how local architects enriched modern architecture to resonate with Peru's unique cultural and geographical context through designs that combine modern elements with traditional and regional features.

1. INTRODUCTION

Cultural heritage and tourism profoundly shape nations' collective imaginations. In the 19th century, the concept of cultural heritage differed markedly from that of today. During that period, heritage was primarily understood as objects and monuments of historical and artistic value, constructing a narrative for each nation-state.

Such a narrative has led to specific regulations to safeguard these sites, recognising them as sources of national pride and heritage in the Peruvian context. This approach became firmly established during the 20th century, playing a crucial role in protecting cultural heritage and focusing on archaeological sites,[1] making it a cornerstone of the country's heritage preservation efforts.

This form of heritage valuation had a significant impact on various sectors, including tourism-related policies. Throughout the latter half of the 20th century, the Peruvian government implemented a series of policies and projects to promote tourism development, including a substantial boost to hotel infrastructure. Between 1933 and 1938,[2] essential infrastructure projects facilitated tourism growth. Notable among these projects were the expansion of the Panamerican Highway and the construction of the Central Highway, which significantly improved the country's connectivity and accessibility.

In this context, the government launched an ambitious hotel plan that included the construction of new hotels, especially in key tourist destinations. This plan aimed to increase the accommodation supply and attract private investment. Expanding hotel infrastructure was a key strategy within a broader effort to modernise Peruvian cities. This initiative capitalised on the growing interest in cultural and archaeological tourism, contributing to the country's economic development and strengthening its image as a premier tourist destination. Moreover, it represented one of Peru's central ideas for modernising hotel infrastructure during the 20th century.

2. TOURIST HOTELS IN PERU: WHEN MODERNITY IS REGIONALISM

The hotel plan represented a significant effort to raise the quality standards in hotel construction in Peru. The initiative aimed to establish technical and aesthetic criteria for new hotel projects and marked the beginning of a modernisation phase in the country's tourist infrastructure. The call for this competition reflected a systematic and professional approach to tourism project planning, emphasising the importance of incorporating technological innovations and functional design in the hotel industry.

In May 1938,[3] the Ministry of Public Works of Peru announced a tender for the design of the Hotel del Cusco, as published in the magazine *El Arquitecto Peruano*.[4] This competition is significant for being one of the first in Peru to be conducted with a rigorous and professional approach, marking a milestone in the history of the country's architecture.

The competition itself and the subsequent construction of the Hotel del Cusco marked a step towards professionalising the hotel sector in Peru.

2. Second government of Oscar Benavides

3. "Puntos de vista… El ministerio de Fomento y el concurso arquitectónico," *Revista el Arquitecto Peruano* no. 10 (Lima, May 1938).

These efforts formed part of a broader movement to enhance the quality of tourism services and boost the country's appeal as an attractive destination for international visitors. The modernisation of hotel infrastructure was also crucial for supporting economic growth and tourism development as Peru was beginning to open up more to the world and embrace its cultural and tourist heritage.

After the 1938 Competition for the Hotel del Cusco, the Peruvian government intensified its efforts to develop hotel infrastructure nationwide. This initiative aimed not only to cater to growing domestic tourism but also to attract international visitors, which was when Peru began to position itself as a major tourist destination. The expansion of hotel infrastructure focused on enhancing the quality and capacity of available accommodations to provide services that met the expectations of tourists of the time.

The development of hotel projects expanded to various strategic regions, each with its tourist appeal. This regionalised approach allowed for easier access to multiple destinations, from archaeological sites to natural areas, and contributed to local economic development by generating employment and promoting trade in the surrounding areas. The new hotels began building a distinctive identity as architects and planners discussed integrating modern designs with distinctive regional elements. According to the initial plan, the locations for the hotels were Cusco, Arequipa, Huancayo, Abancay, Ayacucho, Piura, Huánuco, Tumbes, Puno, Huaraz, Chala, Camaná, and Tingo María. The number of rooms ranged between 82 and 8, most under construction, except for Arequipa, which had an awarded contract; Tingo María, with eight bedrooms and six cabins already completed; Ayacucho, which was in the bidding process, and Tumbes, which was in the planning stage.

Martucelli argues that the hotels of the time reflect the profound changes in Peruvian architecture during the first half of the 20th century. These changes included innovations in design and construction and an adaptation of architectural styles to local characteristics.[5] Regionalism in hotel design incorporated architectural elements that highlighted the cultural and regional diversity of the country, offering tourists an enriching experience that resonated with Peruvian cultural heritage.

More than a mere apprehension of European heritage, the neo-colonial style allowed architects to integrate their designs with local urban environments. For some, this choice also helped shape a national narrative based on archaeological discoveries in the country, giving the constructions a historical dimension through a new artistic expression.[6]

Notably, tourist hotels in Peru have evolved in their design by incorporating elements of modern architecture. These hotels initially include neo-colonial characteristics and features on the exterior, while their architectural programmes and interior details adopt modern elements.

Additionally, regionalism played a crucial role in shaping the architectural identity of the hotels. There was an emphasis placed on preserving Peruvian cultural identity in each design through the inclusion of decorative and structural elements that echoed local styles and traditions,

from Indigenous motifs to colonial details, thus resulting in a unique fusion of the modern and the traditional.

The early hotels featured notable neo-colonial characteristics, such as arches, pediments, balconies, and towers, reminiscent of churches due to their visual weight. However, there was a clear awareness that the environments these hotels aimed to offer were ahead of their time. These characteristics are evident in cities like Cusco and Arequipa at first glance.

Over time, some hotels moved away from incorporating neo-colonial elements, and modern features became more pronounced, adapting well to diverse geographic contexts, as seen in hotels in Iquitos, Tacna, and Chiclayo.

This essay will focus on three specific cases: Arequipa, which was one of the first projects and the first built; Tacna, known for its significant advances in modern form during the early construction period; and Ayacucho, a discordant case in the modernisation process, as it was one of the last to be built and featured neo-colonial characteristics.

2.1 AREQUIPA HOTEL

Designed by architects Álvarez Calderón and Harth-Terré,[7] the hotel, inaugurated in 1939, is part of the state-driven hotel expansion policy. This project raises the standard of comfort in southern Peru.

Although the hotel's design incorporates neo-colonial architectural elements, such as pediments and shields on the facade made of *sillar*[8] stone, it also carefully integrates modern features. This combination reflects the architects' commitment to creating a building that offers both identity and quality for tourists, which is evident in the hotel's functionality and comfort at the time.

The choice of location, in the Selva Alegre area on the outskirts of Arequipa, was vital for tourism in southern Peru. It enhanced its appeal and expanded urban growth, and the hotel acted as a reference point for this expansion, thus helping to build a new urban profile at the time. **(Fig. 01)**

The building's exterior volumetry, characterised by solid volumes, recalls contemporary religious constructions and addresses the region's concern for seismic stability. In contrast, the lightness of the green areas and extensive gardens establish a harmonious connection with the surrounding natural landscape.

A notable design feature is the arrangement of rooms, terraces, and courtyards, which offer views of the Misti Volcano, enhancing the guest experience and highlighting Arequipa's regional identity, distinguishing it from other regions. Integrating the landscape into the hotel's modern design shows a remarkable sensitivity to the natural environment.

The hotel's large dining room is also a key component of its design, providing a spacious and functional area that complements the building's character. It is worth noting that the hotel's initial design included 45 rooms. However, due to its growing popularity and high-quality services, an expansion was carried out to meet demand.

7. "Puntos de vista… Ley hotelera y los arquitectos peruanos," *Revista el Arquitecto Peruano* no. 13 (Lima, August 1938)

8. White stone is symbolic of Arequipa, which is an element of authenticity and cultural connection.

2.2 TACNA HOTEL

The Tacna Tourist Hotel, inaugurated on March 31, 1951, during General Manuel A. Odría's government, is located approximately 200 metres from the Plaza de Armas and near the city's financial centre. As a key city on the border with Chile, Tacna received particular attention in developing its hotel infrastructure, and the Tacna Hotel is a notable example of modern architecture in this context.

The design of the Tacna Hotel reflects a precise adherence to the principles of the modern movement, characterised by functionality, simplicity, and innovative use of materials. The hotel's architecture stands out for its expressive tectonic character, emphasising the honesty of materials and structural clarity. The arrangement of volumes testifies to the simplicity and efficiency that define modern architecture, with a form that responds to both functional demands and an aesthetically coherent design. **(Fig. 02)**

Although simple, handling light and treating space show precision to maximise functionality and comfort. Incorporating green areas into the design reinforces the balance between the building and its natural surroundings, complementing the modern philosophy of harmony with the environment.

The hotel features a comprehensive architectural programme, including various rooms, a banquet hall, a bar, a spacious foyer, and a basement with garages and service areas in a separate pavilion. This spatial organisation reflects the efficiency of modern design and offers optimised functionality for users, in line with the flexibility and adaptability principles of the modern movement.[9]

The Tacna Hotel is a prime example of modern architecture. It respects Tacna's cultural and urban traditions while fully integrating them into contemporary design. Its focus on functionality, simplicity in form, and innovative use of materials highlights its relevance within the modern movement and its impact on regional architecture.

2.3 AYACUCHO HOTEL

The Ayacucho Hotel, designed by architect Carlos Silva Santisteban Tinajeros, was one of the first proposed but the last to be constructed and operational. Its design paradoxically combines neo-colonial features with a modern architectural programme.

The Ayacucho Hotel is fascinating due to its location in the heart of the city's historic centre, despite the considerable debate this decision generated.[10] Architect Belaunde had initially suggested placing the hotel on the city's outskirts, like the approach taken in Arequipa, to make better use of Ayacucho's landscapes. However, the regional reality of Ayacucho, with fewer connections and transportation options compared to Arequipa, made this proposal less viable. **(Fig. 03)**

The slow progress in connecting the region with the capital affected the expected flow of visitors, which was initially projected to be 32 rooms. Despite delays in the bidding process, construction, and modifications to the 1944 plans developed by the Ministry of Public Works, the decision

9. "Puntos de vista… Política hotelera. Especial Hoteles de Turistas en el Perú," *Revista el Arquitecto Peruano* no. 174 (Lima, January 1952).

10. "Algo sobre el propuesto hotel de Ayacucho," *Revista el Arquitecto Peruano* no. 81 (Lima, April 1944).

was made to continue with the project at the original location. The few reconsiderations focused on expanding the building and adapting the design to its surroundings. The hotel, located near Ayacucho's Plaza de Armas, was integrated into an area with numerous colonial buildings, and maintained a neo-colonial facade with stone and riverbed pediments, as well as local materials in the entrance porticos and interior floors.

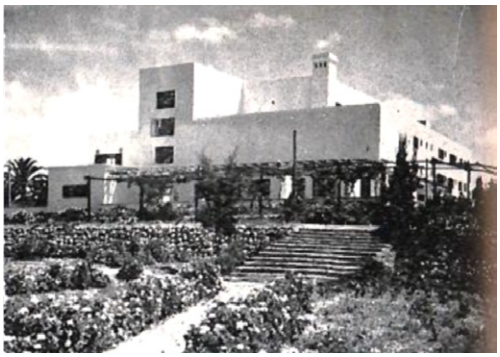
The Ayacucho Hotel seamlessly incorporates Peruvian regional architecture. Located in Ayacucho's historic centre, it reflects the city's rich heritage with its detailed design, blending traditional elements like wooden balconies and adobe walls with modern needs. The hotel's internal courtyards offer tranquillity and natural light, enhancing the guest experience and architectural continuity. It stands as a significant example of integrating historical charm with contemporary functionality.

Urban limitations influenced the planning of the courtyard and terraces, which became vital elements for connecting the building with the surrounding vegetation and urban landscape. Despite the constraints and historical context, the hotel's architectural programme was advanced for its time and now meets modern standards of comfort.

The hotel is currently undergoing renovations to accommodate high tourist demand during significant regional events such as Carnival and Holy Week. **(Fig. 04)**

3. CONVERGENCE OF MODERNITY AND TRADITION: A CLOSING REFLECTION

As the country emerged as an international tourist destination, the need to accommodate a growing number of visitors played a crucial role in renewing and expanding hotel and service infrastructure and indeed, in modernising and updating infrastructure in Peru. This phenomenon led to the construction of new facilities with modern standards of comfort and functionality and the renovation of existing structures to meet expectations. The modernisation of tourist infrastructure revitalised and transformed cities, connecting them in new ways.



In Peru, the modernisation of hotel infrastructure led to the development of properties that embrace modern principles whilst respecting cultural heritage, with regionalism responding to how a local perspective reinterpreted the modern movement. Rather than applying uniform architectural formulas, modernity incorporated cultural, historical, and environmental elements specific to each region.[11]

Heritage discourses mobilised state policies and shaped perceptions. This approach is apparent in the reimagining of neo-colonial style as a new form of decolonisation, where modern structures serve as a physical manifestation of this reevaluation, as observed in hotels built throughout the 20th century. These examples illustrate how Peruvian architects, through a modern lens, express national and regional identity, creating architecture that is functional, aesthetic, and deeply rooted in the local context.

The three tourist hotels analysed exemplify Peru's evolution in the southern region, showcasing different architectural strategies. The Tacna

Figure 2. Tacna Hotel © Credits *El Arquitecto Peruano*

Figure 3. Ayacucho Hotel © Credits *Ayacucho Regional Archive.*

Figure 4. Current Photo DM Hotel of Ayacucho © Credits Ilenyd Bravo

Hotel reflects modern architecture in its functional approach and tectonic design while still honouring its cultural identity as a border region. Its integration with extensive green areas and a natural environment underscores the adaptability of modernism in a historical centre. In contrast, the Arequipa Hotel, situated on the city's outskirts, achieves a synthesis by using traditional elements like stone block pediments in a functional design that integrates with the local landscape. Finally, the Ayacucho Hotel grapples with the challenges of dealing with a dense and heritage-rich context, seeking to address the situation that, despite criticism at the time, now makes sense.

Modern architecture, far from uniform and homogeneous, manifests itself in various ways depending on geographic and cultural contexts. While the modern movement promoted functionality, simplicity, and technological innovation, local perspectives have given rise to multiple forms of modernity reflecting regional particularities. In Peru, this plurality of modernities is in convergence, where regionalism acts as a local expression of modernity, perceived as an evolution that respects and represents the characteristics of the Peruvian environment. In this way, it contributed to an architecture that was not only functional and aesthetic according to modern principles but also culturally resonant and significant to the local population. ■

SITUATING INDIAN ARCHITECTURAL DISCOURSE: TRANSNATIONAL NETWORKS OF LATE MODERNISM

SAURAJEETA BOSE PAUL
POLITECNICO DI TORINO

ABSTRACT.

Following independence, India's architectural development was fostered through transnational professional collaborations and international aid. MARG, established in 1946 (Modern Architectural Research Group) inspired by the contemporary MARS (1933-1957) group, published an eponymous magazine which engaged in dialogues with CIAM and later TEAM 10 through the contributions of Minnette di Silva, Otto Koenigsberger, B.V Doshi in the 1950s. At the same time, internationally educated Indian architects such as Achyut Kanvinde, Habib Rehman, and Charles Correa held positions of power in the government as well as on the editorial boards of other publications formulating a modern vocabulary for public infrastructure.

While the existing literature on Indian architecture highlights the contributions of notable architects, it overlooks the deliberations that occurred within the architectural community. Publications such as the *Journal of Indian Institute of Architects (JIIA)* and *MARG* were instrumental in advancing architectural discourse, highlighting the relationship between indigenous techniques and the incorporation of "modernism" in India. Publications such as *Design* and *The Indian Architect* were established later to address the technical aspects of the construction industry while connecting international design debates to the Indian context.

The 1959 Seminar of Architecture in Delhi marked a significant turning point for Indian architectural discourse because it challenged the validity of the modern movement in India. This shift in architectural vocabulary was driven by the discourse revived by the publications to mark the shift of Indian modernism while challenging the notion of critical regionalism. This paper delves into the discourse regarding "modernisation" in India through the lens of the specialised press, highlighting the institutional and professional collaborations which shaped it post-CIAM i.e. 1957-1969. This research connects discourses across publications to present the transnational exchanges that impacted the development of identity in post-colonial India. The paper also examines the Indian publications as a critical space for discourse building upon Beatriz Colomina's "Little Magazines: Small Utopia."

1. INTRODUCTION

20th-century architecture in India bore witness to several movements and figurative transitions, comparable to that of Western countries, particularly from 1947, i.e. post-independence. This period saw the proliferation of the International Style, brought about by Nehru's vision of a "modern" India defined by science and technology and ethics of secular humanism. The inheritance of centralised policy making and technocratic paternalism from the British along with the European socialist democratic model for industrial modernisation, combined with American funding and co-operation[1] led to an adaptation of a different notion of modernity in India.

The adaptation of the International Style in India resulted in a nationwide construction process discussed through multiple channels such as the radio, exhibitions, and seminars. The dynamic flows of knowledge were driven by the dual nature of exchanges originating from the architects trained in the West and the presence of foreign investors and industries in India. This exchange is visible through the study of architectural periodicals such as *MARG* (1946 - to date), *Journal of the Indian Institute of Architecture* 1932- to date, published in Bombay and *Design* (1957-88), *The Indian Architect* (1959 – 1986) based in Delhi. These publications were entirely in English, including the advertisements, showcasing the influence of Anglophone countries.

In 1959, a significant shift occurred in the world of architecture and history. The death of CIAM marked the end of an era and the move towards a more "contemporary" style to address the failures of "modernism".[2] This shift in global politics with the advent of the Cold war, and India's involvement in the Non-Alignment Movement (NAM) in 1961 also led to distancing itself from the western ideology of modernism, which was accompanied by the rise of regionalist tendencies and adaptation of a more historical and contextual approach to the built environment. Although 'post-modernism' is not a term directly applied to Indian architecture in the 1960s, the influences of the global debate can be seen through the reassessment of the printed media and exhibitions of that period.

This study of India's discourse on modernism and the international influences through architectural periodicals highlights the intertwined relationship between architecture and media from 1957-1969. The research attempts to unravel the discourse behind the development of 'post-modern' or 'critical regionalism' in India and its connection to the search for an 'Indian Identity' of post-colonial India. Other questions also arise such as what the nature of the international exchanges during the chosen period signify and can these publications be classified amongst the Little Magazines framework proposed by Beatriz Colomina in "Little Magazines: Small Utopia."

2. FRAMEWORK

The little magazine was defined as "a space for new ideas, led by a guiding spirit, trying to make one point, and usually representing an institution at its most iconoclastic",[3] by Denise Scott Brown in "Little magazines in Architecture and Urbanism." A critical analysis of Indian publications

1. Scriver, Peter, and Amit Srivastava. India: Modern Architectures in History. Chicago: The University of Chicago Press. 2015.

2. Laurence, Peter. "Modern (or Contemporary) Architecture circa 1959." In A Critical History of Contemporary Architecture. Farnham, Surrey : Ashgate Publishing, 2014

3. Denise Scott Brown, "Little Magazines in Architecture and Urbanism," Journal of the American Institute of Planners 34, 4 1968: 223–233. 40.

in the mid-1960s shows a period of littleness, through the nature of its communication and discourse. This research builds upon Beatriz Colombia and Craig Buckley's *Clip, Stamp, Fold: The Radical Architecture of Little Magazines, 196X to 197X*, and Veronique Patteeuw's *Architecture, Writing and Criticism in the 1960s and 1970s* to re-examine the sites of architectural production in India in the period 1959-1969.

The existing literature mainly focuses on architectural publications and spaces in Europe, America, and Australia. The representation of Southeast Asian publications is non-existent in the discourse, and only recently has the role of architectural periodicals in the development of modernity in the Global South been brought to the fore through articles such as Maristella Casciato's "Scienza e arte dell'architettura: due riviste nell'india di Nehru," 2012 and Devika Singh's "Architecture and Media" in the 2022 exhibition and eponymous publication *The Project of Independence: Architectures of Decolonization in South Asia, 1947-1985*. While publications such as *MARG* and *Design* are highlighted, the oldest and singular institutional journal, *JIIA*, is ignored. Similarly, *The Indian Architect* receives no attention even though it had global subscriptions and contributors.

This research[4] has a two-fold approach. The first part involves investigating the biography and anatomy of the selected periodicals to delineate the thematic and diachronic spaces of discourse. The second step examines the periodicals and their interconnections as a system of knowledge, constructed through the textual and visual content. For discourse analysis, Grieg Chrysler's *Writing Spaces - Discourses of Architecture, Urbanism and the Built Environment* is taken as a reference to build the framework for understanding the nature of the publications. The analysis of the discourse places the magazines as a space of knowledge, each with its own politics of writing and expression of built form. The hypothesis to be tested is the eligibility of the periodicals to be classified as "little magazines" and if the space provided for dissent and provocation through them was significant.

To gain a comprehensive understanding of the nature of transnational architectural exchange and discourse post-CIAM in India, three publications *The Indian Architect*, *Design*, *Journal of Indian Institute of Architects*, from the period of 1957-1969. Are selected. These three magazines are significant as they allow for a cross-sectional interlink between theoretical discourses of institutional publications, trade publications and the "little" magazine. The editorial board, contributing authors and the content of the magazines are analysed to identify the connections established though the journals.

3. THE PERIODICALS AND THEIR REPRESENTATIVE INSTITUTIONS

The *Journal of Indian Institute of Architects* is an institutional publication issued by the Indian Institute of Architects and has been in circulation since the 1934. As it was an institutional journal, it mainly reported on the internal occurrences and events of the IIA, publishing reports of its annual meetings,

4. This paper is a continuation of my master's thesis supervised by Prof. Paolo Scrivano and Gaia Caramellino at Politecnico di Milano.

and the various talks given by its members on other platforms. The Journal had positioned itself as the only direct link between the Institute and its readers, differentiating itself from the other publications present during that period. This journal was subscription-based only for the members of the association. This periodical was closely associated with the *RIBA Journal* and its impact could be seen through its structure and contents.

The Indian Architect was first published with the intention of sharing technical knowledge on the Indian sub-continent, and to function as a forum where architects and engineers could exchange notes. This magazine could be termed as a "little magazine" due to the critical nature of its editorials, and the self-publication nature. This magazine catered to architects, town planners and construction engineers, as stated on its title page.

Design which was later rebranded as *Design: incorporating Indian Builder* was launched in Delhi in 1957 by Patwant Singh, to combine the fields of architecture, urban planning, visual arts, graphics, and industrial design. This magazine, as a successor to *Indian Builder*, had a clear ambition to bridge the reputed gap between the artistic and the mundane. This magazine is highly regarded because of the editorial board, the diverse nature of its contributors, and its critical stance against the political and institutional stances of that period.

4. SITUATING THE DISCOURSE IN THE "POST-MODERN" TIME

The 1953 CIAM IX meeting marked a split in the ideals of the group, which came to the fore in 1959 with the disbandment of the same. The notions of identity and association with physical form propagated by Allison and Peter Smithson, later TEAM X, also had an impact in the Indian subcontinent, with the discourse shifting away from the "modernist" trope followed by Corbusier. The deliberations occurring worldwide were also broadcast in India through various seminars and radio talks, which were then reported in the periodicals. Some of the essays and speeches presented by prominent architects were also published through collaboration with other institutions. This paper studies the nature of the deliberations of the articles along with the editorials to present a comprehensive discussion.

A quantitative analysis of the contents of the magazines shows that urban planning, modernism and its identity in India and international articles made up the largest volume of discourse in each magazine, followed by education and profession. Mapping reveals the networks through which knowledge was exchanged and established.

4.1 TRANSNATIONAL EXCHANGES AND EXPOSURE

From an editorial standpoint, Design was the most international in its character by virtue of its editorial *board* which consisted of prominent figures such as Nobuya Abe, Marcel Breuer, Charles Fabri, Seigfried Gideon, Walter Gropius, A.P Kanvinde, Richard Neutra, Gio Ponti amongst others. The content of the magazine, as well as its contributors, had an equally international outlook, with commentary on events such as the World Fair

1967 (Montreal). The section on Art was also significant in this aspect as it reported multiple international exhibitions and an association of MoMA through the articles of Bernard Rudofsky, Allen S. Weller. The influence of art in architecture was also a focus of the magazine as it called for a reevaluation of the current strategies of urban development.

The *JIIA* on the other hand was affiliated with the Royal Institute of British Architects (RIBA) thus influencing its publishing style and content. The Journal, as the only direct link between the Institute and its readers, was quite vocal about its relation and the importance of counterpart institutions such as RIBA and the IUA (Internation Union of Architects) in Indian architectural education and practice. the organisation had an insular nature, as it only published articles by its members,[5] thus limiting itself. The major theme of the international articles was European examples of town planning and industrialisation, gradually shifting to an introverted stance in the mid-1960s. A vocal protagonist of this publication was L.M Chithale, who reported on the preview of the film *The New Age of Architecture* by the editors of the Architectural Forum, New York, in an effort to broaden the American influence on Indian architecture. The contribution of the USSR can also be observed through multiple articles on architectural education, but it failed to change the mainstream education system.

The Indian Architect had a large international presence, both in its circulation as well as the content it published. The magazine took on a more nuanced perspective towards the contribution of foreign architects in India, particularly through built projects such as embassies in Delhi (January 1960), through the review and role of exhibitions such as the World Agricultural Fair (February 1960), etc. The magazine also published articles from other international sources such as the A.I.A journals, RIBA lectures, and articles by eminent architects like Philip Johnson, Paul Rudolph, Juhani Pallasma. The magazine, in July 1963, dedicated an entire edition to international innovative schemes, highlighting the current mindset on contemporary architecture in Europe to inspire Indian architects. Additionally, the magazine featured reference sheets of construction details and global standards, international book reviews, and news about exhibitions and conferences worldwide to keep the audience informed of events around the world.

A major intention of the publication of the international articles in the periodicals was two-fold: first, to inspire the search for appropriate design techniques and technologies in India, moving beyond aesthetic requirements and towards a more contextual approach towards implementation of modernism in India. Second, it sought to create a platform for discussion amongst the fraternity and link Indian architectural discourse to a broader audience. Mapping the places referred to in the articles highlights the close connection of *JIIA* with the U.K., *The Indian Architect* and *Design* was very international in its publication, publishing articles from both the first and second-world power blocs.

5. The IIA had over 600 members in 1959, growing to 1750 members in 1965. Currently, there are nearly 29,000 affiliated members of IIA, and 127,202 registered.

4.2 POST-MODERNISM / CRITICAL REGIONALISM OR SIMPLY APPROPRIATE ARCHITECTURE

The revivalist stance of the *JIIA* was expressed through its editorials and articles by L.M Chithale and M.K Jadhav in 1958, where they called for the need for a coherent architectural policy and the need for technical education to include critical thinking. The editorial board took a critical stance against the adaptation of Western stylistic influences and argued for a nuanced solution to building in India. These deliberations came to the fore in the 1959 Seminar for Architecture, where multiple topics including national policy for architectural expression, the role of architect in society, the effect of climate on building strategies, art and architecture, and the role of civic design and urban aesthetics were discussed highlighting the shift of the intellectual discourse away from the "modernist" trope followed in the last decade.

The impact of the seminar was also reflected in the editorials of the periodicals in the 1960s. For instance, Mulk Raj Anand in *The Indian Architect* stressed the need to rethink the relationship of architecture and its context, its discovery and situatedness, leading to new forms. Multiple editorials touched upon the topic of designing according to climate and weather, especially in India bemoaning the current unsuitable styles adapted in the name of "modernity" continuing onto the section "Designing for the Tropics". *Design* also reflected on the outcomes of the 1959 Seminar proposing "identifying the problem areas in India and directing the limited resources to them"[6] and to develop organisational patterns which respond to the needs of the times and self-correcting based on operations. The editorial also noted that there was little that India could borrow from other countries, except the experience of what to avoid in urban development and architecture.

Towards the end of the 1960s, the discourse had shifted towards low-cost housing typologies and domestic architecture such as residences from across India and the world. The shift from the search for appropriate tectonics and form towards fulfilling the basic need of housing was also driven by the two periods of war and recession which India faced in the 1960s, along with the curtailment of American aid. In the early 1970s, an article on contemporary Indian architecture was published by *The Indian Architect*, which highlighted the new language of robustness and functionalism along with the use of new materials in erstwhile cities of Bhopal, Bangalore, Hyderabad, and Bombay which heralded the direction contemporary Indian architecture was taking. *Design* was very active in representing the dynamic nature that Indian architecture was taking in the 1960s. They published the work of young upcoming architects such as the Design Group, Uttam Jain, Jeet Malhotra and important projects across the country to provide a forum for discussion and to showcase the diverse production across the country.

A major topic of discourse was the proposed Masterplan for Delhi, which was derided for its lack of coherent vision, resulting in a "neurotic, nervous and scarred city".[7] The discourse on urban planning revolved around the recent exercises in urban planning carried out in Chandigarh, Durgapur, Bhubanaeshwar, while referencing historical cases such as Jaipur and

7. Singh, Patwant. "Editorial: How to Succeed..."

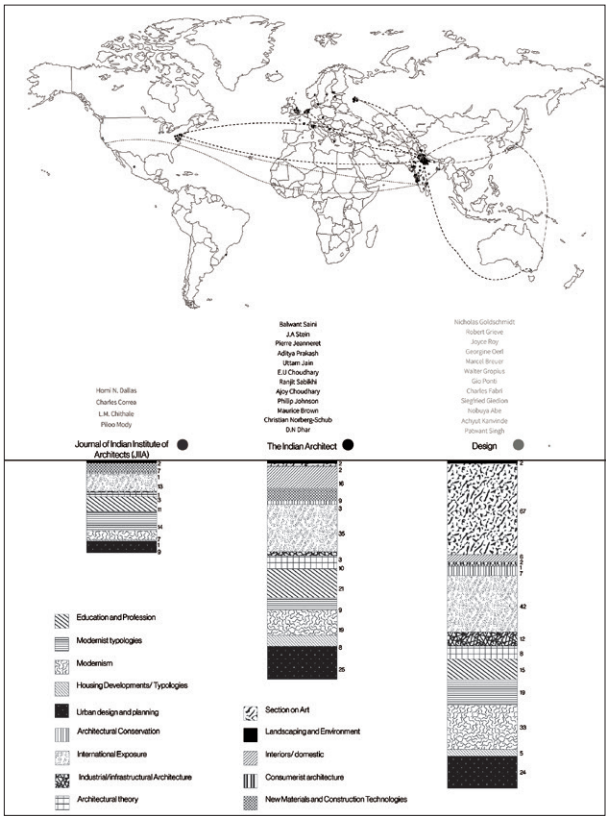

Fig 1: Chart showing thematic analysis of articles and their mapping.

Fig 2: Selection of articles highlighting international exchange and discourse related to search for appropriate form.

Fig 3: Positioning as "Little Magazines."

Fatehpur Sikhri. The aspect of climate and town planning was also addressed through a series of articles "Shopping centres in the Tropics", "Street pattern and orientation of Housing estates in the Tropics," by *Interim Plan*.

The shift towards a more contextually appropriate architecture and urban planning for India could be observed in all the periodicals, albeit focusing on different aspects. The outcome would later be considered as post-modern or critical regionalism by Western academics, a stance which is contested.

5. CONCLUSION: POSITIONING THE PERIODICALS AS "LITTLE MAGAZINES"

"Little magazines were defined as something that functioned as a networked, interactive and international platform for experimental design and discourse".[8] This, along with the self-publication, small circulation and ephemeral nature of the selected periodicals would justify its inclusion in the framework.

The importance of *JIIA* was strengthened in the 1960s during which it had become a monthly publication. However, the content of the magazine had been

8. Colomina, Beatriz. "Little Magazines: Small Utopia." In Las Revistas de Arquitectura (1900-1975): Crónicas, Manifiestos, Propaganda, 13–20. Pamplona: Escuela Técnica Superior de Arquitectura Universidad de Navarra, 2012

reduced to just a mouthpiece of the institute, rather than that of professional information due to the limitation of contributors to only members of IIA, restricting the variety of content it could publish. Additionally, the reluctance of the editorial board to acknowledge the views expressed in the journal as that of the Institute was quite contradictory to their role as the link between the Institute and its members pushes this journal to its current non-existential importance and cannot be positioned as a "little magazine."

Although a technical magazine, the articles and reviews published in *The Indian Architect* took on a critical stance. The magazine also published reviews of the preceding years, addressing topics such as housing, architectural profession and education regulations, and political shifts and complimented them with articles looking towards the future, such as "industrialisation" and "moving forward". While it was supported by subscriptions and advertisements, it was a monthly publication with reporting on technical advancements and news across the world through its reference sheets.

Design shifted towards a stronger critical stance in the mid-1960s as opposition to the political scenario and unrest of students, the ineffectiveness and "tunnel vision" of policy makers, the expression of architectural elements and design, and the rudderless direction of architectural education. It also published a vibrant discourse on art and architecture from across the world. The covers presented a bold visual character compared to the other publications of that period. The content published in T*he Indian Architect* and *Design*, with its diverse nature of contributors and editorials, positioned it as a platform for discourse and debate, justifying its position as an infrastructure for hosting change. ■

ABSTRACT

This paper discusses how to balance the needs of preservation, enhancement and use of the Modernist Architecture of Tashkent, the capital city of Uzbekistan. It is by now widely acknowledged that preservation is to be intended as management of change rather than strict conservation. A sustainable preservation implies reducing waste by conserving as much as possible, while adapting the existing structures to meet the evolving requirements of use. To this end, it is essential to acquire a thorough knowledge of the building, hence to identify the most significant features that need to be retained. Using this approach, the authors demonstrate the process of analysing a building and developing an effective conservation strategy that integrates preservation and managing change.

1. INTRODUCTION

Change is an inherent aspect of human existence. Throughout our lives, we go through innumerable changes, and while we change as individuals, the environment we live in transforms with us. The very concept of cultural heritage was somewhat conceived as a countermeasure against constant change. In a world filled with uncertainty, the legacy of the past represented a lifeline to hold on to, and an essential means of understanding ourselves. As time went by, the past kept extending, and the amount of objects of cultural significance consequently increased. However, the gradual expansion of the list of cultural heritage objects is not merely owed to the passing of time. Changes in the socio-political and cultural context, in particular those that happened in the aftermath of World War II, came to redefine the very concept of cultural heritage, making it more inclusive. If until then, cultural heritage mostly comprised individual monuments extrapolated from their context, the issuing of the Venice Charter[1] and, later on, of the Declaration of Amsterdam,[2] brought about new perspectives. Today, it is widely accepted that human interaction has influenced the entire environment, making almost anything eligible to be considered heritage. The subtext is that heritage values are not static: cultural identities continue evolving as they are formed by values that are passed down and continually redefined across generations. In recent years, this process has brought recognition to the architectural heritage of the Modern Movement, which has often been included in national, if not international, lists of protection. It goes without saying that it is not only the definition of cultural heritage that has changed. The approach to conservation itself has been substantially revised. Whereas the "conventional" approach tended to value the material fabric of a monument the most, recent theories have come to recognise a more comprehensive set of values. This shift is based on the acknowledgement that heritage is important not only to conservation experts but to the whole community and that people in society attribute different values to heritage.[3] Consequently, the complete rejection of any transformation has often been replaced by the acceptance of controlled modifications, provided that the latter do not compromise the significance of the building itself. To this end, new conservation practices have been developed. Among others, the one proposed by the Burra Charter "advocates a cautious approach to change: do as much as necessary to care for the place and to make it useable, but otherwise change it as little as possible so that its cultural significance is retained."[4] It is self-evident that assessment of values plays a central role in this process, as cultural significance is the main driver of conservation, intended as "an integral part of good management of places of cultural significance".[5] We can therefore state that the management of cultural heritage is the management of change, and the operative tool to support it is the Conservation Plan.

The Tashkent Modernism XX/XXI research,[6] hereinafter described, has been based on these principles.

1. International Charter for the Conservation and Restoration of Monuments and Sites (Venice: ICOMOS, 1964).

2. The Declaration of Amsterdam, 1975.

3. James S. Kerr, *The Seventh Edition Conservation Plan* (Australia: ICOMOS, 2013).

4. Australia ICOMOS Burra Charter, 2013, p. 1.

5. Burra Charter, p. 3 (Art. 2).

6. The Tashkent Modernism XX/XXI research has been commissioned and supported by the Art and Culture Development Foundation of the Republic of Uzbekistan, and has been carried out by an international team composed of GRACE (studio of architecture), Politecnico di Milano (Department of Architecture and Urban Studies), Boris Chukhovich (independent architectural historian), and Laboratorio Permanente (studio of architecture).

2. TASHKENT'S MODERNIST HERITAGE

The rich modern heritage of Tashkent testifies to the complex history of the city, which, having been at the crossroads of cultures for centuries, is characterised by multiculturalism and vivacity. Due to its geographical location, the capital city of Uzbekistan has always been one of the most important centres of Central Asia. This became all the more true in the second half of the 20th century, when Tashkent achieved the status of the fourth-largest city in the Soviet Union, after Moscow, Leningrad and Kiev. As a result of the aforementioned, Tashkent was identified as the best candidate to both showcase the Soviet-East to the USSR, and to the rest of the world and to become the Soviet gateway to Asia. This situation called for the design of a new city "representative of the growing socio-political and cultural importance of Tashkent."[7] The latter thus became a testing ground for social and urban experiments, which were suddenly catalysed by the violent earthquake that occurred on April 26, 1966.[8] The devastating event nearly levelled the core of the old city, providing the sought-after opportunity of modernisation. Urban planners decided to organise the new city centre as a system of ensembles, each characterised by a specific role such as administrative/governmental, educational, cultural, etc. For the most part, Tashkent modernist architectures have been designed and built after the earthquake, as an integral part of the reconstruction plan of the city. While representative of those specific urban functions, these architectures were also made use of by planners to effectively manage urban nodes and structure the city, indissolubly connecting them to the urban fabric **(Fig. 1)**. Their prominent placement creates interesting perspectives, making these buildings important landmarks. In line with the international Modern Movement, Tashkent's modernist buildings were also characterised by a certain amount of novelty. This particularly refers to technological solutions, as new materials and construction techniques were tested. Experimentation was also applied in the implementation of climate mitigation systems, as well as in the research on seismic resistance. The most fascinating aspect of Tashkent modernism, however, lies in the balanced mixture of features drawn from international/Soviet modernism and those referring to oriental tradition, which generated hybridisations in terms of settlement, typologies and decorations, making these architectures unique.

Unfortunately, Soviet modernist architecture in Tashkent is facing significant challenges similar to those of modernist heritage worldwide, if not worse. The delayed recognition of their value has caused the demolition of several of Tashkent's modernist buildings. Many others have undergone substantial transformations, which have often irreversibly erased their original architectural features. The commissioning of Tashkent Modernism XX/XXI research shows that the time is finally ripe for re-evaluating the recent past and its legacy. The inclusion of several modernist architectures on the list of tangible cultural heritage of Uzbekistan[9] is an important step in this direction, and it entails the need to develop a conservation strategy, capable of retaining the newly acknowledged significance of this heritage.

7. A.I. Vanke, et al, *General'nyj plan razvitiia Tashkenta* [General Plan for the Development of Tashkent], 1967.

8. Paul Stronski, *Tashkent: Forging a Soviet City, 1930-1966* (Pittsburgh: University of Pittsburgh Press, 2010); Philipp Meuser, Seismic Modernism. Architecture and Housing in Soviet Tashkent (Berlin: DOM Publishers, 2016).

9. A first batch of modernist buildings was included in the National List of Real Estate Objects of Tangible Cultural Heritage in 2019 (Resolution of the Cabinet of Ministers of the Republic of Uzbekistan no. 846 of October 4, 2019). Further twentieth-century buildings were added to the list in 2024, together with 154 modernist mosaics (Resolutions of the Cabinet of Ministers of the Republic of Uzbekistan no. 227 of April 22, 2024 and no. 154 of March 25, 2024).

3. ASSESSING THE SIGNIFICANCE OF TASHKENT MODERNIST HERITAGE

Given that a large part of Tashkent was built from the ground up following the 1966 earthquake, the first important task was to select representative buildings for preservation. Firstly, it was decided to exclude mass housing and standardised constructions to focus on unique public buildings. At this stage, forty architectures were under consideration. To further narrow the list down, a preliminary assessment was undertaken. Evaluation criteria included the authenticity and integrity of the buildings. After the collapse of the Soviet Union, several Tashkent modernist architectures were radically transformed as a result of cultural and political shifts, as well as their alterations in use. Those buildings that were changed beyond recognition were eliminated and for the remaining buildings, other aspects were considered. These included the relevance to the local community, professionals and institutions, the willingness of owners to cooperate, and the availability of information. At the end of this process, twenty-five buildings were short-listed to be analysed within the scope of the research.

It is, by now, widely acknowledged that in order to design any conservation action, it is essential to acquire a thorough understanding of the building. This is all the more important when choosing to adopt a value-based approach, such as that which is promoted by the Burra Charter. The building has to be scrutinised from every perspective in order to assess significance in the most comprehensive and accurate way possible. It will indeed be the elements of significance, whether tangible or intangible, that inform decision-making and define the conservation strategy.

To this end, a series of studies were initiated, encompassing archival and historical analyses aimed at tracing the construction history of the buildings, on-site inspections coupled with visual and instrumental investigations to assess their state of repair, interviews with technicians involved in their maintenance to gather information on the latest issues and interventions and so on. The comparison between historical photos and current ones, as well as that between the original blueprints and the as-built, has been particularly helpful in identifying changes that have occurred throughout time and therefore, to assess the authenticity and integrity of the buildings.

Based on the data collected, a statement of significance was drafted for each building. Note that the statement of significance is not a history or description, but a concise summary of a place's cultural importance. It highlights each significant aspect, emphasising the most critical ones, to support decisions regarding its protection and management.

Accordingly, the statement of significance has been supplemented with some operational tools and, in particular, with what we called Levels of Significance. These levels consist of three different categories of elements. The first category (Maximum Level of Interest) includes those features that are of the utmost importance and need to be carefully preserved to ensure that the significance of the building is fully retained. This entails that these elements cannot be transformed in any way, and that conservation activities are required.

The second category (Medium Level of Interest) comprises elements of secondary importance, which, as necessary, can be modified following approval by a designated committee of experts.

Finally, a third category was dedicated to the so-called Hidden Modernist Features. The latter gathers those modernist characteristics of the building which have been reversibly transformed or have been concealed but still exist and could be reinstated contributing to a better understanding of the original design. This last category, more than the others, raises the question of managing change. The transformations that have led to the elimination or concealment of the buildings' modernist features have often been driven by practical needs regarding their use. Sometimes, they have occurred to adapt the buildings to a renewed architectural taste, or in an attempt to reclaim these buildings, which, as a Soviet legacy, have generated mixed feelings for some time.

In addition, the analysis of the buildings portrayed an extremely varied scenario. The twenty-five buildings proved to be very different from each other in terms of function, use, authenticity and integrity, and state of repair.

Addressing this situation obviously required decisions on a case-by-case basis, consistently adhering to the guidance provided by the statement of significance. By balancing the needs of preservation, enhancement, and use, a catalogue of possible strategies was created, demonstrating how conservation often entails change and, conversely, sometimes change is worth preserving.

4. CONSERVATION STRATEGIES

Given that change is unavoidable, we can confidently state that all the buildings analysed within the research have undergone change, if only as a result of the deterioration owing to the passing of time. Buildings that have changed the least are, however, those that, although highly authentic, are in the worst state of repair, which has often come to affect the use of the building. The extreme case is that of the Palace of Aviation Constructors, a cultural centre highly valued by the local community which, due to a prolonged lack of maintenance, has become unsuitable for use and risks being abandoned.

The most common situation, however, is that of buildings that were kept in use, thanks to transformations. This is the case of the State Museum of the History of Uzbekistan, formerly known as the Lenin Museum. Inaugurated in 1970 to celebrate the centenary of Lenin's birth, the building embodies the typical modernist theme of floating volumes. The museum was originally notable for its lightness, which straightforwardly referred to the transparent architecture of the 1960s **(Fig. 2)**. While the building has largely retained its original features, some minor or reversible changes have occurred. The most significant change has affected the transparency of the façades, which is currently lost. During the renewal of the exhibition in the 2000s, opaque panels were installed along the internal perimeter of the building, completely blocking the view to the outside, as well as incoming and outgoing light. The original transparency was extremely valuable and essential to the overall significance of the museum on a conceptual and architectural level.

Figure 1. Map of Tashkent indicating the location of the city's most interesting modernist architecture. ©Michela Barazzetti, and Laura Codilupi. "The Lenin Museum in Tashkent: A Soviet Architecture in Central Asia," Master's thesis, Politecnico di Milano, 2022.

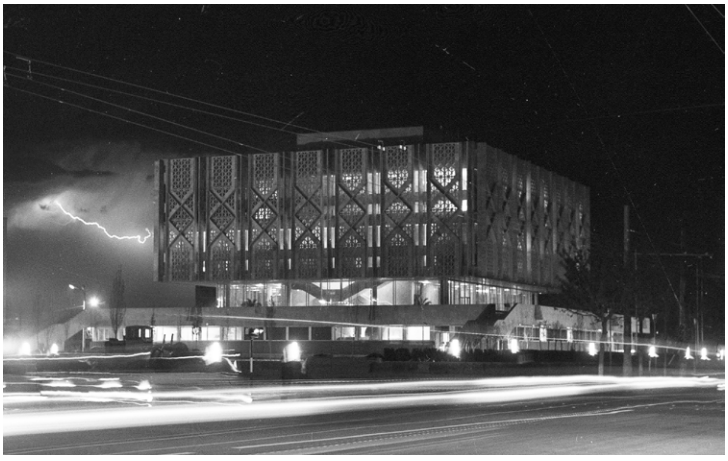

Figure 2. Night view of the State Museum of the History of Uzbekistan before the 2000s renewal of the exhibition. Notice the transparency of the facades, which is now lost ©Arkhiv kinofotodokumentov RUz, 1-37518.

Figure 3. Zhemchug residential building unfolded elevation. Comparison between the original inner façade (1985) and the current one (2022). ©Gianluca Maggio. "Living in the Post-Soviet Modernism: Zhemchug 'the Pearl' Modernist High-Rise Building," Master's thesis, Politecnico di Milano, 2023.

The proposed conservation strategy therefore aims to restore this hidden feature, re-establishing visual connections and the original lighting. This operation will involve redesigning of the exhibition, which will also provide the occasion to upgrade the museum's visitor's facilities, such as adding a café, and a bookshop, etc., aligning them with international standards. This will obviously need to be done without impacting the significance of the building while possibly enhancing its interpretation.

The Zhemchug high-rise residential building is another interesting case. Labelled as an experimental building since its very conception, it aimed to decline the qualities of the traditional Mahalla[10] in a contemporary manner. Experimentation, nonetheless, went beyond the field of sociology, extending to construction techniques. At a time when prefabrication largely prevailed, Zhemchug was built entirely using the sliding formwork system, blending in perfectly with the post-earthquake reconstruction efforts. Throughout the last forty years Zhemchug has undergone several transformations, affecting both the exterior and interior of the building. While the former are minimal and mostly reversible, the latter are more significant and permanent. Residents of the Pearl have taken full possession of the building, modifying and decorating the interior courtyard façades according to their personal taste **(Fig. 3)**. Some even expanded their homes by occupying the perimeter areas of the common courtyards. These interventions have significantly altered the original appearance of the courtyards, but at the same time, they have demonstrated the partial success of the vertical mahalla concept. Thus, the changes within the building can be viewed as a sign of Zhemchug's vitality and as a value worth preserving.

The preservation strategy developed for Zhemchug proposes a two-pronged approach, addressing the different levels of transformation of the building's interior and exterior. For the exterior façade, the goal is to reverse most changes to achieve an overall appearance close to the original. Conversely, the changes within the interior will be accepted and preserved, while protecting the most significant architectural features, which have retained a satisfactory level of authenticity.

This solution will continue to foster use, which is the first and most important guarantee of conservation, while preserving and enhancing the cultural significance of the building, both in its tangible and intangible forms.

5. CONCLUSION

The aforementioned strategies are an example of how conservation can at times be achieved through controlled change. Planning the future of a heritage building, through developing a Conservation and Management Plan, implies prefiguring possible future scenarios and preventively address any issues, even through changes when necessary. This will make it more likely to avoid reaching situations where there is no room left for decision-making, as this could cost the building its significance, either partly or totally.

"Change to a significant place is inevitable, if only as a result of the passage of time, but can be neutral or beneficial in its effect on heritage

10. The Mahalla is the traditional, community-based and self-governing neighbourhood typical of Central Asia.

values. It is only harmful if (and to the extent that) significance is eroded."[11] Conservators should thus start seeing themselves as positive changemakers who drive change instead of being passively subjected to it. In the long run, this approach will enable preservation much more than remedial conservation. ■

BIOGRAPHY

Sofia Celli is a research fellow at Politecnico di Milano in the Department of Architecture and Urban Studies. After graduating from Politecnico di Milano, she received her PhD at Università di Parma. During her doctoral studies, she took part in the Getty Foundation's Keeping It Modern initiative, contributing to the development of a conservation and management plan for Havana's National Schools of Art (grant 2018). Since 2017, she has provided teaching support to restoration courses at Politecnico di Milano, Xi'an Jiaotong University and Università di Parma.

Davide Del Curto is a full professor of architectural preservation at Politecnico di Milano, Department of Architecture and Urban Studies, and vice-rector of Mantua Campus. His research deals with building diagnostics and preventive conservation, focusing on the 20th century. He participated in research programmes and restoration campaigns for heritage buildings from the 13th to 20th centuries. He took part in the preparation of the conservation management plan for Urbino University Collegi by Giancarlo De Carlo (2015-2018), and the National Art Schools of Cuba (2018-2020), both of which were awarded the Keeping it Modern grant by the Getty Foundation and the Modernist Architecture of Tashkent (2021-2023).

Ekaterina Golovatyuk is a Russian architect and researcher and co-founder of GRACE. Golovatyuk's past work experience includes a long-term collaboration with OMA/AMO, focusing on cultural and research projects in Russia, Europe and Hong Kong. Preservation is a central theme/concern of the office's work, with a particular focus on 20th-century heritage. Golovatyuk occasionally lectures at Politecnico di Milano, Triennale di Milano, MARCH Architectural School, Strelka Institute for Media, Architecture and Design, and Garage Museum of Contemporary Art. She was part of the Scientific Committee of Matera 2019 Cultural Capital and has advised private and state cultural institutions in Russia, Central Asia, UK and Italy.

SHARED MODERNISM AND HERITAGE IN LATIN AMERICA AND AFRICA: CHALLENGES OF SHARED AND CONTESTED HERITAGE

NWOLA UDUKU
AHUWA RESEARCH CENTRE, SCHOOL OF ARCHITECTURE,
UNIVERSITY OF LIVERPOOL, ENGLAND UK

ABSTRACT.
This paper foregrounds a roundtable that has as its context the shared history of contested modernism in both Latin America and sub-Saharan Africa. It challenges the canon that posits that the evolution of modernism, in Eastern Europe and its transfer to the US and the West, since the disepersal of key architects during WW2 as providing the official 'origin-story' of the modern movement. It instead aligns its arguments more closely with more recent research which suggests that indigenous elements such as the coboga blocks and mashrabyya screens, that have longer historical traditions and local indigenous origins that have been incorporated or appropriated into our understanding of the features and reading of modernist /international tropical design. Examples of this are the idea that louvres and screen walls are 'modernist' elements without the recognition that they have much older cultural-creative histories in Latin America and Africa. This paper and roundtable propose that the genesis of international style tropical modernism, has a longer genesis than critical regionalism and other concepts coined in the late stages of the 20th century. It debates two key linked questions: Firstly what constitutes modernism and modernity in Africa and Latin America? Secondly what are the uniting challenges there are in our engagement with and conservation of tropical modernist buildings and landscapes in Africa and Latin America, considering our shared climate and cultural heritage? Its sub-questions consider the following: 1. How can we constructively examine this transatlantic link, that both defines and distinguishes these two major continental masses? 2. Can we identify shared physical as well as clear cultural conceptual heritage? Finally, and most importantly: 3. how do we successfully go about both communicating and conserving this body of 'modernist heritage'

1. INTRODUCTION AND CONTEXT

Whilst tropical modernism and its regional variations are now an established part of the non-Western Architectural canon, with Latin American modernism having one of the longest documented histories since its recognition, at the seminal 1943 MoMa exhibition 'Brazil Builds: 1652 -1942' West African modernism's recognition is more recent, emerging through journals, books and trade publications, and recently a series of exhibitions and publications about African Modernism.

This paper focuses on the challenges and contestations related to the specific West Africa – Brazil trans-continental regions as the Latin American subcontinental land mass has close cultural and physical-climatic links with Western Africa. Latin America's non-humid countries, have climate similarities with the Sahel zone in Africa, and elsewhere. Characterised by heat, and high diurnal temperature differentials both these regions share building methods incorporating local earth construction, and utilisation of wooden shutters and screens for privacy and to shield against heat and glare. To set the context to the analysis the climate and cultural characteristics of this region are important.

1.1 CLIMATE

Climatologically, the 'warm humid tropics', where much of Western Africa and equatorial Latin America is situated, have been historically defined as situated within 12.5 degrees North and South of the Equator, and having fast growing vegetation, flora and fauna within the generally warm-hot (21-30 deg C) hot humid (60 -100 %) conditions and limited wind speed (below 6m/s) which characterise this region. In Latin America this zone covers the Amazonia region, running East-West from Peru, Ecuador, Colombia, Colombia, Guyana to Brazil, incorporating states from Amazonia to Bahia.[1] **(Fig 1)**.

1.2 CULTURE

Culturally Latin America has many influences. From those of the 'first nation' origins, to European ancestry nationals, to those with Asian and African forbears. With this there is an established mix of cultural practices. With the initial domination of Spain in much of the continent and subsequent moves to independence or self-rule for different groups constituted within Latin America's different nation states. Aside from Brazil most nations also remain Spanish speaking with links to historic Catholic and Islamic cultural practices. Brazil a former Portuguese colony, remains culturally more aligned to Portugal. Within the tropical humid zone this paper focuses on Brazil and the other nations within the zone which retain particularly strong links to African cultural practice as the region was directly involved in the triangular trade involving persons, merchandise and raw products being transported from West Africa to the West coast of Brazil and other areas of tropical Latin America.[2]

Western African states, this paper's focus have this shared history as this area of the African continent was the most affected by the 'triangular' enslavement process, with those arriving bringing with them African cultures and practices. Religious practices are best known with the introduction of

African cultural elements to the catholic religion introducing African religious practice as evidenced through Santeria, Candomblé, and Abakua practices. Music and culinary cultures also are represented in the translocation of living and lifestyles from Africa to Latin America, with foods such as yam, cassava, and plantains consumed across regions in both sub-continents. In material culture including shelter construction practice the similarity in climate has meant local materials are similar in both regions and unsurprisingly therefore local construction practices in rural settlements are also similar.[3]

Within both these regions the perception and recording of heritage is challenging and contested. The physical architectural heritage of the built environment is particularly difficult to record. The reasons for this are many, however key amongst these are the paucity of information available on many of the lesser known buildings which have not had the documentary records that are available in archives or official documentation. Also, the hidden figures behind much of this construction remain largely un-noted and uncelebrated in the architectural historical accounts which remain defined by the northern architectural 'canon'. The recording of the intangible, which includes oral histories and narratives of buildings and those involved in their construction, is challenging to undertake. Furthermore, these 'official' architectural histories are difficult to contest or reappraise as evidence sources, such as oral histories and non-formal archival picture sources have been until relatively recently difficult to cite within academic scholarship formats such as scholarly journals and monographs.

Here our interest focuses on the challenges related evolution of (tropical) modernist design in both Africa and Latin America in similar climate and culture zones with a view to interrogating what similarities, or differences there are to its evolution and uptake across both continents with similar but not always fully aligned cultural contexts. For architecture this is important as the lived lives in places and spaces is always influenced by one's engagement with forms of culture and context.

2. EARLIER PRE-MODERN HERITAGE

Early African architectural links to Latin America through the long history and aftermath of transatlantic relations through enslavement and subsequent trading relationships with countries with significant population connections, related to enslavement, with West Africa, Latin America and the Americas. This relationship is thought to have influenced the architecture of late 19th century coastal towns such as Lagos, Freetown, Monrovia Porto Novo and Cotonou, all of which had Brazillian, Cuban and Southern American state links. The importation of stylistic elements such as the courtyard, the use of tiles and wooden crafted louvred windows are characteristics of the genre called 'Brazilian' style in cities such as Lagos. With exceptional examples such as the Shitta Mosque, designed and built by returnee formerly enslaved Catholic-affiliated craftsmen from particularly Brazil for the Lagos' Muslim population. Indeed returnee, Nigerian Yoruba citizens who had been emancipated from enslavement were re-settled in the Lagos "popo-

Aguda"area. Records also exist of returnee Afro-Brazilians who became successful traders in West Africa bringing culinary, dress and building cultures from Brazil to West Africa.[4]

This however was pre-dated by more locally originated design practices which can be traced back to both traditional or 'vernacular' domestic shelter and construction methods which Spain and Portugal, the nations most involved with the initial conquest of Latin America and also that of skilled enslaved and later on freed artisans from parts of Africa, where making and construction skills had been highly developed. The *mashribyya* being an often-quoted example of an Islamic origin form of screening that was designed using wooden battens that both provided privacy and shade in tropical shelter conditions such as housing and commercial facades.[5]

3. MODERNISM CHALLENGES

In Latin America the early 20th heralded the evolution and recognition of the 'modernist' era as design and architectural influences of the style, contrary to the past canon owes as much to its development to the incorporation of local and indigenous construction approaches and practices to the influence of architects and design from elsewhere in the world. This does not discount the influence of and involvement of Western architectural players in the evolution of 'modernist' Architecture in tropical Latin America with its Brazilian nucleus. The migration to tropical Latin America, by architects who were caught up or displaced by the politics and economic travails of Europe links to this process. This involved the pratices of European trained architects and local architects who had travelled to gain and understanding of European and US architectural trends who then went on to develop and create Latin America's modernist buildings which span the early to the later mid-20th century.

Highlights amongst these include Niemeyer's Brasilia Ensemble, the original works of Lina bo Bardi, and architecture to be found elsewhere Latin America, prime examples being in Mexico (UNAM), **(Fig. 2)** Argentina (Buenos Aries) and the Rio de Janeiro – Sao Paulo Brazilian architecture. This was not a solely a two-way relationship, as Le Corbusier's visit to Brazil in 1929, during his tour of Argentina, should be considered as evidence that key Western figures in Architecture wanted to explore and understand the unique nature of Latin American architecture, within a wider global modernist context.[6]

African modernism arguably has a later genesis and more regional variations. In the South Southern African countries being much more in step with the aforementioned Latin American mixed evolution of an authentic not totally Western-dictated post war architectural style. Southern Africa also hosted émigré architects from Europe sometimes making the move from Europe to the Americas via cities such as Johannesburg, Cape Town or Kampala. However its architecture also had distinct African influences and a local settler population rapidly did have a cadre of indigenous architects whose inspiration and ideas were unique and not only dependent on external 'Western' influence.[7]

Figure 3. LATIN AMERICAN-AFRICAN TROPICAL CLIMATE ZONES (adapted) – E. Frith

South Africa does have a distinct or identifiable style, with the city ensembles in Pretoria tending towards the late modernist – brutalism. The more eclectic California 'case study' house types, are also to found not only in the Johannesburg-Pretoria, or Gauteng region but also in Cape Town and Durban, predominantly in the design of residences for the wealthy. The subtropical climate of the Cape, and its now post-apartheid and ongoing socio-economic stratification, means that this 'West Coast' modernism style fits particularly well in its Western Cape transformation.

Elsewhere in Africa, West and East Africa's architectural modernism emerges from a colonial architecture that had been developed from colonial architecture and engineering which provided the backdrop to the evolution of urban areas in African colonies. It also was influenced by the strong presence of Missionary architecture in the design and provision of social infrastructure such as schools and health care facilities in the global South, including sub-Saharan Africa.

The post-WW2 era led to local demands for independence and retiring colonial powers developing large infrastructure development projects including schools, hospitals and housing. These were initially designed by colonially appointed Western Architects and planners, who had been exposed to the then new modernism during their education. In West Africa, many of the AA-tropical school trained architects, and their associates from elsewhere in Europe and globally; or with Maxwell Fry and Jane Drew, had been employed by the colonial government's PWD departments and worked on developing a 'post' colonial architecture, which responded to climate science and also cultural context, as they saw it.[8]

To add to this expatriate-settler group of architects was an emerging group of indigenous architects who were Western trained and influenced by international trends in Architecture and planning. These influences were however generally from the ruling country to the colony and rarely cross influences from other 'southern' nations, in Africa or elsewhere. However as mentioned earlier on there are a few instances of architectural and design transfer, firstly the movement of Ernst May, from Europe to Uganda,

8. I. Jackson and J. Holland, *The Architecture of Maxwell Fry and Jane Drew* (London, Ashgate, 2014).

(Kampala) to the USA, also the Portuguese architect Pancho Guedes from Portugal to Mozambique and then went on to work and teach in South Africa. The architectural historian Chipkin, (1993) notes the 'little Brazil' style which identified the stylistic links of many of the architects graduating from South Africa's emerging schools of architecture at Wits and Cape Town with Latin America, and the publicity of the Brazil Builds exhibition in 1943. Indeed the president in chief of the Institute of South African Architects in his acceptance speech in 1946 "spoke enthusiastically" about the architecture he had seen during his earlier trip to Brazil.[9]

4. SIMILARITIES AND DIFFERENCES

Modern Movement architecture in most of Sub-Saharan Africa does not have this lineage. There it is a post WW2 phenomenon possibly with some interwar art deco examples of colonial architectural design. In Latin America, this distinctive time-framing is not fixed, and with its settler-émigré linkages to Europe and the US this process happened earlier, with only Southern Africa having similar encounters with Europe and elsewhere in the West. There are however similarities which are not only geographic and climatic, but that also encompass elements as varied as culture, materiality and programme-use values where both continents' architectures are closely linked.

The architecture produced by Lina bo Bardi in Brazil, it is argued is complementary to the works produced by the 2023 Golden Boot Venice Award Nigerian artist and designer Demas Woko, both of whom developed a specific engagement with the communities for whom they designed and produced original interpretations of 'modern' architecture that remain both site specific and cultural contextual.[10] This was with religious perspective in the case of Woko, and a strident socialist perspective in Bo Bardi's case. Also, Ari Sharon's Ife University team took inspiration from UNAM in Mexico in the development of the artistic – cultural program layout of the now celebrated Ife University Campus.[11] Finally, the early modernist architecture in Brazil, such as Niemeyer's Ministry of Education and Health, Rio De Janeiro, compares favourably with the 'end of colony' building typologies found in Francophone African such as Dakar.[12]

5. CHALLENGES AND CONTESTATIONS

What has yet to be investigated in detail is a deeper comparison and exploration of design philosophies and practical processes, (such as building techniques, and materials use) which have as has noted here been historically similar a century ago but also might be interesting to investigate from both a linear historical development line, which may or may not exist, but also in terms of what future correspondences a (post) modern architectural linkage might bring between the equatorial region architecture of these two continents. Nigeria's capital, Abuja for example did have its original planners go around the world seeking interesting and relevant examples, which included a trip to Brasilia, but this could have developed into deeper investigation and study linkage and engagement with Brazilian and tropical

12. Oscar Niemeyer y Ana Luiza Nobre, *The Curves of Time* (Londres: Phaidon, 2007), L. Bignon, *French Colonial Dakar* (Londres: Bloomsbury, 2014).

Latin American precedents in city planning. The final design for Abuja was determined by planners and architects from the USA and Western Europe, with no reference to the research visits to Brazil.[13] Thus the UNAM-Ife design relationship remains, the closest that Western Africa has had with Latin America in the post-colonial early modernist era.

The most productive confluence of art culture and practice has been arguably during the first and second festivals of African culture, in Dakar, Senegal and Lagos, Nigeria, in 1961 and 1977 respectively. Again, though as festivals these were liminal affairs although both Dakar 61 and FESTAC77 have now been researched and written about by a host of authors, particularly FESTAC.[14] Although both were temporal and contributed to a liminal zone of engagement their legacy was significant. In 61' Senghor's idea of design working through forms or fractals is a valid thesis that remains to be explored further, whilst FESTAC77 delivered building, **(Fig. 3)**. and book *Building Lagos*. In both festivals, art practitioners from Latin America and elsewhere in the black Atlantic world as well as those in Africa were involved. There are many challenges to the successful recording conservation and preservation of buildings and their architectural genesis.

To do this successfully will require:

- More information from both sides about what architecture exists and where the similarities differences and challenges are
- Joint visions in research and enabling frameworks that allow for and encourage these transcontinental relationships and collaborations to take place at formal and informal levels to create opportunities
- Spaces for practice and praxis in a joint examination and analysis of these two regional strands of modern movement architecture.
- South-South conferences education courses policies, [such as Docomomo] – recognising these shared heritage issues and has begun culturally in areas of religion and other forms of cultural practice in parts of Bahia and Western Nigeria for example, where culture, climate and geography all align.

Importantly also this should engender more local and indigenous architectural writing about the history of these buildings and their heritage, integrating oral and other contemporary and intangible history sources.

For Latin American – African transcontinental relations at tropical regional level in architecture there remains a lot to be both explored and built upon, however there is more that unites these two geographical regions than separates them. The Atlantic may be deep but the straits between the continents are close. This is as today where issues of culture, tangible and intangible particularly environmentally for each region's-built environment. ■

Ola Uduku is a researcher at Liverpool University in modern architecture, the history of educational architecture in West Africa, and contemporary issues related to social infrastructure provision for minority communities in the 'West' and 'South'. She is an advocate of equity in all its forms in the workplace, particularly in the Architectural profession. She promotes Docomomo in Africa specifically and was President of the African Studies Association UK (2020-2022). She is currently working on a project titled "Aid by Design" examining Aid and its relationship to Architecture, and the history of health Architecture in Africa.

‘NO HOLDS BARRED’; BEHIND MODERNIST HOTELS IN NIGERIA AND BRAZIL

WAREBI GABRIEL BRISIBE
DEPARTMENT OF ARCHITECTURE,
RIVERS STATE UNIVERSITY, PORT-HARCOURT

ABSTRACT

During the 1960s, some countries in Africa and South America seeking to stand on their own and be counted amongst the league of nations, embarked on building commemorative white-elephant projects, such as government funded luxury hotels. Many of these turned out to be modernist, concrete monstrosities, built to harness what they hoped where the tourism potentials of the blooming capital and regional cities of these countries. Some of these cities had been slated to host international exhibitions, biennales, festivals, trade fairs or sporting competitions, and the tourists’ populations where what these hotels were meant to serve. The mid-twentieth century modernist hotels followed the design movement characterized by concrete minimalist structures, clean lines and the instantly recognizable heritage of simple décor and austere exterior finish. Most included balconies, especially where ocean views and other vistas were to be captured. Vast lobbies and enormous pool areas with generous room spaces were the order of the day. This paper adopts a case study approach using case buildings from Rio, Brazil and Lagos, Nigeria, to investigate spatial and height liberalism as a form of decolonization or revolution in modernist hotels built around the mid-20th century, with particular emphasis on the 1960s. It examines their initial rise, eventual fall and current state as concrete carcasses premised upon this ambitious ideology. The study reveals that factors such as decolonization and revolution might have played a significant role in the development of such architecture and could as well have contributed to its demise.

1. INTRODUCTION: THE ARCHITECTURE OF DECOLONIZATION

To understand the architecture of decolonization, one must first understand the concept and its history. The first waves of decolonization were originally called revolutions and independence and it happened in the Americas and the Caribbean. Decolonization in Africa is part of what is termed the second wave which came as a response to the existing coloniality of the indigenous population by the European nation states. Mignolo argues that decolonization cannot be understood without understanding modernity and coloniality that engendered it[1]. Indeed it cannot altogether be extricated from the taint of colonialism or its alter egoolonialism or its alter ego of modernity. There is no outsider"e in the worldon and marginalization. -modernity. As Grosfuguel mentioned, "no culture in the world remained untouched by European modernity. There is no outsider"[2].

So, in effect, modernity begat coloniality, which in turn begat decolonization and to end coloniality, it is necessary to first end the fictions of modernity[3]. This is where the dilemma unfolds, a study of modernist architecture, proliferated and built off the concept of decolonization is an irony of sorts.

2. DECOLONIZATION IN LATIN AMERICA

The architecture of decolonization is reminiscent of the concept of the architecture of revolution, developed more or less in rebellion to the imposed application of European architectural traditions during colonization. On this discourse, there are a plethora of scholars who have researched on and analysed the issue of decolonisation in former Spanish and Portuguese colonies of South America. They include, the likes of Ramon Grosfugel (2011), Walter Mignolo (2007, 2009, 2018) and as discussed in the context of Mexico by Luis Carranza (2010).

Their work infers those different architectural solutions reflected the varied understandings of the decolonization/revolution's significance to various members of the indigenous populace. So, if architecture reflects the needs, desires and struggles of a society, it can be understood as a material expression of that society and as such, like Carranza, we can equally infer that certain, large scale, modernist projects embarked on in the post-independence eras of some countries are ways of displaying the complex and multiple expressions of revolution and decolonisation observable through architecture of a previously colonized people.

Manuel Amábilis, an architect of Mayan ancestry in Mexico, revived pre-Hispanic Mayan architecture in the Ibero-American exposition of 1929 to serve as a message of rejection of the architecture of colonization and exploitation in the post-revolution era.[4] This shows that architecture can showcase the ideals of a people in a confrontational manner, especially when the architecture is borne out of experiences of suppression, marginalization and prejudice. Although there are several scenarios like this that paint the picture of architecture as a form of decolonization borne out of the need for freedom of self and cultural expression, it is, however, not always the case.

1. Mignolo, "Epistemic Disobedience: Independent Thought and Decolonial Freedom," 159-181.

2. Grosfuguel, "Decolonizing Post-Colonial Studies and Paradigms of Political-Economy: Transmodernity, Decolonial Thinking, and Global Coloniality."

3. Mignolo and Walsh, *On Decoloniality: Concepts, Analytics, Praxis*.

4. Carranza, *Episodes in the History of Modern Mexico: Architecture as Revolution*, 28.

Further studies reveal that there are more questions raised than answered. For instance, Carranza observed, and rightly so, that the aftermath of independence is often a period dominated by the indigenous intelligentsia, elites, and politicians, exploring the social potential of different fields of study and material culture in bringing about a new society.

Although Brazil had long before then been released from the clutches of colonialism, there was however a change of guard; a military government whose entry was sanctioned at that time by the United States of America and who had anti-communism as one its biggest agendas. This was decolonization on a different scale, using capitalism was its vehicle. As such, the architecture of the mid-20th century reflected this need for liberation as the case study reveals.

3. DECOLONIZATION IN AFRICA AND NIGERIA

Similarly, in her work on Architecture and decolonization in Northern Africa, Samia Henni (2016) posits that just as there are built environments in previous colonies that showcase obedience to colonial directives, there are also those that clearly show direct disobedience in planning and building design. She discusses this extensively in her work on the Architecture of Counterrevolution in Algeria.

Kahira Amal Djiar's (2009) also describes one of the early instances of decolonisation in Africa. she discusses the cultural and psychological implications of French Colonialism in Algiers. Unlike Henni, she does not examine how the resulting domestic architecture serves as a form of revolt against the colonialists; her study shows that although there was resistance against the colonizers, rather than create a new architecture of decolonization, Algerians sought to maintain traditions as seen in their heritage architecture, and thus enacted a refusal to change as acts of decolonization. Both Henni and Djiar argue that conditions under which independence ensued, when read and interpreted by stakeholders, can play an integral role in understanding the architecture produced after colonization, or architecture produced as direct defiance of the oppressive systems of colonization.

For the Nigerian nation state, the 1950s saw the gradual devolution of regional power from British colonials to Nigerians and this culminated in the eventual conceding of national power after full independence in 1960. Other aspects where decolonization has been examined in Nigeria is in art. Okeke-Agula's (2015) demonstrated the specific ways the experience of political sovereignty was translated into artistic modernism in relation to the experience and realities of a post-colonial Nigeria. While Toyin Falola looked at development planning and decolonization in Nigeria. But in seeking to understand decolonization in architecture in Nigeria, the concept of building in post-independence Nigeria needs to be examined.

During that era, buildings were affected by the politics of decolonization as the indigenous educated elites sought to redefine their social and political status during the early years of self-governance. This was reinforced and given financial impetus by the nation's newfound wealth from crude oil trade in the 1960s. With its financial backing, Nigeria embarked on a series of projects and infrastructural developments in various sectors of the economy,

such as electricity generation, roads, housing, schools, airports and hotels to boost the tourism industry. A popular quote from one of Nigeria's former military dictators captures the ideology behind its neo-colonialistic spending spree; "Nigeria's problem is not money, but how to spend it" (Gen. Yakubu Gowon). The 1962 Nigeria International Trade Fair, held in Lagos 18 months after independence, was one of the new country's bold and lavish developmental statements. It was supported by adverts from the likes of the United African Company (UAC) which displayed bold captions in their pavilions stating "The World Looks to Nigeria"[5].

The UAC, one of Nigeria's largest organisations at the time, created two separate pavilions for its subsidiaries, the African Timber & Plywood Limited and the Nigeria Breweries[6], at the exhibitions. Both were targeted towards Nigeria's proposed and fast-growing hotel and hospitality industry. The pavilions thus enframed a narrative that twinned progress and decolonisation with architecture, whilst simultaneously making a connection between the UAC's operations and the future economic prosperity of Nigeria. During the period of decolonisation, and by that, I mean post-independence, the UAC increasingly built specialist factories and showrooms to service Nigeria's growing hospitality demands.

Some of these large projects such as the luxury hotels were undertaken to spite the colonial government and its development arm, the Colonial Development Corporation (CDC), established in 1948 to focus on developing tourism in the British colonies. The CDC had earlier funded the Paramount Hotel, in Freetown, Sierra Leone, designed by the architect James Cubitt as a way to re-cast the empire as a force for good by reinvesting aid money back into the colonies, but with the intent of "doing good without losing money". However, by the early 1960s, and with the independence of a number of sub-Saharan African states like Nigeria and Ghana, they had a change of heart from financing luxury hotels in the West African sub-region. This was because all of a sudden, they did not think West Africa was a worthwhile investment hub for tourism anymore and that the new frontiers were the Caribbeans and parts of East Africa, like Kenya. They even changed their name from the Colonial Development Corporation to the Commonwealth Development Corporation, maintaining the same acronym.

4. PURPOSE OF THE STUDY

Some of these indigenous elites Carranza referred to, and who came into power in the Nigerian state, were obsessed with the western way of life which included its architecture and entertainment amongst other things. To them material expressions like architecture could serve as a tool for postcolonialism or neocolonialism, a symbol of dominance and political control, and a re-adaptation of indigenous bourgeoisie claims to prominence and power. Postcolonialism indicates the degree to which independence itself failed to completely eradicate the influence of colonializing powers, while neocolonialism suggests a superimposed ideology over an existing one or that the de-colonised are, through entrenched colonial economic, political,

5. Anon, "The World Looks at Nigeria," *UAC News XI*, no. 9 (October 1961). United Africa Company Collection, Unilever Archives, Port Sunlight.

6. Nigerian Breweries Ltd: Exhibition at the Nigerian International Trade Fair, UAC/2/1/A/9/6/1, United Africa Company Collection, Unilever Archives, Port Sunlight.

and epistemic structures, never entirely free from the imperial project. In effect, the force of imperial ideology is not easily eradicated.

These studies show that whether explicit or implied, architectural production has certain political undertones. This is seen not just in iconic state monuments like hotels and exhibition centres, but also in simple unassuming residential structures. This paper examines architecture that is not just iconic but loud, brash and at a white-elephant scale. It focuses on architecture of modernist hotels possibly built on the premise of decolonization or counterrevolution yet taking it a step further by their share ambition and scale to make or prove a point.

5. STUDY LOCATIONS

The selected case buildings all have something in common. They were all built within the modernist era of the 1960s and followed the concrete minimalist structures with clean lines and austere exterior finish, reminiscent of the period. Most included balconies, especially where ocean views and other vistas were to be captured. Vast lobbies and enormous pool areas with generous room spaces were also common features. In addition, the two hotels chosen as case studies had been abandoned for long periods of time in their history, due to several reasons but primarily down to the unsustainability of their grand plans and the difficulty in maintainability. The hotels were selected for their waterfront locations, enormous scope and numerous rooms, and were designed primarily as tourist centers with facilities for hosting conventions, events and exhibitions. These are the Nacional Rio in Brazil and the Federal Palace hotel in Nigeria.

Nonetheless, both structures were historic landmarks in their times and the first hotels of their status and ratings in their respective cities. This paper discusses the parallels between the two hotels in Brazil and in Nigeria respectively. It examines them through the bifocal lenses of decolonization and modernity, to show if they have certain shared or contested heritage, or alternative or parallel narratives, which may either way connect them by a common thread. Ultimately, the paper seeks to address the question of what constitutes modernity or modernism in Africa and Latin America as evidenced through the architecture of hotels.

6. SELECTED MODERNIST HOTELS IN NIGERIA: THE FEDERAL PALACE HOTEL LAGOS

Federal Palace Hotel and Suites, which has been undergoing renovation for some decades, is one of such hotels built at the dawn of Nigeria's independence in 1960. It is Located on Ahmadu Bello Way, Victoria Island overlooking the Lagos harbor. It was incorporated in 1964 and owned by the Federal Government of Nigeria until 1992 when it was acquired by The Tourist Company of Nigeria. To buy into the huge tourist boom of the 1970s, one of the wings designed by the notable Nigerian architect, Lai Balogun, was built to coincide with the Festival of Arts and Culture (FESTAC) in 1977. Constructed in the quintessential modernist style of the sixties, it was an ambitious 5-star project with over 630 rooms and suites spread across 7

Figure 1. Federal Palace Hotel, Lagos. (Source: https://commons.wikimedia.org/wiki/user.Godmyhelper)

floors and a service floor on the eight level. In addition to rooms, it spots a collection of ballrooms, restaurants, mini-bars, a sports and health club and swimming pool. It is also famous for its floating restaurant connected by a walkway and deck to the lagoon.

The 1960s was an era of experimentation for buildings in terms of height and space liberalism for a newly independent state like Nigeria. This 8th floor statement was Nigeria's first venture into the world of high-rise grand projects, of which she quickly developed a taste for, as it was followed up four years later (1964) by the 26-storey Cocoa house in Ibadan. The first skyscraper in West Africa, built from the proceeds of the booming cocoa trade, and then the 32-storey NECOM house built in 1979 during the oil boom era. Apparently, as the wealth of the nation increased, so did the height liberalism in its modernist concrete-built forms.

During the colonial era, the highest buildings did not exceed 4-storeys. The National Investment and Property Company (NIPC) founded by Chief Obafemi Awolowo proposed a series of high-rise developments on broad street in Lagos and were met with a lot of rejections by the colonial administration. High-rise buildings were part of the plan to turn parts of western Nigeria into the New York of Africa and indigenous elites had vowed that in the independence era, post-colonial buildings would dwarf all colonial structures in height and space, to make a statement emphasizing and materializing decolonization.

7. SELECTED MODERNIST HOTELS IN BRAZIL: THE HOTEL NACIONAL RIO

An ambitious modernist skyscraper of concrete and aluminum built from 1968 to 1972 as Brazil's main hub to latch onto the booming entertainment and tourism industry of that era. It had hosted conventions, music stars and events such as the prestigious Rio Film Festival in its hay days. Having fell into hard times and decline, it was also abandoned for upwards of two decades, while vandalized and stripped bare to nothing but its concrete shell

Figure 2. Hotel National Rio (https://commons.wikimedia.org/wiki/user:Ame_museler)

and structural bones. It became a home for squatters and was mummified in graffiti for those twenty unproductive years of its life. Designed by the renowned Brazilian architect Oscar Niemeyer, this building is as grand as they come, with over 600 rooms, a 2800-seater convention center, five restaurants, a helipad and several other facilities across 34 floors. Niemeyer's exploration of the use of concrete was highly influential and made him one of the key figures and proponents of modern architecture. This concrete monstrosity was said to be part of a push to develop the western part of Rio, but with its doors shutting in 1995, this idea might have been a push too far.

The Hotel Nacional Rio was built during the Military dictatorship era between 1964 to 1985, but specifically during the time of the "Brazilian Miracle" a counterrevolution era in the 1970s marked by exceptional economic growth during the military dictatorship. The growth was achieved via a developmentalist model, during which time the average annual GDP growth was close to 10%. Peak growth was reached during the tenure of Emilio Garrastazu Medici, who was President from 1969 to 1973. His tenure coincided with the construction of the hotel Nacional Rio. A time of new economic models, new policies, and even the possibility of a neo-colonialist or counter revolutionist ideology as the government sought to move from communism to becoming pro-capitalist.

The 34 floors were even considered a conservative agreement for a building that was originally planned for 55 floors. Indeed, the use of concrete and quest for verticality was synonymous with the spirit of the age which in this case is the modernist era. However, the exorbitance in height and space liberalism can be attributed to economic boom, the lure of tourism brought about by capitalism, and the need for a new image of a country transiting

from one era into another, as mirrored by other nations in Latin America and other regions.

8. CONCLUSIONS

With these connections made, the similar narratives and shared heritage exposed are not mere coincidences but a pointer to the fact that as Uduku puts it, the genesis of 'international style tropical modernism', has had a longer incubation period in both Latin America and Africa than critical regionalism and other concepts developed in the latter half of the 20th century. The root cause can be traced to the economic prosperity experienced in both regions, and in both cases immediately after the change of administration in the country. In the case of Nigeria, it was a transition from colonial rule to indigenous rule and for Brazil it was after the military junta of 1969, marking the end of the fourth republic. In both cases, the countries wanted to either project a new image by decolonization or launder an existing one tainted by corruption by possible neo-colonization or counterrevolution. And what better way to do that than to invest in the hospitality and tourism industry to bring the world to them, thus making the UAC's slogan of "The World Looks to Nigeria" apt at that point. ■

He obtained his MSc in Architecture from the University of Jos, Nigeria and a PhD in Architecture from Newcastle University, United Kingdom. His research interests are in African Architectural History and Culture and Colonial/Post-colonial studies in Architecture. He is a recipient of the Canadian Centre for Architecture CCA/Mellon Research Grant (2019-2023), the Gerda Henkel Stiftung patrimonial grant (2022), the CCA Find and Tell Elsewhere grant (2023) and the African Heritage and Humanities Initiative (2023) Collaborative Faculty Seed Grant, University of Michigan, Ann Arbor.

MODERNISM AND HERITAGE IN LATIN AMERICA AND AFRICA: THE CASE OF SUSTAINABILITY POLICIES AT UNAM'S SCHOOL OF ARCHITECTURE IN CIUDAD UNIVERSITARIA, MEXICO CITY

ERNESTO VALERO THOMAS
SCHOOL OF ARCHITECTURE
UNIVERSIDAD NACIONAL AUTÓNOMA DE MÉXICO

ABSTRACT.

The Central University City Campus of the Universidad Nacional Autónoma de México [National Autonomous University of Mexico] (UNAM) was built from 1949 to 1952 by teams with the leadership of more than sixty managers, architects, engineers and artists who contributed to the project. The ensemble of buildings, sports facilities and open spaces constitutes a unique example of 20th-century modernism integrating urbanism, architecture, engineering, landscape design and fine arts with references to local traditions, especially to Mexico's pre-Hispanic past. This integration embodies social and cultural values of universal significance and is one of Latin America's most significant icons of modernity. Essential trends of architectural thinking from the 20th century converge in the Central University City Campus of UNAM: modern architecture, historicist regionalism, and plastic integration. The last two are of Mexican origin. (UNESCO's Declaration)

In 2007, the original campus was inscribed in UNESCO's World Heritage List, which considered more than fifty buildings on 176.5 hectares. UNAM's School of Architecture is part of the site. More than eight thousand students in four programmes (Architecture, Landscape Architecture, Urban Planning, and Product Design) and more than one thousand faculty and administrative members actively utilize an area of two hectares. Like other academic entities on the central campus, the School of Architecture requires the sustainable rehabilitation of its facilities. In 2024, the life cycle and functionality of the buildings and their public space challenge us to intervene with rehabilitations that consider energy efficiency, water governance, waste management, thermal comfort and accessibility for all. The methodology considers the flow and consumption of water, food, and waste in the Central Campus. The objective is to shape architectural practices, decentralized infrastructures, and cultural narratives of environmental sustainability in a UNESCO's protected site.

1. INTRODUCTION

On March 22nd, 1954, thousands of students from different schools attended the brand-new facilities of Ciudad Universitaria [University City] (CU), in the south-west of Mexico City. It was the beginning of their academic terms at the Universidad Nacional Autónoma de México [National Autonomous University of Mexico] (UNAM). This event marked the proper inauguration the of the new campus. Seventy years later in 2024, CU is still a very dynamic academic campus (176.5 hectares) that belongs to the UNESCO's World Heritage List. However, the life cycle and functionality of the built environment in this place challenge us to intervene its buildings and public spaces with rehabilitations that consider renewable energy, waste management, water governance, thermal comfort in buildings, and accessibility for all, among other characteristic of sustainable environments. This paper will focus on recent proposals of sustainable interventions at UNAM's School of Architecture (2 hectares). The rationale of these interventions is backed with design theories and historical analysis of the Modern Movement that will be discussed in the round table called Modernism and Heritage in Latin America and Africa: Challenges of Shared and Contested Heritage. This session is part of the 18th International Docomomo Conference, with the main theme of "Modern Futures: Sustainable Development and Cultural Diversity."

In the round table, Fernando Luiz Lara comments that we witness the perpetuation of exclusion and the eradication of memory as tactics of urbanization all over Latin America. Thus, it is important that we ask over and over whose heritage and whose memories are we preserving. This is a key question in the approach of the rehabilitation of UNAM's School of Architecture. Adefolatomiwa Toye discusses the significance of Ciudad Universitaria to Nigerian delegates who visited the campus in December 1960, and how architectural features were redefined at Obafemi Awolowo University. The visit to Mexico City inspired an appreciation of architectural characteristics that would later be incorporated in the design of the university campus in Lagos, which included elaborate facade murals and terraced outdoor spaces. In 2024, what is the present situation of both campus in terms of protection and plans for a sustainable future?

Ikem Stanley Okoye asks what does it mean when architectural decoration by artists do not represent Africanness as such, but instead focus on infrastructural modernization? This is also a valid question in the case of the artworks in CU that initially were narrative tools to strengthen official discourses of the Mexican development. Warebi Gabriel Brisib uses case studies of modernists hotels from Brazil and Nigeria, to investigate spatial liberalism as a form of decolonization the mid-20th century, with particular emphasis on the 1960s. The study reveals that factors such as decolonization and revolution might have played a significant role in the development of such buildings and could as well have contributed to their demise. In the case of UNAM's School of Architecture, what kind

of sustainable discourses today contribute to the narrative of sovereignty and decentralization of energy consumption?

2. CHANGING THE NARRATIVE OF SUSTAINABLE DEVELOPMENT: THE CASE OF ARCHITECTURE AND URBAN POLICIES AT UNAM'S SCHOOL OF ARCHITECTURE IN CIUDAD UNIVERSITARIA

The Central University City Campus of the Universidad Nacional Autónoma de México [National Autonomous University of Mexico] (UNAM) was built from 1949 to 1952 by teams under the leadership of more than 60 managers, architects, engineers and artists who contributed to the project. The ensemble of buildings, sports facilities and open spaces constitutes a unique example of 20th-century modernism integrating urbanism, architecture, engineering, landscape design and fine arts with references to local traditions, especially to Mexico's pre-Hispanic past. This integration embodies social and cultural values of universal significance and is one of Latin America's most significant icons of modernity. In 2007, the original Campus was inscribed in the UNESCO's World Heritage List, which considered more than fifty buildings on 176.5 hectares. Essential trends of architectural thinking from the 20th century converge in the Central University City Campus of UNAM: modern architecture, historicist regionalism, and plastic integration. The last two are of Mexican origin. (UNESCO's Declaration).

In terms of environmental sustainability, UNAM embodies a strong tradition in the development of technologies and strategies for the mitigation of global warming from areas such as Engineering and Chemistry. For instance, Dr. Mario Molina (1943-2020) co-recipient of the Nobel Prize in Chemistry in 1995 for his role in discovering the threat to the Earth's ozone layer from chlorofluorocarbon gases, did his undergraduate studies in Chemistry at UNAM in Mexico City. Nowadays, strengthening this tradition is relevant in a global context where the consumption of fossil fuels for the generation of electricity, transport, and heating generates two-thirds of the emissions of gases that trap heat in the atmosphere.[1]

UNAM's School of Architecture is part of CU. More than eight thousand students and more than one thousand faculty and administrative members actively utilize an area of 2 hectares. The school hosts four academic programs (Architecture, Landscape Architecture, Urban Planning, and Industrial Design). Notably, these professional fields are linked to economic sectors and industrial processes with a high environmental impact. For instance, the production of cement and steel for construction, the plowing of fields, and the degradation of various ecosystems for the expansion of cities emit large amounts of carbon dioxide daily, causing also thermal retention.[2] In this context, what is the role of UNAM's School of Architecture in the construction of a sustainable future? One possibility is to propose an agenda for changing the narrative of development that motivates teachers, students, local authorities, and the

1. Greenhouse gases come from six sectors: 25% in electricity production, 24% in food, agriculture and land use, 21% in industry, 14% in transportation, 6% in buildings and construction, and 10% other energy-related emissions. Greenhouse gas sinks are the counterpoint to these sources. While ~59% of these emissions stay in the atmosphere, ~24% are quickly removed by plants on land and ~17% are taken up by oceans. See "The Drawdown Review 2020," Project Drawdown, https://drawdown.org/drawdown-review.

civil society to imagine buildings and public spaces that help us reverse global warming.

3. FROM 1954 TO 2024: THE TRANSITION FROM A LOGIC OF EXTRACTIVISM TO A LOGIC OF REGENERATIVE ENVIRONMENTS IN CIUDAD UNIVERSITARIA

One of the characteristics in CU is the integration of murals and artworks embedded to several buildings. One of the art pieces is the mural called 'La Ciencia y el Trabajo' [Science and Labour] authored in 1952 by José Chávez Morado. It is located in the Alfonso Caso Auditorium at the Old School of Sciences. The mural shows the construction of Ciudad Universitaria. It was painted with a vinyl technique and therefore has to be protected in a display case. On the left side of the mural we can see the first scene, which reflects a group of farmers carrying construction tools. It is a transition to a different manual labour, from one that requires agricultural knowledge to another that is requested in urban environments. This scene refers to the former ejidatarios [holders of a share of common lands] who owned the ground where CU is currently located. The second

scene shows Cuatlicue, mother goddess of the earth accompanied by a child with a pre-Hispanic mask and at the top is the circular basement of Cuicuilco, an archaeological area very close to the university area of Mexico City. In the next scene, construction workers excavate the ground of CU to insert infrastructures. The scene that follows contains engineers and architects that examine plans and papers. What follows is the scene with a group of workers, who were represented in a ghost like form, fading from the frame. Finally, scientists manipulate a machine.

An interpretation of the mural serves as a backdrop of the argument that the narrative of development in Mexico should be transformed from a logic of extractivism to a logic of regenerative environments. The displacement of peasants and farmers that originally owned the lands of CU is worth of analysis. What kind of displacements do we witness today in the development of the country? The narratives are male dominated. Only men are represented as the workers, professionals and scientists in the country in 1952. In 2024, the role of women in the construction of the future must be included in the narratives of development. In the mural, pipes and tubes are elements that symbolize infrastructures in the mid-20th century. What are the characteristics of infrastructures in 2024? How can we propose sustainable infrastructures to allow the flow of water, waste, and electricity in 2024 for Ciudad Universitaria? The following section will describe two proposals for the School of Architecture.

4. INTERVENTION FOR SUSTAINABILITY AT UNAM'S SCHOOL OF ARCHITECTURE

This section will expose two projects that are proposed by the the Department of Sustainable Infrastructures at UNAM's School of Architecture. These proposals engage in "thinking futures" with attention to the social values and norms of UNAM, hierarchical structures in the administration of the university, and social imaginaries of the community that visualise the campus as a metabolic entity of circulatory flows such as food and waste that are organised via infrastructures.

The accessibility and safe mobility project for the School of Architecture is based on a shared problem on other scales and contexts: our buildings and cities discriminate and are not friendly to pedestrians, much less with people who require special and additional attention to navigate the streets and buildings. Pavement design and differences in floor levels play an important role in the solution to this problem. The sinking of the stone walkways is another aspect that affects pedestrian traffic in the School of Architecture. Actions such as re-leveling the ground and channeling rainwater is required to avoid flooding for six months a year and to provide water infiltration to the gardens.

In terms of organic waste, the proposal is to manage a collection system of food waste (10% of total generation) and from gardening activities. The project considers a 'separation islands' for the operation and correct operation of the waste management system. This prototype

will allow the separation of waste and will create the conditions to recycle and valorize a high percentage of waste.

5. CONCLUSION

The paper explores the future of a sustainable built environment at UNAM's School of Architecture. The school is located within and area of the central campus that is protected by UNESCO. This is one example from many that are discussed in the roundtable, which highlights the need for a new global approach of modern heritage conservation and sustainable policies, particularly in Africa and Latin America. The goal is to construct policies and practices on the conservation of modern heritage, while shaping the agenda in search of regenerative environments, quality of life, and better environments in cities from Africa and Latin America. ■

BIOGRAPHY

Dr. Ernesto Valero Thomas is a professional in the fields of Architecture and Urban Studies. His research focuses on designing hybrid methods for mapping the flow and consumption of water, food, waste and electricity in emerging cities around the world. From 2017 to 2021 he held the position of Senior Lecturer in Sustainable Design at DETAO-Shanghai Institute of Visual Arts, where he served as the Academic Coordinator of the Ecological Architecture Design Program. He currently serves as Senior Manager of the Sustainable Infrastructures Initiative at the School of Architecture in the National Autonomous University of Mexico. His work has been published in peer-reviewed journals from the United States (UCLA), Mexico (UNAM), United Kingdom (UEL), and in the book Drawdown: The Most Comprehensive Plan Ever Proposed to Reverse Global Warming. (Penguin Random House) He has taught courses at the Edinburgh School of Architecture and Landscape Architecture. His research findings have been presented in Germany, The Netherlands, France, Ecuador, Ireland, India, South Korea, and China. Ernesto holds a Ph.D. in Architecture and Urban Design from the University of Edinburgh. He received an MSc in Advanced Sustainable Design from the University of Edinburgh, and a BArch at the National Autonomous University of Mexico.

WHOSE MEMORIES, WHOSE HERITAGE? REFLECTING ON THE SPATIAL HISTORY OF THE AMERICAS

FERNANDO LUIZ LARA
UNIVERSITY OF PENNSYLVANIA, WEITZMAN SCHOOL OF DESIGN

ABSTRACT

In June of 2022 Brazilian indigenous leader Ailton Krenak spoke in an interview about his country's preservation institution's obsession with lime and brick. His main point, very much valid, is that Brazilian IPHAN (National Office of Preservation) values colonial architectures over everything else, protecting mostly structures built by Iberian settlers, using Iberian technologies[1]. Krenak's words are a stark reminder that to study the built environment of the Americas is to constantly wrestle with an inherent contradiction. While our disciplines of architecture, urban design, landscape, and planning share the fundamental belief that space and place matter, the overwhelming majority of our canonical knowledge and the vernacular used to describe these disciplines comes from another continent. We still teach architectural history as North Atlantic history[2].

It is important that we ask over and over whose heritage and whose memories are we preserving. Why exactly do we fight to preserve and repurpose a neo-gothic church or a Greek- revival library thousands of miles away from Northern Europe and the Mediterranean Sea? The answer to those questions yields ugly traces of white supremacy and Eurocentrism.

At a fundamental level, we lack a basic spatial history of our continent. I dare to elaborate that despite having all that space (which, by the way, was never empty) we do not know the history of our spaces except for very selected pieces of it. Such ignorance creates a dislocated relationship between time and space, made more dramatic by the fact that modern cities in the Americas were designed to forget and to exclude[3]. The result of having not yet theorized our American spaces is that we have also not yet problematized it and therefore we witness the perpetuation of exclusion and memory erasure as main features of urbanization all over the continent.

1. WHOSE MEMORIES, WHOSE HERITAGE?

When we discuss Modern Architecture as heritage we are still discussing a Eurocentric version of modernism. Sometimes this is explicitly stated like when William Curtis wrote in his classic survey book that "modernism is the intellectual property of the West". Most time it is implicit in the way scholars present modernity as something that originated in and by Europeans. Even the two pillars of Latin American architectural thought in the late 20th century: Christian Fernandes Cox proposal of "modernidad apropriada" and Marina Waisman's proposal of "modernidad divergente" are still based on European concepts that should be adapted to local realities. Arturo Escobar's and Walter Mignolo's synthesis of modernity/coloniality as one and the same imploded the diffusionist idea of modernity as a European concept 30 years ago. When we understand that modernity and coloniality are two manifestations of the same phenomena we are forced to admit that the Americas have participated in this construction since day 1 of October 12, 1492. The exploitation of non-European peoples and the erasure of their memories are as much part of modernity as the 18th- century Enlightenment or the 19th-century industrial revolution. Modern architecture would not exist without those processes that took over the planet in the last 500 years, and it is about time we discuss it with such framework.

2. UNLEARNING EUROCENTRISM IN THE AMERICAS

Theorizing our own space and writing our own history is urgent because as reminded by Edward Said in his classic "Orientalism", European scholars developed narratives about all other societies on Earth and as a result established themselves as the center of human knowledge[4]. According to the Eurocentric narrative, the Americas were a vast continent empty of sophisticated cultures, ready to be conquered by superior knowledge of the self-proclaimed "old world". The adjective old here works much as Said's oriental; locating in the Americas a degree of infancy that required guidance, if not discipline. The first European traveler's account of sophisticated cities were buried under the convenient idea that the Americas were empty, ready to be cultured and cultivated.

My argument in this chapter is that we need a complete revision of whose memories and whose values we use to discuss our spaces. In 2022 the Journal of the Society of Architectural Historians invited me to edit a roundtable in which 9 authors discussed concepts that we need to analyze the spaces of the Americas[5]. In that text I recalled Jorge Luis Borges short story Funes el Memorioso in which the Argentine author reminds us that the being whose memory holds onto every little detail is incapable of thinking. Reasoning requires that we recall some memories to the forefront and relegate others to the subconscious. As we all know from our curriculum debates, the discussion around architectural history surveys gets intense when one proposes that parts of our canonical knowledge should be pushed aside to give space for new manifestations. As Swati

Chattopadhyay proposed in Unlearning the City and Ariella Aïsha Azoulay argued in Potential History, there are plenty that we need to unlearn.

More recently, the provocative website Platformspace (full disclosure, I am one of the contributing editors) published a series of articles questioning exactly what we need to unlearn. The elegant answers by Swati Chattopadhyay, Mabel Wilson, Peter Christensen, Ana Maria Leon, Charles Davis, Lawrence Chua, Sammia Hanni and Lesley Lokko. In the words of Chattopadhyay:

> *"it's important to recognize that as good researchers, when we go out there, collect oral histories, do the ethnographic work that is necessary, that is not the solution to anything we're talking about here. That is additive. That is not regenerative. You still have to apply a practice of reading to those. It doesn't matter if it is non-textual, it's non-visual. I'm working on a project on small spaces. How do we write the history of the hidey hole? How do you write the history of that cage? How do you write that truth? What kind of language do you need to write? Where is the source? I work primarily on the historical archive and there has to be certain practices of reading. Yes, it's important to think about oral history, the non-visual. I'm thinking about sound a lot. But, I don't think we have figured out how to do that. It is extremely difficult to put that into a language of history writing. One of the struggles that I'm having is that I don't think we can write histories of that. I know I'm not writing an architectural history and I don't make apologies for that. But that's, for me, the unlearning of architectural history"*[6].

Writing in constant dialogue with the authors cited above and standing on the shoulders of decolonial theorists such as Arturo Escobar and Walter Mignolo, I argue that the rise of architecture as a unique discipline and the conquest of the American continent are not just chronological coincidences but interdependent variables of the same process of modernization. Traditional scholarship in architecture have not entertained those parallel developments at all.

The field of architectural history and theory still treats the spatial occupation of the Americas as a consequence of the Renaissance and European modernization, despite a few decades of scholarly literature in related disciplines questioning such assumptions. (Fanon 1961; Said 1978; Bhabha 1990; Dussel 1995; Escobar 1995).

The remaking of the world by modernization processes was triggered by the encounter with the Americas and implemented simultaneously at both sides of the Atlantic.

3. EDMUNDO O'GORMAN AND THE INVENTION OF THE AMERICAS

In 1958 Edmundo O'Gorman published La invención de América: Investigación acerca de la estructura histórica del Nuevo Mundo y del

6. S. Chattopadhyay et al., "Series of Unlearning Conversations," *Platform Space*, 2021-2022, https://www.platformspace.net/home/unlearning-part-i.

sentido de su devenir (O'Gorman, 1958). In this book O'Gorman uses cartographic information to demonstrate that it was the encounter with the Americas that triggered a revolution in Europe and not the other way around. The bulk of O'Gorman's argument is that America was invented as an otherness that allowed Europe to place itself as a center. The world for Europeans in the 15th century was formed by three land masses – Europe, Africa, Asia – surrounded by the Mare Oceanum. Analyzing the medieval idea of orbis terrarum (earth island) in opposition to orbis alterius (other possible islands inhabited by unkown creatures)

O'Gorman explains that the invention of America tears down the medieval notion of the orbis terrarium, the inhabitable world, as an insular entity closely bounded by a menacing ocean, and replaces it with an image of the world as a fully masterable terraqueous globe. Here I need to highlight the concept of masterable for its direct link to technology. As synthesized by Rene Descartes in the separation between res cogitans (mind) from res extensa (everything else), the minds of European men were now 'masters' of everything else that is not only land and resources but also all women and all non-European men. The connection with modern technology could not be more explicit.

Another fundamental concept to understand the role of the Americas in the development of European modernization and its architectural theories is the modernity/coloniality conundrum. Sociologist Anibal Quijano is credited with the concept when he moved away from economic-centric Dependency Theory to propose a World-System that explains the intricate relationship of modernization and colonization.[7] A few years later Arturo Escobar published Encountering Development: The making and unmaking of the Third Word, in which he elaborates the thesis that there is no modernization without colonization, both being sides of the same coin.

Doreen Massey and Ricardo Padron broke the code on how space is central to the Cartesian establishment of modernity/coloniality.[8] Up until the late 16th century most navigators used itineraries, sequences of geographical occurrences that locate the traveler within the path. The so-called cartesian coordinates, pioneered by the Portuguese system of padrões and centuries later systematized by Rene Descartes, removes the conquistador / navigator from the spaces here represented. As in the Cogito Ergo Sum, the mind now is separated from the body. The mind of the European men controls the representation of everything else: non-male, non-European and non- human. Spatial separation is key to that system, separation between mind and body, men and women, human and nature.

4. THE ARCHITECTURE OF CONTROL / ARCHITECTURE AS CONTROL

The development of representation techniques to manipulate spaces from afar, commonly known as architectural drawings, is part of this very same process described in the previous paragraph. Architecture as we know it was born from Leon Battista Alberti's idea of design as

7. Aníbal Quijano and Immanuel Wallerstein, "Americanity as a Concept, or the Americas in the Modern World," *International Social Science Journal* 44, no. 4 (1992): 549-557.

8. Doreen Massey, *For Space* (London: Sage, 2005); Ricardo Padrón, *The Spacious Word: Cartography, Literature, and Empire in Early Modern Spain* (Chicago: University of Chicago Press, 2004).

something separate from construction. In the Latin languages the concept of design is expressed by the words proyecto, projeto, or progetto, from the Latin projetare, meaning, to launch forward. Before Alberti, architecture was all about how to select the best design based on how we built in the past. After Alberti, architecture became about how we should build in the future. Intellectual concepts now mattered more than construction experience.

The Americas, as we know them, were invented when European scholars realized that Columbus had not arrived in India nor China, but instead had "discovered" a whole new world. As Edmundo O'Gorman taught us almost 70 years ago, it was the encounter with such alterity, or otherness, that forced the Europeans to rethink their entire ontology, therefore triggering the forces of modernization.

To envision why the encounter with the Americas is so relevant just follow the thoughts of Mexican historian Edmundo O'Gorman. Using maps as the basis of his analysis, O'Gorman shows that Europe had never been central to World History before 1492, nor was in any way inevitably moving in that direction. Instead, the impact of the encounter of 526 years ago was equivalent to what would occur if we find life in another planet tomorrow. O'Gorman then elaborates on how such ground-shifting event accelerated the protestant reformation (1517) and the works of Galilei and Kepler in the early 1600s.

Following the important works of O'Gorman, Walter Mignolo, and Roberto Fernandez we realize that it was here, in the Americas, that architecture's power of abstraction was first tested. This *American Laborator*[9] inaugurated in the early 16th century, gave us the processes by which a specific thread of knowledge carefully crafted from multiple roots (a.k.a. Western Civilization), became dominant in this little planet of ours, and the Gulf of Mexico is once again central in that history. It was here that all the gold and silver coming from Mexico and Peru were brought, pausing at the protected waters of La Habana before being shipped to Madrid. In the effort of controlling this vast territory of land and water, the tools of abstraction proposed first by Alberti and Descartes were tested and perfected, soon made available to European naval powers to control the entire planet.

The abstraction that is so important for every architect after the Renaissance is manifest in the very process of descriptive geometry associated with Gaspar Monge in the eighteenth century, but which in reality can be traced back to Albrecht Durer's Underweysung der Messung mit dem Zirckel und Richtscheyt from 1525. What Cortez was doing in Tenochtitlan was simultaneously being codified by Durer in Nuremberg: mathematical formulas used to describe space were instrumental for controlling lands across the Atlantic. This is no coincidence and decolonial theory has stressed over and over that everything called modernity was deeply influenced by the European occupation of the Americas as discussed by Dussel and Mignolo.

9. Ramón Fernández, *El Laboratório Americano* (Madrid: Biblioteca Nueva, 1997).

However, chronological parallelism does not mean symmetry. It was in the Americas that the project of modernity encompassed the scale of a whole continent, from the first Spanish cities of the last decade of the 15th century to the Jeffersonian grid of the early 19th century and the Argentine law of Avellaneda of 1876. The rise of spatial abstraction is shared with the rise of architecture as a discipline and any suggestion of calibrating abstract and non-abstract concepts is perceived as a threat.

Abstraction, as the definition goes, is quality of dealing with ideas rather than events, or something that exists only as ideas. The key question here is which facts have been elevated to the realm of ideas and which facts have been discarded. Modernity was created when we abandoned any relational knowledge and adopted a superficial (what occurs on the surface) understanding of space in which the controlling white man is removed from and every non-man, non-white beings are reduced to objects to be plotted and therefore controlled.

Spatial abstraction had been a tool of coloniality and inequality since the world-system took shape in the 16th century, and architecture is deeply embedded in this process. We use abstraction to separate our design students from everything they knew before and immerse them with a new set of values, architectural values. Once delinked from any previous spatial relations, our studio pedagogy teaches them to master abstraction, almost always discarding any site context or content in order to manipulate only geometry. Site plans do not register community life. Contours do not tell the history of the land. Plans and sections are arbitrarily narratives that force behaviors on people.

Those are the janus-faced powers of architecture: it could be used to envision a better world but 95% of the time it is used to reinforce the status-quo. If we want to mitigate the erasures imbedded in spatial inequality to keep moving towards more inclusive design processes, we need to understand the history of the relationship between design and exclusion. The historical roots of spatial abstraction are intertwined with the historical roots of architectural design, and the Americas played a central role in that development.

Here space, both real and abstract, acquired a central position in the transformation that we call modernity. Roberto Fernandez elaborated in his *El Laboratorio Americano* that America was the place where Europe inaugurated modernity through a monstrous negation of specific histories so that only space now existed.

5. WHOSE MEMORIES, WHOSE HERITAGES?

In architecture we are still very much enchanted with modernization. We love our modernist buildings, we plan modernizing infrastructures, we strive to modernity as synonym to building. Or better yet, we strive to development as a synonym to architecture. I propose that every architectural scholar read Colombian anthropologist Arturo Escobar, and the sooner the better. Escobar have devoted his life to showing that

modernization has a dark side called colonization – the idea that the ways of life of one population are better and therefore should be imposed on other populations.

Escobar's contribution to 21st century scholarship is to stitch modernization and colonization back together as faces of the same coin. We have been trained to abhor colonization and to worship modernization. When we understand that they are two faces of the same process we understand the crisis of the contemporary world as the crisis of white – heterosexual - male, the ones who have always been favored by modernization and development as we know it.

As Ailton Krenak reminded us in the quote at the beginning of this essay, our preservation institutions have been scaffolding for settle colonial processes and white supremacy. It is urgent that we engage the memories of indigenous groups, people of African descent, and disenfranchised immigrants that need to be weaved back into our historical narrative. ■

BIOGRAPHY

Fernando Luiz Lara is a Professor of Architectural History and Theory at the Weitzman School of Design, University of Pennsylvania. Lara works on theorizing spaces of the Americas with an emphasis on the dissemination of architecture and planning ideas beyond the traditional disciplinary the modern and contemporary architecture of our continent, its meaning, context, and social-economic insertion. His latest books include Street Matters (with Ana Paula Koury, 2022); Spatial Concepts for Decolonizing the Americas (edited with Felipe Hernandez, 2022); Excepcionalidad del Modernismo Brasileño (2019); and Modern Architecture in Latin America (with Luis Carranza, 2015).

MODERN ARCHITECTURE AND ORNAMENT?

IKEM STANLEY OKOYE
UNIVERSITY OF DELAWARE

ABSTRACT.

Despite Adolf Loos, ornamentation in 1920s and 30s New Way architecture, that is to say colonial-era modernism by Africans, was often conceived in ideas that appropriated and re-imagined African patterns, symbols, & etc. as expressions of locality, then later of Africanity, in ways quite distinct from the African customary. In time, European or euroadjacent architects working in Africa expanded this tendency. From the late 1950s onwards, we encounter in, examples in which decorative schemas involving postcolonial modernist African artists engaged in painterly imagery arises, instead, and often in the form of mosaics depicting aspects of traditional culture—this was rarely the case in the eastern half of Latin America, perhaps a comment on the status of indigenous peoples. It may have been less so in the Western Latin Americas. What does it mean, however, when architectural decoration by African artists abandon both tendencies, do not represent African-ness as such, but instead focus on infrastructural modernization as a representational content for architectural ornament? Nigerian artist Yusuf Grillo's mural at the Lagos City Hall will help answer this question or round off this history at its maximal moment.

Modernist architecture in *some* parts of Latin America, certainly in Colombia, Guyana, Surinam and Brazil—and certainly no one can claim knowledge across all of the Latin Americas—seems to have hewn quite close to the idea that ornament or decoration as central to architectural style was almost unethical if not exactly always a crime in the Loosian sense. For Brazil, to take one influential instance, we might speak of ornament in a *structural* or *formal* sense, meaning that the highly sculptural work of Niemeyer (our Lady of Fatima, Brazilia,1958) or Lina Bo Bardi (Museum of Art, Sao Paolo, 1968) are better understood as decorative on the scale of an urban landscape, even if aspects of their architecture includes elements that are ornamental. Something related can be said for Bogota, Colombia, where one is hard pressed to find anything other than the formal sculpturality or rectilinear regularities that are typically modernism's trademark, Rogelio Salmona's *Torres del Parque* (1964-70) then stands out as an apartment block invested in geometric forms apparently inspired by Islamic formalisms. And, yes, these then produce a dazzling dynamic movement on its curving façade that has the effect of being decorative. In the small, in some ways now more out of the way cities like Paramaribo Surinam or Georgetown, Guyana, the small number of modern buildings erected in these contexts, often by architects from Europe (P.J. Nagel's buildings in Paramaribo for instance) the buildings tend once more to be straightforwardly reminiscent of buildings we might see in other places. To the extent they included non-structural/non-form-focused decorative elements as was the case in the interior of the Bank of Suriname building, this came in the form of a pseudo-Abstractionist image and was restricted to a small section of the building.

By contrast, in most African locations, certainly in Nigeria, or Ghana, Senegal or Mozambique (all of course presenting no less a *differing* set of chronological trajectories of decolonization and postcoloniality than do Latin America's), ornamentation in architecture was often purely ornamental. This is not to say that African modern architecture lacked structural drama in the senses just outlined of extensive surfaces of a building subjected *neither to* structural gymnastics nor to the structural logic of something like decorative concrete blocks acting as *brise soleil*, but that what is most often encountered, instead, are *vast* areas of a wall surface acting as a canvas on which a low-relief mural is stretched across even ten floors of a multi-storey building's façade. Although this generalization may, for Latin America, be a comment more relevant to the western (Chile, Argentina, Peru et cetera) and more Pacific- adjacent "half" of Latin America than the eastern, more Atlantic and therefore Africa-facing Latin Americas (if not even the Lusophone from Spanish speaking Latin worlds), what I summarize for the east, does stand in stark contrast to the situation in sub-Saharan African contexts outside South Africa. In the African context, moreover, although indigenous architects are involved in the production of modern architecture in Africa, for at least the period up to say 1973, expatriated Europeans (and Israelis) or naturalized Europeans living on the continent, secured the commissions as architects for the major buildings including both governmental and commercial or corporate projects unlike what the narrative is in Latin America. Although Nagel was Dutch and of course Brazil's Bardi was

originally from Italy, there is quite a difference between how accounts are written of them compared to the situation in Africa where the non-African architects securing the major modernist projects where additionally marked by being white.

1. SIMILARITIES AND A DIFFERENCE SUMMARIZED

In modern architectural decoration in Africa therefore, one can posit a difference from the Americas perhaps even an effect, that has to do with the building as canvas, and often as a canvas in which certain projections of Africanity might be deployed in order quite literally to stamp an African identity on an otherwise arguably Western style or form—even despite the arguments about international style's neutrality.

Examples in Nigeria would include the later work of Godwin and Hopewood at Ibadan, or James Cubitt at Nsukka, Arieh Sharon with A.A. Egbor at the University of Ife, or in Ghana James Cubitt at Kumasi, Ghana, or even half a continent away Pancho Guedes's 1953 Santos e Rocha building, in Maputo, Mozambique. Guedes thus seemed as alert as were those practicing in West Africa, to the politics, romanticist or real, of making modern architecture African in ways not replicated in the pacific facing vs Atlantic facing worlds of the Latin American difference. In this paper, then, with a consideration of the idea of the infrastructural sublime in mind, I explore the moment of a shift in modern architecture's practices of decoration in Nigeria circa 1968—a shift without any clear companion in Latin America to which it might be compared given the different starting points.

The Cold War had political effects almost as significant in Africa as in Latin America, and there are ways in which the rise of military dictatorships and of civil wars, and of the effects these had on culture—architecture included, I insist that Africa near the turn of the 60s, and Nigeria in 1968 particularly, marks an even more specific moment for architecture—the first and only unravelling of the sacrosanct idea of post-colonial sovereignty along the lines inherited at Independence, and over which African countries were divided. What is interesting for architecture is that 1968 marks a moment, too, in which abstraction is abandoned in architectural ornamentation in lieu of a realist image that simultaneously attempts to heal a nation riven by its civil war (sometimes known as the Nigeria Biafra war), and in doing so deploys a certain rhetoric about modernity and modern infrastructure as salvific.

2. MODERNIST BUILDINGS AND ARTISTS AS ORNAMENT MAKERS

At the centre of my observation, perhaps marking a difference from parallel engagements in Latin America, is Lagos—at the time the commercial and governmental/administrative capital Nigeria. Its protagonist is not an architect at all, but rather the Lagosian artist,[1] partly of Black Brazilian descent,[2] Yusuf Grillo. Before focusing on the work that demands out attention, I must give a historical context by pointing to an early, Greek-owned Lagosian hotel, the best of its day, known as the Bristol Hotel, a mid-1960s marker of luxury tourism. A modernist building, it captured the headlines and imagination of Nigerians–not least because it replaced an older Bristol Hotel building that

1. Dele Jegede, "More to Art than Exhibition," *Glendora Review-African Quarterly on the Arts*, vol. 3, no.2 (2020).

2. Yusuf A. Nzibo, "Muslim Factor in the Afro-Brazilian Struggle Against Slavery," *Journal of the Institute of Muslim Minority Affairs*, vol VII, no.2 (July 1986): 547-556.

was a neoclassical structure destroyed in the 1940s amidst a racism-triggered uprising against colonial segregation.[3] The new Bristol, a replacement for the burned-out husk, now included a large mural on the outsides of the building.

Africa-themed murals continued to be commissioned in other buildings, for example in the 1963 Independence with sculptor Felix Idubor's high relief cement-sculpted scenes, visible upon approach, depicting highly stylized genre figures from Nigerian life, installed near the entrance. In a nearby building for NECOM, in roughly the same period, one finds a first use of mosaics by Yusuf Grillo (1934-2021), an abstracted pattern reminiscent of those constrained to the borders of a project we shall shortly explore than it is at the centre of the decorative project itself, although Grillo often later recalls this building as being Independence House itself (see Jegede, 2000).Encounters between architecture and the visual arts were expanded, especially in hotels that emerged a few years later in Lagos. An intriguing exception to the use of giant-sized murals on building externals, as a provider of a kind of local flavor (because these had no impact *par se* on building form or the spatial layout of actual buildings) occurred in the Lagos City Hall. In this modernist building, no mosaic or painted giant mural covers any portion of its external facades. The drama of mural art unfolds as a surprise, and only once one enters the building to be confronted by a large, sprawling mural that moreover seems to offer an atypical and unexpected illustration of a once unfamiliar urban scene. Other murals are also distributed in some of its more accessible but constrained spaces, passages into the building.

But first about the building. It was engulfed by a fire in 2001, and a renovation project was commenced that did not maintain the style of the original building. What one encounters today, then, is not the original building. It was, in any case, a sternly modernist building. Lagos City Hall **(Fig. 1)** was designed by Israeli architecture and engineering firm AMY Ltd, and appears to have been conceived as what one journalist calls a hub for "social engagements and business," it was later reimagined as an "address for entertainment and tourism."[4] Certainly, by the turn of the millennium, several renowned institutions have occupied some of its spaces as tenants since its founding, recently including the Nigerian offices of the Goethe Institute. Completed in the middle of downtown Lagos Island in late 1968 amidst a still ongoing Nigerian civil war, a festive inaugural event was nevertheless held, in which important figures of Lagosian social life, including its Military Governor Mobolaji Johnson, were in attendance.[5] It nevertheless appears to have been opened to full public use only in 1970 as the civil war concluded, and Nigeria had not broken apart after all, thus ushering a new spirit for a nation where as Military President General Gowon once put it, there was to be "no victor and no vanquished".

Approached from a distance, we encounter a large horizontally extended thirteen bay front-facade (sides are shorter) only interrupted by a vehicular ramp that arrives above a lower level, giving entry to its main hall. But, remaining on the outside, the building offers very little that could be considered a diversion from its strict, almost commercial, late modernist aesthetics. Its thirteen bays are clearly defined by stout concrete columns that were once clad in dark colored panels, and they support a heavy and broad cantilevered roof

3. This was brought to notice when a Sierra Leonean guest, whose reservation had been confirmed, arrived to be denied his stay once it was realized he was Black.

providing a shallow protection to the main cladding enveloping the building. The cladding-proper is essentially a curtain wall that runs in horizontal bands of glazing and narrower opaque panels.

The Interior of the building is surprising, regardless of which way into the building one passes. Indeed, there are several entrances, and one might categorize these as a formal entrance arrived at by car and likely to be the one used on ceremonial occasions by those who arrive by car. The other, a set of more common entrances, serves mainly pedestrians walking in from the less formal other side of the building away from the main entrance. There are other Grillo murals in the Lagos City Hall. The large one on which I have focused is most likely to be encountered first if one enters the building after driving (or more likely being driven up in a limousine like a VIP), to the formal entrance hallway past its multiple swing doors **(Fig. 2)**. Other mosaics in the building are smaller and at eye level, viewed from narrow corridors pressed up to image in ways not available to a viewer who arrives by car at the main entrance. The encounter walking in from the more pedestrian entrance of the crowded back street that ordinary people will use feels quite different, and its subject matter is more familiar to Grillo *aficionados*

The experience is different being dropped off at the main entrance by car. Passing through its entrance doors brings one to its multistory arrival hall. At both ends internal stair flights soar, producing an unexpected drama. Nevertheless, although a visitor is first drawn to a vast wooden sculpture in two large panels at the entrance as one walks into this space, this is hardly architectural ornamentation as such. The hall also includes a mezzanine gallery, however, where a huge mosaic mural is installed tantalizingly out of immediate reach.

The work is a grand, photographic vista of Lagos, focused on the Island—its more modern core in other words—where can be observed its downtown. It captures tall buildings, some identifiably skyscrapers that crowd towards the middle of the panel. Another element in the image snakes away from the images' crowded center–a bridgeway hovering above the waters of the Lagos Lagoon. This is the Third Mainland Bridge **(Fig. 3)**, a project that was in part meant to ease the traffic on both the Island and on the mainland, and across the two or three bridges connecting them. This Mainland Bridge is essentially a traffic bypass writ large, and any focus on it by an artist cannot but be a comment, whether optimistic or as critique, on i*nfrastructural development*, and on *modernization* itself as figured by the state. The infinite bridge that it is, also speaks to issues of Nigerian sovereignty, given the incredibly traumatic civil war, which after all was in truth also as a global front for a proxy Cold War era struggle between two superpowers for influence on the African continent.[6]

Grillo's work at the City Hall is significant, given its obviously engaging realism in ways that the artist would not previously have been best known for. Its scale, and the difficulty of apprehending it from any location in which we may actually *stand* (as an embodied viewer in its presence rather than for instance as illustration in a book) as well as the Bridge's disappearance into the horizon as an infinite object, calls forth both Bennett's (1988) notion of the technologies of

vision,[7] as well separately as Jamieson (1991),[8] theorization of the infrastructural sublime in post modernism, and Ong's (2011) asserting the role of speculation and the spectacular in relation both to representing the Biafran threat to Nigerian sovereignty and its overcoming, as well as it does the post-civil war oil boom that enabled the most dramatic reconstruction of the Lagosian postcolonial urban landscape. The bridge-object on which our vision focuses is also quite unlike what one encounters as the decorative in other buildings of the period, including the one encountered in the constricted space of the building's other entrances.

The divergent murals, the one at the main entrance and its intentional contrast with the others in the same building, then, surprises one by their oscillations as well as other solicitations–given familiarity with murals-schemes on the outsides of African civic architecture in the postcolony. Although it is unlikely that the artist initially chose to work on the inside, rather than externally, the depiction of Lagos and its bridgeway, and its mode and medium, enhance this interior space greatly while also serving as a demonstration of the symbiotic relationship between art and transformational civic life in a universe emerging from tragedy.

Grillo's critical perspective is enhanced by thinking of how here we have architectural decoration by a commissioned West African artist on a modernist building that departs from representing African-ness as such, whether abstract or realist, non-objective or figural. It moved instead to what might seem like a mere focus on infrastructural modernization and the liberal economics of the free market as salvific. This is a veiled critique of infrastructural prowess the future. This was certainly a departure for the place of ornament in modernist architecture in Africa. I wonder whether there is evidence of a single building and its ornamentation, so cleverly capturing a similar shift, in relation to building decoration and the post-dictatorship era in Latin America. ■

The workshop "MODERN FUTURE: LIVING THE FUTURE" promotes higher education between partner universities and Docomomo International Specialist Committee Education+Training

Chairs
Umberto Bonomo – DOCOMOMO CHILE – PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE
Horacio Torrent – DOCOMOMO CHILE – PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

Workshop Scientific Committee
Carolina Quiroga – DOCOMOMO ARGENTINA – DOCOMOMO ISC EDUCATION + TRAINING
Andrea Canziani – DOCOMOMO ITALY – DOCOMOMO ISC EDUCATION + TRAINING
Wido Quist – TU DELFT, THE NETHERLANDS – DOCOMOMO INTERNATIONAL
Wessel de Jonge – TU DELFT, THE NETHERLANDS – DOCOMOMO NETHERLANDS - DOCOMOMO ISC EDUCATION + TRAINING

Workshop Tutors
Wido Quist - TU DELFT, THE NETHERLANDS – DOCOMOMO INTERNATIONAL
Lidwine Spoormans - TU DELFT, THE NETHERLANDS – DOCOMOMO INTERNATIONAL
Andrea Canziani - DOCOMOMO ITALY – DOCOMOMO ISC EDUCATION + TRAINING
Carolina Quiroga - UNIVERSIDAD DE BUENOS AIRES – DOCOMOMO ISC EDUCATION + TRAINING
Lucas Fehr - UNIVERSIDADE PRESBITERIANA MACKENZIE, SAO PAULO, BRAZIL
Rodrigo Gertosio - DAU, PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE – DOCOMOMO CHILE
Anna Braghini - PONTIFICIA UNIVERSIDAD CATÓLICA DE VALPARAÍSO, CHILE
Sebastián Navarrate - UNIVERSIDAD MAYOR, CHILE
Filipe Temtem - UNIVERSIDAD SAN SEBASTIÁN, CHILE
Francisco Quintana - MPUR, PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE
Alfredo Hidalgo - TECNOLÓGICO DE MONTERREY, MÉXICO
Umberto Bonomo - PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE – DOCOMOMO CHILE

Lecturers
Wessel de Jonge - TU DELFT, THE NETHERLANDS – DOCOMOMO NETHERLANDS
Wido Quist - TU DELFT, THE NETHERLANDS – DOCOMOMO INTERNATIONAL
Lidwine Spoormans - TU DELFT, THE NETHERLANDS – DOCOMOMO INTERNATIONAL
Fabiano Lemes de Oliveira - POLITÉCNICO DE MILANO, ITALY
Claudio Vásquez - MASE, PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE
Francisco Quintana - MPUR, PONTIFICIA UNIVERSIDAD CATÓLICA DE CHILE

Docomomo international is a non–profit organization dedicated to the documentation and conservation of buildings, sites and neighbourhoods of the Modern Movement. It aims to:

- Bring the significance of the architecture of the Modern Movement to the attention of the public, the authorities, the professionals and the educational community.
- Identify and promote the surveying of the works of the Modern Movement.
- Promote the conservation and (re)use of buildings and sites of the Modern Movement.
- Oppose destruction and disfigurement of significant works.
- Foster and disseminate the development of appropriate techniques and methods of conservation and adaptative (re)use.
- Attract funding for documentation conservation and (re)use.
- Explore and develop new ideas for the future of a sustainable built environment based on the past experiences of the Modern Movement.

Docomomo international wishes to extend its field of actions to new territories, establish new partnerships with institutions, organizations and NGOs active in modern architecture, develop and publish the international register, and enlarge the scope of its activities in the realm of research, documentation and education.

In pursuit of the mission of **Docomomo** international, as updated in the Eindhoven–Seoul Statement 2014, the theme of the 18th International **Docomomo** Conference is “Modern Futures: Sustainable Development and Cultural Diversity.”

The Conference takes place in Santiago de Chile, from 10 to 14 December 2024, at the Facultad de Arquitectura, Diseño y Estudios Urbanos of Pontificia Universidad Católica de Chile.
